

## SY89295U

### 2.5V/3.3V 1.5GHz Precision LVPECL Programmable Delay

## General Description

The SY89295U is a programmable delay line that delays the input signal using a digital control signal. The delay can vary from 3.2ns to 14.8ns in 10ps increments. In addition, the input signal is LVPECL, uses either a 2.5V  $\pm 5\%$  or 3.3V  $\pm 10\%$  power supply, and is guaranteed over the full industrial temperature range ( $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$ ).

The delay varies in discrete steps based on a control word. The control word is 10-bits long and controls the delay in 10ps increments. The eleventh bit is D[10] and is used to simultaneously cascade the SY89295U which allows for a larger delay range. In addition, the input pins IN and /IN default to an equivalent low state when left floating. Further, for maximum flexibility, the control register interface accepts CMOS or TTL level signals.

For applications that require an analog delay input, see the SY89296L which is a programmable delay chip with fine tune control. The SY89295U and SY89296U are part of Micrel's high-speed, Precision Edge<sup>®</sup> product line.

Data sheets and support documentation can be found on Micrel's web site at: [www.micrel.com](http://www.micrel.com).

Precision Edge<sup>®</sup>

## Features

- Precision LVPECL programmable delay line
- Guaranteed AC performance over temperature and voltage:
  - $>1.5\text{GHz } f_{\text{MAX}}$
  - $<160\text{ps}$  rise/fall times
- Low-jitter design:
  - $<10\text{ps}_{\text{PP}}$  total jitter
  - $<2\text{ps}_{\text{RMS}}$  cycle-to-cycle jitter
  - $<1\text{ps}_{\text{RMS}}$  random jitter
- Programmable delay range: 3.2ns to 14.8ns in 10ps increments
- Increased monotonicity over the MIC100EP195
- $\pm 10\text{ps}$  INL
- $V_{\text{BB}}$  output reference voltage
- Parallel inputs accepts LVPECL or CMOS/LVTTL
- Low voltage operation: 2.5V  $\pm 5\%$  and 3.3V  $\pm 10\%$
- Industrial  $-40^{\circ}\text{C}$  to  $+85^{\circ}\text{C}$  temperature range
- Available in 32-pin (5mm  $\times$  5mm) MLF<sup>®</sup> and 32-pin TQFP packages

## Applications

- Clock de-skewing
- Timing adjustments
- Aperture centering

### Functional Block Diagram

**SY89295U Block Diagram**

## Pin Description

Pin Number	Pin Name	Pin Function	
23, 25, 26, 27, 29, 30, 31, 32, 1, 2	D[9:0]	CMOS, ECL, or TTL Control Bits: These control signals adjust the delay from IN to Q. See “AC Electrical Characteristics” for delay values. In addition, see “Interface Applications” section which illustrates the proper interfacing techniques for different logic standards. D[9:0] contains pull-downs and defaults LOW when left floating. D0 (LSB), and D9 (MSB). See “Typical Operating Characteristics” for delay information.	
3	D10	CMOS, ECL, or TTL Control Bit: This bit is used to cascade devices for an extended delay range. In addition, it drives CASCADE, and /CASCADE. Further, D[10] contains a pull-down and defaults LOW when left floating.	
4, 5	IN, /IN	LVPECL/ECL Signal Input: Input signal to be delayed. IN contains a 75k $\Omega$ pull-down and will default to a logic LOW if left floating.	
6	VBB <sup>(1)</sup>	Reference Voltage Output: When using a single-ended input signal source to IN or /IN, connect the unused input of the differential pair to this pin. This pin can also be used to re-bias AC-coupled inputs to IN and /IN. When used, de-couple to V <sub>CC</sub> using a 0.01 $\mu$ F capacitor, otherwise leave floating if not used. Maximum sink/source is $\pm$ 0.5mA.	
7	VEF	Reference Voltage Output: Connect this pin to V <sub>CF</sub> when D[9:0], and D[10] is ECL..	
		<b>Logic Standard</b>	<b>V<sub>CF</sub> Connects to:</b>
		LVPECL	V <sub>EF</sub> , <sup>(1)</sup>
		CMOS	No Connect
		TTL	1.5V Source
8	VCF	Reference Voltage Input: The voltage driven on V <sub>CF</sub> sets the logic transition threshold for D[9:0], and D[10].	
9, 24, 28	GND, Exposed Pad <sup>(2)</sup>	Negative Supply: For MLF <sup>®</sup> package, exposed pad must be connected to a ground plane that is the same potential as the ground pin.	
10	LEN	ECL Control Input: When HIGH latches the D[9:0] and D[10] bits. When LOW, the D[9:0] and D[10] latches are transparent.	
11	SETMIN	ECL Control Input: When HIGH, D[9:0] registers are reset. When LOW, the delay is set by SETMAX or D[9:0] and D[10]. SETMIN contains a pull-down and defaults LOW when left floating.	
12	SETMAX	ECL Control Input: When SETMAX is set HIGH and SETMIN is set LOW, D[9:0] = 111111111. When SETMAX is LOW, the delay is set by SETMIN or D[9:0] and D[10]. SETMAX contains a pull-down and defaults LOW when left floating.	
13, 18, 19, 22	VCC	Positive Power Supply: Bypass with 0.1 $\mu$ F and 0.01 $\mu$ F low ESR capacitors.	
14, 15	/Cascade, Cascade	LVPECL Differential Output: The outputs are used when cascading two or more SY89295U to extend the delay range.	
16	/EN	LVPECL Single-Ended Control Input: When LOW, Q is delayed from IN. When HIGH, Q is a differential LOW. /EN contains a pull-down and defaults LOW when left floating.	
20, 21	/Q, Q	LVPECL Differential Output: Q is a delayed version of IN. Always terminate the output with 50 $\Omega$ to V <sub>CC</sub> – 2V. See “Output Interface Applications” section.	
17	NC	No Connect.	

