
Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**Message Address (MA):** 32-bit DW-aligned MSI message address.
1:0	0x0 RO	**Reserved (RSVD):**

52.6.17 MSI Message Upper Address (IDE_HOST_MSIMUA)—Offset 48h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:2] + 48h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Message Upper Address (MUA):** Upper 32-bit of a 64-bit DW-aligned MSI message address.

52.6.18 MSI Message Data (IDE_HOST_MSIMD)—Offset 4Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:2] + 4Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**Reserved (RSVD):**
15:0	0x0 RW	**Message Data (MD):** MSI Message Data

52.6.19 Power Management Capabilities, Next Pointer and Capability ID (IDE_HOST_PMCAP_PMNP_PMCID)—Offset 50h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:2] + 50h

Default: 00230001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0x0 RO	**PME Support (PMES):** This 5-bit field indicates the power states in which the function may assert PME#. A value of 0b for any bit indicates that the function is not capable of asserting the PME# signal while in that power state. • bit(27) X XXX1b - PME# can be asserted from D0 • bit(28) X XX1Xb - PME# can be asserted from D1 • bit(29) X X1XXb - PME# can be asserted from D2 • bit(30) X 1XXXb - PME# can be asserted from D3hot • bit(31) 1 XXXXb - PME# can be asserted from D3cold
26	0x0 RO	**D2 Support (D2S):** Hardwired to 0 to indicate that this device does not support D2
25	0x0 RO	**D1 Support (D1S):** Hardwired to 0 to indicate that this device does not support D1
24:22	0x0 RO	**Aux Current (AUXC):** Not implemented. Hardwired to 0.
21	0x1 RO	**Device Specific Initialization (DSI):** indicates whether special initialization of this function is required (beyond the standard PCI configuration header) before the generic class device driver is able to use it. A 1 indicates that the function requires a device specific initialization sequence following transition to the D0 uninitialized state. Hardwired to 1 to indicate Device Specific Initialization is required.
20	0x0 RO	**Reserved (RSVD):**
19	0x0 RO	**PME Clock (PMECLK):** Not implemented. Hardwired to 0.
18:16	0x3 RO	**Version (VER):** Hardwired to value of 011b indicates that this function complies with rev 1.2 of PCI Power Management Interface Spec
15:8	0x0 RO	**Next Item Pointer (NP):** Indicates the pointer for the next entry in the capabilities list. Hardwired to 0 to indicate no more linked list item.
7:0	0x1 RO	**Capability ID (CID):** Hardwired to 01h to indicate the linked list item as the PCI Power Management registers

52.6.20 Power Management Data, Control/Status Register Bridge Support Extensions, Control and Status (IDE_HOST_PMD_PMCSRBSE_PMCSR)—Offset 54h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:2] + 54h

Default: 00000008h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**Data:** Not implemented. Hardwired to 0.
23:16	0x0 RO	**Control/Status Register Bridge Support Extensions (CSRBSE):** Not implemented. Hardwired to 0.
15	0x0 RO	**PME Status (PMESTS):** This bit is set when the function would normally assert the PME signal independent of the state of the PME_En bit. • Writing a 1 to this bit will clear it and cause the function to stop asserting a PME (if enabled). • Writing a 0 has no effect. If the function supports PME from D3cold, then this bit is sticky and must be explicitly cleared by the operating system each time the operating system is initially loaded. Not implemented. Hardwired to 0.
14:13	0x0 RO	**Data Scale (DS):** Not implemented. Hardwired to 0.
12:9	0x0 RO	**Data Select (DSEL):** Not implemented. Hardwired to 0.
8	0x0 RO	**PME Enable (PMEEN):** A 1 enables the function to assert PME. When 0, PME assertion is disabled. This bit defaults to 0 if the function does not support PME generation from D3cold. If the function supports PME from D3cold then this bit is sticky and must be explicitly cleared by the operating system each time it is initially loaded. Not implemented. Hardwired to 0.
7:4	0x0 RO	**Reserved (RSVD1):**
3	0x1 RO	**No Soft Reset (NSR):** When set to 1, this bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved. Upon transition from the D3hot to the D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the PowerState bits.
2	0x0 RO	**Reserved (RSVD0):**
1:0	0x0 RW	**Power State (PWRST):** This 2-bit field is used both to determine the current power state of a function and to set the function into a new power state. The definition of the field values is given below: 00b - D0 01b - D1 10b - D2 11b - D3hot If software attempts to write an unsupported, optional state to this field, the write operation must complete normally on the bus; however, the data is discarded and no state change occurs.

52.6.21 Process Stepping Information (IDE_HOST_PSI)—Offset F8h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:2] + F8h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RO	**Reserved (RSVD):** Not implemented. Hardwired to 0.
27:24	0x0 RO/V	**Dot Portion of Process ID (DPOP):** Reserved.
23:16	0x0 RO/V	**Manufacturing Stepping (MSID):** Reserved.
15:8	0x0 RO/V	**Manufacturing ID (MID):** Reserved.
7:0	0x0 RO/V	**Process Portion of Process ID (PPOP):** Reserved.

52.7 Registers in Memory Space—HECI1_MMIO_MBAR

These registers are accessed in Host Memory Space starting at the relocatable memory address defined by the Base Address Register (BAR) HECI1_MMIO_MBAR_LO described in Section 52.2.9, "HECI MMIO Base Address Low (HECI1_MMIO_MBAR_LO)—Offset 10h" on page 2243 and HECI1_MMIO_MBAR_HI described in Section 52.2.10, "HECI MMIO Base Address High (HECI1_MMIO_MBAR_HI)—Offset 14h" on page 2244.

52.7.1 Host CB Write Window (HECI1_H_CB_WW)—Offset 0h

This register is for host to write into its Circular Buffer.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [HECI1_MMIO_MBAR] + 0h

HECI1_MMIO_MBAR Type: PCI Configuration Register (Size: 64 bits)
HECI1_MMIO_MBAR Reference: [B:0, D:24, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 WO	**Host Circular Buffer Write Window Field (H_CB_WWF):** This field is for host to write into its circular buffer. This field is write only, reads will return arbitrary data. Writes to this register will increment the H_CBWP as long as CSE_RDY is 1. When CSE_RDY is 0, writes to this register have no effect and are not delivered to the H_CB, nor is H_CBWP incremented.

52.7.2 Host Control and Status Register (HECI1_H_CSR)—Offset 4h

This register reports status information about the host circular buffer (H_CB) and allows host software to control interrupt generation.

Note to software: reserved bits in this register must be set to 0 whenever this register is written.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [HECI1_MMIO_MBAR] + 4h

Default: 80000000h

HECI1_MMIO_MBAR Type: PCI Configuration Register (Size: 64 bits)
HECI1_MMIO_MBAR Reference: [B:0, D:24, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x80 RO	**Host Circular Buffer Depth (H_CBD):** This field indicates the maximum number of 32 bit entries available in the host circular buffer (H_CB). Host software uses this field along with the H_CBRP and H_CBWP fields to calculate the number of valid entries in the H_CB to read or number of entries available for write. Programmers note: This field is implemented with a '1-hot' scheme. Only one bit will be set to a '1' at a time. Each bit position represents the value n of a buffer depth of (2^n). For example, when bit# 1 is 1, the buffer depth is 2; when bit#2 is 1, the buffer depth is 4, etc. **This field is hardwired to represent a depth of 128 entries.**
23:16	0x0 RO/V	**Host CB Write Pointer (H_CBWP):** Points to next location in the H_CB for host to write the data. Software uses this field along with H_CBRP and H_CBD fields to calculate the number of valid entries in the H_CB to read or number of entries available for write.
15:8	0x0 RO/V	**Host CB Read Pointer (H_CBRP):** Points to next location in the H_CB where a valid data is available for embedded controller to read. Software uses this field along with H_CBWR and H_CBD fields to calculate the number of valid entries in the host CB to read or number of entries available for write.
7	0x0 RO	**Reserved (RSVD_7_7):** Reserved.
6	0x0 RW/1C/V	**Host D0I3 Interrupt Status (H_D0I3C_IS):** HW sets this bit to 1 when D0I3C.H_D0I3_IR is set and D0I3C.H_D0I3_CIP transitions from 1 to 0. Host clears this bit to 0 by writing a 1 to this bit position. H_D0I3C_IE has no effect on this bit.
5	0x0 RW	**Host D0I3 Interrupt Enable (H_D0I3C_IE):** Host sets this bit to 1 to enable the host interrupt (MSI, INTx, SMI or SCI) to be asserted when H_D0I3C_IS is set to 1.
4	0x0 RW	**Host Reset (H_RST):** Setting this bit to 1 will initiate the HECI reset sequence to get the circular buffers into a known good state for host and CSE communication. When this bit transitions from 0 to 1, hardware will clear the H_RDY and CSE_RDY bits.
3	0x0 RW/V	**Host Ready (H_RDY):** This bit indicates that the host is ready to process messages.
2	0x0 RW/V	**Host Interrupt Generate (H_IG):** Once message(s) are written into its CB, the host sets this bit to one for the HW to set the CSE_IS bit in the CSE_CSR and to generate an interrupt message to mIA. HW then clears this bit to 0.
1	0x0 RW/1C/V	**Host Interrupt Status (H_IS):** HW sets this bit to 1 when CSE_IG bit is set to 1. Host clears this bit to 0 by writing a 1 to this bit position. H_IE has no effect on this bit.
0	0x0 RW	**Host Interrupt Enable (H_IE):** Host sets this bit to 1 to enable the host interrupt (MSI, INTx, SMI or SCI) to be asserted when H_IS is set to 1.

52.7.3 CSE Circular Buffer Read Window (HECI1_CSE_CB_RW)—Offset 8h

This register is for host to read from the CSE Circular Buffer (CSE_CB).

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [HECI1_MMIO_MBAR] + 8h

Default: FFFFFFFFh

HECI1_MMIO_MBAR Type: PCI Configuration Register (Size: 64 bits)
HECI1_MMIO_MBAR Reference: [B:0, D:24, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0xffffffff RO	**CSE Circular Buffer Read Window Field (CSE_CB_RWF):** This bit field is for host to read from the CSE Circular Buffer. This field is read only, writes have no effect. Reads to this register will increment the CSE_CBRP as long as CSE_RDY is 1. When CSE_RDY is 0, reads to this register have no effect, all 1s are returned, and CSE_CBRP is not incremented.

52.7.4 CSE Control and Status Register Host Access (HECI1_CSE_CSR_HA)—Offset Ch

This register allows host software to read the CSE Control Status register (CSE_CSR).

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [HECI1_MMIO_MBAR] + Ch

Default: 80000000h

HECI1_MMIO_MBAR Type: PCI Configuration Register (Size: 64 bits)
HECI1_MMIO_MBAR Reference: [B:0, D:24, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x80 RO	**CSE Circular Buffer Depth Host Read Access (CSE_CBD_HRA):** Host read access to CSE_CBD. **This field is hardwired to represent a depth of 128 entries.**
23:16	0x0 RO/V	**CSE CB Write Pointer Host Read Access (CSE_CBWP_HRA):** Host read only access to CSE_CBWP.
15:8	0x0 RO/V	**CSE CB Read Pointer Host Read Access (CSE_CBRP_HRA):** Host read only access to CSE_CBRP.
7	0x0 RO/V	**NMI Status Host Read Access (NMI_STS_HRA):** Host read access to NMI_STS.
6	0x0 RO	**Reserved (RSVD_6_6):** Reserved.
5	0x0 RO/V	**Pointer Reset Host Read Access (PTR_RST_HRA):** Host read access to PTR_RST.
4	0x0 RO/V	**CSE Reset Host Read Access (CSE_RST_HRA):** Host read access to CSE_RST.
3	0x0 RO/V	**CSE Ready Host Read Access (CSE_RDY_HRA):** Host read access to CSE_RDY.
2	0x0 RO/V	**CSE Interrupt Generate Host Read Access (CSE_IG_HRA):** Host read only access to CSE_IG.
1	0x0 RO/V	**CSE Interrupt Status Host Read Access (CSE_IS_HRA):** Host read only access to CSE_IS.
0	0x0 RO/V	**CSE Interrupt Enable Host Read Access (CSE_IE_HRA):** Host read only access to CSE_IE.

52.7.5 D0i3 Control (HECI1_D0I3C)—Offset 800h

This register allows host to configure the power mode using D0i0/D0i3 support.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [HECI1_MMIO_MBAR] + 800h

Default: 00000000h

HECI1_MMIO_MBAR Type: PCI Configuration Register (Size: 64 bits)
HECI1_MMIO_MBAR Reference: [B:0, D:24, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0x0 RO	**Reserved (RSVD_31_4):** Reserved.
3	0x0 RO	**Restore Required (H_D0I3C_RR):** When this bit is set (by HW), SW must restore the state of the IP. This bit is cleared by SW writing a 1. **In CSE this bit is never set so it does not need to be cleared by SW.**
2	0x0 RW	**D0i3 (H_D0I3C_I3):** SW sets this bit to 1 in order to move the IP into the D0i3 state. Clearing this bit will return the IP into the fully active D0 state (D0i0). When this bit changes state, mIA may be interrupted (see H_PCI_CSR.D0I3C_IS register's description)
1	0x0 RW	**Interrupt Request (H_D0I3C_IR):** SW sets this bit to 1 to ask for an interrupt to be generated on completion of the command. SW must clear or set this bit on each write to this register. When this bit is set to 1, Command-in-Progress deassertion is captured in H_CSR.H_D0I3_IS. If H_CSR.H_D0I3_IE is 1 as well, host interrupt will be initiated.
0	0x0 RO/V	**Command-in-Progress (H_D0I3C_CIP):** HW sets this bit on a 0-)1 or 1-)0 transition of D0i3 bit (bit [2]). While set, the other bits in this register are not valid and it is illegal for SW to write to any of them. While clear, all other bits in this register are valid and SW may write to them. If Interrupt Request (bit [1]) was set for the current command, HW may clear this bit before the interrupt has been made visible to SW, since when SW actually handles a particular interrupt is not visible to HW. SW writes to this bit have no effect. This bit is auto-cleared by HW one cycle after it is set.

52.8 Registers in Memory Space—HECI2_MMIO_MBAR

These registers are accessed in Host Memory Space starting at the relocatable memory address defined by the Base Address Register (BAR) HECI2_MMIO_MBAR_LO described in Section 52.3.9, "HECI MMIO Base Address Low (HECI2_MMIO_MBAR_LO)—Offset 10h" on page 2263 and HECI2_MMIO_MBAR_HI described in Section 52.3.10, "HECI MMIO Base Address High (HECI2_MMIO_MBAR_HI)—Offset 14h" on page 2264.

52.8.1 Host CB Write Window (HECI2_H_CB_WW)—Offset 0h

This register is for host to write into its Circular Buffer.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [HECI2_MMIO_MBAR] + 0h

HECI2_MMIO_MBAR Type: PCI Configuration Register (Size: 64 bits)
HECI2_MMIO_MBAR Reference: [B:0, D:24, F:1] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 WO	**Host Circular Buffer Write Window Field (H_CB_WWF):** This field is for host to write into its circular buffer. This field is write only, reads will return arbitrary data. Writes to this register will increment the H_CBWP as long as CSE_RDY is 1. When CSE_RDY is 0, writes to this register have no effect and are not delivered to the H_CB, nor is H_CBWP incremented.

52.8.2 Host Control and Status Register (HECI2_H_CSR)—Offset 4h

This register reports status information about the host circular buffer (H_CB) and allows host software to control interrupt generation.

Note to software: reserved bits in this register must be set to 0 whenever this register is written.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [HECI2_MMIO_MBAR] + 4h

Default: 80000000h

HECI2_MMIO_MBAR Type: PCI Configuration Register (Size: 64 bits)
HECI2_MMIO_MBAR Reference: [B:0, D:24, F:1] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x80 RO	**Host Circular Buffer Depth (H_CBD):** This field indicates the maximum number of 32 bit entries available in the host circular buffer (H_CB). Host software uses this field along with the H_CBRP and H_CBWP fields to calculate the number of valid entries in the H_CB to read or number of entries available for write. Programmers note: This field is implemented with a '1-hot' scheme. Only one bit will be set to a '1' at a time. Each bit position represents the value n of a buffer depth of (2^n). For example, when bit# 1 is 1, the buffer depth is 2; when bit#2 is 1, the buffer depth is 4, etc. **This field is hardwired to represent a depth of 128 entries.**
23:16	0x0 RO/V	**Host CB Write Pointer (H_CBWP):** Points to next location in the H_CB for host to write the data. Software uses this field along with H_CBRP and H_CBD fields to calculate the number of valid entries in the H_CB to read or number of entries available for write.
15:8	0x0 RO/V	**Host CB Read Pointer (H_CBRP):** Points to next location in the H_CB where a valid data is available for embedded controller to read. Software uses this field along with H_CBWR and H_CBD fields to calculate the number of valid entries in the host CB to read or number of entries available for write.
7	0x0 RO	**Reserved (RSVD_7_7):** Reserved.
6	0x0 RW/1C/V	**Host D0I3 Interrupt Status (H_D0I3C_IS):** HW sets this bit to 1 when D0I3C.H_D0I3_IR is set and D0I3C.H_D0I3_CIP transitions from 1 to 0. Host clears this bit to 0 by writing a 1 to this bit position. H_D0I3C_IE has no effect on this bit.
5	0x0 RW	**Host D0I3 Interrupt Enable (H_D0I3C_IE):** Host sets this bit to 1 to enable the host interrupt (MSI, INTx, SMI or SCI) to be asserted when H_D0I3C_IS is set to 1.
4	0x0 RW	**Host Reset (H_RST):** Setting this bit to 1 will initiate the HECI reset sequence to get the circular buffers into a known good state for host and CSE communication. When this bit transitions from 0 to 1, hardware will clear the H_RDY and CSE_RDY bits.
3	0x0 RW/V	**Host Ready (H_RDY):** This bit indicates that the host is ready to process messages.
2	0x0 RW/V	**Host Interrupt Generate (H_IG):** Once message(s) are written into its CB, the host sets this bit to one for the HW to set the CSE_IS bit in the CSE_CSR and to generate an interrupt message to mIA. HW then clears this bit to 0.
1	0x0 RW/1C/V	**Host Interrupt Status (H_IS):** HW sets this bit to 1 when CSE_IG bit is set to 1. Host clears this bit to 0 by writing a 1 to this bit position. H_IE has no effect on this bit.
0	0x0 RW	**Host Interrupt Enable (H_IE):** Host sets this bit to 1 to enable the host interrupt (MSI, INTx, SMI or SCI) to be asserted when H_IS is set to 1.

52.8.3 CSE Circular Buffer Read Window (HECI2_CSE_CB_RW)—Offset 8h

This register is for host to read from the CSE Circular Buffer (CSE_CB).

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [HECI2_MMIO_MBAR] + 8h

Default: FFFFFFFFh

HECI2_MMIO_MBAR Type: PCI Configuration Register (Size: 64 bits)
HECI2_MMIO_MBAR Reference: [B:0, D:24, F:1] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0xffffffff RO	**CSE Circular Buffer Read Window Field (CSE_CB_RWF):** This bit field is for host to read from the CSE Circular Buffer. This field is read only, writes have no effect. Reads to this register will increment the CSE_CBRP as long as CSE_RDY is 1. When CSE_RDY is 0, reads to this register have no effect, all 1s are returned, and CSE_CBRP is not incremented.

52.8.4 CSE Control and Status Register Host Access (HECI2_CSE_CSR_HA)—Offset Ch

This register allows host software to read the CSE Control Status register (CSE_CSR).

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [HECI2_MMIO_MBAR] + Ch

Default: 80000000h

HECI2_MMIO_MBAR Type: PCI Configuration Register (Size: 64 bits)
HECI2_MMIO_MBAR Reference: [B:0, D:24, F:1] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x80 RO	**CSE Circular Buffer Depth Host Read Access (CSE_CBD_HRA):** Host read access to CSE_CBD. **This field is hardwired to represent a depth of 128 entries.**
23:16	0x0 RO/V	**CSE CB Write Pointer Host Read Access (CSE_CBWP_HRA):** Host read only access to CSE_CBWP.
15:8	0x0 RO/V	**CSE CB Read Pointer Host Read Access (CSE_CBRP_HRA):** Host read only access to CSE_CBRP.
7	0x0 RO/V	**NMI Status Host Read Access (NMI_STS_HRA):** Host read access to NMI_STS.
6	0x0 RO	**Reserved (RSVD_6_6):** Reserved.
5	0x0 RO/V	**Pointer Reset Host Read Access (PTR_RST_HRA):** Host read access to PTR_RST.
4	0x0 RO/V	**CSE Reset Host Read Access (CSE_RST_HRA):** Host read access to CSE_RST.
3	0x0 RO/V	**CSE Ready Host Read Access (CSE_RDY_HRA):** Host read access to CSE_RDY.
2	0x0 RO/V	**CSE Interrupt Generate Host Read Access (CSE_IG_HRA):** Host read only access to CSE_IG.
1	0x0 RO/V	**CSE Interrupt Status Host Read Access (CSE_IS_HRA):** Host read only access to CSE_IS.
0	0x0 RO/V	**CSE Interrupt Enable Host Read Access (CSE_IE_HRA):** Host read only access to CSE_IE.

52.8.5 D0i3 Control (HECI2_D0I3C)—Offset 800h

This register allows host to configure the power mode using D0i0/D0i3 support.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [HECI2_MMIO_MBAR] + 800h

HECI2_MMIO_MBAR Type: PCI Configuration Register (Size: 64 bits)
HECI2_MMIO_MBAR Reference: [B:0, D:24, F:1] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0x0 RO	**Reserved (RSVD_31_4):** Reserved.
3	0x0 RO	**Restore Required (H_D0I3C_RR):** When this bit is set (by HW), SW must restore the state of the IP. This bit is cleared by SW writing a 1. **In CSE this bit is never set so it does not need to be cleared by SW.**
2	0x0 RW	**D0i3 (H_D0I3C_I3):** SW sets this bit to 1 in order to move the IP into the D0i3 state. Clearing this bit will return the IP into the fully active D0 state (D0i0). When this bit changes state, mIA may be interrupted (see H_PCI_CSR.D0I3C_IS register's description)
1	0x0 RW	**Interrupt Request (H_D0I3C_IR):** SW sets this bit to 1 to ask for an interrupt to be generated on completion of the command. SW must clear or set this bit on each write to this register. When this bit is set to 1, Command-in-Progress deassertion is captured in H_CSR.H_D0I3_IS. If H_CSR.H_D0I3_IE is 1 as well, host interrupt will be initiated.
0	0x0 RO/V	**Command-in-Progress (H_D0I3C_CIP):** HW sets this bit on a 0-)1 or 1-)0 transition of D0i3 bit (bit [2]). While set, the other bits in this register are not valid and it is illegal for SW to write to any of them. While clear, all other bits in this register are valid and SW may write to them. If Interrupt Request (bit [1]) was set for the current command, HW may clear this bit before the interrupt has been made visible to SW, since when SW actually handles a particular interrupt is not visible to HW. SW writes to this bit have no effect. This bit is auto-cleared by HW one cycle after it is set.

52.9 Registers in Memory Space—HECI3_MMIO_MBAR

These registers are accessed in Host Memory Space starting at the relocatable memory address defined by the Base Address Register (BAR) HECI3_MMIO_MBAR_LO described in Section 52.4.9, "HECI MMIO Base Address Low (HECI3_MMIO_MBAR_LO)—Offset 10h" on page 2280 and HECI3_MMIO_MBAR_HI described in Section 52.4.10, "HECI MMIO Base Address High (HECI3_MMIO_MBAR_HI)—Offset 14h" on page 2281.

52.9.1 Host CB Write Window (HECI3_H_CB_WW)—Offset 0h

This register is for host to write into its Circular Buffer.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [HECI3_MMIO_MBAR] + 0h

HECI3_MMIO_MBAR Type: PCI Configuration Register (Size: 64 bits)
HECI3_MMIO_MBAR Reference: [B:0, D:24, F:4] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 WO	**Host Circular Buffer Write Window Field (H_CB_WWF):** This field is for host to write into its circular buffer. This field is write only, reads will return arbitrary data. Writes to this register will increment the H_CBWP as long as CSE_RDY is 1. When CSE_RDY is 0, writes to this register have no effect and are not delivered to the H_CB, nor is H_CBWP incremented.

52.9.2 Host Control and Status Register (HECI3_H_CSR)—Offset 4h

This register reports status information about the host circular buffer (H_CB) and allows host software to control interrupt generation.

Note to software: reserved bits in this register must be set to 0 whenever this register is written.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [HECI3_MMIO_MBAR] + 4h

Default: 80000000h

HECI3_MMIO_MBAR Type: PCI Configuration Register (Size: 64 bits)
HECI3_MMIO_MBAR Reference: [B:0, D:24, F:4] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x80 RO	**Host Circular Buffer Depth (H_CBD):** This field indicates the maximum number of 32 bit entries available in the host circular buffer (H_CB). Host software uses this field along with the H_CBRP and H_CBWP fields to calculate the number of valid entries in the H_CB to read or number of entries available for write. Programmers note: This field is implemented with a '1-hot' scheme. Only one bit will be set to a '1' at a time. Each bit position represents the value n of a buffer depth of (2^n). For example, when bit# 1 is 1, the buffer depth is 2; when bit#2 is 1, the buffer depth is 4, etc. **This field is hardwired to represent a depth of 128 entries.**
23:16	0x0 RO/V	**Host CB Write Pointer (H_CBWP):** Points to next location in the H_CB for host to write the data. Software uses this field along with H_CBRP and H_CBD fields to calculate the number of valid entries in the H_CB to read or number of entries available for write.
15:8	0x0 RO/V	**Host CB Read Pointer (H_CBRP):** Points to next location in the H_CB where a valid data is available for embedded controller to read. Software uses this field along with H_CBWR and H_CBD fields to calculate the number of valid entries in the host CB to read or number of entries available for write.
7	0x0 RO	**Reserved (RSVD_7_7):** Reserved.
6	0x0 RW/1C/V	**Host D0I3 Interrupt Status (H_D0I3C_IS):** HW sets this bit to 1 when D0I3C.H_D0I3_IR is set and D0I3C.H_D0I3_CIP transitions from 1 to 0. Host clears this bit to 0 by writing a 1 to this bit position. H_D0I3C_IE has no effect on this bit.
5	0x0 RW	**Host D0I3 Interrupt Enable (H_D0I3C_IE):** Host sets this bit to 1 to enable the host interrupt (MSI, INTx, SMI or SCI) to be asserted when H_D0I3C_IS is set to 1.
4	0x0 RW	**Host Reset (H_RST):** Setting this bit to 1 will initiate the HECI reset sequence to get the circular buffers into a known good state for host and CSE communication. When this bit transitions from 0 to 1, hardware will clear the H_RDY and CSE_RDY bits.
3	0x0 RW/V	**Host Ready (H_RDY):** This bit indicates that the host is ready to process messages.
2	0x0 RW/V	**Host Interrupt Generate (H_IG):** Once message(s) are written into its CB, the host sets this bit to one for the HW to set the CSE_IS bit in the CSE_CSR and to generate an interrupt message to mIA. HW then clears this bit to 0.
1	0x0 RW/1C/V	**Host Interrupt Status (H_IS):** HW sets this bit to 1 when CSE_IG bit is set to 1. Host clears this bit to 0 by writing a 1 to this bit position. H_IE has no effect on this bit.
0	0x0 RW	**Host Interrupt Enable (H_IE):** Host sets this bit to 1 to enable the host interrupt (MSI, INTx, SMI or SCI) to be asserted when H_IS is set to 1.

52.9.3 CSE Circular Buffer Read Window (HECI3_CSE_CB_RW)—Offset 8h

This register is for host to read from the CSE Circular Buffer (CSE_CB).

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [HECI3_MMIO_MBAR] + 8h

Default: FFFFFFFFh

HECI3_MMIO_MBAR Type: PCI Configuration Register (Size: 64 bits)
HECI3_MMIO_MBAR Reference: [B:0, D:24, F:4] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0xffffffff RO	**CSE Circular Buffer Read Window Field (CSE_CB_RWF):** This bit field is for host to read from the CSE Circular Buffer. This field is read only, writes have no effect. Reads to this register will increment the CSE_CBRP as long as CSE_RDY is 1. When CSE_RDY is 0, reads to this register have no effect, all 1s are returned, and CSE_CBRP is not incremented.

52.9.4 CSE Control and Status Register Host Access (HECI3_CSE_CSR_HA)—Offset Ch

This register allows host software to read the CSE Control Status register (CSE_CSR).

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [HECI3_MMIO_MBAR] + Ch

Default: 80000000h

HECI3_MMIO_MBAR Type: PCI Configuration Register (Size: 64 bits)
HECI3_MMIO_MBAR Reference: [B:0, D:24, F:4] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x80 RO	**CSE Circular Buffer Depth Host Read Access (CSE_CBD_HRA):** Host read access to CSE_CBD. **This field is hardwired to represent a depth of 128 entries.**
23:16	0x0 RO/V	**CSE CB Write Pointer Host Read Access (CSE_CBWP_HRA):** Host read only access to CSE_CBWP.
15:8	0x0 RO/V	**CSE CB Read Pointer Host Read Access (CSE_CBRP_HRA):** Host read only access to CSE_CBRP.
7	0x0 RO/V	**NMI Status Host Read Access (NMI_STS_HRA):** Host read access to NMI_STS.
6	0x0 RO	**Reserved (RSVD_6_6):** Reserved.
5	0x0 RO/V	**Pointer Reset Host Read Access (PTR_RST_HRA):** Host read access to PTR_RST.
4	0x0 RO/V	**CSE Reset Host Read Access (CSE_RST_HRA):** Host read access to CSE_RST.
3	0x0 RO/V	**CSE Ready Host Read Access (CSE_RDY_HRA):** Host read access to CSE_RDY.
2	0x0 RO/V	**CSE Interrupt Generate Host Read Access (CSE_IG_HRA):** Host read only access to CSE_IG.
1	0x0 RO/V	**CSE Interrupt Status Host Read Access (CSE_IS_HRA):** Host read only access to CSE_IS.
0	0x0 RO/V	**CSE Interrupt Enable Host Read Access (CSE_IE_HRA):** Host read only access to CSE_IE.

52.9.5 D0i3 Control (HECI3_D0I3C)—Offset 800h

This register allows host to configure the power mode using D0i0/D0i3 support.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [HECI3_MMIO_MBAR] + 800h

HECI3_MMIO_MBAR Type: PCI Configuration Register (Size: 64 bits)
HECI3_MMIO_MBAR Reference: [B:0, D:24, F:4] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0x0 RO	**Reserved (RSVD_31_4):** Reserved.
3	0x0 RO	**Restore Required (H_D0I3C_RR):** When this bit is set (by HW), SW must restore the state of the IP. This bit is cleared by SW writing a 1. **In CSE this bit is never set so it does not need to be cleared by SW.**
2	0x0 RW	**D0i3 (H_D0I3C_I3):** SW sets this bit to 1 in order to move the IP into the D0i3 state. Clearing this bit will return the IP into the fully active D0 state (D0i0). When this bit changes state, mIA may be interrupted (see H_PCI_CSR.D0I3C_IS register's description)
1	0x0 RW	**Interrupt Request (H_D0I3C_IR):** SW sets this bit to 1 to ask for an interrupt to be generated on completion of the command. SW must clear or set this bit on each write to this register. When this bit is set to 1, Command-in-Progress deassertion is captured in H_CSR.H_D0I3_IS. If H_CSR.H_D0I3_IE is 1 as well, host interrupt will be initiated.
0	0x0 RO/V	**Command-in-Progress (H_D0I3C_CIP):** HW sets this bit on a 0-)1 or 1-)0 transition of D0i3 bit (bit [2]). While set, the other bits in this register are not valid and it is illegal for SW to write to any of them. While clear, all other bits in this register are valid and SW may write to them. If Interrupt Request (bit [1]) was set for the current command, HW may clear this bit before the interrupt has been made visible to SW, since when SW actually handles a particular interrupt is not visible to HW. SW writes to this bit have no effect. This bit is auto-cleared by HW one cycle after it is set.

52.10 Registers in Memory Space—KT_HOST_MEMBAR

These registers are accessed in Host Memory Space starting at the relocatable memory address defined by the Base Address Register (BAR) KT_HOST_MEMBAR described in Section 52.5.6, "KT Memory BAR (KT_HOST_MEMBAR)—Offset 14h" on page 2296.

52.10.1 KT Receive Buffer Register (MEM_KTRBR)—Offset 0h

This register implements the standard Receiver Buffer register in the KT Block. This is read-only. DLAB (i.e. KTLCR[7]) shall be 0. In non-FIFO mode, this register will be read when the receiver data is ready. In FIFO mode, a read from this register will be translated into a read from the RBR FIFO.

Reset condition: Host reset. Non-sticky.

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [KT_HOST_MEMBAR] + 0h

KT_HOST_MEMBAR Type: PCI Configuration Register (Size: 32 bits)
KT_HOST_MEMBAR Reference: [B:0, D:24, F:3] + 14h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO/V	**Receiver Buffer Register (RBR):** Implements the Receiver Buffer register of the Serial Interface.

52.10.2 KT Transmitter Holding Register (MEM_KTTHR)—Offset 0h

This register implements the standard Transmitter Holding register in the KT Block. This is write-only. DLAB (i.e. KTLCR[7]) shall be 0. In non-FIFO mode, this register will be written when the Host needs to transmit data. In FIFO mode, a write to this register will be translated into a write to the THR FIFO.

Reset condition: Host reset. Non-sticky.

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [KT_HOST_MEMBAR] + 0h

KT_HOST_MEMBAR Type: PCI Configuration Register (Size: 32 bits)
KT_HOST_MEMBAR Reference: [B:0, D:24, F:3] + 14h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 WO	**Transmitter Holding Register (THR):** Implements the Transmit Data register of the Serial Interface.

52.10.3 KT Divisor Latch LSB Register (MEM_KTDLLR)—Offset 0h

This register implements the standard DLL register in the KT Block. DLAB (i.e. KTLCR[7]) shall be 1 in order for this register to be accessed. this register is supported only for SW compatibility and has no impact on HW performance.

Reset condition: Host reset. Non-sticky.

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [KT_HOST_MEMBAR] + 0h

KT_HOST_MEMBAR Type: PCI Configuration Register (Size: 32 bits)
KT_HOST_MEMBAR Reference: [B:0, D:24, F:3] + 14h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW/V	**Divisor Latch LSB (DLL):** Implements the DLL register of the Serial Interface.

52.10.4 KT Interrupt Enable register (MEM_KTIER)—Offset 1h

This register implements the standard Interrupt Enable register in the KT Block. The bits enable specific events to interrupt the Host. See bit specific definition below. DLAB (i.e. KTLCR[7]) shall is 0 in order for this register to be accessed.

Reset condition: Host reset. Non-sticky.

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [KT_HOST_MEMBAR] + 1h

KT_HOST_MEMBAR Type: PCI Configuration Register (Size: 32 bits)
KT_HOST_MEMBAR Reference: [B:0, D:24, F:3] + 14h

Bit Range	Default & Access	Field Name (ID): Description
7:4	0x0 RO	**Reserved (RSVD):** Reserved.
3	0x0 RW	**MSR (IER3):** When set, enables bits in Modem Status register to cause an interrupt to the Host
2	0x0 RW	**LSR (IER2):** When set, enables bits in Receiver Line Status Register to cause an interrupt to the Host
1	0x0 RW	**THR (IER1):** When set, enables an interrupt to the Host when the Transmitter Holding register is empty
0	0x0 RW	**DR (IER0):** When set, enables an interrupt to the Host when the Received Data is available OR Receiver FIFO timeout.

52.10.5 KT Divisor Latch MSB Register (MEM_KTDLMR)—Offset 1h

This register implements the standard DLM register in the KT Block. DLAB (i.e. KTLCR[7]) shall be 1 in order for this register to be accessed. This register is supported only for SW compatibility and has no impact on HW performance.

Reset condition: Host reset. Non-sticky.

Type: Memory Mapped I/O Register (Size: 8 bits)

BAR and Offset: [KT_HOST_MEMBAR] + 1h

Default: 00h

KT_HOST_MEMBAR Type: PCI Configuration Register (Size: 32 bits)
KT_HOST_MEMBAR Reference: [B:0, D:24, F:3] + 14h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW/V	**Divisor Latch MSB (DLM):** Implements the DLM register of the Serial Interface.

52.10.6 KT Interrupt Identification Register (MEM_KTIIR)—Offset 2h

This register implements the standard Interrupt Identification register in the KT Block. This is read-only. This register is created to provide minimum software overhead during data character transfers. The register prioritizes KT interrupts into 4 levels and records them in the IIRSTS field of this register. The four levels of interrupt conditions in order of priority are: Receiver Line Status; Received Data Ready/Character Timeout Indication; Transmitter Holding Register Empty; MODEM Status. When the Host accesses the IIR, the HW freezes all interrupts and indicates the highest priority pending interrupt to the Host. While this Host access is occurring, the HW records new interrupts, but does not change its current indication until the access is complete. Table in the Host Interrupt Generation section shows the contents.

Reset condition: Host reset. Non-sticky.

Type: Memory Mapped I/O Register (Size: 8 bits)

BAR and Offset: [KT_HOST_MEMBAR] + 2h

Default: 01h

KT_HOST_MEMBAR Type: PCI Configuration Register (Size: 32 bits)
KT_HOST_MEMBAR Reference: [B:0, D:24, F:3] + 14h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RO/V	**FIFO Enable (FIEN1):** This field is connected by HW to the FIFO Enable field of the FCR register.
6	0x0 RO/V	**FIFO Enable (FIEN0):** This field is connected by HW to the FIFO Enable field of the FCR register.
5:4	0x0 RO	**Reserved (RSVD):** Hardwired to 0.
3:1	0x0 RO/V	**IIR Status (IIRSTS):** These bits are asserted by the HW according to the source of the interrupt and the priority level. Refer to the section on Host Interrupt Generation for a table of values.
0	0x1 RO/V	**Interrupt Status (INTSTS):** 0: indicates a pending Host interrupt and IIRSTS may be used as a pointer to the appropriate interrupt service routine. It reflects the logical-NOR of all UART interrupts. An individual UART interrupt will be identified as pending when the individual event status is asserted AND its corresponding event interrupt enable is asserted as well. For example, the THR Empty interrupt will be identified as pending when both LSR[THRE] bit is 1 AND IER[IER1] is 1. 1: indicates no pending Host interrupt.

52.10.7 KT FIFO Control register (MEM_KTFCR)—Offset 2h

This register implements the standard FIFO Control register in the KT Block. It is used to configure features pertinent to the FIFO mode of operation. This is write-only.

Reset condition: Host reset. Non-sticky.

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [KT_HOST_MEMBAR] + 2h

KT_HOST_MEMBAR Type: PCI Configuration Register (Size: 32 bits)
KT_HOST_MEMBAR Reference: [B:0, D:24, F:3] + 14h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0x0 WO	**Receiver Trigger Level (RTL):** Trigger level in bytes for the Receiver FIFO. Once the trigger level number of bytes is reached, an interrupt will be sent to the Host [7:6] RCVR FIFO Trigger Level (bytes) • 00 -- 01 • 01 -- 04 • 10 -- 08 • 11 -- 14
5:4	0x0 WO	**Reserved (RSVD):** Writes to this field shall be dropped.
3	0x0 WO	**RDY Mode (RDYM):** This bit has no effect on HW performance
2	0x0 WO	**XMT FIFO Clear (XFIC):** When the Host writes one to this bit the HW will clear the XMT FIFO. This bit is self-cleared by HW.
1	0x0 WO	**RCV FIFO Clear (RFIC):** When the Host writes one to this bit the HW will clear the RCV FIFO. This bit is self-cleared by HW.
0	0x0 WO	**FIFO Enable (FIE):** When set indicates that the KT interface is working in FIFO node. When this bit value is changed the RCV and XMT FIFO are cleared by HW. This bit must be a 1 when other FCR bits are written to or they will NOT be programmed.

52.10.8 KT Line Control register (MEM_KTLCR)—Offset 3h

This register implements the standard Line Control register in the KT Block. It specifies the format of the asynchronous data communications exchange and sets the DLAB bit. Most bits in this register have no effect on HW and are only used by the FW.

Reset condition: Host reset. Non-sticky.

Type: Memory Mapped I/O Register (Size: 8 bits)

BAR and Offset: [KT_HOST_MEMBAR] + 3h

Default: 03h

KT_HOST_MEMBAR Type: PCI Configuration Register (Size: 32 bits)
KT_HOST_MEMBAR Reference: [B:0, D:24, F:3] + 14h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RW	**Divisor Latch Access Bit (DLAB):** • 1: Allows access to the Divisor Latch Registers and reading of the FIFO Control Register. • 0: Allows access to RBR, THR, IER and IIR registers.
6	0x0 RW	**Break Control (BC):** This bit has no effect on HW
5:4	0x0 RW	**Parity Bit Mode (PBM):** This bit has no effect on HW
3	0x0 RW	**Parity Enable (PE):** This bit has no effect on HW
2	0x0 RW	**Stop Bit Select (SBS):** This bit has no effect on HW
1:0	0x3 RW	**Word Select Byte (WSB):** This bit has no effect on HW.

52.10.9 KT Modem Control register (MEM_KTMCR)—Offset 4h

This register implements the standard Modem Control register in the KT Block. It controls the interface with the modem. Because the FW emulates the modem, the Host communicates with the FW via this register. This register has impact on the HW in the loopback mode.

Reset condition: Host reset. Non-sticky.

Type: Memory Mapped I/O Register (Size: 8 bits)

BAR and Offset: [KT_HOST_MEMBAR] + 4h

Default: 00h

KT_HOST_MEMBAR Type: PCI Configuration Register (Size: 32 bits)
KT_HOST_MEMBAR Reference: [B:0, D:24, F:3] + 14h

Bit Range	Default & Access	Field Name (ID): Description
7:5	0x0 RO	**Reserved (RSVD):** Reserved.
4	0x0 RW	**Loop Back Mode (LBM):** When set by Host indicates that the serial port is in loop Back mode. This means that the data that is transmitted by the host should be received. Helps in debug of the interface
3	0x0 RW	**Output 2 (OUT2):** This bit has no effect on HW in normal mode. In loop back mode the value of this bit is written by HW to Modem Status Register bit (7)
2	0x0 RW	**Output 1 (OUT1):** This bit has no effect on HW in normal mode. In loop back mode the value of this bit is written by HW to Modem Status Register bit(6)
1	0x0 RW	**Request to Send Out (RTSO):** This bit has no effect on HW in normal mode. In loopback mode, the value of this bit is written by HW to Modem Status Register bit(4)
0	0x0 RW	**Data Terminal Ready Out (DRTO):** This bit has no effect on HW in normal mode. In loopback mode, the value in this bit is written by HW to Modem Status Register Bit(5)

52.10.10 KT Line Status register (MEM_KTLSR)—Offset 5h

This register implements the standard Line Status register in the KT Block. It provides status information of the data transfer to the Host. Error indication etc are provided by the HW/FW to the host via this register.

Reset condition: Host reset. Non-sticky.

Type: Memory Mapped I/O Register (Size: 8 bits)

BAR and Offset: [KT_HOST_MEMBAR] + 5h

Default: 60h

KT_HOST_MEMBAR Type: PCI Configuration Register (Size: 32 bits)
KT_HOST_MEMBAR Reference: [B:0, D:24, F:3] + 14h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RO/C/V	**RCVR FIFO Error (RXFER):** This bit is cleared in non FIFO mode. This bit is connected to UART LSR[BI] bit in FIFO mode.
6	0x1 RO/V	**Transmitter Empty (TEMT):** In non-FIFO mode: this bit will be set to 1 whenever the Transmitter Holding Register (THR) and the Transmitter Shift Register (TSR) are both empty, OR cleared to 0 whenever either THR or TSR contains a data byte. In FIFO mode: this bit will be set to 1 whenever XMIT FIFO and TSR are both empty, OR cleared to 0 whenever either XMIT FIFO or TSR contains a data byte. Implementation note: This bit is connected by HW to THRE bit
5	0x1 RO/V	**Transmitter Holding Register Empty (THRE):** The bit will always be set whenever Host changes UART FCR[FIE] bit. This bit is controlled differently in FIFO vs non-FIFO modes: Non-FIFO mode: This bit will be cleared by HW when Host writes to THR, and set by HW when FW reads from THR. FIFO mode: This bit will be set by HW when XMIT FIFO is empty , and cleared by HW when XMIT FIFO is NOT empty.
4	0x0 RO/C/V	**Break Interrupt (BI):** This bit will be cleared by HW when the UART LSR register is read by Host. This bit will be set by HW in two cases: In FIFO mode, when FW sets the KTRIVR[SBI] bit. In non-FIFO mode, when FW sets the KTRBR[BIA] bit.
3	0x0 RO	**Framing Error (FE):** This bit is NOT implemented and hardwired to 0.
2	0x0 RO	**Parity Error (PE):** This bit is NOT implemented and hardwired to 0.
1	0x0 RO/C/V	**Overrun Error (OE):** HW will clear this bit when Host reads from KTLSR register and this is source of interrupt. HW will set this bit when overrun error is detected. In non-FIFO mode, the character that triggers the overrun error shall overwrite the character in the RBR register. In FIFO mode, the character that triggers the overrun error shall be dropped without corrupting the RCVR FIFO.
0	0x0 RO/V	**Data Ready (DR):** Non-FIFO Mode: this bit will be set by HW when FW writes to RBR and cleared by HW when Host reads from RBR. FIFO Mode: the bit will be set by HW when RCVR FIFO is not empty and cleared by HW when RCVR FIFO is empty.

52.10.11 KT Modem Status register (MEM_KTMSR)—Offset 6h

This register implements the standard Modem Status register in the KT Block. It provides the current state of the control lines from the modem. The modem functionality is emulated by the FW.

Reset condition: Host reset. Non-sticky.

Type: Memory Mapped I/O Register (Size: 8 bits)

BAR and Offset: [KT_HOST_MEMBAR] + 6h

Default: 00h

KT_HOST_MEMBAR Type: PCI Configuration Register (Size: 32 bits)
KT_HOST_MEMBAR Reference: [B:0, D:24, F:3] + 14h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RO	**Data Carrier Detect (DCD):** In Loop Back mode this bit is connected by HW to the value of MCR bit 3
6	0x0 RO	**Ring Indicator (RI):** In Loop Back mode this bit is connected by HW to the value of MCR bit 2.
5	0x0 RO	**Data Set Ready (DSR):** In Loop Back mode this bit is connected by HW to the value of MCR bit 0.
4	0x0 RO	**Clear To Send (CTS):** In Loop Back mode this bit is connected by HW to the value of MCR bit 1.
3	0x0 RO/C/V	**Delta Data Carrier Detect (DDCD):** This bit is set when bit 7 is changed. This bit is cleared by HW when the MSR register is being read by the HOST driver.
2	0x0 RO/C/V	**Trailing Edge of Read Detector (TERI):** This bit is set when bit 6 is changed from 1 to 0. This bit is cleared by HW when the MSR register is being read by the Host driver.
1	0x0 RO/C/V	**Delta Data Set Ready (DDSR):** This bit is set when bit 5 is changed. This bit is cleared by HW when the MSR register is being read by the Host driver
0	0x0 RO/C/V	**Delta Clear To Send (DCTS):** This bit is set when bit 4 is changed. This bit is cleared by HW when the MSR register is being read by the Host driver

52.10.12 KT Scratch register (MEM_KTSCR)—Offset 7h

This register implements the standard Scratch register in the KT Block. It allows Host SW programmers to hold temporary data. It has NO effect on HW.

Reset condition: Host reset. Non-sticky.

Type: Memory Mapped I/O Register (Size: 8 bits)

BAR and Offset: [KT_HOST_MEMBAR] + 7h

Default: 00h

KT_HOST_MEMBAR Type: PCI Configuration Register (Size: 32 bits)
KT_HOST_MEMBAR Reference: [B:0, D:24, F:3] + 14h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Scratch Register Data (SCRD):** Reserved.

52.11 Registers in Memory Space—Fixed Address

These registers are accessed in Host Memory Space through fixed memory addresses.

52.11.1 FTPM Locality State (HOST_LOC_0_LOC_STATE_HROA)—Offset FED40000h

Reads by host SW from this register will reflect the value of FTPM_LOC_STATE register in mIA space. This register is aliased to the following addresses in the host address space: FED4_x000, x=0,1,2,3,4. This register is implemented in flip-flops.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [0x0] + FED40000h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO/V	**Reserved (RSVD_31_8):** Opaque to HW. Defined by FW.
7	0x0 RO/V	**Register Valid Status (FTPM_REG_VALID_STS):** Opaque to HW. This bit is used by FW to signal to host SW when this register is valid.
6:5	0x0 RO/V	**Reserved (RSVD_6_5):** Opaque to HW. Defined by FW.
4:2	0x0 RO/V	**Active Locality (FTPM_ACTV_LOC):** The encodings are: • 000 - Locality 0, • 001 - Locality 1, • 010 - Locality 2, • 011 - Locality 3, • 100 - Locality 4, • 101 and 111 - reserved. FW sets these bits to mux in the active locality. Once set, the FTPM HCI will pass cycles from the active host locality to the FTPM shared SRAM. Writes from in-active localities will be dropped and reads will return 0's.
1	0x0 RO/V	**Locality Assigned (FTPM_LOC_ASSIGNED):** A value of 0 indicates to host SW that no locality is assigned, a value of 1 indicates a locality has been assigned.
0	0x0 RO/V	**Establishment (FTPM_ESTABLISHMENT):** Opaque to HW. This bit is set to 0 by FW when HASH_START occurs and set to 1 when the RESET_ESTABLISHMENT bit is set.

52.11.2 FTPM Locality Reserved (HOST_LOC_0_LOC_RSVD)—Offset FED40004h

This register was added in order to support QW reads from Locality State register.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [0x0] + FED40004h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO	**Reserved (FTPM_LOC_RSVD_BITS):** Reserved.

52.11.3 FTPM Locality n Control Register (HOST_LOC_0_LOC_CTRL)—Offset FED40008h

Writes by host SW to this register will update the value of the corresponding LOC_n_CTRL_CSEROA register in mIA space. Writes by host SW to this register may be configured by CSE FW to trigger an MSI/PME to mIA. This register is implemented in flip-flops.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [0x0] + FED40008h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 WO	**FTPM Locality n Control Bits (FTPM_LOC_CTRL_BITS):** Reserved.

52.11.4 FTPM Locality n Status Register Host Read Only Access. (HOST_LOC_0_LOC_STS_HROA)—Offset FED4000Ch

Reads by host SW from this register will reflect the value of the corresponding LOC_n_STS register in mIA space. This register is opaque to HW. This register is implemented in flip-flops.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [0x0] + FED4000Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**FTPM Locality n Status Bits (FTPM_LOC_STS_BITS):** Reserved.

52.11.5 FTPM Locality Config Area Reserved Read Write[0-7] (HOST_LOC_0_RSVD_RW1[0-7])—Offset FED40010h, Count 8, Stride 4h

This register represents a DW of RW memory in FTPM EBB which has no defined functionality. This DW is aliased to the same offset for each locality, and even inactive localities can access it.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset[0-7]: [0x0] + FED40010h + [0-7]*4h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**FTPM Locality Config Area Reserved Read Write DW (RSVD_RW_31_0):** Reserved.

52.11.6 FTPM Interface ID Host Read Only Access 0 (HOST_LOC_0_INTF_ID_0)—Offset FED40030h

This register is opaque to HW. This register is implemented in flip-flops.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [0x0] + FED40030h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**FTPM Interface ID Bits 0 (FTPM_INTF_ID_BITS_0):** These are the 32 LSbits used by FW to inform host SW as to the interface type of the TPM. The exact usage is defined by TCG.

52.11.7 FTPM Interface ID Host Read Only Access 1 (HOST_LOC_0_INTF_ID_1)—Offset FED40034h

This register is opaque to HW. This register is implemented in flip-flops.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [0x0] + FED40034h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**FTPM Interface ID Bits 1 (FTPM_INTF_ID_BITS_1):** These are the 32 MSbits used by FW to inform host SW as to the interface type of the TPM. The exact usage is defined by TCG.

52.11.8 FTPM Locality Config Area Reserved Read Write[0-1] (HOST_LOC_0_RSVD_RW2[0-1])—Offset FED40038h, Count 2, Stride 4h

This register represents a DW of RW memory in FTPM EBB which has no defined functionality. This DW is aliased to the same offset for each locality, and even inactive localities can access it.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset[0-1]: [0x0] + FED40038h + [0-1]*4h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**FTPM Locality Config Area Reserved Read Write DW (RSVD_RW_31_0):** Reserved.

52.11.9 Control Area Request (HOST_LOC_0_CA_REQUEST)—Offset FED40040h

This register is implemented in flip-flops. This register is implemented in retention flops to maintain state through PG.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [0x0] + FED40040h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**HOST_CA_REQUEST:** Host software sets this field to a CSxE firmware-defined value to indicate a state change request to the fTPM. Any host write to this register shall result in an interrupt to the CSxE firmware, or wakeup the CSxE subsystem when it is in power-gated state.

52.11.10 Control Area Status (HOST_LOC_0_CA_STATUS)—Offset FED40044h

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [0x0] + FED40044h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**HOST_CA_STATUS:** Reserved.

52.11.11 Control Area Cancel (HOST_LOC_0_CA_CANCEL)—Offset FED40048h

This register is implemented in flip-flops. This register is implemented in retention flops to maintain state through PG.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [0x0] + FED40048h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**HOST_CA_CANCEL:** Host software sets this field to a CSxE firmware-defined value to indicate that a command should be canceled. Any host write to this register shall result in an interrupt to the CSxE firmware, or wakeup the CSxE subsystem when it is in power-gated state.

52.11.12 Control Area Start (HOST_LOC_0_CA_START)—Offset FED4004Ch

This register is implemented in flip-flops. This register is implemented in retention flops to maintain state through PG.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [0x0] + FED4004Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Control Area Start (HOST_CA_START):** Host software sets this field to a CSxE firmware defined value to indicate that a command is available for processing. The reset value indicates that a command is NOT available for processing. Any host write to this register shall result in an interrupt to the CSE firmware or wakeup the CSE subsystem when it is in power-gated state.

52.11.13 Control Area Interrupt Reserved Part 1 (HOST_LOC_0_CA_INT_RSVD1)—Offset FED40050h

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [0x0] + FED40050h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**RSVD_31_0:** Reserved

52.11.14 Control Area Interrupt Reserved Part 2 (HOST_LOC_0_CA_INT_RSVD2)—Offset FED40054h

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [0x0] + FED40054h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**RSVD_31_0:** Reserved

52.11.15 Control Area Command Size (HOST_LOC_0_CA_CMD_SZ)—Offset FED40058h

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [0x0] + FED40058h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**HOST_CA_CMD_SZ:** Reserved.

52.11.16 Control Area Command Part 1 (HOST_LOC_0_CA_CMD1)—Offset FED4005Ch

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [0x0] + FED4005Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**HOST_CA_CMD1:** Reserved.

52.11.17 Control Area Command Part 2 (HOST_LOC_0_CA_CMD2)—Offset FED40060h

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [0x0] + FED40060h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**HOST_CA_CMD2:** Reserved.

52.11.18 Control Area Response Size (HOST_LOC_0_CA_RSP_SZ)—Offset FED40064h

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [0x0] + FED40064h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**HOST_CA_RSP_SZ:** Reserved.

52.11.19 Control Area Response Part 1 (HOST_LOC_0_CA_RSP1)—Offset FED40068h

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [0x0] + FED40068h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**HOST_CA_RSP1:** Reserved.

52.11.20 Control Area Response Part 2 (HOST_LOC_0_CA_RSP2)—Offset FED4006Ch

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [0x0] + FED4006Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**HOST_CA_RSP2:** Reserved.

52.11.21 FTPM Reserved Read Write[0-3] (HOST_LOC_0_RSVD_RW3[0-3])—Offset FED40070h, Count 4, Stride 4h

This register represents a DW of RW memory in FTPM EBB which has no defined functionality. The access to this DW is allowed only to an active locality.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset[0-3]: [0x0] + FED40070h + [0-3]*4h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**FTPM Reserved Read Write DW (RSVD_RW_31_0):** Reserved.

52.11.22 FTPM Command and Response Buffer[0-991] (HOST_LOC_0_FTPM_CRB[0-991])—Offset FED40080h, Count 992, Stride 4h

This register represents a DW of RW memory in FTPM CRB (EBB).

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset[0-991]: [0x0] + FED40080h + [0-991]*4h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**FTPM Command and Response Buffer DW (HOST_FTPM_CRB_DW):** Reserved.

52.12 Registers in I/O Space—KT_HOST_IOBAR

These registers are accessed in Host I/O Space starting at the relocatable I/O address defined by the Base Address Register (BAR) KT_HOST_IOBAR described in Section 52.5.5, "KT IO BAR (KT_HOST_IOBAR)—Offset 10h" on page 2296.

52.12.1 KT Receive Buffer Register (IO_KTRBR)—Offset 0h

This register implements the standard Receiver Buffer register in the KT Block. This is read-only. DLAB (i.e. KTLCR[7]) shall be 0. In non-FIFO mode, this register will be read when the receiver data is ready. In FIFO mode, a read from this register will be translated into a read from the RBR FIFO.

Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [KT_HOST_IOBAR] + 0h

KT_HOST_IOBAR Type: PCI Configuration Register (Size: 32 bits)
KT_HOST_IOBAR Reference: [B:0, D:24, F:3] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO/V	**Receiver Buffer Register (RBR):** Implements the Receiver Buffer register of the Serial Interface.

52.12.2 KT Transmitter Holding Register (IO_KTTHR)—Offset 0h

This register implements the standard Transmitter Holding register in the KT Block. This is write-only. DLAB (i.e. KTLCR[7]) shall be 0. In non-FIFO mode, this register will be written when the Host needs to transmit data. In FIFO mode, a write to this register will be translated into a write to the THR FIFO.

Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [KT_HOST_IOBAR] + 0h

KT_HOST_IOBAR Type: PCI Configuration Register (Size: 32 bits)
KT_HOST_IOBAR Reference: [B:0, D:24, F:3] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 WO	**Transmitter Holding Register (THR):** Implements the Transmit Data register of the Serial Interface.

52.12.3 KT Divisor Latch LSB Register (IO_KTDLLR)—Offset 0h

This register implements the standard DLL register in the KT Block. DLAB (i.e. KTLCR[7]) shall be 1 in order for this register to be accessed. this register is supported only for SW compatibility and has no impact on HW performance.

Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [KT_HOST_IOBAR] + 0h

Default: 00h

KT_HOST_IOBAR Type: PCI Configuration Register (Size: 32 bits)
KT_HOST_IOBAR Reference: [B:0, D:24, F:3] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW/V	**Divisor Latch LSB (DLL):** Implements the DLL register of the Serial Interface.

52.12.4 KT Interrupt Enable register (IO_KTIER)—Offset 1h

This register implements the standard Interrupt Enable register in the KT Block. The bits enable specific events to interrupt the Host. See bit specific definition below. DLAB (i.e. KTLCR[7]) shall is 0 in order for this register to be accessed.

Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [KT_HOST_IOBAR] + 1h

Default: 00h

KT_HOST_IOBAR Type: PCI Configuration Register (Size: 32 bits)
KT_HOST_IOBAR Reference: [B:0, D:24, F:3] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:4	0x0 RO	**Reserved (RSVD):** Reserved.
3	0x0 RW	**MSR (IER3):** When set, enables bits in Modem Status register to cause an interrupt to the Host
2	0x0 RW	**LSR (IER2):** When set, enables bits in Receiver Line Status Register to cause an interrupt to the Host
1	0x0 RW	**THR (IER1):** When set, enables an interrupt to the Host when the Transmitter Holding register is empty
0	0x0 RW	**DR (IER0):** When set, enables an interrupt to the Host when the Received Data is available OR Receiver FIFO timeout.

52.12.5 KT Divisor Latch MSB Register (IO_KTDLMR)—Offset 1h

This register implements the standard DLM register in the KT Block. DLAB (i.e. KTLCR[7]) shall be 1 in order for this register to be accessed. This register is supported only for SW compatibility and has no impact on HW performance.

Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [KT_HOST_IOBAR] + 1h

KT_HOST_IOBAR Type: PCI Configuration Register (Size: 32 bits)
KT_HOST_IOBAR Reference: [B:0, D:24, F:3] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW/V	**Divisor Latch MSB (DLM):** Implements the DLM register of the Serial Interface.

52.12.6 KT Interrupt Identification Register (IO_KTIIR)—Offset 2h

This register implements the standard Interrupt Identification register in the KT Block. This is read-only. This register is created to provide minimum software overhead during data character transfers. The register prioritizes KT interrupts into 4 levels and records them in the IIRSTS field of this register. The four levels of interrupt conditions in order of priority are: Receiver Line Status; Received Data Ready/Character Timeout Indication; Transmitter Holding Register Empty; MODEM Status. When the Host accesses the IIR, the HW freezes all interrupts and indicates the highest priority pending interrupt to the Host. While this Host access is occurring, the HW records new interrupts, but does not change its current indication until the access is complete. Table in the Host Interrupt Generation section shows the contents.

Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

Default: 01h

BAR and Offset: [KT_HOST_IOBAR] + 2h

KT_HOST_IOBAR Type: PCI Configuration Register (Size: 32 bits)
KT_HOST_IOBAR Reference: [B:0, D:24, F:3] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RO/V	**FIFO Enable (FIEN1):** This field is connected by HW to the FIFO Enable field of the FCR register.
6	0x0 RO/V	**FIFO Enable (FIEN0):** This field is connected by HW to the FIFO Enable field of the FCR register.
5:4	0x0 RO	**Reserved (RSVD):** Hardwired to 0.
3:1	0x0 RO/V	**IIR Status (IIRSTS):** These bits are asserted by the HW according to the source of the interrupt and the priority level. Refer to the section on Host Interrupt Generation for a table of values.
0	0x1 RO/V	**Interrupt Status (INTSTS):** 0: indicates a pending Host interrupt and IIRSTS may be used as a pointer to the appropriate interrupt service routine. It reflects the logical-NOR of all UART interrupts. An individual UART interrupt will be identified as pending when the individual event status is asserted AND its corresponding event interrupt enable is asserted as well. For example, the THR Empty interrupt will be identified as pending when both LSR[THRE] bit is 1 AND IER[IER1] is 1. 1: indicates no pending Host interrupt.

52.12.7 KT FIFO Control register (IO_KTFCR)—Offset 2h

This register implements the standard FIFO Control register in the KT Block. It is used to configure features pertinent to the FIFO mode of operation. This is write-only.

Reset condition: Host reset. Non-sticky.

Type: I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [KT_HOST_IOBAR] + 2h

KT_HOST_IOBAR Type: PCI Configuration Register (Size: 32 bits)
KT_HOST_IOBAR Reference: [B:0, D:24, F:3] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0x0 WO	**Receiver Trigger Level (RTL):** Trigger level in bytes for the Receiver FIFO. Once the trigger level number of bytes is reached, an interrupt will be sent to the Host [7:6] RCVR FIFO Trigger Level (bytes) • 00 -- 01 • 01 -- 04 • 10 -- 08 • 11 -- 14
5:4	0x0 WO	**Reserved (RSVD):** Writes to this field shall be dropped.
3	0x0 WO	**RDY Mode (RDYM):** This bit has no effect on HW performance.
2	0x0 WO	**XMT FIFO Clear (XFIC):** When the Host writes one to this bit the HW will clear the XMT FIFO. This bit is self-cleared by HW.
1	0x0 WO	**RCV FIFO Clear (RFIC):** When the Host writes one to this bit the HW will clear the RCV FIFO. This bit is self-cleared by HW.
0	0x0 WO	**FIFO Enable (FIE):** When set indicates that the KT interface is working in FIFO node. When this bit value is changed the RCV and XMT FIFO are cleared by HW. This bit must be a 1 when other FCR bits are written to or they will NOT be programmed.

52.12.8 KT Line Control register (IO_KTLCR)—Offset 3h

This register implements the standard Line Control register in the KT Block. It specifies the format of the asynchronous data communications exchange and sets the DLAB bit. Most bits in this register have no effect on HW and are only used by the FW.

Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

Default: 03h

BAR and Offset: [KT_HOST_IOBAR] + 3h

KT_HOST_IOBAR Type: PCI Configuration Register (Size: 32 bits)
KT_HOST_IOBAR Reference: [B:0, D:24, F:3] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RW	**Divisor Latch Access Bit (DLAB):** • 1: Allows access to the Divisor Latch Registers and reading of the FIFO Control Register. • 0: Allows access to RBR, THR, IER and IIR registers.
6	0x0 RW	**Break Control (BC):** This bit has no effect on HW.
5:4	0x0 RW	**Parity Bit Mode (PBM):** This bit has no effect on HW.
3	0x0 RW	**Parity Enable (PE):** This bit has no effect on HW.
2	0x0 RW	**Stop Bit Select (SBS):** This bit has no effect on HW.
1:0	0x3 RW	**Word Select Byte (WSB):** This bit has no effect on HW.

52.12.9 KT Modem Control register (IO_KTMCR)—Offset 4h

This register implements the standard Modem Control register in the KT Block. It controls the interface with the modem. Because the FW emulates the modem, the Host communicates with the FW via this register. This register has impact on the HW in the loopback mode.

Reset condition: Host reset. Non-sticky.

Type: I/O Register (Size: 8 bits)

BAR and Offset: [KT_HOST_IOBAR] + 4h

Default: 00h

KT_HOST_IOBAR Type: PCI Configuration Register (Size: 32 bits)
KT_HOST_IOBAR Reference: [B:0, D:24, F:3] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:5	0x0 RO	**Reserved (RSVD):** Reserved.
4	0x0 RW	**Loop Back Mode (LBM):** When set by Host indicates that the serial port is in loop Back mode. This means that the data that is transmitted by the host should be received. Helps in debug of the interface
3	0x0 RW	**Output 2 (OUT2):** This bit has no effect on HW in normal mode. In loop back mode the value of this bit is written by HW to Modem Status Register bit (7)
2	0x0 RW	**Output 1 (OUT1):** This bit has no effect on HW in normal mode. In loop back mode the value of this bit is written by HW to Modem Status Register bit(6)
1	0x0 RW	**Request to Send Out (RTSO):** This bit has no effect on HW in normal mode. In loopback mode, the value of this bit is written by HW to Modem Status Register bit(4)
0	0x0 RW	**Data Terminal Ready Out (DRTO):** This bit has no effect on HW in normal mode. In loopback mode, the value in this bit is written by HW to Modem Status Register Bit(5)

52.12.10 KT Line Status register (IO_KTLSR)—Offset 5h

This register implements the standard Line Status register in the KT Block. It provides status information of the data transfer to the Host. Error indication etc are provided by the HW/FW to the host via this register.

Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [KT_HOST_IOBAR] + 5h

Default: 60h

KT_HOST_IOBAR Type: PCI Configuration Register (Size: 32 bits)
KT_HOST_IOBAR Reference: [B:0, D:24, F:3] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RO/C/V	**RCVR FIFO Error (RXFER):** This bit is cleared in non FIFO mode. This bit is connected to UART LSR[BI] bit in FIFO mode.
6	0x1 RO/C/V	**Transmitter Empty (TEMT):** In non-FIFO mode: this bit will be set to 1 whenever the Transmitter Holding Register (THR) and the Transmitter Shift Register (TSR) are both empty, OR cleared to 0 whenever either THR or TSR contains a data byte. In FIFO mode: this bit will be set to 1 whenever XMIT FIFO and TSR are both empty, OR cleared to 0 whenever either XMIT FIFO or TSR contains a data byte. Implementation note: This bit is connected by HW to THRE bit.
5	0x1 RO/C/V	**Transmitter Holding Register Empty (THRE):** The bit will always be set whenever Host changes UART FCR[FIE] bit. This bit is controlled differently in FIFO vs non-FIFO modes: Non-FIFO mode: This bit will be cleared by HW when Host writes to THR, and set by HW when FW reads from THR. FIFO mode: This bit will be set by HW when XMIT FIFO is empty, and cleared by HW when XMIT FIFO is NOT empty.
4	0x0 RO/C/V	**Break Interrupt (BI):** This bit will be cleared by HW when the UART LSR register is read by Host. This bit will be set by HW in two cases: In FIFO mode, when FW sets the KTRIVR[SBI] bit. In non-FIFO mode, when FW sets the KTRBR[BIA] bit.
3	0x0 RO	**Framing Error (FE):** This bit is NOT implemented and hardwired to 0.
2	0x0 RO	**Parity Error (PE):** This bit is NOT implemented and hardwired to 0.
1	0x0 RO/C/V	**Overrun Error (OE):** HW will clear this bit when Host reads from KTLSR register and this is source of interrupt. HW will set this bit when overrun error is detected. In non-FIFO mode, the character that triggers the overrun error shall overwrite the character in the RBR register. In FIFO mode, the character that triggers the overrun error shall be dropped without corrupting the RCVR FIFO.
0	0x0 RO/V	**Data Ready (DR):** Non-FIFO Mode: this bit will be set by HW when FW writes to RBR and cleared by HW when Host reads from RBR. FIFO Mode: the bit will be set by HW when RCVR FIFO is not empty and cleared by HW when RCVR FIFO is empty.

52.12.11 KT Modem Status register (IO_KTMSR)—Offset 6h

This register implements the standard Modem Status register in the KT Block. It provides the current state of the control lines from the modem. The modem functionality is emulated by the FW.

Reset condition: Host reset. Non-sticky.

Type: I/O Register (Size: 8 bits)

BAR and Offset: [KT_HOST_IOBAR] + 6h

Default: 00h

KT_HOST_IOBAR Type: PCI Configuration Register (Size: 32 bits)
KT_HOST_IOBAR Reference: [B:0, D:24, F:3] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RO	**Data Carrier Detect (DCD):** In Loop Back mode this bit is connected by HW to the value of MCR bit 3
6	0x0 RO	**Ring Indicator (RI):** In Loop Back mode this bit is connected by HW to the value of MCR bit 2.
5	0x0 RO	**Data Set Ready (DSR):** In Loop Back mode this bit is connected by HW to the value of MCR bit 0.
4	0x0 RO	**Clear To Send (CTS):** In Loop Back mode this bit is connected by HW to the value of MCR bit 1.
3	0x0 RO/C/V	**Delta Data Carrier Detect (DDCD):** This bit is set when bit 7 is changed. This bit is cleared by HW when the MSR register is being read by the HOST driver.
2	0x0 RO/C/V	**Trailing Edge of Read Detector (TERI):** This bit is set when bit 6 is changed from 1 to 0. This bit is cleared by HW when the MSR register is being read by the Host driver.
1	0x0 RO/C/V	**Delta Data Set Ready (DDSR):** This bit is set when bit 5 is changed. This bit is cleared by HW when the MSR register is being read by the Host driver.
0	0x0 RO/C/V	**Delta Clear To Send (DCTS):** This bit is set when bit 4 is changed. This bit is cleared by HW when the MSR register is being read by the Host driver.

52.12.12 KT Scratch register (IO_KTSCR)—Offset 7h

This register implements the standard Scratch register in the KT Block. It allows Host SW programmers to hold temporary data. It has NO effect on HW.

Reset condition: Host reset. Non-sticky.

Type: I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [KT_HOST_IOBAR] + 7h

KT_HOST_IOBAR Type: PCI Configuration Register (Size: 32 bits)
KT_HOST_IOBAR Reference: [B:0, D:24, F:3] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Scratch Register Data (SCRD):** Reserved.

52.13 Registers in I/O Space—IDE_HOST_PCMDIOBAR

These registers are accessed in Host I/O Space starting at the relocatable I/O address defined by the Base Address Register (BAR) IDE_HOST_PCMDIOBAR described in Section 52.6.5, "IDE Primary Command Block IO BAR (IDE_HOST_PCMDIOBAR)—Offset 10h" on page 2308.

52.13.1 IDE Data Register (IDEDATA)—Offset 0h

This register serves as the data interface in IDE PIO modes. Unit of access is in WORD. Host writes to this register are converted into writes to the PIO buffer in CSxE memory at monotonically increasing WORD address. Host writes are dropped under any one of the following conditions: (1) PIO modes are disabled. (Cfg. IDEPBPR[EN] defined in CSxE memory space) (2) PIO buffer is full. Host reads from this register are converted into reads from the PIO buffer in CSxE memory at monotonically increasing WORD address. Host reads are dropped under any one of the following conditions: (1) PIO modes are disabled. (Cfg. IDEPBPR[EN] defined in CSxE memory space) (2) PIO buffer is empty.

Reset condition: no connection to any reset signal.

Type: I/O Register
(Size: 16 bits)

BAR and Offset: [IDE_HOST_PCMDIOBAR] + 0h

Default: 0000h

IDE_HOST_PCMDIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_PCMDIOBAR Reference: [B:0, D:24, F:2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x0 RW/V	**IDE Data Register (IDEDR):** Data interface in IDE PIO modes. Host reads/writes from/to this register are converted into reads/writes from/to the PIO buffer in CSxE memory.

52.13.2 IDE Features Register (IDEFR)—Offset 1h

This register implements the standard Features register in the Primary IDE Command Block. This is write-only. BE[0] shall be deasserted.

Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [IDE_HOST_PCMDIOBAR] + 1h

Default: 00h

IDE_HOST_PCMDIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_PCMDIOBAR Reference: [B:0, D:24, F:2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 WO	**IDE Features Data (IDEFD):** The IDE Features register is command specific and is used to enable and disable interface features.

52.13.3 IDE Error Register DEV0 (IDEERD0)—Offset 1h

This register implements the standard Device 0 Error register in the Primary IDE Command Block. This is read-only. BE[0] shall be deasserted. DEV = 0 (i.e. IDEDHIR[4] = 0).

Reset condition: CSxE reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [IDE_HOST_PCMDIOBAR] + 1h

Default: 00h

IDE_HOST_PCMDIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_PCMDIOBAR Reference: [B:0, D:24, F:2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO/V	**IDE Error Data (IDEED):** Upon command completion of any command except EXECUTE DEVICE DIAGNOSTIC or DEVICE RESET, the content of this register is valid and contains error status when the ERR bit is set to 1 in the Status register (i.e. IDESR0[ERR] = 1). Following a power-on, a hardware or software reset, or command completion of an EXECUTE DEVICE DIAGNOSTIC or DEVICE RESET command, this register contains a diagnostic code. Bit 2 ABRT (command aborted) is set to 1 to indicate the requested command has been command aborted because the command code or a command parameter is invalid, the command is not supported, a pre-requisite for the command has not been met, or some other error has occurred.

52.13.4 IDE Error Register DEV1 (IDEERD1)—Offset 1h

This register implements the standard Device 1 Error register in the Primary IDE Command Block. This is read-only. BE[0] shall be deasserted. DEV = 1 (i.e. IDEDHIR[4] = 1).

Reset condition: CSxE reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [IDE_HOST_PCMDIOBAR] + 1h

Default: 00h

IDE_HOST_PCMDIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_PCMDIOBAR Reference: [B:0, D:24, F:2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO/V	**IDE Error Data (IDEED):** Upon command completion of any command except EXECUTE DEVICE DIAGNOSTIC or DEVICE RESET, the content of this register is valid and contains error status when the ERR bit is set to 1 in the Status register (i.e. IDESR0[ERR] = 1). Following a power-on, a hardware or software reset, or command completion of an EXECUTE DEVICE DIAGNOSTIC or DEVICE RESET command, this register contains a diagnostic code. Bit 2 ABRT (command aborted) is set to 1 to indicate the requested command has been command aborted because the command code or a command parameter is invalid, the command is not supported, a pre-requisite for the command has not been met, or some other error has occurred.

52.13.5 IDE Sector Count In Register (IDESCIR)—Offset 2h

This register implements the standard Sector Count In register in the Primary IDE Command Block. All 3 registers (IDESCIR, IDESCOR0, IDESCOR1) will be updated with the same write data when this register is write-accessed. This is write-only. This register is meaningful for an ATA command while unused for an ATAPI command.

Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [IDE_HOST_PCMDIOBAR] + 2h

Default: 00h

IDE_HOST_PCMDIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_PCMDIOBAR Reference: [B:0, D:24, F:2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 WO	**IDE Sector Count Data (IDESCD):** The Sector Count register specifies the sector count of the data for which an ATA transfer has been made.

52.13.6 IDE Sector Count Out Register DEV0 (IDESCOR0)—Offset 2h

This register implements the standard Device 0 Sector Count Out register in the Primary IDE Command Block. This is read-only. DEV = 0 (i.e. IDEDHIR[4] = 0). CSxE FW writes to this register upon completion of an ATA/ATAPI command. This register is called IDE Interrupt Reason Register DEV0 for an ATAPI command.

Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [IDE_HOST_PCMDIOBAR] + 2h

Default: 00h

IDE_HOST_PCMDIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_PCMDIOBAR Reference: [B:0, D:24, F:2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO/V	**IDE Sector Count Out DEV0 (ISCOD0):** Sector Count Out register for Device 0

52.13.7 IDE Sector Count Out Register DEV1 (IDESCOR1)—Offset 2h

This register implements the standard Device 1 Sector Count Out register in the Primary IDE Command Block. This is read-only. DEV = 1 (i.e. IDEDHIR[4] = 1). CSxE FW writes to this register upon completion of an ATA/ATAPI command. This register is called IDE Interrupt Reason Register DEV1 for an ATAPI command.

Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [IDE_HOST_PCMDIOBAR] + 2h

Default: 00h

IDE_HOST_PCMDIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_PCMDIOBAR Reference: [B:0, D:24, F:2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO/V	**IDE Sector Count Out DEV1 (ISCOD1):** Sector Count Out register for Device 1

52.13.8 IDE Sector Number In Register (IDESNIR)—Offset 3h

This register implements the standard Sector Number In register in the Primary IDE Command Block in CHS addressing mode. All 3 registers (IDESNIR, IDESNOR0, IDESNOR1) will be updated with the same write data when this register is write-accessed. This is write-only. This register is called IDE LBA Low In Register in LBA addressing mode. This register is reserved for an ATAPI command.

Reset condition: Host reset. Non-sticky.

Type: I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [IDE_HOST_PCMDIOBAR] + 3h

IDE_HOST_PCMDIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_PCMDIOBAR Reference: [B:0, D:24, F:2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 WO	**IDE Sector Number Data (IDESND):** The Sector Number register is set by the host to specify the starting sector number associated with the next ATA command to be executed. Following a qualified ATA command sequence the device will set the register value to the last sector read or written as a result of the previous ATA command.

52.13.9 IDE Sector Number Out Register DEV0 (IDESNOR0)—Offset 3h

This register implements the standard Device 0 Sector Number Out register in the Primary IDE Command Block. This is read-only. DEV = 0 (i.e. IDEDHIR[4] = 0). CSxE FW writes to this register upon completion of an ATA command. This register is called IDE LBA Low Out Register DEV0 in LBA addressing mode. This register is reserved for an ATAPI command.

Reset condition: Host reset. Non-sticky.

Type: I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [IDE_HOST_PCMDIOBAR] + 3h

IDE_HOST_PCMDIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_PCMDIOBAR Reference: [B:0, D:24, F:2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO/V	**IDE Sector Number Out DEV0 (IDESNO0):** Sector Number Out register for Device 0

52.13.10 IDE Sector Number Out Register DEV1 (IDESNOR1)—Offset 3h

This register implements the standard Device 1 Sector Number Out register in the Primary IDE Command Block. This is read-only. DEV = 1 (i.e. IDEDHIR[4] = 1). CSxE FW writes to this register upon completion of an ATA command. This register is called IDE LBA Low Out Register DEV1 in LBA addressing mode. This register is reserved for an ATAPI command.

Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [IDE_HOST_PCMDIOBAR] + 3h

Default: 00h

IDE_HOST_PCMDIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_PCMDIOBAR Reference: [B:0, D:24, F:2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO/V	**IDE Sector Number Out DEV1 (IDESNO1):** Sector Number Out register for Device 1

52.13.11 IDE Cylinder Low In Register (IDECLIR)—Offset 4h

This register implements the standard Cylinder Low In register in the Primary IDE Command Block. All 3 registers (IDECLIR, IDCLOR0, IDCLOR1) will be updated with the same write data when this register is write-accessed. This is write-only. This register is called IDE LBA Mid In Register in LBA addressing mode. This register is called IDE Byte Count Low Limit Register for an ATAPI command.

Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [IDE_HOST_PCMDIOBAR] + 4h

Default: 00h

IDE_HOST_PCMDIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_PCMDIOBAR Reference: [B:0, D:24, F:2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 WO	**IDE Cylinder Low Data. (IDECLD):** The Cylinder Low register is set by the host to specify the cylinder number low byte. Following an ATA command, the contents of this register is written by the device, identifying the cylinder number low byte.

52.13.12 IDE Cylinder Low Out Register DEV0 (IDCLOR0)—Offset 4h

This register implements the standard Device 0 Cylinder Low Out register in the Primary IDE Command Block. This is read-only. DEV = 0 (i.e. IDEDHIR[4] = 0). CSxE FW writes to this register upon completion of an ATA command. This register is called IDE LBA Mid Out Register DEV0 in LBA addressing mode. This register is called IDE Byte Count Low Register DEV0 for an ATAPI command.

Reset condition: Host reset. Non-sticky.

Type: I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [IDE_HOST_PCMDIOBAR] + 4h

IDE_HOST_PCMDIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_PCMDIOBAR Reference: [B:0, D:24, F:2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO/V	**IDE Cylinder Low Out DEV0. (IDECLO0):** Cylinder Low Out Register for Device 0.

52.13.13 IDE Cylinder Low Out Register DEV1 (IDCLOR1)—Offset 4h

This register implements the standard Device 1 Cylinder Low Out register in the Primary IDE Command Block. This is read-only. DEV = 1 (i.e. IDEDHIR[4] = 1). CSxE FW writes to this register upon completion of an ATA command. This register is called IDE LBA Mid Out Register DEV1 in LBA addressing mode. This register is called IDE Byte Count Low Register DEV1 for an ATAPI command.

Reset condition: Host reset. Non-sticky.

Type: I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [IDE_HOST_PCMDIOBAR] + 4h

IDE_HOST_PCMDIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_PCMDIOBAR Reference: [B:0, D:24, F:2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO/V	**IDE Cylinder Low Out DEV1. (IDECLO1):** Cylinder Low Out Register for Device 1.

52.13.14 IDE Cylinder High In Register (IDECHIR)—Offset 5h

This register implements the standard Cylinder High In register in the Primary IDE Command Block. All 3 registers (IDECHIR, IDCHOR0, IDCHOR1) will be updated with the same write data when this register is write-accessed. This is write-only. This register is called IDE LBA High In Register in LBA addressing mode. This register is called IDE Byte Count High Limit Register for an ATAPI command.

Reset condition: Host reset. Non-sticky.

Type: I/O Register (Size: 8 bits)

BAR and Offset: [IDE_HOST_PCMDIOBAR] + 5h

Default: 00h

IDE_HOST_PCMDIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_PCMDIOBAR Reference: [B:0, D:24, F:2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 WO	**IDE Cylinder High Data (IDECHD):** The Cylinder High register is set by the host to specify the cylinder number high byte. Following an ATA command, the contents of this register is written by the device, identifying the cylinder number high byte.

52.13.15 IDE Cylinder High Out Register DEV0 (IDCHOR0)—Offset 5h

This register implements the standard Device 0 Cylinder High Out register in the Primary IDE Command Block. This is read-only. DEV = 0 (i.e. IDEDHIR[4] = 0). CSxE FW writes to this register upon completion of an ATA command. This register is called IDE LBA High Out Register DEV0 in LBA addressing mode. This register is called IDE Byte Count High Register DEV0 for an ATAPI command.

Reset condition: Host reset. Non-sticky.

Type: I/O Register (Size: 8 bits)

BAR and Offset: [IDE_HOST_PCMDIOBAR] + 5h

Default: 00h

IDE_HOST_PCMDIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_PCMDIOBAR Reference: [B:0, D:24, F:2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO/V	**IDE Cylinder High Out DEV0 (IDECHO0):** Cylinder High Out register for Device 0

52.13.16 IDE Cylinder High Out Register DEV1 (IDCHOR1)—Offset 5h

This register implements the standard Device 1 Cylinder High Out register in the Primary IDE Command Block. This is read-only. DEV = 1 (i.e. IDEDHIR[4] = 1). CSxE FW writes to this register upon completion of an ATA command. This register is called IDE LBA High Out Register DEV1 in LBA addressing mode. This register is called IDE Byte Count High Register DEV1 for an ATAPI command.

Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [IDE_HOST_PCMDIOBAR] + 5h

IDE_HOST_PCMDIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_PCMDIOBAR Reference: [B:0, D:24, F:2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO/V	**IDE Cylinder High Out DEV1 (IDECHO1):** Cylinder High Out register for Device 1

52.13.17 IDE Drive/Head In Register (IDEDHIR)—Offset 6h

This register implements the standard Drive/Head In register in the Primary IDE Command Block. All 3 registers (IDEDHIR, IDDHOR0, IDDHOR1) will be updated with the same write data when this register is write-accessed. This is write-only. Bit 4 of this register is the DEV (master/slave) bit. This bit is cleared by hardware on IDE software reset (IDDCR[SRST] = 1) in addition to Host reset. This register is called IDE Device In Register in LBA addressing mode or for an ATAPI command.

Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [IDE_HOST_PCMDIOBAR] + 6h

IDE_HOST_PCMDIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_PCMDIOBAR Reference: [B:0, D:24, F:2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 WO	**IDE Drive/Head Data (IDEDHD):** The Drive/Head Register is used by the host and the device to select the type of addressing (CHS or LBA), the drive letter, and either bits 3 through 0 of the head number in CHS mode or in LBA mode, bits D3:D0 reflect the logical block number bits LBA27:LBA24.

52.13.18 IDE Drive/Head Out Register DEV0 (IDDHOR0)—Offset 6h

This register implements the standard Device 0 Drive/Head Out register in the Primary IDE Command Block. This is read-only. DEV = 0 (i.e. IDEDHIR[4] = 0). CSxE FW writes to this register upon completion of an ATA command. This register is called IDE Device Out Register DEV0 in LBA addressing mode or for an ATAPI command.

Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [IDE_HOST_PCMDIOBAR] + 6h

Default: 00h

IDE_HOST_PCMDIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_PCMDIOBAR Reference: [B:0, D:24, F:2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO/V	**IDE Drive/Head Out DEV0 (IDEDHO0):** Drive/Head Out register of Device 0

52.13.19 IDE Drive/Head Out Register DEV1 (IDDHOR1)—Offset 6h

This register implements the standard Device 1 Drive/Head Out register in the Primary IDE Command Block. This is read-only. DEV = 1 (i.e. IDEDHIR[4] = 1). CSxE FW writes to this register upon completion of an ATA command. This register is called IDE Device Out Register DEV1 in LBA addressing mode or for an ATAPI command.

Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [IDE_HOST_PCMDIOBAR] + 6h

Default: 00h

IDE_HOST_PCMDIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_PCMDIOBAR Reference: [B:0, D:24, F:2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO/V	**IDE Drive/Head Out DEV1 (IDEDHO1):** Drive/Head Out register of Device 1

52.13.20 IDE Command Register (IDECR)—Offset 7h

This register implements the standard Command register in the Primary IDE Command Block. This is write-only.

Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [IDE_HOST_PCMDIOBAR] + 7h

IDE_HOST_PCMDIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_PCMDIOBAR Reference: [B:0, D:24, F:2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 WO	**IDE Command Data (IDECD):** The Command register specifies the ATA/ATAPI Command code being issued to the drive by the host. Command processing begins when this register is written. The content of the Command Block registers becomes parameters of the command when this register is written. Writing this register clears any pending interrupt condition. Please refer to the description of the INTM and INTS bits in the IDGCR register in the CSxE memory space for detailed conditions under which interrupt condition shall be cleared.

52.13.21 IDE Status Register DEV0 (IDESR0)—Offset 7h

This register implements the standard Device 0 Status register in the Primary IDE Command Block. This is read-only. DEV = 0 (i.e. IDEDHIR[4] = 0). CSxE FW writes to this register upon completion of an ATA/ATAPI command. Additionally upon completion of the last data phase of a PIO transfer, HW will load this register with value of the SRAFP field in the IDESRAP register in the CSxE memory space. Host read of this register clears Device 0's interrupt. Please refer to the description of the INTM bit in the IDGCR register in the CSxE memory space for detailed conditions under which interrupt condition shall be cleared. The bit description is for ATA mode. Different name in ATAPI mode, if applicable, is cited as well.

Reset condition: CSxE reset with the BSY bit as an exception. Please refer to description of the BSY bit below for a list of BSY bit reset conditions. Non-sticky.

Type: I/O Register (Size: 8 bits)

BAR and Offset: [IDE_HOST_PCMDIOBAR] + 7h

Default: 80h

IDE_HOST_PCMDIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_PCMDIOBAR Reference: [B:0, D:24, F:2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7	0x1 RO/V	**Busy (BSY):** This bit is set by HW when the IDECR is being written and DEV=0, OR when IDDCR[SRST] bit is asserted by Host, OR host system reset, OR D3 to D0 transition of the IDE function. This bit is cleared by FW write of 0. Please refer to general register description above for special handling for a PIO transfer. When this bit is 1, any other bit in this register is meaningless.
6	0x0 RO/V	**Drive Ready (DRDY):** When set, indicates drive is ready for command. Update of this bit is completely FW-assisted. This bit is also called Device Ready. Please refer to general register description above for special handling for a PIO transfer.
5	0x0 RO/V	**Drive Fault (DF):** When set, indicates Error on the drive. Update of this bit is completely FW-assisted. This bit is called DMA Ready for a DMA ATAPI command. Please refer to general register description above for special handling for a PIO transfer.
4	0x0 RO/V	**Drive Seek Complete (DSC):** When set, indicates Heads are positioned over the desired cylinder. Update of this bit is completely FW-assisted. This bit is called Service for an ATAPI command. Please refer to general register description above for special handling for a PIO transfer.
3	0x0 RO/V	**Data Request (DRQ):** Set when the drive wants to exchange data with the Host via the data register. Update of this bit is completely FW-assisted. Please refer to general register description above for special handling for a PIO transfer.
2	0x0 RO/V	**Corrected Data (CORR):** When set, indicates a correctable read error has occurred. Update of this bit is completely FW-assisted. Please refer to general register description above for special handling for a PIO transfer.
1	0x0 RO/V	**Index (IDX):** This bit is set once per rotation of the medium when the index mark passes under the read/write head. Update of this bit is completely FW-assisted. Please refer to general register description above for special handling for a PIO transfer.
0	0x0 RO/V	**Error (ERR):** When set, indicates an error occurred in the process of executing the current command. The Error Register of the selected device contains the error information. Update of this bit is completely FW-assisted. This bit is called Check for an ATAPI command. Please refer to general register description above for special handling for a PIO transfer.

52.13.22 IDE Status Register DEV1 (IDESR1)—Offset 7h

This register implements the standard Device 1 Status register in the Primary IDE Command Block. This is read-only. DEV = 1 (i.e. IDEDHIR[4] = 1). CSxE FW writes to this register upon completion of an ATA/ATAPI command. Additionally upon completion of the last data phase of a PIO transfer, HW will load this register with value of the SRAFP field in the IDESRAP register in the CSxE memory space. Host read of this register clears Device 1's interrupt. Please refer to the description of the INTM bit in the IDGCR register in the CSxE memory space for detailed conditions under which interrupt condition shall be cleared. The bit description is for ATA mode. Different name in ATAPI mode, if applicable, is cited as well.

Reset condition: CSxE reset with the BSY bit as an exception. Please refer to description of the BSY bit below for a list of BSY bit reset conditions. Non-sticky.

Type: I/O Register (Size: 8 bits)

BAR and Offset: [IDE_HOST_PCMDIOBAR] + 7h

Default: 80h

IDE_HOST_PCMDIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_PCMDIOBAR Reference: [B:0, D:24, F:2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7	0x1 RO/V	**Busy (BSY):** This bit is set by HW when the IDECR is being written and DEV=1, OR when IDDCR[SRST] bit is asserted by Host, OR host system reset, OR D3 to D0 transition of the IDE function. This bit is cleared by FW write of 0. Please refer to general register description above for special handling for a PIO transfer. When this bit is 1, any other bit in this register is meaningless.
6	0x0 RO/V	**Drive Ready (DRDY):** When set, indicates drive is ready for command. Update of this bit is completely FW-assisted. This bit is also called Device Ready. Please refer to general register description above for special handling for a PIO transfer.
5	0x0 RO/V	**Drive Fault (DF):** When set, indicates Error on the drive. Update of this bit is completely FW-assisted. This bit is called DMA Ready for a DMA ATAPI command. Please refer to general register description above for special handling for a PIO transfer.
4	0x0 RO/V	**Drive Seek Complete (DSC):** When set, indicates Heads are positioned over the desired cylinder. Update of this bit is completely FW-assisted. This bit is called Service for an ATAPI command. Please refer to general register description above for special handling for a PIO transfer.
3	0x0 RO/V	**Data Request (DRQ):** Set when the drive wants to exchange data with the Host via the data register. Update of this bit is completely FW-assisted. Please refer to general register description above for special handling for a PIO transfer.
2	0x0 RO/V	**Corrected Data (CORR):** When set, indicates a correctable read error has occurred. Update of this bit is completely FW-assisted. Please refer to general register description above for special handling for a PIO transfer.
1	0x0 RO/V	**Index (IDX):** This bit is set once per rotation of the medium when the index mark passes under the read/write head. Update of this bit is completely FW-assisted. Please refer to general register description above for special handling for a PIO transfer.
0	0x0 RO/V	**Error (ERR):** When set, indicates an error occurred in the process of executing the current command. The Error Register of the selected device contains the error information. Update of this bit is completely FW-assisted. This bit is called Check for an ATAPI command. Please refer to general register description above for special handling for a PIO transfer.

52.14 Registers in I/O Space—IDE_HOST_PCTLIOBAR

These registers are accessed in Host I/O Space starting at the relocatable I/O address defined by the Base Address Register (BAR) IDE_HOST_PCTLIOBAR described in described in Section 52.6.6, "IDE Primary Control Block IO BAR (IDE_HOST_PCTLIOBAR)—Offset 14h" on page 2308.

52.14.1 IDE Device Control Register (IDDCR)—Offset 2h

This register implements the standard Device Control register in the Primary IDE Control Block. This is write-only. BE[0] shall be deasserted.

Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [IDE_HOST_PCTLIOBAR] + 2h

Default: 00h

IDE_HOST_PCTLIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_PCTLIOBAR Reference: [B:0, D:24, F:2] + 14h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0x0 WO	**Reserved (RSVD1):** Writable by Host, but NO HW effect due to writes.
2	0x0 WO	**Software Reset (SRST):** • 1: both devices shall perform the software reset protocol. • 0: both devices shall exit software reset.
1	0x0 WO	**Host Interrupt Disable (nIEN):** • 1: disables HW from generating interrupt to the Host. • 0: enables HW to generate interrupt to the Host.
0	0x0 WO	**Reserved (RSVD0):** Writable by Host, but NO HW effect due to writes.

52.14.2 IDE Alternate Status Register (IDASR)—Offset 2h

This register implements the standard Alternate Status register in the Primary IDE Control Block. This is read-only. It shadows the standard Status registers in the Primary IDE Command Block. Read of this register does NOT clear the interrupt status bits in the selected Status register. IDESR0 is shadowed when DEV = 0 (i.e. IDEDHIR[4] = 0). IDESR1 is shadowed when DEV = 1 (i.e. IDEDHIR[4] = 1).

Reset condition: There is no reset associated with this register because it is NOT a physical register.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [IDE_HOST_PCTLIOBAR] + 2h

Default: 00h

IDE_HOST_PCTLIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_PCTLIOBAR Reference: [B:0, D:24, F:2] + 14h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO/V	**IDE Alternate Status Register (IDEASR):** Shadows DEV0/DEV1 Status register on Host reads depending on IDEDHIR[4] setting.

52.15 Registers in I/O Space—IDE_HOST_BMIOBAR

These registers are accessed in Host I/O Space starting at the relocatable I/O address defined by the Base Address Register (BAR) IDE_HOST_BMIOBAR described in described in Section 52.6.9, "IDE Bus Master Block IO BAR (IDE_HOST_BMIOBAR)—Offset 20h" on page 2310.

52.15.1 IDE Primary Bus Master Command Register (IDEPBMCR)—Offset 0h

This register implements the standard IDE Primary Bus Master Command register in the IDE Bus Master Block.

Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [IDE_HOST_BMIOBAR] + 0h

IDE_HOST_BMIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_BMIOBAR Reference: [B:0, D:24, F:2] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7:4	0x0 RO	**Reserved (RSVD1):** Not implemented. Hardwired to 0.
3	0x0 RW	**Read or Write Control (RWC):** This bit sets the direction of the bus master transfer. • 0: reads are performed from Host system memory. • 1: writes are performed to Host system memory. This bit shall NOT be changed when the bus master function is active.
2:1	0x0 RO	**Reserved (RSVD0):** Not implemented. Hardwired to 0.
0	0x0 RW/V	**Start/Stop Bus Master (SSBM):** Host starts a bus master operation in the device by setting this bit to 1. The device shall only transfer data between the ATA device and Host memory in the bus master operation. Host stops the bus master operation by clearing this bit to 0. All state information will be lost when 0 is written. Host CANNOT stop and then resume the bus master operation. When Host clears this bit to 0 while the bus master operation is still active, the bus master operation will be aborted and data transferred from the device may be discarded before being written to host memory. In any event the device should terminate any DMA burst in progress compliant with the ATA protocol being used. If the UDMA protocol is being used, there may be a CRC error report. The ATA device may be in an indeterminate state. HW will clear this bit to 0 after the data transfer has been completed, as indicated by satisfaction of either of the following conditions: (1) IDEPBMSR[BMIA] is cleared to 0. OR (2) IDEPBMSR[INT] is set to 1.

52.15.2 IDE Primary Bus Master Device Specific 0 Register (IDEPBMDS0R)—Offset 1h

This register implements the standard IDE Primary Bus Master Device Specific 0 register in the IDE Bus Master Block. This register is programmed by the Host for any device specific data.

Reset condition: CSxE reset. Non-sticky.

Type: I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [IDE_HOST_BMIOBAR] + 1h

IDE_HOST_BMIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_BMIOBAR Reference: [B:0, D:24, F:2] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW/V	**Device Specific Data0 (DSD0):** Device Specific

52.15.3 IDE Primary Bus Master Status Register (IDEPBMSR)—Offset 2h

This register implements the standard IDE Primary Bus Master Status register in the IDE Bus Master Block.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [IDE_HOST_BMIOBAR] + 2h

Default: 80h

IDE_HOST_BMIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_BMIOBAR Reference: [B:0, D:24, F:2] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7	0x1 RO/V	**Simplex Only (SO):** This bit indicates whether or not both bus master channels (primary and secondary) can be operated at the same time. If the bit is 0, both channels operate independently and can be used at the same time. If the bit is 1, only one channel may be used at a time. Reset condition: CSxE reset. Non-sticky.
6	0x0 RW/V	**Device 1 DMA Capable (D1DC):** This read/write bit is set by device dependent code (BIOS or host software) to indicate that Device 1 for this channel is capable of DMA transfers, and that the device has been initialized for optimum performance. Reset condition: Host reset. Non-sticky.
5	0x0 RW/V	**Device 0 DMA Capable (D0DC):** This read/write bit is set by device dependent code (BIOS or host software) to indicate that Device 0 for this channel is capable of DMA transfers, and that the device has been initialized for optimum performance. Reset condition: Host reset. Non-sticky.
4:3	0x0 RO	**Reserved (RSVD):** Not implemented. Hardwired to 0.
2	0x0 RW/1C/V	**Interrupt (INT):** HW shall set this bit to 1 on rising edge detection of the ATA channels interrupt line (INTRQ). Host SW writes 1 to clear this bit. Host SW can use this bit to determine if an ATA device has asserted its interrupt line (INTRQ) (see ATA standard). When this bit is 1, all data MUST have been transferred to the Hosts system memory. The adapter shall not set this bit to 1 until it has flushed all internal data buffers. NOTE: When INTRQ is deasserted, HW won't clear this bit atomically. When INTRQ is deasserted, this bit shall be cleared as well by Host SW writing 1 to this bit. Reset condition: CSxE reset. Non-sticky.
1	0x0 RW/1C/V	**Error (ER):** FW will set this bit to 1 when the device encounters an error in transferring data to/from Host memory. The exact error condition is bus specific and can be determined in a bus specific manner. Host SW writes 1 to clear this bit. Reset condition: CSxE reset. Non-sticky.

Bit Range	Default & Access	Field Name (ID): Description
0	0x0 RO/V	**Bus Master IDE Active (BMIA):** HW shall set this bit when (1) Host sets the IDEPBMCR[SSBM] bit. FW shall clear this bit when (1) The last transfer for a region is performed, where EOT for that region is set in the region descriptor. OR (2) FW detects that Host cleared IDEPBMCR[SSBM] bit as indicated by a value of 1 in proxy bit IDEBMCR[SSBMC] in CSxE root space. Before clearing this bit to 0, FW must satisfy the following conditions in addition: (1) All data transferred from the device during the previous bus master command has been transferred to the Hosts system memory, unless the bus master command was aborted. OR (2) All data has been written to the device. Reset condition: CSxE reset. Non-sticky.

52.15.4 IDE Primary Bus Master Device Specific 1 Register (IDEPBMDS1R)—Offset 3h

This register implements the standard IDE Primary Bus Master Device Specific 1 register in the IDE Bus Master Block. This register is programmed by the Host for any device specific data.

Reset condition: CSxE reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [IDE_HOST_BMIOBAR] + 3h

IDE_HOST_BMIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_BMIOBAR Reference: [B:0, D:24, F:2] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW/V	**Device Specific Data1 (DSD1):** Device Specific Data

52.15.5 IDE Primary Bus Master Descriptor Table Pointer Register Byte 0 (IDEPBMDTPR0)—Offset 4h

This register implements the Byte 0 of the standard IDE Primary Bus Master Descriptor Table Pointer register in the IDE Bus Master Block. The descriptor table pointer is used for bus master operation in the primary channel.

Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [IDE_HOST_BMIOBAR] + 4h

IDE_HOST_BMIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_BMIOBAR Reference: [B:0, D:24, F:2] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Descriptor Table Pointer Byte 0 (DTPB0):** Byte 0 of the Descriptor Table pointer. The Descriptor Table shall be DW-aligned. Hence bit[1:0] shall always be 0.

52.15.6 IDE Primary Bus Master Descriptor Table Pointer Register Byte 1 (IDEPBMDTPR1)—Offset 5h

This register implements the Byte 1 of the standard IDE Primary Bus Master Descriptor Table Pointer register in the IDE Bus Master Block. The descriptor table pointer is used for bus master operation in the primary channel.

Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [IDE_HOST_BMIOBAR] + 5h

IDE_HOST_BMIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_BMIOBAR Reference: [B:0, D:24, F:2] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Descriptor Table Pointer Byte 1 (DTPB1):** Byte 1 of the Descriptor Table pointer.

52.15.7 IDE Primary Bus Master Descriptor Table Pointer Register Byte 2 (IDEPBMDTPR2)—Offset 6h

This register implements the Byte 2 of the standard IDE Primary Bus Master Descriptor Table Pointer register in the IDE Bus Master Block. The descriptor table pointer is used for bus master operation in the primary channel.

Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [IDE_HOST_BMIOBAR] + 6h

Default: 00h

IDE_HOST_BMIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_BMIOBAR Reference: [B:0, D:24, F:2] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Descriptor Table Pointer Byte 2 (DTPB2):** Byte 2 of the Descriptor Table pointer.

52.15.8 IDE Primary Bus Master Descriptor Table Pointer Register Byte 3 (IDEPBMDTPR3)—Offset 7h

This register implements the Byte 3 of the standard IDE Primary Bus Master Descriptor Table Pointer register in the IDE Bus Master Block. The descriptor table pointer is used for bus master operation in the primary channel.

Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [IDE_HOST_BMIOBAR] + 7h

Default: 00h

IDE_HOST_BMIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_BMIOBAR Reference: [B:0, D:24, F:2] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Descriptor Table Pointer Byte 3 (DTPB3):** Byte 3 of the Descriptor Table pointer.

52.15.9 IDE Secondary Bus Master Command Register (IDESBMCR)—Offset 8h

This register implements the standard IDE Secondary Bus Master Command register in the IDE Bus Master Block. Usage notes: The Secondary IDE Channel is permanently disabled. Access attributes are maintained to satisfy test requirement. No bus master functionality is implemented behind the register.

Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [IDE_HOST_BMIOBAR] + 8h

IDE_HOST_BMIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_BMIOBAR Reference: [B:0, D:24, F:2] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7:4	0x0 RO	**Reserved (RSVD1):** Not implemented. Hardwired to 0.
3	0x0 RW	**Read or Write Control (RWC):** This bit sets the direction of the bus master transfer. • 0: reads are performed from Host system memory. • 1: writes are performed to Host system memory. This bit shall NOT be changed when the bus master function is active.
2:1	0x0 RO	**Reserved (RSVD0):** Not implemented. Hardwired to 0.
0	0x0 RW	**Start/Stop Bus Master (SSBM):** Host starts a bus master operation in the device by setting this bit to 1. The device shall only transfer data between the ATA device and Host memory in the bus master operation. Host stops the bus master operation by clearing this bit to 0. All state information will be lost when 0 is written. Host CANNOT stop and then resume the bus master operation.

52.15.10 IDE Secondary Bus Master Device Specific 0 Register (IDESBMDS0R)—Offset 9h

This register implements the standard IDE Secondary Bus Master Device Specific 0 register in the IDE Bus Master Block. This register is programmed by the Host for any device specific data. Usage notes: The Secondary IDE Channel is permanently disabled. Access attributes are maintained to satisfy test requirement. No bus master functionality is implemented behind the register.

Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [IDE_HOST_BMIOBAR] + 9h

IDE_HOST_BMIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_BMIOBAR Reference: [B:0, D:24, F:2] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Device Specific Data0 (DSD0):** Device Specific

52.15.11 IDE Secondary Bus Master Status Register (IDESBMSR)—Offset Ah

This register implements the standard IDE Secondary Bus Master Status register in the IDE Bus Master Block. Usage notes: The Secondary IDE Channel is permanently disabled. Access attributes are maintained to satisfy test requirement. No bus master functionality is implemented behind the register.

Reset condition: Host reset with the SO bit as an exception. Non-sticky.

Type: I/O Register (Size: 8 bits)

BAR and Offset: [IDE_HOST_BMIOBAR] + Ah

Default: 80h

IDE_HOST_BMIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_BMIOBAR Reference: [B:0, D:24, F:2] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7	0x1 RO/V	**Simplex Only (SO):** Value indicates whether both Bus Master Channels can be operated at the same time or not. • 0: Both can be operated independently • 1: Only one can be operated at a time. This bit shadows IDEPBMSR[SO]. Reset condition: CSxE reset. Non-sticky.
6	0x0 RW	**Device 1 DMA Capable (D1DC):** This read/write bit is set by device dependent code (BIOS or host software) to indicate that Device 1 for this channel is capable of DMA transfers, and that the device has been initialized for optimum performance.
5	0x0 RW	**Device 0 DMA Capable (D0DC):** This read/write bit is set by device dependent code (BIOS or host software) to indicate that Device 0 for this channel is capable of DMA transfers, and that the device has been initialized for optimum performance.
4:3	0x0 RO	**Reserved (RSVD):** Not implemented. Hardwired to 0.
2	0x0 RO	**Interrupt (INT):** No functionality implemented. Hardwired to 0.
1	0x0 RO	**Error (ER):** Not implemented. Hardwired to 0.
0	0x0 RO	**Bus Master IDE Active (BMIA):** Not implemented. Hardwired to 0.

52.15.12 IDE Secondary Bus Master Device Specific 1 Register (IDESBMDS1R)—Offset Bh

This register implements the standard IDE Secondary Bus Master Device Specific 1 register in the IDE Bus Master Block. This register is programmed by the Host for any device specific data. Usage notes: The Secondary IDE Channel is permanently disabled. Access attributes are maintained to satisfy test requirement. No bus master functionality is implemented behind the register.

Reset condition: Host reset. Non-sticky.

Type: I/O Register (Size: 8 bits)

BAR and Offset: [IDE_HOST_BMIOBAR] + Bh

Default: 00h

IDE_HOST_BMIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_BMIOBAR Reference: [B:0, D:24, F:2] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Device Specific Data1 (DSD1):** Device Specific Data

52.15.13 IDE Secondary Bus Master Descriptor Table Pointer Register Byte 0 (IDESBMDTPR0)—Offset Ch

This register implements the Byte 0 of the standard IDE Secondary Bus Master Descriptor Table Pointer register in the IDE Bus Master Block. The descriptor table pointer is used for bus master operation in the secondary channel. Usage notes: The Secondary IDE Channel is permanently disabled. Access attributes are maintained to satisfy test requirement. No bus master functionality is implemented behind the register.

Reset condition: Host reset. Non-sticky.

Type: I/O Register (Size: 8 bits)

BAR and Offset: [IDE_HOST_BMIOBAR] + Ch

Default: 00h

IDE_HOST_BMIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_BMIOBAR Reference: [B:0, D:24, F:2] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Descriptor Table Pointer Byte 0 (DTPB0):** Byte 0 of the Descriptor Table pointer. The Descriptor Table shall be DW-aligned. Hence bit[1:0] shall always be 0.

52.15.14 IDE Secondary Bus Master Descriptor Table Pointer Register Byte 1 (IDESBMDTPR1)—Offset Dh

This register implements the Byte 1 of the standard IDE Secondary Bus Master Descriptor Table Pointer register in the IDE Bus Master Block. The descriptor table pointer is used for bus master operation in the secondary channel. Usage notes: The Secondary IDE Channel is permanently disabled. Access attributes are maintained to satisfy test requirement. No bus master functionality is implemented behind the register.

Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [IDE_HOST_BMIOBAR] + Dh

Default: 00h

IDE_HOST_BMIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_BMIOBAR Reference: [B:0, D:24, F:2] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Descriptor Table Pointer Byte 1 (DTPB1):** Byte 1 of the Descriptor Table pointer.

52.15.15 IDE Secondary Bus Master Descriptor Table Pointer Register Byte 2 (IDESBMDTPR2)—Offset Eh

This register implements the Byte 2 of the standard IDE Secondary Bus Master Descriptor Table Pointer register in the IDE Bus Master Block. The descriptor table pointer is used for bus master operation in the secondary channel. Usage notes: The Secondary IDE Channel is permanently disabled. Access attributes are maintained to satisfy test requirement. No bus master functionality is implemented behind the register.

Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [IDE_HOST_BMIOBAR] + Eh

Default: 00h

IDE_HOST_BMIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_BMIOBAR Reference: [B:0, D:24, F:2] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Descriptor Table Pointer Byte 2 (DTPB2):** Byte 2 of the Descriptor Table pointer.

52.15.16 IDE Secondary Bus Master Descriptor Table Pointer Register Byte 3 (IDESBMDTPR3)—Offset Fh

This register implements the Byte 3 of the standard IDE Secondary Bus Master Descriptor Table Pointer register in the IDE Bus Master Block. The descriptor table pointer is used for bus master operation in the secondary channel. Usage notes: The Secondary IDE Channel is permanently disabled. Access attributes are maintained to satisfy test requirement. No bus master functionality is implemented behind the register.

Reset condition: Host reset. Non-sticky.

Type: I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [IDE_HOST_BMIOBAR] + Fh

IDE_HOST_BMIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_BMIOBAR Reference: [B:0, D:24, F:2] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Descriptor Table Pointer Byte 3 (DTPB3):** Byte 3 of the Descriptor Table pointer.

52.16 Sideband Registers—KT (Host)

The Sideband registers accessible to the Host are described here. They are accessible in Host Memory Space starting at the Sideband Base Address Register (SBREG_BAR). See Section 3.4.1, "Using SBREG_BAR Method" on page 187.

52.16.1 KT Host Interrupt Pin Register (KTHIPINR)—Offset 0h

This register provides for BIOS to specify which interrupt pin KT shall use in the Host root space when generating an interrupt in the PCI legacy mode.

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xe4] + 0h
Host Memory Space: SBREG_BAR + 0xe40000 + 0h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**Reserved (RSVD):** Not implemented. Hardwired to 0.
7:0	0x0 RW/O	**Interrupt Pin (IPIN):** BIOS writes to this field once to specify which interrupt pin KT shall use. After written once, this register will become read-only. This field shall be shadowed into the Interrupt Pin register in the PCI header of the KT Host PCI function. Value Decoding • 00h The function does NOT use an interrupt pin. • 01h INTA • 02h INTB • 03h INTC • 04h INTD • 05h - FFh Reserved Reset condition: Host side reset. Non-sticky.

52.16.2 BIOS KT Host PCI Function Disable Register (BKTHDISR)—Offset 4h

This register provides for BIOS to enable or disable the KT Host PCI function.

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xe4] + 4h
Host Memory Space: SBREG_BAR + 0xe40000 + 4h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0x0 RO	**Reserved (RSVD):** Not implemented. Hardwired to 0.
0	0x0 RW	**Host PCI Function Disable (HDIS):** BIOS sets this bit to disable the KT Host PCI function. BIOS clears this bit to enable the KT Host PCI function. Reset condition: Host side reset. Non-sticky.

52.17 Sideband Registers—IDE (Host)

The Sideband registers accessible to the Host are described here. They are accessible in Host Memory Space starting at the Sideband Base Address Register (SBREG_BAR). See Section 3.4.1, "Using SBREG_BAR Method" on page 187.

52.17.1 IDE Host Interrupt Pin Register (IDEHIPINR)—Offset 0h

This register provides for BIOS to specify which interrupt pin IDE shall use in the Host root space when generating an interrupt in the PCI legacy mode.

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xe4] + 0h
Host Memory Space: SBREG_BAR + 0xe40000 + 0h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**Reserved (RSVD):** Not implemented. Hardwired to 0.
7:0	0x0 RW/O	**Interrupt Pin (IPIN):** BIOS writes to this field once to specify which interrupt pin IDE shall use. After written once, this register will become read-only. This field shall be shadowed into the Interrupt Pin register in the PCI header of the IDE Host PCI function. Value Decoding 00h The function does NOT use an interrupt pin. 01h INTA 02h INTB 03h INTC 04h INTD 05h - FFh Reserved Reset condition: Host side reset. Non-sticky.

52.17.2 BIOS IDE Host PCI Function Disable Register (BIDEHDISR)—Offset 4h

This register provides for BIOS to enable or disable the IDE Host PCI function.

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xe4] + 4h
Host Memory Space: SBREG_BAR + 0xe40000 + 4h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0x0 RO	**Reserved (RSVD):** Not implemented. Hardwired to 0.
0	0x0 RW	**Host PCI Function Disable (HDIS):** BIOS sets this bit to disable the IDE Host PCI function. BIOS clears this bit to enable the IDE Host PCI function. Reset condition: Host side reset. Non-sticky.

§ §

53 HSUART Controller - B0, D26, F(0, 1, 2)

53.1 Introduction and Index

The host-accessible registers for the HSUART Controller are described here.

To determine the number of devices/functions available refer to the following:

- Table 1-1, “Features by product SKU - Server and Cloud Storage SKUs 0 through 4”
- Table 1-2, “Features by Product SKU - Network and Enterprise Storage SKUs 5 through 10”
- Table 1-3, “Features by Product SKU - Extended Temperature SKUs 11 through 14”.

The legend for the register access codes are described in Chapter 43, “Introduction.”

53.1.1 Host Configuration Space

These registers are discovered in Host Configuration Space starting at Bus 0, Device 26 (decimal), Function (0, 1, 2). The offset addresses are listed.

Table 53-1. Summary of PCI Configuration Registers—0/26/0,1,2

Offset (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
0	4	19D88086	"VENDOR_DEVICE_ID—Offset 0h" on page 2387
4	4	00100000	"CMD_STAT_REG—Offset 4h" on page 2388
8	4	07000200	"REV_CLASS_CODE—Offset 8h" on page 2390
C	4	00800000	"CACHE—Offset Ch" on page 2390
10	4	00000001	"IOBA—Offset 10h" on page 2391
14	4	00000000	"MEMBA—Offset 14h" on page 2391
2C	4	00008086	"SUBSYSTEM_VENDOR_ID—Offset 2Ch" on page 2392
34	4	00000040	"CAP_PTR—Offset 34h" on page 2392
3C	4	000001FF	"INTERRUPT—Offset 3Ch" on page 2392
40	4	00005005	"MSIC—Offset 40h" on page 2393
44	4	00000000	"MSIA—Offset 44h" on page 2394
48	4	00000000	"MSID—Offset 48h" on page 2394
50	4	00030001	"PMC—Offset 50h" on page 2395
54	4	00000008	"PMCSR—Offset 54h" on page 2396
60	4	00000000h	"DSC—Offset 60h" on page 2397
74	4	00000000h	"FUNC_RDCFG_HIDE—Offset 74h" on page 2398

53.1.2 Host Memory Space—MEMBA

An index of the registers that are accessible in Host Memory Space is shown here. There is a set of these registers for each of the three HSUART Functions (F0, F1, and F2).

Table 53-2. Summary of Memory Mapped I/O Registers—MEMBA

Offset (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
0	1	00	"RBR_THR_DLL—Offset 0h" on page 2399
1	1	00	"IER_DLH—Offset 1h" on page 2399
2	1	00	"IIR_FCR—Offset 2h" on page 2400
3	1	00	"LCR—Offset 3h" on page 2400
4	1	00	"MCR—Offset 4h" on page 2402
5	1	60	"LSR—Offset 5h" on page 2404
6	1	00	"MSR—Offset 6h" on page 2406
7	1	00	"SPR—Offset 7h" on page 2408
8	4	00000000	"UART_FISR—Offset 8h" on page 2408
20	4	00000000	"RFOR—Offset 20h" on page 2408
24	4	00000010	"ABR—Offset 24h" on page 2409
28	4	00000000	"ACR—Offset 28h" on page 2410
30	4	00000010	"PSR—Offset 30h" on page 2410
34	4	000000D8	"UCMR—Offset 34h" on page 2410
38	4	00003D09	"UCDR—Offset 38h" on page 2411
80	4	000F0000	"CH0SR—Offset 80h" on page 2412
84	4	00000000	"CH0CR—Offset 84h" on page 2412
88	4	00008000	"CH0DCR—Offset 88h" on page 2414
90	4	00000000	"CH0BSR—Offset 90h" on page 2415
94	4	00000000	"CH0MTSR—Offset 94h" on page 2415
A0	4	00000000	"CH0D0SAR—Offset A0h" on page 2415
A4	4	00000000	"CH0D0TSR—Offset A4h" on page 2416
A8	4	00000000	"CH0D1SAR—Offset A8h" on page 2416
AC	4	00000000	"CH0D1TSR—Offset ACh" on page 2416
B0	4	00000000	"CH0D2SAR—Offset B0h" on page 2417
B4	4	00000000	"CH0D2TSR—Offset B4h" on page 2417
B8	4	00000000	"CH0D3SAR—Offset B8h" on page 2418
BC	4	00000000	"CH0D3TSR—Offset BCh" on page 2418
C0	4	000F0000	"CH1SR—Offset C0h" on page 2419
C4	4	00000000	"CH1CR—Offset C4h" on page 2420
C8	4	00008000	"CH1DCR—Offset C8h" on page 2421
D0	4	00000000	"CH1BSR—Offset D0h" on page 2422
D4	4	00000000	"CH1MTSR—Offset D4h" on page 2422
E0	4	00000000	"CH1D0SAR—Offset E0h" on page 2422
E4	4	00000000	"CH1D0TSR—Offset E4h" on page 2423

Table 53-2. Summary of Memory Mapped I/O Registers—MEMBA (Continued)

Offset (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
E8	4	00000000	"CH1D1SAR—Offset E8h" on page 2423
EC	4	00000000	"CH1D1TSR—Offset ECh" on page 2423
F0	4	00000000	"CH1D2SAR—Offset F0h" on page 2424
F4	4	00000000	"CH1D2TSR—Offset F4h" on page 2424
F8	4	00000000	"CH1D3SAR—Offset F8h" on page 2425
FC	4	00000000	"CH1D3TSR—Offset FCh" on page 2425

53.1.3 Host I/O Space—IOBA

An index of the registers that are accessible in Host I/O Space is shown here. There is a set of these registers for each of the three HSUART Functions (F0, F1, and F2).

Table 53-3. Summary of I/O Registers—IOBA

Offset (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
0	1	00	"RBR_THR_DLL—Offset 0h" on page 2426
1	1	00	"IER_DLH—Offset 1h" on page 2426
2	1	00	"IIR_FCR—Offset 2h" on page 2427
3	1	00	"LCR—Offset 3h" on page 2428
4	1	00	"MCR—Offset 4h" on page 2430
5	1	00	"LSR—Offset 5h" on page 2432
6	1	00	"MSR—Offset 6h" on page 2434
7	1	00	"SPR—Offset 7h" on page 2436

53.2 Registers in Configuration Space

53.2.1 VENDOR_DEVICE_ID—Offset 0h

Note: The default value of DEVICE_ID can be overwritten using the setidval sideband message.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:26, F:0] + 0h

Default: 19D88086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x19d8 RO/V	**DEVICE_ID:** Device ID
15:0	0x8086 RO	**VENDOR_ID:** Identifies uniquely Intel products.

53.2.2 CMD_STAT_REG—Offset 4h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:26, F:0] + 4h

Default: 00100000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/1C	**STATUS_DETECTED_PARITY_ERROR:** Detected Parity Error. This bit is set when the device receives an uncorrectable data error or parity error regardless of the Parity Error Response bit (CMD_STAT_REG.COMMAND_PARITY_ERROR_RESPONSE_ENABLE).
30	0x0 RW/1C	**STATUS_SIGNALED_SYSTEM_ERROR:** Signaled System Error. Never expected to be asserted. This bit is set when the device has detected an uncorrectable error and reported it via SERR message over sideband. This requires SERR Enable bit to be set in Command register.
29	0x0 RW/1C	**STATUS_RECEIVED_MASTER_ABORT:** Received Master Abort. This bit is set when device receives a Completion transaction with Unsupported Request completion status. No error will be reported.
28	0x0 RW/1C	**STATUS_RECEIVED_TARGET_ABORT:** Received Target Abort. This bit is set when device receives a Completion transaction with Completer Abort completion status. No error will be reported.
27	0x0 RW/1C	**STATUS_SIGNALED_TARGET_ABORT:** Signaled Target Abort. Set by the device when aborting a request that violates the device programming model. When SERR Enable is set SERR message will be send over sideband.
26:25	0x0 RSV	**STATUS_RESERVED_25:** Reserved.
24	0x0 RW/1C	**STATUS_MASTER_DATA_PARITY_ERROR:** Master Data Parity Error. This bit is set if the Parity Error Response bit (CMD_STAT_REG.COMMAND_PARITY_ERROR_RESPONSE_ENABLE) is set and it receives a completion with poisoned data from IOSF.
23:21	0x0 RSV	**STATUS_RESERVED_21:** Reserved.
20	0x1 RO	**STATUS_NEW_CAP:** New Capabilities. Indicates that a device implements extended capabilities. The Controller sets this bit, and implements a capabilities list.
19	0x0 RO/V	**STATUS_INTERRUPT_STATUS:** Interrupt Status. The Interrupt Status field is a RO field that indicates that an interrupt message is pending internally to the device.
18:16	0x0 RSV	**STATUS_RESERVED_16:** Reserved.
15:11	0x0 RSV	**COMMAND_RESERVED_11:** Reserved.
10	0x0 RW	**COMMAND_INTERRUPT_DISABLE:** Interrupt Disable. Controls the ability of a device to generate a legacy interrupt message. When set, the device cannot generate legacy interrupt messages.

Bit Range	Default & Access	Field Name (ID): Description
9	0x0 RSV	**COMMAND_RESERVED_9:** Reserved.
8	0x0 RW	**COMMAND_SERR_ENABLE:** SERR# Enable
7	0x0 RSV	**COMMAND_RESERVED_7:** Reserved.
6	0x0 RW	**COMMAND_PARITY_ERROR_RESPONSE_ENABLE:** Parity Error Response. This bit controls the setting of STATUS_MASTER_DATA_PARITY_ERROR. 0 = Parity errors can be ignored by the device. 1 = Device can report parity errors.
5:3	0x0 RSV	**COMMAND_RESERVED_3:** Reserved.
2	0x0 RW	**COMMAND_BUS_ACCESS_ENABLE:** Must be set to 1 for the device to initiate memory read and write requests as a master. This bit does not affect a device's ability to generate MSI message, Error Message, or completion cycles as a target.
1	0x0 RW	**COMMAND_MEM_ACCESS_ENABLE:** Memory Access Enable
0	0x0 RW	**COMMAND_IO_ACCESS_ENABLE:** When set, IO Space Decoding is enabled and IO transactions targeting the device are accepted.

53.2.3 REV_CLASS_CODE—Offset 8h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:26, F:0] + 8h

Default: 07000200h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0x70002 RO	**CLASS_CODE:** The class code is a RO hard-coded value that identifies its functionality. ***Note:*** This field (Programming Interface, Sub Class Code, Base Class Code) is RO from Primary and RW from Sideband.
7:0	0x0 RO/V	**REVISION_ID:** The default revision ID is 0x0.

53.2.4 CACHE—Offset Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:26, F:0] + Ch

Default: 00800000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RSV	**BIST:** Reserved.
23:16	0x80 RO	**HEADER_TYPE:** This indicates if a device is single-function or multifunction. If a single function is the only active one then this field has a value of 0x00 to indicate a single-function device. If other functions are enabled then this field has a value of 0x80 to indicate a multi-function device.
15:8	0x0 RSV	**RESERVED_1:** Reserved.
7:0	0x0 RSV	**RESERVED_0:** Reserved.

53.2.5 IOBA—Offset 10h

The Base Address registers (BARs) are used to map register space of the various functions. It has a memory BAR, IO BAR.

The internal registers memories are accessed as direct memory mapped offsets from the Base Address register. Software can access a Dword or 64 bits.

Note: If this is a Dummy function the register is RO as 0.

Type: PCI Configuration Register (Size: 32 bits) **Offset:** [B:0, D:26, F:0] + 10h

Default: 00000001h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0x0 RW	**BASE_ADDR:** Reserved.
2:1	0x0 RO	**MEMORY_TYPE:** Hardwired to 0 for 8 byte access.
0	0x1 RO	**MEMORY_IO_SPACE:** Reserved.

53.2.6 MEMBA—Offset 14h

The Base Address registers (BARs) are used to map register space of the various functions.

The internal registers memories are accessed as direct memory mapped offsets from the Base Address register. Software can access a Dword or 64 bits.

Type: PCI Configuration Register (Size: 32 bits) **Offset:** [B:0, D:26, F:0] + 14h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RW	**BASE_ADDR:** Reserved.
7:4	0x0 RO	**MEM_SIZE:** Set to 0 to indicate 256 byte memory Space.
3	0x0 RO	**PREFETCHABLE:** Set to 0 to indicate MEMBA is not prefetchable.
2:1	0x0 RO	**MEMORY_TYPE:** Set to 0 to indicate the BAR is located in lower 4G space.
0	0x0 RO	**MEMORY_IO_SPACE:** Reserved.

53.2.7 SUBSYSTEM_VENDOR_ID—Offset 2Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:26, F:0] + 2Ch

Default: 00008086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW/O/P	**SUBSYSTEM_ID:** ***Note:*** This field is RO from Sideband and RW/O from Primary.
15:0	0x8086 RW/O/P	**SUBSYSTEM_VENDOR_ID:** ***Note:*** This field is RO from Sideband and RW/O from Primary.

53.2.8 CAP_PTR—Offset 34h

The Capabilities Pointer field is an 8 bit field that provides an offset in the device's PCI configuration space for the location of the first item in the Capabilities Linked List (CLL).

Controller sets this bit and implements a capabilities list to indicate that it supports PCI power management, Message Signaled Interrupts (MSIs), and PCIe extended capabilities. Its value is 0x40, which is the address of the first entry: MSI cap.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:26, F:0] + 34h

Default: 00000040h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RSV	**RESERVED:** Reserved.
7:0	0x40 RO	**CAP_PTR:**

53.2.9 INTERRUPT—Offset 3Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:26, F:0] + 3Ch

Default: 000001FFh

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RSV	**RESERVED:** Reserved.
15:8	0x1 RW/P/L	**INTERRUPT_PIN:** A value of 0x1, 0x2, 0x3, or 0x4 indicates that this function implements legacy interrupt on INTA#, INTB#, INTC#, or INTD#, respectively. This bit is locked by PLKCTL.CL.
7:0	0xff RW	**INTERRUPT_LINE:** Read/write register programmed by software to indicate which of the system interrupt request lines this controller's interrupt pin is bound to. See the PCIe definition for more details. Each of the PCIe functions has its own register. ***Note:*** For Dummy functions this register is RO as zero.

53.2.10 MSIC—Offset 40h

MSI Capability Register.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:26, F:0] + 40h

Default: 00005005h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RSV	**RESERVED:** Reserved.
23	0x0 RO	**AD64C:** 64-bit capable. A value of 1 indicates it is capable of generating 64-bit message addresses.
22:20	0x0 RW	**MMEN:** Multiple Message Enable. Indicates it supports a single message per function.
19:17	0x0 RO	**MMC:** Multiple Message Capable. Indicates a single requested message per each function.
16	0x0 RW	**MSI_EN:** If set to 1, equals MSI. In this case, controller generates an MSI for interrupt assertion instead of INTx signaling.
15:8	0x50 RO	**NEXT_POINTER:** Next cap Pointer. This field provides an offset to the next capability item in the capability list. Its value of 0x50 points to the PM capability structure.
7:0	0x5 RO	**CAP_ID:** This field equals 0x05 indicating the linked list item as being the MSI registers.

53.2.11 MSIA—Offset 44h

Written by the system to indicate 32 bits of the address to use for the MSI memory write transaction.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:26, F:0] + 44h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**MSIAddr:** Reserved.
1:0	0x0 RO	**MSI_DW:** Value of 0 indicates memory address is always DW aligned.

53.2.12 MSID—Offset 48h

Written by the system to indicate the lower 16 bits of the data written in the MSI memory write Dword transaction. The upper 16 bits of the transaction are written as 0b.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:26, F:0] + 48h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RSV	**RESERVED:** Reserved.
15:0	0x0 RW	**MSID:**

53.2.13 PMC—Offset 50h

All fields are reset on full power-up. All of the fields except PME_En and PME_Status are reset on exit from D3cold state. If aux power is not supplied, the PME_En and PME_Status fields also reset on exit from D3cold state.

Note: See the detailed description for registers loaded from the EEPROM at initialization time. Behavior of some fields depend on the Power Management bit in EEPROM word 0x0A.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:26, F:0] + 50h

Default: 00030001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0x0 RO	**PME_SUPPORT:** This 5-bit field indicates the power states in which the function may assert PME#. A value of 0b for any bit indicates that the function is not capable of asserting the PME# signal while in that power state.
26	0x0 RO	**D2_SUPPORT:** Does not support D2 state.
25	0x0 RO	**D1_SUPPORT:** Does not support D1 state.
24:22	0x0 RO	**AUX_CURRENT:** Required current defined in the Data Register.
21	0x0 RO	**DSI:** Controller requires its device driver to be executed following transition to the D0 uninitialized state.
20	0x0 RSV	**RESERVED:** Reserved.
19	0x0 RO	**PME_CLOCK:** Disabled; Hardwired to 0.
18:16	0x3 RO	**VERSION:** Complies with the PCI PM specification, revision 1.2
15:8	0x0 RO	**NEXT_POINTER:** This field provides an offset to the next capability item in the capability list. Value of 0xA0 points to the PCI Express capability.
7:0	0x1 RO	**CAP_ID:** This fields equals 0x01 indicating the linked list item as being the PCI Power Management registers.

53.2.14 PMCSR—Offset 54h

All fields are reset on full power-up. All of the fields except PME_En and PME_Status are reset on exit from D3cold state. If aux power is not supplied, the PME_En and PME_Status fields also reset on exit from D3cold state. Each device function has its own PMCSR register.

Note: See the detailed description for registers loaded from the EEPROM at initialization time. Behavior of some fields depend on the Power Management bit in EEPROM word 0x0A.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:26, F:0] + 54h

Default: 00000008h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**DATA:** No Data.
23:16	0x0 RSV	**RESERVED16:** Reserved.
15	0x0 RO	**PME_STATUS:**
14:9	0x0 RSV	**RESERVED:** Reserved.
8	0x0 RO	**PME_EN:** Hardwired to 0, indicate not support PME.
7:4	0x0 RSV	**RESERVED4:** Reserved.
3	0x1 RO	**NO_SOFT_RESET:** • When set (1) this bit indicates that when controller transitions from D3hot to D0 because of modifying Power State bits in the PMCSR register, no internal reset is issued and Configuration Context is preserved. Upon transition from the D3hot to the D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the Power State bits. • When clear (0) controller performs an internal reset upon transitioning from D3hot to D0 via software control of the Power State bits in the PMCSR register. Configuration Context is lost when performing the soft reset. Upon transition from the D3hot to the D0 state, full re-initialization sequence is needed to return the device to D0 Initialized. Regardless of this bit, devices that transition from D3hot to D0 by a system or bus segment reset will return to the device state D0 Uninitialized with only PME context preserved if PME is supported and enabled.
2	0x0 RSV	**RESERVED2:** Reserved.
1:0	0x0 RW/V	**POWER_STATE:** This field is used to set and report the power state of a function as follows: • 00b = D0 • 01b = D1 (cycle ignored if written with this value) • 10b = D2 (cycle ignored if written with this value) • 11b = D3 hot

53.2.15 DSC—Offset 60h

Device Specific control and Status Register.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:26, F:0] + 60h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RSV	**RESERVED_3:** Reserved.
19	0x0 RW/1C	**URD:** Unsupported Request Detect: When set, this bit is set when unsupported request is detected.
18:16	0x0 RSV	**RESERVED_2:** Reserved.
15:4	0x0 RSV	**RESERVED_1:** Reserved.
3	0x0 RW	**URRE:** Unsupported Request Reporting Enable: When set, this bit enables the reporting of Non-fatal error.
2:0	0x0 RSV	**RESERVED_0:** Reserved.

53.2.16 FUNC_RDCFG_HIDE—Offset 74h

Function-Hide Register. Hiding is programmable per-function. Since hiding affects reads to FUNC_RDCFG_HIDE itself, this register is not shared in order to avoid read-modify-write errors.

Note: If function 0 is hidden, O/S will not discover function 1 and function 2.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:26, F:0] + 74h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0x0 RSV	**RESERVED_0:** Reserved.
0	0x0 RW	**HIDE:** HIDE: • 0 - HSUART Not Hidden • 1 - HSUART Hidden

53.3 Registers in Memory Space—MEMBA

These registers are accessed in Host Memory Space starting at the relocatable memory address defined by the Base Address Register (BAR) MEMBA. There is a set of these registers for each of the three HSUART Functions (F0, F1, and F2).

53.3.1 RBR_THR_DLL—Offset 0h

RBR = Receive buffer register THR = Transmit hold register DLL = Divisor Latch low.

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [MEMBA] + 0h

MEMBA Type: PCI Configuration Register (Size: 32 bits)
MEMBA Reference: [B:0, D:26, F:0,1,2] + 14h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW/V	**RBR_THR_DLL:** When DLAB =0, this 8 bit is used as Received Buffer Register as Read, and is used as Transmit Holding Register as Write. When DLAB is 1, this register is used as DLL (Divisor Latch Low Byte Register).

53.3.2 IER_DLH—Offset 1h

IER = Interrupt Enable Register DLH = Divisor Latch High.

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [MEMBA] + 1h

MEMBA Type: PCI Configuration Register (Size: 32 bits)
MEMBA Reference: [B:0, D:26, F:0,1,2] + 14h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW/V	**IER_DLH:** When DLAB =0, this 8 bit is used as Interrupt Enable Register. When DLAB =1, this 8 bit is used as DLH (Divisor Latch High Byte Register).

53.3.3 IIR_FCR—Offset 2h

IIR = Interrupt Identification Register FCR = FIFO control register.

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [MEMBA] + 2h

MEMBA Type: PCI Configuration Register (Size: 32 bits)
MEMBA Reference: [B:0, D:26, F:0,1,2] + 14h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW/V	**IIR_FCR:** When this 8 bit is read, it is serving as Interrupt Identification Registers. When this 8 bit is written, it is serving as FCR (FIFO control register.).

53.3.4 LCR—Offset 3h

Line Control Register.

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [MEMBA] + 3h

MEMBA Type: PCI Configuration Register (Size: 32 bits)
MEMBA Reference: [B:0, D:26, F:0,1,2] + 14h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RW	**LCR_DLAB:** Divisor Latch Register Access Bit: The divisor-latch access bit must be set high (logic 1) to access the divisor latches of the baud rate generator during a read or write operation. It must be set low (logic 0) to access the receiver buffer, the Transmit Holding register, or the Interrupt Enable register. This bit does not need to be set when using auto-baud. • 0: Access Transmit Holding register (THR), Receive Buffer register (RBR) and Interrupt Enable register. • 1: Access Divisor Latch registers (DLL and DLH).
6	0x0 RW	**LCR_SB:** Set Break: The set-break control bit transmits a Break condition to the receiving UART. When SB is set to logic 1, the serial output (TXD) is forced to the Spacing (logic 0) state and remains there until SB is set to logic 0. This bit acts only on the TXD pin and has no effect on the transmitter logic. • 0: No effect on TXD output. • 1: Forces TXD output to 0 (space). This feature enables the processor to alert a terminal in a computer communications system. If the following sequence is executed, no erroneous characters will be transmitted because of the break: Load 0x00 in the Transmit Holding register in response to a TDRQ Interrupt. After TDRQ goes high (indicating that 0x00 is being shifted out), set the break bit before the parity or stop bits reach the TXD pin. Wait for the transmitter to be idle (TEMT = 1), and clear the break bit when normal transmission has to be restored. During the Break, the transmitter can be used as a character timer to accurately establish the Break duration. In FIFO mode, wait for the transmitter to be idle (TEMT=1) to set and clear the break bit.

Bit Range	Default & Access	Field Name (ID): Description
5	0x0 RW	**LCR_STKYP:** Sticky Parity: This bit is the sticky-parity bit, which can be used in multiprocessor communications. • 0: No effect on parity bit. • 1: Forces parity bit to be opposite of EPS bit value. When PEN and STKYP are logic 1, the bit that is transmitted in the parity-bit location (the bit just before the stop bit) is the complement of the EPS bit. If EPS is 0, then the bit at the parity-bit location will be transmitted as a 1. In the receiver, if STKYP and PEN are 1, then the receiver compares the bit that is received in the parity-bit location with the complement of the EPS bit. If the values being compared are not equal, the receiver sets the parity-error bit in LSR, and causes an Error Interrupt if Line-Status Interrupts were enabled. For example, if EPS is 0, the receiver expects the bit received at the parity-bit location to be 1. If it is not, then the parity-error bit is set. By forcing the bit value at the parity-bit location, rather than calculating a parity value, a system with a master transmitter and multiple receivers can identify some transmitted characters as receiver addresses and the rest of the characters as data. If PEN = 0, STKYP is ignored.
4	0x0 RW	**LCR_EPS:** Even Parity Select: EPS is only valid when the parity is enabled (PEN = 1). • 0: Sends and checks for odd parity. • 1: Sends and checks for even parity.
3	0x0 RW	**LCR_PEN:** Parity Enable (PEN): When PEN is logic 1, a parity bit is generated (transmit data) or checked (receive data) between the last data-word bit and stop bit of the serial data. • 0: No parity function. • 1: Allows parity generation and checking.
2	0x0 RW	**LCR_STB:** Stop Bits: This bit specifies the number of stop bits transmitted and received in each serial character. • 0: 1 stop bit. • 1: 2 stop bits; except for 5-bit character, then 1 bits The receiver checks the first stop bit only, regardless of the number of stop bits selected.
1:0	0x0 RW	**LCR_WLS:** Word Length Select: The word length select bits specify the number of data bits (five to eight bits are allowed) in each transmitted or received serial character. • 00: 5-bit character (default). • 01: 6-bit character 10: 7-bit character 11: 8-bit character.

53.3.5 MCR—Offset 4h

Modem Control Register.

Type: Memory Mapped I/O Register (Size: 8 bits)

BAR and Offset: [MEMBA] + 4h

Default: 00h

MEMBA Type: PCI Configuration Register (Size: 32 bits)
MEMBA Reference: [B:0, D:26, F:0,1,2] + 14h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0x0 RSV	**MCR_RESERVED:** Reserved.
5	0x0 RW	**MCR_AFE:** MCR-Auto Flow Enable: This is a reserved bit in 16550 spec. • 0: Auto-RTS and Auto-CTS are disabled. • 1: Auto-CTS is enabled. If MCR[RTS] is also set, both Auto-CTS and Auto-RTS is enabled. Auto-RTS is not enabled if AFE is not set regardless of the state of MCR[RTS]. Autoflow automates the flow of data between the UART and the remote device.
4	0x0 RW	**MCR_LOOP:** Modem Control Register-Loop back test mode. This bit provides a local loopback feature for diagnostic testing of the UART. This feature allows the processor to verify the UART transmit and receive data paths. The Transmit, Receive, and Modem Control interrupts are operational in this mode. • 0: Normal UART operation. • 1: Loopback Test mode operation Serial output uart_txd pin is set to logic 1. Serial input uart_rxd pin is disconnected from external input line. The output of the Transmitter Shift register is looped back into the Receiver Shift register. The modem-control inputs (uart_cts, uart_dsr, uart_dcd, and uart_ri) are activated by MCR bits 0-3 instead of the modem-control inputs. A Break signal can also be transferred from the transmitter section to the receiver section in Loopback mode. When LOOP is set to logic 1, the following will occur: The TXD (transmitter output) pin is set to a logic-1 state. The RXD (receiver input) pin is disconnected. The output of the Transmitter Shift register is looped back into the Receiver-Shift register input. The four modem-control inputs (uart_cts, uart_dsr, uart_dcd, and uart_ri) are disconnected from the pins and the modem-control output pins (uart_rts and uart_dtr) are forced to their inactive state. The lower four bits of the Modem Control register (MCR) are connected to the upper four modem status register (MSR) bits. Flow control can be tested; if autoflow is enabled, the MCR[RTS] bit has no effect on the nCTS input as nRTS is asserted by the autoflow logic. • DTR = 1 forces DSR to a 1 • RTS = 1 forces CTS to a 1 • OUT1 = 1 forces RI to a 1 • OUT2= 1 forces DCD to a 1 Coming out of the Loopback Test mode may result in unpredictable activation of the delta bits (bits 3:0) in the Modem Status register (MSR). It is recommended that MSR is read once to clear the delta bits in the MSR.
3	0x0 RW	**MCR_OUT2:** Output2: The function of the auxiliary output OUT2 bit differs depending on the mode of the UART. • 0: uart_dcd UART pin input set low when in Loop-back mode. • 1: uart_dcd UART pin input set high when in Loop-back mode.
2	0x0 RW	**MCR_OUT1:** Modem Control Register-output1: The auxiliary output OUT1 bit is only used in Loopback Test mode. • 0: uart_ri UART pin input set low when in Loop-back mode. • 1: uart_ri UART pin input set high when in Loop-back mode.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RW	**MCR_RTS:** When Auto Flow is disabled: MCR[AFE] = 0: • 0: Primary output uart_rts pin is forced to logic 1. • 1: Primary output uart_rts pin is forced to logic 0. When Auto Flow is enabled: MCR[AFE] = 1: • 0: Auto-RTS is disabled. • 1: Auto-RTS is enabled.
0	0x0 RW	**MCR_DTR:** Modem Control Register-Data Terminal Ready. This bit controls the Data Terminal Ready output. • 0: Primary output uart_dtr pin is forced to logic 1. • 1: Primary output uart_dtr pin is forced to logic 0. The uart_dtr output of the UART may be applied to an EIA inverting line driver (such as the DS1488) to obtain the proper polarity input at the succeeding modem or data set.

53.3.6 LSR—Offset 5h

Line Status Register.

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 60h

BAR and Offset: [MEMBA] + 5h

MEMBA Type: PCI Configuration Register (Size: 32 bits)
MEMBA Reference: [B:0, D:26, F:0,1,2] + 14h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RO/V	**LSR_FIFOE:** Line Status Register - FIFO Error Status: • 0: No character has error inside the Receive FIFO. • 1: At least one character in Receiver FIFO has errors. In non-FIFO mode, this bit is always set to 0. In FIFO mode, FIFOE is set to 1 when there is at least one parity error, framing error, or break indication for any of the characters in the FIFO. A processor read to the Line Status register does not reset this bit. FIFOE is reset when all error bytes have been read from the FIFO. If DMA requests are enabled and FIFOE is set to 1, the Error Interrupt is generated and no Receive DMA request is generated even if the Receive FIFO reaches the trigger level. If DMA requests are not enabled setting FIFOE to 1 does not generate an interrupt.
6	0x1 RO/V	**LSR_TEMT:** Line Status Register - Transmitter Empty: • 0: There is data in the Transmit Shift register, the Transmit Holding register, or the FIFO (in FIFO mode). • 1: All the data in the transmitter has been shifted out.
5	0x1 RO/V	**LSR_TDRQ:** Line Status Register - Transmit data Request: • 0: The UART is NOT ready to receive data for transmission. • 1: The UART is ready to receive data for transmission. The assertion of TDRQ causes the UART to interrupt the processor when the Transmit Data Request Interrupt Enable IER[TIE] is set high, and generates a DMA request to the DMA controller if DMA Request is enabled. TDRQ is set to 1 when the new symbol is copied from Transmit Holding register into the Transmit Shift register. The bit is reset to logic 0 concurrently with the loading of the Transmit Holding register by the processor. In FIFO mode, TDRQ is set to logic 1 when the FIFO is less than half full. It is cleared when the FIFO is more than half full. If more than 64 characters are loaded into the FIFO, the excess characters are lost.
4	0x0 RO/C/V	**LSR_BI:** Line Status Register - Break Interrupt: • 0: No break signal has been received. • 1: Break signal has been received. BI is set to logic 1 when the received data input is held in the Spacing (logic 0) state for longer than a full character transmission time (that is, the total time of start bit + data bits + parity bit + stop bits). The Break Indicator is reset when the processor reads the Line Status register. In FIFO mode, only one Break character (equal to 0x00) is loaded into the FIFO regardless of the length of the Break condition. BI shows the Break condition for the character at the bottom of the FIFO, not the most recent character received.

Bit Range	Default & Access	Field Name (ID): Description
3	0x0 RO/C/V	**LSR_FE:** Line Status Register - frame error: • 0: No Framing error. • 1: Framing error has occurred. FE indicates that the received character did not have a valid stop bit. FE is set to logic 1 when the bit following the last data bit or parity bit is detected as logic 0 bit (spacing level). If the Line Control register had been set for two stop bits, the receiver does not check for a valid second stop bit. The FE indicator is reset when the processor reads the Line Status register. The UART will resynchronize after a framing error by assuming that the framing error was due to the next start bit. Therefore it samples this start bit twice and then takes in the data. In FIFO mode, FE shows a framing error for the character at the bottom of the FIFO, not for the most recent character received.
2	0x0 RO/C/V	**LSR_PE:** Line Status Register - Parity Enable: • 0: No Parity error. • 1: Parity error has occurred. PE indicates that the received character does not have the correct even or odd parity, as selected by the Even Parity Select bit. The PE is set to logic 1 upon detection of a parity error and is reset to logic 0 when the processor reads the Line Status register. In FIFO mode, PE shows a parity error for the character at the bottom of the FIFO, not the most recent character received.
1	0x0 RO/C/V	**LSR_OE:** Line Status Register - Overflow Error: • 0: No overflow error. Data has not been lost. • 1: Overflow error. Receive data has been lost. In non-FIFO mode, OE indicates that data in the Receiver Buffer register was not read by the processor before the next character was received; the new character is lost. In FIFO mode, OE indicates that all 64 bytes of the FIFO are full and the most recently received byte has been discarded. The OE indicator is set to logic 1 upon detection of an overflow condition and reset when the processor reads the Line Status register.
0	0x0 RO/V	**LSR_DR:** Line Status Register - Data Ready: • 0: No data has been received. • 1: Data is available in RBR or the FIFO. DR is set to logic 1 when a complete incoming character has been received and transferred into the Receiver Buffer register or the FIFO. In non-FIFO mode, DR is reset to 0 when the receive buffer is read. In FIFO mode, DR is reset to logic 0 if the FIFO is empty (last character has been read from RBR) or the RESETRF bit is set in FCR.

53.3.7 MSR—Offset 6h

Modem Status Register.

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [MEMBA] + 6h

MEMBA Type: PCI Configuration Register (Size: 32 bits)
MEMBA Reference: [B:0, D:26, F:0,1,2] + 14h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RO/V	**MSR_DCD:** Modem Status Register - data Carrier Detect: Loopback is disabled, MCR[LOOP] = 0. • 0: Primary input uart_dcd is logic 1. • 1: Primary input uart_dcd is logic 0. Loopback is enabled, MCR[LOOP] = 1. • 0: MCR[OUT2] is logic 0. • 1: MCR[OUT2] is logic 1.
6	0x0 RO/V	**MSR_RI:** Modem Status Register - Ring Indicator: Loopback is disabled, MCR[LOOP] = 0. • 0: Primary input uart_ri is logic 1. • 1: Primary input uart_ri is logic 0. Loopback is enabled, MCR[LOOP] = 1. • 0: MCR[OUT1] is logic 0. • 1: MCR[OUT1] is logic 1.
5	0x0 RO/V	**MSR_DSR:** Modem Status Register - Data Set Ready: Loopback is disabled, MCR[LOOP] = 0. • 0: Primary input uart_dsr is logic 1. • 1: Primary input uart_dsr is logic 0. Loopback is enabled, MCR[LOOP] = 1. • 0: MCR[DTR] is logic 0. • 1: MCR[DTR] is logic 1.
4	0x0 RO/V	**MSR_CTS:** Modem Status Register - Clear to Send: Loopback is disabled, MCR[LOOP] = 0. • 0: Primary input uart_cts is logic 1. • 1: Primary input uart_cts is logic 0. Loopback is enabled, MCR[LOOP] = 1. • 0: MCR[RTS] is logic 0. • 1: MCR[RTS] is logic 1.
3	0x0 RO/C/V	**MSR_DDCR:** Modem Status Register - Delta Data Carrier Ready: • 0: No change in uart_dcr pin since last read of MSR. • 1: uart_dcr pin has changed state. When DDCR is set the modem status interrupt will be generated if enabled in IER.
2	0x0 RO/C/V	**MSR_TERI:** Modem Status Register - Trailing Edge Ring Indicator: • 0: uart_ri pin has not changed from 0 to 1 since last read of MSR. • 1: uart_ri pin has changed from 0 to 1. When TERI is set the modem status interrupt will be generated if enabled in IER.
1	0x0 RO/C/V	**MSR_DDSR:** Modem Status Register - Delta Data Set Ready: • 0: No change in uart_dsr pin since last read of MSR. • 1: uart_dsr pin has changed state. When DDSR is set the modem status interrupt will be generated if enabled in IER.

Bit Range	Default & Access	Field Name (ID): Description
0	0x0 RO/V	**MSR_DCTS:** Modem Status Register - Delta Clear to Send: • 0: No change in uart_cts pin since last read of MSR. • 1: uart_cts pin has change state. When DCTS is set the modem status interrupt will be generated if enabled in IER.

53.3.8 SPR—Offset 7h

Scratch Pad Status Register.

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [MEMBA] + 7h

MEMBA Type: PCI Configuration Register (Size: 32 bits)
MEMBA Reference: [B:0, D:26, F:0,1,2] + 14h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**SPR:** Scratch Pad Register (SCRATCH): Writing to this field does not affect the operation of the UART in any way.

53.3.9 UART_FISR—Offset 8h

UART Functional Interrupt Status Register.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MEMBA] + 8h

MEMBA Type: PCI Configuration Register (Size: 32 bits)
MEMBA Reference: [B:0, D:26, F:0,1,2] + 14h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0x0 RSV	**RESERVED:** Reserved.
2	0x0 RO/V	**DWCIS:** DMA Write Channel Interrupt Status (DWCIS): Set when Functions DMA write channel interrupt line is asserted.
1	0x0 RO/V	**DRCIS:** DMA Read Channel Interrupt Status (DRCIS): Set when Functions DMA read channel interrupt line is asserted.
0	0x0 RO/V	**UIS:** UART Interrupt Status (UIS): Set when Functions UART interrupt line is asserted.

53.3.10 RFOR—Offset 20h

Receiver FIFO Occupancy Register.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MEMBA] + 20h

MEMBA Type: PCI Configuration Register (Size: 32 bits)
MEMBA Reference: [B:0, D:26, F:0,1,2] + 14h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0x0 RSV	**RESERVED:** Reserved.
6:0	0x0 RO	**RFBC:** Receive FIFO Byte Count (RFBC): Number of bytes (0-64) present in the receive FIFO.

