XC4000XL Electrical Specifications

Definition of Terms

In the following tables, some specifications may be designated as Advance or Preliminary. These terms are defined as follows:

Advance: Initial estimates based on simulation and/or extrapolation from other speed grades, devices, or device families. Values are subject to change. Use as estimates, not for production.

Preliminary: Based on preliminary characterization. Further changes are not expected.

Unmarked: Specifications not identified as either Advance or Preliminary are to be considered Final.

Except for pin-to-pin input and output parameters, the a.c. parameter delay specifications included in this document are derived from measuring internal test patterns. All specifications are representative of worst-case supply voltage and junction temperature conditions.

All specifications subject to change without notice.

XC4000XL D.C. Characteristics

Absolute Maximum Ratings

| | Description | | | Units | | |
|------------------|--|--|-------------|-------|--|--|
| V _{CC} | Supply voltage relative to Ground | | -0.5 to 4.0 | V | | |
| V _{IN} | Input voltage relative to Ground (Note 1) | ve to Ground (Note 1) | | | | |
| V _{TS} | Voltage applied to 3-state output (Note 1) | ate output (Note 1) | | | | |
| V _{CCt} | Longest Supply Voltage Rise Time from 1 V to 3V | ipply Voltage Rise Time from 1 V to 3V | | | | |
| T _{STG} | Storage temperature (ambient) | | -65 to +150 | °C | | |
| T _{SOL} | Maximum soldering temperature (10 s @ 1/16 in. = 1 | l.5 mm) | +260 | °C | | |
| т | | Ceramic packages | +150 | °C | | |
| ТJ | Junction Temperature | Plastic packages | +125 | °C | | |

Note 1: Maximum DC excursion above V_{cc} or below Ground must be limited to either 0.5 V or 10 mA, whichever is easier to achieve. During transitions, the device pins may undershoot to -2.0 V or overshoot toV_{CC} +2.0 V, provided this over or undershoot lasts less than 10 ns and with the forcing current being limited to 200 mA.

Note: Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions is not implied. Exposure to Absolute Maximum Ratings conditions for extended periods of time may affect device reliability.

Recommended Operating Conditions

| Symbol | Description | | Min | Max | Units |
|-----------------|---|--|------------------------|-----------------|-------|
| Vee | Supply voltage relative to Gnd, $T_J = 0$ °C to +85°C | \circ Gnd, T _J = 0 °C to +85°C Commercial | | 3.6 | V |
| V _{CC} | Supply voltage relative to Gnd, $T_J = -40^{\circ}C$ to $+100^{\circ}C$ | Industrial | 3.0 | 3.6 | V |
| V _{IH} | High-level input voltage | · | 50% of V _{CC} | 5.5 | V |
| V _{IL} | Low-level input voltage | | 0 | 30% of V_{CC} | V |
| T _{IN} | Input signal transition time | | | 250 | ns |

Notes: At junction temperatures above those listed above, all delay parameters increase by 0.35% per °C. Input and output measurement threshold is \sim 50% of V_{CC}.

Product Obsolete/Under Obsolescence XC4000E and XC4000X Series Field Programmable Gate Arrays

D.C. Characteristics Over Recommended Operating Conditions

| Symbol | Description | | Min | Max | Units | |
|------------------|--|---|---------------------|------|-------|--|
| V | High-level output voltage @ I_{OH} = -4.0 mA, V_{CC} | min (LVTTL) | 2.4 | | V | |
| V _{OH} | High-level output voltage @ I_{OH} = -500 µA, (LVC | MOS) | 90% V _{CC} | | V | |
| V _{OL} | Low-level output voltage @ I_{OL} = 12.0 mA, V _{CC} r | out voltage @ I _{OL} = 12.0 mA, V _{CC} min (LVTTL) (Note 1) | | | | |
| | Low-level output voltage @ I_{OL} = 1500 µA, (LVC | oltage @ I _{OL} = 1500 μA, (LVCMOS) | | | | |
| V _{DR} | Data Retention Supply Voltage (below which cor | figuration data may be lost) | 2.5 | | V | |
| I _{CCO} | Quiescent FPGA supply current (Note 2) | | 5 | mA | | |
| ۱ _L | Input or output leakage current | | -10 | +10 | μA | |
| C _{IN} | Input capacitance (sample tested) | BGA, SBGA, PQ, HQ, MQ packages | | 10 | pF | |
| | | PGA packages | | 16 | pF | |
| I _{RPU} | Pad pull-up (when selected) @ V _{in} = 0 V (sample | e tested) | 0.02 | 0.25 | mA | |
| I _{RPD} | Pad pull-down (when selected) @ $V_{in} = 3.6 V$ (sa | d pull-down (when selected) @ $V_{in} = 3.6 V$ (sample tested) | | | | |
| I _{RLL} | Horizontal Longline pull-up (when selected) @ lo | gic Low | 0.3 | 2.0 | mA | |

Note 1: With up to 64 pins simultaneously sinking 12 mA.

Note 2: With no output current loads, no active input or Longline pull-up resistors, all I/O pins Tri-stated and floating.