### Notes:

1. Single-ended operation is only functional at 3.3V.
2. MLF<sup>®</sup> package only.

### Absolute Maximum Ratings<sup>(1)</sup>

Supply Voltage ( $V_{CC}$ )	-0.5V to +4.0V
Input Voltage ( $V_{IN}$ )	-0.5V to $V_{CC}$
LVPECL Output Current ( $I_{OUT}$ )	
Continuous	50mA
Surge	100mA
Lead Temperature (soldering, 20 sec.)	+260°C
Storage Temperature Range ( $T_S$ )	-65°C to +150°C

### Operating Ratings<sup>(2)</sup>

Supply Voltage ( $V_{CC}$ )	+2.375V to +3.6V
Ambient Temperature ( $T_A$ )	-40°C to +85°C
Package Thermal Resistance <sup>(3)</sup>	
MLF <sup>®</sup> ( $\theta_{JA}$ )	
Still-Air	35°C/W
MLF <sup>®</sup> ( $\psi_{JB}$ )	
Junction-to-Board	28°C/W
TQFP ( $\theta_{JA}$ )	
Still-Air	28°C/W
TQFP ( $\psi_{JB}$ )	
Junction-to-Board	20°C/W

### DC Electrical Characteristics<sup>(4)</sup>

$T_A = -40^\circ\text{C}$  to  $+85^\circ\text{C}$ , unless noted.

Symbol	Parameter	Condition	Min.	Typ.	Max.	Units
$V_{CC}$	Power Supply	$V_{CC} = 2.5\text{V}$	2.375	2.5	2.625	V
		$V_{CC} = 3.3\text{V}$	3	3.3	3.6	
$I_{EE}$	Power Supply Current	No load, max. $V_{CC}$			220	mA
$V_{IN}$	Input Voltage Swing (IN, /IN)	See Figure 1a.	150		1200	mV
$V_{DIFF\_IN}$	Differential Input Voltage Swing (IN, /IN)	See Figure 1b.	300		2400	mV
$V_{IHCMR}$	Input High Common Mode Range	IN, /IN	$V_{EE} + 1.2$		$V_{CC}$	V

$V_{CC} = 3.3\text{V}$ ,  $T_A = -40^\circ\text{C}$  to  $85^\circ\text{C}$ , unless otherwise stated.

Symbol	Parameter	Condition	Min.	Typ.	Max.	Units
$V_{IH}$	Input High Voltage (IN, /IN)		2.075		2.420	V
$V_{IL}$	Input Low High Voltage (IN, /IN)		1.355		1.675	V
$V_{BB}$	Output Voltage Reference		1.775	1.875	1.975	V
$V_{EF}$	Mode Connection		1.9	2.0	2.1	V
$V_{CF}$	Input Select Voltage		1.55	1.65	1.75	V

**Notes:**

1. Permanent device damage may occur if "Absolute Maximum Ratings" are exceeded. This is a stress rating only and functional operation is not implied at conditions other than those detailed in the operational sections of this data sheet. Exposure to "Absolute Maximum Rating" conditions for extended periods may affect device reliability.
2. The data sheet limits are not guaranteed if the device is operated beyond the operating ratings.
3. Thermal performance on MLF<sup>®</sup> packages assumes exposed pad is soldered (or equivalent) to the device most negative potential (GND).
4. The circuit is designed to meet the DC specifications shown in the table above after thermal equilibrium has been established. Input and output parameters vary 1:1 with  $V_{CC}$ , with the exception of  $V_{CF}$ .