53.3.11 ABR—Offset 24h

Auto BAUD Control Register.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000010h

BAR and Offset: [MEMBA] + 24h

MEMBA Type: PCI Configuration Register (Size: 32 bits)
MEMBA Reference: [B:0, D:26, F:0,1,2] + 14h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0x0 RSV	**RESERVED:** Reserved.
4	0x1 RW	**UUE:** UART Unit Enable (UUE): • 0: UART transceiver is disabled. • 1: UART transceiver is enabled. Transceiver is also disabled by hardware whenever the function is D3-hot PM state.
3	0x0 RW	**ABT:** Auto-baud Table (ABT): • 0: Formula used to calculate baud rates allowing all possible baud rates. • 1: Standard baud rates to be chosen by UART. When set to 1, UART will round the calculated baud rate to nearest standard baud rate.
2	0x0 RW	**ABUP:** Auto-Baud UART Program (ABUP): • 0: Processor Programs Divisor Latch registers. • 1: UART Programs Divisor Latch registers Setting ABUP allows the UART to automatically program the Divisor Latch registers (DLL and DLH) when the auto-baud circuit has detected the baud rate, regardless of the state of the Divisor-Latch Access bit (LCR[DLAB]). For this to occur, the Auto-Baud Enable (ABE) bit must be set. Clearing this bit allows the processor to read the Auto-Baud Count register (ACR) and determine the baud rate using its own algorithm rather than using the UARTs.
1	0x0 RW	**ABLIE:** Auto-Baud Lock Interrupt Enable (ABLIE): • 0: Auto Baud Lock Interrupt disabled (Source IIR[ABL]). • 1: Auto Baud Lock Interrupt enabled (Source IIR[ABL]). Setting ABLIE enables the IIR[ABL] Interrupt, which occurs when the auto-baud circuit has detected the baud rate and written the value into the Auto-Baud Count register (ACR). The Divisor Latch registers can then be programmed by the processor or auto-baud circuitry as dictated by the state of the ABUP.
0	0x0 RW	**ABE:** Auto-Baud Enable (ABE): • 0: Auto Baud disabled. • 1: Auto Baud enabled. Setting ABE enables the auto-baud circuitry within the UART. The circuitry counts the number of clocks in the start bit and writes this count into the Auto-Baud Count register (ACR). It will then interrupt the processor if the Auto Baud Lock Interrupt Enable (ABLIE) bit is set. It will also automatically program the Divisor Latch registers (DLL and DLH) if the Auto-Baud UART Program (ABUP) bit is set.

53.3.12 ACR—Offset 28h

Auto Baud Count Register.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MEMBA] + 28h

Default: 00000000h

MEMBA Type: PCI Configuration Register (Size: 32 bits)
MEMBA Reference: [B:0, D:26, F:0,1,2] + 14h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RSV	**RESERVED:** Reserved.
15:0	0x0 RO/V	**ABC:** Auto-Baud Count (ABC): Auto-baud count is the number of FUART clock cycles within a start bit pulse.

53.3.13 PSR—Offset 30h

Pre-Scaler Register.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MEMBA] + 30h

Default: 00000010h

MEMBA Type: PCI Configuration Register (Size: 32 bits)
MEMBA Reference: [B:0, D:26, F:0,1,2] + 14h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RSV	**RESERVED:** Reserved.
15:0	0x10 RW	**PS:** Pre-Scalar (PS): # of samples per character bit.

53.3.14 UCMR—Offset 34h

UART CLOCK GEN Multiplier Register.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MEMBA] + 34h

Default: 000000D8h

MEMBA Type: PCI Configuration Register (Size: 32 bits)
MEMBA Reference: [B:0, D:26, F:0,1,2] + 14h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RSV	**RESERVED:** Reserved.
23:0	0xd8 RW	**UCMUL:** UART Clock Gen Multiplier (UCMUL): UART Clock Gen Multiplier to derive the UART transceiver clock.

53.3.15 UCDR—Offset 38h

UART CLOCK GEN Divisor Register.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MEMBA] + 38h

Default: 00003D09h

MEMBA Type: PCI Configuration Register (Size: 32 bits)
MEMBA Reference: [B:0, D:26, F:0,1,2] + 14h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RSV	**RESERVED:** Reserved.
23:0	0x3d09 RW	**UCDIV:** UART Clock Gen Divisor (UCDIV): UART Clock Gen Divisor to derive the UART transceiver clock.

53.3.16 CH0SR—Offset 80h

Channel Status Register.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 000F0000h

BAR and Offset: [MEMBA] + 80h

MEMBA Type: PCI Configuration Register (Size: 32 bits)
MEMBA Reference: [B:0, D:26, F:0,1,2] + 14h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RO/V	**CDESC:** Current Descriptor (CDESC): • 00: Descriptor 0 • 01: Descriptor 1 • 10: Descriptor 2 • 11: Descriptor 3 The current descriptor will points to the descriptor to be served at any moment. While none of the descriptor is valid the current descriptor will point to the descriptor 0.
29:20	0x0 RSV	**RESERVED_2:** Reserved 2.
19:16	0xf RO/V	**DESCE:** Descriptor Empty (DESCE): One bit per descriptor, value of 1 indicates the descriptor transfer size is not 0.
15	0x0 RO/C/V	**CHE:** Channel Error (CHE): When set this bit indicates the following error condition. write channel: RX FIFO error status transitioned from 1 to 0. Once read this bit will only get set again when the RX FIFO Error status transition from 1 to 0. Error status is assumed 1 when FIFO contains erroneous data. read channel: The last read request is returned with malformed completion. In this case the UART TX FIFO will not be updated.
14:12	0x0 RSV	**RESERVED_1:** Reserved 1.
11:8	0x0 RO/C/V	**DESCTO:** Descriptor Time Out (DESCTO): One bit per descriptor, value of 1 indicates the descriptor has timed out. This only valid for write channel. In the event of descriptor timeout the available data in the buffer will be written to the memory and channel timeout interrupt will be asserted if enabled through descriptor control register. If the timeout condition will occur at the descriptor done boundary only descriptor done status is updated.
7:4	0x0 RSV	**RESERVED_0:** Reserved 0.
3:0	0x0 RO/C/V	**DESCD:** Descriptor Done (DESCD): One bit per descriptor, value of 1 indicates the descriptor request has been completed.

53.3.17 CH0CR—Offset 84h

Channel Control Register.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MEMBA] + 84h

MEMBA Type: PCI Configuration Register (Size: 32 bits)
MEMBA Reference: [B:0, D:26, F:0,1,2] + 14h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RSV	**RESERVED_0:** Reserved 0.
1	0x0 WO	**CHD:** Channel Direction (CHD): • 0: Read Channel (UART TX). • 1: Write Channel (UART RX).
0	0x0 WO	**CHA:** Channel Active (CHA): • 0: Channel is disabled. • 1: Channel is enabled. Whenever channel stops the hardware will clear this bit. Channel can be stopped by HW on descriptor done, timeout or error condition.

53.3.18 CH0DCR—Offset 88h

Channel 0 Descriptor Control Register.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MEMBA] + 88h

Default: 00008000h

MEMBA Type: PCI Configuration Register (Size: 32 bits)
MEMBA Reference: [B:0, D:26, F:0,1,2] + 14h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RSV	**RESERVED_3:** Reserved 3.
27:24	0x0 RW	**CHTOI:** Channel Time Out Interrupt (CHTOI): One bit per descriptor, value of 1 indicates the channel should generate interrupt once timeout is detected. This is only applicable to write channel.
23	0x0 RW	**CHEI:** Channel Error Interrupt (CHEI): Value of 1 indicates the channel should generate interrupt if the channel error condition has occurred.
22:20	0x0 RSV	**RESERVED_2:** Reserved 2.
19:16	0x0 RW	**CHDI:** Channel Done Interrupt (CHDI): One bit per descriptor, value of 1 indicates the channel should generate interrupt once descriptor is done.
15	0x1 RW	**CHSOE:** Channel Stop on Error (CHSOTO): Value of 1 indicates the channel should stop on error condition while any serving descriptor.
14	0x0 RW	**CHSOTO:** Channel Stop on Timeout (CHSOTO): Value of 1 indicates the channel should stop on timeout condition while any serving descriptor.
13:12	0x0 RSV	**RESERVED_1:** Reserved 1.
11:8	0x0 RW	**CHSOD:** Channel Stop on Done (CHSOD): One bit per descriptor, value of 1 indicates the channel should stop once the descriptor request has been completed.
7:4	0x0 RSV	**RESERVED_0:** Reserved 0.
3:0	0x0 RW/V	**DESCA:** Descriptor Active (DESCA): One bit per descriptor, value of 1 indicates the descriptor is active. Whenever the descriptor is done or timed out the corresponding descriptor active bit will be cleared.

53.3.19 CH0BSR—Offset 90h

Channel Buffer Size.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MEMBA] + 90h

MEMBA Type: PCI Configuration Register (Size: 32 bits)
MEMBA Reference: [B:0, D:26, F:0,1,2] + 14h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RSV	**RESERVED_0:** Reserved 0.
15:0	0x0 RW	**CHBS:** Channel Buffer Size (CHBS): Indicates the size of UART FIFO connected to the channel.

53.3.20 CH0MTSR—Offset 94h

Channel Minimum Transfer Size Register.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MEMBA] + 94h

MEMBA Type: PCI Configuration Register (Size: 32 bits)
MEMBA Reference: [B:0, D:26, F:0,1,2] + 14h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RSV	**RESERVED_0:** Reserved 0.
15:0	0x0 RW	**CHMTSR:** Channel Minimum Transfer Size (CHMTSR): Indicates the minimum number of bytes required to make the DMA request.

53.3.21 CH0D0SAR—Offset A0h

Channel Descriptor 0 Start Address Register.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MEMBA] + A0h

MEMBA Type: PCI Configuration Register (Size: 32 bits)
MEMBA Reference: [B:0, D:26, F:0,1,2] + 14h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/V	**CHD0SAR:** Channel Descriptor 0 Start Address (CHD0SAR):

53.3.22 CH0D0TSR—Offset A4h

Channel Descriptor 0 Transfer Size Register.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MEMBA] + A4h

Default: 00000000h

MEMBA Type: PCI Configuration Register (Size: 32 bits)
MEMBA Reference: [B:0, D:26, F:0,1,2] + 14h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RSV	**RESERVED_0:** Reserved 0.
15:0	0x0 RW/V	**CHD0TS:** Channel Descriptor 0 Transfer Size (CHD0TS):

53.3.23 CH0D1SAR—Offset A8h

Channel Descriptor 1 Start Address Register.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MEMBA] + A8h

Default: 00000000h

MEMBA Type: PCI Configuration Register (Size: 32 bits)
MEMBA Reference: [B:0, D:26, F:0,1,2] + 14h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/V	**CHD1SAR:** Channel Descriptor 1 Start Address (CHD1SAR):

53.3.24 CH0D1TSR—Offset ACh

Channel Descriptor 1 Transfer Size Register.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MEMBA] + ACh

Default: 00000000h

MEMBA Type: PCI Configuration Register (Size: 32 bits)
MEMBA Reference: [B:0, D:26, F:0,1,2] + 14h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RSV	**RESERVED_0:** Reserved 0.
15:0	0x0 RW/V	**CHD1TS:** Channel Descriptor 1 Transfer Size (CHD1TS):

53.3.25 CH0D2SAR—Offset B0h

Channel Descriptor 2 Start Address Register.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MEMBA] + B0h

MEMBA Type: PCI Configuration Register (Size: 32 bits)
MEMBA Reference: [B:0, D:26, F:0,1,2] + 14h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/V	**CHD2SAR:** Channel Descriptor 2 Start Address (CHD2SAR):

53.3.26 CH0D2TSR—Offset B4h

Channel Descriptor 2 Transfer Size Register.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MEMBA] + B4h

MEMBA Type: PCI Configuration Register (Size: 32 bits)
MEMBA Reference: [B:0, D:26, F:0,1,2] + 14h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RSV	**RESERVED_0:** Reserved 0.
15:0	0x0 RW/V	**CHD2TS:** Channel Descriptor 2 Transfer Size (CHD2TS):

53.3.27 CH0D3SAR—Offset B8h

Channel Descriptor 3 Start Address Register.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MEMBA] + B8h

MEMBA Type: PCI Configuration Register (Size: 32 bits)
MEMBA Reference: [B:0, D:26, F:0,1,2] + 14h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/V	**CHD3SAR:** Channel Descriptor 3 Start Address (CHD3SAR):

53.3.28 CH0D3TSR—Offset BCh

Channel Descriptor 3 Transfer Size Register.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MEMBA] + BCh

MEMBA Type: PCI Configuration Register (Size: 32 bits)
MEMBA Reference: [B:0, D:26, F:0,1,2] + 14h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RSV	**RESERVED_0:** Reserved 0.
15:0	0x0 RW/V	**CHD3TS:** Channel Descriptor 3 Transfer Size (CHD3TS):

53.3.29 CH1SR—Offset C0h

Channel Status Register.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 000F0000h

BAR and Offset: [MEMBA] + C0h

MEMBA Type: PCI Configuration Register (Size: 32 bits)
MEMBA Reference: [B:0, D:26, F:0,1,2] + 14h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RO/V	**CDESC:** Current Descriptor (CDESC): • 00: Descriptor 0 • 01: Descriptor 1 • 10: Descriptor 2 • 11: Descriptor 3 The current descriptor will points to the descriptor to be served at any moment. While none of the descriptor is valid the current descriptor will point to the descriptor 0.
29:20	0x0 RSV	**RESERVED_2:** Reserved 2.
19:16	0xf RO/V	**DESCE:** Descriptor Empty (DESCE): One bit per descriptor, value of 1 indicates the descriptor transfer size is not 0.
15	0x0 RO/C/V	**CHE:** Channel Error (CHE): When set this bit indicates the following error condition. write channel: RX FIFO error status transitioned from 1 to 0. Once read this bit will only get set again when the RX FIFO Error status transition from 1 to 0. Error status is assumed 1 when FIFO contains erroneous data. read channel: The last read request is returned with malformed completion. In this case the UART TX FIFO will not be updated.
14:12	0x0 RSV	**RESERVED_1:** Reserved 1.
11:8	0x0 RO/C/V	**DESCTO:** Descriptor Time Out (DESCTO): One bit per descriptor, value of 1 indicates the descriptor has timed out. This only valid for write channel. In the event of descriptor timeout the available data in the buffer will be written to the memory and channel timeout interrupt will be asserted if enabled through descriptor control register. If the timeout condition will occur at the descriptor done boundary only descriptor done status is updated.
7:4	0x0 RSV	**RESERVED_0:** Reserved 0.
3:0	0x0 RO/C/V	**DESCD:** Descriptor Done (DESCD): One bit per descriptor, value of 1 indicates the descriptor request has been completed.

53.3.30 CH1CR—Offset C4h

Channel Control Register.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MEMBA] + C4h

Default: 00000000h

MEMBA Type: PCI Configuration Register (Size: 32 bits)
MEMBA Reference: [B:0, D:26, F:0,1,2] + 14h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RSV	**RESERVED_0:** Reserved 0.
1	0x0 WO	**CHD:** Channel Direction (CHD): • 0: Read Channel (UART TX). • 1: Write Channel (UART RX).
0	0x0 WO	**CHA:** Channel Active (CHA): • 0: Channel is disabled. • 1: Channel is enabled. Whenever channel stops the hardware will clear this bit. Channel can be stopped by HW on descriptor done, timeout or error condition.

53.3.31 CH1DCR—Offset C8h

Channel 0 Descriptor Control Register.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00008000h

BAR and Offset: [MEMBA] + C8h

MEMBA Type: PCI Configuration Register (Size: 32 bits)
MEMBA Reference: [B:0, D:26, F:0,1,2] + 14h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RSV	**RESERVED_3:** Reserved 3.
27:24	0x0 RW	**CHTOI:** Channel Time Out Interrupt (CHTOI): One bit per descriptor, value of 1 indicates the channel should generate interrupt once timeout is detected. This is only applicable to write channel.
23	0x0 RW	**CHEI:** Channel Error Interrupt (CHEI): Value of 1 indicates the channel should generate interrupt if the channel error condition has occurred.
22:20	0x0 RSV	**RESERVED_2:** Reserved 2.
19:16	0x0 RW	**CHDI:** Channel Done Interrupt (CHDI): One bit per descriptor, value of 1 indicates the channel should generate interrupt once descriptor is done.
15	0x1 RW	**CHSOE:** Channel Stop on Error (CHSOTO): Value of 1 indicates the channel should stop on error condition while any serving descriptor.
14	0x0 RW	**CHSOTO:** Channel Stop on Timeout (CHSOTO): Value of 1 indicates the channel should stop on timeout condition while any serving descriptor.
13:12	0x0 RSV	**RESERVED_1:** Reserved 1.
11:8	0x0 RW	**CHSOD:** Channel Stop on Done (CHSOD): One bit per descriptor, value of 1 indicates the channel should stop once the descriptor request has been completed.
7:4	0x0 RSV	**RESERVED_0:** Reserved 0.
3:0	0x0 RW/V	**DESCA:** Descriptor Active (DESCA): One bit per descriptor, value of 1 indicates the descriptor is active. Whenever the descriptor is done or timed out the corresponding descriptor active bit will be cleared.

53.3.32 CH1BSR—Offset D0h

Channel Buffer Size.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MEMBA] + D0h

Default: 00000000h

MEMBA Type: PCI Configuration Register (Size: 32 bits)
MEMBA Reference: [B:0, D:26, F:0,1,2] + 14h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RSV	**RESERVED_0:** Reserved 0.
15:0	0x0 RW	**CHBS:** Channel Buffer Size (CHBS): Indicates the size of UART FIFO connected to the channel.

53.3.33 CH1MTSR—Offset D4h

Channel Minimum Transfer Size Register.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MEMBA] + D4h

Default: 00000000h

MEMBA Type: PCI Configuration Register (Size: 32 bits)
MEMBA Reference: [B:0, D:26, F:0,1,2] + 14h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RSV	**RESERVED_0:** Reserved 0.
15:0	0x0 RW	**CHMTSR:** Channel Minimum Transfer Size (CHMTSR): Indicates the minimum number of bytes required to make the DMA request.

53.3.34 CH1D0SAR—Offset E0h

Channel Descriptor 0 Start Address Register.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MEMBA] + E0h

Default: 00000000h

MEMBA Type: PCI Configuration Register (Size: 32 bits)
MEMBA Reference: [B:0, D:26, F:0,1,2] + 14h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/V	**CHD0SAR:** Channel Descriptor 0 Start Address (CHD0SAR):

53.3.35 CH1D0TSR—Offset E4h

Channel Descriptor 0 Transfer Size Register.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MEMBA] + E4h

MEMBA Type: PCI Configuration Register (Size: 32 bits)
MEMBA Reference: [B:0, D:26, F:0,1,2] + 14h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RSV	**RESERVED_0:** Reserved 0.
15:0	0x0 RW/V	**CHD0TS:** Channel Descriptor 0 Transfer Size (CHD0TS):

53.3.36 CH1D1SAR—Offset E8h

Channel Descriptor 1 Start Address Register.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MEMBA] + E8h

MEMBA Type: PCI Configuration Register (Size: 32 bits)
MEMBA Reference: [B:0, D:26, F:0,1,2] + 14h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/V	**CHD1SAR:** Channel Descriptor 1 Start Address (CHD1SAR):

53.3.37 CH1D1TSR—Offset ECh

Channel Descriptor 1 Transfer Size Register.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MEMBA] + ECh

MEMBA Type: PCI Configuration Register (Size: 32 bits)
MEMBA Reference: [B:0, D:26, F:0,1,2] + 14h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RSV	**RESERVED_0:** Reserved 0.
15:0	0x0 RW/V	**CHD1TS:** Channel Descriptor 1 Transfer Size (CHD1TS):

53.3.38 CH1D2SAR—Offset F0h

Channel Descriptor 2 Start Address Register.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MEMBA] + F0h

MEMBA Type: PCI Configuration Register (Size: 32 bits)
MEMBA Reference: [B:0, D:26, F:0,1,2] + 14h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/V	**CHD2SAR:** Channel Descriptor 2 Start Address (CHD2SAR):

53.3.39 CH1D2TSR—Offset F4h

Channel Descriptor 2 Transfer Size Register.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MEMBA] + F4h

MEMBA Type: PCI Configuration Register (Size: 32 bits)
MEMBA Reference: [B:0, D:26, F:0,1,2] + 14h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RSV	**RESERVED_0:** Reserved 0.
15:0	0x0 RW/V	**CHD2TS:** Channel Descriptor 2 Transfer Size (CHD2TS):

53.3.40 CH1D3SAR—Offset F8h

Channel Descriptor 3 Start Address Register.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MEMBA] + F8h

Default: 00000000h

MEMBA Type: PCI Configuration Register (Size: 32 bits)
MEMBA Reference: [B:0, D:26, F:0,1,2] + 14h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/V	**CHD3SAR:** Channel Descriptor 3 Start Address (CHD3SAR):

53.3.41 CH1D3TSR—Offset FCh

Channel Descriptor 3 Transfer Size Register.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MEMBA] + FCh

Default: 00000000h

MEMBA Type: PCI Configuration Register (Size: 32 bits)
MEMBA Reference: [B:0, D:26, F:0,1,2] + 14h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RSV	**RESERVED_0:** Reserved 0.
15:0	0x0 RW/V	**CHD3TS:** Channel Descriptor 3 Transfer Size (CHD3TS):

53.4 Registers in I/O Space—IOBA

These registers are accessed in Host I/O Space starting at the relocatable I/O address defined by the Base Address Register (BAR) IOBA described in Section 53.2.5, "IOBA—Offset 10h" on page 2391. There is a set of these registers for each of the three HSUART Functions (F0, F1, and F2).

53.4.1 RBR_THR_DLL—Offset 0h

RBR = Receive buffer register THR = Transmit hold register DLL = Divisor Latch low.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [IOBA] + 0h

Default: 00h

IOBA Type: PCI Configuration Register (Size: 32 bits)
IOBA Reference: [B:0, D:26, F:0,1,2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW/V	**RBR_THR_DLL:** When DLAB =0, this 8 bit is used as Received Buffer Register as Read, and is used as Transmit Holding Register as Write. When DLAB is 1, this register is used as DLL (Divisor Latch Low Byte Register).

53.4.2 IER_DLH—Offset 1h

IER = Interrupt Enable Register DLH = Divisor Latch High.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [IOBA] + 1h

Default: 00h

IOBA Type: PCI Configuration Register (Size: 32 bits)
IOBA Reference: [B:0, D:26, F:0,1,2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW/V	**IER_DLH:** When DLAB =0, this 8 bit is used as Interrupt Enable Register. When DLAB =1, this 8 bit is used as DLH (Divisor Latch High Byte Register).

53.4.3 IIR_FCR—Offset 2h

IIR = Interrupt Identification Register FCR = FIFO control register.

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [IOBA] + 2h

IOBA Type: PCI Configuration Register (Size: 32 bits)
IOBA Reference: [B:0, D:26, F:0,1,2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW/V	**IIR_FCR:** When this 8 bit is read, it is serving as Interrupt Identification Registers. When this 8 bit is written, it is serving as FCR (FIFO control register.).

53.4.4 LCR—Offset 3h

Line Control Register.

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [IOBA] + 3h

IOBA Type: PCI Configuration Register (Size: 32 bits)
IOBA Reference: [B:0, D:26, F:0,1,2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RW	**LCR_DLAB:** Divisor Latch Register Access Bit (DLAB): The divisor-latch access bit must be set high (logic 1) to access the divisor latches of the baud rate generator during a read or write operation. It must be set low (logic 0) to access the receiver buffer, the Transmit Holding register, or the Interrupt Enable register. This bit does not need to be set when using auto-baud. • 0: Access Transmit Holding register (THR), Receive Buffer register (RBR) and Interrupt Enable register. • 1: Access Divisor Latch registers (DLL and DLH)
6	0x0 RW	**LCR_SB:** Set Break (SB): The set-break control bit transmits a Break condition to the receiving UART. When SB is set to logic 1, the serial output (TXD) is forced to the Spacing (logic 0) state and remains there until SB is set to logic 0. This bit acts only on the TXD pin and has no effect on the transmitter logic. • 0: No effect on TXD output. • 1: Forces TXD output to 0 (space). This feature enables the processor to alert a terminal in a computer communications system. If the following sequence is executed, no erroneous characters will be transmitted because of the break: Load 0x00 in the Transmit Holding register in response to a TDRQ Interrupt. After TDRQ goes high (indicating that 0x00 is being shifted out), set the break bit before the parity or stop bits reach the TXD pin. Wait for the transmitter to be idle (TEMT = 1), and clear the break bit when normal transmission has to be restored. During the Break, the transmitter can be used as a character timer to accurately establish the Break duration. In FIFO mode, wait for the transmitter to be idle (TEMT=1) to set and clear the break bit.
5	0x0 RW	**LCR_STKYP:** Sticky Parity (STKYP): This bit is the sticky-parity bit, which can be used in multiprocessor communications. • 0: No effect on parity bit. • 1: Forces parity bit to be opposite of EPS bit value. When PEN and STKYP are logic 1, the bit that is transmitted in the parity-bit location (the bit just before the stop bit) is the complement of the EPS bit. If EPS is 0, then the bit at the parity-bit location will be transmitted as a 1. In the receiver, if STKYP and PEN are 1, then the receiver compares the bit that is received in the parity-bit location with the complement of the EPS bit. If the values being compared are not equal, the receiver sets the parity-error bit in LSR, and causes an Error Interrupt if Line-Status Interrupts were enabled. For example, if EPS is 0, the receiver expects the bit received at the parity-bit location to be 1. If it is not, then the parity-error bit is set. By forcing the bit value at the parity-bit location, rather than calculating a parity value, a system with a master transmitter and multiple receivers can identify some transmitted characters as receiver addresses and the rest of the characters as data. If PEN = 0, STKYP is ignored.
4	0x0 RW	**LCR_EPS:** Even Parity Select (EPS): EPS is only valid when the parity is enabled (PEN = 1). • 0: Sends and checks for odd parity. • 1: Sends and checks for even parity.

Bit Range	Default & Access	Field Name (ID): Description
3	0x0 RW	**LCR_PEN:** Parity Enable (PEN): When PEN is logic 1, a parity bit is generated (transmit data) or checked (receive data) between the last data-word bit and stop bit of the serial data. • 0: No parity function. • 1: Allows parity generation and checking.
2	0x0 RW	**LCR_STB:** Stop Bits (STB): This bit specifies the number of stop bits transmitted and received in each serial character. • 0: 1 stop bit • 1: 2 stop bits; except for 5-bit character, then 1 bits The receiver checks the first stop bit only, regardless of the number of stop bits selected.
1:0	0x0 RW	**LCR_WLS:** Word Length Select (WLS): The word length select bits specify the number of data bits (five to eight bits are allowed) in each transmitted or received serial character. • 00: 5-bit character (default) • 01: 6-bit character • 10: 7-bit character • 11: 8-bit character

53.4.5 MCR—Offset 4h

Modem Control Register.

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [IOBA] + 4h

IOBA Type: PCI Configuration Register (Size: 32 bits)
IOBA Reference: [B:0, D:26, F:0,1,2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0x0 RSV	**MCR_RESERVED:** Reserved.
5	0x0 RW	**MCR_AFE:** MCR-Auto Flow Enable (AFE): This is a reserved bit in 16550 spec. • 0: Auto-RTS and Auto-CTS are disabled. • 1: Auto-CTS is enabled. If MCR[RTS] is also set, both Auto-CTS and Auto-RTS is enabled. Auto-RTS is not enabled if AFE is not set regardless of the state of MCR[RTS]. Autoflow automates the flow of data between the UART and the remote device.
4	0x0 RW	**MCR_LOOP:** Modem Control Register-Loop back test mode (LOOP): This bit provides a local loopback feature for diagnostic testing of the UART. This feature allows the processor to verify the UART transmit and receive data paths. The Transmit, Receive, and Modem Control interrupts are operational in this mode. • 0: Normal UART operation. • 1: Loopback Test mode operation. Serial output uart_txd pin is set to logic 1. Serial input uart_rxd pin is disconnected from external input line. The output of the Transmitter Shift register is looped back into the Receiver Shift register. The modem-control inputs (uart_cts, uart_dsr, uart_dcd, and uart_ri) are activated by MCR bits 0-3 instead of the modem-control inputs. A Break signal can also be transferred from the transmitter section to the receiver section in Loopback mode. When LOOP is set to logic 1, the following will occur: The TXD (transmitter output) pin is set to a logic-1 state. The RXD (receiver input) pin is disconnected. The output of the Transmitter Shift register is looped back into the Receiver-Shift register input. The four modem-control inputs (uart_cts, uart_dsr, uart_dcd, and uart_ri) are disconnected from the pins and the modem-control output pins (uart_rts and uart_dtr) are forced to their inactive state. The lower four bits of the Modem Control register (MCR) are connected to the upper four modem status register (MSR) bits. Flow control can be tested; if autoflow is enabled, the MCR[RTS] bit has no effect on the nCTS input as nRTS is asserted by the autoflow logic. • DTR = 1 forces DSR to a 1 • RTS = 1 forces CTS to a 1 • OUT1 = 1 forces RI to a 1 • OUT2= 1 forces DCD to a 1 Coming out of the Loopback Test mode may result in unpredictable activation of the delta bits (bits 3:0) in the Modem Status register (MSR). It is recommended that MSR is read once to clear the delta bits in the MSR.
3	0x0 RW	**MCR_OUT2:** Output2 (OUT2): The function of the auxiliary output OUT2 bit differs depending on the mode of the UART. • 0: uart_dcd UART pin input set low when in Loop-back mode • 1: uart_dcd UART pin input set high when in Loop-back mode.
2	0x0 RW	**MCR_OUT1:** Modem Control Register-output1 (OUT1): The auxiliary output OUT1 bit is only used in Loopback Test mode. • 0: uart_ri UART pin input set low when in Loop-back mode • 1: uart_ri UART pin input set high when in Loop-back mode

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RW	**MCR_RTS:** When Auto Flow is disabled MCR[AFE] = 0: • 0: Primary output uart_rts pin is forced to logic 1. • 1: Primary output uart_rts pin is forced to logic 0. When Auto Flow is enabled: MCR[AFE] = 1: • 0: Auto-RTS is disabled. • 1: Auto-RTS is enabled.
0	0x0 RW	**MCR_DTR:** Modem Control Register-Data Terminal Ready (DTR): This bit controls the Data Terminal Ready output. • 0: Primary output uart_dtr pin is forced to logic 1. • 1: Primary output uart_dtr pin is forced to logic 0. The uart_dtr output of the UART may be applied to an EIA inverting line driver (such as the DS1488) to obtain the proper polarity input at the succeeding modem or data set.

53.4.6 LSR—Offset 5h

Line Status Register.

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [IOBA] + 5h

IOBA Type: PCI Configuration Register (Size: 32 bits)
IOBA Reference: [B:0, D:26, F:0,1,2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RO/V	**LSR_FIFOE:** Line Status Register - FIFO Error Status (FIFOE): • 0: No character has error inside the Receive FIFO. • 1: At least one character in Receiver FIFO has errors. In non-FIFO mode, this bit is always set to 0. In FIFO mode, FIFOE is set to 1 when there is at least one parity error, framing error, or break indication for any of the characters in the FIFO. A processor read to the Line Status register does not reset this bit. FIFOE is reset when all error bytes have been read from the FIFO. If DMA requests are enabled and FIFOE is set to 1, the Error Interrupt is generated and no Receive DMA request is generated even if the Receive FIFO reaches the trigger level. If DMA requests are not enabled setting FIFOE to 1 does not generate an interrupt.
6	0x0 RO/V	**LSR_TEMT:** Line Status Register - Transmitter Empty (TEMT): • 0: There is data in the Transmit Shift register, the Transmit Holding register, or the FIFO (in FIFO mode). • 1: All the data in the transmitter has been shifted out.
5	0x0 RO/V	**LSR_TDRQ:** Line Status Register - Transmit data Request (TDRQ) • 0: The UART is NOT ready to receive data for transmission. • 1: The UART is ready to receive data for transmission. The assertion of TDRQ causes the UART to interrupt the processor when the Transmit Data Request Interrupt Enable IER[TIE] is set high, and generates a DMA request to the DMA controller if DMA Request is enabled. TDRQ is set to 1 when the new symbol is copied from Transmit Holding register into the Transmit Shift register. The bit is reset to logic 0 concurrently with the loading of the Transmit Holding register by the processor. In FIFO mode, TDRQ is set to logic 1 when the FIFO is less than half full. It is cleared when the FIFO is more than half full. If more than 64 characters are loaded into the FIFO, the excess characters are lost.
4	0x0 RO/C/V	**LSR_BI:** Line Status Register - Break Interrupt (BI): • 0: No break signal has been received. • 1: Break signal has been received. BI is set to logic 1 when the received data input is held in the Spacing (logic 0) state for longer than a full character transmission time (that is, the total time of start bit + data bits + parity bit + stop bits). The Break Indicator is reset when the processor reads the Line Status register. In FIFO mode, only one Break character (equal to 0x00) is loaded into the FIFO regardless of the length of the Break condition. BI shows the Break condition for the character at the bottom of the FIFO, not the most recent character received.

Bit Range	Default & Access	Field Name (ID): Description
3	0x0 RO/C/V	**LSR_FE:** Line Status Register - frame error (FE): • 0: No Framing error. • 1: Framing error has occurred. FE indicates that the received character did not have a valid stop bit. FE is set to logic 1 when the bit following the last data bit or parity bit is detected as logic 0 bit (spacing level). If the Line Control register had been set for two stop bits, the receiver does not check for a valid second stop bit. The FE indicator is reset when the processor reads the Line Status register. The UART will resynchronize after a framing error by assuming that the framing error was due to the next start bit. Therefore it samples this start bit twice and then takes in the data. In FIFO mode, FE shows a framing error for the character at the bottom of the FIFO, not for the most recent character received.
2	0x0 RO/C/V	**LSR_PE:** Line Status Register - Parity Enable (PE): • 0: No Parity error. • 1: Parity error has occurred. PE indicates that the received character does not have the correct even or odd parity, as selected by the Even Parity Select bit. The PE is set to logic 1 upon detection of a parity error and is reset to logic 0 when the processor reads the Line Status register. In FIFO mode, PE shows a parity error for the character at the bottom of the FIFO, not the most recent character received.
1	0x0 RO/C/V	**LSR_OE:** Line Status Register - Overflow Error (OE): • 0: No overflow error. Data has not been lost. • 1: Overflow error. Receive data has been lost. In non-FIFO mode, OE indicates that data in the Receiver Buffer register was not read by the processor before the next character was received; the new character is lost. In FIFO mode, OE indicates that all 64 bytes of the FIFO are full and the most recently received byte has been discarded. The OE indicator is set to logic 1 upon detection of an overflow condition and reset when the processor reads the Line Status register.
0	0x0 RO/V	**LSR_DR:** Line Status Register - Data Ready (DR): • 0: No data has been received. • 1: Data is available in RBR or the FIFO. DR is set to logic 1 when a complete incoming character has been received and transferred into the Receiver Buffer register or the FIFO. In non-FIFO mode, DR is reset to 0 when the receive buffer is read. In FIFO mode, DR is reset to logic 0 if the FIFO is empty (last character has been read from RBR) or the RESETRF bit is set in FCR.

53.4.7 MSR—Offset 6h

Modem Status Register

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [IOBA] + 6h

IOBA Type: PCI Configuration Register (Size: 32 bits)
IOBA Reference: [B:0, D:26, F:0,1,2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RO/V	**MSR_DCD:** Modem Status Register - data Carrier Detect (DCD): Loopback is disabled, MCR[LOOP] = 0 • 0: Primary input uart_dcd is logic 1. • 1: Primary input uart_dcd is logic 0. Loopback is enabled, MCR[LOOP] = 1 • 0: MCR[OUT2] is logic 0. • 1: MCR[OUT2] is logic 1.
6	0x0 RO/V	**MSR_RI:** Modem Status Register - Ring Indicator (RI): Loopback is disabled, MCR[LOOP] = 0 • 0: Primary input uart_ri is logic 1. • 1: Primary input uart_ri is logic 0. Loopback is enabled, MCR[LOOP] = 1 • 0: MCR[OUT1] is logic 0. • 1: MCR[OUT1] is logic 1.
5	0x0 RO/V	**MSR_DSR:** Modem Status Register - Data Set Ready (DSR): Loopback is disabled, MCR[LOOP] = 0 • 0: Primary input uart_dsr is logic 1. • 1: Primary input uart_dsr is logic 0. Loopback is enabled, MCR[LOOP] = 1 • 0: MCR[DTR] is logic 0. • 1: MCR[DTR] is logic 1.
4	0x0 RO/V	**MSR_CTS:** Modem Status Register - Clear to Send (CTS): Loopback is disabled, MCR[LOOP] = 0 • 0: Primary input uart_cts is logic 1. • 1: Primary input uart_cts is logic 0. Loopback is enabled, MCR[LOOP] = 1 • 0: MCR[RTS] is logic 0. • 1: MCR[RTS] is logic 1.
3	0x0 RO/C/V	**MSR_DDCR:** Modem Status Register - Delta Data Carrier Ready (DDCR): • 0: No change in uart_dcr pin since last read of MSR • 1: uart_dcr pin has changed state. When DDCR is set the modem status interrupt will be generated if enabled in IER.
2	0x0 RO/C/V	**MSR_TERI:** Modem Status Register - Trailing Edge Ring Indicator (TERI): • 0: uart_ri pin has not changed from 0 to 1 since last read of MSR. • 1: uart_ri pin has changed from 0 to 1. When TERI is set the modem status interrupt will be generated if enabled in IER.
1	0x0 RO/C/V	**MSR_DDSR:** Modem Status Register - Delta Data Set Ready (DDSR): • 0: No change in uart_dsr pin since last read of MSR. • 1: uart_dsr pin has changed state. When DDSR is set the modem status interrupt will be generated if enabled in IER.

Bit Range	Default & Access	Field Name (ID): Description
0	0x0 RO/V	**MSR_DCTS:** Modem Status Register - Delta Clear to Send (DCTS): • 0: No change in uart_cts pin since last read of MSR. • 1: uart_cts pin has change state. When DCTS is set the modem status interrupt will be generated if enabled in IER.

53.4.8 SPR—Offset 7h

Scratch Pad Status Register.

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [IOBA] + 7h

IOBA Type: PCI Configuration Register (Size: 32 bits)
IOBA Reference: [B:0, D:26, F:0,1,2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**SPR:** Scratch Pad Register (SCRATCH): Writing to this field does not affect the operation of the UART in any way.

§ §

54 Innovation Engine - B0, D27, F(0, 1, 3, 4)

54.1 Introduction and Index

The host-accessible registers for the Innovation Engine are described here.

To determine the number of devices/functions available refer to the following:

- Table 1-1, "Features by product SKU - Server and Cloud Storage SKUs 0 through 4"
- Table 1-2, "Features by Product SKU - Network and Enterprise Storage SKUs 5 through 10"
- Table 1-3, "Features by Product SKU - Extended Temperature SKUs 11 through 14".

The legend for the register access codes are described in Chapter 43, "Introduction."

54.1.1 Host Configuration Space—HECI1 (F:0)

These registers are discovered in Host Configuration Space starting at Bus 0, Device 27 (decimal), Function 0. The offset addresses are listed.

Table 54-1. Summary of PCI Configuration Registers HECI1—0/27/0

Offset (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
0	4	19E58086	"Identifiers (HECI1_ID)—Offset 0h" on page 2454
4	2	0000	"Command (HECI1_CMD)—Offset 4h" on page 2455
6	2	0010	"Status (HECI1_STS)—Offset 6h" on page 2456
8	4	07800000	"Revision ID and Class Code (HECI1_RID_CC)—Offset 8h" on page 2457
C	1	00	"Cache Line Size (HECI1_CLS)—Offset Ch" on page 2457
D	1	00	"Master Latency Timer (HECI1_MLT)—Offset Dh" on page 2457
E	1	80	"Header Type (HECI1_HTYPE)—Offset Eh" on page 2458
F	1	00	"Built In Self-Test (HECI1_BIST)—Offset Fh" on page 2458
10	4	00000004	"HECI MMIO Base Address Low (HECI1_MMIO_MBAR_LO)—Offset 10h" on page 2458
14	4	00000000	"HECI MMIO Base Address High (HECI1_MMIO_MBAR_HI)—Offset 14h" on page 2459
2C	4	00000000	"Sub System Identifiers (HECI1_SS)—Offset 2Ch" on page 2459
34	1	50	"Capabilities Pointer (HECI1_CAP)—Offset 34h" on page 2459
3C	2	0100	"Interrupt Information (HECI1_INTR)—Offset 3Ch" on page 2460
3E	1	00	"Minimum Grant (HECI1_MGNT)—Offset 3Eh" on page 2460
3F	1	00	"Maximum Latency (HECI1_MLAT)—Offset 3Fh" on page 2460
40	4	00000000	"Host Firmware Status (HECI1_HFS)—Offset 40h" on page 2461
44	4	80000000	"Miscellaneous Shadow (HECI1_MISC_SHDW)—Offset 44h" on page 2463
48	4	00000000	"General Status Shadow 1 (HECI1_GS_SHDW1)—Offset 48h" on page 2464
4C	4	00000000	"Host General Status (HECI1_H_GS1)—Offset 4Ch" on page 2465

1	1	00	"KT Interrupt Enable register (MEM_KTIER)—Offset 1h" on page 2548
1	1	00	"KT Divisor Latch MSB Register (MEM_KTDLMR)—Offset 1h" on page 2548
2	1	01	"KT Interrupt Identification Register (MEM_KTIIR)—Offset 2h" on page 2549
2	1	00	"KT FIFO Control register (MEM_KTFCR)—Offset 2h" on page 2550
3	1	03	"KT Line Control register (MEM_KTLCR)—Offset 3h" on page 2551
4	1	00	"KT Modem Control register (MEM_KTMCR)—Offset 4h" on page 2552
5	1	60	"KT Line Status register (MEM_KTLSR)—Offset 5h" on page 2553
6	1	00	"KT Modem Status register (MEM_KTMSR)—Offset 6h" on page 2554
7	1	00	"KT Scratch register (MEM_KTSCR)—Offset 7h" on page 2554

54.1.10 Host Memory Space—Fixed Address

An index of the registers that are accessible in Host Memory Space is shown here.

Table 54-10. Summary of Memory Mapped I/O Registers—Fix Addresses

Memory Address (hex)	Bytes (decimal)	Default Value (hex)	Register Name (Register Symbol)
FED40000	4	00000000	"FTPM Locality State (HOST_LOC_0_LOC_STATE_HROA)—Offset FED40000h" on page 2555
FED40004	4	00000000	"FTPM Locality Reserved (HOST_LOC_0_LOC_RSVD)—Offset FED40004h" on page 2555
FED40008	4	00000000	"FTPM Locality n Control Register (HOST_LOC_0_LOC_CTRL)—Offset FED40008h" on page 2556
FED4000C	4	00000000	"FTPM Locality n Status Register Host Read Only Access. (HOST_LOC_0_LOC_STS_HROA)—Offset FED4000Ch" on page 2556
FED40010	4	00000000	"FTPM Locality Config Area Reserved Read Write[0-7] (HOST_LOC_0_RSVD_RW1[0-7])—Offset FED40010h, Count 8, Stride 4h" on page 2556
FED40030	4	00000000	"FTPM Interface ID Host Read Only Access 0 (HOST_LOC_0_INTF_ID_0)—Offset FED40030h" on page 2557
FED40034	4	00000000	"FTPM Interface ID Host Read Only Access 1 (HOST_LOC_0_INTF_ID_1)—Offset FED40034h" on page 2557
FED40038	4	00000000	"FTPM Locality Config Area Reserved Read Write[0-1] (HOST_LOC_0_RSVD_RW2[0-1])—Offset FED40038h, Count 2, Stride 4h" on page 2557
FED40040	4	00000000	"Control Area Request (HOST_LOC_0_CA_REQUEST)—Offset FED40040h" on page 2558
FED40044	4	00000000	"Control Area Status (HOST_LOC_0_CA_STATUS)—Offset FED40044h" on page 2558
FED40048	4	00000000	"Control Area Cancel (HOST_LOC_0_CA_CANCEL)—Offset FED40048h" on page 2558
FED4004C	4	00000000	"Control Area Start (HOST_LOC_0_CA_START)—Offset FED4004Ch" on page 2559
FED40050	4	00000000	"Control Area Interrupt Reserved Part 1 (HOST_LOC_0_CA_INT_RSVD1)—Offset FED40050h" on page 2559
FED40054	4	00000000	"Control Area Interrupt Reserved Part 2 (HOST_LOC_0_CA_INT_RSVD2)—Offset FED40054h" on page 2559
FED40058	4	00000000	"Control Area Command Size (HOST_LOC_0_CA_CMD_SZ)—Offset FED40058h" on page 2560
FED4005C	4	00000000	"Control Area Command Part 1 (HOST_LOC_0_CA_CMD1)—Offset FED4005Ch" on page 2560
FED40060	4	00000000	"Control Area Command Part 2 (HOST_LOC_0_CA_CMD2)—Offset FED40060h" on page 2560
FED40064	4	00000000	"Control Area Response Size (HOST_LOC_0_CA_RSP_SZ)—Offset FED40064h" on page 2560
FED40068	4	00000000	"Control Area Response Part 1 (HOST_LOC_0_CA_RSP1)—Offset FED40068h" on page 2561
FED4006C	4	00000000	"Control Area Response Part 2 (HOST_LOC_0_CA_RSP2)—Offset FED4006Ch" on page 2561
FED40070	4 x 4	00000000	"FTPM Reserved Read Write[0-3] (HOST_LOC_0_RSVD_RW3[0-3])—Offset FED40070h, Count 4, Stride 4h" on page 2561
FED40080	4 x 992	00000000	"FTPM Command and Response Buffer[0-991] (HOST_LOC_0_FTPM_CRB[0-991])—Offset FED40080h, Count 992, Stride 4h" on page 2561

54.1.11 Host I/O Space—KT_HOST_IOBAR

An index of the registers that are accessible in Host I/O Space is shown here.

Table 54-11. Summary of I/O Registers—KT_HOST_IOBAR

Offset (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
0	1	00	"KT Receive Buffer Register (IO_KTRBR)—Offset 0h" on page 2562
0	1	00	"KT Transmitter Holding Register (IO_KTTHR)—Offset 0h" on page 2562
0	1	00	"KT Divisor Latch LSB Register (IO_KTDLLR)—Offset 0h" on page 2563
1	1	00	"KT Interrupt Enable register (IO_KTIER)—Offset 1h" on page 2563
1	1	00	"KT Divisor Latch MSB Register (IO_KTDLMR)—Offset 1h" on page 2564
2	1	01	"KT Interrupt Identification Register (IO_KTIIR)—Offset 2h" on page 2564
2	1	00	"KT FIFO Control register (IO_KTFCR)—Offset 2h" on page 2565
3	1	03	"KT Line Control register (IO_KTLCR)—Offset 3h" on page 2566
4	1	00	"KT Modem Control register (IO_KTMCR)—Offset 4h" on page 2567
5	1	60	"KT Line Status register (IO_KTLSR)—Offset 5h" on page 2568
6	1	00	"KT Modem Status register (IO_KTMSR)—Offset 6h" on page 2569
7	1	00	"KT Scratch register (IO_KTSCR)—Offset 7h" on page 2569

54.1.12 Host I/O Space—IDE_HOST_PCMDIOBAR

An index of the registers that are accessible in Host I/O Space is shown here.

Table 54-12. Summary of I/O Registers—IDE_HOST_PCMDIOBAR

Offset (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
0	1	0000	"IDE Data Register (IDEDATA)—Offset 0h" on page 2570
1	1	00	"IDE Features Register (IDEFR)—Offset 1h" on page 2570
1	1	00	"IDE Error Register DEV0 (IDEERD0)—Offset 1h" on page 2571
1	1	00	"IDE Error Register DEV1 (IDEERD1)—Offset 1h" on page 2571
2	1	00	"IDE Sector Count In Register (IDESCIR)—Offset 2h" on page 2572
2	1	00	"IDE Sector Count Out Register DEV0 (IDESCOR0)—Offset 2h" on page 2572
2	1	00	"IDE Sector Count Out Register DEV1 (IDESCOR1)—Offset 2h" on page 2572
3	1	00	"IDE Sector Number In Register (IDESNIR)—Offset 3h" on page 2573
3	1	00	"IDE Sector Number Out Register DEV0 (IDESNOR0)—Offset 3h" on page 2573
3	1	00	"IDE Sector Number Out Register DEV1 (IDESNOR1)—Offset 3h" on page 2573
4	1	00	"IDE Cylinder Low In Register (IDECLIR)—Offset 4h" on page 2574

5	1	00	"IDE Cylinder High Out Register DEV1 (IDCHOR1)—Offset 5h" on page 2576
6	1	00	"IDE Drive/Head In Register (IDEDHIR)—Offset 6h" on page 2577
6	1	00	"IDE Drive/Head Out Register DEV0 (IDDHOR0)—Offset 6h" on page 2577
6	1	00	"IDE Drive/Head Out Register DEV1 (IDDHOR1)—Offset 6h" on page 2578
7	1	00	"IDE Command Register (IDECR)—Offset 7h" on page 2578
7	1	80	"IDE Status Register DEV0 (IDESR0)—Offset 7h" on page 2579
7	1	80	"IDE Status Register DEV1 (IDESR1)—Offset 7h" on page 2580

54.1.13 Host I/O Space—IDE_HOST_PCTLIOBAR

An index of the registers that are accessible in Host I/O Space is shown here.

Table 54-13. Summary of I/O Registers—IDE_HOST_PCTLIOBAR

Offset (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
2	1	00	"IDE Device Control Register (IDDCR)—Offset 2h" on page 2581
2	1	00	"IDE Alternate Status Register (IDASR)—Offset 2h" on page 2581

54.1.14 Host I/O Space—IDE_HOST_BMIOBAR

An index of the registers that are accessible in Host I/O Space is shown here.

Table 54-14. Summary of I/O Registers—IDE_HOST_BMIOBAR

Offset (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
0	1	00	"IDE Primary Bus Master Command Register (IDEPBMCR)—Offset 0h" on page 2582
1	1	00	"IDE Primary Bus Master Device Specific 0 Register (IDEPBMDS0R)—Offset 1h" on page 2583
2	1	80	"IDE Primary Bus Master Status Register (IDEPBMSR)—Offset 2h" on page 2584
3	1	00	"IDE Primary Bus Master Device Specific 1 Register (IDEPBMDS1R)—Offset 3h" on page 2586
4	1	00	"IDE Primary Bus Master Descriptor Table Pointer Register Byte 0 (IDEPBMDTPR0)—Offset 4h" on page 2586
5	1	00	"IDE Primary Bus Master Descriptor Table Pointer Register Byte 1 (IDEPBMDTPR1)—Offset 5h" on page 2586
6	1	00	"IDE Primary Bus Master Descriptor Table Pointer Register Byte 2 (IDEPBMDTPR2)—Offset 6h" on page 2587
7	1	00	"IDE Primary Bus Master Descriptor Table Pointer Register Byte 3 (IDEPBMDTPR3)—Offset 7h" on page 2587
8	1	00	"IDE Secondary Bus Master Command Register (IDESBMCR)—Offset 8h" on page 2588
9	1	00	"IDE Secondary Bus Master Device Specific 0 Register (IDESBMDS0R)—Offset 9h" on page 2588
A	1	80	"IDE Secondary Bus Master Status Register (IDESBMSR)—Offset Ah" on page 2589
B	1	00	"IDE Secondary Bus Master Device Specific 1 Register (IDESBMDS1R)—Offset Bh" on page 2590
C	1	00	"IDE Secondary Bus Master Descriptor Table Pointer Register Byte 0 (IDESBMDTPR0)—Offset Ch" on page 2590
D	1	00	"IDE Secondary Bus Master Descriptor Table Pointer Register Byte 1 (IDESBMDTPR1)—Offset Dh" on page 2591
E	1	00	"IDE Secondary Bus Master Descriptor Table Pointer Register Byte 2 (IDESBMDTPR2)—Offset Eh" on page 2591
F	1	00	"IDE Secondary Bus Master Descriptor Table Pointer Register Byte 3 (IDESBMDTPR3)—Offset Fh" on page 2592

54.1.15 Sideband Registers

An index of the Sideband registers that are accessible to the Host are listed here. Each is accessible in Host Memory Space using the Sideband Base Address Register (SBREG_BAR). See Section 3.4.1, "Using SBREG_BAR Method" on page 187.

Table 54-15. Summary of Sideband Registers for KT (Host)—0xf4

Offset (hex)	Default Value (hex)	Register Name (Register Symbol)
0	00000000	"KT Host Interrupt Pin Register (KTHIPINR)—Offset 0h" on page 2593
4	00000000	"BIOS KT Host PCI Function Disable Register (BKTHDISR)—Offset 4h" on page 2593

Table 54-16. Summary of Sideband Registers IDE (Host)—0xf4

Offset (hex)	Default Value (hex)	Register Name (Register Symbol)
0	00000000	"IDE Host Interrupt Pin Register (IDEHIPINR)—Offset 0h" on page 2594
4	00000000	"BIOS IDE Host PCI Function Disable Register (BIDEHDISR)—Offset 4h" on page 2594

54.2 Registers in Configuration Space—HECI1

54.2.1 Identifiers (HECI1_ID)—Offset 0h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:0] + 0h

Default: 19E58086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x19E5 RO/V	**Device ID (DID):** Indicates what device number assigned by Intel.
15:0	0x8086 RO	**Vendor ID (VID):** 16-bit field which indicates that Intel is the vendor, assigned by the PCI SIG.

54.2.2 Command (HECI1_CMD)—Offset 4h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:27, F:0] + 4h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0x0 RO	**RSVD:** Reserved
10	0x0 RW	**Interrupt Disable (ID):** Disables this device from generating PCI line based interrupts. This bit does not have any effect on MSI operations.
9	0x0 RO	**Fast Back-to-Back Enable (FBE):** Not implemented, hardwired to 0.
8	0x0 RO	**SERR# Enable (SEE):** Not implemented, hardwired to 0.
7	0x0 RO	**Wait Cycle Enable (WCC):** Not implemented, hardwired to 0.
6	0x0 RO	**Parity Error Response Enable (PEE):** Not implemented, hardwired to 0.
5	0x0 RO	**VGA Palette Snooping Enable (VAG):** Not implemented, hardwired to 0
4	0x0 RO	**Memory Write and Invalidate Enable (MWIE):** Not implemented, hardwired to 0.
3	0x0 RO	**Special Cycle Enable (SCE):** Not implemented, hardwired to 0.
2	0x0 RW	**Bus Master Enable (BME):** Controls the HECI host controller's ability to act as a system memory master for data transfers. When this bit is cleared, HECI bus master activity stops and any active DMA engines return to an idle condition. This bit is made visible to firmware through the H_PCI_CSR register, and changes to this bit may be configured by the H_PCI_CSR register to generate an MSI to mIA. When this bit is '0', HECI is blocked from generating MSI to the host CPU. ***Note:*** This bit does not block HECI accesses to CSE-UMA.
1	0x0 RW	**Memory Space Enable (MSE):** Controls access to the HECI host controller’s memory-mapped register space.
0	0x0 RO	**I/O Space Enable (IOSE):** Not implemented, hardwired to 0.

54.2.3 Status (HECI1_STS)—Offset 6h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:27, F:0] + 6h

Default: 0010h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RO	**Detected Parity Error (DPE):** Not implemented, hardwired to 0.
14	0x0 RO	**Signaled System Error (SSE):** Not implemented, hardwired to 0.
13	0x0 RO	**Received Master-Abort (RMA):** Not implemented, hardwired to 0.
12	0x0 RO	**Received Target Abort (RTA):** Not implemented, hardwired to 0.
11	0x0 RO	**Signaled Target-Abort (STA):** Not implemented, hardwired to 0.
10:9	0x0 RO	**DEVSEL# Timing (DEVT):** These bits are hardwired to 00.
8	0x0 RO	**Master Data Pariy Error Detected (DPD):** Not implemented, hardwired to 0.
7	0x0 RO	**Fast Back-to-Back Capable (FBC):** Not implemented, hardwired to 0.
6	0x0 RO	**RSVD (RSVD_6_6):** Reserved
5	0x0 RO	**66 MHz Capable (C66):** Not implemented, hardwired to 0.
4	0x1 RO	**Capabilities List (CL):** Indicates the presence of a capabilities list, hardwired to 1.
3	0x0 RO/V	**Interrupt Status (IS):** Reflects the state of the INTx# signal at the input of the enable/disable circuit. • This bit is a 1 when the INTx# is asserted. • This bit is a 0 after the interrupt is cleared (independent of the state of the Interrupt Disable bit in the command register). ***Note:*** This bit is not set by an MSI.
2:0	0x0 RO	**RSVD (RSVD_2_0):** Reserved

54.2.4 Revision ID and Class Code (HECI1_RID_CC)—Offset 8h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:0] + 8h

Default: 07800000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x7 RO	**Base Class Code (BCC):** Indicates the base class code of the HECI host controller device.
23:16	0x80 RO	**Sub Class Code (SCC):** Indicates the sub class code of the HECI host controller device.
15:8	0x0 RO	**Programming Interface (PI):** Indicates the programming interface of the HECI host controller device.
7:0	0x0 RO/V	**Revision ID (RID):** Indicates stepping of the HECI host controller.

54.2.5 Cache Line Size (HECI1_CLS)—Offset Ch

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:27, F:0] + Ch

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO	**Cache Line Size (CLS):** Not implemented, hardwired to 0.

54.2.6 Master Latency Timer (HECI1_MLT)—Offset Dh

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:27, F:0] + Dh

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO	**Master Latency Timer (MLT):** Not implemented, hardwired to 0.

54.2.7 Header Type (HECI1_HTYPE)—Offset Eh

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:27, F:0] + Eh

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7	0x1 RO	**Multi-Function Device (MFD):** Indicates the HECI host controller is part of a multi-function device.
6:0	0x0 RO	**Header Layout (HL):** Indicates that the HECI host controller uses a target device layout.

54.2.8 Built In Self-Test (HECI1_BIST)—Offset Fh

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:27, F:0] + Fh

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RO	**BIST Capable (BC):** Not implemented, hardwired to 0.
6:0	0x0 RO	**RSVD:** Reserved

54.2.9 HECI MMIO Base Address Low (HECI1_MMIO_MBAR_LO)—Offset 10h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:0] + 10h

Default: 00000004h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RW	**Base Address Low (BA_LO):** Lower 32 bits of base address of register memory space.
11:4	0x0 RO	**Memory Size (MS):** This field is hardwired to 0 to indicate that HECI device requests 4KB of memory space.
3	0x0 RO	**Prefetchable (PF):** Indicates that this range is not pre-fetchable
2:1	0x2 RO	**Type (TP):** Indicates that this range can be mapped anywhere in 64-bit address space.
0	0x0 RO	**Resource Type Indicator (RTE):** Indicates a request for register memory space.

54.2.10 HECI MMIO Base Address High (HECI1_MMIO_MBAR_HI)—Offset 14h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:0] + 14h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Base Address High (BA_HI):** Upper 32 bits of base address of register memory space.

54.2.11 Sub System Identifiers (HECI1_SS)—Offset 2Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:0] + 2Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW/O	**Subsystem ID (SSID):** Indicates the sub- system identifier. This field should be programmed by BIOS during boot-up. Once written, this register becomes Read Only.
15:0	0x0 RW/O	**Subsystem Vendor ID (SSVID):** Indicates the sub-system vendor identifier. This field should be programmed by BIOS during boot- up. Once written, this register becomes Read Only.

54.2.12 Capabilities Pointer (HECI1_CAP)—Offset 34h

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:27, F:0] + 34h

Default: 50h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x50 RO	**Capability Pointer (CP):** Indicates the first capability pointer offset. It points to the PCI power management capability offset.

54.2.13 Interrupt Information (HECI1_INTR)—Offset 3Ch

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:27, F:0] + 3Ch

Default: 0100h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x1 RO/V	**Interrupt Pin (IPIN):** This field indicates the virtual interrupt pin the HECI host controller uses. A value of 0x1/0x2/0x3/0x4 indicates that this function implements legacy interrupt on INTA/INTB/INTC/INTD, respectively. When legacy interrupt is not used this register should be set to 0x0. Programmed by BIOS over IOSF SB through corresponding Private CR register.
7:0	0x0 RW	**Interrupt Line (ILINE):** Software written value to indicate which interrupt line (vector) the interrupt is connected to. No hardware action is taken on this field.

54.2.14 Minimum Grant (HECI1_MGNT)—Offset 3Eh

Type: PCI Configuration Register
(Size: 8 bits)

Offset: [B:0, D:27, F:0] + 3Eh

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO	**Grant (GNT):** Not implemented, hardwired to 0.

54.2.15 Maximum Latency (HECI1_MLAT)—Offset 3Fh

Type: PCI Configuration Register
(Size: 8 bits)

Offset: [B:0, D:27, F:0] + 3Fh

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO	**Latency (LAT):** Not implemented, hardwired to 0.

54.2.16 Host Firmware Status (HECI1_HFS)—Offset 40h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:0] + 40h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RO	**BIOS MSG ACK:** Acknowledge for register based BIOS message in MEI 1 H_GS Register.
27:25	0x0 RO	**BIOS MSG ACK Data:** Message specific data for acknowledged BIOS message.
24:20	0x0 RO	Reserved
19:16	0x0 RO	**Operating Mode:** This field describes the current operating mode of Intel® ME. • 1:0 - Reserved • 2 - Debug Mode • 14:3 - Reserved • 15 - Intel® SPS firmware is running in Intel® ME
15:12	0x0 RO	**Error Code:** If set to nonzero value the Intel® ME firmware has encountered a fatal error and stopped normal operation. • 0 - No Error • 1 - Uncategorized Failure - The Intel® ME firmware has experienced an uncategorized error. Further details of the failure can be found in the Extended Status Data. • 2 - Disabled - Firmware was disabled on this platform. • 3 - Image Failure - The Intel® ME firmware stored in the system flash is not valid.
11	0x0 RO	**Update in Progress:** The bit is set if any type of Intel® ME firmware update is in progress.
10	0x0 RO	**Recovery BUP Load Fault:** This bit is set when firmware is not able to load recovery bring-up from the flash. It means that the recovery section in Intel® ME region on the SPI flash.
9	0x0 RO	**Init Complete:** When this but is not set firmware is still in initialization phase. When firmware has fully entered a stable state, this but is set to 1 and "Current State" field of this register provides the steady state of the Intel® ME subsystem.
8:6	0x0 RO	**Operating State:** This field describes the current operating state of Intel® ME. • 000 - Preboot • 001 - M0 with UMA • 010 - Reserved • 011 - Reserved • 100 - M3 without UMA • 101 - M0 without UMA - normal state for Intel® SPS firmware • 110 - Bring up • 111 - M0 without UMA but with error
5	0x0 RO	**FPT or Factory Defaults Bad:** This bit is set when the firmware discovers a bad checksum of Intel® ME region Flash Partition Table (FPT) or Factory Defaults. When this bit set, it may or may not have the error code shown in bit [15:12]. The system can get this bit clear only by re-flashing the whole Intel® ME region in the SPI Flash.
4	0x0 RO	**Manufacturing Mode:** When this bit is set, the platform is still in manufacturing mode. Host can use this bit to inform user that the platform is NOT READY for production yet. This but is set as long as Intel® ME Region access is not locked for flash masters other than Intel® ME. For shipping machine, this bit MUST be 0.

Bit Range	Default & Access	Field Name (ID): Description
3:0	0x0 RO	**Current State:** This field describes the current operation state of the firmware. • 0 - Reset - Intel® ME is in reset state, will exit this state within 1 millisecond • 1 - Initialization - Intel® ME is initializing, will exit this state within 2 seconds • 2 - Recovery - Intel® ME is in recovery mode, check ME1.GMES register to determine cause • 3 - Reserved • 4 - Disabled - Intel® ME functionality has been disabled, it executes idle loop • 5 - Operational - Intel® ME is in normal operational state • 6 - Reserved • 7 - State Transition - Intel® ME sets this state before starting a transition to a new Operating State. It is a temporary state, may appear on transition between Initialization and Operational.

54.2.17 Miscellaneous Shadow (HECI1_MISC_SHDW)—Offset 44h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:0] + 44h

Default: 80000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x1 RO	**Miscellaneous Shadow Valid (MSVLD):** This bit is hardwired to 1 to indicate that this HECI device implements the Miscellaneous Shadow register. This bit can be used by host software that is bus/dev/function number agnostic (such as HECI operating system driver) to discover whether the Miscellaneous Shadow register is implemented or not.
30:17	0x0 RO	**RSVD_30_17:** Reserved
16	0x0 RO/V	**CSE UMA Size Valid (CUSZV):** This bit indicates that firmware has written the CUSZ field. This field reflects the value of CSE CUBA.CUSZV.
15:7	0x0 RO	**Reserved (RSVD_15_7):** Reserved.
6:0	0x0 RO/V	**CSE UMA Size (CUSZ):** These bits reflect firmware's desired size of CSEUMA memory region. It is configured by firmware prior to bring up core power and allowing BIOS to initialize memory. The legal CSEUMA sizes and encodings for this field are: • 0000000b (0MB, no CSEUMA region) • 0000001b (1MB) • 0000010b (2MB) • 0000100b (4MB) • 0001000b (8MB) • 0010000b (16MB) • 0100000b (32MB) • 1000000b (64MB) This field reflects the value of CSE CUBA.CUSZ.

54.2.18 General Status Shadow 1 (HECI1_GS_SHDW1)—Offset 48h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:0] + 48h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**EOP Status:** This bit presents the Intel® ME notion of EOP status. If BIOS encounters this bit set to '1' during POST it signals an error in platform power flow.
30:28	0x0 RO	**Infrastructure Progress Code:** This field identifies the infrastructure progress code: • 0 - ROM - Intel® ME is in ROM phase • 1 - BUP - Intel® ME is in BRINGUP phase • 2 - uKernel - Intel® ME is in Micro Kernel phase • 3 - Policy Module - Intel® ME is in Policy Module phase • 4 - Other Module - Intel® ME is loading modules in M0 or M3 Operating State
27:16	0x0 RO	**Extended Status Data:** These bits provide extended status data for the current state of operating of the firmware. Or, if the firmware is in a fatal error state, these bits provide extended error code information.
15:13	0x0 RO	**Firmware Heartbeat:** This number increments approximately every second if Intel® ME firmware is running.
12	0x0 RO	Intel® ME Target Image Boot Fault • 0 - Target image loaded successfully • 1 - Target image boot failed, switched to backup image or recovery image
11:8	0x0 RO	Reserved
7	0x0 RO	**Warm Reset Request:** If this bit is set, Intel® ME informs BIOS that a warm reset is requested by Intel® ME.
6	0x0 RO	**MFS Failure:** If this bit is set, Intel® ME informs BIOS that Intel® ME File System failure has been detected during recent Intel® ME boot.
5:4	0x0 RO	Reserved

3:1	0x0
	RO
		Recovery Cause: If ME1.HFS.Current State indicates that Intel® ME firmware is running in recovery mode these bits provide the cause of this mode:
		• 0 - Intel® ME recovery jumper asserted
		• 1 - Security strap override jumper asserted
		• 2 - Recovery forced with IPMI command
		• 3 - Invalid flash configuration, either:
		  • flash master access permissions configuration is wrong
		  • VSCC entry is missing or wrong
		  • flash erase block size in Intel® ME region configuration
		• 4 - Intel® ME internal error
		  Intel® ME could not start in operational mode because of some firmware problems.
		• 5..7 - Reserved for future extensions

0	0x0 RO	**BIST in Progress:** If this bit is set Intel® ME Built In Self-Test is in Progress.

54.2.19 Host General Status (HECI1_H_GS1)—Offset 4Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:0] + 4Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Host General Status (H_GS1):** General status of Host. This field is not used by hardware.

54.2.20 PCI Power Management Capability ID (HECI1_PID)—Offset 50h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:27, F:0] + 50h

Default: 8C01h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x8c RO	**Next Capability (NEXT):** Indicates the location of the next capability item in the list. This is the Message Signaled Interrupts capability.
7:0	0x1 RO	**Cap ID (CID):** Indicates that this pointer is a PCI power management.

54.2.21 PCI Power Management Capabilities (HECI1_PC)—Offset 52h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:27, F:0] + 52h

Default: 4003h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0x8 RO	**PME Support (PSUP):** Indicates the states that can generate PME#. HECI can assert PME# from D3hot only.
10	0x0 RO	**D2 Support (D2S):** The D2 state is not supported for the HECI host controller.
9	0x0 RO	**D _Support (D1S):** The D1 state is not supported for the HECI host controller.
8:6	0x0 RO	**Aux_Current (AUXC):** Reports the maximum Suspend well current required when in the D3COLD state. Value of 0 is reported.
5	0x0 RO	**Device Specific Initialization (DSI):** Indicates whether device-specific initialization is required.
4	0x0 RO	**Reserved (RSVD):** Reserved.
3	0x0 RO	**PME Clock (PMEC):** Indicates that PCI clock is not required to generate PME#.
2:0	0x3 RO	**Version (VS):** Indicates support for Revision 1.2 of the PCI Power Management Specification.

54.2.22 PCI Power Management Control and Status (HECI1_PMCS)—Offset 54h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:27, F:0] + 54h

Default: 0008h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW/1C/V	**PME Status (PMES):** The PME Status bit in HECI space can be set to '1' by CSE FW performing a write into CSE side register to set PMES. This bit is cleared by host CPU writing a '1' to it. CSE cannot clear this bit. Host CPU writes with value '0' have no effect on this bit.
14:9	0x0 RO	**Reserved (RSVD_14_9):** Reserved.
8	0x0 RW	**PME Enable (PMEE):** When set, PME_assert and PME_deassert messages are sent over the SoC Sideband to the SoC PMC based on the PMES bit. When reset these messages are not sent to the PMC.
7:4	0x0 RO	**Reserved (RSVD_7_4):** Reserved.
3	0x1 RO	**No Soft Reset (NSR):** This bit indicates that when the HECI host controller is transitioning from D3hot to D0 due to power state command, it does not perform and internal reset.
2	0x0 RO	**Reserved (RSVD_2_2):** Reserved.
1:0	0x0 RW	**Power State (PS):** This field is used both to determine the current power state of the HECI host controller and to set a new power state. The values are: • 00 - D0 state • 11 - D3HOT state The D1 and D2 states are not supported for this HECI host controller.

54.2.23 General Status Shadow 2 (HECI1_GS_SHDW2)—Offset 60h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:0] + 60h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**General Status Shadow 2 (GSS2):** This field is host side shadow of CSE General Status 2 (CSE_GS2).

54.2.24 General Status Shadow 3 (HECI1_GS_SHDW3)—Offset 64h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:0] + 64h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**General Status Shadow 3 (GSS3):** This field is host side shadow of CSE General Status 3 (CSE_GS3).

54.2.25 General Status Shadow 4 (HECI1_GS_SHDW4)—Offset 68h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:0] + 68h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**General Status Shadow 4 (GSS4):** This field is host side shadow of CSE General Status 4 (CSE_GS4).

54.2.26 General Status Shadow 5 (HECI1_GS_SHDW5)—Offset 6Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:0] + 6Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**General Status Shadow 5 (GSS5):** This field is host side shadow of CSE General Status 5 (CSE_GS5).

54.2.27 Host General Status 2 (HECI1_H_GS2)—Offset 70h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:0] + 70h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Host General Status 2 (H_GS2):** General status of Host. This field is not used by hardware.

54.2.28 Host General Status 3 (HECI1_H_GS3)—Offset 74h

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:27, F:0] + 74h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Host General Status 3 (H_GS3):** General status of Host. This field is not used by hardware.

54.2.29 Message Signaled Interrupt Identifiers (HECI1_MID)—Offset 8Ch

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:27, F:0] + 8Ch

Default: 0005h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x0 RO	**Next Pointer (NEXT):** Indicates the next item in the list. This can be additional capability pointers or, if zero, indicates that this is the last item in the list.
7:0	0x5 RO	**Capability ID (CID):** Indicates Message Signaled Interrupts (MSI).

54.2.30 Message Signaled Interrupt Message Control (HECI1_MC)—Offset 8Eh

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:27, F:0] + 8Eh

Default: 0080h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x0 RO	**Reserved (RSVD):** Reserved.
7	0x1 RO	**64 Bit Address Capable (C64):** Specifies whether capable of generating 64-bit messages.
6:4	0x0 RO	**Multiple Message Enable (MME):** Not implemented, hardwired to 0.
3:1	0x0 RO	**Multiple Message Capable (MMC):** Not implemented, hardwired to 0.
0	0x0 RW	**MSI Enable (MSIE):** If set, MSI is enabled and INTx virtual wires are not used to generate interrupts.

54.2.31 Message Signaled Interrupt Message Address (HECI1_MA)—Offset 90h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:0] + 90h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**Address (ADDR):** Lower 32 bits of the system specified message address, always DW aligned.
1:0	0x0 RO	**Reserved (RSVD):** Reserved.

54.2.32 Message Signaled Interrupt Upper Address (HECI1_MUA)—Offset 94h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:0] + 94h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Upper Address (UADDR):** Upper 32 bits of the system specified message address. This register is optional and only implemented if MC.C64=1.

54.2.33 Message Signaled Interrupt Message Data (HECI1_MD)—Offset 98h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:27, F:0] + 98h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x0 RW	**Data (DATA):** This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the FSB during the data phase of the MSI memory write transaction.

54.2.34 HECI Interrupt Delivery Mode (HECI1_HIDM)—Offset A0h

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:27, F:0] + A0h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0x0 RO	**Reserved (RSVD):** Reserved.
2	0x0 RW/1S	**HIDM Lock (HIDM_L):** Writing 1 to this bit locks the HIDM field.
1:0	0x0 RW/L	**HECI Interrupt Delivery Mode (HIDM):** These bits control what type of interrupt the HECI will send when CSE FW writes to set the CSE_IG bit. They are interpreted as follows: • 00 - Generate Legacy or MSI interrupt • 01 - Generate SCI • 10 - Generate SMI This field may be locked by writing 1 to HIDM_L bit.

54.2.35 Host Extend Register Status (HECI1_HERS)—Offset BCh

This register is used to communicate the CSE FW measurement status information to host.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:0] + BCh

Default: 40000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO/V	**Extend Register Valid (ERV):** Set by FW after all FW has been loaded and the measurement data has been stored in HERx registers. • If ERA field is SHA-1, the result of the extend operation is in HER:5-1. • If ERA field is SHA-256, the result is in HER:8-1.
30	0x1 RO	**Extend Feature Present (EFP):** This bit is hardwired to 1 to allow driver software to easily detect the chipset supports the Extend Registers FW measurement feature.
29:4	0x0 RO	**Reserved (RSVD_29_4):** Reserved.
3:0	0x0 RO/V	**Extend Register Algorithm (ERA):** This field indicates the hash algorithm used in the FW measurement Extend operation. Encodings are: • 0x0: SHA-1 • 0x2: SHA-256 • Other values: reserved. This field is set by FW with the used hash algorithm value when the ERV bit is set to 1. This field is meaningless when the ERV bit is 0. This field does NOT have any defined reset value.

54.2.36 Host Extend Register DW1. (HECI1_HER1)—Offset C0h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:0] + C0h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**Host Extend Register DW1 (ERDW1):** 1st DWORD result of the extend operation. ***Note:*** Note: Extend Operation is HER[5:1] if using SHA-1. If using SHA-256 then Extend Operation is HER[8:1].

54.2.37 Host Extend Register DW2. (HECI1_HER2)—Offset C4h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:0] + C4h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**Host Extend Register DW2 (ERDW2):** 2nd DWORD result of the extend operation. ***Note:*** Extend Operation is HER[5:1] if using SHA-1. If using SHA-256 then Extend Operation is HER[8:1].

54.2.38 Host Extend Register DW3. (HECI1_HER3)—Offset C8h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:0] + C8h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**Host Extend Register DW3 (ERDW3):** 3rd DWORD result of the extend operation. ***Note:*** Extend Operation is HER[5:1] if using SHA-1. If using SHA-256 then Extend Operation is HER[8:1].

54.2.39 Host Extend Register DW4. (HECI1_HER4)—Offset CCh

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:0] + CCh

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**Host Extend Register DW4 (ERDW4):** 4th DWORD result of the extend operation. ***Note:*** Extend Operation is HER[5:1] if using SHA-1. If using SHA-256 then Extend Operation is HER[8:1].

54.2.40 Host Extend Register DW5. (HECI1_HER5)—Offset D0h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:0] + D0h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**Host Extend Register DW5 (ERDW5):** 5th DWORD result of the extend operation. ***Note:*** Extend Operation is HER[5:1] if using SHA-1. If using SHA-256 then Extend Operation is HER[8:1].

54.2.41 Host Extend Register DW6. (HECI1_HER6)—Offset D4h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:0] + D4h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**Host Extend Register DW6 (ERDW6):** 6th DWORD result of the extend operation. ***Note:*** Extend Operation is HER[5:1] if using SHA-1. If using SHA-256 then Extend Operation is HER[8:1].

54.2.42 Host Extend Register DW7. (HECI1_HER7)—Offset D8h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:0] + D8h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**Host Extend Register DW7 (ERDW7):** 7th DWORD result of the extend operation. ***Note:*** Extend Operation is HER[5:1] if using SHA-1. If using SHA-256 then Extend Operation is HER[8:1].

