DESCRIPTION

The 74ALVC162834A is an 18-bit registered driver. Data flow is controlled by active low output enable ($\overline{OE}$), active low latch enable ($\overline{LE}$) and clock inputs (CP).

When $\overline{LE}$ is LOW, the A to Y data flow is transparent. When $\overline{LE}$ is HIGH and CP is held at LOW or HIGH, the data is latched; on the LOW to HIGH transient of CP the A-data is stored in the latch/flip-flop.

The 74ALVC162834A is designed with 30 Ω series resistors in both HIGH or LOW output stages.

When $\overline{OE}$ is LOW the outputs are active. When $\overline{OE}$ is HIGH, the outputs go to the high impedance OFF-state. Operation of the $\overline{OE}$ input does not affect the state of the latch/flip-flop.

To ensure the high-impedance state during power up or power down, $\overline{OE}$ should be tied to V_{CC} through a pullup resistor; the minimum value of the resistor is determined by the current-sinking capability of the driver.

NOTES:

1. C_{PD} is used to determine the dynamic power dissipation (P_D in μW):
 $P_D = C_{PD} \times V_{CC}^2 \times f_i + \sum (C_L \times V_{CC}^2 \times f_o)$ where: f_i = input frequency in MHz; C_L = output load capacitance in pF;
 f_o = output frequency in MHz; V_{CC} = supply voltage in V; $\sum (C_L \times V_{CC}^2 \times f_o)$ = sum of outputs.
