1 Description

QUINT POWER power supply units – Maximum system availability with SFB technology
Compact power supply units of the new QUINT POWER generation maximize the availability of your system. With the SFB technology (Selective Fuse Breaking Technology), six times the nominal current for 12 ms, even the standard power circuit-breakers can now also be triggered reliably and quickly. Faulty current paths are switched off selectively, the fault is located and important system parts continue to operate. Comprehensive diagnostics are provided through constant monitoring of output voltage and current. This preventive function monitoring visualizes critical operating modes and reports them to the control unit before an error can occur.

Features

- Quick tripping of the standard power circuit-breakers using dynamic power reserve SFB technology
- Reliable starting of difficult loads with static POWER BOOST power reserve
- Preventive function monitoring
- Can be used worldwide
- High degree of operational safety due to high MTBF > 500 000 h, long mains buffering times > 20 ms, high dielectric strength up to 300 V AC

DANGER OF EXPLOSION!

Only remove equipment when it is disconnected and not in the potentially explosive area.

DANGER

Components with dangerously high voltage and high stored energy are located in the device!
Never carry out work on live parts!
Depending on the ambient temperature and the load, the housing can become very hot!

Make sure you always use the latest documentation.
It can be downloaded at www.phoenixcontact.net/download

4 Technical data

| Input data | |
|--|---|
| Input nominal voltage range | 100 V AC ... 240 V AC |
| AC input voltage range | 85 V AC ... 264 V AC |
| Short-term input voltage | 300 V AC |
| DC input voltage range | 90 V DC ... 350 V DC |
| AC frequency range | 45 Hz ... 65 Hz |
| DC frequency range | 0 Hz |
| Current consumption | Approx. 1.2 A (120 V AC) Approx. 0.6 A (230 V AC) |
| Inrush current limitation | < 15 A (typical) |
| I^2t | < 1 A ² s |
| Power failure bypass | > 30 ms (120 V AC) > 30 ms (230 V AC) |
| Typical response time | < 0.5 s |
| Protective circuitry | Transient surge protection Varistor |
| Input fuse, integrated | 5 A (slow-blow, internal) |
| Recommended backup fuse for mains protection | 6 A (characteristic B) 10 A (characteristic B) 16 A (characteristic B) |
| Discharge current to PE | < 3.5 mA |
| Output data | |
| Nominal output voltage | 24 V DC \pm 1% |
| Setting range of the output voltage | 18 V DC ... 29.5 V DC (> 24 V constant capacity) |
| Output current | 5 A (-25°C ... 70°C, U _{OUT} = 24 V DC) 7.5 A (with POWER BOOST, -25°C ... 40°C permanently, U _{OUT} = 24 V DC) 30 A (with SFB technology, 12 ms) |
| Magnetic fuse tripping | max 2 A (Characteristic C) |
| Derating | From +60°C 2.5% per Kelvin |
| Control deviation | < 1 % (change in load, static 10% ... 90%) < 2 % (change in load, dynamic 10% ... 90%) < 0.1 % (change in input voltage \pm 10%) |
| Power loss nominal load max. | 15 W |
| Maximum power dissipation idling | 3 W |
| Efficiency | > 90 % (for 230 V AC and nominal values) |
| Ascent time | < 0.5 ms |
| Residual ripple | < 40 mV _{PP} (with nominal values) |
| Connection in parallel | Yes, for redundancy and increased capacity |

Output data (Continued)

| | |
|--|---------------------------------|
| Connection in series | Yes |
| Surge protection against internal surge voltages | Yes, limited to approx. 35 V DC |
| Resistance to reverse feed | max. 35 V DC |

DC OK active

| | |
|--------------------|--|
| Output description | $U_{OUT} > 0.9 \times U_N$: High signal |
| Voltage | + 18 V DC ... 24 V DC |
| Current | ≤ 20 mA (short circuit resistant) |
| Status display | $U_{OUT} > 0.9 \times U_N$: "DC OK" LED green / $U_{OUT} < 0.9 \times U_N$: Flashing "DC OK" LED |