54.2.43 Host Extend Register DW8. (HECI1_HER8)—Offset DCh

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:0] + DCh

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**Host Extend Register DW8 (ERDW8):** 8th DWORD result of the extend operation. ***Note:*** Extend Operation is HER[5:1] if using SHA-1. If using SHA-256 then Extend Operation is HER[8:1].

54.2.44 Manufacturer's ID (HECI1_MANID)—Offset F8h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:0] + F8h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RO	**Reserved (RSVD_31_28):** Reserved.
27:24	0x0 RO/V	**Dot Portion of Process ID (DPOP):** Indicates the dot process.
23:16	0x0 RO/V	**Manufacturing Stepping ID (MSID):** This field is incremented for each stepping of the part. This field can be used by software to differentiate steppings when Revision ID may not change.
15:8	0x0 RO/V	**Manufacturing ID (MID):** This field is set by the SoC.
7:0	0x0 RO/V	**Process Portion of Process ID (PPOP):** Indicates the process. The dot portion of the process is reflected in bits [27:24]. This field can be used by software to differentiate steppings when Revision ID may not change.

54.3 Registers in Configuration Space—HECI2

54.3.1 Identifiers (HECI2_ID)—Offset 0h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:1] + 0h

Default: 19E68086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x19E6 RO/V	**Device ID (DID):** Indicates what device number assigned by Intel.
15:0	0x8086 RO	**Vendor ID (VID):** 16-bit field which indicates that Intel is the vendor, assigned by the PCI SIG.

54.3.2 Command (HECI2_CMD)—Offset 4h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:27, F:1] + 4h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0x0 RO	**RSVD:** Reserved
10	0x0 RW	**Interrupt Disable (ID):** Disables this device from generating PCI line based interrupts. This bit does not have any effect on MSI operations.
9	0x0 RO	**Fast Back-to-Back Enable (FBE):** Not implemented, hardwired to 0.
8	0x0 RO	**SERR# Enable (SEE):** Not implemented, hardwired to 0.
7	0x0 RO	**Wait Cycle Enable (WCC):** Not implemented, hardwired to 0.
6	0x0 RO	**Parity Error Response Enable (PEE):** Not implemented, hardwired to 0.
5	0x0 RO	**VGA Palette Snooping Enable (VAG):** Not implemented, hardwired to 0
4	0x0 RO	**Memory Write and Invalidate Enable (MWIE):** Not implemented, hardwired to 0.
3	0x0 RO	**Special Cycle Enable (SCE):** Not implemented, hardwired to 0.
2	0x0 RW	**Bus Master Enable (BME):** Controls the HECI host controller's ability to act as a system memory master for data transfers. When this bit is cleared, HECI bus master activity stops and any active DMA engines return to an idle condition. This bit is made visible to firmware through the H_PCI_CSR register, and changes to this bit may be configured by the H_PCI_CSR register to generate an MSI to mIA. When this bit is '0', HECI is blocked from generating MSI to the host CPU. ***Note:*** This bit does not block HECI accesses to CSE-UMA
1	0x0 RW	**Memory Space Enable (MSE):** Controls access to the HECI host controllers memory-mapped register space.
0	0x0 RO	**I/O Space Enable (IOSE):** Not implemented, hardwired to 0.

54.3.3 Status (HECI2_STS)—Offset 6h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:27, F:1] + 6h

Default: 0010h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RO	**Detected Parity Error (DPE):** Not implemented, hardwired to 0.
14	0x0 RO	**Signaled System Error (SSE):** Not implemented, hardwired to 0.
13	0x0 RO	**Received Master-Abort (RMA):** Not implemented, hardwired to 0.
12	0x0 RO	**Received Target Abort (RTA):** Not implemented, hardwired to 0.
11	0x0 RO	**Signaled Target-Abort (STA):** Not implemented, hardwired to 0.
10:9	0x0 RO	**DEVSEL# Timing (DEVT):** These bits are hardwired to 00.
8	0x0 RO	**Master Data Pariy Error Detected (DPD):** Not implemented, hardwired to 0.
7	0x0 RO	**Fast Back-to-Back Capable (FBC):** Not implemented, hardwired to 0.
6	0x0 RO	**RSVD (RSVD_6_6):** Reserved
5	0x0 RO	**66 MHz Capable (C66):** Not implemented, hardwired to 0.
4	0x1 RO	**Capabilities List (CL):** Indicates the presence of a capabilities list, hardwired to 1.
3	0x0 RO/V	**Interrupt Status (IS):** Reflects the state of the INTx# signal at the input of the enable/disable circuit. This bit is a 1 when the INTx# is asserted. This bit is a 0 after the interrupt is cleared (independent of the state of the Interrupt Disable bit in the command register). ***Note:*** This bit is not set by an MSI.
2:0	0x0 RO	**RSVD (RSVD_2_0):** Reserved

54.3.4 Revision ID and Class Code (HECI2_RID_CC)—Offset 8h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:1] + 8h

Default: 07800000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x7 RO	**Base Class Code (BCC):** Indicates the base class code of the HECI host controller device.
23:16	0x80 RO	**Sub Class Code (SCC):** Indicates the sub class code of the HECI host controller device.
15:8	0x0 RO	**Programming Interface (PI):** Indicates the programming interface of the HECI host controller device.
7:0	0x0 RO/V	**Revision ID (RID):** Indicates stepping of the HECI host controller.

54.3.5 Cache Line Size (HECI2_CLS)—Offset Ch

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:27, F:1] + Ch

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO	**Cache Line Size (CLS):** Not implemented, hardwired to 0.

54.3.6 Master Latency Timer (HECI2_MLT)—Offset Dh

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:27, F:1] + Dh

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO	**Master Latency Timer (MLT):** Not implemented, hardwired to 0.

54.3.7 Header Type (HECI2_HTYPE)—Offset Eh

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:27, F:1] + Eh

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7	0x1 RO	**Multi-Function Device (MFD):** Indicates the HECI host controller is part of a multi-function device.
6:0	0x0 RO	**Header Layout (HL):** Indicates that the HECI host controller uses a target device layout.

54.3.8 Built In Self-Test (HECI2_BIST)—Offset Fh

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:27, F:1] + Fh

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RO	**BIST Capable (BC):** Not implemented, hardwired to 0.
6:0	0x0 RO	**RSVD:** Reserved

54.3.9 HECI MMIO Base Address Low (HECI2_MMIO_MBAR_LO)—Offset 10h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:1] + 10h

Default: 00000004h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RW	**Base Address Low (BA_LO):** Lower 32 bits of base address of register memory space.
11:4	0x0 RO	**Memory Size (MS):** This field is hardwired to 0 to indicate that HECI device requests 4KB of memory space.
3	0x0 RO	**Prefetchable (PF):** Indicates that this range is not pre-fetchable
2:1	0x2 RO	**Type (TP):** Indicates that this range can be mapped anywhere in 64-bit address space.
0	0x0 RO	**Resource Type Indicator (RTE):** Indicates a request for register memory space.

54.3.10 HECI MMIO Base Address High (HECI2_MMIO_MBAR_HI)—Offset 14h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:1] + 14h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Base Address High (BA_HI):** Upper 32 bits of base address of register memory space.

54.3.11 Sub System Identifiers (HECI2_SS)—Offset 2Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:1] + 2Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW/O	**Subsystem ID (SSID):** Indicates the sub- system identifier. This field should be programmed by BIOS during boot-up. Once written, this register becomes Read Only.
15:0	0x0 RW/O	**Subsystem Vendor ID (SSVID):** Indicates the sub-system vendor identifier. This field should be programmed by BIOS during boot- up. Once written, this register becomes Read Only.

54.3.12 Capabilities Pointer (HECI2_CAP)—Offset 34h

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:27, F:1] + 34h

Default: 50h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x50 RO	**Capability Pointer (CP):** Indicates the first capability pointer offset. It points to the PCI power management capability offset.

54.3.13 Interrupt Information (HECI2_INTR)—Offset 3Ch

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:27, F:1] + 3Ch

Default: 0100h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x1 RO/V	**Interrupt Pin (IPIN):** This field indicates the virtual interrupt pin the HECI host controller uses. A value of 0x1/0x2/0x3/0x4 indicates that this function implements legacy interrupt on INTA/INTB/INTC/INTD, respectively. When legacy interrupt is not used this register should be set to 0x0.
7:0	0x0 RW	**Interrupt Line (ILINE):** Software written value to indicate which interrupt line (vector) the interrupt is connected to. No hardware action is taken on this field.

54.3.14 Minimum Grant (HECI2_MGNT)—Offset 3Eh

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:27, F:1] + 3Eh

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO	**Grant (GNT):** Not implemented, hardwired to 0.

54.3.15 Maximum Latency (HECI2_MLAT)—Offset 3Fh

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:27, F:1] + 3Fh

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO	**Latency (LAT):** Not implemented, hardwired to 0.

54.3.16 Host Firmware Status (HECI2_HFS)—Offset 40h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:1] + 40h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RO	**BIOS MSG ACK:** Acknowledge for register based BIOS message in MEI 1 H_GS Register.
27:25	0x0 RO	**BIOS MSG ACK Data:** Message specific data for acknowledged BIOS message.
24:20	0x0 RO	Reserved
19:16	0x0 RO	**Operating Mode:** This field describes the current operating mode of Intel® ME. • 1:0 - Reserved • 2 - Debug Mode • 14:3 - Reserved • 15 - Intel® SPS firmware is running in Intel® ME
15:12	0x0 RO	**Error Code:** If set to nonzero value the Intel® ME firmware has encountered a fatal error and stopped normal operation. • 0 - No Error • 1 - Uncategorized Failure - The Intel® ME firmware has experienced an uncategorized error. Further details of the failure can be found in the Extended Status Data. • 2 - Disabled - Firmware was disabled on this platform. • 3 - Image Failure - The Intel® ME firmware stored in the system flash is not valid.
11	0x0 RO	**Update in Progress:** The bit is set if any type of Intel® ME firmware update is in progress.
10	0x0 RO	**Recovery BUP Load Fault:** This bit is set when firmware is not able to load recovery bring-up from the flash. It means that the recovery section in Intel® ME region on the SPI flash.
9	0x0 RO	**Init Complete:** When this but is not set firmware is still in initialization phase. When firmware has fully entered a stable state, this but is set to 1 and "Current State" field of this register provides the steady state of the Intel® ME subsystem.
8:6	0x0 RO	**Operating State:** This field describes the current operating state of Intel® ME. • 000 - Preboot • 001 - M0 with UMA • 010 - Reserved • 011 - Reserved • 100 - M3 without UMA • 101 - M0 without UMA - normal state for Intel® SPS firmware • 110 - Bring up • 111 - M0 without UMA but with error
5	0x0 RO	**FPT or Factory Defaults Bad:** This bit is set when the firmware discovers a bad checksum of Intel® ME region Flash Partition Table (FPT) or Factory Defaults. When this bit set, it may or may not have the error code shown in bit [15:12]. The system can get this bit clear only by re-flashing the whole Intel® ME region in the SPI Flash.
4	0x0 RO	**Manufacturing Mode:** When this bit is set, the platform is still in manufacturing mode. Host can use this bit to inform user that the platform is NOT READY for production yet. This but is set as long as Intel® ME Region access is not locked for flash masters other than Intel® ME. For shipping machine, this bit MUST be 0.

Bit Range	Default & Access	Field Name (ID): Description
3:0	0x0 RO	**Current State:** This field describes the current operation state of the firmware. • 0 - Reset - Intel® ME is in reset state, will exit this state within 1 millisecond • 1 - Initialization - Intel® ME is initializing, will exit this state within 2 seconds • 2 - Recovery - Intel® ME is in recovery mode, check ME1.GMES register to determine cause • 3 - Reserved • 4 - Disabled - Intel® ME functionality has been disabled, it executes idle loop • 5 - Operational - Intel® ME is in normal operational state • 6 - Reserved • 7 - State Transition - Intel® ME sets this state before starting a transition to a new Operating State. It is a temporary state, may appear on transition between Initialization and Operational.

54.3.17 General Status Shadow 1 (HECI2_GS_SHDW1)—Offset 48h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:1] + 48h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**EOP Status:** This bit presents the Intel® ME notion of EOP status. If BIOS encounters this bit set to '1' during POST it signals an error in platform power flow.
30:28	0x0 RO	**Infrastructure Progress Code:** This field identifies the infrastructure progress code: • 0 - ROM - Intel® ME is in ROM phase • 1 - BUP - Intel® ME is in BRINGUP phase • 2 - uKernel - Intel® ME is in Micro Kernel phase • 3 - Policy Module - Intel® ME is in Policy Module phase • 4 - Other Module - Intel® ME is loading modules in M0 or M3 Operating State
27:16	0x0 RO	**Extended Status Data:** These bits provide extended status data for the current state of operating of the firmware. Or, if the firmware is in a fatal error state, these bits provide extended error code information.
15:13	0x0 RO	**Firmware Heartbeat:** This number increments approximately every second if Intel® ME firmware is running.
12	0x0 RO	Intel® ME Target Image Boot Fault • 0 - Target image loaded successfully • 1 - Target image boot failed, switched to backup image or recovery image
11:8	0x0 RO	Reserved
7	0x0 RO	**Warm Reset Request:** If this bit is set, Intel® ME informs BIOS that a warm reset is requested by Intel® ME.
6	0x0 RO	**MFS Failure:** If this bit is set, Intel® ME informs BIOS that Intel® ME File System failure has been detected during recent Intel® ME boot.
5:4	0x0 RO	Reserved

3:1	0x0
	RO
		Recovery Cause: If ME1.HFS.Current State indicates that Intel® ME firmware is running in recovery mode these bits provide the cause of this mode:
		• 0 - Intel® ME recovery jumper asserted
		• 1 - Security strap override jumper asserted
		• 2 - Recovery forced with IPMI command
		• 3 - Invalid flash configuration, either:
		  • flash master access permissions configuration is wrong
		  • VSCC entry is missing or wrong
		  • flash erase block size in Intel® ME region configuration
		• 4 - Intel® ME internal error
		  Intel® ME could not start in operational mode because of some firmware problems.
		• 5..7 - Reserved for future extensions

0	0x0 RO	**BIST in Progress:** If this bit is set Intel® ME Built In Self-Test is in Progress.

54.3.18 Host General Status (HECI2_H_GS1)—Offset 4Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:1] + 4Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Host General Status (H_GS1):** General status of Host. This field is not used by hardware.

54.3.19 PCI Power Management Capability ID (HECI2_PID)—Offset 50h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:27, F:1] + 50h

Default: 8C01h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x8c RO	**Next Capability (NEXT):** Indicates the location of the next capability item in the list. This is the Message Signaled Interrupts capability.
7:0	0x1 RO	**Cap ID (CID):** Indicates that this pointer is a PCI power management.

54.3.20 PCI Power Management Capabilities (HECI2_PC)—Offset 52h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:27, F:1] + 52h

Default: 4003h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0x8 RO	**PME Support (PSUP):** Indicates the states that can generate PME#. HECI can assert PME# from D3hot only.
10	0x0 RO	**D2 Support (D2S):** The D2 state is not supported for the HECI host controller.
9	0x0 RO	**D _Support (D1S):** The D1 state is not supported for the HECI host controller.
8:6	0x0 RO	**Aux_Current (AUXC):** Reports the maximum Suspend well current required when in the D3COLD state. Value of 0 is reported.
5	0x0 RO	**Device Specific Initialization (DSI):** Indicates whether device-specific initialization is required.
4	0x0 RO	**Reserved (RSVD):** Reserved.
3	0x0 RO	**PME Clock (PMEC):** Indicates that PCI clock is not required to generate PME#.
2:0	0x3 RO	**Version (VS):** Indicates support for Revision 1.2 of the PCI Power Management Specification.

54.3.21 PCI Power Management Control and Status (HECI2_PMCS)—Offset 54h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:27, F:1] + 54h

Default: 0008h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW/1C/V	**PME Status (PMES):** The PME Status bit in HECI space can be set to '1' by CSE FW performing a write into CSE side register to set PMES. This bit is cleared by host CPU writing a '1' to it. CSE cannot clear this bit. Host CPU writes with value '0' have no effect on this bit.
14:9	0x0 RO	**Reserved (RSVD_14_9):** Reserved.
8	0x0 RW	**PME Enable (PMEE):** When set, PME_assert and PME_deassert messages are sent over the Soc Sideband to the SoC PMC based on the PMES bit. When reset these messages are not sent to the PMC.
7:4	0x0 RO	**Reserved (RSVD_7_4):** Reserved.
3	0x1 RO	**No Soft Reset (NSR):** This bit indicates that when the HECI host controller is transitioning from D3hot to D0 due to power state command, it does not perform and internal reset.
2	0x0 RO	**Reserved (RSVD_2_2):** Reserved.
1:0	0x0 RW	**Power State (PS):** This field is used both to determine the current power state of the HECI host controller and to set a new power state. The values are: • 00 - D0 state • 11 - D3HOT state The D1 and D2 states are not supported for this HECI host controller.

54.3.22 General Status Shadow 2 (HECI2_GS_SHDW2)—Offset 60h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:1] + 60h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**General Status Shadow 2 (GSS2):** This field is host side shadow of CSE General Status 2 (CSE_GS2).

54.3.23 General Status Shadow 3 (HECI2_GS_SHDW3)—Offset 64h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:1] + 64h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**General Status Shadow 3 (GSS3):** This field is host side shadow of CSE General Status 3 (CSE_GS3).

54.3.24 General Status Shadow 4 (HECI2_GS_SHDW4)—Offset 68h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:1] + 68h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**General Status Shadow 4 (GSS4):** This field is host side shadow of CSE General Status 4 (CSE_GS4).

54.3.25 General Status Shadow 5 (HECI2_GS_SHDW5)—Offset 6Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:1] + 6Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**General Status Shadow 5 (GSS5):** This field is host side shadow of CSE General Status 5 (CSE_GS5).

54.3.26 Host General Status 2 (HECI2_H_GS2)—Offset 70h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:1] + 70h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Host General Status 2 (H_GS2):** General status of Host. This field is not used by hardware.

54.3.27 Host General Status 3 (HECI2_H_GS3)—Offset 74h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:1] + 74h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Host General Status 3 (H_GS3):** General status of Host. This field is not used by hardware.

54.3.28 Message Signaled Interrupt Identifiers (HECI2_MID)—Offset 8Ch

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:27, F:1] + 8Ch

Default: 0005h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x0 RO	**Next Pointer (NEXT):** Indicates the next item in the list. This can be additional capability pointers or, if zero, indicates that this is the last item in the list.
7:0	0x5 RO	**Capability ID (CID):** Indicates Message Signaled Interrupts (MSI).

54.3.29 Message Signaled Interrupt Message Control (HECI2_MC)—Offset 8Eh

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:27, F:1] + 8Eh

Default: 0080h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x0 RO	**Reserved (RSVD):** Reserved.
7	0x1 RO	**64 Bit Address Capable (C64):** Specifies whether capable of generating 64-bit messages.
6:4	0x0 RO	**Multiple Message Enable (MME):** Not implemented, hardwired to 0.
3:1	0x0 RO	**Multiple Message Capable (MMC):** Not implemented, hardwired to 0.
0	0x0 RW	**MSI Enable (MSIE):** If set, MSI is enabled and INTx virtual wires are not used to generate interrupts.

54.3.30 Message Signaled Interrupt Message Address (HECI2_MA)—Offset 90h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:1] + 90h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**Address (ADDR):** Lower 32 bits of the system specified message address, always DW aligned.
1:0	0x0 RO	**Reserved (RSVD):** Reserved.

54.3.31 Message Signaled Interrupt Upper Address (HECI2_MUA)—Offset 94h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:1] + 94h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Upper Address (UADDR):** Upper 32 bits of the system specified message address. This register is optional and only implemented if MC.C64=1.

54.3.32 Message Signaled Interrupt Message Data (HECI2_MD)—Offset 98h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:27, F:1] + 98h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x0 RW	**Data (DATA):** This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the FSB during the data phase of the MSI memory write transaction.

54.3.33 HECI Interrupt Delivery Mode (HECI2_HIDM)—Offset A0h

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:27, F:1] + A0h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0x0 RO	**Reserved (RSVD):** Reserved.
2	0x0 RW/1S	**HIDM Lock (HIDM_L):** Writing 1 to this bit locks the HIDM field.
1:0	0x0 RW/L	**HECI Interrupt Delivery Mode (HIDM):** These bits control what type of interrupt the HECI will send when CSE FW writes to set the CSE_IG bit. They are interpreted as follows: • 00 - Generate Legacy or MSI interrupt • 01 - Generate SCI • 10 - Generate SMI This field may be locked by writing 1 to HIDM_L bit.

54.3.34 Manufacturer's ID (HECI2_MANID)—Offset F8h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:1] + F8h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RO	**Reserved (RSVD_31_28):** Reserved.
27:24	0x0 RO/V	**Dot Portion of Process ID (DPOP):** Indicates the dot process.
23:16	0x0 RO/V	**Manufacturing Stepping ID (MSID):** This field is incremented for each stepping of the part. ***Note:*** This field can be used by software to differentiate steppings when Revision ID may not change.
15:8	0x0 RO/V	**Manufacturing ID (MID):** This field is set by the SoC.
7:0	0x0 RO/V	**Process Portion of Process ID (PPOP):** Indicates the process. The dot portion of the process is reflected in bits [27:24]. This field can be used by software to differentiate steppings when Revision ID may not change.

54.4 Registers in Configuration Space—HECI3

54.4.1 Identifiers (HECI3_ID)—Offset 0h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:4] + 0h

Default: 19E98086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x19E9 RO/V	**Device ID (DID):** Indicates what device number assigned by Intel.
15:0	0x8086 RO	**Vendor ID (VID):** 16-bit field which indicates that Intel is the vendor, assigned by the PCI SIG.

54.4.2 Command (HECI3_CMD)—Offset 4h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:27, F:4] + 4h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0x0 RO	**RSVD:** Reserved
10	0x0 RW	**Interrupt Disable (ID):** Disables this device from generating PCI line based interrupts. This bit does not have any effect on MSI operations.
9	0x0 RO	**Fast Back-to-Back Enable (FBE):** Not implemented, hardwired to 0.
8	0x0 RO	**SERR# Enable (SEE):** Not implemented, hardwired to 0.
7	0x0 RO	**Wait Cycle Enable (WCC):** Not implemented, hardwired to 0.
6	0x0 RO	**Parity Error Response Enable (PEE):** Not implemented, hardwired to 0.
5	0x0 RO	**VGA Palette Snooping Enable (VAG):** Not implemented, hardwired to 0
4	0x0 RO	**Memory Write and Invalidate Enable (MWIE):** Not implemented, hardwired to 0.
3	0x0 RO	**Special Cycle Enable (SCE):** Not implemented, hardwired to 0.
2	0x0 RW	**Bus Master Enable (BME):** Controls the HECI host controller's ability to act as a system memory master for data transfers. When this bit is cleared, HECI bus master activity stops and any active DMA engines return to an idle condition. This bit is made visible to firmware through the H_PCI_CSR register, and changes to this bit may be configured by the H_PCI_CSR register to generate an MSI to mIA. When this bit is '0', HECI is blocked from generating MSI to the host CPU. ***Note:*** This bit does not block HECI accesses to CSE-UMA
1	0x0 RW	**Memory Space Enable (MSE):** Controls access to the HECI host controllers memory-mapped register space.
0	0x0 RO	**I/O Space Enable (IOSE):** Not implemented, hardwired to 0.

54.4.3 Status (HECI3_STS)—Offset 6h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:27, F:4] + 6h

Default: 0010h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RO	**Detected Parity Error (DPE):** Not implemented, hardwired to 0.
14	0x0 RO	**Signaled System Error (SSE):** Not implemented, hardwired to 0.
13	0x0 RO	**Received Master-Abort (RMA):** Not implemented, hardwired to 0.
12	0x0 RO	**Received Target Abort (RTA):** Not implemented, hardwired to 0.
11	0x0 RO	**Signaled Target-Abort (STA):** Not implemented, hardwired to 0.
10:9	0x0 RO	**DEVSEL# Timing (DEVT):** These bits are hardwired to 00.
8	0x0 RO	**Master Data Pariy Error Detected (DPD):** Not implemented, hardwired to 0.
7	0x0 RO	**Fast Back-to-Back Capable (FBC):** Not implemented, hardwired to 0.
6	0x0 RO	**RSVD (RSVD_6_6):** Reserved
5	0x0 RO	**66 MHz Capable (C66):** Not implemented, hardwired to 0.
4	0x1 RO	**Capabilities List (CL):** Indicates the presence of a capabilities list, hardwired to 1.
3	0x0 RO/V	**Interrupt Status (IS):** Reflects the state of the INTx# signal at the input of the enable/disable circuit. This bit is a 1 when the INTx# is asserted. This bit is a 0 after the interrupt is cleared (independent of the state of the Interrupt Disable bit in the command register). ***Note:*** This bit is not set by an MSI.
2:0	0x0 RO	**RSVD (RSVD_2_0):** Reserved

54.4.4 Revision ID and Class Code (HECI3_RID_CC)—Offset 8h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:4] + 8h

Default: 07800000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x7 RO	**Base Class Code (BCC):** Indicates the base class code of the HECI host controller device.
23:16	0x80 RO	**Sub Class Code (SCC):** Indicates the sub class code of the HECI host controller device.
15:8	0x0 RO	**Programming Interface (PI):** Indicates the programming interface of the HECI host controller device.
7:0	0x0 RO/V	**Revision ID (RID):** Indicates stepping of the HECI host controller.

54.4.5 Cache Line Size (HECI3_CLS)—Offset Ch

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:27, F:4] + Ch

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO	**Cache Line Size (CLS):** Not implemented, hardwired to 0.

54.4.6 Master Latency Timer (HECI3_MLT)—Offset Dh

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:27, F:4] + Dh

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO	**Master Latency Timer (MLT):** Not implemented, hardwired to 0.

54.4.7 Header Type (HECI3_HTYPE)—Offset Eh

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:27, F:4] + Eh

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7	0x1 RO	**Multi-Function Device (MFD):** Indicates the HECI host controller is part of a multi-function device.
6:0	0x0 RO	**Header Layout (HL):** Indicates that the HECI host controller uses a target device layout.

54.4.8 Built In Self-Test (HECI3_BIST)—Offset Fh

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:27, F:4] + Fh

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RO	**BIST Capable (BC):** Not implemented, hardwired to 0.
6:0	0x0 RO	**RSVD:** Reserved

54.4.9 HECI MMIO Base Address Low (HECI3_MMIO_MBAR_LO)—Offset 10h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:4] + 10h

Default: 00000004h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RW	**Base Address Low (BA_LO):** Lower 32 bits of base address of register memory space.
11:4	0x0 RO	**Memory Size (MS):** This field is hardwired to 0 to indicate that HECI device requests 4KB of memory space.
3	0x0 RO	**Prefetchable (PF):** Indicates that this range is not pre-fetchable.
2:1	0x2 RO	**Type (TP):** Indicates that this range can be mapped anywhere in 64-bit address space.
0	0x0 RO	**Resource Type Indicator (RTE):** Indicates a request for register memory space.

54.4.10 HECI MMIO Base Address High (HECI3_MMIO_MBAR_HI)—Offset 14h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:4] + 14h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Base Address High (BA_HI):** Upper 32 bits of base address of register memory space.

54.4.11 Sub System Identifiers (HECI3_SS)—Offset 2Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:4] + 2Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW/O	**Subsystem ID (SSID):** Indicates the sub- system identifier. This field should be programmed by BIOS during boot-up. Once written, this register becomes Read Only.
15:0	0x0 RW/O	**Subsystem Vendor ID (SSVID):** Indicates the sub-system vendor identifier. This field should be programmed by BIOS during boot- up. Once written, this register becomes Read Only.

54.4.12 Capabilities Pointer (HECI3_CAP)—Offset 34h

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:27, F:4] + 34h

Default: 50h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x50 RO	**Capability Pointer (CP):** Indicates the first capability pointer offset. It points to the PCI power management capability offset.

54.4.13 Interrupt Information (HECI3_INTR)—Offset 3Ch

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:27, F:4] + 3Ch

Default: 0100h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x1 RO/V	**Interrupt Pin (IPIN):** This field indicates the virtual interrupt pin the HECI host controller uses. A value of 0x1/0x2/0x3/0x4 indicates that this function implements legacy interrupt on INTA/INTB/INTC/INTD, respectively. When legacy interrupt is not used this register should be set to 0x0.
7:0	0x0 RW	**Interrupt Line (ILINE):** Software written value to indicate which interrupt line (vector) the interrupt is connected to. No hardware action is taken on this field.

54.4.14 Minimum Grant (HECI3_MGNT)—Offset 3Eh

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:27, F:4] + 3Eh

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO	**Grant (GNT):** Not implemented, hardwired to 0.

54.4.15 Maximum Latency (HECI3_MLAT)—Offset 3Fh

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:27, F:4] + 3Fh

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO	**Latency (LAT):** Not implemented, hardwired to 0.

54.4.16 Host Firmware Status (HECI3_HFS)—Offset 40h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:4] + 40h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RO	**BIOS MSG ACK:** Acknowledge for register based BIOS message in MEI 1 H_GS Register.
27:25	0x0 RO	**BIOS MSG ACK Data:** Message specific data for acknowledged BIOS message.
24:20	0x0 RO	Reserved
19:16	0x0 RO	**Operating Mode:** This field describes the current operating mode of Intel® ME. • 1:0 - Reserved • 2 - Debug Mode • 14:3 - Reserved • 15 - Intel® SPS firmware is running in Intel® ME
15:12	0x0 RO	**Error Code:** If set to nonzero value the Intel® ME firmware has encountered a fatal error and stopped normal operation. • 0 - No Error • 1 - Uncategorized Failure - The Intel® ME firmware has experienced an uncategorized error. Further details of the failure can be found in the Extended Status Data. • 2 - Disabled - Firmware was disabled on this platform. • 3 - Image Failure - The Intel® ME firmware stored in the system flash is not valid.
11	0x0 RO	**Update in Progress:** The bit is set if any type of Intel® ME firmware update is in progress.
10	0x0 RO	**Recovery BUP Load Fault:** This bit is set when firmware is not able to load recovery bring-up from the flash. It means that the recovery section in Intel® ME region on the SPI flash.
9	0x0 RO	**Init Complete:** When this but is not set firmware is still in initialization phase. When firmware has fully entered a stable state, this but is set to 1 and "Current State" field of this register provides the steady state of the Intel® ME subsystem.
8:6	0x0 RO	**Operating State:** This field describes the current operating state of Intel® ME. • 000 - Preboot • 001 - M0 with UMA • 010 - Reserved • 011 - Reserved • 100 - M3 without UMA • 101 - M0 without UMA - normal state for Intel® SPS firmware • 110 - Bring up • 111 - M0 without UMA but with error
5	0x0 RO	**FPT or Factory Defaults Bad:** This bit is set when the firmware discovers a bad checksum of Intel® ME region Flash Partition Table (FPT) or Factory Defaults. When this bit set, it may or may not have the error code shown in bit [15:12]. The system can get this bit clear only by re-flashing the whole Intel® ME region in the SPI Flash.
4	0x0 RO	**Manufacturing Mode:** When this bit is set, the platform is still in manufacturing mode. Host can use this bit to inform user that the platform is NOT READY for production yet. This but is set as long as Intel® ME Region access is not locked for flash masters other than Intel® ME. For shipping machine, this bit MUST be 0.

Bit Range	Default & Access	Field Name (ID): Description
3:0	0x0 RO	**Current State:** This field describes the current operation state of the firmware. • 0 - Reset - Intel® ME is in reset state, will exit this state within 1 millisecond • 1 - Initialization - Intel® ME is initializing, will exit this state within 2 seconds • 2 - Recovery - Intel® ME is in recovery mode, check ME1.GMES register to determine cause • 3 - Reserved • 4 - Disabled - Intel® ME functionality has been disabled, it executes idle loop • 5 - Operational - Intel® ME is in normal operational state • 6 - Reserved • 7 - State Transition - Intel® ME sets this state before starting a transition to a new Operating State. It is a temporary state, may appear on transition between Initialization and Operational.

54.4.17 General Status Shadow 1 (HECI3_GS_SHDW1)—Offset 48h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:4] + 48h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**EOP Status:** This bit presents the Intel® ME notion of EOP status. If BIOS encounters this bit set to '1' during POST it signals an error in platform power flow.
30:28	0x0 RO	**Infrastructure Progress Code:** This field identifies the infrastructure progress code: • 0 - ROM - Intel® ME is in ROM phase • 1 - BUP - Intel® ME is in BRINGUP phase • 2 - uKernel - Intel® ME is in Micro Kernel phase • 3 - Policy Module - Intel® ME is in Policy Module phase • 4 - Other Module - Intel® ME is loading modules in M0 or M3 Operating State
27:16	0x0 RO	**Extended Status Data:** These bits provide extended status data for the current state of operating of the firmware. Or, if the firmware is in a fatal error state, these bits provide extended error code information.
15:13	0x0 RO	**Firmware Heartbeat:** This number increments approximately every second if Intel® ME firmware is running.
12	0x0 RO	Intel® ME Target Image Boot Fault • 0 - Target image loaded successfully • 1 - Target image boot failed, switched to backup image or recovery image
11:8	0x0 RO	Reserved
7	0x0 RO	**Warm Reset Request:** If this bit is set, Intel® ME informs BIOS that a warm reset is requested by Intel® ME.
6	0x0 RO	**MFS Failure:** If this bit is set, Intel® ME informs BIOS that Intel® ME File System failure has been detected during recent Intel® ME boot.
5:4	0x0 RO	Reserved

3:1	0x0
	RO
		Recovery Cause: If ME1.HFS.Current State indicates that Intel® ME firmware is running in recovery mode these bits provide the cause of this mode:
		• 0 - Intel® ME recovery jumper asserted
		• 1 - Security strap override jumper asserted
		• 2 - Recovery forced with IPMI command
		• 3 - Invalid flash configuration, either:
		  • flash master access permissions configuration is wrong
		  • VSCC entry is missing or wrong
		  • flash erase block size in Intel® ME region configuration
		• 4 - Intel® ME internal error
		  Intel® ME could not start in operational mode because of some firmware problems.
		• 5..7 - Reserved for future extensions

0	0x0 RO	**BIST in Progress:** If this bit is set Intel® ME Built In Self-Test is in Progress.

54.4.18 Host General Status (HECI3_H_GS1)—Offset 4Ch

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:27, F:4] + 4Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Host General Status (H_GS1):** General status of Host. This field is not used by hardware.

54.4.19 PCI Power Management Capability ID (HECI3_PID)—Offset 50h

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:27, F:4] + 50h

Default: 8C01h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x8c RO	**Next Capability (NEXT):** Indicates the location of the next capability item in the list. This is the Message Signaled Interrupts capability.
7:0	0x1 RO	**Cap ID (CID):** Indicates that this pointer is a PCI power management.

54.4.20 PCI Power Management Capabilities (HECI3_PC)—Offset 52h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:27, F:4] + 52h

Default: 4003h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0x8 RO	**PME Support (PSUP):** Indicates the states that can generate PME#. HECI can assert PME# from D3hot only.
10	0x0 RO	**D2 Support (D2S):** The D2 state is not supported for the HECI host controller.
9	0x0 RO	**D _Support (D1S):** The D1 state is not supported for the HECI host controller.
8:6	0x0 RO	**Aux_Current (AUXC):** Reports the maximum Suspend well current required when in the D3COLD state. Value of 0 is reported.
5	0x0 RO	**Device Specific Initialization (DSI):** Indicates whether device-specific initialization is required.
4	0x0 RO	**Reserved (RSVD):** Reserved.
3	0x0 RO	**PME Clock (PMEC):** Indicates that PCI clock is not required to generate PME#.
2:0	0x3 RO	**Version (VS):** Indicates support for Revision 1.2 of the PCI Power Management Specification.

54.4.21 PCI Power Management Control and Status (HECI3_PMCS)—Offset 54h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:27, F:4] + 54h

Default: 0008h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW/1C/V	**PME Status (PMES):** The PME Status bit in HECI space can be set to '1' by CSE FW performing a write into CSE side register to set PMES. This bit is cleared by host CPU writing a '1' to it. CSE cannot clear this bit. Host CPU writes with value '0' have no effect on this bit.
14:9	0x0 RO	**Reserved (RSVD_14_9):** Reserved.
8	0x0 RW	**PME Enable (PMEE):** When set, PME_assert and PME_deassert messages are sent over the SoC Sideband to the SoC PMC based on the PMES bit. When reset these messages may not be sent.
7:4	0x0 RO	**Reserved (RSVD_7_4):** Reserved.
3	0x1 RO	**No Soft Reset (NSR):** This bit indicates that when the HECI host controller is transitioning from D3hot to D0 due to power state command, it does not perform and internal reset.
2	0x0 RO	**Reserved (RSVD_2_2):** Reserved.
1:0	0x0 RW	**Power State (PS):** This field is used both to determine the current power state of the HECI host controller and to set a new power state. The values are: • 00 - D0 state • 11 - D3HOT state The D1 and D2 states are not supported for this HECI host controller.

54.4.22 General Status Shadow 2 (HECI3_GS_SHDW2)—Offset 60h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:4] + 60h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**General Status Shadow 2 (GSS2):** This field is host side shadow of CSE General Status 2 (CSE_GS2).

54.4.23 General Status Shadow 3 (HECI3_GS_SHDW3)—Offset 64h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:4] + 64h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**General Status Shadow 3 (GSS3):** This field is host side shadow of CSE General Status 3 (CSE_GS3).

54.4.24 General Status Shadow 4 (HECI3_GS_SHDW4)—Offset 68h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:4] + 68h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**General Status Shadow 4 (GSS4):** This field is host side shadow of CSE General Status 4 (CSE_GS4).

54.4.25 General Status Shadow 5 (HECI3_GS_SHDW5)—Offset 6Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:4] + 6Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**General Status Shadow 5 (GSS5):** This field is host side shadow of CSE General Status 5 (CSE_GS5).

54.4.26 Host General Status 2 (HECI3_H_GS2)—Offset 70h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:4] + 70h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Host General Status 2 (H_GS2):** General status of Host. This field is not used by hardware.

54.4.27 Host General Status 3 (HECI3_H_GS3)—Offset 74h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:4] + 74h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Host General Status 3 (H_GS3):** General status of Host. This field is not used by hardware.

54.4.28 Message Signaled Interrupt Identifiers (HECI3_MID)—Offset 8Ch

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:27, F:4] + 8Ch

Default: 0005h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x0 RO	**Next Pointer (NEXT):** Indicates the next item in the list. This can be additional capability pointers or, if zero, indicates that this is the last item in the list.
7:0	0x5 RO	**Capability ID (CID):** Indicates a Message Signaled Interrupt (MSI).

54.4.29 Message Signaled Interrupt Message Control (HECI3_MC)—Offset 8Eh

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:27, F:4] + 8Eh

Default: 0080h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x0 RO	**Reserved (RSVD):** Reserved.
7	0x1 RO	**64 Bit Address Capable (C64):** Specifies whether capable of generating 64-bit messages.
6:4	0x0 RO	**Multiple Message Enable (MME):** Not implemented, hardwired to 0.
3:1	0x0 RO	**Multiple Message Capable (MMC):** Not implemented, hardwired to 0.
0	0x0 RW	**MSI Enable (MSIE):** If set, MSI is enabled and INTx virtual wires are not used to generate interrupts.

54.4.30 Message Signaled Interrupt Message Address (HECI3_MA)—Offset 90h

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:27, F:4] + 90h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**Address (ADDR):** Lower 32 bits of the system specified message address, always DW aligned.
1:0	0x0 RO	**Reserved (RSVD):** Reserved.

54.4.31 Message Signaled Interrupt Upper Address (HECI3_MUA)—Offset 94h

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:27, F:4] + 94h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Upper Address (UADDR):** Upper 32 bits of the system specified message address. This register is optional and only implemented if MC.C64=1.

54.4.32 Message Signaled Interrupt Message Data (HECI3_MD)—Offset 98h

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:27, F:4] + 98h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x0 RW	**Data (DATA):** This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the FSB during the data phase of the MSI memory write transaction.

54.4.33 HECI Interrupt Delivery Mode (HECI3_HIDM)—Offset A0h

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:27, F:4] + A0h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0x0 RO	**Reserved (RSVD):** Reserved.
2	0x0 RW/1S	**HIDM Lock (HIDM_L):** Writing 1 to this bit locks the HIDM field.
1:0	0x0 RW/L	**HECI Interrupt Delivery Mode (HIDM):** These bits control what type of interrupt the HECI will send when CSE FW writes to set the CSE_IG bit. They are interpreted as follows: • 00 - Generate Legacy or MSI interrupt • 01 - Generate SCI • 10 - Generate SMI This field may be locked by writing 1 to HIDM_L bit.

54.4.34 Manufacturer's ID (HECI3_MANID)—Offset F8h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:4] + F8h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RO	**Reserved (RSVD_31_28):** Reserved.
27:24	0x0 RO/V	**Dot Portion of Process ID (DPOP):** Indicates the dot process.
23:16	0x0 RO/V	**Manufacturing Stepping ID (MSID):** This field is incremented for each stepping of the part. This field can be used by software to differentiate steppings when Revision ID may not change.
15:8	0x0 RO/V	**Manufacturing ID (MID):** This field is set by the SoC.
7:0	0x0 RO/V	**Process Portion of Process ID (PPOP):** Indicates the process. The dot portion of the process is reflected in bits [27:24]. This field can be used by software to differentiate steppings when Revision ID may not change.

54.5 Registers in Configuration Space—KT (Host)

54.5.1 Device ID and Vendor ID (KT_HOST_DID_VID)—Offset 0h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:3] + 0h

Default: 19E88086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x19E8 RO/V	**Device ID (DID):** This field identifies the particular device.
15:0	0x8086 RO	**Vendor ID (VID):** This field identifies the manufacturer of the device. The value of 0x8086 indicates Intel.

54.5.2 Status and Command (KT_HOST_STS_CMD)—Offset 4h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:3] + 4h

Default: 00B00000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**Detected Parity Error (DPE):** Not implemented. Hardwired to 0.
30	0x0 RO	**Signaled System Error (SSE):** Not implemented. Hardwired to 0.
29	0x0 RW/1C/V	**Received Master Abort (RMA):** This bit must be set by a master device whenever its transaction (except for Special Cycle) is completed with Unsupported Request Completion Status (a.k.a. Master-Abort). All master devices must implement this bit.
28	0x0 RW/1C/V	**Received Target Abort (RTA):** This bit must be set by a master device whenever its transaction is completed with Completer Abort Completion Status (a.k.a. Target-Abort). All master devices must implement this bit.
27	0x0 RW/1C/V	**Signaled Target Abort (STA):** This bit must be set by a target device whenever it completes a Posted or Non-Posted transaction with a Completer Abort (a.k.a. Target-Abort) error. Devices that will never signal Completer Abort (a.k.a. Target-Abort) do not need to implement this bit.
26:25	0x0 RO	**Devsel Timing (DEVT):** These bits encode the timing of DEVSEL#. There are three allowable timings for assertion of DEVSEL# as described below: • 00b: fast • 01b: medium • 10b: slow • 11b: reserved These bits are read-only and must indicate the slowest time that a device asserts DEVSEL# for any bus command except Configuration Read and Configuration Write. Hardwired to 00b.
24	0x0 RO	**Master Data Parity Error (MDPE):** Not implemented. Hardwired to 0.
23	0x1 RO	**Fast Back to Back Capable (FBTBC):** This bit indicates whether or not the target is capable of accepting fast back-to-back transactions when the transactions are not to the same agent. This bit can be set to 1 if the device can accept these transactions and must be set to 0 otherwise. Hardwired to 1.
22	0x0 RO	**Reserved (RSVD3):** Reserved (RSVD)
21	0x1 RO	**66 Mhz Capable (MCAP):** This bit indicates whether or not this device is capable of running at 66 MHz. A value of 0 indicates 33 MHz. A value of 1 indicates that the device is 66 MHz capable. Hardwired to 1.
20	0x1 RO	**Capabilities List (CAPL):** This optional read-only bit indicates whether or not this device implements the pointer for a New Capabilities linked list at offset 34h. A value of zero indicates that no New Capabilities linked list is available. A value of one indicates that the value read at offset 34h is a pointer in Configuration Space to a linked list of new capabilities.
19	0x0 RO	**Interrupt Status (INTS):** This read-only bit reflects the state of the interrupt in the device/function. Only when the Interrupt Disable bit in the command register is a 0 and this Interrupt Status bit is a 1, will the device's/function's INTx# signal be asserted. Setting the Interrupt Disable bit to a 1 has no effect on the state of this bit. Read-only and hardwired to 0 for a device that does NOT support pin-based interrupt.
18:16	0x0 RO	**Reserved (RSVD2):**

Bit Range	Default & Access	Field Name (ID): Description
15:11	0x0 RO	**Reserved (RSVD1):**
10	0x0 RW	**Interrupt Disable (INTD):** This bit disables the device/function from asserting INTx#. A value of 0 enables the assertion of its INTx# signal. A value of 1 disables the assertion of its INTx# signal. This bit's state after RST# is 0.
9	0x0 RO	**Fast Back to Back Enable (FBTBEN):** Not implemented. Hardwired to 0.
8	0x0 RO	**System Error Enable (SERREN):** Not implemented. Hardwired to 0.
7	0x0 RO	**Reserved (RSVD0):**
6	0x0 RO	**Parity Error Response (PERRR):** Not implemented. Hardwired to 0.
5	0x0 RO	**VGA Palette Snoop (VGAPS):** Not implemented. Hardwired to 0.
4	0x0 RO	**Memory Write and Invalidate Enable (MWRIEN):** Not implemented. Hardwired to 0.
3	0x0 RO	**Special Cycles (SPCYC):** Not implemented. Hardwired to 0.
2	0x0 RW	**Bus Master Enable (BME):** Controls the ability of a PCI device to issue Memory and I/O Read/Write Requests. When this bit is Set, the PCI device function is allowed to issue Memory or I/O Requests. When this bit is Clear, the PCI device function is not allowed to issue any Memory or I/O Requests. ***Note:*** As MSI/MSI-X interrupt Messages are in-band memory writes, setting the Bus Master Enable bit to 0b disables MSI/MSI-X interrupt Messages as well. Requests other than Memory or I/O Requests are not controlled by this bit. Default value of this bit is 0b. This bit is hardwired to 0b if a PCI device function does not generate Memory or I/O Requests.
1	0x0 RW	**Memory Space Enable (MSE):** Controls a device's response to Memory Space accesses. • A value of 0 disables the device response. • A value of 1 allows the device to respond to Memory Space accesses. State after RST# is 0.
0	0x0 RW	**IO Space Enable (IOSE):** Controls a device's response to I/O Space accesses. • A value of 0 disables the device response. • A value of 1 allows the device to respond to I/O Space accesses. State after RST# is 0.

54.5.3 Class Code and Revision ID (KT_HOST_CC_RID)—Offset 8h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:3] + 8h

Default: 07000200h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x7 RO	**Base Class Code (BCC):** Identifies the Base Class Code of an external 16550-compatible serial controller device driver.
23:16	0x0 RO	**Sub-Class Code (SCC):** Identifies the Sub-Class Code of an external 16550-compatible serial controller device driver.
15:8	0x2 RO	**Programming Interface (PI):** Identifies the Programming Interface of an external 16550-compatible serial controller device driver.
7:0	0x0 RO/V	**Revision ID (RID):** This register specifies a device specific revision identifier. The value is chosen by the vendor. Zero is an acceptable value. This field should be viewed as a vendor defined extension to the Device ID.

54.5.4 BIST, Header Type, Latency Timer, and Cache Line Size (KT_HOST_BIST_HTYPE_LT_CLS)—Offset Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:3] + Ch

Default: 00800000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**Built In Self Test (BIST):** Not implemented. Hardwired to 0.
23	0x1 RO/V	**Header Type 1 (HTYPE1):** This bit identifies whether or not the device contains multiple functions. • If the bit is 0, then the device is single function. • If the bit is 1, then the device has multiple functions.
22:16	0x0 RO	**Header Type 0 (HTYPE0):** This field identifies the layout of the second part of the predefined header (beginning at byte 10h in Configuration Space). • The encoding 00h specifies the non-bridge Configuration Space Header. • The encoding 01h specifies the PCI-to-PCI bridge Configuration Space Header. • The encoding 02h specifies the CardBus bridge Configuration Space Header. • All other encodings are reserved. Hardwired to 0 to identify the non-bridge Configuration Space Header.
15:8	0x0 RO	**Latency Timer (LT):** Not implemented. Hardwired to 0.
7:0	0x0 RO	**Cache Line Size (CLS):** Not implemented. Hardwired to 0.

54.5.5 KT IO BAR (KT_HOST_IOBAR)—Offset 10h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:3] + 10h

Default: 00000001h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0x0 RW	**IO BAR (IOBAR):** Software programs this space with the base address of the device's IO region.
2	0x0 RO	**IO Size (IOSIZE):** Hardwired to 0 to indicate 8B of IO space.
1	0x0 RO	**Reserved (RSVD):** Hardwired to 0 for an IO BAR.
0	0x1 RO	**IO Space Indicator (IOSPACE):** Hardwired to 1 to identify an IO BAR.

54.5.6 KT Memory BAR (KT_HOST_MEMBAR)—Offset 14h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:3] + 14h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RW	**Memory BAR (MEMBAR):** Software programs this register with the base address of the device's memory region.
11:4	0x0 RO	**Memory Size (MEMSIZE):** Hardwired to 0 to indicate 4KB of memory space.
3	0x0 RO	**Prefetchable (PREFETCH):** A device can mark a range as prefetchable if there are no side effects on reads, the device returns all bytes on reads regardless of the byte enables. Hardwired to 0 to indicate the device's memory space as non-prefetchable.
2:1	0x0 RO	**Type (TYP):** Hardwired to 0 to indicate that Base register is 32 bits wide and mapping can be done anywhere in the 32-bit Memory Space.
0	0x0 RO	**Memory Space Indicator (MEMSPACE):** Hardwired to 0 to identify a Memory BAR.

54.5.7 Cardbus CIS Pointer (KT_HOST_CCP)—Offset 28h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:3] + 28h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO	**Cardbus CIS Pointer (CCP):** Not implemented. Hardwired to 0.

54.5.8 Subsystem ID and Subsystem Vendor ID (KT_HOST_SID_SVID)—Offset 2Ch

These registers are used to uniquely identify the add-in card or subsystem where the PCI device resides. They provide a mechanism for add-in card vendors to distinguish their add-in cards from one another even though the add-in cards may have the same PCI controller on them (and, therefore, the same Vendor ID and Device ID).

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:3] + 2Ch

Default: 00008086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW/O	**Subsystem ID (SID):** Value of this field is vendor-specific. This is written by BIOS. No hardware action will be taken on this value. Implementation Note: The Write-Once lock must be implemented per field. SID should have its own lock.
15:0	0x8086 RW/O	**Subsystem Vendor ID (SVID):** This field identifies the vendor of the add-in card or subsystem. This is written by BIOS. No hardware action will be taken on this value. Implementation Note: The Write-Once lock must be implemented per field. SVID should have its own lock.

54.5.9 Expansion ROM Base Address (KT_HOST_XRBAR)—Offset 30h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:3] + 30h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO	**Expansion ROM Base Address (XRBAR):** Not implemented. Hardwired to 0.

54.5.10 Capabilities List Pointer (KT_HOST_CAPP)—Offset 34h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:3] + 34h

Default: 00000040h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**Reserved (RSVD):**
7:0	0x40 RO	**Capabilities Pointer (CAPP):** Indicates the pointer for the first entry in the capabilities list which is the MSI Capability.

54.5.11 Maximum Latency, Minimum Grant, Interrupt Pin and Interrupt Line (KT_HOST_MAXL_MING_INTP_INTL)—Offset 3Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:3] + 3Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**Maximum Latency (MAXL):** Not implemented. Hardwired to 0.
23:16	0x0 RO	**Minimum Grant (MING):** Not implemented. Hardwired to 0.
15:8	0x0 RO/V	**Interrupt Pin (INTP):** This register specifies which interrupt pin KT uses in PCI interrupt mode. Value Decoding • 00h The function does NOT use an interrupt pin. • 01h INTA • 02h INTB • 03h INTC • 04h INTD • 05h - FFh Reserved. ***Note:*** This field shadows the KTHIPINR.IPIN field in the PTIO Host private CR space which is configured by BIOS over IOSF SB.
7:0	0x0 RW	**Interrupt Line (INTL):** This register is used to communicate interrupt line routing information. POST software will write the routing information into this register as it initializes and configures the system.

54.5.12 MSI Message Control, Next Pointer and Capability ID (KT_HOST_MSIMC_MSINP_MSICID)—Offset 40h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:3] + 40h

Default: 00805005h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0x0 RO	**Reserved (RSVD):**
24	0x0 RO	**Per Vector Masking Capable (PVMC):** Not implemented. Hardwired to 0 to indicate the function does NOT support MSI per-vector masking.
23	0x1 RO	**64 bit address capable (XAC):** Hardwired to 1 to indicate the function is capable of sending a 64-bit message address.
22:20	0x0 RW	**Multiple Message Enable (MMEN):** Encoded number of interrupt vectors allocated by SW. This field is RW for software compatibility, but only one interrupt vector is ever sent by the function.
19:17	0x0 RO	**Multiple Message Capable (MMC):** Encoded number of interrupt vectors requested by a device. Hardwired to 0 to indicate one requested interrupt vector.
16	0x0 RW	**MSI Enable (MSIE):** If set, MSI interrupt delivery is enabled whereas pin-based interrupt delivery SHALL be disabled. If cleared, prior to returning the configuration write (that clears this field) completion, the function must send any pending MSI(s).
15:8	0x50 RO	**Next Item Pointer (NP):** Indicates the pointer for the next entry in the capabilities list. Hardwired to 50h to point to the PM Capability list.
7:0	0x5 RO	**Capability ID (CID):** Hardwired to 05h to indicate the linked list item as the MSI Capability registers.

54.5.13 MSI Message Address (KT_HOST_MSIMA)—Offset 44h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:3] + 44h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**Message Address (MA):** 32-bit DW-aligned MSI message address.
1:0	0x0 RO	**Reserved (RSVD):**

54.5.14 MSI Message Upper Address (KT_HOST_MSIMUA)—Offset 48h

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:27, F:3] + 48h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Message Upper Address (MUA):** Upper 32-bit of a 64-bit DW-aligned MSI message address.

54.5.15 MSI Message Data (KT_HOST_MSIMD)—Offset 4Ch

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:27, F:3] + 4Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**Reserved (RSVD):**
15:0	0x0 RW	**Message Data (MD):** MSI Message Data

54.5.16 Power Management Capabilities, Next Pointer and Capability ID (KT_HOST_PMCAP_PMNP_PMCID)—Offset 50h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:3] + 50h

Default: 00230001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0x0 RO	**PME Support (PMES):** This 5-bit field indicates the power states in which the function may assert PME#. A value of 0b for any bit indicates that the function is not capable of asserting the PME# signal while in that power state. • bit(27) X XXX1b - PME# can be asserted from D0 • bit(28) X XX1Xb - PME# can be asserted from D1 • bit(29) X X1XXb - PME# can be asserted from D2 • bit(30) X 1XXXb - PME# can be asserted from D3hot • bit(31) 1 XXXXb - PME# can be asserted from D3cold
26	0x0 RO	**D2 Support (D2S):** Hardwired to 0 to indicate that this device does not support D2.
25	0x0 RO	**D1 Support (D1S):** Hardwired to 0 to indicate that this device does not support D1.
24:22	0x0 RO	**Aux Current (AUXC):** Not implemented. Hardwired to 0.
21	0x1 RO	**Device Specific Initialization (DSI):** indicates whether special initialization of this function is required (beyond the standard PCI configuration header) before the generic class device driver is able to use it. A 1 indicates that the function requires a device specific initialization sequence following transition to the D0 uninitialized state. Hardwired to 1 to indicate Device Specific Initialization is required.
20	0x0 RO	**Reserved (RSVD):**
19	0x0 RO	**PME Clock (PMECLK):** Not implemented. Hardwired to 0.
18:16	0x3 RO	**Version (VER):** Hardwired to value of 011b indicates that this function complies with rev 1.2 of PCI Power Management Interface Spec.
15:8	0x0 RO	**Next Item Pointer (NP):** Indicates the pointer for the next entry in the capabilities list. Hardwired to 0 to indicate no more linked list item.
7:0	0x1 RO	**Capability ID (CID):** Hardwired to 01h to indicate the linked list item as the PCI Power Management registers.

54.5.17 Power Management Data, Control/Status Register Bridge Support Extensions, Control and Status (KT_HOST_PMD_PMCSRBSE_PMCSR)—Offset 54h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:3] + 54h

Default: 00000008h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**Data:** Not implemented. Hardwired to 0.
23:16	0x0 RO	**Control/Status Register Bridge Support Extensions (CSRBSE):** Not implemented. Hardwired to 0.
15	0x0 RO	**PME Status (PMESTS):** This bit is set when the function would normally assert the PME signal independent of the state of the PME_En bit. • Writing a 1 to this bit will clear it and cause the function to stop asserting a PME (if enabled). • Writing a 0 has no effect. If the function supports PME from D3cold, then this bit is sticky and must be explicitly cleared by the operating system each time the operating system is initially loaded. Not implemented. Hardwired to 0.
14:13	0x0 RO	**Data Scale (DS):** Not implemented. Hardwired to 0.
12:9	0x0 RO	**Data Select (DSEL):** Not implemented. Hardwired to 0.
8	0x0 RO	**PME Enable (PMEEN):** A 1 enables the function to assert PME. When 0, PME assertion is disabled. This bit defaults to 0 if the function does not support PME generation from D3cold. If the function supports PME from D3cold then this bit is sticky and must be explicitly cleared by the operating system each time it is initially loaded. Not implemented. Hardwired to 0.
7:4	0x0 RO	**Reserved (RSVD1):**
3	0x1 RO	**No Soft Reset (NSR):** When set to 1, this bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved. Upon transition from the D3hot to the D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the PowerState bits.
2	0x0 RO	**Reserved (RSVD0):**
1:0	0x0 RW	**Power State (PWRST):** This 2-bit field is used both to determine the current power state of a function and to set the function into a new power state. The definition of the field values is given below: • 00b - D0 • 01b - D1 • 10b - D2 • 11b - D3hot If software attempts to write an unsupported, optional state to this field, the write operation must complete normally on the bus; however, the data is discarded and no state change occurs.

54.5.18 Process Stepping Information (KT_HOST_PSI)—Offset F8h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:3] + F8h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RO	**Reserved (RSVD):** Not implemented. Hardwired to 0.
27:24	0x0 RO/V	**Dot Portion of Process ID (DPOP):** Reserved.
23:16	0x0 RO/V	**Manufacturing Stepping (MSID):** Reserved.
15:8	0x0 RO/V	**Manufacturing ID (MID):** Reserved.
7:0	0x0 RO/V	**Process Portion of Process ID (PPOP):** Reserved.

54.6 Registers in Configuration Space—IDE (Host)

54.6.1 Device ID and Vendor ID (IDE_HOST_DID_VID)—Offset 0h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:2] + 0h

Default: 19E78086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x19e7 RO/V	**Device ID (DID):** This field identifies the particular device. This identifier is allocated by the vendor.
15:0	0x8086 RO	**Vendor ID (VID):** This field identifies the manufacturer of the device. The value of 0x8086 indicates Intel.

54.6.2 Status and Command (IDE_HOST_STS_CMD)—Offset 4h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:2] + 4h

Default: 00B00000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**Detected Parity Error (DPE):** Not implemented. Hardwired to 0.
30	0x0 RO	**Signaled System Error (SSE):** Not implemented. Hardwired to 0.
29	0x0 RW/1C/V	**Received Master Abort (RMA):** This bit must be set by a master device whenever its transaction (except for Special Cycle) is completed with Unsupported Request Completion Status (a.k.a. Master-Abort). All master devices must implement this bit.
28	0x0 RW/1C/V	**Received Target Abort (RTA):** This bit must be set by a master device whenever its transaction is completed with Completer Abort Completion Status (a.k.a. Target-Abort). All master devices must implement this bit.
27	0x0 RW/1C/V	**Signaled Target Abort (STA):** This bit must be set by a target device whenever it completes a Posted or Non-Posted transaction with a Completer Abort (a.k.a. Target-Abort) error. Devices that will never signal Completer Abort (a.k.a. Target-Abort) do not need to implement this bit.
26:25	0x0 RO	**Devsel Timing (DEVT):** These bits encode the timing of DEVSEL#. There are three allowable timings for assertion of DEVSEL# as described below: • 00b: fast • 01b: medium • 10b: slow • 11b: reserved These bits are read-only and must indicate the slowest time that a device asserts DEVSEL# for any bus command except Configuration Read and Configuration Write. Hardwired to 00b.
24	0x0 RO	**Master Data Parity Error (MDPE):** Not implemented. Hardwired to 0.
23	0x1 RO	**Fast Back to Back Capable (FBTBC):** This bit indicates whether or not the target is capable of accepting fast back-to-back transactions when the transactions are not to the same agent. This bit can be set to 1 if the device can accept these transactions and must be set to 0 otherwise. Hardwired to 1.
22	0x0 RO	**Reserved (RSVD3):** Reserved (RSVD
21	0x1 RO	**66 Mhz Capable (MCAP):** This bit indicates whether or not this device is capable of running at 66 MHz. • A value of 0 indicates 33 MHz • A value of 1 indicates that the device is 66 MHz capable Hardwired to 1.
20	0x1 RO	**Capabilities List (CAPL):** This optional read-only bit indicates whether or not this device implements the pointer for a New Capabilities linked list at offset 34h. • A value of zero indicates that no New Capabilities linked list is available. • A value of one indicates that the value read at offset 34h is a pointer in Configuration Space to a linked list of new capabilities.
19	0x0 RO	**Interrupt Status (INTS):** This read-only bit reflects the state of the interrupt in the device/function. Only when the Interrupt Disable bit in the command register is a 0 and this Interrupt Status bit is a 1, will the device's/function's INTx# signal be asserted. Setting the Interrupt Disable bit to a 1 has no effect on the state of this bit. Read-only and hardwired to 0 for a device that does NOT support pin-based interrupt.
18:16	0x0 RO	**Reserved (RSVD2):**

Bit Range	Default & Access	Field Name (ID): Description
15:11	0x0 RO	**Reserved (RSVD1):**
10	0x0 RW	**Interrupt Disable (INTD):** This bit disables the device/function from asserting INTx#. • A value of 0 enables the assertion of its INTx# signal • A value of 1 disables the assertion of its INTx# signal This bit's state after RST# is 0.
9	0x0 RO	**Fast Back to Back Enable (FBTBEN):** Not implemented. Hardwired to 0.
8	0x0 RO	**System Error Enable (SERREN):** Not implemented. Hardwired to 0.
7	0x0 RO	**Reserved (RSVD0):**
6	0x0 RO	**Parity Error Response (PERRR):** Not implemented. Hardwired to 0.
5	0x0 RO	**VGA Palette Snoop (VGAPS):** Not implemented. Hardwired to 0.
4	0x0 RO	**Memory Write and Invalidate Enable (MWRIEN):** Not implemented. Hardwired to 0.
3	0x0 RO	**Special Cycles (SPCYC):** Not implemented. Hardwired to 0.
2	0x0 RW	**Bus Master Enable (BME):** Controls the ability of a PCI device to issue Memory and I/O Read/Write Requests. When this bit is Set, the PCI device function is allowed to issue Memory or I/O Requests. When this bit is Clear, the PCI device function is not allowed to issue any Memory or I/O Requests. ***Note:*** As MSI/MSI-X interrupt Messages are in-band memory writes, setting the Bus Master Enable bit to 0b disables MSI/MSI-X interrupt Messages as well. Requests other than Memory or I/O Requests are not controlled by this bit. Default value of this bit is 0b. This bit is hardwired to 0b if a PCI device function does not generate Memory or I/O Requests.
1	0x0 RO	**Memory Space Enable (MSE):** Controls a device's response to Memory Space accesses. • A value of 0 disables the device response. • A value of 1 allows the device to respond to Memory Space accesses. State after RST# is 0. Read-only and hardwired to 0 because IDE does NOT support Memory Space accesses.
0	0x0 RW	**IO Space Enable (IOSE):** Controls a device's response to I/O Space accesses. • A value of 0 disables the device response. • A value of 1 allows the device to respond to I/O Space accesses. State after RST# is 0.

54.6.3 Class Code and Revision ID (IDE_HOST_CC_RID)—Offset 8h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:2] + 8h

Default: 01018500h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x1 RO	**Base Class Code (BCC):** Identifies the Base Class Code of an external IDE controller device driver.
23:16	0x1 RO	**Sub-Class Code (SCC):** Identifies the Sub-Class Code of an external IDE controller device driver.
15:8	0x85 RO	**Programming Interface (PI):** Identifies the Programming Interface of an IDE controller device driver.
7:0	0x0 RO/V	**Revision ID (RID):** This register specifies a device specific revision identifier. The value is chosen by the vendor. Zero is an acceptable value. This field should be viewed as a vendor defined extension to the Device ID.

54.6.4 BIST, Header Type, Latency Timer, and Cache Line Size (IDE_HOST_BIST_HTYPE_LT_CLS)—Offset Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:2] + Ch

Default: 00800000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**Built In Self Test (BIST):** Not implemented. Hardwired to 0.
23	0x1 RO/V	**Header Type 1 (HTYPE1):** This bit identifies whether or not the device contains multiple functions. • If the bit is 0, then the device is single function • If the bit is 1, then the device has multiple functions
22:16	0x0 RO	**Header Type 0 (HTYPE0):** This field identifies the layout of the second part of the predefined header (beginning at byte 10h in Configuration Space). • The encoding 00h specifies the non-bridge Configuration Space Header. • The encoding 01h specifies the PCI-to-PCI bridge Configuration Space Header. • The encoding 02h specifies the CardBus bridge Configuration Space Header. • All other encodings are reserved. Hardwired to 0 to identify the non-bridge Configuration Space Header.
15:8	0x0 RO	**Latency Timer (LT):** Not implemented. Hardwired to 0.
7:0	0x0 RO	**Cache Line Size (CLS):** Not implemented. Hardwired to 0.

54.6.5 IDE Primary Command Block IO BAR (IDE_HOST_PCMDIOBAR)—Offset 10h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:2] + 10h

Default: 00000001h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0x0 RW	**IO BAR (IOBAR):** Software programs this space with the base address of the device's IO region.
2	0x0 RO	**IO Size (IOSIZE):** Hardwired to 0 to indicate 8B of IO space.
1	0x0 RO	**Reserved (RSVD):** Hardwired to 0 for an IO BAR.
0	0x1 RO	**IO Space Indicator (IOSPACE):** Hardwired to 1 to identify an IO BAR.

54.6.6 IDE Primary Control Block IO BAR (IDE_HOST_PCTLIOBAR)—Offset 14h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:2] + 14h

Default: 00000001h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**IO BAR (IOBAR):** Software programs this space with the base address of the device's IO region.
1	0x0 RO	**Reserved (RSVD):** Hardwired to 0 for an IO BAR.
0	0x1 RO	**IO Space Indicator (IOSPACE):** Hardwired to 1 to identify an IO BAR.

54.6.7 IDE Secondary Command Block IO BAR (IDE_HOST_SCMDIOBAR)—Offset 18h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:2] + 18h

Default: 00000001h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0x0 RW	**IO BAR (IOBAR):** Software programs this space with the base address of the device's IO region.
2	0x0 RO	**IO Size (IOSIZE):** Hardwired to 0 to indicate 8B of IO space.
1	0x0 RO	**Reserved (RSVD):** Hardwired to 0 for an IO BAR.
0	0x1 RO	**IO Space Indicator (IOSPACE):** Hardwired to 1 to identify an IO BAR.

54.6.8 IDE Secondary Control Block IO BAR (IDE_HOST_SCTLIOBAR)—Offset 1Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:2] + 1Ch

Default: 00000001h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**IO BAR (IOBAR):** Software programs this space with the base address of the device's IO region.
1	0x0 RO	**Reserved (RSVD):** Hardwired to 0 for an IO BAR.
0	0x1 RO	**IO Space Indicator (IOSPACE):** Hardwired to 1 to identify an IO BAR.

54.6.9 IDE Bus Master Block IO BAR (IDE_HOST_BMIOBAR)—Offset 20h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:2] + 20h

Default: 00000001h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0x0 RW	**IO BAR (IOBAR):** Software programs this space with the base address of the device's IO region.
3:2	0x0 RO	**IO Size (IOSIZE):** Hardwired to 0 to indicate 16B of IO space.
1	0x0 RO	**Reserved (RSVD):** Hardwired to 0 for an IO BAR.
0	0x1 RO	**IO Space Indicator (IOSPACE):** Hardwired to 1 to identify an IO BAR.

54.6.10 Cardbus CIS Pointer (IDE_HOST_CCP)—Offset 28h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:2] + 28h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO	**Cardbus CIS Pointer (CCP):** Not implemented. Hardwired to 0.

54.6.11 Subsystem ID and Subsystem Vendor ID (IDE_HOST_SID_SVID)—Offset 2Ch

These registers are used to uniquely identify the add-in card or subsystem where the PCI device resides. They provide a mechanism for add-in card vendors to distinguish their add-in cards from one another even though the add-in cards may have the same PCI controller on them (and, therefore, the same Vendor ID and Device ID).

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:2] + 2Ch

Default: 00008086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW/O	**Subsystem ID (SID):** Value of this field is vendor-specific. This is written by BIOS. No hardware action will be taken on this value. Implementation Note: The Write-Once lock must be implemented per field. SID should have its own lock.
15:0	0x8086 RW/O	**Subsystem Vendor ID (SVID):** This field identifies the vendor of the add-in card or subsystem. This is written by BIOS. No hardware action will be taken on this value. Implementation Note: The Write-Once lock must be implemented per field. SVID should have its own lock.

54.6.12 Expansion ROM Base Address (IDE_HOST_XRBAR)—Offset 30h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:2] + 30h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO	**Expansion ROM Base Address (XRBAR):** Not implemented. Hardwired to 0.

54.6.13 Capabilities List Pointer (IDE_HOST_CAPP)—Offset 34h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:2] + 34h

Default: 00000040h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**Reserved (RSVD):**
7:0	0x40 RO	**Capabilities Pointer (CAPP):** Indicates the pointer for the first entry in the capabilities list which is the MSI Capability.

54.6.14 Maximum Latency, Minimum Grant, Interrupt Pin and Interrupt Line (IDE_HOST_MAXL_MING_INTP_INTL)—Offset 3Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:2] + 3Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**Maximum Latency (MAXL):** Not implemented. Hardwired to 0.
23:16	0x0 RO	**Minimum Grant (MING):** Not implemented. Hardwired to 0.
15:8	0x0 RO/V	**Interrupt Pin (INTP):** This register specifies which interrupt pin IDE uses in PCI interrupt mode. Value Decoding • 00h The function does NOT use an interrupt pin. • 01h INTA • 02h INTB • 03h INTC • 04h INTD • 05h - FFh Reserved.
7:0	0x0 RW	**Interrupt Line (INTL):** This register is used to communicate interrupt line routing information. POST software will write the routing information into this register as it initializes and configures the system.

54.6.15 MSI Message Control, Next Pointer and Capability ID (IDE_HOST_MSIMC_MSINP_MSICID)—Offset 40h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:2] + 40h

Default: 00805005h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0x0 RO	**Reserved (RSVD):**
24	0x0 RO	**Per Vector Masking Capable (PVMC):** Not implemented. Hardwired to 0 to indicate the function does NOT support MSI per-vector masking.
23	0x1 RO	**64 bit address capable (XAC):** Hardwired to 1 to indicate the function is capable of sending a 64-bit message address.
22:20	0x0 RW	**Multiple Message Enable (MMEN):** Encoded number of interrupt vectors allocated by SW. This field is RW for software compatibility, but only one interrupt vector is ever sent by the function.
19:17	0x0 RO	**Multiple Message Capable (MMC):** Encoded number of interrupt vectors requested by a device. Hardwired to 0 to indicate one requested interrupt vector.
16	0x0 RW	**MSI Enable (MSIE):** If set, MSI interrupt delivery is enabled whereas pin-based interrupt delivery SHALL be disabled. If cleared, prior to returning the configuration write (that clears this field) completion, the function must send any pending MSI(s).
15:8	0x50 RO	**Next Item Pointer (NP):** Indicates the pointer for the next entry in the capabilities list. Hardwired to 50h to point to the PM Capability list.
7:0	0x5 RO	**Capability ID (CID):** Hardwired to 05h to indicate the linked list item as the MSI Capability registers.

54.6.16 MSI Message Address (IDE_HOST_MSIMA)—Offset 44h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:2] + 44h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**Message Address (MA):** 32-bit DW-aligned MSI message address.
1:0	0x0 RO	**Reserved (RSVD):**

54.6.17 MSI Message Upper Address (IDE_HOST_MSIMUA)—Offset 48h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:2] + 48h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Message Upper Address (MUA):** Upper 32-bit of a 64-bit DW-aligned MSI message address.

54.6.18 MSI Message Data (IDE_HOST_MSIMD)—Offset 4Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:2] + 4Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**Reserved (RSVD):**
15:0	0x0 RW	**Message Data (MD):** MSI Message Data

54.6.19 Power Management Capabilities, Next Pointer and Capability ID (IDE_HOST_PMCAP_PMNP_PMCID)—Offset 50h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:2] + 50h

Default: 00230001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0x0 RO	**PME Support (PMES):** This 5-bit field indicates the power states in which the function may assert PME#. A value of 0b for any bit indicates that the function is not capable of asserting the PME# signal while in that power state. • bit(27) X XXX1b - PME# can be asserted from D0 • bit(28) X XX1Xb - PME# can be asserted from D1 • bit(29) X X1XXb - PME# can be asserted from D2 • bit(30) X 1XXXb - PME# can be asserted from D3hot • bit(31) 1 XXXXb - PME# can be asserted from D3cold
26	0x0 RO	**D2 Support (D2S):** Hardwired to 0 to indicate that this device does not support D2.
25	0x0 RO	**D1 Support (D1S):** Hardwired to 0 to indicate that this device does not support D1.
24:22	0x0 RO	**Aux Current (AUXC):** Not implemented.Hardwired to 0.
21	0x1 RO	**Device Specific Initialization (DSI):** indicates whether special initialization of this function is required (beyond the standard PCI configuration header) before the generic class device driver is able to use it. A 1 indicates that the function requires a device specific initialization sequence following transition to the D0 uninitialized state. Hardwired to 1 to indicate Device Specific Initialization is required.
20	0x0 RO	**Reserved (RSVD):**
19	0x0 RO	**PME Clock (PMECLK):** Not implemented.Hardwired to 0.
18:16	0x3 RO	**Version (VER):** Hardwired to value of 011b indicates that this function complies with rev 1.2 of PCI Power Management Interface Spec.
15:8	0x0 RO	**Next Item Pointer (NP):** Indicates the pointer for the next entry in the capabilities list. Hardwired to 0 to indicate no more linked list item.
7:0	0x1 RO	**Capability ID (CID):** Hardwired to 01h to indicate the linked list item as the PCI Power Management registers.

54.6.20 Power Management Data, Control/Status Register Bridge Support Extensions, Control and Status (IDE_HOST_PMD_PMCSRBSE_PMCSR)—Offset 54h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:2] + 54h

Default: 00000008h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**Data:** Not implemented. Hardwired to 0.
23:16	0x0 RO	**Control/Status Register Bridge Support Extensions (CSRBSE):** Not implemented. Hardwired to 0.
15	0x0 RO	**PME Status (PMESTS):** This bit is set when the function would normally assert the PME signal independent of the state of the PME_En bit. • Writing a 1 to this bit will clear it and cause the function to stop asserting a PME (if enabled). • Writing a 0 has no effect. If the function supports PME from D3cold, then this bit is sticky and must be explicitly cleared by the operating system each time the operating system is initially loaded. Not implemented. Hardwired to 0.
14:13	0x0 RO	**Data Scale (DS):** Not implemented. Hardwired to 0.
12:9	0x0 RO	**Data Select (DSEL):** Not implemented. Hardwired to 0.
8	0x0 RO	**PME Enable (PMEEN):** A 1 enables the function to assert PME. When 0, PME assertion is disabled. This bit defaults to 0 if the function does not support PME generation from D3cold. If the function supports PME from D3cold then this bit is sticky and must be explicitly cleared by the operating system each time it is initially loaded. Not implemented. Hardwired to 0.
7:4	0x0 RO	**Reserved (RSVD1):**
3	0x1 RO	**No Soft Reset (NSR):** When set to 1, this bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved. Upon transition from the D3hot to the D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the PowerState bits.
2	0x0 RO	**Reserved (RSVD0):**
1:0	0x0 RW	**Power State (PWRST):** This 2-bit field is used both to determine the current power state of a function and to set the function into a new power state. The definition of the field values is given below: • 00b - D0 • 01b - D1 • 10b - D2 • 11b - D3hot If software attempts to write an unsupported, optional state to this field, the write operation must complete normally on the bus; however, the data is discarded and no state change occurs.