## DC Electrical Characteristics<sup>(4)</sup> (Continued)

$V_{CC} = 2.5V$ ,  $T_A = -40^{\circ}C$  to  $85^{\circ}C$ , unless otherwise stated.

Symbol	Parameter	Condition	Min.	Typ.	Max.	Units
$V_{IH}$	Input High Voltage (IN, /IN)		1.275		1.62	V
$V_{IL}$	Input Low High Voltage (IN, /IN)		0.555		0.875	V
$V_{BB}$	Output Voltage Reference		1.175	1.075	0.975	V
$V_{EF}$	Mode Connection		1.10	1.20	1.30	V
$V_{CF}$	Input Select Voltage		1.15	1.25	1.35	V

## LVPECL Outputs DC Electrical Characteristics<sup>(4)</sup>

$V_{CC} = 3.3V$ ;  $R_{LOAD} = 50\Omega$  to  $V_{CC}-2V$ ;  $T_A = -40^{\circ}C$  to  $+85^{\circ}C$ , unless noted.

Symbol	Parameter	Condition	Min.	Typ.	Max.	Units
$V_{OH}$	Output HIGH Voltage (Q, /Q)		2.155	2.280	2.405	V
$V_{OL}$	Output LOW Voltage (Q, /Q)		1.355	1.480	1.605	V
$V_{OUT}$	Output Voltage Swing (Q, /Q)	See Figure 1a.	550	800		mV
$V_{DIFF\_OUT}$	Differential Output Voltage Swing (Q, /Q)	See Figure 1b.	1.1	1.6		V

## LVPECL Outputs DC Electrical Characteristics<sup>(5)</sup>

$V_{CC} = 2.5V$ ;  $R_{LOAD} = 50\Omega$  to  $V_{CC}-2V$ ;  $T_A = -40^{\circ}C$  to  $+85^{\circ}C$ , unless noted.

Symbol	Parameter	Condition	Min.	Typ.	Max.	Units
$V_{CC}$	Output HIGH Voltage (Q, /Q)		1.355	1.480	1.605	V
$I_{EE}$	Output LOW Voltage (Q, /Q)		0.555	0.68	0.805	V
$V_{IN}$	Output Voltage Swing (Q, /Q)	See Figure 1a.	550	800		mV
$V_{DIFF\_OUT}$	Differential Output Voltage Swing (Q, /Q)	See Figure 1b.	1.1	1.6		V

## LVTTTL/CMOS DC Electrical Characteristics<sup>(6)</sup>

$V_{CC} = 2.5V \pm 5\%$  or  $3.3V \pm 10\%$ ;  $T_A = -40^{\circ}C$  to  $+85^{\circ}C$ , unless noted.

Symbol	Parameter	Condition	Min	Typ	Max	Units
$V_{IH}$	Input HIGH Voltage		2.0			V
$V_{IL}$	Input LOW Voltage				0.8	V
$I_{IH}$	Input HIGH Current				40	$\mu A$
$I_{IL}$	Input LOW Current		-300			$\mu A$

### Notes:

- The circuit is designed to meet the DC specifications shown in the table above after thermal equilibrium has been established.  $V_{OH}$  and  $V_{OL}$  parameters vary 1:1 with  $V_{CC}$ .
- The circuit is designed to meet the DC specifications shown in the table above after thermal equilibrium has been established.

## AC Electrical Characteristics<sup>(7)</sup>

T<sub>A</sub> = -40°C to +85°C, unless noted.

Symbol	Parameter	Condition	Min.	Typ.	Max.	Units
f <sub>MAX</sub>	Maximum Operating Frequency	Clock V <sub>OUT</sub> ≥ 400mV	1.5			GHz

INL	Integral Non-Linearity	<b>Note 9</b>		±10		ps
t <sub>S</sub>	Setup Time D to LEN D to IN /EN to IN	<b>Note 10</b> <b>Note 11</b>	200 350 300			ps
t <sub>H</sub>	Hold Time LEN to D IN to /EN	<b>Note 12</b>	200 400			ps

### Notes:

- High-frequency AC electricals are guaranteed by design and characterization.
- Duty cycle skew guaranteed only for differential operation measured from the cross point of the input to the crosspoint of the output.
- INL (Integral Non-Linearity) is defined from its corresponding point on the ideal delay versus D[9:0] curve as the deviation from its ideal delay. The maximum difference is the INL. Theoretical Ideal Linearity (TIL) = (measured maximum delay – measured minimum delay) ÷ 1024. INL = measured delay – measured minimum delay + (step number ∞ TIL).
- This setup time defines the amount of time prior to the input signal. The delay tap of the device must be set.
- This setup time defines the amount of the time that /EN must be asserted prior to the next transition of IN, /IN to prevent an output response greater than ±75mV to the IN, /IN transition.
- Hold time is the minimum time that /EN must remain asserted after a negative going IN or a positive going /IN to prevent an output response greater than ±75mV to the IN, /IN transition.