Power-On Power Supply Requirements

Xilinx FPGAs require a minimum rated power supply current capacity to insure proper initialization, and the power supply ramp-up time does affect the current required. A fast ramp-up time requires more current than a slow ramp-up time. The slowest ramp-up time is 50 ms. Current capacity is not specified for a ramp-up time faster than 2ms. The current capacity varies linealy with ramp-up time, *e.g.*, an XC4036XL with a ramp-up time of 25 ms would require a capacity predicted by the point on the straight line drawn from 1A at 120 μ s to 500 mA at 50 ms at the 25 ms time mark. This point is approximately 750 mA.

| Product | Description | Ramp-u | ıp Time |
|-----------------------|---------------------------------|------------------|--------------|
| FIGUUCI | Description | Fast (120 μs) | Slow (50 ms) |
| XC4005 - 36XL | Minimum required current supply | 1 A | 500 mA |
| XC4044- 62XL | Minimum required current supply | 2 A | 500 mA |
| XC4085XL ¹ | Minimum required current supply | 2 A ¹ | 500 mA |

Notes: 1. The XC4085XL fast ramp-up time is 5 ms.

Devices are guaranteed to initialize properly with the minimum current listed above. A larger capacity power supply may result in a larger initialization current.

This specification applies to Commercial and Industrial grade products only.

Ramp-up Time is measured from 0 V_{DC} to 3.6 V_{DC} . Peak current required lasts less than 3 ms, and occurs near the internal power on reset threshold voltage. After initialization and before configuration, I_{CC} max is less than 10 mA.

XC4000XL A.C. Characteristics

Testing of the switching parameters is modeled after testing methods specified by MIL-M-38510/605. All devices are 100% functionally tested. Internal timing parameters are derived from measuring internal test patterns. Listed below are representative values where one global clock input drives one vertical clock line in each accessible column, and where all accessible IOB and CLB flip-flops are clocked by the global clock net.

When fewer vertical clock lines are connected, the clock distribution is faster; when multiple clock lines per column are driven from the same global clock, the delay is longer. For more specific, more precise, and worst-case guaranteed data, reflecting the actual routing structure, use the values provided by the static timing analyzer (TRCE in the Xilinx Development System) and back-annotated to the simulation netlist. These path delays, provided as a guideline, have been extracted from the static timing analyzer report. All timing parameters assume worst-case operating conditions (supply voltage and junction temperature. Values apply to all XC4000XL devices and are expressed in nanoseconds unless otherwise noted.

XC4000XL Pin-to-Pin Output Parameter Guidelines

Testing of switching parameters is modeled after testing methods specified by MIL-M-38510/605. All devices are 100% functionally tested. Pin-to-pin timing parameters are derived from measuring external and internal test patterns and are guaranteed over worst-case operating conditions (supply voltage and junction temperature). Listed below are representative values for typical pin locations and normal clock loading. For more specific, more precise, and worst-case guaranteed data, reflecting the actual routing structure, use the values provided by the static timing analyzer (TRCE in the Xilinx Development System) and back-annotated to the simulation netlist. These path delays, provided as a guideline, have been extracted from the static timing analyzer report. Values are expressed in nanoseconds unless otherwise noted.

| For output SLOW option add | T _{SLOW} | All Devices | 0.5 | 3.0 | 2.5 | 2.0 | 1.7 | 1.6 | ns |

Notes: Clock-to-out minimum delay is measured with the fastest route and the lightest load, Clock-to-out maximum delay is measured using the farthest distance and a reference load of one clock pin (IK or OK) per IOB as well as driving all accessible CLB flip-flops. For designs with a smaller number of clock loads, the pad-to-IOB clock pin delay as determined by the static timing analyzer (TRCE) can be added to the AC parameter Tokpof and used as a worst-case pin-to-pin clock-to-out delay for clocked outputs for FAST mode configurations.

Output timing is measured at ~50% V_{CC} threshold with 50 pF external capacitive load. For different loads, see Figure 1.

Capacitive Load Factor

Figure 1 shows the relationship between I/O output delay and load capacitance. It allows a user to adjust the specified output delay if the load capacitance is different than 50 pF. For example, if the actual load capacitance is 120 pF, add 2.5 ns to the specified delay. If the load capacitance is 20 pF, subtract 0.8 ns from the specified output delay.

Figure 1 is usable over the specified operating conditions of voltage and temperature and is independent of the output slew rate control.

Figure 1: Delay Factor at Various Capacitive Loads

* The XC4013XL, XC4036XL, and 4062XL have significantly faster partial and full delay setup times than other devices.

IFF = Input Flip Flop or Latch. FCL = Fast Capture Latch

Notes: Input setup time is measured with the fastest route and the lightest load.

Input hold time is measured using the furthest distance and a reference load of one clock pin per IOB as well as driving all accessible CLB flip-flops. For designs with a smaller number of clock loads, the pad-to-IOB clock pin delay as determined by the static timing analyzer (TRCE) can be used as a worst-case pin-to-pin no-delay input hold specification.

XC4000XL IOB Input Switching Characteristic Guidelines

Testing of switching parameters is modeled after testing methods specified by MIL-M-38510/605. All devices are 100% functionally tested. Internal timing parameters are derived from measuring internal test patterns. Listed below are representative values. For more specific, more precise, and worst-case guaranteed data, use the values reported by the static timing analyzer (TRCE in the Xilinx Development System) and back-annotated to the simulation netlist. These path delays, provided as a guideline, have been extracted from the static timing analyzer report. All timing parameters assume worst-case operating conditions (supply voltage and junction temperature).

Revision Control

| Version | Nature of Changes |
|------------------|--|
| 02/01/1999 (1.5) | Release included in the 1999 data book, section 6 |
| | Replaced Electrical Specification and pinout pages for E, EX, and XL families with separate updates and added URL link on placeholder page for electrical specifications/pinouts for WebLINX users |
| 09/30/1999 (1.7) | Added Power-on specification. |
| 10/18/1999 (1.8) | Corrected posted file to include missing page (IOB Output Parameters). |
| 03/01/2013 (2.0) | The products listed in this data sheet are obsolete. See XCN08011 for further information. |

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