54.6.21 Process Stepping Information (IDE_HOST_PSI)—Offset F8h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:27, F:2] + F8h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RO	**Reserved (RSVD):** Not implemented. Hardwired to 0.
27:24	0x0 RO/V	**Dot Portion of Process ID (DPOP):** Reserved.
23:16	0x0 RO/V	**Manufacturing Stepping (MSID):** Reserved.
15:8	0x0 RO/V	**Manufacturing ID (MID):** Reserved.
7:0	0x0 RO/V	**Process Portion of Process ID (PPOP):** Reserved.

54.7 Registers in Memory Space—HECI1_MMIO_MBAR

These registers are accessed in Host Memory Space starting at the relocatable memory address defined by the Base Address Register (BAR) HECI1_MMIO_MBAR_LO described in Section 54.2.9, "HECI MMIO Base Address Low (HECI1_MMIO_MBAR_LO)—Offset 10h" on page 2458 and HECI1_MMIO_MBAR_HI described in Section 54.2.10, "HECI MMIO Base Address High (HECI1_MMIO_MBAR_HI)—Offset 14h" on page 2459.

54.7.1 Host CB Write Window (HECI1_H_CB_WW)—Offset 0h

This register is for host to write into its Circular Buffer.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [HECI1_MMIO_MBAR] + 0h

HECI1_MMIO_MBAR Type: PCI Configuration Register (Size: 64 bits)
HECI1_MMIO_MBAR Reference: [B:0, D:27, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 WO	**Host Circular Buffer Write Window Field (H_CB_WWF):** This field is for host to write into its circular buffer. This field is write only, reads will return arbitrary data. Writes to this register will increment the H_CBWP as long as CSE_RDY is 1. When CSE_RDY is 0, writes to this register have no effect and are not delivered to the H_CB, nor is H_CBWP incremented.

54.7.2 Host Control and Status Register (HECI1_H_CSR)—Offset 4h

This register reports status information about the host circular buffer (H_CB) and allows host software to control interrupt generation.

Note to software: reserved bits in this register must be set to 0 whenever this register is written.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [HECI1_MMIO_MBAR] + 4h

Default: 80000000h

HECI1_MMIO_MBAR Type: PCI Configuration Register (Size: 64 bits)
HECI1_MMIO_MBAR Reference: [B:0, D:27, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x80 RO	**Host Circular Buffer Depth (H_CBD):** This field indicates the maximum number of 32 bit entries available in the host circular buffer (H_CB). Host software uses this field along with the H_CBRP and H_CBWP fields to calculate the number of valid entries in the H_CB to read or number of entries available for write. Programmers note: This field is implemented with a '1-hot' scheme. Only one bit will be set to a '1' at a time. Each bit position represents the value n of a buffer depth of (2^n). For example, when bit# 1 is 1, the buffer depth is 2; when bit#2 is 1, the buffer depth is 4, etc. **This field is hardwired to represent a depth of 128 entries.**
23:16	0x0 RO/V	**Host CB Write Pointer (H_CBWP):** Points to next location in the H_CB for host to write the data. Software uses this field along with H_CBRP and H_CBD fields to calculate the number of valid entries in the H_CB to read or number of entries available for write.
15:8	0x0 RO/V	**Host CB Read Pointer (H_CBRP):** Points to next location in the H_CB where a valid data is available for embedded controller to read. Software uses this field along with H_CBWR and H_CBD fields to calculate the number of valid entries in the host CB to read or number of entries available for write.
7	0x0 RO	**Reserved (RSVD_7_7):** Reserved.
6	0x0 RW/1C/V	**Host D0I3 Interrupt Status (H_D0I3C_IS):** HW sets this bit to 1 when D0I3C.H_D0I3_IR is set and D0I3C.H_D0I3_CIP transitions from 1 to 0. Host clears this bit to 0 by writing a 1 to this bit position. H_D0I3C_IE has no effect on this bit.
5	0x0 RW	**Host D0I3 Interrupt Enable (H_D0I3C_IE):** Host sets this bit to 1 to enable the host interrupt (MSI, INTx, SMI or SCI) to be asserted when H_D0I3C_IS is set to 1.
4	0x0 RW	**Host Reset (H_RST):** Setting this bit to 1 will initiate the HECI reset sequence to get the circular buffers into a known good state for host and CSE communication. When this bit transitions from 0 to 1, hardware will clear the H_RDY and CSE_RDY bits.
3	0x0 RW/V	**Host Ready (H_RDY):** This bit indicates that the host is ready to process messages.
2	0x0 RW/V	**Host Interrupt Generate (H_IG):** Once message(s) are written into its CB, the host sets this bit to one for the HW to set the CSE_IS bit in the CSE_CSR and to generate an interrupt message to mIA. HW then clears this bit to 0.
1	0x0 RW/1C/V	**Host Interrupt Status (H_IS):** HW sets this bit to 1 when CSE_IG bit is set to 1. Host clears this bit to 0 by writing a 1 to this bit position. H_IE has no effect on this bit.
0	0x0 RW	**Host Interrupt Enable (H_IE):** Host sets this bit to 1 to enable the host interrupt (MSI, INTx, SMI or SCI) to be asserted when H_IS is set to 1.

54.7.3 CSE Circular Buffer Read Window (HECI1_CSE_CB_RW)—Offset 8h

This register is for host to read from the CSE Circular Buffer (CSE_CB).

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [HECI1_MMIO_MBAR] + 8h

Default: FFFFFFFFh

HECI1_MMIO_MBAR Type: PCI Configuration Register (Size: 64 bits)
HECI1_MMIO_MBAR Reference: [B:0, D:27, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0xffffffff RO	**CSE Circular Buffer Read Window Field (CSE_CB_RWF):** This bit field is for host to read from the CSE Circular Buffer. This field is read only, writes have no effect. Reads to this register will increment the CSE_CBRP as long as CSE_RDY is 1. When CSE_RDY is 0, reads to this register have no effect, all 1s are returned, and CSE_CBRP is not incremented.

54.7.4 CSE Control and Status Register Host Access (HECI1_CSE_CSR_HA)—Offset Ch

This register allows host software to read the CSE Control Status register (CSE_CSR).

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [HECI1_MMIO_MBAR] + Ch

Default: 80000000h

HECI1_MMIO_MBAR Type: PCI Configuration Register (Size: 64 bits)
HECI1_MMIO_MBAR Reference: [B:0, D:27, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x80 RO	**CSE Circular Buffer Depth Host Read Access (CSE_CBD_HRA):** Host read access to CSE_CBD. **This field is hardwired to represent a depth of 128 entries.**
23:16	0x0 RO/V	**CSE CB Write Pointer Host Read Access (CSE_CBWP_HRA):** Host read only access to CSE_CBWP.
15:8	0x0 RO/V	**CSE CB Read Pointer Host Read Access (CSE_CBRP_HRA):** Host read only access to CSE_CBRP.
7	0x0 RO/V	**NMI Status Host Read Access (NMI_STS_HRA):** Host read access to NMI_STS.
6	0x0 RO	**Reserved (RSVD_6_6):** Reserved.
5	0x0 RO/V	**Pointer Reset Host Read Access (PTR_RST_HRA):** Host read access to PTR_RST.
4	0x0 RO/V	**CSE Reset Host Read Access (CSE_RST_HRA):** Host read access to CSE_RST.
3	0x0 RO/V	**CSE Ready Host Read Access (CSE_RDY_HRA):** Host read access to CSE_RDY.
2	0x0 RO/V	**CSE Interrupt Generate Host Read Access (CSE_IG_HRA):** Host read only access to CSE_IG.
1	0x0 RO/V	**CSE Interrupt Status Host Read Access (CSE_IS_HRA):** Host read only access to CSE_IS.
0	0x0 RO/V	**CSE Interrupt Enable Host Read Access (CSE_IE_HRA):** Host read only access to CSE_IE.

54.7.5 D0i3 Control (HECI1_D0I3C)—Offset 800h

This register allows host to configure the power mode using D0i0/D0i3 support.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [HECI1_MMIO_MBAR] + 800h

Default: 00000000h

HECI1_MMIO_MBAR Type: PCI Configuration Register (Size: 64 bits)
HECI1_MMIO_MBAR Reference: [B:0, D:27, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0x0 RO	**Reserved (RSVD_31_4):** Reserved.
3	0x0 RO	**Restore Required (H_D0I3C_RR):** When this bit is set (by HW), SW must restore the state of the IP. This bit is cleared by SW writing a 1. **In CSE this bit is never set so it does not need to be cleared by SW.**
2	0x0 RW	**D0i3 (H_D0I3C_I3):** SW sets this bit to 1 in order to move the IP into the D0i3 state. Clearing this bit will return the IP into the fully active D0 state (D0i0). When this bit changes state, mIA may be interrupted (see H_PCI_CSR.D0I3C_IS register's description)
1	0x0 RW	**Interrupt Request (H_D0I3C_IR):** SW sets this bit to 1 to ask for an interrupt to be generated on completion of the command. SW must clear or set this bit on each write to this register. When this bit is set to 1, Command-in-Progress deassertion is captured in H_CSR.H_D0I3_IS. If H_CSR.H_D0I3_IE is 1 as well, host interrupt will be initiated.
0	0x0 RO/V	**Command-in-Progress (H_D0I3C_CIP):** HW sets this bit on a 0-)1 or 1-)0 transition of D0i3 bit (bit [2]). While set, the other bits in this register are not valid and it is illegal for SW to write to any of them. While clear, all other bits in this register are valid and SW may write to them. If Interrupt Request (bit [1]) was set for the current command, HW may clear this bit before the interrupt has been made visible to SW, since when SW actually handles a particular interrupt is not visible to HW. SW writes to this bit have no effect. This bit is auto-cleared by HW one cycle after it is set.

54.8 Registers in Memory Space—HECI2_MMIO_MBAR

These registers are accessed in Host Memory Space starting at the relocatable memory address defined by the Base Address Register (BAR) HECI2_MMIO_MBAR_LO described in Section 54.3.9, "HECI MMIO Base Address Low (HECI2_MMIO_MBAR_LO)—Offset 10h" on page 2478 and HECI2_MMIO_MBAR_HI described in Section 54.3.10, "HECI MMIO Base Address High (HECI2_MMIO_MBAR_HI)—Offset 14h" on page 2479.

54.8.1 Host CB Write Window (HECI2_H_CB_WW)—Offset 0h

This register is for host to write into its Circular Buffer.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [HECI2_MMIO_MBAR] + 0h

HECI2_MMIO_MBAR Type: PCI Configuration Register (Size: 64 bits)
HECI2_MMIO_MBAR Reference: [B:0, D:27, F:1] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 WO	**Host Circular Buffer Write Window Field (H_CB_WWF):** This field is for host to write into its circular buffer. This field is write only, reads will return arbitrary data. Writes to this register will increment the H_CBWP as long as CSE_RDY is 1. When CSE_RDY is 0, writes to this register have no effect and are not delivered to the H_CB, nor is H_CBWP incremented.

54.8.2 Host Control and Status Register (HECI2_H_CSR)—Offset 4h

This register reports status information about the host circular buffer (H_CB) and allows host software to control interrupt generation.

Note to software: reserved bits in this register must be set to 0 whenever this register is written.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [HECI2_MMIO_MBAR] + 4h

Default: 80000000h

HECI2_MMIO_MBAR Type: PCI Configuration Register (Size: 64 bits)
HECI2_MMIO_MBAR Reference: [B:0, D:27, F:1] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x80 RO	**Host Circular Buffer Depth (H_CBD):** This field indicates the maximum number of 32 bit entries available in the host circular buffer (H_CB). Host software uses this field along with the H_CBRP and H_CBWP fields to calculate the number of valid entries in the H_CB to read or number of entries available for write. Programmers note: This field is implemented with a '1-hot' scheme. Only one bit will be set to a '1' at a time. Each bit position represents the value n of a buffer depth of (2^n). For example, when bit# 1 is 1, the buffer depth is 2; when bit#2 is 1, the buffer depth is 4, etc. **This field is hardwired to represent a depth of 128 entries.**
23:16	0x0 RO/V	**Host CB Write Pointer (H_CBWP):** Points to next location in the H_CB for host to write the data. Software uses this field along with H_CBRP and H_CBD fields to calculate the number of valid entries in the H_CB to read or number of entries available for write.
15:8	0x0 RO/V	**Host CB Read Pointer (H_CBRP):** Points to next location in the H_CB where a valid data is available for embedded controller to read. Software uses this field along with H_CBWR and H_CBD fields to calculate the number of valid entries in the host CB to read or number of entries available for write.
7	0x0 RO	**Reserved (RSVD_7_7):** Reserved.
6	0x0 RW/1C/V	**Host D0I3 Interrupt Status (H_D0I3C_IS):** HW sets this bit to 1 when D0I3C.H_D0I3_IR is set and D0I3C.H_D0I3_CIP transitions from 1 to 0. Host clears this bit to 0 by writing a 1 to this bit position. H_D0I3C_IE has no effect on this bit.
5	0x0 RW	**Host D0I3 Interrupt Enable (H_D0I3C_IE):** Host sets this bit to 1 to enable the host interrupt (MSI, INTx, SMI or SCI) to be asserted when H_D0I3C_IS is set to 1.
4	0x0 RW	**Host Reset (H_RST):** Setting this bit to 1 will initiate the HECI reset sequence to get the circular buffers into a known good state for host and CSE communication. When this bit transitions from 0 to 1, hardware will clear the H_RDY and CSE_RDY bits.
3	0x0 RW/V	**Host Ready (H_RDY):** This bit indicates that the host is ready to process messages.
2	0x0 RW/V	**Host Interrupt Generate (H_IG):** Once message(s) are written into its CB, the host sets this bit to one for the HW to set the CSE_IS bit in the CSE_CSR and to generate an interrupt message to mIA. HW then clears this bit to 0.
1	0x0 RW/1C/V	**Host Interrupt Status (H_IS):** HW sets this bit to 1 when CSE_IG bit is set to 1. Host clears this bit to 0 by writing a 1 to this bit position. H_IE has no effect on this bit.
0	0x0 RW	**Host Interrupt Enable (H_IE):** Host sets this bit to 1 to enable the host interrupt (MSI, INTx, SMI or SCI) to be asserted when H_IS is set to 1.

54.8.3 CSE Circular Buffer Read Window (HECI2_CSE_CB_RW)—Offset 8h

This register is for host to read from the CSE Circular Buffer (CSE_CB).

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [HECI2_MMIO_MBAR] + 8h

Default: FFFFFFFFh

HECI2_MMIO_MBAR Type: PCI Configuration Register (Size: 64 bits)
HECI2_MMIO_MBAR Reference: [B:0, D:27, F:1] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0xffffffff RO	**CSE Circular Buffer Read Window Field (CSE_CB_RWF):** This bit field is for host to read from the CSE Circular Buffer. This field is read only, writes have no effect. Reads to this register will increment the CSE_CBRP as long as CSE_RDY is 1. When CSE_RDY is 0, reads to this register have no effect, all 1s are returned, and CSE_CBRP is not incremented.

54.8.4 CSE Control and Status Register Host Access (HECI2_CSE_CSR_HA)—Offset Ch

This register allows host software to read the CSE Control Status register (CSE_CSR).

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [HECI2_MMIO_MBAR] + Ch

Default: 80000000h

HECI2_MMIO_MBAR Type: PCI Configuration Register (Size: 64 bits)
HECI2_MMIO_MBAR Reference: [B:0, D:27, F:1] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x80 RO	**CSE Circular Buffer Depth Host Read Access (CSE_CBD_HRA):** Host read access to CSE_CBD. **This field is hardwired to represent a depth of 128 entries.**
23:16	0x0 RO/V	**CSE CB Write Pointer Host Read Access (CSE_CBWP_HRA):** Host read only access to CSE_CBWP.
15:8	0x0 RO/V	**CSE CB Read Pointer Host Read Access (CSE_CBRP_HRA):** Host read only access to CSE_CBRP.
7	0x0 RO/V	**NMI Status Host Read Access (NMI_STS_HRA):** Host read access to NMI_STS.
6	0x0 RO	**Reserved (RSVD_6_6):** Reserved.
5	0x0 RO/V	**Pointer Reset Host Read Access (PTR_RST_HRA):** Host read access to PTR_RST.
4	0x0 RO/V	**CSE Reset Host Read Access (CSE_RST_HRA):** Host read access to CSE_RST.
3	0x0 RO/V	**CSE Ready Host Read Access (CSE_RDY_HRA):** Host read access to CSE_RDY.
2	0x0 RO/V	**CSE Interrupt Generate Host Read Access (CSE_IG_HRA):** Host read only access to CSE_IG.
1	0x0 RO/V	**CSE Interrupt Status Host Read Access (CSE_IS_HRA):** Host read only access to CSE_IS.
0	0x0 RO/V	**CSE Interrupt Enable Host Read Access (CSE_IE_HRA):** Host read only access to CSE_IE.

54.8.5 D0i3 Control (HECI2_D0I3C)—Offset 800h

This register allows host to configure the power mode using D0i0/D0i3 support.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [HECI2_MMIO_MBAR] + 800h

HECI2_MMIO_MBAR Type: PCI Configuration Register (Size: 64 bits)
HECI2_MMIO_MBAR Reference: [B:0, D:27, F:1] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0x0 RO	**Reserved (RSVD_31_4):** Reserved.
3	0x0 RO	**Restore Required (H_D0I3C_RR):** When this bit is set (by HW), SW must restore the state of the IP. This bit is cleared by SW writing a 1. **In CSE this bit is never set so it does not need to be cleared by SW.**
2	0x0 RW	**D0i3 (H_D0I3C_I3):** SW sets this bit to 1 in order to move the IP into the D0i3 state. Clearing this bit will return the IP into the fully active D0 state (D0i0). When this bit changes state, mIA may be interrupted (see H_PCI_CSR.D0I3C_IS register's description)
1	0x0 RW	**Interrupt Request (H_D0I3C_IR):** SW sets this bit to 1 to ask for an interrupt to be generated on completion of the command. SW must clear or set this bit on each write to this register. When this bit is set to 1, Command-in-Progress deassertion is captured in H_CSR.H_D0I3_IS. If H_CSR.H_D0I3_IE is 1 as well, host interrupt will be initiated.
0	0x0 RO/V	**Command-in-Progress (H_D0I3C_CIP):** HW sets this bit on a 0-)1 or 1-)0 transition of D0i3 bit (bit [2]). While set, the other bits in this register are not valid and it is illegal for SW to write to any of them. While clear, all other bits in this register are valid and SW may write to them. If Interrupt Request (bit [1]) was set for the current command, HW may clear this bit before the interrupt has been made visible to SW, since when SW actually handles a particular interrupt is not visible to HW. SW writes to this bit have no effect. This bit is auto-cleared by HW one cycle after it is set.

54.9 Registers in Memory Space—HECI3_MMIO_MBAR

These registers are accessed in Host Memory Space starting at the relocatable memory address defined by the Base Address Register (BAR) HECI3_MMIO_MBAR_LO described in Section 54.4.9, "HECI MMIO Base Address Low (HECI3_MMIO_MBAR_LO)—Offset 10h" on page 2495 and HECI3_MMIO_MBAR_HI described in Section 54.4.10, "HECI MMIO Base Address High (HECI3_MMIO_MBAR_HI)—Offset 14h" on page 2496.

54.9.1 Host CB Write Window (HECI3_H_CB_WW)—Offset 0h

This register is for host to write into its Circular Buffer.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [HECI3_MMIO_MBAR] + 0h

HECI3_MMIO_MBAR Type: PCI Configuration Register (Size: 64 bits)
HECI3_MMIO_MBAR Reference: [B:0, D:27, F:4] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 WO	**Host Circular Buffer Write Window Field (H_CB_WWF):** This field is for host to write into its circular buffer. This field is write only, reads will return arbitrary data. Writes to this register will increment the H_CBWP as long as CSE_RDY is 1. When CSE_RDY is 0, writes to this register have no effect and are not delivered to the H_CB, nor is H_CBWP incremented.

54.9.2 Host Control and Status Register (HECI3_H_CSR)—Offset 4h

This register reports status information about the host circular buffer (H_CB) and allows host software to control interrupt generation.

Note to software: reserved bits in this register must be set to 0 whenever this register is written.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [HECI3_MMIO_MBAR] + 4h

Default: 80000000h

HECI3_MMIO_MBAR Type: PCI Configuration Register (Size: 64 bits)
HECI3_MMIO_MBAR Reference: [B:0, D:27, F:4] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x80 RO	**Host Circular Buffer Depth (H_CBD):** This field indicates the maximum number of 32 bit entries available in the host circular buffer (H_CB). Host software uses this field along with the H_CBRP and H_CBWP fields to calculate the number of valid entries in the H_CB to read or number of entries available for write. Programmers note: This field is implemented with a '1-hot' scheme. Only one bit will be set to a '1' at a time. Each bit position represents the value n of a buffer depth of (2^n). For example, when bit# 1 is 1, the buffer depth is 2; when bit#2 is 1, the buffer depth is 4, etc. **This field is hardwired to represent a depth of 128 entries.**
23:16	0x0 RO/V	**Host CB Write Pointer (H_CBWP):** Points to next location in the H_CB for host to write the data. Software uses this field along with H_CBRP and H_CBD fields to calculate the number of valid entries in the H_CB to read or number of entries available for write.
15:8	0x0 RO/V	**Host CB Read Pointer (H_CBRP):** Points to next location in the H_CB where a valid data is available for embedded controller to read. Software uses this field along with H_CBWR and H_CBD fields to calculate the number of valid entries in the host CB to read or number of entries available for write.
7	0x0 RO	**Reserved (RSVD_7_7):** Reserved.
6	0x0 RW/1C/V	**Host D0I3 Interrupt Status (H_D0I3C_IS):** HW sets this bit to 1 when D0I3C.H_D0I3_IR is set and D0I3C.H_D0I3_CIP transitions from 1 to 0. Host clears this bit to 0 by writing a 1 to this bit position. H_D0I3C_IE has no effect on this bit.
5	0x0 RW	**Host D0I3 Interrupt Enable (H_D0I3C_IE):** Host sets this bit to 1 to enable the host interrupt (MSI, INTx, SMI or SCI) to be asserted when H_D0I3C_IS is set to 1.
4	0x0 RW	**Host Reset (H_RST):** Setting this bit to 1 will initiate the HECI reset sequence to get the circular buffers into a known good state for host and CSE communication. When this bit transitions from 0 to 1, hardware will clear the H_RDY and CSE_RDY bits.
3	0x0 RW/V	**Host Ready (H_RDY):** This bit indicates that the host is ready to process messages.
2	0x0 RW/V	**Host Interrupt Generate (H_IG):** Once message(s) are written into its CB, the host sets this bit to one for the HW to set the CSE_IS bit in the CSE_CSR and to generate an interrupt message to mIA. HW then clears this bit to 0.
1	0x0 RW/1C/V	**Host Interrupt Status (H_IS):** HW sets this bit to 1 when CSE_IG bit is set to 1. Host clears this bit to 0 by writing a 1 to this bit position. H_IE has no effect on this bit.
0	0x0 RW	**Host Interrupt Enable (H_IE):** Host sets this bit to 1 to enable the host interrupt (MSI, INTx, SMI or SCI) to be asserted when H_IS is set to 1.

54.9.3 CSE Circular Buffer Read Window (HECI3_CSE_CB_RW)—Offset 8h

This register is for host to read from the CSE Circular Buffer (CSE_CB).

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [HECI3_MMIO_MBAR] + 8h

Default: FFFFFFFFh

HECI3_MMIO_MBAR Type: PCI Configuration Register (Size: 64 bits)
HECI3_MMIO_MBAR Reference: [B:0, D:27, F:4] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0xffffffff RO	**CSE Circular Buffer Read Window Field (CSE_CB_RWF):** This bit field is for host to read from the CSE Circular Buffer. This field is read only, writes have no effect. Reads to this register will increment the CSE_CBRP as long as CSE_RDY is 1. When CSE_RDY is 0, reads to this register have no effect, all 1s are returned, and CSE_CBRP is not incremented.

54.9.4 CSE Control and Status Register Host Access (HECI3_CSE_CSR_HA)—Offset Ch

This register allows host software to read the CSE Control Status register (CSE_CSR).

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [HECI3_MMIO_MBAR] + Ch

Default: 80000000h

HECI3_MMIO_MBAR Type: PCI Configuration Register (Size: 64 bits)
HECI3_MMIO_MBAR Reference: [B:0, D:27, F:4] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x80 RO	**CSE Circular Buffer Depth Host Read Access (CSE_CBD_HRA):** Host read access to CSE_CBD. **This field is hardwired to represent a depth of 128 entries.**
23:16	0x0 RO/V	**CSE CB Write Pointer Host Read Access (CSE_CBWP_HRA):** Host read only access to CSE_CBWP.
15:8	0x0 RO/V	**CSE CB Read Pointer Host Read Access (CSE_CBRP_HRA):** Host read only access to CSE_CBRP.
7	0x0 RO/V	**NMI Status Host Read Access (NMI_STS_HRA):** Host read access to NMI_STS.
6	0x0 RO	**Reserved (RSVD_6_6):** Reserved.
5	0x0 RO/V	**Pointer Reset Host Read Access (PTR_RST_HRA):** Host read access to PTR_RST.
4	0x0 RO/V	**CSE Reset Host Read Access (CSE_RST_HRA):** Host read access to CSE_RST.
3	0x0 RO/V	**CSE Ready Host Read Access (CSE_RDY_HRA):** Host read access to CSE_RDY.
2	0x0 RO/V	**CSE Interrupt Generate Host Read Access (CSE_IG_HRA):** Host read only access to CSE_IG.
1	0x0 RO/V	**CSE Interrupt Status Host Read Access (CSE_IS_HRA):** Host read only access to CSE_IS.
0	0x0 RO/V	**CSE Interrupt Enable Host Read Access (CSE_IE_HRA):** Host read only access to CSE_IE.

54.9.5 D0i3 Control (HECI3_D0I3C)—Offset 800h

This register allows host to configure the power mode using D0i0/D0i3 support.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [HECI3_MMIO_MBAR] + 800h

HECI3_MMIO_MBAR Type: PCI Configuration Register (Size: 64 bits)
HECI3_MMIO_MBAR Reference: [B:0, D:27, F:4] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0x0 RO	**Reserved (RSVD_31_4):** Reserved.
3	0x0 RO	**Restore Required (H_D0I3C_RR):** When this bit is set (by HW), SW must restore the state of the IP. This bit is cleared by SW writing a 1. **In CSE this bit is never set so it does not need to be cleared by SW.**
2	0x0 RW	**D0i3 (H_D0I3C_I3):** SW sets this bit to 1 in order to move the IP into the D0i3 state. Clearing this bit will return the IP into the fully active D0 state (D0i0). When this bit changes state, mIA may be interrupted (see H_PCI_CSR.D0I3C_IS register's description)
1	0x0 RW	**Interrupt Request (H_D0I3C_IR):** SW sets this bit to 1 to ask for an interrupt to be generated on completion of the command. SW must clear or set this bit on each write to this register. When this bit is set to 1, Command-in-Progress deassertion is captured in H_CSR.H_D0I3_IS. If H_CSR.H_D0I3_IE is 1 as well, host interrupt will be initiated.
0	0x0 RO/V	**Command-in-Progress (H_D0I3C_CIP):** HW sets this bit on a 0-)1 or 1-)0 transition of D0i3 bit (bit [2]). While set, the other bits in this register are not valid and it is illegal for SW to write to any of them. While clear, all other bits in this register are valid and SW may write to them. If Interrupt Request (bit [1]) was set for the current command, HW may clear this bit before the interrupt has been made visible to SW, since when SW actually handles a particular interrupt is not visible to HW. SW writes to this bit have no effect. This bit is auto-cleared by HW one cycle after it is set.

54.10 Registers in Memory Space—KT_HOST_MEMBAR

These registers are accessed in Host Memory Space starting at the relocatable memory address defined by the Base Address Register (BAR) KT_HOST_MEMBAR described in Section 54.5.6, "KT Memory BAR (KT_HOST_MEMBAR)—Offset 14h" on page 2513.

54.10.1 KT Receive Buffer Register (MEM_KTRBR)—Offset 0h

This register implements the standard Receiver Buffer register in the KT Block. This is read-only. DLAB(i.e. KTLCR[7]) shall be 0. In non-FIFO mode, this register will be read when the receiver data is ready. In FIFO mode, a read from this register will be translated into a read from the RBR FIFO. Reset condition: Host reset. Non-sticky.

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [KT_HOST_MEMBAR] + 0h

KT_HOST_MEMBAR Type: PCI Configuration Register (Size: 32 bits)
KT_HOST_MEMBAR Reference: [B:0, D:27, F:3] + 14h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO/V	**Receiver Buffer Register (RBR):** Implements the Receiver Buffer register of the Serial Interface.

54.10.2 KT Transmitter Holding Register (MEM_KTTHR)—Offset 0h

This register implements the standard Transmitter Holding register in the KT Block. This is write-only. DLAB(i.e. KTLCR[7]) shall be 0. In non-FIFO mode, this register will be written when the Host needs to transmit data. In FIFO mode, a write to this register will be translated into a write to the THR FIFO. Reset condition: Host reset. Non-sticky.

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [KT_HOST_MEMBAR] + 0h

KT_HOST_MEMBAR Type: PCI Configuration Register (Size: 32 bits)
KT_HOST_MEMBAR Reference: [B:0, D:27, F:3] + 14h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 WO	**Transmitter Holding Register (THR):** Implements the Transmit Data register of the Serial Interface.

54.10.3 KT Divisor Latch LSB Register (MEM_KTDLLR)—Offset 0h

This register implements the standard DLL register in the KT Block. DLAB(i.e. KTLCR[7]) shall be 1 in order for this register to be accessed. this register is supported only for SW compatibility and has no impact on HW performance. Reset condition: Host reset. Non-sticky.

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [KT_HOST_MEMBAR] + 0h

KT_HOST_MEMBAR Type: PCI Configuration Register (Size: 32 bits)
KT_HOST_MEMBAR Reference: [B:0, D:27, F:3] + 14h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW/V	**Divisor Latch LSB (DLL):** Implements the DLL register of the Serial Interface.

54.10.4 KT Interrupt Enable register (MEM_KTIER)—Offset 1h

This register implements the standard Interrupt Enable register in the KT Block. The bits enable specific events to interrupt the Host. See bit specific definition below. DLAB(i.e. KTLCR[7]) shall is 0 in order for this register to be accessed. Reset condition: Host reset. Non-sticky.

Type: Memory Mapped I/O Register (Size: 8 bits)

BAR and Offset: [KT_HOST_MEMBAR] + 1h

Default: 00h

KT_HOST_MEMBAR Type: PCI Configuration Register (Size: 32 bits)
KT_HOST_MEMBAR Reference: [B:0, D:27, F:3] + 14h

Bit Range	Default & Access	Field Name (ID): Description
7:4	0x0 RO	**Reserved (RSVD):** Reserved.
3	0x0 RW	**MSR (IER3):** When set, enables bits in Modem Status register to cause an interrupt to the Host
2	0x0 RW	**LSR (IER2):** When set, enables bits in Receiver Line Status Register to cause an interrupt to the Host
1	0x0 RW	**THR (IER1):** When set, enables an interrupt to the Host when the Transmitter Holding register is empty.
0	0x0 RW	**DR (IER0):** When set, enables an interrupt to the Host when the Received Data is available OR Receiver FIFO timeout.

54.10.5 KT Divisor Latch MSB Register (MEM_KTDLMR)—Offset 1h

This register implements the standard DLM register in the KT Block. DLAB(i.e. KTLCR[7]) shall be 1 in order for this register to be accessed. This register is supported only for SW compatibility and has no impact on HW performance. Reset condition: Host reset. Non-sticky.

Type: Memory Mapped I/O Register (Size: 8 bits)

BAR and Offset: [KT_HOST_MEMBAR] + 1h

Default: 00h

KT_HOST_MEMBAR Type: PCI Configuration Register (Size: 32 bits)
KT_HOST_MEMBAR Reference: [B:0, D:27, F:3] + 14h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW/V	**Divisor Latch MSB (DLM):** Implements the DLM register of the Serial Interface.

54.10.6 KT Interrupt Identification Register (MEM_KTIIR)—Offset 2h

This register implements the standard Interrupt Identification register in the KT Block. This is read-only. This register is created to provide minimum software overhead during data character transfers. The register prioritizes KT interrupts into 4 levels and records them in the IIRSTS field of this register. The four levels of interrupt conditions in order of priority are: Receiver Line Status; Received Data Ready/Character Timeout Indication; Transmitter Holding Register Empty; MODEM Status. When the Host accesses the IIR, the HW freezes all interrupts and indicates the highest priority pending interrupt to the Host. While this Host access is occurring, the HW records new interrupts, but does not change its current indication until the access is complete. Table in the Host Interrupt Generation section shows the contents. Reset condition: Host reset. Non-sticky.

Type: Memory Mapped I/O Register (Size: 8 bits)

BAR and Offset: [KT_HOST_MEMBAR] + 2h

Default: 01h

KT_HOST_MEMBAR Type: PCI Configuration Register (Size: 32 bits)
KT_HOST_MEMBAR Reference: [B:0, D:27, F:3] + 14h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RO/V	**FIFO Enable (FIEN1):** This field is connected by HW to the FIFO Enable field of the FCR register.
6	0x0 RO/V	**FIFO Enable (FIEN0):** This field is connected by HW to the FIFO Enable field of the FCR register.
5:4	0x0 RO	**Reserved (RSVD):** Hardwired to 0.
3:1	0x0 RO/V	**IIR Status (IIRSTS):** These bits are asserted by the HW according to the source of the interrupt and the priority level. Refer to the section on Host Interrupt Generation for a table of values.
0	0x1 RO/V	**Interrupt Status (INTSTS):** • 0: indicates a pending Host interrupt and IIRSTS may be used as a pointer to the appropriate interrupt service routine. It reflects the logical-NOR of all UART interrupts. An individual UART interrupt will be identified as pending when the individual event status is asserted AND its corresponding event interrupt enable is asserted as well. For example, the THR Empty interrupt will be identified as pending when both LSR[THRE] bit is 1 AND IER[IER1] is 1. • 1: indicates no pending Host interrupt.

54.10.7 KT FIFO Control register (MEM_KTFCR)—Offset 2h

This register implements the standard FIFO Control register in the KT Block. It is used to configure features pertinent to the FIFO mode of operation. This is write-only. Reset condition: Host reset. Non-sticky.

Type: Memory Mapped I/O Register (Size: 8 bits)

BAR and Offset: [KT_HOST_MEMBAR] + 2h

Default: 00h

KT_HOST_MEMBAR Type: PCI Configuration Register (Size: 32 bits)
KT_HOST_MEMBAR Reference: [B:0, D:27, F:3] + 14h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0x0 WO	**Receiver Trigger Level (RTL):** Trigger level in bytes for the Receiver FIFO. Once the trigger level number of bytes is reached, an interrupt will be sent to the Host [7:6] RCVR FIFO Trigger Level (bytes) • 00 -- 01 • 01 -- 04 • 10 -- 08 • 11 -- 14
5:4	0x0 WO	**Reserved (RSVD):** Writes to this field shall be dropped.
3	0x0 WO	**RDY Mode (RDYM):** This bit has no effect on HW performance.
2	0x0 WO	**XMT FIFO Clear (XFIC):** When the Host writes one to this bit the HW will clear the XMT FIFO. This bit is self-cleared by HW.
1	0x0 WO	**RCV FIFO Clear (RFIC):** When the Host writes one to this bit the HW will clear the RCV FIFO. This bit is self-cleared by HW.
0	0x0 WO	**FIFO Enable (FIE):** When set indicates that the KT interface is working in FIFO node. When this bit value is changed the RCV and XMT FIFO are cleared by HW. This bit must be a 1 when other FCR bits are written to or they will NOT be programmed.

54.10.8 KT Line Control register (MEM_KTLCR)—Offset 3h

This register implements the standard Line Control register in the KT Block. It specifies the format of the asynchronous data communications exchange and sets the DLAB bit. Most bits in this register have no effect on HW and are only used by the FW. Reset condition: Host reset. Non-sticky.

Type: Memory Mapped I/O Register (Size: 8 bits)

BAR and Offset: [KT_HOST_MEMBAR] + 3h

Default: 03h

KT_HOST_MEMBAR Type: PCI Configuration Register (Size: 32 bits)
KT_HOST_MEMBAR Reference: [B:0, D:27, F:3] + 14h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RW	**Divisor Latch Access Bit (DLAB):** • 1: Allows access to the Divisor Latch Registers and reading of the FIFO Control Register. • 0: Allows access to RBR, THR, IER and IIR registers.
6	0x0 RW	**Break Control (BC):** This bit has no effect on HW.
5:4	0x0 RW	**Parity Bit Mode (PBM):** This bit has no effect on HW.
3	0x0 RW	**Parity Enable (PE):** This bit has no effect on HW.
2	0x0 RW	**Stop Bit Select (SBS):** This bit has no effect on HW.
1:0	0x3 RW	**Word Select Byte (WSB):** This bit has no effect on HW.

54.10.9 KT Modem Control register (MEM_KTMCR)—Offset 4h

This register implements the standard Modem Control register in the KT Block. It controls the interface with the modem. Because the FW emulates the modem, the Host communicates with the FW via this register. This register has impact on the HW in the loopback mode. Reset condition: Host reset. Non-sticky.

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [KT_HOST_MEMBAR] + 4h

KT_HOST_MEMBAR Type: PCI Configuration Register (Size: 32 bits)
KT_HOST_MEMBAR Reference: [B:0, D:27, F:3] + 14h

Bit Range	Default & Access	Field Name (ID): Description
7:5	0x0 RO	**Reserved (RSVD):** Reserved.
4	0x0 RW	**Loop Back Mode (LBM):** When set by Host indicates that the serial port is in loop Back mode. This means that the data that is transmitted by the host should be received. Helps in debug of the interface
3	0x0 RW	**Output 2 (OUT2):** This bit has no effect on HW in normal mode. In loop back mode the value of this bit is written by HW to Modem Status Register bit (7).
2	0x0 RW	**Output 1 (OUT1):** This bit has no effect on HW in normal mode. In loop back mode the value of this bit is written by HW to Modem Status Register bit(6).
1	0x0 RW	**Request to Send Out (RTSO):** This bit has no effect on HW in normal mode. In loopback mode, the value of this bit is written by HW to Modem Status Register bit(4).
0	0x0 RW	**Data Terminal Ready Out (DRTO):** This bit has no effect on HW in normal mode. In loopback mode, the value in this bit is written by HW to Modem Status Register Bit(5).

54.10.10 KT Line Status register (MEM_KTLSR)—Offset 5h

This register implements the standard Line Status register in the KT Block. It provides status information of the data transfer to the Host. Error indication etc are provided by the HW/FW to the host via this register. Reset condition: Host reset. Non-sticky.

Type: Memory Mapped I/O Register (Size: 8 bits)

BAR and Offset: [KT_HOST_MEMBAR] + 5h

Default: 60h

KT_HOST_MEMBAR Type: PCI Configuration Register (Size: 32 bits)
KT_HOST_MEMBAR Reference: [B:0, D:27, F:3] + 14h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RO/C/V	**RCVR FIFO Error (RXFER):** This bit is cleared in non FIFO mode. This bit is connected to UART LSR[BI] bit in FIFO mode.
6	0x1 RO/V	**Transmitter Empty (TEMT):** In non-FIFO mode: This bit will be set to 1 whenever the Transmitter Holding Register (THR) and the Transmitter Shift Register (TSR) are both empty, OR cleared to 0 whenever either THR or TSR contains a data byte. In FIFO mode: This bit will be set to 1 whenever XMIT FIFO and TSR are both empty, OR cleared to 0 whenever either XMIT FIFO or TSR contains a data byte. Implementation note: This bit is connected by HW to THRE bit
5	0x1 RO/V	**Transmitter Holding Register Empty (THRE):** The bit will always be set whenever Host changes UART FCR[FIE] bit. This bit is controlled differently in FIFO vs non-FIFO modes: Non-FIFO mode: This bit will be cleared by HW when Host writes to THR, and set by HW when FW reads from THR. FIFO mode: This bit will be set by HW when XMIT FIFO is empty , and cleared by HW when XMIT FIFO is NOT empty.
4	0x0 RO/C/V	**Break Interrupt (BI):** This bit will be cleared by HW when the UART LSR register is read by Host. This bit will be set by HW in two cases: In FIFO mode, when FW sets the KTRIVR[SBI] bit. In non-FIFO mode, when FW sets the KTRBR[BIA] bit.
3	0x0 RO	**Framing Error (FE):** This bit is NOT implemented and hardwired to 0.
2	0x0 RO	**Parity Error (PE):** This bit is NOT implemented and hardwired to 0.
1	0x0 RO/C/V	**Overrun Error (OE):** HW will clear this bit when Host reads from KTLSR register and this is source of interrupt. HW will set this bit when overrun error is detected. In non-FIFO mode, the character that triggers the overrun error shall overwrite the character in the RBR register. In FIFO mode, the character that triggers the overrun error shall be dropped without corrupting the RCVR FIFO.
0	0x0 RO/V	**Data Ready (DR):** Non-FIFO Mode: This bit will be set by HW when FW writes to RBR and cleared by HW when Host reads from RBR. FIFO Mode: The bit will be set by HW when RCVR FIFO is not empty and cleared by HW when RCVR FIFO is empty.

54.10.11 KT Modem Status register (MEM_KTMSR)—Offset 6h

This register implements the standard Modem Status register in the KT Block. It provides the current state of the control lines from the modem. The modem functionality is emulated by the FW. Reset condition: Host reset. Non-sticky.

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [KT_HOST_MEMBAR] + 6h

KT_HOST_MEMBAR Type: PCI Configuration Register (Size: 32 bits)
KT_HOST_MEMBAR Reference: [B:0, D:27, F:3] + 14h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RO	**Data Carrier Detect (DCD):** In Loop Back mode this bit is connected by HW to the value of MCR bit 3
6	0x0 RO	**Ring Indicator (RI):** In Loop Back mode this bit is connected by HW to the value of MCR bit 2.
5	0x0 RO	**Data Set Ready (DSR):** In Loop Back mode this bit is connected by HW to the value of MCR bit 0.
4	0x0 RO	**Clear To Send (CTS):** In Loop Back mode this bit is connected by HW to the value of MCR bit 1.
3	0x0 RO/C/V	**Delta Data Carrier Detect (DDCD):** This bit is set when bit 7 is changed. This bit is cleared by HW when the MSR register is being read by the HOST driver.
2	0x0 RO/C/V	**Trailing Edge of Read Detector (TERI):** This bit is set when bit 6 is changed from 1 to 0. This bit is cleared by HW when the MSR register is being read by the Host driver.
1	0x0 RO/C/V	**Delta Data Set Ready (DDSR):** This bit is set when bit 5 is changed. This bit is cleared by HW when the MSR register is being read by the Host driver.
0	0x0 RO/C/V	**Delta Clear To Send (DCTS):** This bit is set when bit 4 is changed. This bit is cleared by HW when the MSR register is being read by the Host driver.

54.10.12 KT Scratch register (MEM_KTSCR)—Offset 7h

This register implements the standard Scratch register in the KT Block. It allows Host SW programmers to hold temporary data. It has NO effect on HW. Reset condition: Host reset. Non-sticky.

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [KT_HOST_MEMBAR] + 7h

KT_HOST_MEMBAR Type: PCI Configuration Register (Size: 32 bits)
KT_HOST_MEMBAR Reference: [B:0, D:27, F:3] + 14h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Scratch Register Data (SCRD):** Reserved.

54.11 Registers in Memory Space—Fixed Address

These registers are accessed in Host Memory Space through fixed memory addresses.

54.11.1 FTPM Locality State (HOST_LOC_0_LOC_STATE_HROA)—Offset FED40000h

Reads by host SW from this register will reflect the value of FTPM_LOC_STATE register in mIA space. This register is aliased to the following addresses in the host address space: FED4_x000, x=0,1,2,3,4. This register is implemented in flip-flops.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [0x0] + FED40000h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO/V	**Reserved (RSVD_31_8):** Opaque to HW. Defined by FW.
7	0x0 RO/V	**Register Valid Status (FTPM_REG_VALID_STS):** Opaque to HW. This bit is used by FW to signal to host SW when this register is valid.
6:5	0x0 RO/V	**Reserved (RSVD_6_5):** Opaque to HW. Defined by FW.
4:2	0x0 RO/V	**Active Locality (FTPM_ACTV_LOC):** The encodings are: • 000 - Locality 0, • 001 - Locality 1, • 010 - Locality 2, • 011 - Locality 3, • 100 - Locality 4, • 101 and 111 - reserved. FW sets these bits to mux in the active locality. Once set, the FTPM HCI will pass cycles from the active host locality to the FTPM shared SRAM. Writes from in-active localities will be dropped and reads will return 0's.
1	0x0 RO/V	**Locality Assigned (FTPM_LOC_ASSIGNED):** A value of 0 indicates to host SW that no locality is assigned, a value of 1 indicates a locality has been assigned.
0	0x0 RO/V	**Establishment (FTPM_ESTABLISHMENT):** Opaque to HW. This bit is set to 0 by FW when HASH_START occurs and set to 1 when the RESET_ESTABLISHMENT bit is set.

54.11.2 FTPM Locality Reserved (HOST_LOC_0_LOC_RSVD)—Offset FED40004h

This register was added in order to support QW reads from Locality State register.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [0x0] + FED40004h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO	**Reserved (FTPM_LOC_RSVD_BITS):** Reserved.

54.11.3 FTPM Locality n Control Register (HOST_LOC_0_LOC_CTRL)—Offset FED40008h

Writes by host SW to this register will update the value of the corresponding LOC_n_CTRL_CSEROA register in mIA space. Writes by host SW to this register may be configured by CSE FW to trigger an MSI/PME to mIA. This register is implemented in flip-flops.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [0x0] + FED40008h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 WO	**FTPM Locality n Control Bits (FTPM_LOC_CTRL_BITS):** Reserved.

54.11.4 FTPM Locality n Status Register Host Read Only Access. (HOST_LOC_0_LOC_STS_HROA)—Offset FED4000Ch

Reads by host SW from this register will reflect the value of the corresponding LOC_n_STS register in mIA space. This register is opaque to HW. This register is implemented in flip-flops.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [0x0] + FED4000Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**FTPM Locality n Status Bits (FTPM_LOC_STS_BITS):** Reserved.

54.11.5 FTPM Locality Config Area Reserved Read Write[0-7] (HOST_LOC_0_RSVD_RW1[0-7])—Offset FED40010h, Count 8, Stride 4h

This register represents a DW of RW memory in FTPM EBB which has no defined functionality. This DW is aliased to the same offset for each locality, and even inactive localities can access it.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset[0-7]: [0x0] + FED40010h + [0-7]*4h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**FTPM Locality Config Area Reserved Read Write DW (RSVD_RW_31_0):** Reserved.

54.11.6 FTPM Interface ID Host Read Only Access 0 (HOST_LOC_0_INTF_ID_0)—Offset FED40030h

This register is opaque to HW. This register is implemented in flip-flops.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [0x0] + FED40030h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**FTPM Interface ID Bits 0 (FTPM_INTF_ID_BITS_0):** These are the 32 LSbits used by FW to inform host SW as to the interface type of the TPM. The exact usage is defined by TCG.

54.11.7 FTPM Interface ID Host Read Only Access 1 (HOST_LOC_0_INTF_ID_1)—Offset FED40034h

This register is opaque to HW. This register is implemented in flip-flops.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [0x0] + FED40034h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**FTPM Interface ID Bits 1 (FTPM_INTF_ID_BITS_1):** These are the 32 MSbits used by FW to inform host SW as to the interface type of the TPM. The exact usage is defined by TCG.

54.11.8 FTPM Locality Config Area Reserved Read Write[0-1] (HOST_LOC_0_RSVD_RW2[0-1])—Offset FED40038h, Count 2, Stride 4h

This register represents a DW of RW memory in FTPM EBB which has no defined functionality. This DW is aliased to the same offset for each locality, and even inactive localities can access it.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset[0-1]: [0x0] + FED40038h + [0-1]*4h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**FTPM Locality Config Area Reserved Read Write DW (RSVD_RW_31_0):** Reserved.

54.11.9 Control Area Request (HOST_LOC_0_CA_REQUEST)—Offset FED40040h

This register is implemented in flip-flops. This register is implemented in retention flops to maintain state through PG.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [0x0] + FED40040h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**HOST_CA_REQUEST:** Host software sets this field to a CSxE firmware-defined value to indicate a state change request to the fTPM. Any host write to this register shall result in an interrupt to the CSxE firmware, or wakeup the CSxE subsystem when it is in power-gated state.

54.11.10 Control Area Status (HOST_LOC_0_CA_STATUS)—Offset FED40044h

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [0x0] + FED40044h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**HOST_CA_STATUS:** Reserved.

54.11.11 Control Area Cancel (HOST_LOC_0_CA_CANCEL)—Offset FED40048h

This register is implemented in flip-flops. This register is implemented in retention flops to maintain state through PG.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [0x0] + FED40048h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**HOST_CA_CANCEL:** Host software sets this field to a CSxE firmware-defined value to indicate that a command should be canceled. Any host write to this register shall result in an interrupt to the CSxE firmware, or wakeup the CSxE subsystem when it is in power-gated state.

54.11.12 Control Area Start (HOST_LOC_0_CA_START)—Offset FED4004Ch

This register is implemented in flip-flops. This register is implemented in retention flops to maintain state through PG.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [0x0] + FED4004Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Control Area Start (HOST_CA_START):** Host software sets this field to a CSxE firmware defined value to indicate that a command is available for processing. The reset value indicates that a command is NOT available for processing. Any host write to this register shall result in an interrupt to the CSE firmware or wakeup the CSE subsystem when it is in power-gated state.

54.11.13 Control Area Interrupt Reserved Part 1 (HOST_LOC_0_CA_INT_RSVD1)—Offset FED40050h

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [0x0] + FED40050h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**RSVD_31_0:** Reserved.

54.11.14 Control Area Interrupt Reserved Part 2 (HOST_LOC_0_CA_INT_RSVD2)—Offset FED40054h

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [0x0] + FED40054h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**RSVD_31_0:** Reserved.

54.11.15 Control Area Command Size (HOST_LOC_0_CA_CMD_SZ)—Offset FED40058h

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [0x0] + FED40058h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**HOST_CA_CMD_SZ:** Reserved.

54.11.16 Control Area Command Part 1 (HOST_LOC_0_CA_CMD1)—Offset FED4005Ch

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [0x0] + FED4005Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**HOST_CA_CMD1:** Reserved.

54.11.17 Control Area Command Part 2 (HOST_LOC_0_CA_CMD2)—Offset FED40060h

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [0x0] + FED40060h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**HOST_CA_CMD2:** Reserved.

54.11.18 Control Area Response Size (HOST_LOC_0_CA_RSP_SZ)—Offset FED40064h

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [0x0] + FED40064h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**HOST_CA_RSP_SZ:** Reserved.

54.11.19 Control Area Response Part 1 (HOST_LOC_0_CA_RSP1)—Offset FED40068h

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [0x0] + FED40068h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**HOST_CA_RSP1:** Reserved.

54.11.20 Control Area Response Part 2 (HOST_LOC_0_CA_RSP2)—Offset FED4006Ch

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [0x0] + FED4006Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**HOST_CA_RSP2:** Reserved.

54.11.21 FTPM Reserved Read Write[0-3] (HOST_LOC_0_RSVD_RW3[0-3])—Offset FED40070h, Count 4, Stride 4h

This register represents a DW of RW memory in FTPM EBB which has no defined functionality. The access to this DW is allowed only to an active locality.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset[0-3]: [0x0] + FED40070h + [0-3]*4h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**FTPM Reserved Read Write DW (RSVD_RW_31_0):** Reserved.

54.11.22 FTPM Command and Response Buffer[0-991] (HOST_LOC_0_FTPM_CRB[0-991])—Offset FED40080h, Count 992, Stride 4h

This register represents a DW of RW memory in FTPM CRB (EBB)

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset[0-991]: [0x0] + FED40080h + [0-991]*4h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**FTPM Command and Response Buffer DW (HOST_FTPM_CRB_DW):** Reserved.

54.12 Registers in I/O Space—KT_HOST_IOBAR

These registers are accessed in Host I/O Space starting at the relocatable I/O address defined by the Base Address Register (BAR) KT_HOST_IOBAR described in Section 54.5.5, "KT IO BAR (KT_HOST_IOBAR)—Offset 10h" on page 2512.

54.12.1 KT Receive Buffer Register (IO_KTRBR)—Offset 0h

This register implements the standard Receiver Buffer register in the KT Block. This is read-only. DLAB(i.e. KTLCR[7]) shall be 0. In non-FIFO mode, this register will be read when the receiver data is ready. In FIFO mode, a read from this register will be translated into a read from the RBR FIFO. Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [KT_HOST_IOBAR] + 0h

KT_HOST_IOBAR Type: PCI Configuration Register (Size: 32 bits)
KT_HOST_IOBAR Reference: [B:0, D:27, F:3] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO/V	**Receiver Buffer Register (RBR):** Implements the Receiver Buffer register of the Serial Interface.

54.12.2 KT Transmitter Holding Register (IO_KTTHR)—Offset 0h

This register implements the standard Transmitter Holding register in the KT Block. This is write-only. DLAB(i.e. KTLCR[7]) shall be 0. In non-FIFO mode, this register will be written when the Host needs to transmit data. In FIFO mode, a write to this register will be translated into a write to the THR FIFO. Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [KT_HOST_IOBAR] + 0h

KT_HOST_IOBAR Type: PCI Configuration Register (Size: 32 bits)
KT_HOST_IOBAR Reference: [B:0, D:27, F:3] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 WO	**Transmitter Holding Register (THR):** Implements the Transmit Data register of the Serial Interface.

54.12.3 KT Divisor Latch LSB Register (IO_KTDLLR)—Offset 0h

This register implements the standard DLL register in the KT Block. DLAB(i.e. KTLCR[7]) shall be 1 in order for this register to be accessed. this register is supported only for SW compatibility and has no impact on HW performance. Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [KT_HOST_IOBAR] + 0h

KT_HOST_IOBAR Type: PCI Configuration Register (Size: 32 bits)
KT_HOST_IOBAR Reference: [B:0, D:27, F:3] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW/V	**Divisor Latch LSB (DLL):** Implements the DLL register of the Serial Interface.

54.12.4 KT Interrupt Enable register (IO_KTIER)—Offset 1h

This register implements the standard Interrupt Enable register in the KT Block. The bits enable specific events to interrupt the Host. See bit specific definition below. DLAB(i.e. KTLCR[7]) shall is 0 in order for this register to be accessed. Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [KT_HOST_IOBAR] + 1h

KT_HOST_IOBAR Type: PCI Configuration Register (Size: 32 bits)
KT_HOST_IOBAR Reference: [B:0, D:27, F:3] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:4	0x0 RO	**Reserved (RSVD):** Reserved.
3	0x0 RW	**MSR (IER3):** When set, enables bits in Modem Status register to cause an interrupt to the Host.
2	0x0 RW	**LSR (IER2):** When set, enables bits in Receiver Line Status Register to cause an interrupt to the Host.
1	0x0 RW	**THR (IER1):** When set, enables an interrupt to the Host when the Transmitter Holding register is empty.
0	0x0 RW	**DR (IER0):** When set, enables an interrupt to the Host when the Received Data is available OR Receiver FIFO timeout.

54.12.5 KT Divisor Latch MSB Register (IO_KTDLMR)—Offset 1h

This register implements the standard DLM register in the KT Block. DLAB(i.e. KTLCR[7]) shall be 1 in order for this register to be accessed. This register is supported only for SW compatibility and has no impact on HW performance. Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [KT_HOST_IOBAR] + 1h

Default: 00h

KT_HOST_IOBAR Type: PCI Configuration Register (Size: 32 bits)
KT_HOST_IOBAR Reference: [B:0, D:27, F:3] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW/V	**Divisor Latch MSB (DLM):** Implements the DLM register of the Serial Interface.

54.12.6 KT Interrupt Identification Register (IO_KTIIR)—Offset 2h

This register implements the standard Interrupt Identification register in the KT Block. This is read-only. This register is created to provide minimum software overhead during data character transfers. The register prioritizes KT interrupts into 4 levels and records them in the IIRSTS field of this register. The four levels of interrupt conditions in order of priority are: Receiver Line Status; Received Data Ready/Character Timeout Indication; Transmitter Holding Register Empty; MODEM Status. When the Host accesses the IIR, the HW freezes all interrupts and indicates the highest priority pending interrupt to the Host. While this Host access is occurring, the HW records new interrupts, but does not change its current indication until the access is complete. Table in the Host Interrupt Generation section shows the contents. Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [KT_HOST_IOBAR] + 2h

Default: 01h

KT_HOST_IOBAR Type: PCI Configuration Register (Size: 32 bits)
KT_HOST_IOBAR Reference: [B:0, D:27, F:3] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RO/V	**FIFO Enable (FIEN1):** This field is connected by HW to the FIFO Enable field of the FCR register.
6	0x0 RO/V	**FIFO Enable (FIEN0):** This field is connected by HW to the FIFO Enable field of the FCR register.
5:4	0x0 RO	**Reserved (RSVD):** Hardwired to 0.
3:1	0x0 RO/V	**IIR Status (IIRSTS):** These bits are asserted by the HW according to the source of the interrupt and the priority level. Refer to the section on Host Interrupt Generation for a table of values.
0	0x1 RO/V	**Interrupt Status (INTSTS):** • 0: indicates a pending Host interrupt and IIRSTS may be used as a pointer to the appropriate interrupt service routine. It reflects the logical-NOR of all UART interrupts. An individual UART interrupt will be identified as pending when the individual event status is asserted AND its corresponding event interrupt enable is asserted as well. For example, the THR Empty interrupt will be identified as pending when both LSR[THRE] bit is 1 AND IER[IER1] is 1. • 1: indicates no pending Host interrupt.

54.12.7 KT FIFO Control register (IO_KTFCR)—Offset 2h

This register implements the standard FIFO Control register in the KT Block. It is used to configure features pertinent to the FIFO mode of operation. This is write-only. Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [KT_HOST_IOBAR] + 2h

KT_HOST_IOBAR Type: PCI Configuration Register (Size: 32 bits)
KT_HOST_IOBAR Reference: [B:0, D:27, F:3] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0x0 WO	**Receiver Trigger Level (RTL):** Trigger level in bytes for the Receiver FIFO. Once the trigger level number of bytes is reached, an interrupt will be sent to the Host [7:6] RCVR FIFO Trigger Level (bytes) • 00 -- 01 • 01 -- 04 • 10 -- 08 • 11 -- 14
5:4	0x0 WO	**Reserved (RSVD):** Writes to this field shall be dropped.
3	0x0 WO	**RDY Mode (RDYM):** This bit has no effect on HW performance.
2	0x0 WO	**XMT FIFO Clear (XFIC):** When the Host writes one to this bit the HW will clear the XMT FIFO. This bit is self-cleared by HW.
1	0x0 WO	**RCV FIFO Clear (RFIC):** When the Host writes one to this bit the HW will clear the RCV FIFO. This bit is self-cleared by HW.
0	0x0 WO	**FIFO Enable (FIE):** When set indicates that the KT interface is working in FIFO node. When this bit value is changed the RCV and XMT FIFO are cleared by HW. This bit must be a 1 when other FCR bits are written to or they will NOT be programmed.

54.12.8 KT Line Control register (IO_KTLCR)—Offset 3h

This register implements the standard Line Control register in the KT Block. It specifies the format of the asynchronous data communications exchange and sets the DLAB bit. Most bits in this register have no effect on HW and are only used by the FW. Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [KT_HOST_IOBAR] + 3h

Default: 03h

KT_HOST_IOBAR Type: PCI Configuration Register (Size: 32 bits)
KT_HOST_IOBAR Reference: [B:0, D:27, F:3] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RW	**Divisor Latch Access Bit (DLAB):** • 1: Allows access to the Divisor Latch Registers and reading of the FIFO Control Register. • 0: Allows access to RBR, THR, IER and IIR registers.
6	0x0 RW	**Break Control (BC):** This bit has no effect on HW.
5:4	0x0 RW	**Parity Bit Mode (PBM):** This bit has no effect on HW.
3	0x0 RW	**Parity Enable (PE):** This bit has no effect on HW.
2	0x0 RW	**Stop Bit Select (SBS):** This bit has no effect on HW.
1:0	0x3 RW	**Word Select Byte (WSB):** This bit has no effect on HW.

54.12.9 KT Modem Control register (IO_KTMCR)—Offset 4h

This register implements the standard Modem Control register in the KT Block. It controls the interface with the modem. Because the FW emulates the modem, the Host communicates with the FW via this register. This register has impact on the HW in the loopback mode. Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [KT_HOST_IOBAR] + 4h

Default: 00h

KT_HOST_IOBAR Type: PCI Configuration Register (Size: 32 bits)
KT_HOST_IOBAR Reference: [B:0, D:27, F:3] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:5	0x0 RO	**Reserved (RSVD):** Reserved.
4	0x0 RW	**Loop Back Mode (LBM):** When set by Host indicates that the serial port is in loop Back mode. This means that the data that is transmitted by the host should be received. Helps in debug of the interface.
3	0x0 RW	**Output 2 (OUT2):** This bit has no effect on HW in normal mode. In loop back mode the value of this bit is written by HW to Modem Status Register bit (7).
2	0x0 RW	**Output 1 (OUT1):** This bit has no effect on HW in normal mode. In loop back mode the value of this bit is written by HW to Modem Status Register bit(6).
1	0x0 RW	**Request to Send Out (RTSO):** This bit has no effect on HW in normal mode. In loopback mode, the value of this bit is written by HW to Modem Status Register bit(4).
0	0x0 RW	**Data Terminal Ready Out (DRTO):** This bit has no effect on HW in normal mode. In loopback mode, the value in this bit is written by HW to Modem Status Register Bit(5).

54.12.10 KT Line Status register (IO_KTLSR)—Offset 5h

This register implements the standard Line Status register in the KT Block. It provides status information of the data transfer to the Host. Error indication etc are provided by the HW/FW to the host via this register. Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [KT_HOST_IOBAR] + 5h

Default: 60h

KT_HOST_IOBAR Type: PCI Configuration Register (Size: 32 bits)
KT_HOST_IOBAR Reference: [B:0, D:27, F:3] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RO/C/V	**RCVR FIFO Error (RXFER):** This bit is cleared in non FIFO mode. This bit is connected to UART LSR[BI] bit in FIFO mode.
6	0x1 RO/C/V	**Transmitter Empty (TEMT):** In non-FIFO mode: This bit will be set to 1 whenever the Transmitter Holding Register (THR) and the Transmitter Shift Register (TSR) are both empty, OR cleared to 0 whenever either THR or TSR contains a data byte. In FIFO mode: This bit will be set to 1 whenever XMIT FIFO and TSR are both empty, OR cleared to 0 whenever either XMIT FIFO or TSR contains a data byte. Implementation note: This bit is connected by HW to THRE bit
5	0x1 RO/C/V	**Transmitter Holding Register Empty (THRE):** The bit will always be set whenever Host changes UART FCR[FIE] bit. This bit is controlled differently in FIFO vs non-FIFO modes: Non-FIFO mode: This bit will be cleared by HW when Host writes to THR, and set by HW when FW reads from THR. FIFO mode: This bit will be set by HW when XMIT FIFO is empty , and cleared by HW when XMIT FIFO is NOT empty.
4	0x0 RO/C/V	**Break Interrupt (BI):** This bit will be cleared by HW when the UART LSR register is read by Host. This bit will be set by HW in two cases: In FIFO mode, when FW sets the KTRIVR[SBI] bit. In non-FIFO mode, when FW sets the KTRBR[BIA] bit.
3	0x0 RO	**Framing Error (FE):** This bit is NOT implemented and hardwired to 0.
2	0x0 RO	**Parity Error (PE):** This bit is NOT implemented and hardwired to 0.
1	0x0 RO/C/V	**Overrun Error (OE):** HW will clear this bit when Host reads from KTLSR register and this is source of interrupt. HW will set this bit when overrun error is detected. In non-FIFO mode, the character that triggers the overrun error shall overwrite the character in the RBR register. In FIFO mode, the character that triggers the overrun error shall be dropped without corrupting the RCVR FIFO.
0	0x0 RO/V	**Data Ready (DR):** Non-FIFO Mode: This bit will be set by HW when FW writes to RBR and cleared by HW when Host reads from RBR. FIFO Mode: The bit will be set by HW when RCVR FIFO is not empty and cleared by HW when RCVR FIFO is empty.

54.12.11 KT Modem Status register (IO_KTMSR)—Offset 6h

This register implements the standard Modem Status register in the KT Block. It provides the current state of the control lines from the modem. The modem functionality is emulated by the FW. Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [KT_HOST_IOBAR] + 6h

KT_HOST_IOBAR Type: PCI Configuration Register (Size: 32 bits)
KT_HOST_IOBAR Reference: [B:0, D:27, F:3] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RO	**Data Carrier Detect (DCD):** In Loop Back mode this bit is connected by HW to the value of MCR bit 3.
6	0x0 RO	**Ring Indicator (RI):** In Loop Back mode this bit is connected by HW to the value of MCR bit 2.
5	0x0 RO	**Data Set Ready (DSR):** In Loop Back mode this bit is connected by HW to the value of MCR bit 0.
4	0x0 RO	**Clear To Send (CTS):** In Loop Back mode this bit is connected by HW to the value of MCR bit 1.
3	0x0 RO/C/V	**Delta Data Carrier Detect (DDCD):** This bit is set when bit 7 is changed. This bit is cleared by HW when the MSR register is being read by the HOST driver.
2	0x0 RO/C/V	**Trailing Edge of Read Detector (TERI):** This bit is set when bit 6 is changed from 1 to 0. This bit is cleared by HW when the MSR register is being read by the Host driver.
1	0x0 RO/C/V	**Delta Data Set Ready (DDSR):** This bit is set when bit 5 is changed. This bit is cleared by HW when the MSR register is being read by the Host driver.
0	0x0 RO/C/V	**Delta Clear To Send (DCTS):** This bit is set when bit 4 is changed. This bit is cleared by HW when the MSR register is being read by the Host driver.

54.12.12 KT Scratch register (IO_KTSCR)—Offset 7h

This register implements the standard Scratch register in the KT Block. It allows Host SW programmers to hold temporary data. It has NO effect on HW. Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [KT_HOST_IOBAR] + 7h

KT_HOST_IOBAR Type: PCI Configuration Register (Size: 32 bits)
KT_HOST_IOBAR Reference: [B:0, D:27, F:3] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Scratch Register Data (SCRD):** Reserved.

54.13 Registers in I/O Space—IDE_HOST_PCMDIOBAR

These registers are accessed in Host I/O Space starting at the relocatable I/O address defined by the Base Address Register (BAR) IDE_HOST_PCMDIOBAR described in Section 54.6.5, "IDE Primary Command Block IO BAR (IDE_HOST_PCMDIOBAR)—Offset 10h" on page 2525.

54.13.1 IDE Data Register (IDEDATA)—Offset 0h

This register serves as the data interface in IDE PIO modes. Unit of access is in WORD. Host writes to this register are converted into writes to the PIO buffer in CSxE memory at monotonically increasing WORD address. Host writes are dropped under any one of the following conditions: (1) PIO modes are disabled. (Cfg. IDEPBPR[EN] defined in CSxE memory space) (2) PIO buffer is full. Host reads from this register are converted into reads from the PIO buffer in CSxE memory at monotonically increasing WORD address. Host reads are dropped under any one of the following conditions: (1) PIO modes are disabled. (Cfg. IDEPBPR[EN] defined in CSxE memory space) (2) PIO buffer is empty. Reset condition: no connection to any reset signal.

Type: I/O Register
(Size: 16 bits)

Default: 0000h

BAR and Offset: [IDE_HOST_PCMDIOBAR] + 0h

IDE_HOST_PCMDIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_PCMDIOBAR Reference: [B:0, D:27, F:2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x0 RW/V	**IDE Data Register (IDEDR):** Data interface in IDE PIO modes. Host reads/writes from/to this register are converted into reads/writes from/to the PIO buffer in CSxE memory.

54.13.2 IDE Features Register (IDEFR)—Offset 1h

This register implements the standard Features register in the Primary IDE Command Block. This is write-only. BE[0] shall be deasserted. Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [IDE_HOST_PCMDIOBAR] + 1h

IDE_HOST_PCMDIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_PCMDIOBAR Reference: [B:0, D:27, F:2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 WO	**IDE Features Data (IDEFD):** The IDE Features register is command specific and is used to enable and disable interface features.

54.13.3 IDE Error Register DEV0 (IDEERD0)—Offset 1h

This register implements the standard Device 0 Error register in the Primary IDE Command Block. This is read-only. BE[0] shall be deasserted. DEV = 0 (i.e. IDEDHIR[4] = 0). Reset condition: CSxE reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [IDE_HOST_PCMDIOBAR] + 1h

Default: 00h

IDE_HOST_PCMDIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_PCMDIOBAR Reference: [B:0, D:27, F:2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO/V	**IDE Error Data (IDEED):** Upon command completion of any command except EXECUTE DEVICE DIAGNOSTIC or DEVICE RESET, the content of this register is valid and contains error status when the ERR bit is set to 1 in the Status register (i.e. IDESR0[ERR] = 1). Following a power-on, a hardware or software reset, or command completion of an EXECUTE DEVICE DIAGNOSTIC or DEVICE RESET command, this register contains a diagnostic code. Bit 2 ABRT (command aborted) is set to 1 to indicate the requested command has been command aborted because the command code or a command parameter is invalid, the command is not supported, a pre-requisite for the command has not been met, or some other error has occurred.

54.13.4 IDE Error Register DEV1 (IDEERD1)—Offset 1h

This register implements the standard Device 1 Error register in the Primary IDE Command Block. This is read-only. BE[0] shall be deasserted. DEV = 1 (i.e. IDEDHIR[4] = 1). Reset condition: CSxE reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [IDE_HOST_PCMDIOBAR] + 1h

Default: 00h

IDE_HOST_PCMDIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_PCMDIOBAR Reference: [B:0, D:27, F:2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO/V	**IDE Error Data (IDEED):** Upon command completion of any command except EXECUTE DEVICE DIAGNOSTIC or DEVICE RESET, the content of this register is valid and contains error status when the ERR bit is set to 1 in the Status register (i.e. IDESR0[ERR] = 1). Following a power-on, a hardware or software reset, or command completion of an EXECUTE DEVICE DIAGNOSTIC or DEVICE RESET command, this register contains a diagnostic code. Bit 2 ABRT (command aborted) is set to 1 to indicate the requested command has been command aborted because the command code or a command parameter is invalid, the command is not supported, a pre-requisite for the command has not been met, or some other error has occurred.

54.13.5 IDE Sector Count In Register (IDESCIR)—Offset 2h

This register implements the standard Sector Count In register in the Primary IDE Command Block. All 3 registers (IDESCIR, IDESCOR0, IDESCOR1) will be updated with the same write data when this register is write-accessed. This is write-only. This register is meaningful for an ATA command while unused for an ATAPI command. Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [IDE_HOST_PCMDIOBAR] + 2h

Default: 00h

IDE_HOST_PCMDIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_PCMDIOBAR Reference: [B:0, D:27, F:2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 WO	**IDE Sector Count Data (IDESCD):** The Sector Count register specifies the sector count of the data for which an ATA transfer has been made.

54.13.6 IDE Sector Count Out Register DEV0 (IDESCOR0)—Offset 2h

This register implements the standard Device 0 Sector Count Out register in the Primary IDE Command Block. This is read-only. DEV = 0 (i.e. IDEDHIR[4] = 0). CSxE FW writes to this register upon completion of an ATA/ATAPI command. This register is called IDE Interrupt Reason Register DEV0 for an ATAPI command. Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [IDE_HOST_PCMDIOBAR] + 2h

Default: 00h

IDE_HOST_PCMDIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_PCMDIOBAR Reference: [B:0, D:27, F:2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO/V	**IDE Sector Count Out DEV0 (ISCOD0):** Sector Count Out register for Device 0.

54.13.7 IDE Sector Count Out Register DEV1 (IDESCOR1)—Offset 2h

This register implements the standard Device 1 Sector Count Out register in the Primary IDE Command Block. This is read-only. DEV = 1 (i.e. IDEDHIR[4] = 1). CSxE FW writes to this register upon completion of an ATA/ATAPI command. This register is called IDE Interrupt Reason Register DEV1 for an ATAPI command. Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [IDE_HOST_PCMDIOBAR] + 2h

Default: 00h

IDE_HOST_PCMDIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_PCMDIOBAR Reference: [B:0, D:27, F:2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO/V	**IDE Sector Count Out DEV1 (ISCOD1):** Sector Count Out register for Device 1.

54.13.8 IDE Sector Number In Register (IDESNIR)—Offset 3h

This register implements the standard Sector Number In register in the Primary IDE Command Block in CHS addressing mode. All 3 registers (IDESNIR, IDESNOR0, IDESNOR1) will be updated with the same write data when this register is write-accessed. This is write-only. This register is called IDE LBA Low In Register in LBA addressing mode. This register is reserved for an ATAPI command. Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [IDE_HOST_PCMDIOBAR] + 3h

Default: 00h

IDE_HOST_PCMDIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_PCMDIOBAR Reference: [B:0, D:27, F:2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 WO	**IDE Sector Number Data (IDESND):** The Sector Number register is set by the host to specify the starting sector number associated with the next ATA command to be executed. Following a qualified ATA command sequence the device will set the register value to the last sector read or written as a result of the previous ATA command.

54.13.9 IDE Sector Number Out Register DEV0 (IDESNOR0)—Offset 3h

This register implements the standard Device 0 Sector Number Out register in the Primary IDE Command Block. This is read-only. DEV = 0 (i.e. IDEDHIR[4] = 0). CSxE FW writes to this register upon completion of an ATA command. This register is called IDE LBA Low Out Register DEV0 in LBA addressing mode. This register is reserved for an ATAPI command. Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [IDE_HOST_PCMDIOBAR] + 3h

Default: 00h

IDE_HOST_PCMDIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_PCMDIOBAR Reference: [B:0, D:27, F:2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO/V	**IDE Sector Number Out DEV0 (IDESNO0):** Sector Number Out register for Device 0.

54.13.10 IDE Sector Number Out Register DEV1 (IDESNOR1)—Offset 3h

This register implements the standard Device 1 Sector Number Out register in the Primary IDE Command Block. This is read-only. DEV = 1 (i.e. IDEDHIR[4] = 1). CSxE FW writes to this register upon completion of an ATA command. This register is called IDE LBA Low Out Register DEV1 in LBA addressing mode. This register is reserved for an ATAPI command. Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [IDE_HOST_PCMDIOBAR] + 3h

Default: 00h

IDE_HOST_PCMDIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_PCMDIOBAR Reference: [B:0, D:27, F:2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO/V	**IDE Sector Number Out DEV1 (IDESNO1):** Sector Number Out register for Device 1.

54.13.11 IDE Cylinder Low In Register (IDECLIR)—Offset 4h

This register implements the standard Cylinder Low In register in the Primary IDE Command Block. All 3 registers (IDECLIR, IDCLOR0, IDCLOR1) will be updated with the same write data when this register is write-accessed. This is write-only. This register is called IDE LBA Mid In Register in LBA addressing mode. This register is called IDE Byte Count Low Limit Register for an ATAPI command. Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [IDE_HOST_PCMDIOBAR] + 4h

Default: 00h

IDE_HOST_PCMDIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_PCMDIOBAR Reference: [B:0, D:27, F:2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 WO	**IDE Cylinder Low Data. (IDECLD):** The Cylinder Low register is set by the host to specify the cylinder number low byte. Following an ATA command, the contents of this register is written by the device, identifying the cylinder number low byte.

54.13.12 IDE Cylinder Low Out Register DEV0 (IDCLOR0)—Offset 4h

This register implements the standard Device 0 Cylinder Low Out register in the Primary IDE Command Block. This is read-only. DEV = 0 (i.e. IDEDHIR[4] = 0). CSxE FW writes to this register upon completion of an ATA command. This register is called IDE LBA Mid Out Register DEV0 in LBA addressing mode. This register is called IDE Byte Count Low Register DEV0 for an ATAPI command. Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [IDE_HOST_PCMDIOBAR] + 4h

Default: 00h

IDE_HOST_PCMDIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_PCMDIOBAR Reference: [B:0, D:27, F:2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO/V	**IDE Cylinder Low Out DEV0. (IDECLO0):** Cylinder Low Out Register for Device 0.

54.13.13 IDE Cylinder Low Out Register DEV1 (IDCLOR1)—Offset 4h

This register implements the standard Device 1 Cylinder Low Out register in the Primary IDE Command Block. This is read-only. DEV = 1 (i.e. IDEDHIR[4] = 1). CSxE FW writes to this register upon completion of an ATA command. This register is called IDE LBA Mid Out Register DEV1 in LBA addressing mode. This register is called IDE Byte Count Low Register DEV1 for an ATAPI command. Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [IDE_HOST_PCMDIOBAR] + 4h

Default: 00h

IDE_HOST_PCMDIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_PCMDIOBAR Reference: [B:0, D:27, F:2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO/V	**IDE Cylinder Low Out DEV1. (IDECLO1):** Cylinder Low Out Register for Device 1.