**AC Electrical Characteristics<sup>(7)</sup>**T<sub>A</sub> = -40°C to +85°C, unless noted.

Symbol	Parameter	Condition	Min.	Typ.	Max.	Units
t <sub>R</sub>	Release Time /EN to IN SETMAX to LEN SETMIN to LEN		500 500 450			ps
t <sub>JITTER</sub>	Cycle-to-Cycle Jitter Total Jitter Random Jitter	<b>Note 13</b> <b>Note 14</b> <b>Note 15</b>			2 10 1	pSRMS pSPP pSRMS
t <sub>r</sub> , t <sub>f</sub>	Output Rise/Fall Time	20% to 80% (Q) 20% to 80% (Cascade)	50 90	85	160 300	ps
	Duty Cycle		45		55	%

**Notes:**

13. Cycle-to-cycle jitter definition: The variation of periods between adjacent cycles over a random sample of adjacent cycle pairs.  
T<sub>jitter\_cc</sub> = T<sub>n</sub> - T<sub>n+1</sub>, where T is the time between rising edges of the output signal.
14. Total jitter definition: With an ideal clock input, no more than one output edge in 10<sup>12</sup> output edges will deviate by more than the specified peak-to-peak jitter value.
15. Random jitter definition: Jitter that is characterized by a Gaussian distribution, unbounded and is quantified by its standard deviation and mean. Random jitter is measured with a K28.7 comma defect pattern, measured at 1.5Gbps.

## Typical Operating Characteristics

$V_{CC} = 3.3V$ ,  $GND = 0$ ,  $D_{IN} = 100mV$ ,  $T_A = 25^\circ C$ , unless otherwise stated.

Figure 6. Terminating Unused I/O

## Applications Information

For best performance, use good high-frequency layout techniques, filter  $V_{CC}$  supplies, and keep ground connections short. Use multiple vias where possible. Also, use controlled impedance transmission lines to interface with the SY89295U data inputs and outputs.

### $V_{BB}$ Reference

The  $V_{BB}$  pin is an internally generated reference and is available for use only by the SY89295U. When unused, this pin should be left unconnected. Two common uses for  $V_{BB}$  are to handle a single-ended PECL input, and to re-bias inputs for AC-coupling applications.

If IN and /IN are driven by a single-ended output,  $V_{BB}$  is used to bias the unused input. Please refer to Figure 10. The PECL signal driving the SY89295U may optionally be inverted in this case.

When the signal is AC-coupled,  $V_{BB}$  is used, as shown in Figure 13, to re-bias IN and /IN. This ensures that SY89295U inputs are within acceptable common mode range.

In all cases,  $V_{BB}$  current sinking or sourcing must be limited to 0.5mA or less.

### Setting D Input Logic Thresholds

In all designs where the SY89295U GND supply is at zero volts, the D inputs can accommodate CMOS and TTL level signals, as well as PECL or LVPECL. Figures 11, 12 and 14 show how to connect  $V_{CF}$  and  $V_{EF}$  for all possible cases.

### Cascading

Two or more SY89295U may be cascaded in order to extend the range of delays permitted. Each additional SY89295U adds about 3.2ns to the minimum delay and adds another 10240ps to the delay range.

Internal cascade circuitry has been included in the SY89295U. Using this internal circuitry, the SY89295U may be cascaded without any external gating.

Examples of cascading 2, 3, or 4 SY89295U appear in Figures 7, 8, and 9.

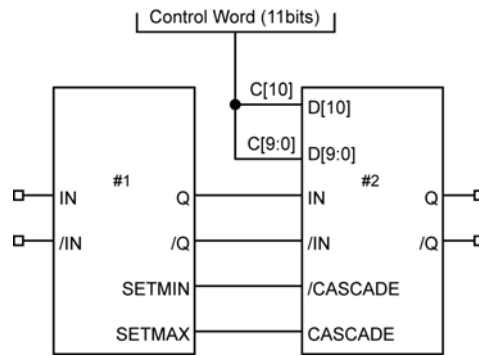

Figure 7. Cascading Two SY89295U

Figure 8. Cascading Three SY89295U

Figure 8. Cascading Four SY89295U

## Interface Applications

\* 3.3V single-ended only, 2.5V, single-ended is not functional.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