DC OK floating

| | |
|--------------------|--|
| Output description | Relay contact, $U_{OUT} > 0.9 \times U_N$: Contact closed |
| Voltage | ≤ 30 V AC/DC |
| Current | ≤ 1 A |
| Status display | $U_{OUT} > 0.9 \times U_N$: "DC OK" LED green / $U_{OUT} < 0.9 \times U_N$: Flashing "DC OK" LED |

POWER BOOST, active

| | |
|--------------------|--|
| Output description | $I_{OUT} < I_N$: High signal |
| Voltage | + 18 V DC ... 24 V DC |
| Current | ≤ 20 mA (short circuit resistant) |
| Status display | $I_{OUT} > I_N$: LED "BOOST" yellow / |

General data

| | |
|--|---|
| Insulation voltage input/output | 4 kV AC (type test) 2 kV AC (routine test) |
| Insulation voltage input / PE | 3.5 kV AC (type test) 2 kV AC (routine test) |
| Insulation voltage output / PE | 500 V DC (routine test) |
| Degree of protection | IP20 |
| Class of protection | I, with PE connection |
| MTBF | > 500 000 h in acc. with IEC 61709 (SN 29500) |
| Type of housing | Steel sheet, zinc-plated |
| Housing material | Steel sheet, zinc-plated |
| Dimensions W / H / D (state of delivery) | 40 mm / 130 mm / 125 mm |
| Dimensions W / H / D (90° turned) | 122 mm / 130 mm / 43 mm |
| Weight | 0.7 kg |

Ambient conditions

| | |
|--|---|
| Ambient temperature (operation) | -25 °C ... 70 °C (> 60 °C derating) |
| Ambient temperature (storage/transport) | -40 °C ... 85 °C |
| Max. permissible relative humidity (operation) | 95 % (at 25 °C, no condensation) |
| Vibration (operation) | < 15 Hz, amplitude ± 2.5 mm in acc. with IEC 60068-2-6 15 Hz ... 150 Hz, 2.3g, 90 min. |
| Shock | 30g in all directions in acc. with IEC 60068-2-27 |
| Pollution degree in acc. with EN 50178 | 2 |
| Climatic class | 3K3 (in acc. with EN 60721) |

Standards

6 Block diagram

7 Safety and warning notes

DANGER OF EXPLOSION!

Only remove equipment when it is disconnected and not in the potentially explosive area.

DANGER

The device contains dangerous live elements and high levels of stored energy. Never carry out work when the power is turned on.

WARNING

Before startup please ensure:

The mains connection has been carried out by a competent person and protection against electric shock is guaranteed!

The device can be disconnected outside the power supply unit in accordance with the regulations as in EN 60950 (e.g. through primary side line protection)!

The ground conductor is connected!

All feed lines are sufficiently protected and dimensioned!

All output lines are dimensioned according to the maximum output current of the device or separately protected!

Sufficient convection is guaranteed!

CAUTION

The power supply units are built-in devices. The device may only be installed and put into operation by qualified personnel. The corresponding national regulations must be observed.

8 Installation

ATTENTION

In order to ensure sufficient convection, we recommend a minimum vertical distance of 5 cm to the other modules. A lateral distance of 5 mm, and in the case of active components, that of 15 mm is necessary for proper functioning of the module. Depending on the ambient temperature and the load of the module, the housing can become very hot!

The power supply unit can be snapped onto all DIN rails in acc. with EN 60715. They must be mounted horizontally (connecting terminal blocks top and bottom).

9 Installation position

Slim-style installation: Installation depth 125 mm (+ DIN rail)
(state at delivery)

Low-profile installation: Installation depth 43 mm (+ DIN rail)

10 Mounting on DIN rails

Slim-style installation

Assembly:

Position the module with the DIN rail guide on the upper edge of the DIN rail, and snap it in with a downward motion.