54.13.14 IDE Cylinder High In Register (IDECHIR)—Offset 5h

This register implements the standard Cylinder High In register in the Primary IDE Command Block. All 3 registers (IDECHIR, IDCHOR0, IDCHOR1) will be updated with the same write data when this register is write-accessed. This is write-only. This register is called IDE LBA High In Register in LBA addressing mode. This register is called IDE Byte Count High Limit Register for an ATAPI command. Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [IDE_HOST_PCMDIOBAR] + 5h

Default: 00h

IDE_HOST_PCMDIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_PCMDIOBAR Reference: [B:0, D:27, F:2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 WO	**IDE Cylinder High Data (IDECHD):** The Cylinder High register is set by the host to specify the cylinder number high byte. Following an ATA command, the contents of this register is written by the device, identifying the cylinder number high byte.

54.13.15 IDE Cylinder High Out Register DEV0 (IDCHOR0)—Offset 5h

This register implements the standard Device 0 Cylinder High Out register in the Primary IDE Command Block. This is read-only. DEV = 0 (i.e. IDEDHIR[4] = 0). CSxE FW writes to this register upon completion of an ATA command. This register is called IDE LBA High Out Register DEV0 in LBA addressing mode. This register is called IDE Byte Count High Register DEV0 for an ATAPI command. Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [IDE_HOST_PCMDIOBAR] + 5h

Default: 00h

IDE_HOST_PCMDIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_PCMDIOBAR Reference: [B:0, D:27, F:2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO/V	**IDE Cylinder High Out DEV0 (IDECHO0):** Cylinder High Out register for Device 0.

54.13.16 IDE Cylinder High Out Register DEV1 (IDCHOR1)—Offset 5h

This register implements the standard Device 1 Cylinder High Out register in the Primary IDE Command Block. This is read-only. DEV = 1 (i.e. IDEDHIR[4] = 1). CSxE FW writes to this register upon completion of an ATA command. This register is called IDE LBA High Out Register DEV1 in LBA addressing mode. This register is called IDE Byte Count High Register DEV1 for an ATAPI command. Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [IDE_HOST_PCMDIOBAR] + 5h

Default: 00h

IDE_HOST_PCMDIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_PCMDIOBAR Reference: [B:0, D:27, F:2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO/V	**IDE Cylinder High Out DEV1 (IDECHO1):** Cylinder High Out register for Device 1.

54.13.17 IDE Drive/Head In Register (IDEDHIR)—Offset 6h

This register implements the standard Drive/Head In register in the Primary IDE Command Block. All 3 registers (IDEDHIR, IDDHOR0, IDDHOR1) will be updated with the same write data when this register is write-accessed. This is write-only. Bit 4 of this register is the DEV (master/slave) bit. This bit is cleared by hardware on IDE software reset (IDDCR[SRST] = 1) in addition to Host reset. This register is called IDE Device In Register in LBA addressing mode or for an ATAPI command. Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [IDE_HOST_PCMDIOBAR] + 6h

IDE_HOST_PCMDIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_PCMDIOBAR Reference: [B:0, D:27, F:2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 WO	**IDE Drive/Head Data (IDEDHD):** The Drive/Head Register is used by the host and the device to select the type of addressing (CHS or LBA), the drive letter, and either bits 3 through 0 of the head number in CHS mode or in LBA mode, bits D3:D0 reflect the logical block number bits LBA27:LBA24.

54.13.18 IDE Drive/Head Out Register DEV0 (IDDHOR0)—Offset 6h

This register implements the standard Device 0 Drive/Head Out register in the Primary IDE Command Block. This is read-only. DEV = 0 (i.e. IDEDHIR[4] = 0). CSxE FW writes to this register upon completion of an ATA command. This register is called IDE Device Out Register DEV0 in LBA addressing mode or for an ATAPI command. Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [IDE_HOST_PCMDIOBAR] + 6h

IDE_HOST_PCMDIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_PCMDIOBAR Reference: [B:0, D:27, F:2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO/V	**IDE Drive/Head Out DEV0 (IDEDHO0):** Drive/Head Out register of Device 0.

54.13.19 IDE Drive/Head Out Register DEV1 (IDDHOR1)—Offset 6h

This register implements the standard Device 1 Drive/Head Out register in the Primary IDE Command Block. This is read-only. DEV = 1 (i.e. IDEDHIR[4] = 1). CSxE FW writes to this register upon completion of an ATA command. This register is called IDE Device Out Register DEV1 in LBA addressing mode or for an ATAPI command. Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [IDE_HOST_PCMDIOBAR] + 6h

Default: 00h

IDE_HOST_PCMDIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_PCMDIOBAR Reference: [B:0, D:27, F:2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO/V	**IDE Drive/Head Out DEV1 (IDEDHO1):** Drive/Head Out register of Device 1.

54.13.20 IDE Command Register (IDECR)—Offset 7h

This register implements the standard Command register in the Primary IDE Command Block. This is write-only. Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [IDE_HOST_PCMDIOBAR] + 7h

Default: 00h

IDE_HOST_PCMDIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_PCMDIOBAR Reference: [B:0, D:27, F:2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 WO	**IDE Command Data (IDECD):** The Command register specifies the ATA/ATAPI Command code being issued to the drive by the host. Command processing begins when this register is written. The content of the Command Block registers becomes parameters of the command when this register is written. Writing this register clears any pending interrupt condition. Please refer to the description of the INTM and INTS bits in the IDGCR register in the CSxE memory space for detailed conditions under which interrupt condition shall be cleared.

54.13.21 IDE Status Register DEV0 (IDESR0)—Offset 7h

This register implements the standard Device 0 Status register in the Primary IDE Command Block. This is read-only. DEV = 0 (i.e. IDEDHIR[4] = 0). CSxE FW writes to this register upon completion of an ATA/ATAPI command. Additionally upon completion of the last data phase of a PIO transfer, HW will load this register with value of the SRAFP field in the IDESRAP register in the CSxE memory space. Host read of this register clears Device 0's interrupt. Please refer to the description of the INTM bit in the IDGCR register in the CSxE memory space for detailed conditions under which interrupt condition shall be cleared. The bit description is for ATA mode. Different name in ATAPI mode, if applicable, is cited as well. Reset condition: CSxE reset with the BSY bit as an exception. Please refer to description of the BSY bit below for a list of BSY bit reset conditions. Non-sticky.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [IDE_HOST_PCMDIOBAR] + 7h

Default: 80h

IDE_HOST_PCMDIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_PCMDIOBAR Reference: [B:0, D:27, F:2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7	0x1 RO/V	**Busy (BSY):** This bit is set by HW when the IDECR is being written and DEV=0, OR when IDDCR[SRST] bit is asserted by Host, OR host system reset, OR D3 to D0 transition of the IDE function. This bit is cleared by FW write of 0. Please refer to general register description above for special handling for a PIO transfer. When this bit is 1, any other bit in this register is meaningless.
6	0x0 RO/V	**Drive Ready (DRDY):** When set, indicates drive is ready for command. Update of this bit is completely FW-assisted. This bit is also called Device Ready. Please refer to general register description above for special handling for a PIO transfer.
5	0x0 RO/V	**Drive Fault (DF):** When set, indicates Error on the drive. Update of this bit is completely FW-assisted. This bit is called DMA Ready for a DMA ATAPI command. Please refer to general register description above for special handling for a PIO transfer.
4	0x0 RO/V	**Drive Seek Complete (DSC):** When set, indicates Heads are positioned over the desired cylinder. Update of this bit is completely FW-assisted. This bit is called Service for an ATAPI command. Please refer to general register description above for special handling for a PIO transfer.
3	0x0 RO/V	**Data Request (DRQ):** Set when the drive wants to exchange data with the Host via the data register. Update of this bit is completely FW-assisted. Please refer to general register description above for special handling for a PIO transfer.
2	0x0 RO/V	**Corrected Data (CORR):** When set, indicates a correctable read error has occurred. Update of this bit is completely FW-assisted. Please refer to general register description above for special handling for a PIO transfer.
1	0x0 RO/V	**Index (IDX):** This bit is set once per rotation of the medium when the index mark passes under the read/write head. Update of this bit is completely FW-assisted. Please refer to general register description above for special handling for a PIO transfer.
0	0x0 RO/V	**Error (ERR):** When set, indicates an error occurred in the process of executing the current command. The Error Register of the selected device contains the error information. Update of this bit is completely FW-assisted. This bit is called Check for an ATAPI command. Please refer to general register description above for special handling for a PIO transfer.

54.13.22 IDE Status Register DEV1 (IDESR1)—Offset 7h

This register implements the standard Device 1 Status register in the Primary IDE Command Block. This is read-only. DEV = 1 (i.e. IDEDHIR[4] = 1). CSxE FW writes to this register upon completion of an ATA/ATAPI command. Additionally upon completion of the last data phase of a PIO transfer, HW will load this register with value of the SRAFP field in the IDESRAP register in the CSxE memory space. Host read of this register clears Device 1's interrupt. Please refer to the description of the INTM bit in the IDGCR register in the CSxE memory space for detailed conditions under which interrupt condition shall be cleared. The bit description is for ATA mode. Different name in ATAPI mode, if applicable, is cited as well. Reset condition: CSxE reset with the BSY bit as an exception. Please refer to description of the BSY bit below for a list of BSY bit reset conditions. Non-sticky.

Type: I/O Register (Size: 8 bits)

BAR and Offset: [IDE_HOST_PCMDIOBAR] + 7h

Default: 80h

IDE_HOST_PCMDIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_PCMDIOBAR Reference: [B:0, D:27, F:2] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7	0x1 RO/V	**Busy (BSY):** This bit is set by HW when the IDECR is being written and DEV=1, OR when IDDCR[SRST] bit is asserted by Host, OR host system reset, OR D3 to D0 transition of the IDE function. This bit is cleared by FW write of 0. Please refer to general register description above for special handling for a PIO transfer. When this bit is 1, any other bit in this register is meaningless.
6	0x0 RO/V	**Drive Ready (DRDY):** When set, indicates drive is ready for command. Update of this bit is completely FW-assisted. This bit is also called Device Ready. Please refer to general register description above for special handling for a PIO transfer.
5	0x0 RO/V	**Drive Fault (DF):** When set, indicates Error on the drive. Update of this bit is completely FW-assisted. This bit is called DMA Ready for a DMA ATAPI command. Please refer to general register description above for special handling for a PIO transfer.
4	0x0 RO/V	**Drive Seek Complete (DSC):** When set, indicates Heads are positioned over the desired cylinder. Update of this bit is completely FW-assisted. This bit is called Service for an ATAPI command. Please refer to general register description above for special handling for a PIO transfer.
3	0x0 RO/V	**Data Request (DRQ):** Set when the drive wants to exchange data with the Host via the data register. Update of this bit is completely FW-assisted. Please refer to general register description above for special handling for a PIO transfer.
2	0x0 RO/V	**Corrected Data (CORR):** When set, indicates a correctable read error has occurred. Update of this bit is completely FW-assisted. Please refer to general register description above for special handling for a PIO transfer.
1	0x0 RO/V	**Index (IDX):** This bit is set once per rotation of the medium when the index mark passes under the read/write head. Update of this bit is completely FW-assisted. Please refer to general register description above for special handling for a PIO transfer.
0	0x0 RO/V	**Error (ERR):** When set, indicates an error occurred in the process of executing the current command. The Error Register of the selected device contains the error information. Update of this bit is completely FW-assisted. This bit is called Check for an ATAPI command. Please refer to general register description above for special handling for a PIO transfer.

54.14 Registers in I/O Space—IDE_HOST_PCTLIOBAR

These registers are accessed in Host I/O Space starting at the relocatable I/O address defined by the Base Address Register (BAR) IDE_HOST_PCTLIOBAR described in Section 54.6.6, "IDE Primary Control Block IO BAR (IDE_HOST_PCTLIOBAR)—Offset 14h" on page 2526.

54.14.1 IDE Device Control Register (IDDCR)—Offset 2h

This register implements the standard Device Control register in the Primary IDE Control Block. This is write-only. BE[0] shall be deasserted. Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [IDE_HOST_PCTLIOBAR] + 2h

IDE_HOST_PCTLIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_PCTLIOBAR Reference: [B:0, D:27, F:2] + 14h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0x0 WO	**Reserved (RSVD1):** Writable by Host, but NO HW effect due to writes.
2	0x0 WO	**Software Reset (SRST):** 1: both devices shall perform the software reset protocol. 0: both devices shall exit software reset.
1	0x0 WO	**Host Interrupt Disable (nIEN):** 1: disables HW from generating interrupt to the Host. 0: enables HW to generate interrupt to the Host.
0	0x0 WO	**Reserved (RSVD0):** Writable by Host, but NO HW effect due to writes.

54.14.2 IDE Alternate Status Register (IDASR)—Offset 2h

This register implements the standard Alternate Status register in the Primary IDE Control Block. This is read-only. It shadows the standard Status registers in the Primary IDE Command Block. Read of this register does NOT clear the interrupt status bits in the selected Status register. IDESR0 is shadowed when DEV = 0 (i.e. IDEDHIR[4] = 0). IDESR1 is shadowed when DEV = 1 (i.e. IDEDHIR[4] = 1). Reset condition: There is no reset associated with this register because it is NOT a physical register.

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [IDE_HOST_PCTLIOBAR] + 2h

IDE_HOST_PCTLIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_PCTLIOBAR Reference: [B:0, D:27, F:2] + 14h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO/V	**IDE Alternate Status Register (IDEASR):** Shadows DEV0/DEV1 Status register on Host reads depending on IDEDHIR[4] setting.

54.15 Registers in I/O Space—IDE_HOST_BMIOBAR

These registers are accessed in Host I/O Space starting at the relocatable I/O address defined by the Base Address Register (BAR) IDE_HOST_BMIOBAR described in Section 54.6.9, "IDE Bus Master Block IO BAR (IDE_HOST_BMIOBAR)—Offset 20h" on page 2527.

54.15.1 IDE Primary Bus Master Command Register (IDEPBMCR)—Offset 0h

This register implements the standard IDE Primary Bus Master Command register in the IDE Bus Master Block. Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [IDE_HOST_BMIOBAR] + 0h

IDE_HOST_BMIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_BMIOBAR Reference: [B:0, D:27, F:2] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7:4	0x0 RO	**Reserved (RSVD1):** Not implemented. Hardwired to 0.
3	0x0 RW	**Read or Write Control (RWC):** This bit sets the direction of the bus master transfer. • 0: reads are performed from Host system memory. • 1: writes are performed to Host system memory. This bit shall NOT be changed when the bus master function is active.
2:1	0x0 RO	**Reserved (RSVD0):** Not implemented. Hardwired to 0.
0	0x0 RW/V	**Start/Stop Bus Master (SSBM):** Host starts a bus master operation in the device by setting this bit to 1. The device shall only transfer data between the ATA device and Host memory in the bus master operation. Host stops the bus master operation by clearing this bit to 0. All state information will be lost when 0 is written. Host CANNOT stop and then resume the bus master operation. When Host clears this bit to 0 while the bus master operation is still active, the bus master operation will be aborted and data transferred from the device may be discarded before being written to host memory. In any event the device should terminate any DMA burst in progress compliant with the ATA protocol being used. If the UDMA protocol is being used, there may be a CRC error report. The ATA device may be in an indeterminate state. HW will clear this bit to 0 after the data transfer has been completed, as indicated by satisfaction of either of the following conditions: (1) IDEPBMSR[BMIA] is cleared to 0. OR (2) IDEPBMSR[INT] is set to 1.

54.15.2 IDE Primary Bus Master Device Specific 0 Register (IDEPBMDS0R)—Offset 1h

This register implements the standard IDE Primary Bus Master Device Specific 0 register in the IDE Bus Master Block. This register is programmed by the Host for any device specific data. Reset condition: CSxE reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [IDE_HOST_BMIOBAR] + 1h

IDE_HOST_BMIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_BMIOBAR Reference: [B:0, D:27, F:2] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW/V	**Device Specific Data0 (DSD0):** Device Specific.

54.15.3 IDE Primary Bus Master Status Register (IDEPBMSR)—Offset 2h

This register implements the standard IDE Primary Bus Master Status register in the IDE Bus Master Block.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [IDE_HOST_BMIOBAR] + 2h

Default: 80h

IDE_HOST_BMIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_BMIOBAR Reference: [B:0, D:27, F:2] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7	0x1 RO/V	**Simplex Only (SO):** This bit indicates whether or not both bus master channels (primary and secondary) can be operated at the same time. • If the bit is 0, both channels operate independently and can be used at the same time. • If the bit is 1, only one channel may be used at a time. Reset condition: CSxE reset. Non-sticky.
6	0x0 RW/V	**Device 1 DMA Capable (D1DC):** This read/write bit is set by device dependent code (BIOS or host software) to indicate that Device 1 for this channel is capable of DMA transfers, and that the device has been initialized for optimum performance. Reset condition: Host reset. Non-sticky.
5	0x0 RW/V	**Device 0 DMA Capable (D0DC):** This read/write bit is set by device dependent code (BIOS or host software) to indicate that Device 0 for this channel is capable of DMA transfers, and that the device has been initialized for optimum performance. Reset condition: Host reset. Non-sticky.
4:3	0x0 RO	**Reserved (RSVD):** Not implemented. Hardwired to 0.
2	0x0 RW/1C/V	**Interrupt (INT):** HW shall set this bit to 1 on rising edge detection of the ATA channels interrupt line (INTRQ). Host SW writes 1 to clear this bit. Host SW can use this bit to determine if an ATA device has asserted its interrupt line (INTRQ) (see ATA standard). When this bit is 1, all data MUST have been transferred to the Hosts system memory. The adapter shall not set this bit to 1 until it has flushed all internal data buffers. NOTE: When INTRQ is deasserted, HW won't clear this bit atomically. When INTRQ is deasserted, this bit shall be cleared as well by Host SW writing 1 to this bit. Reset condition: CSxE reset. Non-sticky.
1	0x0 RW/1C/V	**Error (ER):** FW will set this bit to 1 when the device encounters an error in transferring data to/from Host memory. The exact error condition is bus specific and can be determined in a bus specific manner. Host SW writes 1 to clear this bit. Reset condition: CSxE reset. Non-sticky.

Bit Range	Default & Access	Field Name (ID): Description
0	0x0 RO/V	**Bus Master IDE Active (BMIA):** HW shall set this bit when (1) Host sets the IDEPBMCR[SSBM] bit. FW shall clear this bit when (1) The last transfer for a region is performed, where EOT for that region is set in the region descriptor. OR (2) FW detects that Host cleared IDEPBMCR[SSBM] bit as indicated by a value of 1 in proxy bit IDEBMCR[SSBMC] in CSxE root space. Before clearing this bit to 0, FW must satisfy the following conditions in addition: (1) All data transferred from the device during the previous bus master command has been transferred to the Hosts system memory, unless the bus master command was aborted. OR (2) All data has been written to the device. Reset condition: CSxE reset. Non-sticky.

54.15.4 IDE Primary Bus Master Device Specific 1 Register (IDEPBMDS1R)—Offset 3h

This register implements the standard IDE Primary Bus Master Device Specific 1 register in the IDE Bus Master Block. This register is programmed by the Host for any device specific data. Reset condition: CSxE reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [IDE_HOST_BMIOBAR] + 3h

IDE_HOST_BMIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_BMIOBAR Reference: [B:0, D:27, F:2] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW/V	**Device Specific Data1 (DSD1):** Device Specific Data.

54.15.5 IDE Primary Bus Master Descriptor Table Pointer Register Byte 0 (IDEPBMDTPR0)—Offset 4h

This register implements the Byte 0 of the standard IDE Primary Bus Master Descriptor Table Pointer register in the IDE Bus Master Block. The descriptor table pointer is used for bus master operation in the primary channel. Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [IDE_HOST_BMIOBAR] + 4h

IDE_HOST_BMIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_BMIOBAR Reference: [B:0, D:27, F:2] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Descriptor Table Pointer Byte 0 (DTPB0):** Byte 0 of the Descriptor Table pointer. The Descriptor Table shall be DW-aligned. Hence bit[1:0] shall always be 0.

54.15.6 IDE Primary Bus Master Descriptor Table Pointer Register Byte 1 (IDEPBMDTPR1)—Offset 5h

This register implements the Byte 1 of the standard IDE Primary Bus Master Descriptor Table Pointer register in the IDE Bus Master Block. The descriptor table pointer is used for bus master operation in the primary channel. Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [IDE_HOST_BMIOBAR] + 5h

IDE_HOST_BMIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_BMIOBAR Reference: [B:0, D:27, F:2] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Descriptor Table Pointer Byte 1 (DTPB1):** Byte 1 of the Descriptor Table pointer.

54.15.7 IDE Primary Bus Master Descriptor Table Pointer Register Byte 2 (IDEPBMDTPR2)—Offset 6h

This register implements the Byte 2 of the standard IDE Primary Bus Master Descriptor Table Pointer register in the IDE Bus Master Block. The descriptor table pointer is used for bus master operation in the primary channel. Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [IDE_HOST_BMIOBAR] + 6h

IDE_HOST_BMIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_BMIOBAR Reference: [B:0, D:27, F:2] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Descriptor Table Pointer Byte 2 (DTPB2):** Byte 2 of the Descriptor Table pointer.

54.15.8 IDE Primary Bus Master Descriptor Table Pointer Register Byte 3 (IDEPBMDTPR3)—Offset 7h

This register implements the Byte 3 of the standard IDE Primary Bus Master Descriptor Table Pointer register in the IDE Bus Master Block. The descriptor table pointer is used for bus master operation in the primary channel. Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [IDE_HOST_BMIOBAR] + 7h

IDE_HOST_BMIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_BMIOBAR Reference: [B:0, D:27, F:2] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Descriptor Table Pointer Byte 3 (DTPB3):** Byte 3 of the Descriptor Table pointer.

54.15.9 IDE Secondary Bus Master Command Register (IDESBMCR)—Offset 8h

This register implements the standard IDE Secondary Bus Master Command register in the IDE Bus Master Block. Usage notes: The Secondary IDE Channel is permanently disabled. Access attributes are maintained to satisfy test requirement. No bus master functionality is implemented behind the register. Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [IDE_HOST_BMIOBAR] + 8h

Default: 00h

IDE_HOST_BMIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_BMIOBAR Reference: [B:0, D:27, F:2] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7:4	0x0 RO	**Reserved (RSVD1):** Not implemented. Hardwired to 0.
3	0x0 RW	**Read or Write Control (RWC):** This bit sets the direction of the bus master transfer. • 0: reads are performed from Host system memory. • 1: writes are performed to Host system memory. This bit shall NOT be changed when the bus master function is active.
2:1	0x0 RO	**Reserved (RSVD0):** Not implemented. Hardwired to 0.
0	0x0 RW	**Start/Stop Bus Master (SSBM):** Host starts a bus master operation in the device by setting this bit to 1. The device shall only transfer data between the ATA device and Host memory in the bus master operation. Host stops the bus master operation by clearing this bit to 0. All state information will be lost when 0 is written. Host CANNOT stop and then resume the bus master operation.

54.15.10 IDE Secondary Bus Master Device Specific 0 Register (IDESBMDS0R)—Offset 9h

This register implements the standard IDE Secondary Bus Master Device Specific 0 register in the IDE Bus Master Block. This register is programmed by the Host for any device specific data. Usage notes: The Secondary IDE Channel is permanently disabled. Access attributes are maintained to satisfy test requirement. No bus master functionality is implemented behind the register. Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [IDE_HOST_BMIOBAR] + 9h

Default: 00h

IDE_HOST_BMIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_BMIOBAR Reference: [B:0, D:27, F:2] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Device Specific Data0 (DSD0):** Device Specific.

54.15.11 IDE Secondary Bus Master Status Register (IDESBMSR)—Offset Ah

This register implements the standard IDE Secondary Bus Master Status register in the IDE Bus Master Block. Usage notes: The Secondary IDE Channel is permanently disabled. Access attributes are maintained to satisfy test requirement. No bus master functionality is implemented behind the register. Reset condition: Host reset with the SO bit as an exception. Non-sticky.

Type: I/O Register
(Size: 8 bits)

Default: 80h

BAR and Offset: [IDE_HOST_BMIOBAR] + Ah

IDE_HOST_BMIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_BMIOBAR Reference: [B:0, D:27, F:2] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7	0x1 RO/V	**Simplex Only (SO):** Value indicates whether both Bus Master Channels can be operated at the same time or not. • 0: Both can be operated independently • 1: Only one can be operated at a time. This bit shadows IDEPBMSR[SO]. Reset condition: CSxE reset. Non-sticky.
6	0x0 RW	**Device 1 DMA Capable (D1DC):** This read/write bit is set by device dependent code (BIOS or host software) to indicate that Device 1 for this channel is capable of DMA transfers, and that the device has been initialized for optimum performance.
5	0x0 RW	**Device 0 DMA Capable (D0DC):** This read/write bit is set by device dependent code (BIOS or host software) to indicate that Device 0 for this channel is capable of DMA transfers, and that the device has been initialized for optimum performance.
4:3	0x0 RO	**Reserved (RSVD):** Not implemented. Hardwired to 0.
2	0x0 RO	**Interrupt (INT):** No functionality implemented. Hardwired to 0.
1	0x0 RO	**Error (ER):** Not implemented. Hardwired to 0.
0	0x0 RO	**Bus Master IDE Active (BMIA):** Not implemented. Hardwired to 0.

54.15.12 IDE Secondary Bus Master Device Specific 1 Register (IDESBMDS1R)—Offset Bh

This register implements the standard IDE Secondary Bus Master Device Specific 1 register in the IDE Bus Master Block. This register is programmed by the Host for any device specific data. Usage notes: The Secondary IDE Channel is permanently disabled. Access attributes are maintained to satisfy test requirement. No bus master functionality is implemented behind the register. Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [IDE_HOST_BMIOBAR] + Bh

Default: 00h

IDE_HOST_BMIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_BMIOBAR Reference: [B:0, D:27, F:2] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Device Specific Data1 (DSD1):** Device Specific Data.

54.15.13 IDE Secondary Bus Master Descriptor Table Pointer Register Byte 0 (IDESBMDTPR0)—Offset Ch

This register implements the Byte 0 of the standard IDE Secondary Bus Master Descriptor Table Pointer register in the IDE Bus Master Block. The descriptor table pointer is used for bus master operation in the secondary channel. Usage notes: The Secondary IDE Channel is permanently disabled. Access attributes are maintained to satisfy test requirement. No bus master functionality is implemented behind the register. Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [IDE_HOST_BMIOBAR] + Ch

Default: 00h

IDE_HOST_BMIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_BMIOBAR Reference: [B:0, D:27, F:2] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Descriptor Table Pointer Byte 0 (DTPB0):** Byte 0 of the Descriptor Table pointer. The Descriptor Table shall be DW-aligned. Hence bit[1:0] shall always be 0.

54.15.14 IDE Secondary Bus Master Descriptor Table Pointer Register Byte 1 (IDESBMDTPR1)—Offset Dh

This register implements the Byte 1 of the standard IDE Secondary Bus Master Descriptor Table Pointer register in the IDE Bus Master Block. The descriptor table pointer is used for bus master operation in the secondary channel. Usage notes: The Secondary IDE Channel is permanently disabled. Access attributes are maintained to satisfy test requirement. No bus master functionality is implemented behind the register. Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [IDE_HOST_BMIOBAR] + Dh

IDE_HOST_BMIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_BMIOBAR Reference: [B:0, D:27, F:2] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Descriptor Table Pointer Byte 1 (DTPB1):** Byte 1 of the Descriptor Table pointer.

54.15.15 IDE Secondary Bus Master Descriptor Table Pointer Register Byte 2 (IDESBMDTPR2)—Offset Eh

This register implements the Byte 2 of the standard IDE Secondary Bus Master Descriptor Table Pointer register in the IDE Bus Master Block. The descriptor table pointer is used for bus master operation in the secondary channel. Usage notes: The Secondary IDE Channel is permanently disabled. Access attributes are maintained to satisfy test requirement. No bus master functionality is implemented behind the register. Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [IDE_HOST_BMIOBAR] + Eh

IDE_HOST_BMIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_BMIOBAR Reference: [B:0, D:27, F:2] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Descriptor Table Pointer Byte 2 (DTPB2):** Byte 2 of the Descriptor Table pointer.

54.15.16 IDE Secondary Bus Master Descriptor Table Pointer Register Byte 3 (IDESBMDTPR3)—Offset Fh

This register implements the Byte 3 of the standard IDE Secondary Bus Master Descriptor Table Pointer register in the IDE Bus Master Block. The descriptor table pointer is used for bus master operation in the secondary channel. Usage notes: The Secondary IDE Channel is permanently disabled. Access attributes are maintained to satisfy test requirement. No bus master functionality is implemented behind the register. Reset condition: Host reset. Non-sticky.

Type: I/O Register
(Size: 8 bits)

BAR and Offset: [IDE_HOST_BMIOBAR] + Fh

Default: 00h

IDE_HOST_BMIOBAR Type: PCI Configuration Register (Size: 32 bits)
IDE_HOST_BMIOBAR Reference: [B:0, D:27, F:2] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Descriptor Table Pointer Byte 3 (DTPB3):** Byte 3 of the Descriptor Table pointer.

54.16 Sideband Registers—KT (Host)

The Sideband registers accessible to the Host are described here. They are accessible in Host Memory Space starting at the Sideband Base Address Register (SBREG_BAR). See Section 3.4.1, "Using SBREG_BAR Method" on page 187.

54.16.1 KT Host Interrupt Pin Register (KTHIPINR)—Offset 0h

This register provides for BIOS to specify which interrupt pin KT shall use in the Host root space when generating an interrupt in the PCI legacy mode.

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xf4] + 0h
Host Memory Space: SBREG_BAR + 0xf40000 + 0h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**Reserved (RSVD):** Not implemented. Hardwired to 0.
7:0	0x0 RW/O	**Interrupt Pin (IPIN):** BIOS writes to this field once to specify which interrupt pin KT shall use. After written once, this register will become read-only. This field shall be shadowed into the Interrupt Pin register in the PCI header of the KT Host PCI function. Value Decoding • 00h The function does NOT use an interrupt pin. • 01h INTA • 02h INTB • 03h INTC • 04h INTD • 05h - FFh Reserved Reset condition: Host side reset. Non-sticky.

54.16.2 BIOS KT Host PCI Function Disable Register (BKTHDISR)—Offset 4h

This register provides for BIOS to enable or disable the KT Host PCI function.

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xf4] + 4h
Host Memory Space: SBREG_BAR + 0xf40000 + 4h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0x0 RO	**Reserved (RSVD):** Not implemented. Hardwired to 0.
0	0x0 RW	**Host PCI Function Disable (HDIS):** BIOS sets this bit to disable the KT Host PCI function. BIOS clears this bit to enable the KT Host PCI function. Reset condition: Host side reset. Non-sticky.

54.17 Sideband Registers—IDE (Host)

The Sideband registers accessible to the Host are described here. They are accessible in Host Memory Space starting at the Sideband Base Address Register (SBREG_BAR). See Section 3.4.1, "Using SBREG_BAR Method" on page 187.

54.17.1 IDE Host Interrupt Pin Register (IDEHIPINR)—Offset 0h

This register provides for BIOS to specify which interrupt pin IDE shall use in the Host root space when generating an interrupt in the PCI legacy mode.

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xf4] + 0h
Host Memory Space: SBREG_BAR + 0xf40000 + 0h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**Reserved (RSVD):** Not implemented. Hardwired to 0.
7:0	0x0 RW/O	**Interrupt Pin (IPIN):** BIOS writes to this field once to specify which interrupt pin IDE shall use. After written once, this register will become read-only. This field shall be shadowed into the Interrupt Pin register in the PCI header of the IDE Host PCI function. Value Decoding • 00h The function does NOT use an interrupt pin. • 01h INTA • 02h INTB • 03h INTC • 04h INTD • 05h - FFh Reserved Reset condition: Host side reset. Non-sticky.

54.17.2 BIOS IDE Host PCI Function Disable Register (BIDEHDISR)—Offset 4h

This register provides for BIOS to enable or disable the IDE Host PCI function.

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xf4] + 4h
Host Memory Space: SBREG_BAR + 0xf40000 + 4h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0x0 RO	**Reserved (RSVD):** Not implemented. Hardwired to 0.
0	0x0 RW	**Host PCI Function Disable (HDIS):** BIOS sets this bit to disable the IDE Host PCI function. BIOS clears this bit to enable the IDE Host PCI function. Reset condition: Host side reset. Non-sticky.

§ §

55 eMMC Controller - B0, D28, F0

55.1 Introduction and Index

The host-accessible registers for the eMMC Controller are described here.

To determine the number of devices/functions available refer to the following:

- Table 1-1, "Features by product SKU - Server and Cloud Storage SKUs 0 through 4"
- Table 1-2, "Features by Product SKU - Network and Enterprise Storage SKUs 5 through 10"
- Table 1-3, "Features by Product SKU - Extended Temperature SKUs 11 through 14".

The legend for the register access codes are described in Chapter 43, "Introduction."

55.1.1 Host Memory Space—BAR or BAR1

An index of the registers that are accessible in Host Memory Space is shown here.

Table 55-1. Summary of Memory Mapped I/O Registers—BAR or BAR1 (Sheet 1 of 3)

Offset (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
eMMC Registers			
0	4	00000000	"SDMA System Address Register/Argument2 Register (SDMASYSADDR)—Offset 0h" on page 2599
4	2	0000	"BlockSize Register (BLOCKSIZE)—Offset 4h" on page 2599
6	2	0000	"BlockCount Register (BLOCKCOUNT)—Offset 6h" on page 2599
8	4	00000000	"Argument1 Register (ARGUMENT1)—Offset 8h" on page 2600
C	2	0000	"TransferMode Register (TRANSFERMODE)—Offset Ch" on page 2600
E	2	0000	"Command Register (COMMAND)—Offset Eh" on page 2600
10	4	00000000	"Response Register (RESPONSE1)—Offset 10h" on page 2601
14	2	0000	"Response Register (RESPONSE2)—Offset 14h" on page 2602
16	2	0000	"Response Register (RESPONSE3)—Offset 16h" on page 2602
18	2	0000	"Response Register (RESPONSE4)—Offset 18h" on page 2602
1A	2	0000	"Response Register (RESPONSE5)—Offset 1Ah" on page 2602
1C	2	0000	"Response Register (RESPONSE6)—Offset 1Ch" on page 2603
1E	2	0000	"Response Register (RESPONSE7)—Offset 1Eh" on page 2603
20	4	00000000	"Buffer DataPort Register (DATAPORT)—Offset 20h" on page 2603
24	4	00000000	"PresentState Register (PRESENTSTATE)—Offset 24h" on page 2604
28	1	00	"HostControl1 Register (HOSTCONTROL1)—Offset 28h" on page 2606
29	1	00	"PowerControl Register (POWERCONTROL)—Offset 29h" on page 2607
2A	1	80	"BlockGapControl Register (BLOCKGAPCONTROL)—Offset 2Ah" on page 2607
2B	1	00	"Wakeup Control Register (WAKEUPCONTROL)—Offset 2Bh" on page 2608
2C	2	0000	"Clock Control Register (CLOCKCONTROL)—Offset 2Ch" on page 2609
2E	1	00	"Timeout Control Register (TIMEOUTCONTROL)—Offset 2Eh" on page 2610
2F	1	00	"Software Reset Register (SOFTWARERESET)—Offset 2Fh" on page 2610
30	2	0000	"Normal Interrupt Status Register (NORMALINTRSTS)—Offset 30h" on page 2611
32	2	0000	"ErrorInterruptStatus Register (ERRORINTRSTS)—Offset 32h" on page 2612
34	2	0000	"Normal Interrupt Status Enable Register (NORMALINTRSTSENA)—Offset 34h" on page 2613
36	2	0000	"Error Interrupt Status Enable Register (ERRORINTRSTSENA)—Offset 36h" on page 2614
38	2	0000	"Normal Interrupt Signal Enable Register (NORMALINTRSIGENA)—Offset 38h" on page 2615
3A	2	0000	"Error Interrupt Signal Enable Register (ERRORINTRSIGENA)—Offset 3Ah" on page 2616
3C	2	0000	"Auto CMD12 Error Status Register (AUTOCMDERRSTS)—Offset 3Ch" on page 2617
3E	2	0000	"Host Control2 Register (HOSTCONTROL2)—Offset 3Eh" on page 2618
40	8	80000007F76F64B2	"Capabilities Register (CAPABILITIES)—Offset 40h" on page 2619

Table 55-1. Summary of Memory Mapped I/O Registers—BAR or BAR1 (Sheet 2 of 3)

Offset (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
48	8	0000000000000000	"Maximum Current Capabilities Register (MAXCURRENTCAP)—Offset 48h" on page 2621
50	2	0000	"Force Event REGISTER for AUTO CMD Error Status (FORCEEVENTFORAUTOCMDERRORSTATUS)—Offset 50h" on page 2621
52	2	0000	"Force Event Register for Error Interrupt Status (FORCEEVENTFORERRINTSTS)—Offset 52h" on page 2622
54	1	00	"ADMA Error Status Register (ADMAERRSTS)—Offset 54h" on page 2623
58	4	00000000	"ADMA System Address Register0&1 (ADMASYSADDR01)—Offset 58h" on page 2623
5C	2	0000	"ADMA System Address Register1 (ADMASYSADDR2)—Offset 5Ch" on page 2623
5E	2	0000	"ADMA System Address Register1 (ADMASYSADDR3)—Offset 5Eh" on page 2624
60	2	0003	"Preset Value Register for Initialization (PRESETVALUE0)—Offset 60h" on page 2624
62	2	0003	"Preset Value Register for Default Speed (PRESETVALUE1)—Offset 62h" on page 2625
64	2	0003	"Preset Value Register for High Speed (PRESETVALUE2)—Offset 64h" on page 2625
66	2	0003	"Preset Value Register for SDR12 (PRESETVALUE3)—Offset 66h" on page 2626
68	2	0002	"Preset Value Register for SDR25 (PRESETVALUE4)—Offset 68h" on page 2626
6A	2	0001	"Preset Value Register for SDR50 (PRESETVALUE5)—Offset 6Ah" on page 2627
6C	2	0000	"Preset Value Register for SDR104 (PRESETVALUE6)—Offset 6Ch" on page 2627
6E	2	0002	"Preset Value Register for DDR50 (PRESETVALUE7)—Offset 6Eh" on page 2628
70	4	00000000	"Boot Timeout Control Register (BOOTTIMEOUTCNT)—Offset 70h" on page 2628
74	2	0000	"Preset Value Register for DDR50 (PRESETVALUE8)—Offset 74h" on page 2629
FC	2	0000	"Slot Interrupt Status Register (SLOTINTRSTS)—Offset FCh" on page 2629
FE	2	1002	"Host Controller Version Register (HOSTCONTROLLERVER)—Offset FEh" on page 2629
Extended eMMC Registers (Convergence Layer)			
804	4	00000800	"Software Latency Tolerance Reporting (SW_LTR_VAL)—Offset 804h" on page 2630
808	4	00000800	"Auto Latency Tolerance Reporting (AUTO_LTR_VAL)—Offset 808h" on page 2630
810	4	00000000	"Capabilities Bypass Control Register (CAP_BYPS)—Offset 810h" on page 2631
814	4	3001EF3C	"eMMC Capabilities Bypass Register1 (CAP_BYPS_REG1)—Offset 814h" on page 2632
818	4	04004000	"eMMC Capabilities Bypass Register2 (CAP_BYPS_REG2)—Offset 818h" on page 2634
81C	4	00000008	"D0i3 Control Register (REG_D0i3)—Offset 81Ch" on page 2635
820	4	00000400	"Front End Module Tx Command Path Delay Register (Tx_CMD_DLY)—Offset 820h" on page 2635
824	4	00000A18	"Front End Module Tx Data Path Delay Register1 (Tx_DATA_DLY_1)—Offset 824h" on page 2636
828	4	1C1C1C00	"Front End Module Tx Data Path Delay Register2 (Tx_DATA_DLY_2)—Offset 828h" on page 2637

Table 55-1. Summary of Memory Mapped I/O Registers—BAR or BAR1 (Sheet 3 of 3)

Offset (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
82C	4	00000000	"Front End Module Rx Data Path Delay Register1 (Rx_CMD_DATA_DLY_1)—Offset 82Ch" on page 2638
830	4	00000000	"Front End Module Rx Strobe Path Delay Register (Rx_STROBE_CTRL_PATH)—Offset 830h" on page 2639
834	4	00000000	"Front End Module Rx Data Path Delay Register2 (Rx_CMD_DATA_DLY_2)—Offset 834h" on page 2640
838	4	00000001	"Master DLL Software Control Register (MASTER_DLL)—Offset 838h" on page 2641
840	4	00000000	"Auto Tuning Value (AUTO_TUNING)—Offset 840h" on page 2641
900	4	00000000	"Root Space Select (eMMC_ROOT_SPACE)—Offset 900h" on page 2642

55.2 Registers in Memory Space—BAR or BAR1

The eMMC operates in either PCI Mode or ACPI Mode. By default all the devices are defined as PCI devices (PCI Mode).

To change a device to an ACPI device (ACPI Mode), it first needs to be enumerated and assigned a BAR. Once this is done, it is possible to configure the device to be an ACPI device. Its address shall be the configured BAR address.

55.2.1 SDMA System Address Register/Argument2 Register (SDMASYSADDR)—Offset 0h

This register contains concatenates reg_sdmasysaddrlo and reg_sdmasysaddrhi

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [BAR or BAR1] + 0h

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**sdma_sysaddress:** Refer to reg_sdmasysaddrlo and reg_sdmasysaddrhi

55.2.2 BlockSize Register (BLOCKSIZE)—Offset 4h

This register is used to configure the number of bytes in a data block

Type: Memory Mapped I/O Register (Size: 16 bits)

Default: 0000h

BAR and Offset: [BAR or BAR1] + 4h

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RO	**RSVD0:** Reserved
14:12	0x0 RW	**sdma_bufboundary:** This Field specifies DMA Buffer Boundary
11:0	0x0 RW	**xfer_blocksize:** This Field specifies Block Size for Data Transfers

55.2.3 BlockCount Register (BLOCKCOUNT)—Offset 6h

This register is used to configure the number of data blocks

Type: Memory Mapped I/O Register (Size: 16 bits)

Default: 0000h

BAR and Offset: [BAR or BAR1] + 6h

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x0 RW	**xfer_blockcount:** This Register specifies Block Size for Data Transfers

55.2.4 Argument1 Register (ARGUMENT1)—Offset 8h

This register contains concatenates argument1lo and argument1hi registers to result SD Command Argument

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [BAR or BAR1] + 8h

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**command_argument1:** refer t oreg_argument1lo and reg_argument1hi.

55.2.5 TransferMode Register (TRANSFERMODE)—Offset Ch

This register is used to control the operations of data transfers

Type: Memory Mapped I/O Register (Size: 16 bits)

Default: 0000h

BAR and Offset: [BAR or BAR1] + Ch

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
15:6	0x0 RO	**RSVD0:** Reserved
5	0x0 RW	**xfermode_multiblksel:** This bit enables multiple block data transfers.
4	0x0 RW	**xfermode_dataxferdir:** This bit defines the direction of data transfers.
3:2	0x0 RW	**xfermode_autocmdena:** This field determines use of auto command functions.
1	0x0 RW	**xfermode_blkcntena:** This bit is used to enable the Block count register, which is only relevant for multiple block transfers
0	0x0 RW	**xfermode_dmaenable:** '1' to enable DMA,

55.2.6 Command Register (COMMAND)—Offset Eh

This register is used to program the Command for host controller

Type: Memory Mapped I/O Register (Size: 16 bits)

Default: 0000h

BAR and Offset: [BAR or BAR1] + Eh

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
15:14	0x0 RO	**RSVD0:** Reserved
13:8	0x0 RW	**command_cmdindex:** This bit shall be set to the command number (CMD0-63, ACMD0-63).

Bit Range	Default & Access	Field Name (ID): Description
7:6	0x0 RW	**command_cmdtype:** This bit is used for select different command types.
5	0x0 RW	**command_datapresent:** This bit is used to checking whether data present or not.
4	0x0 RW	**command_indexchkena:** This bit is used to enable/disable Command Index checking.
3	0x0 RW	**command_crcchkena:** This bit is used to enable/disable CRC checking.
2	0x0 RO	**RSVD1:** Reserved
1:0	0x0 RW	**command_responsetype:** Response Type Select.

55.2.7 Response Register (RESPONSE1)—Offset 10h

This register is used to store responses from SD Cards (concatinates response0 and response1 registers)

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [BAR or BAR1] + 10h

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO	**command_response:** R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit

55.2.8 Response Register (RESPONSE2)—Offset 14h

This register is used to store responses from SD Cards

Type: Memory Mapped I/O Register (Size: 16 bits)

BAR and Offset: [BAR or BAR1] + 14h

Default: 0000h

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x0 RO	**command_response:** R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit

55.2.9 Response Register (RESPONSE3)—Offset 16h

This register is used to store responses from SD Cards

Type: Memory Mapped I/O Register (Size: 16 bits)

BAR and Offset: [BAR or BAR1] + 16h

Default: 0000h

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x0 RO	**command_response:** R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit

55.2.10 Response Register (RESPONSE4)—Offset 18h

This register is used to store responses from SD Cards

Type: Memory Mapped I/O Register (Size: 16 bits)

BAR and Offset: [BAR or BAR1] + 18h

Default: 0000h

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x0 RO	**command_response:** R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit

55.2.11 Response Register (RESPONSE5)—Offset 1Ah

This register is used to store responses from SD Cards

Type: Memory Mapped I/O Register (Size: 16 bits)

BAR and Offset: [BAR or BAR1] + 1Ah

Default: 0000h

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x0 RO	**command_response:** R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit

55.2.12 Response Register (RESPONSE6)—Offset 1Ch

This register is used to store responses from SD Cards

Type: Memory Mapped I/O Register (Size: 16 bits)

Default: 0000h

BAR and Offset: [BAR or BAR1] + 1Ch

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x0 RO	**command_response:** R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit

55.2.13 Response Register (RESPONSE7)—Offset 1Eh

This register is used to store responses from SD Cards

Type: Memory Mapped I/O Register (Size: 16 bits)

Default: 0000h

BAR and Offset: [BAR or BAR1] + 1Eh

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x0 RO	**command_response:** R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit

55.2.14 Buffer DataPort Register (DATAPORT)—Offset 20h

This register is used to access internal buffer

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [BAR or BAR1] + 20h

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**sdhcdmactrl_piobufrddata:** The Host Controller Buffer can be accessed through this 32-bit Data Port Register.

55.2.15 PresentState Register (PRESENTSTATE)—Offset 24h

The Host Driver can get status of the Host Controller from this 32-bit read-only register

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [BAR or BAR1] + 24h

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RO	**RSVD0:** Reserved
28	0x0 RO	**sdif_dat7in_dsync:** This status is used to check DAT line level to recover from errors, and for debugging.
27	0x0 RO	**sdif_dat6in_dsync:** This status is used to check DAT line level to recover from errors, and for debugging.
26	0x0 RO	**sdif_dat5in_dsync:** This status is used to check DAT line level to recover from errors, and for debugging.
25	0x0 RO	**sdif_dat4in_dsync:** This status is used to check DAT line level to recover from errors, and for debugging.
24	0x0 RO	**sdif_cmdin_dsync:** This status is used to check DAT line level to recover from errors, and for debugging.
23	0x0 RO	**sdif_dat3in_dsync:** This status is used to check DAT line level to recover from errors, and for debugging.
22	0x0 RO	**sdif_dat2in_dsync:** This status is used to check DAT line level to recover from errors, and for debugging.
21	0x0 RO	**sdif_dat1in_dsync:** This status is used to check DAT line level to recover from errors, and for debugging.
20	0x0 RO	**sdif_dat0in_dsync:** This status is used to check DAT line level to recover from errors, and for debugging.
19	0x0 RO	**sdif_wp_dsync:** The Write Protect Switch is supported for memory and combo cards.
18	0x0 RO	**sdif_cd_n_dsync:** This bit reflects the inverse value of the SDCD# pin.
17	0x0 RO	**sdhccarddet_statestable_dsync:** This bit is used for testing.
16	0x0 RO	**sdhccarddet_inserted_dsync:** This bit indicates whether a card has been inserted.
15:12	0x0 RO	**RSVD1:** Reserved
11	0x0 RO	**sdhcdmactrl_piobufrdena:** This status is used for non-DMA read transfers. This read only flag indicates that valid data exists in the host side buffer status.
10	0x0 RO	**sdhcdmactrl_piobufwrena:** This status is used for non-DMA write transfers. This read only flag indicates if space is available for write data.
9	0x0 RO	**sdhcdmactrl_rdxferactive:** This status is used for detecting completion of a read transfer.
8	0x0 RO	**sdhcdmactrl_wrxferactive:** This status indicates a write transfer is active.
7:4	0x0 RO	**RSVD2:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
3	0x0 RO	**sdhcsdctrl_retuningreq_dsync:** Host Controller may request Host Driver to execute re-tuning sequence by setting this bit.
2	0x0 RO	**sdhcdmactrl_datalineactive:** This bit indicates whether one of the DAT line on SD bus is in use.
1	0x0 RO	**presentstate_inhibitdat:** This status bit is generated if either the DAT Line Active or the Read transfer Active is set to 1.
0	0x0 RO	**presentstate_inhibitcmd:** If this bit is 0, it indicates the CMD line is not in use and the HC can issue a SD command using the CMD line. This bit is set immediately after the Command register (00Fh) is written. This bit is cleared when the command response is received.

55.2.16 HostControl1 Register (HOSTCONTROL1)—Offset 28h

This register is used to program DMA modes, LED Control, Data Transfer Width, High Speed Enable, Card detect test level and signal selection.

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [BAR or BAR1] + 28h

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RW	**hostctrl1_cdsigselect:** This bit selects source for card detection.
6	0x0 RW	**hostctrl1_cdtestlevel:** This bit is used for indicating whether card is inserted or not.
5	0x0 RW	**hostctrl1_extdatawidth:** This bit controls 8-bit bus width mode for embedded device.
4:3	0x0 RW	**hostctrl1_dmaselect:** One of supported DMA modes can be selected.
2	0x0 RW	**hostctrl1_highspeedena:** This bit is used for setting speed mode.
1	0x0 RW	**hostctrl1_datawidth:** This bit selects the data width of the HC.
0	0x0 RW	**hostctrl1_ledcontrol:** This bit is used to caution the user not to remove the card while the SD card is being accessed.

55.2.17 PowerControl Register (POWERCONTROL)—Offset 29h

This register is used to program the SD Bus power and voltage level

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [BAR or BAR1] + 29h

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
7:5	0x0 RO	**RSVD0:** Reserved
4	0x0 RW	**emmc_hwreset:** Hardware reset signal is generated for eMMC card.
3:1	0x0 RW	**pwrctrl_sdbusvoltage:** By setting these bits, the HD selects the voltage level for the SD card.
0	0x0 RW	**pwrctrl_sdbuspower:** This bit is used detect whether power is on or off.

55.2.18 BlockGapControl Register (BLOCKGAPCONTROL)—Offset 2Ah

This register is used to program the block gap request, read wait control and interrupt at block gap

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 80h

BAR and Offset: [BAR or BAR1] + 2Ah

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
7	0x1 RW	**blkgapctrl_bootackena:** To check for the boot acknowledge in boot operation.
6	0x0 RW	**blkgapctrl_altbootmode:** To start boot code access in alternative mode.
5	0x0 RW	**blkgapctrl_bootenable:** To start boot code access. • '0' To stop boot code access • '1' To start boot code access
4	0x0 RW	**blkgapctrl_spimode:** SPI mode enable bit. • '0' SD Mode • '1' SPI Mode
3	0x0 RW	**blkgapctrl_interrupt:** This bit is valid only in 4-bit mode of the SDIO card and selects a sample point in the interrupt cycle.
2	0x0 RW	**blkgapctrl_rdwaitctrl:** The read wait function is optional for SDIO cards.
1	0x0 RW	**blkgapctrl_continue:** This bit is used to restart a transaction which was stopped using the Stop At Block Gap Request.
0	0x0 RW	**blkgapctrl_stopatblkgap:** This bit is used to stop executing a transaction at the next block gap for non- DMA,SDMA and ADMA transfers.

55.2.19 Wakeup Control Register (WAKEUPCONTROL)—Offset 2Bh

This register is used to program the wakeup functionality

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [BAR or BAR1] + 2Bh

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0x0 RO	**RSVD0:** Reserved
2	0x0 RW	**wkupctrl_cardremoval:** This bit enables wakeup event via Card Insertion assertion in the Normal Interrupt Status register.
1	0x0 RW	**wkupctrl_cardinsertion:** This bit enables wakeup event via Card Insertion assertion in the Normal Interrupt Status register.
0	0x0 RW	**wkupctrl_cardinterrupt:** This bit enables wakeup event via Card Interrupt assertion in the Normal Interrupt Status register.

55.2.20 Clock Control Register (CLOCKCONTROL)—Offset 2Ch

This register is used to program the Clock frequency select, generator select, Clock enable, Internal Clock state fields

Type: Memory Mapped I/O Register (Size: 16 bits)

BAR and Offset: [BAR or BAR1] + 2Ch

Default: 0000h

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x0 RW	**clkctrl_sdclkfreqsel:** This register is used to select the frequency of the SDCLK pin.
7:6	0x0 RW	**clkctrl_sdclkfreqsel_upperbits:** Bit 07-06 is assigned to bit 09-08 of clock divider in SDCLK Frequency Select
5	0x0 RW	**clkctrl_clkgensel:** This bit is used to select the clock generator mode in SDCLK Frequency Select.
4:3	0x0 RO	**RSVD0:** Reserved
2	0x0 RW	**clkctrl_sdclkena:** This bit enables/disables SD Clock. • '0' Disable • '1' Enable
1	0x0 RO	**sdhcclkgen_intclkstable_dsync:** This bit is set to 1 when SD clock is stable after writing to Internal Clock Enable in this register to 1.
0	0x0 RW	**clkctrl_intclkena:** This bit enables setting of internal clock. • '0' Stop • '1' Oscillate

55.2.21 Timeout Control Register (TIMEOUTCONTROL)—Offset 2Eh

The register sets the Data Timeout counter value

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [BAR or BAR1] + 2Eh

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
7:4	0x0 RO	**RSVD0:** Reserved
3:0	0x0 RW	**timeout_ctrvalue:** This value determines the interval by which DAT line time-outs are detected.

55.2.22 Software Reset Register (SOFTWARERESET)—Offset 2Fh

This register is used to program the software reset for data, command and for all.

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [BAR or BAR1] + 2Fh

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0x0 RO	**RSVD0:** Reserved
2	0x0 RW	**swreset_for_dat:** Only part of data circuit is reset. • '0' Work • '1' Reset
1	0x0 RW	**swreset_for_cmd:** Only part of command circuit is reset. • '0' Work • '1' reset.
0	0x0 RW	**swreset_for_all:** If this bit is set to 1, the SD card shall reset itself and must be re initialized by the HD.

55.2.23 Normal Interrupt Status Register (NORMALINTRSTS)—Offset 30h

This register gives the status of all the interrupts.

Type: Memory Mapped I/O Register (Size: 16 bits)

Default: 0000h

BAR and Offset: [BAR or BAR1] + 30h

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RO	**reg_errorintrsts:** This bit is set If any of the bits in the Error Interrupt Status Register are set.
14	0x0 RW	**normalintrsts_bootcomplete:** This status is set if the boot operation gets terminated.
13	0x0 RW	**normalintrsts_rcvbootack:** This status is set if the boot acknowledge is received from device.
12	0x0 RO	**normalintrsts_retuningevent:** This status is set if Re-Tuning Request in the Present State register changes from 0 to 1.
11	0x0 RO	**normalintrsts_intc:** This status is set if INT_C is enabled and INT_C# pin is in low level. It is cleared by resetting the INT_C interrupt factor.
10	0x0 RO	**normalintrsts_intb:** This status is set if INT_B is enabled and INT_B# pin is in low level. It is cleared by resetting
9	0x0 RO	**normalintrsts_inta:** This status is set if INT_A is enabled and INT_A# pin is in low level. It is cleared by resetting
8	0x0 RO	**normalintrsts_cardintsts:** This status is set to generate Card Interrupt. • '0' No Card Interrupt • '1' Generate Card Interrupt
7	0x0 RW	**normalintrsts_cardremsts:** This status is set if the Card Inserted in the Present State register changes from 1 to 0.
6	0x0 RW	**normalintrsts_cardinssts:** This status is set if the Card Inserted in the Present State register changes from 0 to 1.
5	0x0 RW	**normalintrsts_bufrdready:** This status is set if the Buffer Read Enable changes from 0 to 1.
4	0x0 RW	**normalintrsts_bufwrready:** This status is set if the Buffer Write Enable changes from 0 to 1.
3	0x0 RW	**normalintrsts_dmainterrupt:** This status is set if the HC detects the Host DMA Buffer Boundary in the Block Size register.
2	0x0 RW	**normalintrsts_blkgapevent:** If the Stop At Block Gap Request in the BlockGap Control Register is set, this bit is set.
1	0x0 RW	**normalintrsts_xfercomplete:** This bit is set when a read / write transaction is completed.
0	0x0 RW	**normalintrsts_cmdcomplete:** This bit is set when we get the end bit of the command response.

55.2.24 ErrorInterruptStatus Register (ERRORINTRSTS)—Offset 32h

This register gives the status of the error interrupts.

Type: Memory Mapped I/O Register (Size: 16 bits)

Default: 0000h

BAR and Offset: [BAR or BAR1] + 32h

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
15:13	0x0 RO	**RSVD0:** Reserved
12	0x0 RW	**errorintrsts_hosterror:** Occurs when detecting Host ERROR
11:10	0x0 RO	**RSVD1:** Reserved
9	0x0 RW	**errorintrsts_admaerror:** This bit is set when the Host Controller detects errors during ADMA based data transfer.
8	0x0 RW	**errorintrsts_autocmderror:** This bit is set when detecting that one of the bits D00-D04 in Auto CMD Error Status register has changed from 0 to 1.
7	0x0 RW	**errorintrsts_currlimiterror:** If this bit is 1, it means that the HC is not supplying power to SD card due to some failure. Reading 0 means that the HC is supplying power and no error has occurred.
6	0x0 RW	**errorintrsts_dataendbiterror:** Occurs when detecting 0 at the end bit position of read data which uses the DAT line or the end bit position of the CRC status.
5	0x0 RW	**errorintrsts_datacrcerror:** Occurs when detecting CRC error when transferring read data which uses the DAT line or when detecting the Write CRC Status having a value of other than 010.
4	0x0 RW	**errorintrsts_datatimeouterror:** This status is set if Data Timeout error occurs.
3	0x0 RW	**errorintrsts_cmdindexerror:** Occurs if a Command Index error occurs in the Command Response.
2	0x0 RW	**errorintrsts_cmdendbiterror:** Occurs when detecting that the end bit of a command response is 0.
1	0x0 RW	**errorintrsts_cmdcrcerror:** This bit is set when Command CRC Error is generated. • '0' No Error • '1' CRC Error
0	0x0 RW	**errorintrsts_cmdtimeouterror:** This bit is set if no response is returned within 64 SDCLK cycles from the end bit of the command.

55.2.25 Normal Interrupt Status Enable Register (NORMALINTRSTSENA)—Offset 34h

This register is used to enable the normal interrupt status register fields.

Type: Memory Mapped I/O Register (Size: 16 bits)

Default: 0000h

BAR and Offset: [BAR or BAR1] + 34h

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RO	**normalintrsts_enableregbit15:** The HC shall control error Interrupts using the Error Interrupt Status Enable register.
14	0x0 RW	**normalintrsts_enableregbit14:** This status is set if the boot operation gets terminated.
13	0x0 RW	**normalintrsts_enableregbit13:** This status is set if the boot acknowledge is received from device.
12	0x0 RW	**normalintrsts_enableregbit12:** This status is set if Re-Tuning Request in the Present State register changes from 0 to 1.
11	0x0 RW	**normalintrsts_enableregbit11:** If this bit is set to 0, the Host Controller shall clear the interrupt request to the System.
10	0x0 RW	**normalintrsts_enableregbit10:** If this bit is set to 0, the Host Controller shall clear the interrupt request to the System.
9	0x0 RW	**normalintrsts_enableregbit9:** If this bit is set to 0, the Host Controller shall clear the interrupt request to the System.
8	0x0 RW	**sdhcregset_cardintstsena:** If this bit is set to 0, the HC shall clear Interrupt request to the System. The Card Interrupt detection is stopped when this bit is cleared and restarted when this bit is set to 1.
7	0x0 RW	**sdhcregset_cardremstsena:** This status is set if the Card Inserted in the Present State register changes from 1 to 0.
6	0x0 RW	**sdhcregset_cardinsstsena:** This status is set if the Card Inserted in the Present State register changes from 0 to 1.
5	0x0 RW	**normalintrsts_enableregbit5:** This status is set if the Buffer Read Enable changes from 0 to 1.
4	0x0 RW	**normalintrsts_enableregbit4:** This status is set if the Buffer Write Enable changes from 0 to 1.
3	0x0 RW	**normalintrsts_enableregbit3:** This status is set if the HC detects the Host DMA Buffer Boundary in the Block Size regiser.
2	0x0 RW	**normalintrsts_enableregbit2:** If the Stop At Block Gap Request in the BlockGap Control Register is set, this bit is set.
1	0x0 RW	**normalintrsts_enableregbit1:** This bit is set when a read / write transaction is completed.
0	0x0 RW	**normalintrsts_enableregbit0:** This bit is set when we get the end bit of the command response.

55.2.26 Error Interrupt Status Enable Register (ERRORINTRSTSENA)—Offset 36h

This register is used to enable the Error Interrupt Status register fields

Type: Memory Mapped I/O Register (Size: 16 bits)

Default: 0000h

BAR and Offset: [BAR or BAR1] + 36h

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
15:13	0x0 RO	**RSVD0:** Reserved
12	0x0 RO	**errorintrsts_enableregbit12:** Occurs when detecting ERROR in m_hresp(dma transaction)
11	0x0 RO	**RSVD1:** Reserved
10	0x0 RW	**errorintrsts_enableregbit10:** This status is set if INT_B is enabled and INT_B# pin is in low level. It is cleared by resetting
9	0x0 RW	**errorintrsts_enableregbit9:** This bit is set when the Host Controller detects errors during ADMA based data transfer.
8	0x0 RW	**errorintrsts_enableregbit8:** This bit is set when detecting that one of the bits D00-D04 in Auto CMD Error Status register has changed from 0 to 1.
7	0x0 RW	**errorintrsts_enableregbit7:** If this bit is 1, it means that the HC is not supplying power to SD card due to some failure. Reading 0 means that the HC is supplying power and no error has occurred.
6	0x0 RW	**errorintrsts_enableregbit6:** Occurs when detecting 0 at the end bit position of read data which uses the DAT line or the end bit position of the CRC status.
5	0x0 RW	**errorintrsts_enableregbit5:** Occurs when detecting CRC error when transferring read data which uses the DAT line or when detecting the Write CRC Status having a value of other than 010.
4	0x0 RW	**errorintrsts_enableregbit4:** This status is set if Data Timeout error occurs.
3	0x0 RW	**errorintrsts_enableregbit3:** Occurs if a Command Index error occurs in the Command Response.
2	0x0 RW	**errorintrsts_enableregbit2:** Occurs when detecting that the end bit of a command response is 0.
1	0x0 RW	**errorintrsts_enableregbit1:** This bit is set when Command CRC Error is generated.
0	0x0 RW	**errorintrsts_enableregbit0:** This bit is set if no response is returned within 64 SDCLK cycles from the end bit of the command.

55.2.27 Normal Interrupt Signal Enable Register (NORMALINTRSIGENA)—Offset 38h

This register is used to enable the Normal Interrupt Signal register.

Type: Memory Mapped I/O Register (Size: 16 bits)

Default: 0000h

BAR and Offset: [BAR or BAR1] + 38h

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RO	**normalintrsts_enableregbit15:** The HD shall control error Interrupts using the Error Interrupt Signal Enable register.
14	0x0 RW	**normalintrsts_enableregbit14:** Boot Terminate Interrupt Signal Enable
13	0x0 RW	**normalintrsts_enableregbit13:** Boot ack rcv Signal Enable
12	0x0 RW	**normalintrsts_enableregbit12:** Re-Tuning Event Signal Enable
11	0x0 RW	**normalintrsts_enableregbit11:** INT_C Signal Enable
10	0x0 RW	**normalintrsts_enableregbit10:** INT_B Signal Enable
9	0x0 RW	**normalintrsts_enableregbit9:** INT_A Signal Enable
8	0x0 RW	**sdhcregset_cardintstsena:** Card Interrupt Signal Enable
7	0x0 RW	**sdhcregset_cardremstsena:** Card Removal Signal Enable
6	0x0 RW	**sdhcregset_cardinsstsena:** Card Insertion Signal Enable
5	0x0 RW	**normalintrsts_enableregbit5:** Buffer Read Ready Signal Enable
4	0x0 RW	**normalintrsts_enableregbit4:** Buffer Write Ready Signal Enable
3	0x0 RW	**normalintrsts_enableregbit3:** DMA Interrupt Signal Enable
2	0x0 RW	**normalintrsts_enableregbit2:** Block Gap Event Signal Enable
1	0x0 RW	**normalintrsts_enableregbit1:** Transfer Complete Signal Enable
0	0x0 RW	**normalintrsts_enableregbit0:** Command Complete Signal Enable

55.2.28 Error Interrupt Signal Enable Register (ERRORINTRSIGENA)—Offset 3Ah

This register is used to enable Error Interrupt Signal register.

Type: Memory Mapped I/O Register (Size: 16 bits)

Default: 0000h

BAR and Offset: [BAR or BAR1] + 3Ah

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
15:13	0x0 RO	**RSVD0:** Reserved
12	0x0 RO	**errorintrsig_enableregbit12:** Target Response Error Signal Enable
11	0x0 RO	**RSVD1:** Reserved
10	0x0 RW	**errorintrsig_enableregbit10:** Tuning Error Signal Enable
9	0x0 RW	**errorintrsig_enableregbit9:** ADMA Error Signal Enable
8	0x0 RW	**errorintrsig_enableregbit8:** Auto CMD Error Signal Enable
7	0x0 RW	**errorintrsig_enableregbit7:** Current Limit Error Signal Enable
6	0x0 RW	**errorintrsig_enableregbit6:** Data End Bit Error Signal Enable
5	0x0 RW	**errorintrsig_enableregbit5:** Data CRC Error Signal Enable
4	0x0 RW	**errorintrsig_enableregbit4:** Data Timeout Error Signal Enable
3	0x0 RW	**errorintrsig_enableregbit3:** Command Index Error Signal Enable
2	0x0 RW	**errorintrsig_enableregbit2:** Command End Bit Error Signal Enable
1	0x0 RW	**errorintrsig_enableregbit1:** Command CRC Error Signal Enable
0	0x0 RW	**errorintrsig_enableregbit0:** Command Timeout Error Signal Enable

55.2.29 Auto CMD12 Error Status Register (AUTOCMDERRSTS)—Offset 3Ch

This register is used to indicate CMD12 response error of Auto CMD12 and CMD23 response error of Auto CMD 23.

Type: Memory Mapped I/O Register (Size: 16 bits)

Default: 0000h

BAR and Offset: [BAR or BAR1] + 3Ch

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x0 RO	**RSVD0:** Reserved
7	0x0 RO	**autocmderrsts_nexterror:** Setting this bit to 1 means CMD_wo_DAT is not executed due to an Auto CMD12 error(D04- D01) in this register. This bit is set to 0 when Auto CMD Error is generated by Auto CMD23
6:5	0x0 RO	**RSVD1:** Reserved
4	0x0 RO	**autocmderrsts_indexerror:** Occurs if the Command Index error occurs in response to a command.
3	0x0 RO	**autocmderrsts_endbiterror:** Occurs when detecting that the end bit of command response is 0.
2	0x0 RO	**autocmderrsts_crcerror:** Occurs when detecting a CRC error in the command response.
1	0x0 RO	**autocmderrsts_timeouterror:** Occurs if the no response is returned within 64 SDCLK cycles from the end bit of the command.
0	0x0 RO	**autocmderrsts_notexecerror:** Setting this bit to 1 means the HC cannot issue Auto CMD12 to stop memory multiple block transfer due to some error.

55.2.30 Host Control2 Register (HOSTCONTROL2)—Offset 3Eh

This register is used to program UHS Select Mode, UHS Select Mode, Driver Strength Select, Execute Tuning, Sampling Clock Select, Asynchronous Interrupt Enable and Preset value enable.

Type: Memory Mapped I/O Register (Size: 16 bits)

Default: 0000h

BAR and Offset: [BAR or BAR1] + 3Eh

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW	**hostctrl2_presetvalueenable:** This bit enables the functions defined in the Preset Value registers.
14	0x0 RW	**hostctrl2_asynchintrenable:** This bit can be set to 1 if a card support asynchronous interrupt and Asynchronous Interrupt Support is set to 1 in the Capabilities register.
13:10	0x0 RO	**RSVD0:** Reserved
9	0x0 RW	**hostctrl2_driverstrength_bit2:** This is the programmed Drive Strength output and Bit[2] of the sdhccore_drivestrength value.
8	0x0 RO	**RSVD1:** Reserved
7	0x0 RW	**hostctrl2_samplingclkselect:** This bit is set by tuning procedure when Execute Tuning is cleared.
6	0x0 RW	**hostctrl2_executetuning:** This bit is set to 1 to start tuning procedure and automatically cleared when tuning procedure is completed.
5:4	0x0 RW	**hostctrl2_driverstrength:** Host Controller output driver in 1.8V signaling is selected by this bit.
3	0x0 RW	**hostctrl2_1p8vsignallingena:** This bit controls voltage regulator for I/O cell.
2:0	0x0 RW	**hostctrl2_uhsmodeselect:** This field is used to select one of UHS-I modes and effective when 1.8V Signaling Enable is set to 1.

55.2.31 Capabilities Register (CAPABILITIES)—Offset 40h

This register provides the host driver with information specific to the host controller implementation.

Type: Memory Mapped I/O Register (Size: 64 bits)

Default: 80000007F76F64B2h

BAR and Offset: [BAR or BAR1] + 40h

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
63	0x1 RO	**corecfg_hs400support:** This field indicates whether HS400 is supported or not.
62:58	0x0 RO	**rsvd0:** Reserved Field
57	0x0 RO	**corecfg_spiblkmode:** This field indicates whether SPI Block Mode is supported or not.
56	0x0 RO	**corecfg_spisupport:** This field indicates whether SPI Mode is supported or not.
55:48	0x0 RO	**corecfg_clockmultiplier:** This field indicates clock multiplier value of programmable clock generator.
47:46	0x0 RO	**corecfg_retuningmodes:** This field defines the re-tuning capability of a Host Controller.
45	0x0 RO	**corecfg_tuningforsdr50:** If this bit is set to 1, this Host Controller requires tuning to operate SDR50.
44	0x0 RO	**rsvd1:** Reserved Field
43:40	0x0 RO	**corecfg_retuningtimercnt:** This field indicates an initial value of the Re-Tuning Timer for Re-Tuning Mode 1 to 3.
39	0x0 RO	**corecfg_type4support:** This bit indicates support of Type 4 Driver.
38	0x0 RO	**corecfg_ddriversupport:** This bit indicates support of Driver Type D for 1.8 Signaling.
37	0x0 RO	**corecfg_cdriversupport:** This bit indicates support of Driver Type C for 1.8 Signaling.
36	0x0 RO	**corecfg_adriversupport:** This bit indicates support of Driver Type A for 1.8 Signaling.
35	0x0 RO	**rsvd2:** Reserved Field
34	0x1 RO	**corecfg_ddr50support:** This bit indicates whether DDR50 is supported.
33	0x1 RO	**corecfg_sdr104support:** This bit indicates whether SDR104 is supported.SDR104 requires tuning.
32	0x1 RO	**corecfg_sdr50support:** This bit indicates whether SDR50 is supported.
31:30	0x3 RO	**corecfg_slottype:** This field indicates usage of a slot by a specific Host System
29	0x1 RO	**corecfg_asynchintrsupport:** Asynchronous Interrupt Support

Bit Range	Default & Access	Field Name (ID): Description
28	0x1 RO	**corecfg_64bitsupport:** This bit indicates whether the HC supports 64bit System Bus
27	0x0 RO	**rsvd3:** Reserved Field
26	0x1 RO	**corecfg_1p8voltsupport:** This bit indicates whether the HC supports 1.8V.
25	0x1 RO	**corecfg_3p0voltsupport:** This bit indicates whether the HC supports 3.0V.
24	0x1 RO	**corecfg_3p3voltsupport:** This bit indicates whether the HC supports 3.3V.
23	0x0 RO	**corecfg_suspressupport:** This bit indicates whether the HC supports Suspend/Resume functionality.
22	0x1 RO	**corecfg_sdmasupport:** This bit indicates whether the HC is capable of using DMA to transfer data between system memory and the HC directly.
21	0x1 RO	**corecfg_highspeedsupport:** This bit indicates whether the HC and the Host System support High Speed mode.
20	0x0 RO	**rsvd4:** Reserved Field
19	0x1 RO	**corecfg_adma2support:** '0'ADMA2 Not Supported
18	0x1 RO	**corecfg_8bitsupport:** This bit indicates whether the Host Controller is capable of using 8-bit bus width mode.
17:16	0x3 RO	**corecfg_maxblklength:** This value indicates the maximum block size that the HD can read and write to the buffer in the HC.
15:8	0x64 RO	**corecfg_baseclkfreq:** 6-bit Base Clock Frequency
7	0x1 RO	**corecfg_timeoutclkunit:** This bit shows the unit of base clock frequency used to detect Data Timeout Error.
6	0x0 RO	**rsvd5:** Reserved Field
5:0	0x32 RO	**corecfg_timeoutclkfreq:** This bit shows the base clock frequency used to detect Data Timeout Error.

55.2.32 Maximum Current Capabilities Register (MAXCURRENTCAP)—Offset 48h

This register indicates maximum current capability for each voltage.

Type: Memory Mapped I/O Register (Size: 64 bits)

Default: 0000000000000000h

BAR and Offset: [BAR or BAR1] + 48h

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
63:24	0x0 RO	**RSVD0:** Reserved
23:16	0x0 RO	**corecfg_maxcurrent1p8v:** Maximum Current for 1.8V
15:8	0x0 RO	**corecfg_maxcurrent3p0v:** Maximum Current for 3.0V
7:0	0x0 RO	**corecfg_maxcurrent3p3v:** Maximum Current for 3.3V

55.2.33 Force Event REGISTER for AUTO CMD Error Status (FORCEEVENTFORAUTOCMDERRORSTATUS)—Offset 50h

This register is not physically implemented, rather it is an address where Auto CMD Error Status register can be written.

Type: Memory Mapped I/O Register (Size: 16 bits)

Default: 0000h

BAR and Offset: [BAR or BAR1] + 50h

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x0 RO	**RSVD0:** Reserved
7	0x0 RO	**forcecmdnotissuedbyautocmd12err:** Force Event for Command Not Issued by AUTO CMD12 Error
6:5	0x0 RO	**RSVD1:** Reserved
4	0x0 RO	**forceautocmdindexerr:** Force Event for AUTO CMD Index Error
3	0x0 RO	**forceautocmdendbiterr:** Force Event for AUTO CMD End Bit Error
2	0x0 RO	**forceautocmdcrcerr:** Force Event for AUTO CMD Timeout Error
1	0x0 RO	**forceautocmdtimeouterr:** Force Event for AUTO CMD Timeout Error
0	0x0 RO	**forceautocmdnotexec:** Force Event for AUTO CMD12 Not Executed

55.2.34 Force Event Register for Error Interrupt Status (FORCEEVENTFORERRINTSTS)—Offset 52h

This register is not physically implemented, rather it is an address where Error Interrupt Status register can be written.