Removing:

Pull the snap lever open with the aid of a screwdriver and slide the module out at the lower edge of the DIN rail.

Low-profile installation

Low-profile installation can be achieved by mounting the device at right-angles to the DIN rail. Mount the DIN rail adapter (UTA 107/30) as described in the figure. No additional mounting material is required. Fixing screws: Torx T10 (torque 0.8 Nm ... 0.9 Nm).

11 Connection to various systems

The connection for 100 V AC ... 240 V AC is established using the L, N, and P screw connections.

The device can be connected to 1-phase AC networks or to two of the phase conductors of three-phase systems (TN, TT or IT systems) in accordance with VDE 0100-300/IEC 60364-3) with nominal voltages of 100 V AC ... 240 V AC.

The device also continues to work on short-term input voltages > 300 V AC.

For operation on two of the phase conductors of a three-phase system, an isolating facility for all poles must be provided.

12 Input

CAUTION

If an internal fuse is triggered, there is most probably a malfunction in the device. In this case, the device must be inspected in the factory!

Protection of the primary side

The device must be installed in acc. with the regulations as in EN 60950. It must be possible to disconnect the device using a suitable isolating facility outside the power supply.

The primary side line protection, for example, is suitable. For device protection, there is an internal fuse. Additional device protection is not necessary.

Recommended backup fuse for mains protection

Power circuit-breaker 6 A, 10 A or 16 A, characteristic B (or identical function). Connect a suitable fuse upstream for DC applications!

13 Output

CAUTION

Make sure that all output lines are dimensioned according to the maximum output current or are separately protected. The cables on the secondary side must have sufficiently large cross sections in order to keep the voltage drops on the lines as low as possible.

The connection is established using screw connections on the screw connection of the DC output:
 24 V DC: "+" and "-"; DC OK switching output active: "DC OK" and "-"; DC OK output floating: "13" and "14"; POWER BOOST switching output active: " $I < I_N$ " and "-".
 At the time of delivery, the output voltage is 24 V DC. The output voltage can be set on the potentiometer.

Protection of the secondary side

The device is electronically protected against short circuit and idling. In the event of a malfunction, the output voltage is limited to 35 V DC.

14 Signaling

An active signal output DC OK, a floating signal contact DC OK and an active signal output POWER BOOST are available for function monitoring. In addition, the DC OK LED and the BOOST LED can be used to evaluate the function of the power supply directly at the installation location (see output characteristic curve).

| | $I < I_N$ | $I > I_N$ | $U_{OUT} < 0.9 \times U_N$ |
|-------------------------------------|---|--|--|
| "DC OK" LED | ON | ON | Flashing |
| "BOOST" LED | OFF | ON | ON |
| Active DC OK switching output | ON | ON | OFF |
| Floating DC OK output | Closed | Closed | Open |
| Active POWER BOOST switching output | ON | OFF | OFF |
| Meaning | Normal operation of the power supply ($U_{OUT} > 21.5 \text{ V}$) | POWER BOOST operation, e.g. to start loads | Overload mode, e.g. consumer short circuit or overload |

Floating contact

The floating signal contact opens and indicates that the set output voltage has undershot by more than 10%. Signals and ohmic loads of up to maximum 30 V and currents of maximum 1 A (or maximum 60 V with maximum 0.5 A) can be switched. For heavily inductive loads such as a relay, a suitable protection circuit (e.g. damping diode) is necessary.

Active signal outputs

The 18 ... 24 V DC signal is applied between the "DC OK" and the "-" connection terminal blocks or between " $I < I_N$ " and "-" and can carry up to 20 mA. By switching from "active high" to "low", the DC OK signal output signalizes when the output voltage is fallen short of by more than 10 %.

The DC OK signal is decoupled from the power output. This ensures that an external supply does not enter from devices connected in parallel.