Type: Memory Mapped I/O Register (Size: 16 bits)

Default: 0000h

BAR and Offset: [BAR or BAR1] + 52h

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0x0 RO	**RSVD0:** Reserved
10	0x0 RO	**forcetuningerr:** Force Event for Tuning Error
9	0x0 RO	**forceadmaerr:** Force Event for ADMA Error • '0' no interrupt • '1' interrupt generated
8	0x0 RO	**forceautocmderr:** Force Event for Auto CMD Error • '0' no interrupt • '1' interrupt generated
7	0x0 RO	**forcecurrlimerr:** Force Event for Current Limit Error • '0' no interrupt • '1' interrupt generated
6	0x0 RO	**forcedatendbiterr:** Force Event for Data End Bit Error. • '0' no interrupt • '1' interrupt generated
5	0x0 RO	**forcedatcrcerr:** Force Event for Data CRC Error
4	0x0 RO	**forcedattimeouterr:** Force Event for Data Timeout Error • '0' no interrupt • '1' interrupt generated
3	0x0 RO	**forcecmdindexerr:** Force Event for Command Index Error
2	0x0 RO	**forcecmdendbiterr:** Force Event for Command End Bit Error • '0' no interrupt • '1' interrupt generated
1	0x0 RO	**forcecmdcrcerr:** Force Event for Command CRC Error
0	0x0 RO	**forcecmdtimeouterr:** Force Event for CMD Timeout Error • '0' No interrupt • '1' interrupt generated

55.2.35 ADMA Error Status Register (ADMAERRSTS)—Offset 54h

When the ADMA Error interrupt occurs, this register holds the ADMA State in ADMA Error States field and ADMA System Address holds address around the error descriptor.

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [BAR or BAR1] + 54h

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0x0 RO	**RSVD0:** Reserved
2	0x0 RO	**admaerrsts_admalenmismatcherr:** ADMA Length Mismatch Error
1:0	0x0 RO	**admaerrsts_admaerrorstate:** This field indicates the state of ADMA when error is occurred during ADMA data transfer.

55.2.36 ADMA System Address Register0&1 (ADMASYSADDR01)—Offset 58h

This register contains the physical address used for ADMA data transfer.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [BAR or BAR1] + 58h

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**adma_sysaddress0:** This register holds byte address of executing command of the Descriptor table.

55.2.37 ADMA System Address Register1 (ADMASYSADDR2)—Offset 5Ch

This register contains the physical address used for ADMA data transfer.

Type: Memory Mapped I/O Register (Size: 16 bits)

Default: 0000h

BAR and Offset: [BAR or BAR1] + 5Ch

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x0 RW	**adma_sysaddress2:** This register holds byte address of executing command of the Descriptor table.

55.2.38 ADMA System Address Register1 (ADMASYSADDR3)—Offset 5Eh

This register contains the physical address used for ADMA data transfer.

Type: Memory Mapped I/O Register (Size: 16 bits)

Default: 0000h

BAR and Offset: [BAR or BAR1] + 5Eh

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x0 RW	**adma_sysaddress3:** This register holds byte address of executing command of the Descriptor table.

55.2.39 Preset Value Register for Initialization (PRESETVALUE0)—Offset 60h

This register is used to read the SDCLK Frequency Select Value, Clock Generator Select Value, and Driver Strength Select Value.

Type: Memory Mapped I/O Register (Size: 16 bits)

Default: 0003h

BAR and Offset: [BAR or BAR1] + 60h

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
15:14	0x0 RO	**DriverStrengthSelectValue:** Driver Strength Select Value
13:11	0x0 RO	**RSVD0:** Reserved
10	0x0 RO	**ClockGeneratorSelectValue:** This bit is effective when Host Controller supports programmable clock
9:0	0x3 RO	**SDCLKFrequencySelectValue:** 10-bit preset value to set SDCLK Frequency Select in the Clock Control Register is described by a host system.

55.2.40 Preset Value Register for Default Speed (PRESETVALUE1)—Offset 62h

This register is used to read the SDCLK Frequency Select Value, Clock Generator Select Value, and Driver Strength Select Value for Default Speed.

Type: Memory Mapped I/O Register (Size: 16 bits)

Default: 0003h

BAR and Offset: [BAR or BAR1] + 62h

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
15:14	0x0 RO	**DriverStrengthSelectValue:** Driver Strength Select Value
13:11	0x0 RO	**RSVD0:** Reserved
10	0x0 RO	**ClockGeneratorSelectValue:** This bit is effective when Host Controller supports programmable clock
9:0	0x3 RO	**SDCLKFrequencySelectValue:** 10-bit preset value to set SDCLK Frequency Select in the Clock Control Register is described by a host system.

55.2.41 Preset Value Register for High Speed (PRESETVALUE2)—Offset 64h

This register is used to read the SDCLK Frequency Select Value, Clock Generator Select Value, and Driver Strength Select Value for High Speed.

Type: Memory Mapped I/O Register (Size: 16 bits)

Default: 0003h

BAR and Offset: [BAR or BAR1] + 64h

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
15:14	0x0 RO	**DriverStrengthSelectValue:** Driver Strength Select Value
13:11	0x0 RO	**RSVD0:** Reserved
10	0x0 RO	**ClockGeneratorSelectValue:** This bit is effective when Host Controller supports programmable clock
9:0	0x3 RO	**SDCLKFrequencySelectValue:** 10-bit preset value to set SDCLK Frequency Select in the Clock Control Register is described by a host system.

55.2.42 Preset Value Register for SDR12 (PRESETVALUE3)—Offset 66h

This register is used to read the SDCLK Frequency Select Value, Clock Generator Select Value, and Driver Strength Select Value for SDR12.

Type: Memory Mapped I/O Register (Size: 16 bits)

Default: 0003h

BAR and Offset: [BAR or BAR1] + 66h

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
15:14	0x0 RO	**DriverStrengthSelectValue:** Driver Strength Select Value
13:11	0x0 RO	**RSVD0:** Reserved
10	0x0 RO	**ClockGeneratorSelectValue:** This bit is effective when Host Controller supports programmable clock
9:0	0x3 RO	**SDCLKFrequencySelectValue:** 10-bit preset value to set SDCLK Frequency Select in the Clock Control Register is described by a host system.

55.2.43 Preset Value Register for SDR25 (PRESETVALUE4)—Offset 68h

This register is used to read the SDCLK Frequency Select Value, Clock Generator Select Value, and Driver Strength Select Value SDR25.

Type: Memory Mapped I/O Register (Size: 16 bits)

Default: 0002h

BAR and Offset: [BAR or BAR1] + 68h

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
15:14	0x0 RO	**DriverStrengthSelectValue:** Driver Strength Select Value
13:11	0x0 RO	**RSVD0:** Reserved
10	0x0 RO	**ClockGeneratorSelectValue:** This bit is effective when Host Controller supports programmable clock
9:0	0x2 RO	**SDCLKFrequencySelectValue:** 10-bit preset value to set SDCLK Frequency Select in the Clock Control Register is described by a host system.

55.2.44 Preset Value Register for SDR50 (PRESETVALUE5)—Offset 6Ah

This register is used to read the SDCLK Frequency Select Value, Clock Generator Select Value, and Driver Strength Select Value for SDR50.

Type: Memory Mapped I/O Register (Size: 16 bits)

Default: 0001h

BAR and Offset: [BAR or BAR1] + 6Ah

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
15:14	0x0 RO	**DriverStrengthSelectValue:** Driver Strength Select Value
13:11	0x0 RO	**RSVD0:** Reserved
10	0x0 RO	**ClockGeneratorSelectValue:** This bit is effective when Host Controller supports programmable clock
9:0	0x1 RO	**SDCLKFrequencySelectValue:** 10-bit preset value to set SDCLK Frequency Select in the Clock Control Register is described by a host system.

55.2.45 Preset Value Register for SDR104 (PRESETVALUE6)—Offset 6Ch

This register is used to read the SDCLK Frequency Select Value, Clock Generator Select Value, and Driver Strength Select Value for SDR 104.

Type: Memory Mapped I/O Register (Size: 16 bits)

Default: 0000h

BAR and Offset: [BAR or BAR1] + 6Ch

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
15:14	0x0 RO	**DriverStrengthSelectValue:** Driver Strength Select Value
13:11	0x0 RO	**RSVD0:** Reserved
10	0x0 RO	**ClockGeneratorSelectValue:** This bit is effective when Host Controller supports programmable clock
9:0	0x0 RO	**SDCLKFrequencySelectValue:** 10-bit preset value to set SDCLK Frequency Select in the Clock Control Register is described by a host system.

55.2.46 Preset Value Register for DDR50 (PRESETVALUE7)—Offset 6Eh

This register is used to read the SDCLK Frequency Select Value, Clock Generator Select Value, and Driver Strength Select Value for DDR50.

Type: Memory Mapped I/O Register (Size: 16 bits)

Default: 0002h

BAR and Offset: [BAR or BAR1] + 6Eh

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
15:14	0x0 RO	**DriverStrengthSelectValue:** Driver Strength Select Value
13:11	0x0 RO	**RSVD0:** Reserved
10	0x0 RO	**ClockGeneratorSelectValue:** This bit is effective when Host Controller supports programmable clock
9:0	0x2 RO	**SDCLKFrequencySelectValue:** 10-bit preset value to set SDCLK Frequency Select in the Clock Control Register is described by a host system.

55.2.47 Boot Timeout Control Register (BOOTTIMEOUTCNT)—Offset 70h

This is used to program the boot timeout value counter.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [BAR or BAR1] + 70h

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**boot_timeoutcnt:** This value determines the interval by which DAT line time-outs are detected during boot operation for eMMC4.4 card.

55.2.48 Preset Value Register for DDR50 (PRESETVALUE8)—Offset 74h

This register is used to read the SDCLK Frequency Select Value, Clock Generator Select Value, and Driver Strength Select Value for DDR50.

Type: Memory Mapped I/O Register (Size: 16 bits)

Default: 0000h

BAR and Offset: [BAR or BAR1] + 74h

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
15:14	0x0 RO	**DriverStrengthSelectValue:** Driver Strength Select Value
13:11	0x0 RO	**RSVD0:** Reserved
10	0x0 RO	**ClockGeneratorSelectValue:** This bit is effective when Host Controller supports programmable clock
9:0	0x0 RO	**SDCLKFrequencySelectValue:** 10-bit preset value to set SDCLK Frequency Select in the Clock Control Register is described by a host system.

55.2.49 Slot Interrupt Status Register (SLOTINTRSTS)—Offset FCh

This register is used to read the interrupt signal for each slot.

Type: Memory Mapped I/O Register (Size: 16 bits)

Default: 0000h

BAR and Offset: [BAR or BAR1] + FCh

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x0 RO	**RSVD0:** Reserved
7:0	0x0 RO	**sdhchostif_slotintrsts:** These status bits indicate the logical OR of Interrupt signal and Wakeup signal for each slot.

55.2.50 Host Controller Version Register (HOSTCONTROLLERVER)—Offset FEh

This register is used to read the vendor version number and specification version number.

Type: Memory Mapped I/O Register (Size: 16 bits)

Default: 1002h

BAR and Offset: [BAR or BAR1] + FEh

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x10 RO	**SDHC_VENVERNUM:** This status is reserved for the vendor version number.
7:0	0x2 RO	**SpecificationVersionNumber:** This status indicates the Host Controller Spec. Version. The upper and lower 4-bits indicate the version.

55.2.51 Software Latency Tolerance Reporting (SW_LTR_VAL)—Offset 804h

Sets the Software Latency Tolerance Reporting fields.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000800h

BAR and Offset: [BAR or BAR1] + 804h

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**Reserved (RSVD):** Reserved.
15	0x0 RW	**Snoop_Requirment:** If the Requirement (bit 15) is clear, that indicates that the device has no LTR requirement for this type of traffic (i.e. it can wait for service indefinitely). If the 10-bit latency value is zero it indicates that the device cannot tolerate any delay and needs the best possible service/response time.
14:13	0x0 RO	**Reserved (RSVD):** Reserved.
12:10	0x2 RW	**Snoop_latency_scale:** Support for codes 010 (1us) or 011 (32us) for Snoop Latency Scale (1us -) 32ms total span) only. Writes to this CSR which don't match those values will be dropped completely, next read will return previous value.
9:0	0x0 RW	**Snoop_value:** 10-bit latency value

55.2.52 Auto Latency Tolerance Reporting (AUTO_LTR_VAL)—Offset 808h

Sets the Auto Latency Tolerance Reporting fields.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000800h

BAR and Offset: [BAR or BAR1] + 808h

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**Reserved (RSVD):** Reserved.
15	0x0 RW	**Snoop_Requirment:** If the Requirement (bit 15) is clear, that indicates that the device has no LTR requirement for this type of traffic (i.e. it can wait for service indefinitely). If the 10-bit latency value is zero it indicates that the device cannot tolerate any delay and needs the best possible service/response time.
14:13	0x0 RO	**Reserved_low:** Reserved_low
12:10	0x2 RW	**Snoop_latency_scale:** Support for codes 010 (1us) or 011 (32us) for Snoop Latency Scale (1us -) 32ms total span) only. Writes to this CSR which don't match those values will be dropped completely, next read will return previous value.
9:0	0x0 RW	**Snoop_value:** 10-bit latency value

55.2.53 Capabilities Bypass Control Register (CAP_BYPS)—Offset 810h

Capabilities Bypass Control register.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [BAR or BAR1] + 810h

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**Reserved (RSVD):** Reserved.
7:0	0x0 RW	**Enable_Cap_Bypass:** 8h5A Enable Capabilities Bypass. All other Capabilities Bypass Disable (using default values).

55.2.54 eMMC Capabilities Bypass Register1 (CAP_BYPS_REG1)—Offset 814h

eMMC Capabilities Bypass register 1

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 3001EF3Ch

BAR and Offset: [BAR or BAR1] + 814h

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RO	**Reserved (RSVD):** Reserved.
29	0x1 RW	**hs400_support:** • 1: HS400 Mode Supported. • 0: HS400 Mode NOT Supported
28	0x1 RW	**timeout_clock_unit:** • 1b1 - to Select MHz Clock • 1b0 - to Select KHz Clock
27:22	0x200 RW	**timeout_clock_freq:** Timeout clock frequency
21	0x0 RW	**SPI_mode_support:** SPI Mode Support • 1b1 SPI Mode Supported • 1b0 SPI Mode Not Supported
20:17	0x0 RW	**timer_count:** Timer Count for Re-Tuning This is the Timer Count for Re-Tuning Timer for Re-Tuning Mode 1 to 3. Setting to 4b0 disables Re-Tuning Timer
16	0x1 RW	**tuning_for_SDR50:** Use Tuning for SDR50 • 1b1 Use Tuning • 1b0 Don’t use Tuning
15	0x1 RW	**ddr50_support:** • 1: DDR50 Mode Supported. • 0: DDR50 Mode NOT Supported
14	0x1 RW	**sdr104_support:** • 1: SDR104 Mode Supported. • 0: SDR104 Mode NOT Supported
13	0x1 RW	**sdr50_support:** • 1: SDR50 Mode Supported. • 0: SDR50 Mode NOT Supported
12:11	0x1 RW	**Slot_Type:** • 00 - Removable SD Card Slot. • 01 - Embedded Slot for One Device. • 10 - Shared Bus Slot. • 11 - Reserved
10	0x1 RW	**Async_Interrupt_Support:** • 1: Asynchronous Interrupt Supported. • 0: Asynchronous Interrupt NOT Supported
9	0x1 RW	**Sys_Addr_64bit_Support:** • 1 - Core supports 64-bit System Address Bus. • 0 - Core supports only 32-bit System Address Bus
8	0x1 RW	**Voltage_Support_1_8V:** • 1: 1.8V Supported. • 0: 1.8V NOT Supported

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RW	**Voltage_Support_3V:** • 1: 3.0V Supported. • 0: 3.0V NOT Supported
6	0x0 RW	**Voltage_Support_3_3V:** • 1: 3.3V Supported. • 0: 3.3V NOT Supported
5	0x1 RW	**Suspend_Resume_Support:** • 1: Suspend/Resume Supported. • 0: Suspend/Resume NOT Supported
4	0x1 RW	**SDMA_Support:** • 1: SDMA mode Supported. • 0: SDMA mode NOT Supported
3	0x1 RW	**High_Speed_Support:** • 1: HIGH_SPEED mode Supported. • 0: HIGH_SPEED mode NOT Supported
2	0x1 RW	**ADMA2_Support:** • 1: ADMA2 mode Supported. • 0: ADMA2 mode NOT Supported
1:0	0x0 RW	**Max_Burst_Length:** Maximum Block Length supported by the Core/Device. • 00: 512 (Bytes). • 01: 1024. • 10: 2048. • 11: Reserved

55.2.55 eMMC Capabilities Bypass Register2 (CAP_BYPS_REG2)—Offset 818h

eMMC Capabilities Bypass register 2

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 04004000h

BAR and Offset: [BAR or BAR1] + 818h

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0x0 RO	**Reserved (RSVD):** Reserved.
26:21	0x20 RW	**tuning_count_val:** Tuning Count Value Configures the Number of Taps (Phases) of the rxclk_in that is supported. The Tuning State machine uses this information to select one of the Taps (Phases) of the rxclk_in during the Tuning Procedure.
20	0x0 RW	**tuning_dis:** Disable the 1.5x Tuning count when calculating total tuning count. The internal tuning count will be set to the corecfg_Tuningcount when this signal is asserted
19	0x0 RW	**driver_type_4:** Driver Type 4 Support • 1b1 Supported • 1b0 NOT Supported
18	0x0 RW	**driver_type_D:** Driver Type D Support • 1b1 Supported • 1b0 NOT Supported
17	0x0 RW	**driver_type_C:** Driver Type C Support • 1b1 Supported • 1b0 NOT Supported
16	0x0 RW	**driver_type_A:** Driver Type A Support • 1b1 Supported • 1b0 NOT Supported
15	0x0 RO	**Reserved (RSVD):** Reserved.
14	0x1 RW	**support_8_bit_embedded:** 8-bit Support for Embedded Device • 1b1 Supported • 1b0 NOT Supported
13:8	0x0 RO	**Reserved (RSVD):** Reserved.
7:0	0x0 RW	**base_sd_clock:** Base Clock Frequency for SD Clock

55.2.56 D0i3 Control Register (REG_D0i3)—Offset 81Ch

D0i3 Control register

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000008h

BAR and Offset: [BAR or BAR1] + 81Ch

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0x0 RO	**Reserved (RSVD):** Reserved.
4	0x0 RO	**Reserved (RSVD):** Reserved.
3	0x1 RW/1C	**RestoreRequired:** When set (by HW), SW must restore state to the IP. The state may have been lost due to a reset or full power lost. SW clears the bit by writing a 1. This bit will be set on initial power up.
2	0x0 RW	**D0i3:** SW sets this bit to 1 to move the IP into the D0i3 state. Writing this bit to 0 will return the IP to the fully active D0 state (D0i0).
1	0x0 RO	**Interrupt_Request:** SW sets this bit to 1 to ask for an interrupt to be generated on completion of the command. SW must clear or set this on each write to this register. Not supported in SCS!
0	0x0 RO	**Cmd_In_Progress:** HW sets this bit on a 1-)0 or 0-)1 transition of bit [2]. While set, the other bits in this register are not valid and it is illegal for SW to write to any bit in this register. When clear all the other bits in the register are valid and SW may write to any bit. If Interrupt Request bit [1] was set for the current command, HW may clear this bit before the interrupt has been made visible to SW, since when SW actually handles

55.2.57 Front End Module Tx Command Path Delay Register (Tx_CMD_DLY)—Offset 820h

Front end module Tx Command Path Delay register

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000400h

BAR and Offset: [BAR or BAR1] + 820h

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0x0 RO	**Reserved (RSVD):** Reserved.
14:8	0x4 RW	**ddr_mode:** Tx CMD Delay (DDR Mode). 0 39 Select number of active delay elements. Each = 125pSec. 40 127 Reserved
7	0x0 RO	**Reserved (RSVD):** Reserved.
6:0	0x0 RW	**sdr_mode:** Tx CMD Delay (SDR Mode). 0 39 Select number of active delay elements. Each = 125pSec. 40 127 - Reserved

55.2.58 Front End Module Tx Data Path Delay Register1 (Tx_DATA_DLY_1)—Offset 824h

Front end module Tx data Path Delay register 1

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000A18h

BAR and Offset: [BAR or BAR1] + 824h

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0x0 RO	**Reserved (RSVD):** Reserved.
14:8	0xa RW	**hs400_mode:** Tx Data Delay (HS400 Mode). • 0-78 - Select number of active delay elements. Each = 125pSec. • 79-127 - Reserved
7	0x0 RO	**Reserved (RSVD):** Reserved.
6:0	0x18 RW	**sdr104_hs200:** Tx Data Delay (SDR104/HS200 Mode) • 0-79 - Select the required delay, as a multiple of 125pSec. • 80-127 - Reserved

55.2.59 Front End Module Tx Data Path Delay Register2 (Tx_DATA_DLY_2)—Offset 828h

Front end module Tx data Path Delay register 2

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 1C1C1C00h

BAR and Offset: [BAR or BAR1] + 828h

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**Reserved (RSVD):** Reserved.
30:24	0x1c RW	**sdr50_mode:** Tx Data Delay (SDR50 Mode) • 0-79 - Select the required delay, as a multiple of 125pSec. • 80-127 - Reserved
23	0x0 RO	**Reserved (RSVD):** Reserved.
22:16	0x1c RW	**ddr50_mode:** Tx Data Delay (DDR50 Mode). • 0-78 - Select number of active delay elements. Each = 125pSec. • 79-127 - Reserved
15	0x0 RO	**Reserved (RSVD):** Reserved.
14:8	0x1c RW	**sdr25_hs50_mode:** Tx Data Delay (SDR25/HS50 Mode • 0-79 - Select the required delay, as a multiple of 125pSec. • 80-127 - Reserved
7	0x0 RO	**Reserved (RSVD):** Reserved.
6:0	0x0 RW	**sdr12_comp_mode:** Tx Data Delay (SDR12/Compatibility Mode) • 0-79 - Select the required delay, as a multiple of 125pSec. • 80-127 - Reserved

55.2.60 Front End Module Rx Data Path Delay Register1 (Rx_CMD_DATA_DLY_1)—Offset 82Ch

Front end module Rx data Path Delay register 1

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [BAR or BAR1] + 82Ch

Default: 00000000h

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**Reserved (RSVD):** Reserved.
30:24	0x0 RW	**sdr50_mode:** Rx CMD + Data Delay (SDR50 Mode). • 0-79 - Select the required delay, as a multiple of 125pSec. • 80-127 - Reserved
23	0x0 RO	**Reserved (RSVD):** Reserved.
22:16	0x0 RW	**ddr50_mode:** Rx CMD + Data Delay (DDR50 Mode). • 0-78 - Select number of active delay elements. Each = 125pSec. • 79-127 - Reserved
15	0x0 RO	**Reserved (RSVD):** Reserved.
14:8	0x0 RW	**sdr25_hs50:** Rx CMD + Data Delay (SDR25/HS50 Mode) • 0-79 - Select the required delay, as a multiple of 125pSec. • 80-127 - Reserved
7	0x0 RO	**Reserved (RSVD):** Reserved.
6:0	0x0 RW	**sdr12_comp:** Rx CMD + Data Delay (SDR12/Compatibility Mode) • 0-79 - Select the required delay, as a multiple of 125pSec. • 80-127 - Reserved

55.2.61 Front End Module Rx Strobe Path Delay Register (Rx_STROBE_CTRL_PATH)—Offset 830h

Front end module Rx strobe Path Delay register

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [BAR or BAR1] + 830h

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0x0 RO	**Reserved (RSVD):** Reserved.
16	0x0 RW	**auto_tuning:** Enable Auto Tuning for HS400 Strobe Path • 0 Auto Tuning Disabled • 1 Auto Tuning Enabled
15	0x0 RO	**Reserved (RSVD):** Reserved.
14:8	0x0 RW	**hs400_mode1:** Rx Strobe Delay DLL 1(HS400 Mode) • 0-39 - Select number of active delay elements. Each = 125pSec • 40-63 - Reserved
7	0x0 RO	**Reserved (RSVD):** Reserved.
6:0	0x0 RW	**hs400_mode2:** Rx Strobe Delay DLL 2(HS400 Mode) • 0-39 - Select number of active delay elements. Each = 125pSec • 40-63 - Reserved

55.2.62 Front End Module Rx Data Path Delay Register2 (Rx_CMD_DATA_DLY_2)—Offset 834h

Front end module Rx data Path Delay register 2

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [BAR or BAR1] + 834h

Default: 00000000h

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0x0 RO	**Reserved (RSVD):** Reserved.
17:16	0x0 RW	**clk_source:** Clock Source for Rx Path • 00 - Rx Clock after Output Buffer • 01 - Rx Clock before Output Buffer • 10 - Automatic Selection based on Working mode (HS 200 before buffer, all others after buffer) • 11 - Reserved
15:14	0x0 RO	**Reserved (RSVD):** Reserved.
13:8	0x0 RW	**path_pll:** Rx Path PLL #3 Delay value For Auto Tuning Mode • 0-39 - Select the required delay, as a multiple of 125pSec. • 40-63 - Reserved
7	0x0 RO	**Reserved (RSVD):** Reserved.
6:0	0x0 RW	**cmd_data_sdr104_hs200:** Rx CMD + Data Delay (SDR104/HS200 Mode) • 0-79 - Select the required delay, as a multiple of 125pSec. • 80-127 - Reserved

55.2.63 Master DLL Software Control Register (MASTER_DLL)—Offset 838h

Master DLL Software control register

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000001h

BAR and Offset: [BAR or BAR1] + 838h

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0x0 RO	**Reserved (RSVD):** Reserved.
24	0x0 RW	**SW_reset_dll:** SW reset for Master DLL • 0 No SW Reset for Master DLL • 1 Force Reset for Master DLL
23	0x0 RO/V	**DLL_lock:** Master DLL Lock Indication
22:8	0x0 RW	**coarse_code:** Set coarse code to DLL. (only valid when Software control is Enabled)
7:4	0x0 RW	**fine_code:** Set fine code to DLL. (only valid when Software control is Enabled)
3	0x0 RO/V	**less:** Phase Detection Less Indication
2	0x0 RO/V	**more:** Phase Detector More Indication
1	0x0 RW	**Master_DLL_Software_Ctrl:** Master DLL Software Ctrl. • 0 Master DLL Automatic Control (SW Control Disabled). • 1 Master DLL Software Control Enabled
0	0x1 RW	**Ctrl_of_Mst_DLL_Ref_Clk:** Ctrl of Master DLL Ref Clock. • 0 - Clock is Disabled. • 1 - Clock is Enabled

55.2.64 Auto Tuning Value (AUTO_TUNING)—Offset 840h

Auto Tuning Value

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [BAR or BAR1] + 840h

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0x0 RO	**Reserved (RSVD):** Reserved.
4:0	0x0 RO/V	**Auto_tuning_val:** Reserved.

55.2.65 Root Space Select (eMMC_ROOT_SPACE)—Offset 900h

Root space select to indicate which root space the IP will output its upstream accesses

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [BAR or BAR1] + 900h

BAR or BAR1 Type: PCI Configuration Register (Size: 64 bits)
BAR or BAR1 Reference: [B:0, D:28, F:0] + 10h or 18h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0x0 RO	**Reserved (RSVD):** Reserved.
0	0x0 RO	**root_space:** Root Space Select Selects the Root Space in which the IP output its upstream accesses • 0 Root Space 0 • 1 Root Space 1

§ §

56 LPC Controller - B0, D31, F0

56.1 Introduction and Index

The host-accessible registers for the LPC Controller are described here.

To determine the number of devices/functions available refer to the following:

- Table 1-1, "Features by product SKU - Server and Cloud Storage SKUs 0 through 4"
- Table 1-2, "Features by Product SKU - Network and Enterprise Storage SKUs 5 through 10"
- Table 1-3, "Features by Product SKU - Extended Temperature SKUs 11 through 14".

The legend for the register access codes are described in Chapter 43, "Introduction."

56.1.1 Host Configuration Space

These registers are discovered in Host Configuration Space starting at Bus 0, Device 31 (decimal), Function 0. The offset addresses are listed.

Table 56-1. Summary of PCI Configuration Registers—0/31/0

Offset (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
80	2	0000	"I/O Decode Ranges (IOD)—Offset 80h" on page 2645
82	2	0000	"I/O Enables (IOE)—Offset 82h" on page 2646
84	4	00000000	"LPC Generic I/O Range #1 (LGIR1)—Offset 84h" on page 2647
88	4	00000000	"LPC Generic I/O Range #2 (LGIR2)—Offset 88h" on page 2648
8C	4	00000000	"LPC Generic I/O Range #3 (LGIR3)—Offset 8Ch" on page 2649

56.2 Registers in Configuration Space

56.2.1 I/O Decode Ranges (IOD)—Offset 80h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:31, F:0] + 80h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:13	0x0 RO	**Reserved (RSVD):** Reserved.
12	0x0 RW	**FDD Range (FDD):** The following table describes which range to decode for the FDD Port: Bits Decode Range • 0 3F0h - 3F5h, 3F7h (Primary). • 1 370h - 375h, 377h (Secondary).
11:10	0x0 RO	**Reserved (RSVD_1):** Reserved.
9:8	0x0 RW	**LPT Range (LPT):** The following table describes which range to decode for the LPT Port: Bits Decode Range • 00 378h - 37Fh and 778h - 77Fh. • 01 278h - 27Fh (port 279h is read only) and 678h - 67Fh. • 10 3BCh - 3BEh and 7BCh - 7BEh. • 11 Reserved.
7	0x0 RO	**Reserved (RSVD_2):** Reserved.
6:4	0x0 RW	**ComB Range (CB):** The following table describes which range to decode for the COMB Port: Bits Decode Range • 000 3F8h - 3FFh (COM 1) • 001 2F8h - 2FFh (COM 2) • 010 220h - 227h • 011 228h - 22Fh • 100 238h - 23Fh • 101 2E8h - 2EFh (COM 4) • 110 338h - 33Fh • 111 3E8h - 3EFh (COM 3)
3	0x0 RO	**Reserved (RSVD_3):** Reserved.
2:0	0x0 RW	**ComA Range (CA):** The following table describes which range to decode for the COMA Port: Bits Decode Range • 000 3F8h - 3FFh (COM 1) • 001 2F8h - 2FFh (COM 2) • 010 220h - 227h • 011 228h - 22Fh • 100 238h - 23Fh • 101 2E8h - 2EFh (COM 4) • 110 338h - 33Fh • 111 3E8h - 3EFh (COM 3)

56.2.2 I/O Enables (IOE)—Offset 82h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:31, F:0] + 82h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:14	0x0 RO	**Reserved (RSVD):** Reserved.
13	0x0 RW	**Microcontroller Enable #2 (ME2):** Enables decoding of I/O locations 4Eh and 4Fh to LPC.
12	0x0 RW	**SuperI/O Enable (SE):** Enables decoding of I/O locations 2Eh and 2Fh to LPC.
11	0x0 RW	**Microcontroller Enable #1 (ME1):** Enables decoding of I/O locations 62h and 66h to LPC.
10	0x0 RW	**Keyboard Enable (KE):** Enables decoding of the keyboard I/O locations 60h and 64h to LPC.
9	0x0 RW	**High Gameport Enable (HGE):** Enables decoding of the I/O locations 208h to 20Fh to LPC.
8	0x0 RW	**Low Gameport Enable (LGE):** Enables decoding of the I/O locations 200h to 207h to LPC. **Power Well:** Core
7:4	0x0 RO	**Reserved (RSVD_1):** Reserved.
3	0x0 RW	**Floppy Drive Enable (FDE):** Enables decoding of the FDD range to LPC. Range is selected by IOD.FDE
2	0x0 RW	**Parallel Port Enable (PPE):** Enables decoding of the LPT range to LPC. Range is selected by IOD.LPT.
1	0x0 RW	**Com Port B Enable (CBE):** Enables decoding of the COMB range to LPC. Range is selected IOD.CB.
0	0x0 RW	**Com Port A Enable (CAE):** Enables decoding of the COMA range to LPC. Range is selected IOD.CA.

56.2.3 LPC Generic I/O Range #1 (LGIR1)—Offset 84h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:0] + 84h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**Reserved (RSVD):** Reserved.
23:18	0x0 RW	**Address [7:2] Mask (Address_7_2_Mask):** A 1 in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match. The corresponding bit in the Address field, below, is ignored. The mask is only provided for the lower 6 bits of the DWord address, allowing for decoding blocks up to 256 bytes in size.
17:16	0x0 RO	**Reserved (RSVD_1):** Reserved.
15:2	0x0 RW	**Address [15:2] (Address_15_2):** DWord-aligned address. ***Note:*** The SoC does not provide decode down to the word or byte level.
1	0x0 RO	**Reserved (RSVD_2):** Reserved.
0	0x0 RW	**LPC Decode Enable (LPC_Decode_Enable):** When this bit is set to 1, then the range specified in this register is enabled for decoding to LPC.

56.2.4 LPC Generic I/O Range #2 (LGIR2)—Offset 88h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:0] + 88h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**Reserved (RSVD):** Reserved.
23:18	0x0 RW	**Address [7:2] Mask (Address_7_2_Mask):** A 1 in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match. The corresponding bit in the Address field, below, is ignored. The mask is only provided for the lower 6 bits of the DWord address, allowing for decoding blocks up to 256 bytes in size.
17:16	0x0 RO	**Reserved (RSVD_1):** Reserved.
15:2	0x0 RW	**Address [15:2] (Address_15_2):** DWord-aligned address. ***Note:*** The SoC does not provide decode down to the word or byte level.
1	0x0 RO	**Reserved (RSVD_2):** Reserved.
0	0x0 RW	**LPC Decode Enable (LPC_Decode_Enable):** When this bit is set to 1, then the range specified in this register is enabled for decoding to LPC.

56.2.5 LPC Generic I/O Range #3 (LGIR3)—Offset 8Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:0] + 8Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**Reserved (RSVD):** Reserved.
23:18	0x0 RW	**Address [7:2] Mask (Address_7_2_Mask):** A 1 in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match. The corresponding bit in the Address field, below, is ignored. The mask is only provided for the lower 6 bits of the DWord address, allowing for decoding blocks up to 256 bytes in size.
17:16	0x0 RO	**Reserved (RSVD_1):** Reserved. **Power Well:** Core
15:2	0x0 RW	**Address [15:2] (Address_15_2):** DWord-aligned address. ***Note:*** The SoC does not provide decode down to the word or byte level.
1	0x0 RO	**Reserved (RSVD_2):** Reserved.
0	0x0 RW	**LPC Decode Enable (LPC_Decode_Enable):** When this bit is set to 1, then the range specified in this register is enabled for decoding to LPC.

56.2.6 LPC Generic I/O Range #4 (LGIR4)—Offset 90h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:0] + 90h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**Reserved (RSVD):** Reserved.
23:18	0x0 RW	**Address [7:2] Mask (Address_7_2_Mask):** A 1 in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match. The corresponding bit in the Address field, below, is ignored. The mask is only provided for the lower 6 bits of the DWord address, allowing for decoding blocks up to 256 bytes in size.
17:16	0x0 RO	**Reserved (RSVD_1):** Reserved.
15:2	0x0 RW	**Address [15:2] (Address_15_2):** DWord-aligned address. ***Note:*** The SoC does not provide decode down to the word or byte level.
1	0x0 RO	**Reserved (RSVD_2):** Reserved.
0	0x0 RW	**LPC Decode Enable (LPC_Decode_Enable):** When this bit is set to 1, then the range specified in this register is enabled for decoding to LPC.

56.2.7 USB Legacy Keyboard/Mouse Control (ULKMC)—Offset 94h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:0] + 94h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**Reserved (RSVD):** Reserved.
15	0x0 RW/1C	**SMI Caused by End of Pass-through (SMIBYENDPS):** Indicates if the event occurred. ***Note:*** Even if the corresponding enable bit is not set in the Bit 7, then this bit will still be active. It is up to the SMM code to use the enable bit to determine the exact cause of the SMI#. Writing a 1 to this bit will clear the latch.
14	0x0 RO	**Reserved (RSVD_1):** Reserved.
13	0x0 RW	**Reserved (RSVD_2):** Reserved.
12	0x0 RO	**Reserved (RSVD_3):** Reserved.
11	0x0 RW/1C	**SMI Caused by Port 64 Write (TRAPBY64W):** Indicates if the event occurred. ***Note:*** Even if the corresponding enable bit is not set in the Bit 3, then this bit will still be active. It is up to the SMM code to use the enable bit to determine the exact cause of the SMI#. Writing a 1 to this bit will clear the latch. ***Note:*** The A20Gate Pass-Through Logic allows specific port 64h Writes to complete without setting this bit.
10	0x0 RW/1C	**SMI Caused by Port 64 Read (TRAPBY64R):** Indicates if the event occurred. ***Note:*** Even if the corresponding enable bit is not set in the Bit 2, then this bit will still be active. It is up to the SMM code to use the enable bit to determine the exact cause of the SMI#. Writing a 1 to this bit will clear the latch.
9	0x0 RW/1C	**SMI Caused by Port 60 Write (TRAPBY60W):** Indicates if the event occurred. ***Note:*** Even if the corresponding enable bit is not set in the Bit 1, then this bit will still be active. It is up to the SMM code to use the enable bit to determine the exact cause of the SMI#. Writing a 1 to this bit will clear the latch. ***Note:*** The A20Gate Pass-Through Logic allows specific port 60h Writes to complete without setting this bit.
8	0x0 RW/1C	**SMI Caused by Port 60 Read (TRAPBY60R):** Indicates if the event occurred. ***Note:*** Even if the corresponding enable bit is not set in the Bit 0, then this bit will still be active. It is up to the SMM code to use the enable bit to determine the exact cause of the SMI#. Writing a 1 to this bit will clear the latch.
7	0x0 RW	**SMI at End of Pass-through Enable (SMIATENDPS):** May need to cause SMI at the end of a pass-through. Can occur if an SMI is generated in the middle of a pass through, and needs to be serviced later.
6	0x0 RO	**Pass Through State (PSTATE):** This read-only bit indicates that the state machine is in the middle of an A20GATE pass-through sequence. If software needs to reset this bit, it should set Bit 5 0.
5	0x0 RW	**A20Gate Pass-Through Enable (A20PASSEN):** When enabled, allows A20GATE sequence Pass-Through function (see details below in Section 20.14). When enabled, a specific cycle sequence involving writes to port 60h and port 64h does not result in the setting of the SMI status bits.SMI# will not be generated, even if the various enable bits are set.

Bit Range	Default & Access	Field Name (ID): Description
4	0x0 RW	**Reserved (RSVD_4):** Reserved.
3	0x0 RW	**SMI on Port 64 Writes Enable (s64WEN):** When set, a 1 in bit 11 will cause an SMI event.
2	0x0 RW	**SMI on Port 64 Reads Enable (s64REN):** When set, a 1 in bit 10 will cause an SMI event.
1	0x0 RW	**SMI on Port 60 Writes Enable (s60WEN):** When set, a 1 in bit 9 will cause an SMI event.
0	0x0 RW	**SMI on Port 60 Reads Enable (s60REN):** When set, a 1 in bit 8 will cause an SMI event.

56.2.8 LPC Generic Memory Range (LGMR)—Offset 98h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:0] + 98h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**Memory Address [31:16] (MA_31_16):** This field specifies a 64KB memory block anywhere in the 4GB memory space that will be decoded to LPC as standard LPC Memory Cycle if enabled.
15:1	0x0 RO	**Reserved (RSVD):** Reserved.
0	0x0 RW	**LPC Memory Range Decode Enable (LMRD_En):** When this bit is set to 1, then the range specified in this register is enabled for decoding to LPC.

56.2.9 FWH ID Select #1 (FS1)—Offset D0h

This register contains the IDSEL fields the LPC Bridge uses for memory cycles going to the FWH.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:0] + D0h

Default: 00112233h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RO	**F8-FF IDSEL (IF8):** IDSEL to use in FWH cycle for range enabled by BDE.EF8.
27:24	0x0 RW	**F0-F7 IDSEL (IF0):** IDSEL to use in FWH cycle for range enabled by BDE.EF0.
23:20	0x1 RW	**E8-EF IDSEL (IE8):** IDSEL to use in FWH cycle for range enabled by BDE.EE8.
19:16	0x1 RW	**E0-E7 IDSEL (IE0):** IDSEL to use in FWH cycle for range enabled by BDE.EE0.
15:12	0x2 RW	**D8-DF IDSEL (ID8):** IDSEL to use in FWH cycle for range enabled by BDE.ED8.
11:8	0x2 RW	**D0-D7 IDSEL (ID0):** IDSEL to use in FWH cycle for range enabled by BDE.ED0.
7:4	0x3 RW	**C8-CF IDSEL (IC8):** IDSEL to use in FWH cycle for range enabled by BDE.EC8.
3:0	0x3 RW	**C0-C7 IDSEL (IC0):** IDSEL to use in FWH cycle for range enabled by BDE.EC0.

56.2.10 FWH ID Select #2 (FS2)—Offset D4h

This register contains the additional IDSEL fields the LPC Bridge uses for memory cycles going to the FWH.

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:31, F:0] + D4h

Default: 4567h

Bit Range	Default & Access	Field Name (ID): Description
15:12	0x4 RW	**70-7F IDSEL (I70):** IDSEL to use in FWH cycle for range enabled by BDE.E70.
11:8	0x5 RW	**60-6F IDSEL (I60):** IDSEL to use in FWH cycle for range enabled by BDE.E60.
7:4	0x6 RW	**50-5F IDSEL (I50):** IDSEL to use in FWH cycle for range enabled by BDE.E50.
3:0	0x7 RW	**40-4F IDSEL (I40):** IDSEL to use in FWH cycle for range enabled by BDE.E40.

56.2.11 BIOS Decode Enable (BDE)—Offset D8h

Note that this register effects the BIOS decode regardless of whether the BIOS is resident on LPC or SPI. The concept of Feature Space does not apply to SPI-based flash. The SoC simply decodes these ranges as memory accesses when enabled for the SPI flash interface.

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:31, F:0] + D8h

Default: FFCFh

Bit Range	Default & Access	Field Name (ID): Description
15	0x1 RO	**F8-FF Enable (EF8):** Enables decoding of 512K of the following BIOS range: • Data space: FFF80000h - FFFFFFFFh. • Feature space: FFB80000h - FFBFFFFFh.
14	0x1 RW	**F0-F8 Enable (EF0):** Enables decoding of 512K of the following BIOS range: • Data space: FFF00000h - FFF7FFFFh. • Feature space: FFB00000h - FFB7FFFFh.
13	0x1 RW	**E8-EF Enable (EE8):** Enables decoding of 512K of the following BIOS range: • Data space: FFE80000h - FFEFFFFFh. • Feature space: FFA80000h - FFAFFFFFh.
12	0x1 RW	**E0-E8 Enable (EE0):** Enables decoding of 512K of the following BIOS range: • Data space: FFE00000h - FFE7FFFFh. • Feature Space: FFA00000h - FFA7FFFFh.
11	0x1 RW	**D8-DF Enable (ED8):** Enables decoding of 512K of the following BIOS range: • Data space: FFD80000h - FFDFFFFFh. • Feature space: FF980000h - FF9FFFFFh.
10	0x1 RW	**D0-D7 Enable (ED0):** Enables decoding of 512K of the following BIOS range: • Data space: FFD00000h - FFD7FFFFh. • Feature space: FF900000h - FF97FFFFh.
9	0x1 RW	**C8-CF Enable (EC8):** Enables decoding of 512K of the following BIOS range: • Data space: FFC80000h - FFCFFFFFh. • Feature space: FF880000h - FF8FFFFFh.
8	0x1 RW	**C0-C7 Enable (EC0):** Enables decoding of 512K of the following BIOS range: • Data space: FFC00000h - FFC7FFFFh. • Feature space: FF800000h - FF87FFFFh.
7	0x1 RW	**Legacy F Segment Enable (LFE):** This enables the decoding of the legacy 64KB range at F0000h - FFFFFh. ***Note:*** Decode for the BIOS legacy F segment is enabled by the LFE bit only, it is not affected by the GEN_PMCON_1.iA64_EN bit.
6	0x1 RW	**Legacy E Segment Enable (LEE):** This enables the decoding of the legacy 64KB range at E0000h - EFFFFh. ***Note:*** Decode for the BIOS legacy E segment is enabled by the LEE bit only, it is not affected by the GEN_PMCON_1.iA64_EN bit.
5:4	0x0 RO	**Reserved (RSVD):** Reserved.
3	0x1 RW	**70-7F Enable (E70):** Enables decoding of 1MB of the following BIOS range: • Data space: FF700000h - FF7FFFFFh. • Feature space: FF300000h - FF3FFFFFh.
2	0x1 RW	**60-6F Enable (E60):** Enables decoding of 1MB of the following BIOS range: • Data space: FF600000h - FF6FFFFFh. • Feature Space: FF200000h - FF2FFFFFh.

Bit Range	Default & Access	Field Name (ID): Description
1	0x1 RW	**50-5F Enable (E50):** Enables decoding of 1MB of the following BIOS range: • Data space: FF500000h - FF5FFFFFh. • Feature space: FF100000h - FF1FFFFFh.
0	0x1 RW	**40-4F Enable (E40):** Enables decoding of 1MB of the following BIOS range: • Data space: FF400000h - FF4FFFFFh. • Feature space: FF000000h - FF0FFFFFh.

56.2.12 BIOS Control (BC)—Offset DCh

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:31, F:0] + DCh

Default: 20h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RW/1L	**BIOS Interface Lock-Down (BILD):** When set, prevents BC.TS and BC.BBS from being changed. This bit can only be written from 0 to 1 once. ***Note:*** BIOS: This bit is not backed up in the RTC well. This bit should also be set in the BUC register in the RTC device to record the last state of this value following a cold reset.
6	0x0 RW/L	**Boot BIOS Strap (BBS):** This field determines the destination of accesses to the BIOS memory range. For the default, Functional Strap section of Signal Description chapter for details. Bits Description • 0 SPI. • 1 LPC. When SPI or LPC is selected, the range that is decoded is further qualified by other configuration bits described in the respective sections. The value in this field can be overwritten by software as long as the BIOS Interface Lock-Down is not set. ***Note:*** Software must not change this bit since the SoC does not support dynamic switching between the SPI and LPC interface it is chosen at boot time by a strap.
5	0x1 RW/L	**Enable InSMM.STS (EISS):** When this bit is set, the BIOS region is not writable until SMM sets the InSMM.STS bit. If this bit [5] is set, then WPD must be a 1 and InSMM.STS must be 1 also. If this bit [5] is clear, then BIOS is writable based only on WPD = 1 and the InSMM.STS is a don't care.
4	0x0 RO	**Top Swap (TS):** When set, the SoC will invert either A16, A17, or A18 for cycles going to the BIOS space (but not the feature space). When cleared, the SoC will not invert A16. If booting from SPI, then the BOOT_BLOCK_SIZE soft strap determines if A16, A17, or A18 should be inverted if Top Swap is enabled. *If the SoC is strapped for to enable Top-Swap Override (GPIO[3] is sampled as height (1) within 400 ns of the rising edge (0 -> 1) of the active-low resume reset signal RSMRST_N), then this bit cannot be cleared by software. The strap jumper should be removed (GPIO[3] set to low(0)) and the system rebooted. BIOS Note: 1. This bit provides a read-only path to view the state of the Top Swap strap. It is backed up and driven from the RTC well. BIOS will need to program the corresponding register in the RTC Controller (in RTC well), which will be reflected in this register. 2. The Register portion of the Top Swap is lockable by the BIOS Interface Lockdown Bit (BC.BILD) but unlockable by SPI Flash Protected Range and Top Swap Override (uCode.PRR_TS_OVR).
3:2	0x0 RW	**SPI Read Configuration (SRC):** This 2-bit field controls two policies related to BIOS reads on the SPI interface: Bit 3- Prefetch Enable Bit 2- Cache Disable Settings are summarized below: Bits 3:2 Description • 00 - No prefetching, but caching enabled. Direct Memory reads load the read buffer cache with valid data, allowing repeated reads to the same range to complete quickly • 01 - No prefetching and no caching. One-to-one correspondence of host BIOS reads to SPI cycles. This value can be used to invalidate the cache. • 10 - Prefetching and Caching enabled. This mode is used for long sequences of short reads to consecutive addresses (i.e. shadowing) • 11 - Illegal. Caching must be enabled when Prefetching is enabled. This eliminates the need for a complex prefetch-flushing mechanism.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RW/1L	**Lock Enable (LE):** When set, setting the WP bit will cause SMI. When cleared, setting the WP bit will not cause SMI. Once set, this bit can only be cleared by a PLTRST#. When this bit is set, EISS - bit [5] of this register is locked down.
0	0x0 RW	**Write Protect Disable (WPD):** When set, access to the BIOS space is enabled for both read and write cycles to BIOS. When cleared, only read cycles are permitted to the FWH or SPI flash. When this bit is written from a 0 to a 1 and the LE bit is also set, an SMI# is generated. This ensures that only SMM code can update BIOS.

56.2.13 PCI Clock Control (PCCTL)—Offset E0h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:0] + E0h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0x0 RO	**Reserved (RSVD):** Reserved.
9	0x0 RO/V	**CLKRUN# Buffer Enable Override (CLKRUN_EN_OVR):** When set to '1', SW is in control of the CLKRUN# buffer enable and the value in CLKRUN_EN_VAL will be propagated to the output buffer enable. When this bit is '0', HW will determine the value of the buffer enable.
8	0x0 RO/V	**CLKRUN# Override (CLKRUN_OVR):** When set to '1', SW is in control of the CLKRUN# pin and the value in CLKRUN_VAL will be propagated to the output pin. When this bit is '0', HW will determine the value of the pin.
7	0x0 RO/V	**CLKRUN# Buffer Enable Value (CLKRUN_EN_VAL):** Either HW or SW may own control of the CLKRUN# pin. This bit provides the value to drive on the active low CLKRUN# buffer enable if CLKRUN_EN_OVR is set to '1'.
6	0x0 RO/V	**CLKRUN# Pin Output Value (CLKRUN_VAL):** Either HW or SW may own control of the CLKRUN# pin. This bit provides the value to drive on the pin if CLKRUN_OVR is set to '1'.
5	0x0 RO/V	**Stop PCI# Value (STP_PCI_VAL):** Either Hardware or Software may own control of the internal STP_PCI#. This bit provides the value to drive on the STP_PCI# if STP_PCI_OVR is set to 1. ***Note:*** 1. SW cannot control the STP_PCI# pin while PLTRST# is asserted (the pin will be at its reset default value).
4	0x0 RO/V	**Stop PCI# Override (STP_PCI_OVR):** When set to 1, Firmware is in control of the STP_PCI# and the value in STP_PCI_VAL will be propagated to the internal STP_PCI#. When this bit is '0', HW will determine the value of the pin. ***Note:*** 1. BIOS cannot control the STP_PCI# pin while PLTRST# is asserted (the pin will be at its reset default value).
3:2	0x0 RW	**Reserved (RSVD_1):** Reserved
1	0x0 RW	**Reserved (RSVD_1):** Reserved.
0	0x0 RW	**Clock Run Enable (CLKRUN_EN):** Enables the CLKRUN# logic to stop the PCI clocks. If the SLP_EN bit is set, then the SoC will drive CLKRUN# low. This will keep the PCI and LPC clocks running on the way to the sleeping state. This is required to meet an LPC specification. This does not necessarily mean that the CLKRUN_EN bit is forced low when SLP_EN is set. Even though the CLKRUN# signal will be low when SLP_EN is set, the state of the CLKRUN_EN bit is ignored when SLP_EN bit is set. This gives flexibility in the implementation.

§ §

57 Primary to Side Band Bridge - B0, D31, F1

57.1 Introduction and Index

The host-accessible registers for the Primary to Side Band (P2SB) Bridge are described here.

The legend for the register access codes are described in Chapter 43, “Introduction.”

57.1.1 Host Configuration Space

These registers are discovered in Host Configuration Space starting at Bus 0, Device 31 (decimal), Function 1. The offset addresses are listed.

Table 57-1. Summary of PCI Configuration Registers—0/31/1

Offset (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
0	4	19DD8086	"PCI Identifier (PCIID)—Offset 0h" on page 2663
4	2	0004	"PCI Command (PCICMD)—Offset 4h" on page 2664
6	2	0000	"PCI Status (PCISTS)—Offset 6h" on page 2665
8	1	00	"Revision ID (PCIRID)—Offset 8h" on page 2665
9	4	00058000	"Class Code (PCICC)—Offset 9h" on page 2666
D	1	00	"PCI Master Latency Timer (PCIMLT)—Offset Dh" on page 2666
E	2	00	"PCI Header Type (PCIHTYPE)—Offset Eh" on page 2666
10	4	00000004	"Sideband Register Access BAR (SBREG_BAR)—Offset 10h" on page 2667
14	4	00000000	"Sideband Register BAR High DWORD (SBREG_BARH)—Offset 14h" on page 2667
2C	4	00000000	"PCI Subsystem Identifiers (PCIHSS)—Offset 2Ch" on page 2668
50	2	00F8	"VLW Bus:Device:Function (VBDF)—Offset 50h" on page 2668
52	2	00F8	"ERROR Bus:Device:Function (EBDF)—Offset 52h" on page 2669
54	4	0000C700	"Routing Configuration (RCFG)—Offset 54h" on page 2670
60	1	00	"High Performance Event Timer Configuration (HPTC)—Offset 60h" on page 2670
64	2	0000	"IOxAPIC Configuration (IOAC)—Offset 64h" on page 2671
6C	2	00F8	"IOxAPIC Bus:Device:Function (IBDF)—Offset 6Ch" on page 2671
70	2	00F8	"HPET Bus:Device:Function (HBDF)—Offset 70h" on page 2672
80	4	00000000	"Sideband Register posted 0 (SBREGPOSTED0)—Offset 80h" on page 2672
84	4	00000000	"Sideband Register posted 1 (SBREGPOSTED1)—Offset 84h" on page 2672
88	4	00000000	"Sideband Register posted 2 (SBREGPOSTED2)—Offset 88h" on page 2673
8C	4	00000000	"Sideband Register posted 3 (SBREGPOSTED3)—Offset 8Ch" on page 2673
90	4	00000000	"Sideband Register posted 4 (SBREGPOSTED4)—Offset 90h" on page 2673
94	4	00000000	"Sideband Register posted 5 (SBREGPOSTED5)—Offset 94h" on page 2673
98	4	00000000	"Sideband Register posted 6 (SBREGPOSTED6)—Offset 98h" on page 2674
9C	4	00000000	"Sideband Register posted 7 (SBREGPOSTED7)—Offset 9Ch" on page 2674
A0	4	00060010	"Display Bus:Device:Function (DISPBDF)—Offset A0h" on page 2674
A4	2	0000	"ICC Register Offsets (ICCOS)—Offset A4h" on page 2675
B0	4	00000000	"Endpoint Mask 0 (EPMASK0)—Offset B0h" on page 2675
B4	4	00000000	"Endpoint Mask 1 (EPMASK1)—Offset B4h" on page 2675
B8	4	00000000	"Endpoint Mask 2 (EPMASK2)—Offset B8h" on page 2676
BC	4	00000000	"Endpoint Mask 3 (EPMASK3)—Offset BCh" on page 2676
C0	4	00000000	"Endpoint Mask 4 (EPMASK4)—Offset C0h" on page 2676
C4	4	00000000	"Endpoint Mask 5 (EPMASK5)—Offset C4h" on page 2676
C8	4	00000000	"Endpoint Mask 6 (EPMASK6)—Offset C8h" on page 2677
CC	4	00000000	"Endpoint Mask 7 (EPMASK7)—Offset CCh" on page 2677
D0	4	00000000	"SBI Address (SBIADDR)—Offset D0h" on page 2677

Table 57-1. Summary of PCI Configuration Registers—0/31/1 (Continued)

Offset (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
D4	4	00000000	"SBI Data (SBIDATA)—Offset D4h" on page 2678
D8	2	0000	"SBI Status (SBISTAT)—Offset D8h" on page 2678
DA	2	0000	"SBI Routing Identification (SBIRID)—Offset DAh" on page 2679
DC	4	00000000	"SBI Extended Address (SBIEXTADDR)—Offset DCh" on page 2679
E0	4	00000007	"P2SB Control (P2SBC)—Offset E0h" on page 2680
F0	4	00000000	"Unsupported Request Error Status (URES)—Offset F0h" on page 2681
F4	4	00000000	"Unsupported Request Error Control (UREC)—Offset F4h" on page 2681
F8	4	00000F00	"Manufacturer's ID (MANID)—Offset F8h" on page 2682

57.2 Registers in Configuration Space

57.2.1 PCI Identifier (PCIID)—Offset 0h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:1] + 0h

Default: 19DD8086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x19dd RO/V	**Device Identification (DID):** The upper 8-bits of this field can be overridden by the SoC. **Power Well:** Core
15:0	0x8086 RO	**Vendor Identification (VID):** Indicates Intel **Power Well:** Core

57.2.2 PCI Command (PCICMD)—Offset 4h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:31, F:1] + 4h

Default: 0004h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0x0 RO	**Reserved (RSVD):** Reserved **Power Well:** Core
10	0x0 RO	**Interrupt Disable (INTD):** P2SB does not issue any interrupts on its own behalf **Power Well:** Core
9	0x0 RO	**Fast Back to Back Enable (FB2BE):** Not applicable **Power Well:** Core
8	0x0 RW	**SERR# Enable (SEE):** This bit enables parity error reporting to the SoC Interrupt Error Handler (IEH) **Power Well:** Core
7	0x0 RO	**Reserved (RSVD_1):** Reserved **Power Well:** Core
6	0x0 RW	**Parity Error Response Enable (PEE):** This bit controls the device's response to parity error. **Power Well:** Core
5	0x0 RO	**VGA Palette Snoop (VGA):** Not applicable. **Power Well:** Core
4	0x0 RO	**Memory Write & Invalidate Enable (MWIE):** Not applicable. **Power Well:** Core
3	0x0 RO	**Special Cycle Enable (SCE):** Not applicable. **Power Well:** Core
2	0x1 RO	**Bus Master Enable (BME):** Bus mastering cannot be disabled as this device acts as a proxy for non-PCI devices. **Power Well:** Core
1	0x0 RW	**Memory Space Enable (MSE):** This bit controls the P2SB acceptance of PCI MMIO BARs only. Other legacy regions are unaffected by this bit. **Power Well:** Core
0	0x0 RW	**I/O Space Enable (IOSE):** Legacy regions are unaffected by this bit. **Power Well:** Core

57.2.3 PCI Status (PCISTS)—Offset 6h

The P2SB does not issue any interrupts, signal any errors, or provide any additional capability structures. This register has no functionality.

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:31, F:1] + 6h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW/1C	**Detected Parity Error (DPE):** This register bit is set when parity error is detected. **Power Well:** Core
14	0x0 RW/1C	**Signaled System Error (SSE):** This register sets when PCICMD.SE bit and PCISTS.DPE bit is set **Power Well:** Core
13:0	0x0 RO	**Reserved (RSVD):** Reserved **Power Well:** Core

57.2.4 Revision ID (PCIRID)—Offset 8h

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:31, F:1] + 8h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO/V	**Revision ID (RID):** Indicates the part revision. This field resets to 0 and can be overridden by the SoC circuitry during the SoC power-up sequence **Power Well:** Core

57.2.5 Class Code (PCICC)—Offset 9h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:1] + 9h

Default: 00058000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**RSVD0:** Reserved
23:16	0x5 RO	**Base Class Code (BCC):** Indicates a Memory Controller device class. **Power Well:** Core
15:8	0x80 RO	**Sub-Class Code (SCC):** Indicates an unspecified sub-class other Memory Controller. **Power Well:** Core
7:0	0x0 RO	**Programming Interface (PI):** No programming interface. **Power Well:** Core

57.2.6 PCI Master Latency Timer (PCIMLT)—Offset Dh

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:31, F:1] + Dh

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO	**Reserved (RSVD):** Reserved **Power Well:** Core

57.2.7 PCI Header Type (PCIHTYPE)—Offset Eh

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:31, F:1] + Eh

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RO	**Multi-Function Device (MFD):** Indicates that this is part of a multi-function device. **Power Well:** Core
6:0	0x0 RO	**Header Type (HTYPE):** Indicates a generic Type 0 PCI device header. **Power Well:** Core

57.2.8 Sideband Register Access BAR (SBREG_BAR)—Offset 10h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:1] + 10h

Default: 00000004h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RW	**Register Base Address (RBA):** Lower DWORD of the base address for the sideband register access BAR. **Power Well:** Core
23:4	0x0 RO	**Hardwired to 0 to request a BAR of 16MB (HW202RB16MB):** Hardwired to 0 to request a BAR of 16MB **Power Well:** Core
3	0x0 RO	**Prefetchable (PREF):** Indicates this is not prefetchable. **Power Well:** Core
2:1	0x2 RO	**Address Type (ATYPE):** Indicates that the BAR can be defined to be located anywhere in 64-bit Host Root Memory Space. **Power Well:** Core
0	0x0 RO	**Space Type (STYPE):** Indicates Memory Space **Power Well:** Core

57.2.9 Sideband Register BAR High DWORD (SBREG_BARH)—Offset 14h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:1] + 14h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Register Base Address (RBAH):** Upper DWORD of the base address for the sideband register access BAR. **Power Well:** Core

57.2.10 PCI Subsystem Identifiers (PCIHSS)—Offset 2Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:1] + 2Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW/O	**Subsystem ID (SSID):** Written by BIOS. Not used by hardware. **Power Well:** Core
15:0	0x0 RW/O	**Subsystem Vendor ID (SSVID):** Written by BIOS. Not used by hardware. **Power Well:** Core

57.2.11 VLW Bus:Device:Function (VBDF)—Offset 50h

This register specifies the bus:device:function ID that the VLW VDM will use for its Requester ID. This field is default to Bus 0: Device 31: Function 0 after reset. BIOS shall program this field accordingly if unique bus:device:function number is required for the VLW message.

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:31, F:1] + 50h

Default: 00F8h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x0 RW	**Bus Number (BUS):** Reserved. **Power Well:** Core
7:3	0x1f RW	**Device Number (DEV):** Reserved. **Power Well:** Core
2:0	0x0 RW	**Function Number (FUNC):** Reserved. **Power Well:** Core

57.2.12 ERROR Bus:Device:Function (EBDF)—Offset 52h

This register specifies the bus:device:function ID that the Error Signaling messages VDM will use for its Requester ID. This field is default to Bus 0: Device 31: Function 0 after reset. BIOS shall program this field accordingly if unique bus:device:function number is required for the VLW message.

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:31, F:1] + 52h

Default: 00F8h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x0 RW	**Bus Number (BUS):** Reserved. **Power Well:** Core
7:3	0x1f RW	**Device Number (DEV):** Reserved. **Power Well:** Core
2:0	0x0 RW	**Function Number (FUNC):** Reserved. **Power Well:** Core

57.2.13 Routing Configuration (RCFG)—Offset 54h

This register contains information used for routing transactions between primary and sideband interfaces.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:1] + 54h

Default: 0000C700h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**Reserved (RSVD):** Reserved. **Power Well:** Core
15:8	0xc7 RW	**Reserved Page Register Destination ID (RPRID):** Specifies the IOSF-SB destination ID for sending Reserved Page Register cycles (e.g. Port 80h). By default this will load to the ID of the LPC device depending on which has been strapped active in the system. **Power Well:** Core
7:1	0x0 RW	**Reserved (RSVD_1):** Reserved. **Power Well:** Core
0	0x0 RW	**RTC Shadow Enable (RSE):** When set, all IO writes to the RTC will be also sent to the PMC. This allows cases where the battery-backed storage is in an external PMIC device. **Power Well:** Core

57.2.14 High Performance Event Timer Configuration (HPTC)—Offset 60h

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:31, F:1] + 60h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RW	**Address Enable (AE):** When set, the P2SB will decode the High Performance Event Timer (HPET) Host Root memory-address range selected by bits 1:0 below. **Power Well:** Core
6:2	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
1:0	0x0 RW	**Address Select (AS):** This 2-bit field selects 1 of 4 possible memory address ranges for the High-Performance Event Timer (HPET) functionality. The encodings are: • 00: FED0_0000h - FED0_03FFFh • 01: FED0_1000h - FED0_13FFFh • 10: FED0_2000h - FED0_23FFFh • 11: FED0_3000h - FED0_33FFFh **Power Well:** Core

57.2.15 IOxAPIC Configuration (IOAC)—Offset 64h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:31, F:1] + 64h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:9	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
8	0x0 RW	**Address Enable (AE):** When set, the P2SB will decode the IOxAPIC Host Root memory-address range selected by bits 7:0 below. **Power Well:** Core
7:0	0x0 RW	**APIC Range Select (ASEL):** These eight bits define the eight address bits 19:12 for the IOxAPIC range. The default value of 00h enables compatibility with prior Intel products as an initial value. This value must not be changed by software unless the IOxAPIC Address Enable (AE) bit is cleared. **Power Well:** Core

57.2.16 IOxAPIC Bus:Device:Function (IBDF)—Offset 6Ch

This register specifies the PCI Bus:Device:Function ID that the IOxAPIC will use in the following:

- As the Requester ID when initiating Interrupt Messages to the CPU.
- As the Completer ID when responding to the reads targeting the IOxAPIC Memory-Mapped I/O (MMIO) registers.

This field is default to Bus 0: Device 31: Function 0 after reset. BIOS shall program this field accordingly if a unique Bus:Device:Function number is required for the internal IOxAPIC.

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:31, F:1] + 6Ch

Default: 00F8h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x0 RW	**Bus Number (BUS):** Reserved. **Power Well:** Core
7:3	0x1f RW	**Device Number (DEV):** Reserved. **Power Well:** Core
2:0	0x0 RW	**Function Number (FUNC):** Reserved. **Power Well:** Core

57.2.17 HPET Bus:Device:Function (HBDF)—Offset 70h

This register specifies the PCI Bus:Device:Function ID that the integrated High-Performance Event Timer (HPET) device will use in the following:

- As the Requester ID when initiating Interrupt Messages to the CPU.
- As the Completer ID when responding to the reads targeting the corresponding HPET Memory-Mapped I/O (MMIO) registers.

This field is default to Bus 0: Device 31: Function 0 after reset. BIOS shall program this field accordingly if unique Bus:Device:Function number is required for the corresponding HPET.

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:31, F:1] + 70h

Default: 00F8h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x0 RW	**Bus Number (BUS):** Reserved. **Power Well:** Core
7:3	0x1f RW	**Device Number (DEV):** Reserved. **Power Well:** Core
2:0	0x0 RW	**Function Number (FUNC):** Reserved. **Power Well:** Core

57.2.18 Sideband Register posted 0 (SBREGPOSTED0)—Offset 80h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:1] + 80h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Sideband Register posted 0 (SBREGPOSTED0):** One hot masks for setting SBREG to posted posted for IOSF-SB endpoint IDs 31-0. **Power Well:** Core

57.2.19 Sideband Register posted 1 (SBREGPOSTED1)—Offset 84h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:1] + 84h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Sideband Register posted 1 (SBREGPOSTED1):** One hot masks for setting SBREG to posted for IOSF-SB endpoint IDs 63-32. **Power Well:** Core

57.2.20 Sideband Register posted 2 (SBREGPOSTED2)—Offset 88h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:1] + 88h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Sideband Register posted 0 (SBREGPOSTED2):** One hot masks for setting SBREG to posted for IOSF-SB endpoint IDs 95-64. **Power Well:** Core

57.2.21 Sideband Register posted 3 (SBREGPOSTED3)—Offset 8Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:1] + 8Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Sideband Register posted 3 (SBREGPOSTED3):** One hot masks for setting SBREG to posted for IOSF-SB endpoint IDs 127-96. **Power Well:** Core

57.2.22 Sideband Register posted 4 (SBREGPOSTED4)—Offset 90h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:1] + 90h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Sideband Register posted 4 (SBREGPOSTED4):** One hot masks for setting SBREG to posted for IOSF-SB endpoint IDs 159-128. **Power Well:** Core

57.2.23 Sideband Register posted 5 (SBREGPOSTED5)—Offset 94h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:1] + 94h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Sideband Register posted 5 (SBREGPOSTED5):** One hot masks for setting SBREG to posted for IOSF-SB endpoint IDs 191-160. **Power Well:** Core

57.2.24 Sideband Register posted 6 (SBREGPOSTED6)—Offset 98h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:1] + 98h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Sideband Register posted 6 (SBREGPOSTED6):** One hot masks for setting SBREG to posted for IOSF-SB endpoint IDs 223-192. **Power Well:** Core

57.2.25 Sideband Register posted 7 (SBREGPOSTED7)—Offset 9Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:1] + 9Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Sideband Register posted 7 (SBREGPOSTED7):** One hot masks for setting SBREG to posted for IOSF-SB endpoint IDs 255-224. **Power Well:** Core

57.2.26 Display Bus:Device:Function (DISPBDF)—Offset A0h

This register specifies the PCI Bus:Device:Function ID that the Display initiated upstream RAVDMs will use for its Requester ID. This will also be used for the claiming these Route-by-ID RAVDMs downstream.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:1] + A0h

Default: 00060010h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
18:16	0x6 RW	**Display Target Block (DTBLK):** This register contains the Target BLK field that will be used when sending RAVDM messages to the CPU Complex North Display. **Power Well:** Core
15:8	0x0 RW	**Bus Number (BUS):** The bus number of the Display in the CPU Complex. **Power Well:** Core
7:3	0x2 RW	**Device Number (DEV):** The bus number of the Display in the CPU Complex. **Power Well:** Core
2:0	0x0 RW	**Function Number (FUNC):** The function number of the Display in the CPU Complex **Power Well:** Core

57.2.27 ICC Register Offsets (ICCOS)—Offset A4h

This register contains the offsets to be used when sending RAVDMs to the Integrated Clock Controller. Each of the two spaces decoded for the ICC have a separate base address that will be used when sending those transactions on IOSF-SB to the ICC.

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:31, F:1] + A4h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x0 RW	**Modulator Control Address Offset (MODBASE):** This specifies the upper 8b for the 16b address that will be used for sending RAVDM access that target the Modulator Control range of the ICC (FFF00h - FFFFFh). **Power Well:** Core
7:0	0x0 RW	**Buffer Address Offset (BUFBASE):** This specifies the upper 8b for the 16b address that will be used for sending RAVDM access that target the Buffer range of the ICC (FFE00h - FFEFFh). **Power Well:** Core

57.2.28 Endpoint Mask 0 (EPMASK0)—Offset B0h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:1] + B0h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/V/L	**Endpoint Mask 0 (EPMASK0):** One hot masks for disabling IOSF-SB endpoint IDs 31-0. **Power Well:** Core

57.2.29 Endpoint Mask 1 (EPMASK1)—Offset B4h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:1] + B4h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/V/L	**Endpoint Mask 1 (EPMASK1):** One hot masks for disabling IOSF-SB endpoint IDs 63-32. **Power Well:** Core

57.2.30 Endpoint Mask 2 (EPMASK2)—Offset B8h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:1] + B8h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/V/L	**Endpoint Mask 2 (EPMASK2):** One hot masks for disabling IOSF-SB endpoint IDs 95-64. **Power Well:** Core

57.2.31 Endpoint Mask 3 (EPMASK3)—Offset BCh

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:1] + BCh

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/V/L	**Endpoint Mask 3 (EPMASK3):** One hot masks for disabling IOSF-SB endpoint IDs 127-96. **Power Well:** Core

57.2.32 Endpoint Mask 4 (EPMASK4)—Offset C0h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:1] + C0h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/V/L	**Endpoint Mask 4 (EPMASK4):** One hot masks for disabling IOSF-SB endpoint IDs 128-159. **Power Well:** Core

57.2.33 Endpoint Mask 5 (EPMASK5)—Offset C4h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:1] + C4h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/V/L	**Endpoint Mask 5 (EPMASK5):** One hot masks for disabling IOSF-SB endpoint IDs 191-160. **Power Well:** Core

57.2.34 Endpoint Mask 6 (EPMASK6)—Offset C8h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:1] + C8h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/V/L	**Endpoint Mask 6 (EPMASK6):** One hot masks for disabling IOSF-SB endpoint IDs 223-192. **Power Well:** Core

57.2.35 Endpoint Mask 7 (EPMASK7)—Offset CCh

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:1] + CCh

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/V/L	**Endpoint Mask 7 (EPMASK7):** One hot masks for disabling IOSF-SB endpoint IDs 255-224. **Power Well:** Core

57.2.36 SBI Address (SBIADDR)—Offset D0h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:1] + D0h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RW	**Destination Port ID (DESTID):** The content of this register field is sent in the IOSF Sideband Message Register Access dest field. **Power Well:** Core
23:20	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
19:16	0x0 RW	**Root Space (RS):** Destination IOSF-SB Root Space. ***Note:*** This register may only be written during manufacturing test. P2SB will only accept writes to this register from transactions with a SAI equal to the SBI_RS_ACCESS_SAI parameter. This should be assigned to the SAI used by the functional test module (typically TAM) that will perform this register write on IOSF-P. **Power Well:** Core
15:0	0x0 RW	**Address Offset (OFFSET):** Register address offset. The content of this register field is sent in the IOSF Sideband Message Register Access address(15:0) field. **Power Well:** Core

57.2.37 SBI Data (SBIDATA)—Offset D4h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:1] + D4h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/V	**Data (DATA):** The content of this register field is sent on the IOSF sideband Message Register Access data(31:0) field. **Power Well:** Core

57.2.38 SBI Status (SBISTAT)—Offset D8h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:31, F:1] + D8h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x0 RW	**Opcode (OPCODE):** This is the Opcode sent in the IOSF sideband message. **Power Well:** Core
7	0x0 RW	**Posted (POSTED):** When set to 1, the message will be send as a posted message instead of non-posted. This should only be used if the receiver is known to support posted operations for the specified operation. **Power Well:** Core
6:3	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
2:1	0x0 RW/V	**Response Status (RESPONSE):** • 00 - Successful • 01 - Unsuccessful / Not Supported • 10 - Powered Down • 11 - Multi-cast Mixed This register reflects the response status for the previously completed transaction. The value of this register is only meaningful if SBISTAT.INITRDY is zero. **Power Well:** Core
0	0x0 RW/1S	**Initiate/ Ready# (INITRDY):** • 0: The IOSF sideband interface is ready for a new transaction • 1: The IOSF sideband interface is busy with the previous transaction. A write to set this register bit to 1 will trigger an IOSF sideband message on the private IOSF sideband interface. The message will be formed based on the values programmed in the Sideband Message Interface Register Access registers. Software needs to ensure that the interface is not busy (SBISTAT.INITRDY is clear) before writing to this register. **Power Well:** Core

57.2.39 SBI Routing Identification (SBIRID)—Offset DAh

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:31, F:1] + DAh

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:12	0x0 RW	**First Byte Enable (FBE):** The content of this field is sent in the IOSF Sideband Register Access FBE field. **Power Well:** Core
11	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
10:8	0x0 RW	**Base Address Register (BAR):** The contents of this field are sent in the IOSF Sideband Register Access BAR field. This should be zero performing a Memory Mapped operation to a PCI compliant device. **Power Well:** Core
7:0	0x0 RW	**Function ID (FID):** The contents of this field are sent in the IOSF Sideband Register access FID field. This field should generally remain at zero unless specifically required by a particular application. **Power Well:** Core

57.2.40 SBI Extended Address (SBIEXTADDR)—Offset DCh

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:1] + DCh

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Extended Address (ADDR):** The content of this register field is sent on the IOSF sideband Message Register Access address(48:32) field. This must be set to all 0 if 16b addressing is desired. **Power Well:** Core

57.2.41 P2SB Control (P2SBC)—Offset E0h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:1] + E0h

Default: 00000007h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0x0 RW	**Reserved (RSVD):** Reserved. **Power Well:** Core
26	0x0 RW	**Data Parity Error Enable (DPEE):** IOSFP data parity error handling (EP bit) enabling bit **Power Well:** Core
25	0x0 RW	**Command Parity Error Enable (CPEE):** IOSFP command parity error handling enabling bit **Power Well:** Core
24	0x0 RW	**Data Phase Parity Error Enable (DPPEE):** IOSFP data phase parity error handling enabling bit **Power Well:** Core
23:18	0x0 RW	**Reserved (RSVD_3):** Reserved. **Power Well:** Core
17	0x0 RW/O	**Endpoint Mask Lock (MASKLOCK):** Locks the value of the eight Endpoint Mask (EPMASK[0-7]) registers. Once this value is written to a one it may only be cleared by a reset. **Power Well:** Core
16	0x0 RW	**PGCB Clock Gating Enable (PGCBCGE):** When asserted, the P2SB can de-assert the clock request to disable the PGCB clock dynamically when it reaches the power-down idle state. **Power Well:** Core
15:9	0x0 RW	**Reserved: (RSVD_1):** Hardware will not allocate these bits for any purpose in the future so that BIOS can always write to the HIDE field with this byte enabled without having to remember any other field values since it will not be possible to do a read-modify-write when the device is hidden. **Power Well:** Core
8	0x0 RW	**Hide Device (HIDE):** When this bit is set, the P2SB will return 1s on any PCI Configuration Read on IOSF-P. All other transactions including PCI Configuration Writes are unaffected by this. This does not affect reads performed on the IOSF-SB interface. **Power Well:** Core
7:3	0x0 RW	**Reserved (RSVD_2):** Reserved. **Power Well:** Core
2:0	0x7 RW	**Max Writes Pending (MAXW):** This controls the maximum number of outstanding writes on IOSF-SB initiated by MMIO writes to the SBREG_BAR. Once the number of SBREG_BAR writes that are issued, but not completed, on IOSF-SB is equal to this value, no new requests will be forwarded until the completions are received. A value of zero will have the same behavior as the value of one (single write outstanding). **Power Well:** Core

57.2.42 Unsupported Request Error Status (URES)—Offset F0h

This register is only reset by a loss of core power

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:1] + F0h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
8	0x0 RW/1C	**Unsupported Request Detected (URD):** Set to 1 by hardware upon detecting an Unsupported Request on IOSF Primary interface that is not considered Advisory Non-Fatal **Power Well:** Core
7:0	0x0 RO	**Reserved (RSVD_1):** Reserved. **Power Well:** Core

57.2.43 Unsupported Request Error Control (UREC)—Offset F4h

This register is only reset by a loss of core power.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:1] + F4h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
8	0x0 RW	**Unsupported Request Reporting Enable (URRE):** If set to 1 by software, it allows reporting of an Unsupported Request as a system error. **Power Well:** SUS
7:0	0x0 RO	**Reserved (RSVD_1):** Reserved. **Power Well:** Core

57.2.44 Manufacturer's ID (MANID)—Offset F8h

This register is assigned during the boot flow using the SetID message based on values found in the fuse block. All fields except MID will be reset by hardware to zero and set only by the SetID message.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:1] + F8h

Default: 00000F00h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
27:24	0x0 RO/V	**Dot portion of Process ID (DOT):** Indicates the dot process **Power Well:** Core
23:16	0x0 RO/V	**Manufacturing Stepping Identifier (MSID):** This field is incremented for each stepping of the part. ***Note:*** This field can be used by software to differentiate steppings when the Stepping Revision ID may not change. **Power Well:** Core
15:8	0xf RO	**Manufacturing Identifier (MID):** 0Fh = Intel **Power Well:** Core
7:0	0x0 RO/V	**Process portion of process ID (PROC):** Indicates the process. The dot portion of the process is reflected in bits (27:24) **Power Well:** Core

§ §

58 Power Management Controller - B0, D31, F2

58.1 Introduction and Index

The host-accessible registers for the Power Management Controller (PMC) are described here.