The POWER BOOST signal output $I < I_N$ signalizes that the nominal current is exceeded. The power supply unit is then in the POWER BOOST mode. Using this preventive function monitoring, critical operating statuses can be governed at an early stage before it results in a voltage dip.

The 18 ... 24 V DC signal can be directly connected to a logic input for evaluation.

Signal loop

Monitoring two devices: Use the active signal output of device 1 and loop in the floating signal output of device 2. In the event of malfunctioning, a common alarm is output. Any number of devices can be looped in. This signal combination saves wiring costs and logic inputs.

15 Function

Output characteristic curve

The power supply unit works with the static power reserve POWER BOOST as shown in the U/I characteristic curve in the figure. At ambient temperatures $T_{amb} < +40\text{ }^\circ\text{C}$, I_{BOOST} is available continuously. At higher temperatures, it's available for a few minutes. In the event of a secondary-side short circuit or overload, the output current is limited to I_{BOOST} . Thereby, the module does not switch off, but rather supplies a continuous output current. The secondary voltage is reduced here until the short circuit is eliminated. The U/I characteristic curve with the power reserve POWER BOOST ensures that both high inrush currents of capacitive loads as well as consumers with DC/DC converters in the primary circuit can be supplied.

In order to trip standard power circuit breakers magnetically and very quickly, power supply units must supply a multiple of their nominal current for a short period.

As can be seen from the characteristic curve, when $I < I_N$, $I > I_N$ and $U < 0.9 \times U_N$. The relevant signaling can be found in the table "Signaling".

$$U_N = 24\text{ V}$$

$$I_N = 5\text{ A}$$

$$I_{BOOST} = 7.5\text{ A}$$

$$\text{SFB technology} = 30\text{ A}$$

$$P_N = 120\text{ W}$$

$$P_{BOOST} = 180\text{ W}$$

Thermal behavior

With an ambient temperature of up to $+40\text{ }^\circ\text{C}$, the device supplies the continuous output current of I_{BOOST} . The device can supply a nominal output current of I_N with ambient temperatures of up to $+60\text{ }^\circ\text{C}$. In the case of ambient temperatures above $+60\text{ }^\circ\text{C}$, the output current must be reduced by 2.5% per Kelvin increase in temperature. The device does not switch off at ambient temperatures of $+70\text{ }^\circ\text{C}$ or thermal overload. The output capacity is reduced as far as necessary to provide device protection. After it has cooled down, the output capacity is increased again.

Parallel operation

Devices of the same type can be connected in parallel to enable both redundancy and an increase in efficiency. On default upon delivery, a further adjustment is not needed. If the output voltage is adjusted, a uniform distribution of power is guaranteed by setting all parallel operated power supply units to exactly the same output voltage. To ensure symmetrical current distribution we recommend that all cable connections from the power supply unit to the busbar are the same length and have the same cross-section! Depending on the system, for parallel connection of more than two power supply units a protective circuit should be installed at each individual device output (e.g. decoupling diode, DC fuse or power circuit breaker). This prevents high return currents in the event of a secondary device fault.

Redundant operation

Redundant circuits are suitable for the supply of systems which make especially high requirements on the operational safety. If a fault occurs in the primary circuit of the first power supply unit, the second device automatically takes over the entire power supply, without interruption, and vice versa. For this reason, the power supply units to be connected in parallel are dimensioned in such a way that the total current requirement of all consumers can be completely covered by one power supply unit. 100% redundancy makes external decoupling diodes necessary (QUINT-DIODE/40, Order No. 2938963)!

Increased performance

For n parallel connected devices, the output current can be increased to $n \times I_N$. Parallel connection to increase efficiency is used for the expansion of existing systems. It is advisable to use parallel connection if the power supply unit does not cover the current requirement of the most powerful consumer. Otherwise the consumers should be spread among individual devices independent of one another. A maximum of five devices can be connected in parallel!

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