To determine the number of devices/functions available refer to the following:

- Table 1-1, "Features by product SKU - Server and Cloud Storage SKUs 0 through 4"
- Table 1-2, "Features by Product SKU - Network and Enterprise Storage SKUs 5 through 10"
- Table 1-3, "Features by Product SKU - Extended Temperature SKUs 11 through 14".

The legend for the register access codes are described in Chapter 43, "Introduction."

58.1.1 Host Configuration Space

These registers are discovered in Host Configuration Space starting at Bus 0, Device 31 (decimal), Function 2. The offset addresses are listed.

Table 58-1. Summary of PCI Configuration Registers—0/31/2

Offset (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
0	4	19DE8086	"PCI Identifier (PCIID)—Offset 0h" on page 2689
40	4	00000001	"ACPI Base Address (ABASE)—Offset 40h" on page 2689
44	4	00000000	"ACPI Control (ACTL)—Offset 44h" on page 2690
A0	4	A0000000	"General PM Configuration A (GEN_PMCON_A)—Offset A0h" on page 2691
A4	4	00004007	"General PM Configuration B (GEN_PMCON_B)—Offset A4h" on page 2693
AC	4	00000000	"Extended Test Mode Register 3 (ETR3)—Offset ACh" on page 2695

58.1.2 Host Memory Space—PWRMBASE

Table 58-2. Summary of Memory Mapped I/O Registers—PWRMBASE

Offset (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
0	4	FFFFFFFF	"Wake Alarm Device Timer: AC (WADT_AC)—Offset 0h" on page 2696
4	4	FFFFFFFF	"Wake Alarm Device Timer: DC (WADT_DC)—Offset 4h" on page 2697
8	4	FFFFFFFF	"Wake Alarm Device Expired Timer: AC (WADT_EXP_AC)—Offset 8h" on page 2698
C	4	FFFFFFFF	"Wake Alarm Device Expired Timer: DC (WADT_EXP_DC)—Offset Ch" on page 2698
10	4	05000000	"Power and Reset Status (PRSTS)—Offset 10h" on page 2699
18	4	00000020	"Power Management Configuration Reg 1 (PM_CFG)—Offset 18h" on page 2700
1C	4	00000000	"PCH Power Management Status (PCH_PM_STS)—Offset 1Ch" on page 2704
24	4	00000000	"PCH Power Management Status (PCH_PM_STS2)—Offset 24h" on page 2705
F0	4	200F0DE4	"ADR Enable (ADR_EN)—Offset F0h" on page 2707
F8	4	00000000	"System Time Capture Trigger (SYSTIMCT)—Offset F8h" on page 2709
FC	4	00000000	"ACPI Timer Control (ACPI_TMR_CTL)—Offset FCh" on page 2709
120	4	00000432	"GPIO Configuration (GPIO_CFG)—Offset 120h" on page 2710
124	4	00000000	"Global Reset Causes (GBLRST_CAUSE0)—Offset 124h" on page 2711
128	4	00000000	"Global Reset Causes (GBLRST_CAUSE1)—Offset 128h" on page 2713
12C	4	00000000	"Host Partition Reset Causes (HPR_CAUSE0)—Offset 12Ch" on page 2714
200	4	0000FFFF	"modPHY Power Management Configuration Reg 1 (MODPHY_PM_CFG1)—Offset 200h" on page 2715
204	4	05000000	"modPHY Power Management Configuration Reg 2 (MODPHY_PM_CFG2)—Offset 204h" on page 2716
208	4	00000000	"modPHY Power Management Configuration Reg 3 (MODPHY_PM_CFG3)—Offset 208h" on page 2718
20C	4	00000000	"modPHY Power Management Configuration Reg 4 (MODPHY_PM_CFG4)—Offset 20Ch" on page 2719
3F0	4	00000000	"IE_STS (IE_STS)—Offset 3F0h" on page 2720
3F4	4	00000000	"ME_STS (ME_STS)—Offset 3F4h" on page 2722
620	4	00000000	"Static PG Related Function Disable Register 1 (ST_PG_FDIS_PMC_1)—Offset 620h" on page 2723
628	4	00000000	"Non-Static PG Related Function Disable Register 1 (NST_PG_FDIS_1)—Offset 628h" on page 2724
640	4	00000000	"Non-Static PG Fuse Disable Read 1 Register (N_STPG_FUSE_SS_DIS_RD_1)—Offset 640h" on page 2724
644	4	00000000	"Static PG Fuse and Soft Strap Disable Read Register 2 (STPG_FUSE_SS_DIS_RD_2)—Offset 644h" on page 2725

58.1.3 Host I/O Space—ABASE

An index of the registers that are accessible in Host I/O Space is shown here.

Table 58-3. Summary of I/O Registers—ABASE

Offset (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
0	4	00000000	"Power Management 1 Enables and Status (PM1_EN_STS)—Offset 0h" on page 2726
4	4	00000000	"Power Management 1 Control —Offset 4h" on page 2728
8	4	00000000	"Power Management 1 Timer (PM1_TMR)—Offset 8h" on page 2729
30	4	00000002	"SMI Control and Enable (SMI_EN)—Offset 30h" on page 2730
34	4	00000000	"SMI Status Register (SMI_STS)—Offset 34h" on page 2732
40	4	00000000	"General Purpose Event Control (GPE_CTRL)—Offset 40h" on page 2735
44	4	00000000	"Device Trap Status Register (DEVTRAP_STS)—Offset 44h" on page 2736
50	4	00000000	"PM2a Control Block (PM2A_CNT_BLK)—Offset 50h" on page 2737
54	4	00002000	"Over-Clocking WDT Control (OC_WDT_CTL)—Offset 54h" on page 2737
80	4	00000000	"General Purpose Event 0 Status [31:0] (GPE0_STS_31_0)—Offset 80h" on page 2738
84	4	00000000	"General Purpose Event 0 Status [63:32] (GPE0_STS_63_32)—Offset 84h" on page 2739
88	4	00000000	"General Purpose Event 0 Status [95:64] (GPE0_STS_95_64)—Offset 88h" on page 2739
8C	4	00000000	"General Purpose Event 0 Status [127:96] (GPE0_STS_127_96)—Offset 8Ch" on page 2740
90	4	00000000	"General Purpose Event 0 Enable [31:0] (GPE0_EN_31_0)—Offset 90h" on page 2742
94	4	00000000	"General Purpose Event 0 Enable [63:32] (GPE0_EN_63_32)—Offset 94h" on page 2742
98	4	00000000	"General Purpose Event 0 Enable [95:64] (GPE0_EN_95_64)—Offset 98h" on page 2742
9C	4	00000000	"General Purpose Event 0 Enable [127:96] (GPE0_EN_127_96)—Offset 9Ch" on page 2743

58.1.4 Host I/O Space—Fixed Address

An index of the registers that are accessible in Host I/O Space is shown here.

Table 58-4. Summary of I/O Registers—Fixed Addresses

Address (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
CF9	1	0	"Reset Control Register (RST_CNT)" on page 2745

58.1.5 Sideband Registers

An index of the Sideband registers that are accessible to the Host are listed here. Each is accessible in Host Memory Space using the Sideband Base Address Register (SBREG_BAR). See Section 3.4.1, "Using SBREG_BAR Method" on page 187.

Table 58-5. Summary of Sideband Registers—0x82

Offset (hex)	Default Value (hex)	Register Name (Register Symbol)
B0	00000000	"Advanced Power Management Status and Control Port (APM_STS_CNT)—Offset B0h" on page 2746
B4	00000000	"Misc SB Reg0 (MISC_SBR0)—Offset B4h" on page 2746

58.2 Registers in Configuration Space

58.2.1 PCI Identifier (PCIID)—Offset 0h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:2] + 0h

Default: 19DE8086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x19DE RO/V	**Device Identification (DID):** These bits are assigned by Intel.
15:0	0x8086 RO	**Vendor Identification (VID):** Indicates Intel

58.2.2 ACPI Base Address (ABASE)—Offset 40h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:2] + 40h

Default: 00000001h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RW/L	**Base Address (BA):** Provides the 256 bytes of I/O space for ACPI logic. This field is locked by GEN_PMCON_B.ACPI_BASE_LOCK.
7:1	0x0 RO	**Reserved (RSVD_7_1):** Always 0.
0	0x1 RO	**Space Type (STYPE):** Always 1 to indicate I/O space.

58.2.3 ACPI Control (ACTL)—Offset 44h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:2] + 44h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0x0 RO	**Reserved (RSVD_31_9):** Reserved.
8	0x0 RW	**PWRM Enable (PWRM_EN):** When set, decode of the Host Memory Space range pointed by PWRMBASE is enabled.
7	0x0 RW	**ACPI Enable (EN):** When set, decode of the I/O range pointed to by the ACPI base register is enabled and the ACPI power management function is enabled.
6:3	0x0 RO	**Reserved (RSVD_6_3):** Reserved.
2:0	0x0 RW	**SCI IRQ Select (SCIS):** Specifies on which IRQ the SCI will internally appear. If not using the APIC, the SCI must be routed to IRQ[9-11], and that interrupt is not sharable with the SERIRQ stream, but is shareable with other PCI interrupts. If using the APIC, the SCI can also be mapped to IRQ20-23, and can be shared with other interrupts. Bits - SCI Map ---- - ------- • 000 - IRQ9 • 001 - IRQ10 • 010 - IRQ11 • 011 - Reserved • 100 - IRQ20 (only if APIC is enabled) • 101 - IRQ21 (only if APIC is enabled) • 110 - IRQ22 (only if APIC is enabled) • 111 - IRQ23 (only if APIC is enabled) When the interrupt is mapped to APIC interrupts 9, 10 or 11, the APIC should be programmed for active-high reception. When the interrupt is mapped to APIC interrupts 20 through 23, the APIC should be programmed for active-low reception.

58.2.4 General PM Configuration A (GEN_PMCON_A)—Offset A0h

Usage: ACPI and Legacy.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:2] + A0h

Default: A0000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x1 RW	**GBE Prep Non-fatal Timeout Enable (GBE_PREP_NFTO_EN):** When cleared, this bit causes the PMC to disable the GBE Prep non-fatal timeout, causing the PMC to wait indefinitely for the ACK STS (response) for Reset/Boot Prep message from the GBe MAC. When set, a non-fatal timeout will apply to the Reset/Boot Prep handshake.
30	0x0 RW	**RSVD:** Reserved
29	0x1 RW	**RSVD:** Reserved
28	0x0 RW	**After G3 PHY Power Enable (AG3_PP_EN):** This bit determines the Host software contribution to whether the LAN PHY is powered up after exiting G3.This bit is in the RTC power well.
27	0x0 RW	**Sx PHY Power Enable (SX_PP_EN):** This bit determines the Host software contribution to whether the LAN PHY remains powered in an Sx/MOFF state that was entered from S0 (rather than from G3).
26:24	0x0 RO	**Reserved (RSVD_26_24):** Reserved.
23	0x0 RW	**DRAM Initialization Scratchpad Bit (DISB):** This bit does not affect hardware functionality in any way. It is provided as a scratchpad bit that is maintained through main power well resets and CF9h-initiated resets. If the bit is 1, then the DRAM initialization was interrupted.
22	0x0 RO	**Reserved (RSVD_22):** Reserved.
21	0x0 RO/V	**Memory Placed in Self-Refresh (MEM_SR):** This bit will be set to 1 if DRAM should have remained powered and held in Self-Refresh through the last power state transition (i.e. the last time the system left S0). The scenarios where this should be the case are: • successful S3 entry and exit • successful Host partition reset without power cycle This indicates that memory was successfully placed into Self-Refresh. This bit will be cleared whenever the SoC begins a transition out of S0.
20:19	0x0 RO	**Reserved (RSVD_20_19):** Reserved.
18	0x0 RW/1C/V	**Minimum SLP_S4# Assertion Width Violation Status (MS4V):** Hardware sets this bit when the SLP_S4# assertion width is less than the time programmed in the SLP_S4# Minimum Assertion Width field in the GEN_PMCON_B register.
17	0x0 RO	**Reserved (RSVD_17):** Reserved.
16	0x0 RW/1C/V	**Global Reset Status (GBL_RST_STS):** This bit is set after a global reset (not G3 or DeepSx) occurs. See the GEN_PMCON_B.HOST_RST_STS bit for potential usage models.
15	0x0 RW	**Allow iCLK PLL Shutdown in C0 (ALLOW_ICLK_PLL_SD_INC0):** When this bit is left at '0' (default), PMC allows iCLK PLL Shutdown only when the CPU is in a non-C0 state.
14	0x0 RW	**Dynamic mPHY CRI Clock Gate Override (MPHY_CRICLK_GATE_OVR):** • 0: Enable CRI clock gating in the modPHY • 1: Disable CRI clock gating in the modPHY BIOS reading this register should always return the correct value.

Bit Range	Default & Access	Field Name (ID): Description
13	0x0 RW	**Allow OPI PLL Shutdown in C0 (ALLOW_OPI_PLL_SD_INC0):** When this bit is left at '0' (default), PMC allows OPI PLL Shutdown only when the CPU is in a non-C0 state. When set to '1', the OPI PLL can be shut down when the CPU is in C0 or Cx state assuming all other gating conditions are satisfied.
12	0x0 RW	**Allow SPXB Clock Gating in C0 (ALLOW_SPXB_CG_INC0):** When this bit is left at '0' (default), PMC allows SBXB Clock gating only when the CPU is in a non-C0 state.
11	0x0 RO	**Reserved (RSVD_11):** Reserved.
10	0x0 RW	**BIOS PCI Express Enable (BIOS_PCI_EXP_EN):** This bit acts as a global enable for the SCI associated with the PCI express ports. If this bit is not set, then the various PCI Express ports cannot cause the PCI_EXP_STS bit to go active.
9	0x0 RO/V	**Power Button Level (PWRBTN_LVL):** This read-only bit indicates the current state of the PMU_PWRBTN_N signal. • 1= High • 0 = Low
8	0x0 RO	**Reserved (RSVD_8):** Reserved.
7	0x0 RW	**Allow L1.LOW Entry During C0 (ALLOW_L1LOW_C0):** When this bit is 0, the PMC only allows L1.LOW entry if the CPU is in Cx (EA = 0). When set to 1, the PMC allows L1.LOW entry regardless of the value of EA.
6	0x0 RW	**Allow L1.LOW Entry with OPI Voltage On (ALLOW_L1LOW_OPI_ON):** When this bit is 0, the PMC only allows L1.LOW entry if the OPI voltage is off. When this bit is 1, the PMC allows L1.LOW entry regardless of whether the OPI voltage is on/off.
5	0x0 RW	**Allow L1.LOW Entry with CPU BCLK REQ Asserted (ALLOW_L1LOW_BCLKREQ_ON):** When this bit is 0, the PMC only allows L1.LOW entry if the CPUs BCLK request is de-asserted. When this bit is 1, the PMC allows L1.LOW entry regardless of whether the CPUs BCLK request is asserted/de-asserted.
4	0x0 RW/L	**SMI Lock (SMI_LOCK):** When this bit is set, writes to the GLB_SMI_EN bit will have no effect. Once the SMI_LOCK bit is set, writes of 0 to SMI_LOCK bit will have no effect (i.e. once set, this bit can only be cleared by host_prim_rst_b).
3	0x0 RW/L	**Reserved:** Reserved.
2	0x0 RO	**Reserved (RSVD_2):** Reserved.
1:0	0x0 RW	**Period SMI Select (PER_SMI_SEL):** Software sets these bits to control the rate at which the periodic SMI# is generated: • 00 = 64 seconds (default) • 01 = 32 seconds • 10 = 16 seconds • 11 = 8 seconds Tolerance for the timer is ± 1 second.

58.2.5 General PM Configuration B (GEN_PMCON_B)—Offset A4h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:2] + A4h

Default: 00004007h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0x0 RO	**Reserved (RSVD_31_19):** Reserved.
18	0x0 RW/L	**RSVD:** Reserved
17	0x0 RW/L	**ACPI Base Lock (ACPI_BASE_LOCK):** When set to 1, this bit locks down the ACPI Base Address Register (ABASE) located at offset 40h. The Base Address Field becomes read-only. This bit becomes locked when a value of 1b is written to it.
16	0x0 RW/L	**RSVD:** Reserved
15	0x0 RW	**PME B0 S5 Disable (PME_B0_S5_DIS):** When cleared (default), wake events from PME_B0_STS are allowed in S5 if PME_B0_EN = 1. When set to 1, this bit blocks wake events from PME_B0_STS in S5, regardless of the state of PME_B0_EN. The net effect of setting PME_B0_S5_DIS = 1 is described here: • When PME_B0_EN = 0 and WOL Enable Override = 0: Don't Wake when in S5. • When PME_B0_EN = 0 and WOL Enable Override = 1: Wake (LAN only) when in S5. • When PME_B0_EN = 1 and WOL Enable Override = 0: Don't Wake when in S5. • When PME_B0_EN = 1 and WOL Enable Override = 1: Wake (LAN only) when in S5. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active.
14	0x1 RW/1C	**SUS Well Power Failure (SUS_PWR_FLR):** This bit is set to '1' whenever SUS well power is lost, as indicated by pri_pwrgood_rst_b assertion.
13	0x0 RW	**WOL Enable Override (WOL_EN_OVRD):** When this bit is set to 1, the integrated LAN is enabled to wake the system from S5 regardless of the value in the PME_B0_EN bit in the GPE0_EN register.
12	0x0 RW/L	**Disable SLP_X Stretching After SUS Well Power Up (DIS_SLP_X_STRCH_SUS_UP):** When this bit is set to 1, all PMU_SLP_* pin stretching is disabled when powering up after a SUS well power loss. When this bit is left at 0, PMU_SLP_* stretching will be performed after SUS power failure as enabled in various other fields.
11:10	0x0 RW/L	**SLP_S3# Minimum Assertion Width (SLP_S3_MIN_ASST_WDTH):** This 2-bit value indicates the minimum assertion width of the PMU_SLP_S3_N signal to guarantee that the Main power supplies have been fully power-cycled. This value may be modified per platform depending on power supply capacitance, board capacitance, power failure detection circuits, etc. Settings are: • 00: 60 µsec • 01: 1 ms • 10: 50 ms • 11: 2 sec This field is not writable when the SLP_Sx# Stretching Policy Lock- Down bit is set. This bit is cleared by the pri_pwrgood_rst_b pin.
9	0x0 RW/1C/V	**Host Reset Status (HOST_RST_STS):** This bit is set by hardware when a host partition reset (not a global reset, DeepSx, or G3) occurs.
8	0x0 RO	**Reserved (RSVD_8):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
7:6	0x0 RW	**SWSMI Rate Select (SWSMI_RATESEL):** This 2-bit value indicates when the SWSMI timer will time out. Valid values are: • 00 1.5ms ± 0.6ms • 01 16ms ± 4ms • 10 32ms ± 4ms • 11 64ms ± 4ms This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active.
5:4	0x0 RW/L	**SLP_S4# Minimum Assertion Width (S4MAW):** This 2-bit value indicates the minimum assertion width of the SLP_S4# signal to guarantee that the DRAMs have been safely power-cycled. This value may be modified per platform depending on DRAM types, power supply capacitance, etc. Valid values are: • 11: 1 second • 10: 2 seconds • 01: 3 seconds • 00: 4 seconds This value is used in two ways: • 1. If the PMU_SLP_S45_N assertion width is ever shorter than this time, the status bit MS4V of the GEN_PMCON_A register is set for BIOS to read when S0 is entered • 2. If enabled by bit 3 in this register, the hardware will prevent the PMU_SLP_S45_N signal from deasserting within this minimum time period after asserting.
3	0x0 RW/L	**SLP_S4# Assertion Stretch Enable (S4ASE):** When set to 1, the PMU_SLP_S45_N pin (which includes the ME override logic) will minimally assert for the time specified in bits 5:4 of this register. When 0, the minimum assertion time for PMU_SLP_S45_N is the same as the timing defined in the timing tables.
2	0x1 RW	**RTC_PWR_STS (RPS):** The SoC will set this bit to 1 to indicate a weak or missing battery. The bit will remain set until the software clears it by writing a 0 back to this bit position. This bit is in the RTC power well and is not cleared by any type of reset.
1	0x1 RW/1C	**PWR_FLR (PF):** • 0 = Indicates that the trickle current has not failed since the last time the bit was cleared. • 1 = Indicates that the trickle current (from the main battery or trickle supply) was removed or failed. Software writes a 1 to this bit to clear it.
0	0x1 RW/V	**AFTERG3_EN (AG3E):** Determines what state to go to when power is reapplied after a power failure (G3 state). • 0 = System will return to an S0 state (boot) after power is re-applied. • 1 = System will return to the S5 state. In the S5 state, the only enabled wake-up event is the Power Button or any enabled wake event that was preserved through the power failure. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active.

58.2.6 Extended Test Mode Register 3 (ETR3)—Offset ACh

This register resides in the primary Core well. All bits except bit[23:16] are reset by host_deep_rst_b. Bit[23:16] are reset by pri_pwrgood_rst_b only.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:2] + ACh

Default: 80000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x1 RW/V/L	**CF9h Lockdown (CF9LOCK):** When set, this will lock the "CF9h Global Reset" bit. When set, this register locks itself. This register is reset by a CF9h reset. ***Note:*** In manufacturing/ debug environments this bit can be left as default 0b. In all other environments, BIOS must program this bit to 1b.
30:21	0x0 RO	**Reserved (RSVD_30_21):** These bits are reserved for Intel.
20	0x0 RW/L	**CF9h Global Reset (CF9GR):** When this bit is set, a CF9h write of 6h or Eh will cause a Global Reset of both the Host and the ME partitions. If this bit is cleared, a CF9h write of 6h or Eh will only reset the Host partition.
19:0	0x0 RO	**Reserved (RSVD_19_0):** These bits are reserved for Intel.

58.3 Registers in Memory Space—PWRMBASE

58.3.1 Wake Alarm Device Timer: AC (WADT_AC)—Offset 0h

Bits in this register only need to be valid for reading when the Main power well is up. However, since some of the events may initially be detected while the Main power well and SUS well are down, they are marked as DSW bits.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [PWRMBASE] + 0h

Default: FFFFFFFFh

PWRMBASE Type: PCI Configuration Register (Size: 32 bits)
PWRMBASE Reference: [B:0, D:31, F:2] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0xFFFFFFFF RW/V	**Wake Alarm Device Timer Value for AC Mode (WADT_AC_VAL):** This field contains the 32-bit wake alarm device timer value (granularity 1s) for AC power. The timer begins decrementing when written to a value other than FFFFFFFFh (regardless of the power source when the write occurs). Upon counting down to 0: • If on AC power, GPE0b_STS.WADT_STS will be set. This status bit being set will generate a host wake if GPE0b_EN.WADT_EN is 1. • If the power source is DC at this time, the status bit is not set. However, if AC power subsequently returns to the platform, the AC Expired Timer begins running. See the WADT_EXP_AC register for details. • The timer returns to its default value of FFFFFFFFh.

58.3.2 Wake Alarm Device Timer: DC (WADT_DC)—Offset 4h

Bits in this register only need to be valid for reading when the Main power well is up. However, since some of the events may initially be detected while the Main power well and SUS well are down, they are marked as DSW bits.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [PWRMBASE] + 4h

Default: FFFFFFFFh

PWRMBASE Type: PCI Configuration Register (Size: 32 bits)
PWRMBASE Reference: [B:0, D:31, F:2] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0xFFFFFFFF RW/V	**Wake Alarm Device Timer Value for DC Mode (WADT_DC_VAL):** This field contains the 32-bit wake alarm device timer value (granularity 1s) for DC power. The timer begins decrementing when written to a value other than FFFFFFFFh (regardless of the power source when the write occurs). Upon counting down to 0: • If on DC power, GPE0b_STS.WADT_STS will be set. This status bit being set will generate a host wake if GPE0b_EN.WADT_EN is 1. • If the power source is AC at this time, the status bit is not set. However, if DC power subsequently returns to the platform, the DC Expired Timer begins running. See the WADT_EXP_DC register for details. • The timer returns to its default value of FFFFFFFFh.

58.3.3 Wake Alarm Device Expired Timer: AC (WADT_EXP_AC)—Offset 8h

Bits in this register only need to be valid for reading when the Main power well is up. However, since some of the events may initially be detected while the Main power well and SUS well are down, they are marked as DSW bits.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [PWRMBASE] + 8h

Default: FFFFFFFFh

PWRMBASE Type: PCI Configuration Register (Size: 32 bits)
PWRMBASE Reference: [B:0, D:31, F:2] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0xFFFFFFFF RW/V	**Wake Alarm Device Expired Timer Value for AC Mode (WADT_EXP_AC_VAL):** This field contains the 32-bit wake alarm device "Expired Timer" value (granularity 1s) for AC power. The timer begins decrementing after switching from DC to AC power, in the case where the WADT_AC timer has already expired while the platform was on DC power. This timer only decrements while operating on AC power. So if the power source switches back to DC power, the timer will stop (but not reset). When AC power returns, the timer will again begin decrementing. ***Note:*** This timer will only begin decrementing under the conditions described above if this field has been configured for something other than its default value of FFFFFFFFh (i.e. FFFFFFFFh = disabled). Upon expiration of this timer: • If on AC power, GPE0b_STS.WADT_STS will be set. This status bit being set will generate a host wake if GPE0b_EN.WADT_EN is 1. • BOTH the AC and DC Expired Timers return to their defaults value of FFFFFFFFh.

58.3.4 Wake Alarm Device Expired Timer: DC (WADT_EXP_DC)—Offset Ch

Bits in this register only need to be valid for reading when the Main power well is up. However, since some of the events may initially be detected while the Main power well and SUS well are down, they are marked as DSW bits.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [PWRMBASE] + Ch

Default: FFFFFFFFh

PWRMBASE Type: PCI Configuration Register (Size: 32 bits)
PWRMBASE Reference: [B:0, D:31, F:2] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0xFFFFFFFF RW/V	**Wake Alarm Device Expired Timer Value for DC Mode (WADT_EXP_DC_VAL):** This field contains the 32-bit wake alarm device "Expired Timer" value (granularity 1s) for DC power. The timer begins decrementing after switching from AC to DC power, in the case where the WADT_DC timer has already expired while the platform was on AC power. This timer only decrements while operating on DC power. So if the power source switches back to AC power, the timer will stop (but not reset). When DC power returns, the timer will again begin decrementing. ***Note:*** This timer will only begin decrementing under the conditions described above if this field has been configured for something other than its default value of FFFFFFFFh (i.e. FFFFFFFFh = disabled). Upon expiration of this timer: • If on DC power, GPE0b_STS.WADT_STS will be set. This status bit being set will generate a host wake if GPE0b_EN.WADT_EN is 1. • BOTH the AC and DC Expired Timers return to their defaults value of FFFFFFFFh.

58.3.5 Power and Reset Status (PRSTS)—Offset 10h

Bits in this register only need to be valid for reading when the Main power well is up. However, since some of the events may initially be detected while the Main power well is down, they are marked as suspend well bits. All suspend well bits in this register are reset by global_rst_b.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [PWRMBASE] + 10h

Default: 05000000h

PWRMBASE Type: PCI Configuration Register (Size: 32 bits)
PWRMBASE Reference: [B:0, D:31, F:2] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x5 RO/V	**Power Management Controller Product ID (PMC_PRODID):** This field communicates the Product Family of the power management functionality.
23:16	0x0 RO/V	**Power Management Controller Revision ID (PMC_REVID):** This field communicates the implementation revision of the power management functionality.
15:12	0x0 RO	**Reserved (RSVD_15_12):** Reserved.
11	0x0 RW/1C/V	**Patch Copied Over Status (PATCH_COPIED_STS):** The SoC sets this bit when the Patch code is successfully authenticated and loaded into the SoC from the flash.
10	0x0 RO/V	**Patch Revision Not Compatible Status (PATCH_REV_NOT_COMP):** The SoC sets this bit when the Patch code is not compatible with the Power Management Controller Product and/or Revision. This bit remains valid after a PMC Patch load is attempted until the next global_rst_b.
9	0x0 RO/V	**Patch Load Timeout Status (PATCH_LOAD_TO):** The SoC sets this bit if the loading function fails to complete within a reasonable time limit.
8	0x0 RO/V	**PMC Operational Status (PMC_OP_STS):** The SoC sets this bit when the PMC becomes operational after completing the Patch Load, or, if no patch is needed. BIOS must wait for this bit to be set before performing resets or sleep events. This bit remains valid after a PMC Patch load until the next global_rst_b.
7	0x0 RW/1C/V	**VE Watch Dog Timer Status (VE_WDT_STS):** This bit will be set to '1' when the VE Watch Dog Timer triggers a reset. It will be cleared by a write of '1' by software.
6	0x0 RW/1C/V	**IE Host Wake Status (IE_HOST_WAKE_STS):** This bit is set when the IE generates a non-maskable wake event and is not affected by any other enable bit. When this bit is set, the host power management logic wakes to S0.
5	0x0 RW/1C/V	**Wake On LAN Override Wake Status (WOL_OVR_WK_STS):** This bit gets set when integrated LAN Signals a Power Management Event AND the system is in S5. BIOS can read this status bit to determine this wake source. Software clears this bit by writing a 1 to it.
4	0x0 RO	**Reserved (RSVD_4):** Reserved.
3	0x0 RO/V	**HR_SHAD_IE_EN_STS:** This register shadows the IE ROM Check in host space. • 0 = IE is disabled • 1 = IE is enabled
2:1	0x0 RO	**Reserved (RSVD_2_1):** Reserved.
0	0x0 RW/1C/V	**ME_HOST_WAKE_STS:** This bit is set when the ME generates a non-maskable wake event and is not affected by any other enable bit. When this bit is set, the host power management logic wakes to S0.

58.3.6 Power Management Configuration Reg 1 (PM_CFG)—Offset 18h

This register contains misc. fields used to configure the SoC power management behavior. This register is in multiple power wells and reset domains (see below).

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [PWRMBASE] + 18h

Default: 00000020h

PWRMBASE Type: PCI Configuration Register (Size: 32 bits)
PWRMBASE Reference: [B:0, D:31, F:2] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**SATA Interface Disable Indication (SATA_DIS_IND):** When set to 1, this bit indicates that the SATA interface on the SoC is completely disabled. Therefore, the mPhy lanes normally assigned to SATA will operate through the PCIe controller (or not be used at all). When cleared, it indicates that at least some of the SATA interface lanes may be used actively in the SoC by the SATA controller, so none of the four lanes assigned to SATA interface can operate through the PCIe controller.
30	0x0 RW	**Timing t591 (TIMING_T591):** This field configures t591 timing involved in the over-clocking flow (Wait times between writes from PMC to ICC registers when executing BCLK slow ramp flow) ***Note:*** Encodings are all min timings.
29	0x0 RW	**Allow 24MHz Crystal Oscillator Shutdown (ALLOW_24_OSC_SD):** When this bit is '0', the 24MHz crystal oscillator will always be running while in S0. When this bit is '1', the 24MHz crystal oscillator may be shut down in S0 (Cx only) if all other conditions allow.
28	0x0 RW	**Time Sync Maximum Attempts (TS_MAXTRY):** The value of this bit determines how many times the PMC will retry time synchronization before stopping and reporting failure to the initiator. Encoding: • 0 Maximum of 5 attempts • 1 Maximum of 10 attempts
27	0x0 RW/L	**Debug Mode Lock (DBG_MODE_LOCK):** When this bit is set to '1', the following bit is locked down • ETR3.SKIP_HOST_RST_HS • ETR3.RST_SX_TO_DBG • ETR3.PSMI_DGB_MODE_EN This bit becomes locked when a value of 1b is written to it. Writes to 0 to this bit are always ignored. Once locked, the only way the bit gets cleared is through a PLTRST# assertion.
26:24	0x0 RO	**Reserved (RSVD_26_24):** Reserved.
23	0x0 RW	**Enable Global Reset on Uncorrectable Parity Error on PMC SRAM Interface (EN_PMC_UNC_ERR):** If this bit is set to '1', a global reset is triggered when a parity error is detected on PMC's SRAM interfaces. No action is taken on such parity errors if this bit is '0'. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active.
22	0x0 RO	**Reserved (RSVD_22):** Reserved.
21	0x0 RW	**RTC Wake from DeepSx Disable (RTC_DSX_WAKE_DIS):** When set, this bit disables RTC wakes from waking the system from DeepSx. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active.
20	0x0 RO	**Reserved (RSVD_20):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
19:18	0x0 RW/L	**SLP_SUS# Minimum Assertion Width (SLP_SUS_MIN_ASST_WDTH):** This 2-bit value indicates the minimum assertion width of the SLP_SUS# signal to guarantee that the SUS well power supplies have been fully power-cycled. This value may be modified per platform depending on power supply capacitance, board capacitance, power failure detection circuits, etc. Settings are: • 00 = 0 ms (i.e. stretching disabled - default) • 01 = 500ms • 10 = 1s • 11 = 4s This field is not writable when the SLP_Sx# Stretching Policy Lock- Down bit is set. This field is ignored when exiting a G3 state if the "Disable SLP_X Stretching After SUS Power Failure" bit is set. Note that unlike with all other SLP_* pin stretching, this disable bit only impacts SLP_SUS# stretching during G3 exit rather than both G3 and DeepSx exit. SLP_SUS# stretching always applies to DeepSx regardless of the disable bit. **Programming Note:** For platforms that enable DeepSx, BIOS must program SLP_SUS# stretching to be greater than or equal to the largest stretching value on any other SLP_* pin (SLP_S3#, SLP_S4#, SLP_LAN#, or SLP_A#). This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active.
17:16	0x0 RW/L	**SLP_A# Minimum Assertion Width (SLP_A_MIN_ASST_WDTH):** This 2-bit value indicates the minimum assertion width of the SLP_A# signal to guarantee that the ASW power supplies have been fully power-cycled. This value may be modified per platform depending on power supply capacitance, board capacitance, power failure detection circuits, etc. Settings are: 00 = 0 ms (i.e. stretching disabled - default) 01 = 4 s 10 = 98 ms 11 = 2 s This field is not writable when the SLP_Sx# Stretching Policy Lock- Down bit is set. This field is ignored when exiting a G3 or DeepSx state if the "Disable SLP_X Stretching After SUS Power Failure" bit is set. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active.
15:14	0x0 RW/L	**SLP_LAN# Minimum Assertion Width (SLP_LAN_MIN_ASST_WDTH):** This 2-bit value indicates the minimum assertion width of the SLP_LAN# signal to guarantee that the power to the PHY has been fully power-cycled. This value may be modified per platform depending on power supply, capacitance, board capacitance, power failure detection circuits, etc. This field is not writable when the SLP_Sx# Stretching Policy Lock Down bit is set to '1'. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active.
13	0x0 RW	**After G3 Last State Enable (AG3_LS_EN):** When GEN_PMCON_B.AG3E is 0, AG3_LS_EN determines whether the SoC will consider the platforms previous state when determining whether to power-up after G3. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active. Encodings: • 0 (default): SoC power-up policies after G3 do not depend on the platforms state when the G3 occurred. • 1: SoC power-up policies after G3 depend on the platforms state when the G3 occurred. - If the power failure occurred while the platform was in S0 or while in the process of going to S0, the platform will power-up to S0 upon exiting G3. - If the power failure occurred while the platform was in Sx or while in the process of going to Sx, the platform will stay in S4/S5 upon exiting G3. ***Note:*** This bit applies only when GEN_PMCON_B.AG3E is 0. If AG3E is 1, the platform will always stay in S4/S5 after G3 regardless of the value of AG3_LS_EN. ***Note:*** The destination state is considered to be S0 during both host wake and throughout host partition resets with/without power cycle.

Bit Range	Default & Access	Field Name (ID): Description
12	0x0 RW	**After Type 8 Global Reset Last State Enable (A8GR_LS_EN):** AGR_LS_EN determines whether the SoC will consider the platforms previous state when determining whether to power-up after non-thermal and non-explicitly requested type 8 global resets. See the Reset Sources table for a list of impacted reset types. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active. Encodings: • 0 (default): SoC power-up policies after a global reset do not depend on the platforms state when the reset occurred. • 1: SoC power-up policies after a global reset depend on the platforms state when the reset occurred. - If the global reset occurred while the platform was in S0 or while in the process of going to S0, the platform will power-up to S0 after the reset. - If the global reset occurred while the platform was in Sx or while in the process of going to Sx, the platform will stay in S5 upon exiting G3. ***Note:*** The destination state is considered to be S0 during both host wake and throughout host partition resets with/without power cycle.
11	0x0 RW	**Global Reset Three Strike Counter Enable (GR_TSC_EN):** When set, GR_TSC_EN will cause the PMC to keep the platform in S5 after the third consecutive type 7 global reset occurs during the boot flow. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active. The three strike counter is reset in the following situations: • The system reaches S0 • A type 8 global reset occurs, including after the three strike counter causes the system to stay in S5. • RSMRST_N asserts (due to DeepSx entry or a G3 event occurring)
10	0x0 RW	**Power Button Debounce Mode (PB_DB_MODE):** This bit controls when interrupts (SMI#, SCI) are generated in response to assertion of the PMU_PWRBTN_N pin. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active. This bit's values cause the following behavior: • '0': The 16ms debounce period applies to all usages of the PMU_PWRBTN_N pin (legacy behavior). • '1': When a falling edge occurs on the PMU_PWRBTN_N pin, an interrupt is generated and the 16ms debounce timer starts. Subsequent interrupts are masked while the debounce timer is running. ***Note:*** Power button override logic always samples the post-debounce version of the pin.
9:8	0x0 RW/L	**Reset Power Cycle Duration (PWR_CYC_DUR):** The value in this register determines the minimum time a platform will stay in reset (SLP_S3#, SLP_S4#, SLP_S5# asserted and also SLP_A# and SLP_LAN# asserted if applicable) during a host partition reset with power cycle or a global reset. The duration programmed in this register takes precedence over the applicable SLP_# stretch timers in these reset scenarios. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active. This field is not writable when the SLP_Sx# Stretching Policy Lock-Down bit is set. Note that the duration programmed in this register should never be smaller than the stretch duration programmed in the following registers • GEN_PMCON_3.SLP_S3_MIN_ASST_WDTH • GEN_PMCON_3.S4MAW • PM_CFG.SLP_A_MIN_ASST_WDTH • PM_CFG.SLP_LAN_MIN_ASST_WDTH
7:6	0x0 RO	**Reserved (RSVD_7_6):** Reserved.
5	0x1 RW/V	**CPU OC Strap (COCS):** SW programs this pin with the value that should be reflected to the GPIO8_OCS pin, when the pin is in native mode. Hardware also sets this bit when the over-clocking watchdog timer expires.
4:2	0x0 RO	**Reserved (RSVD_4_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1:0	0x0 RW/V	**Timing t581 (TIMING_T581):** This field configures the t581 timing involved in the power down flow (CPUPWRGD inactive to ICC_ICLK_INIT inactive). Encodings (all min timings): • 00: 10 us (default) • 01: 100 us • 10: 1 ms • 11: 10 ms reset_type=host_deep_rst_b

58.3.7 PCH Power Management Status (PCH_PM_STS)—Offset 1Ch

This register contains misc. fields used to record events pertaining to SoC power management. Unless otherwise indicated, all RWC bits are cleared with a write of 1 by software. This register is in multiple power wells and reset domains (see below).

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [PWRMBASE] + 1Ch

Default: 00000000h

PWRMBASE Type: PCI Configuration Register (Size: 32 bits)
PWRMBASE Reference: [B:0, D:31, F:2] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0x0 RO	**Reserved (RSVD_30_25):** Reserved.
16	0x0 RW/1C/V	**ADR Reset Status (ADR_RST_STS):** When set to '1', this bit indicates that the Asynchronous DRAM Refresh (ADR) flow was executed during a prior global reset entry.
15:13	0x0 RW	**BIOS Discovered DDR Speed (SPD_DDR_SPEED):** • 000=DDR 1600 • 001=DDR 1867 • 010=DDR 2133 • 011=DDR 2400 • 100=DDR 2666
12	0x0 RW	**Equal Speed Enable (EQUAL_SPEED_ENABLE):** • 0= Do not enable SSC PLL relock when SPD_DDR_SPEED = MAX_DDR_SKU • 1= enable SSC PLL relock when SPD_DDR_SPEED = MAX_DDR_SK
11	0x0 RW	**The triggered reset is an SPD reset (SPD_BIOS_RESET):** • 0= not SPD reset • 1= SPD Reset
10:7	0x0 RO	**Reserved (RSVD_10_7):** Reserved.
6	0x0 RW/1C/V	**IE uncorrectable Error Status (IE_UE_STS):** PMC FW Sets this bit as an indication that ME uncorrectable error as been forwarded to PMC FW
5:1	0x0 RO	**Reserved (RSVD_5_1):** Reserved.
0	0x0 RW/1C/V	**ME Uncorrectable Error Status (ME_UE_STS):** PMC FW sets this bit as an indication that a ME uncorrectable error has been forwarded to PMC FW.

58.3.8 PCH Power Management Status (PCH_PM_STS2)—Offset 24h

This register contains misc. fields used to record events pertaining to SoC power management. Unless otherwise indicated, all RWC bits are cleared with a write of '1' by software.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [PWRMBASE] + 24h

Default: 00000000h

PWRMBASE Type: PCI Configuration Register (Size: 32 bits)
PWRMBASE Reference: [B:0, D:31, F:2] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0x0 RO	**Reserved (RSVD_31_21):** Reserved.
20:17	0x0 RO/V	**Current SPD SPEED (CURRENT_SPD_SPEED):** 0xxxx = undefined, use max DDR mem config (fuse) • 1000 = DDR1600 • 1001 = DDR1866 • 1010 = DDR2133 • 0000 = DDR2400 ***Note:*** The value of current SPD SPEED is only updated when the SPD reset is happened.
16	0x0 RO/V	**SPD_RESET_PCODE:** • 0 = PMC indicates to Pcode that this is not a SPD Reset. • 1 = PMC indicates to Pcode that this is a SPD Reset Set by PMC when SPD Reset is triggered
15	0x0 RW/1C/V	**IE Host Boot Prep Done Failure (IE_HBPD):** IE Host Boot Preparation did not complete.
14	0x0 RW/1C/V	**CPU Reset Done Failure (CRD):** CPU Reset Done message did not arrive from the CPU.
13	0x0 RW/1C/V	**ME Host Boot Prep Done Failure (ME_HBPD):** Intel® ME Host Boot Preparation did not complete.
12	0x0 RW/1C/V	**PINSTOP Acknowledge Failure (PINSTOP_ACK):** The GbE PHY did not respond to the PINSTOP message.
11	0x0 RW/1C/V	**PSCHS Acknowledge Failure (PSCHS_ACK):** The GbE MAC did not respond to the PSCHS message.
10	0x0 RW/1C/V	**SMT Reset Acknowledge Failure (SMT_RST_ACK):** One or more SMT controllers did not respond to the Intel® Management Engine bus reset warning.
9	0x0 RW/1C/V	**EXI State Transition Acknowledge Failure (EXI_STATE_TRANS_ACK):** EXI state transition ACK did not arrive.
8	0x0 RW/1C/V	**SPI Common Prep Handshake Failure (SPI_HRHS):** The SPI controller did not complete the host partition reset/Sx entry handshake.
7	0x0 RW/1C/V	**XCK Common Prep Handshake Failure (XCK_HRHS):** The integrated clocking unit did not complete the host partition reset/Sx entry handshake.
6	0x0 RW/1C/V	**CPU S345/Reset Warn Acknowledge Failure (CPU_S345RW_ACK):** The CPU did not respond to the GO_S345 or RESET_WARN message.
5	0x0 RW/1C/V	**CPU S1 Acknowledge Failure (CPU_S1_ACK):** The CPU did not respond to the GO_S1_XXX message.
4	0x0 RW/1C/V	**DMI L23 Entry Failure (DMI_L23):** The DMI interface did not respond to the request to entry L23.
3	0x0 RW/1C/V	**SMBus Host Reset Handshaking Failure (SMB_SRHS):** The host SMBus controller did not complete the host partition reset handshake.

Bit Range	Default & Access	Field Name (ID): Description
2	0x0 RW/1C/V	**South Port L23 Entry Failure (SP_L23):** The SoC PCI Express ports did not complete the host partition reset/Sx entry handshake.
1	0x0 RW/1C/V	**XHCI Common Prep Handshake Failure (XHCI_HRHS):** The USB XHCI controller did not complete the host partition reset/Sx entry handshake.
0	0x0 RW/1C/V	**EVA L23 Entry Failure (EVA_L23):** The EVA did not complete the host partition reset/Sx entry handshake.

58.3.9 ADR Enable (ADR_EN)—Offset F0h

This register contains several enable bits related to the ”Automatic DIMM Self-Refresh” Asynchronous DRAM Refresh (ADR) feature. The default value of each bit is chosen based on the expected usage, but the values are programmable to retain flexibility. See the section on ADR later in chap. 16 for more information. This register is in the CORE power well and is reset by host_prim_rst_b.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [PWRMBASE] + F0h

Default: 200F0DE4h

PWRMBASE Type: PCI Configuration Register (Size: 32 bits)
PWRMBASE Reference: [B:0, D:31, F:2] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RO	**Reserved (RSVD_31_30):** Reserved.
29	0x1 RW	**ADR GPIO Reset Enable (ADR_GPIO_RST_EN):** If this bit is set to '1', a Global Reset will be generated once the internal flush sequence is completed after: • Triggered by the ADR_TRIGGER signal pin (if available in the SoC product SKU). -OR- • Qualified internal events and the following are true: The ADR feature is part of the particular SoC product SKU, and ADR_FEAT_EN (bit 0) is a 1. If this bit is cleared, the active-high ADR_TRIGGER signal pin can still be enabled to affect the internal flush, but on its own, the signal does not trigger a Global Reset. ***Note:*** Unlike the other ADR_EN bits in this register, this enable bit is not required to be set to 1 for this source to trigger the warning to the SoC and CPU. This bit only impacts whether or not this source will actually trigger a Global Reset.
28:20	0x0 RO	**Reserved (RSVD_28_20):** Reserved.
19	0x1 RW/V	**IE Uncorrectable Error ADR Enable (IE_UERR_ADR_EN):** If this bit is set to '1', the IE uncorrectable SRAM error is included in the ADR feature. ***Note:*** The default value for this bit was chosen to be '1' because this reset source is not considered to be time-critical.
18	0x1 RW/V	**IE Initiated Global Reset ADR Enable (IEGBL_ADR_EN):** If this bit is set to '1', the IE-initiated global reset source is included in the ADR feature. ***Note:*** The default value for this bit was chosen to be '1' because this reset source is not considered to be time-critical.
17	0x1 RW/V	**IE FW Watchdog Timer ADR Enable (IEWDT_ADR_EN):** If this bit is set to '1', the IE firmware watchdog timer global reset source is included in the ADR feature. ***Note:*** The default value for this bit was chosen to be '1' because this reset source is not considered to be time-critical.
16	0x1 RW/V	**IE Initiated Power Button Override ADR Enable (IEPBO_ADR_EN):** If this bit is set to '1', the IE-Initiated Power Button Override Global Reset source is included in the ADR feature. ***Note:*** The default value for this bit was chosen to be '1' because this reset source is not considered to be time-critical.
15	0x0 RO	**Reserved (RSVD_15):** Reserved.
14	0x0 RW/V	**PMC Parity Error ADR Enable (PMC_PARERR_ADR_EN):** If this bit is set to '1', the PMC SUS RAM Parity Error Global Reset source is included in the ADR feature. ***Note:*** The default value for this bit was chosen to be '0' because this reset source is considered to be time-critical.
13	0x0 RO	**Reserved (RSVD_13):** Reserved.
12	0x0 RW/V	**SYS_PWROK Failure ADR Enable (SYSPWR_ADR_EN):** If this bit is set to '1', the SYS_PWROK Failure Global Reset source is included in the ADR feature. ***Note:*** The default value for this bit was chosen to be '0' because this reset source is considered to be time-critical.

Bit Range	Default & Access	Field Name (ID): Description
11	0x1 RW/V	**ME Uncorrectable Error ADR Enable (ME_UERR_ADR_EN):** If this bit is set to '1', the Intel® ME Uncorrectable SRAM error Global Reset source is included in the ADR feature. ***Note:*** Note: The default value for this bit was chosen to be '1' because this reset source is not considered to be time-critical.
10	0x1 RW/V	**PMC FW Watchdog Timer ADR Enable (PMCWDT_ADR_EN):** If this bit is set to '1', the PMC Firmware Watchdog Timer Global Reset source is included in the ADR feature. ***Note:*** The default value for this bit was chosen to be '1' because this reset source is not considered to be time-critical.
9	0x0 RO	**Reserved (RSVD_9):** Reserved.
8	0x1 RW/V	**ME-Initiated Global Reset ADR Enable (MEGBL_ADR_EN):** If this bit is set to '1', the ME-initiated Global Reset source is included in the ADR feature. ***Note:*** The default value for this bit was chosen to be '1' because this reset source is not considered to be time-critical.
7	0x1 RW/V	**ME FW Watchdog Timer ADR Enable (MEWDT_ADR_EN):** If this bit is set to '1', the ME Firmware Watchdog Timer Global Reset source is included in the ADR feature. ***Note:*** The default value for this bit was chosen to be '1' because this reset source is not considered to be time-critical.
6	0x1 RW/V	**ME-Initiated Power Button Override ADR Enable (MEPBO_ADR_EN):** If this bit is set to '1', the ME-Initiated Power Button Override Global Reset source is included in the ADR feature. ***Note:*** The default value for this bit was chosen to be '1' because this reset source is not considered to be time-critical.
5	0x1 RW/V	**Power Button Override ADR Enable (PBO_ADR_EN):** If this bit is set to '1', the Power Button Override Global Reset source is included in the ADR feature. ***Note:*** The default value for this bit was chosen to be '1' because this reset source is not considered to be time-critical.
4:3	0x0 RO	**Reserved (RSVD_4_3):** Reserved.
2	0x1 RW/V	**PMC FW-Initiated Global Reset ADR Enable (PMCGBL_ADR_EN):** If this bit is set to '1', all PMC firmware-initiated Global Reset sources are included in the ADR feature. The specific sources are: - SMBUS slave unconditional power down message • I/O space CF9h write or Shutdown Special-Cycle with the policy set for Global Reset. • Host partition reset entry timeout. • Sx entry timeout. • Any Host partition reset triggered with the "Promote Host Partition Reset to Global Reset" policy bit set to 1. ***Note:*** The default value for this bit was chosen to be '1' because any FW-handled global reset source is not considered to be time-critical.
1	0x0 RO	**Reserved (RSVD_1):** Reserved.
0	0x0 RW/V	**ADR Feature Enable (ADR_FEAT_EN):** If this bit is a '1' and the SoC product SKU supports ADR, SoC, support for Asynchronous DRAM Refresh is enabled. The other bits in this register determine which individual reset sources are included.

58.3.10 System Time Capture Trigger (SYSTIMCT)—Offset F8h

This register contains bits related to the "Audio Time Capture (ATC)" feature. This register is in the CORE power well and is reset by host_prim_rst_b.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [PWRMBASE] + F8h

Default: 00000000h

PWRMBASE Type: PCI Configuration Register (Size: 32 bits)
PWRMBASE Reference: [B:0, D:31, F:2] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0x0 RO	**Reserved (RSVD_31_1):** Reserved.
0	0x0 RW/1S/V	**Capture Now (CAPTURE_NOW):** Write of '1' to this bit triggers time capture in all components supporting this feature. Hardware clears this register to indicate that time capture is complete. Once the bit is set to '1', subsequent writes of '0' or '1' have no effect until the bit is cleared by hardware. Please refer to the Audio Time Synchronization section for more details on Audio Synchronization and for a list of consumers of the "capture" signal from PMC. Implementation note: Once the bit is written to '1'. hardware should keep the "capture" signal asserted high for 16 PMC clocks, then keep the signal deasserted low for another 16 PMC clocks and then clear this register bit.

58.3.11 ACPI Timer Control (ACPI_TMR_CTL)—Offset FCh

This register allows software to disable the ACPI Timer, which could result in power savings for the SoC. This register is in the CORE power well and is reset by host_prim_rst_b.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [PWRMBASE] + FCh

Default: 00000000h

PWRMBASE Type: PCI Configuration Register (Size: 32 bits)
PWRMBASE Reference: [B:0, D:31, F:2] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RO	**Reserved (RSVD_31_2):** Reserved.
1	0x0 RW	**ACPI Timer Disable (ACPI_TIM_DIS):** This bit determines whether the ACPI Timer is enabled to run. Note that even when enabled, the timer only runs during S0. - 0: ACPI Timer is enabled (default) - 1: ACPI Timer is disabled (halted at the current value)
0	0x0 RW/1S/V	**ACPI Timer Clear (ACPI_TIM_CLR):** Writing a 1 to this bit will clear the ACPI Timer to all 0s. Hardware will automatically clear the bit back to '0' once the timer clear operation has completed. Writing a 0 to this bit has no effect. Implementation Note: The SoC must be capable of honoring this bit even while ACPI_TIM_DIS=1.

58.3.12 GPIO Configuration (GPIO_CFG)—Offset 120h

This register is in the PRIMARY power well and is reset by global_rst_b. reset_type=global_rst_b.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [PWRMBASE] + 120h

Default: 00000432h

PWRMBASE Type: PCI Configuration Register (Size: 32 bits)
PWRMBASE Reference: [B:0, D:31, F:2] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:11	0x0 RO	**Reserved (RSVD_31_11):** Reserved.
10:8	0x4 RW	**GPIO Group to GPE_DW2 assignment encoding (GPE0_DW2):** This register assigns a specific GPIO Group to the ACPI GPE0[95:64]. • 0h = reserved[7:0] and GPP_A[23:0] • 1h = reserved[7:0] and GPP_B[23:0] • 2h = reserved[7:0] and GPP_C[23:0] • 3h = reserved[7:0] and GPP_D[23:0] • 4h = reserved[7:0] and GPP_E[23:0] • 5h = reserved[7:0] and GPP_F[23:0] • 6h = reserved[23:0] and GPP_G[7:0] • 7h = reserved[20:0] and GPD[11:0]
7	0x0 RO	**Reserved (RSVD_7):** Reserved.
6:4	0x3 RW	**GPIO Group to GPE_DW1 assignment encoding (GPE0_DW1):** This register assigns a specific GPIO Group to the ACPI GPE0[63:32]. • 0h = reserved[7:0] and GPP_A[23:0] • 1h = reserved[7:0] and GPP_B[23:0] • 2h = reserved[7:0] and GPP_C[23:0] • 3h = reserved[7:0] and GPP_D[23:0] • 4h = reserved[7:0] and GPP_E[23:0] • 5h = reserved[7:0] and GPP_F[23:0] • 6h = reserved[23:0] and GPP_G[7:0] • 7h = reserved[20:0] and GPD[11:0]
3	0x0 RO	**Reserved (RSVD_3):** Reserved.
2:0	0x2 RW	**GPIO Group to GPE_DW0 assignment encoding (GPE0_DW0):** This register assigns a specific GPIO Group to the ACPI GPE0[31:0]. • 0h = reserved[7:0] and GPP_A[23:0] • 1h = reserved[7:0] and GPP_B[23:0] • 2h = reserved[7:0] and GPP_C[23:0] • 3h = reserved[7:0] and GPP_D[23:0] • 4h = reserved[7:0] and GPP_E[23:0] • 5h = reserved[7:0] and GPP_F[23:0] • 6h = reserved[23:0] and GPP_G[7:0] • 7h = reserved[20:0] and GPD[11:0]

58.3.13 Global Reset Causes (GBLRST_CAUSE0)—Offset 124h

This register logs causes of host partition resets.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [PWRMBASE] + 124h

Default: 00000000h

PWRMBASE Type: PCI Configuration Register (Size: 32 bits)
PWRMBASE Reference: [B:0, D:31, F:2] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0x0 RO	**Reserved (RSVD_31_25):** Shadow additional HW initiated GBLRST causes once they're added.
24	0x0 RW/1C/V	**IE HW Uncorrectable Error (IE_UNCOR_ERR):** This bit is set to '1' by hardware when a global reset is triggered by IE hardware due to the detection of an uncorrectable ECC or parity error on a data read from one of its SRAMs.
23	0x0 RW/1C/V	**IE FW Watchdog Timer (IE_WDT):** This bit is set to '1' by hardware when a global reset is triggered by the second expiration of the IE firmware watchdog timer.
22	0x0 RW/1C/V	**IE-Initiated Global Reset (IE_GBL):** This bit is set to '1' by hardware when a global reset is triggered by an ME FW write of 1's to both GENCTL.'IE-Partition Reset' and GENCTL.'IE-Initiated Host Reset With Power Cycle' in the same write cycle (this is IE FW's method of requesting a global reset).
21	0x0 RW/1C/V	**IE-Initiated Power Button Override (IE_PBO):** This bit is set to '1' by hardware when a global reset is triggered by an IE FW write of '1' to GENCTL.'IE-Initiated Power Button Override
20	0x0 RW/1C/V	**Over-Clocking WDT Expiration In ICC Survivability Mode (OC_WDT_EXP_ICCSURV):** This bit is set to '1 by hardware when a global reset is triggered by the expiration of the over-clocking watchdog timer while running in a mode that has ICC survivability impact (OC_WDT_ICCSURV=1).
19	0x0 RW/1C/V	**Over-Clocking WDT Expiration In Non-ICC Survivability Mode (OC_WDT_EXP_NO_ICCSURV):** This bit is set to '1 by hardware when a global reset is triggered by the expiration of the over-clocking watchdog timer while running in a mode that does not have ICC survivability impact (OC_WDT_ICCSURV=0).
18	0x0 RW/1C/V	**ADR GPIO Reset (ADR_GPIO_RST):** This bit is set to '1' by hardware when a global reset is triggered by the assertion of the SoC ADR_TRIGGER signal pin.
17	0x0 RW/1C/V	**ME HW Uncorrectable Error (ME_UNCOR_ERR):** This bit is set to '1' by hardware when a global reset is triggered by ME hardware due to the detection of an uncorrectable ECC or parity error on a data read from one of its SRAM s.
16	0x0 RW/1C/V	**CPU Thermal Runaway Watchdog Timer (CPU_THRM_WDT):** This bit is set to '1' by hardware when a global reset is triggered by the expiration of the CPU Thermal Runaway Watchdog Timer.
15:14	0x0 RW/1C/V	**Reserved (RSVD_15_14):** Reserved.
13	0x0 RW/1C/V	**AS Well Power Failure (ASW_FLR):** This bit is set to '1' by hardware when a global reset is triggered by an unexpected loss of ASW power (i.e. a deassertion of APWROK at an unexpected time).
12	0x0 RW/1C/V	**SYS_PWROK Failure (SYSPWR_FLR):** This bit is set to '1' by hardware when a global reset is triggered by an unexpected loss of SYS_PWROK. FW arms this global reset source via GBLRST_CTL.EN_SYSPWR_FLR. This register bit is in the RTC power well and is retained if the system has a functioning RTC battery during the G3 Mechanical Off state.
11	0x0 RW/1C/V	**PCH_PWROK Failure (PCHPWR_FLR):** This bit is set to '1' by hardware when a global reset is triggered by an unexpected loss of PCH_PWROK. FW arms this global reset source via GBLRST_CTL.EN_PCHPWR_FLR. This register bit is in the RTC power well and is retained if the system has a functioning RTC battery during the G3 Mechanical Off state.
10	0x0 RW/1C/V	**PMC Firmware Global Reset (PMC_FW):** This bit is set to '1' by hardware when a global reset is triggered by a request from PMC firmware (i.e. a write of '1' to the GBLRST_CTL.TRIG_GBL bit).
9	0x0 RW/1C/V	**ME Firmware Watchdog Timer (ME_WDT):** This bit is set to '1' by hardware when a global reset is triggered by the second expiration of the ME firmware watchdog timer.
8	0x0 RW/1C/V	**PMC Firmware Watchdog Timer (PMC_WDT):** This bit is set to '1' by hardware when a global reset is triggered by the second expiration of the PMC firmware watchdog timer.

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RW/1C/V	**LTRESET# With Policy 1 (LTRST_POL1):** This bit is set to '1' by hardware when a global reset is triggered by an LTRESET# assertion with LT_E2STS.LT_RESET_POLICY = 1.
6	0x0 RW/1C/V	**ME-Initiated Global Reset (ME_GBL):** This bit is set to '1' by hardware when a global reset is triggered by an ME FW write of 1's to both GENCTL."ME-Partition Reset" and GENCTL."ME-Initiated Host Reset With Power Cycle" in the same write cycle (this is ME FW's method of requesting a global reset).
5	0x0 RW/1C/V	**CPU Thermal Trip (CPU_TRIP):** This bit is set to '1' by hardware when a global reset is triggered by a CPU thermal trip event (i.e. an assertion of the THRMTRIP# pin).
4	0x0 RW/1C/V	**ME-Initiated Power Button Override (ME_PBO):** This bit is set to '1' by hardware when a global reset is triggered by an ME FW write of '1' to GENCTL."ME-Initiated Power Button Override."
3	0x0 RW/1C/V	**ICH Catastrophic Temperature Event (ICH_CAT_TMP):** This bit is set to '1' by hardware when a global reset is triggered by a catastrophic temperature event from the ICH internal thermal sensor.
2	0x0 RW/1C/V	**PMC SUS RAM Uncorrectable Error (PMC_UNC_ERR):** This bit is set to '1' by hardware when a global reset is triggered due to an uncorrectable parity error on a data read from one of the PMC SUS well register files.
1	0x0 RW/1C/V	**Power Button Override (PB_OVR):** This bit is set to '1' by hardware when a global reset is triggered by a power button override (i.e. an assertion of the PMU_PWRBTN_N pin for 5.1 seconds).
0	0x0 RO	**Reserved (RSVD_0):** Reserved.

58.3.14 Global Reset Causes (GBLRST_CAUSE1)—Offset 128h

This register logs causes of host partition resets.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [PWRMBASE] + 128h

Default: 00000000h

PWRMBASE Type: PCI Configuration Register (Size: 32 bits)
PWRMBASE Reference: [B:0, D:31, F:2] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0x0 RO	**Reserved (RSVD_31_6):** Reserved.
5	0x0 RW/1C/V	**ME Set Power Button Status (ME_SET_PBO_STS):** If this bit is set, the cause of the previous global reset was ME FW setting the power button override status.
4	0x0 RO	**Reserved (RSVD_4):** Reserved.
3	0x0 RW/1C/V	**Host SMBus Message (HSMB_MSG):** If this bit is set, the cause of the previous global reset was a global reset request received over the host SMBus interface.
2	0x0 RW/1C/V	**Host Partition Reset Promotion (HOST_RST_PROM):** If this bit is set, the cause of the previous global reset was a host partition reset that was promoted to a global reset either due to ME or host policy.
1	0x0 RW/1C/V	**Sx Entry Timeout (SX_ENTRY_TIMEOUT):** If this bit is set, the cause of the previous global reset was an expiration of the timer that runs during Sx entry.
0	0x0 RW/1C/V	**Host Partition Reset Timeout (HOST_RESET_TIMEOUT):** If this bit is set, the cause of the previous global reset was an expiration of the timer that runs during host partition resets.

58.3.15 Host Partition Reset Causes (HPR_CAUSE0)—Offset 12Ch

This register logs causes of host partition resets.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [PWRMBASE] + 12Ch

Default: 00000000h

PWRMBASE Type: PCI Configuration Register (Size: 32 bits)
PWRMBASE Reference: [B:0, D:31, F:2] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0x0 RO	**Reserved (RSVD_31_19):** Reserved.
18	0x0 RO/V	**IE Initiated Host Reset With Power Down (IE_HRPD):** IE initiated host reset with power down
17	0x0 RO/V	**IE Initiated Host Reset With Power Cycle (IE_HRPC):** IE initiated host reset with power cycle.
16	0x0 RO/V	**IE Initiated Host Rest Without Power Cycle (IE_HR):** IE initiated host reset without power cycle.
15	0x0 RO	**Reserved (RSVD_15):** Reserved.
14	0x0 RO/V	**LT Sleep Error (LT_SLPERR):** Sleep entry attempted while LT secrets were present in memory.
13	0x0 RO/V	**Host SMBUS Host Reset With Power Cycle (HSMB_HRPC):** SMBus initiated host partition reset with power cycle.
12	0x0 RO/V	**Host SMBUS Host Reset Without Power Cycle (HSMB_HR):** SMBus initiated host partition reset without power cycle.
11	0x0 RO	**Reserved (RSVD_11_11):** Reserved.
10	0x0 RO/V	**ME-Initiated Host Reset With Power Down (MI_HRPD):** Intel® ME initiated host reset with power down.
9	0x0 RO/V	**ME-Initiated Host Reset With Power Cycle (MI_HRPC):** Intel® ME initiated host reset with power cycle.
8	0x0 RO/V	**ME-Initiated Host Reset Without Power Cycle (MI_HR):** Intel® ME initiated host reset without power cycle.
7	0x0 RO	**Reserved (RSVD_7):** Reserved.
6	0x0 RO/V	**Host TCO Watchdog Timer Second Expiration (TCO_WDT):** Host TCO watchdog timer reached zero for the second time.
5:4	0x0 RO	**Reserved (RSVD_5_4):** Reserved.
3	0x0 RO/V	**LTRESET (LTRST):** LTRESET message received and the LT.RESET.POLICY bit = '0'.
2	0x0 RO/V	
1	0x0 RO/V	**Write to CF9 (CF9_ES):** This bit will be set when Host software writes a value of 6h or Eh to the CF9h register in Host I/O Space. ***Note:*** The "shutdown" special cycle from the CPU will also set this bit.
0	0x0 RO	**Reserved (RSVD_0):** Reserved.

58.3.16 modPHY Power Management Configuration Reg 1 (MODPHY_PM_CFG1)—Offset 200h

This register contains misc. fields used to configure the SoC power management behavior with respect to the modPHY.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [PWRMBASE] + 200h

Default: 0000FFFFh

PWRMBASE Type: PCI Configuration Register (Size: 32 bits)
PWRMBASE Reference: [B:0, D:31, F:2] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**ModPHY Lane S0 SUS Well Power Gating Policy [15:0] (MLS0SWPGP):** This is a bit per lane that controls SUS Well Power Gating for a ModPHY lane to be used for S0 and S0ix use models as described above in HAS. • Bit 0: Corresponds to ModPHY Lane 0 • Bit 1: Corresponds to ModPHY Lane 1 • Bit 2: Corresponds to ModPHY Lane 2 : : Bit 15: Corresponds to ModPHY Lane 15 For each lane: • 0: Lane power gating not permitted in S0. • 1: Lane power gating is permitted in S0. Note that strap information/PCIe Lane reversal information will be factored by BIOS when programming these bits in the configuration registers. Note that it is illegal SW programming to have a bit location to be 1 in this field and the corresponding bit position to be 0 in MLSXSWPGP
15:0	0xffff RW	• **ModPHY Lane Sx SUS Well Power Gating Policy [15:0] (MLSXSWPGP):** This is a bit per lane that controls SUS Well Power Gating for a ModPHY lane when system is in Sx. • Bit 0: Corresponds to ModPHY Lane 0 • Bit 1: Corresponds to ModPHY Lane 1 • Bit 2: Corresponds to ModPHY Lane 2 : : Bit 15: Corresponds to ModPHY Lane 15 For each lane: • 0: Lane power gating not permitted in Sx. • 1: Lane power gating is permitted in Sx. Note that strap information/PCIe Lane reversal information will be factored by BIOS when programming these bits in the configuration registers. For ease of PMC implementation, this field will be used to manage Sx policies even in S0. In other words, the earlier restriction that BIOS does not have to program this field if MLSPDDGE is 1 does not apply any more. BIOS shall set this field appropriately for all cases.

58.3.17 modPHY Power Management Configuration Reg 2 (MODPHY_PM_CFG2)—Offset 204h

This register contains misc. fields used to configure the SoC power management behavior with respect to the modPHY.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [PWRMBASE] + 204h

Default: 05000000h

PWRMBASE Type: PCI Configuration Register (Size: 32 bits)
PWRMBASE Reference: [B:0, D:31, F:2] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**Gen2PLL Request Control (G2PLLREQCTL):** This bit controls how PMC should treat Gen2PLL power request for ModPHY power gating flows. • 0 - PMC should treat Gen2PLL request as non restore power request • 1 - PMC should treat Gen2PLL request as restore power request
30	0x0 RW	**ModPHY Lane SUS Power Domain Dynamic Gating Enable (MLSPDDGE):** When this bit is set to 1, ModPHY Lane SUS Well Dynamic Gating is enabled. ModPHY lane SPD is managed using the variables defined by the PMC. When this bit is 0, ModPHY Lane SUS Well Gating can still be done at a more coarse level using MLSXSWPGP and MLS0SWPGP fields.
29	0x0 RW	**Enable ModPHY FET Control (EMFC):** This bit enables PMC dynamic control of ModPHY external FET. When this bit is 0 and MLSPDDGE is 1, PMC goes through all of the ModPHY power gating flows except that the external FET is not turned off. This bit is being provided primarily to prevent External FET gating during EXI debug
28:24	0x5 RW/L	**External FET Ramp Time (EFRT):** This field defines the ramp time of ModPHY FET. • 00000b: 00us • 00001b: 20us • 00010b: 40us • ... • 00101b: 100us • ... • 11111b: 620us This bit is locked while PM_SYNC_MISC_CFG.PM_SYNC_LOCK = '1'
23:20	0x0 RO	**Reserved (RSVD_23_20):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
19:0	0x0 RW	**ASL Over-rides [19:0] (ASLOR):** This field provides ASL code to take over SPD power gating control. If ASL code sets a bit corresponding to a controller, it implies that PMC shall ignore any other inputs from that controller and assume that the controller is ready for SPD power gating. 0 in a bit position: Use HW interfaces for the controller to manage SPD gating/wake-up. 1 in a bit position: Ignore HW interfaces for the controller, rely only on MSPDRTReq field thats managed by ASL code. • Bit 0: Corresponds to PCIe Controller A, Function 0 • Bit 1: Corresponds to PCIe Controller A, Function 1 • Bit 2: Corresponds to PCIe Controller A, Function 2 • Bit 3: Corresponds to PCIe Controller A, Function 3 • Bit 4: Corresponds to PCIe Controller B, Function 0 • Bit 5: Corresponds to PCIe Controller B, Function 1 • Bit 6: Corresponds to PCIe Controller B, Function 2 • Bit 7: Corresponds to PCIe Controller B, Function 3 • Bit 8: Corresponds to PCIe Controller C, Function 0 • Bit 9: Corresponds to PCIe Controller C, Function 1 • Bit 10: Corresponds to PCIe Controller C, Function 2 • Bit 11: Corresponds to PCIe Controller C, Function 3 • Bit 12: Corresponds to SATA Controller • Bit 13: Corresponds to Gbe Controller • Bit 14: Corresponds to xHCI Controller • Bit 15: Corresponds to xDCI Controller • Bit 16: Corresponds to UFS Controller • Bits[19:17]: Reserved This field is going to be used in conjunction with MSPDRTReq and MSPDRTRAck fields above. If ASL code intends to over-ride HW decisions, it will set the corresponding bit for a controller/function to 1 in ASLOR and use MSPDRTReq bits to power-up/power-down SPD.

58.3.18 modPHY Power Management Configuration Reg 3 (MODPHY_PM_CFG3)—Offset 208h

This register contains misc. fields used to configure the SoC power management behavior with respect to the modPHY.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [PWRMBASE] + 208h

Default: 00000000h

PWRMBASE Type: PCI Configuration Register (Size: 32 bits)
PWRMBASE Reference: [B:0, D:31, F:2] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RO	**Reserved (RSVD_31_20):** Reserved.
19:0	0x0 RW	**Controller SPD RTD3 Request [19:0] (MSPDRTREQ):** This field represents ASL code trigger request for ModPHY SPD gating. If this bit is set (to 1) for a controller, it implies that ASL code provides consent for SPD to be gated for the corresponding controllers lanes. Note that this bit could also be more statically used by BIOS to set this to 1 for a controller where SPD will only be managed through other interfaces implying ASL code does not exist for a controller. This is not a POR mode of operation if a function is enabled ASL code will exist for all controllers that are enabled. However, the controllers that are not enabled (Function Disabled), this field will be statically set by BIOS to activate ASL component in SPD gating equations. • Bit 0: Corresponds to PCIe Controller A, Function 0 • Bit 1: Corresponds to PCIe Controller A, Function 1 • Bit 2: Corresponds to PCIe Controller A, Function 2 • Bit 3: Corresponds to PCIe Controller A, Function 3 • Bit 4: Corresponds to PCIe Controller B, Function 0 • Bit 5: Corresponds to PCIe Controller B, Function 1 • Bit 6: Corresponds to PCIe Controller B, Function 2 • Bit 7: Corresponds to PCIe Controller B, Function 3 • Bit 8: Corresponds to PCIe Controller C, Function 0 • Bit 9: Corresponds to PCIe Controller C, Function 1 • Bit 10: Corresponds to PCIe Controller C, Function 2 • Bit 11: Corresponds to PCIe Controller C, Function 3 • Bit 12: Corresponds to SATA Controller • Bit 13: Corresponds to Gbe Controller • Bit 14: Corresponds to xHCI Controller • Bit 15: Corresponds to xDCI Controller • Bit 16: Corresponds to UFS Controller • Bits[19:17]: Reserved

58.3.19 modPHY Power Management Configuration Reg 4 (MODPHY_PM_CFG4)—Offset 20Ch

This register contains misc. fields used to configure the SoC power management behavior with respect to the modPHY.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [PWRMBASE] + 20Ch

Default: 00000000h

PWRMBASE Type: PCI Configuration Register (Size: 32 bits)
PWRMBASE Reference: [B:0, D:31, F:2] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RO	**Reserved (RSVD_31_20):** Reserved.
19:0	0x0 RO/V	**Controller SPD RTD3 Request Acknowledge [19:0] (MSPDRTRACK):** This field represents the acknowledge for ASL code trigger request for ModPHY SPD gating. PMC sets a bit in this field to 1 to acknowledge that it has registered the corresponding MSPDRTREQ. Note that the action of setting this bit to 1 is immediate no other gating conditions are involved in this. Actual SPD shutdown may happen later once other power gating conditions have been satisfied as well. PMC clears a bit to 0 in this field once the corresponding MSPTDRTREQ is cleared by the ASL code and SPD state has been fully restored. • Bit 0: Corresponds to PCIe Controller A, Function 0 • Bit 1: Corresponds to PCIe Controller A, Function 1 • Bit 2: Corresponds to PCIe Controller A, Function 2 • Bit 3: Corresponds to PCIe Controller A, Function 3 • Bit 4: Corresponds to PCIe Controller B, Function 0 • Bit 5: Corresponds to PCIe Controller B, Function 1 • Bit 6: Corresponds to PCIe Controller B, Function 2 • Bit 7: Corresponds to PCIe Controller B, Function 3 • Bit 8: Corresponds to PCIe Controller C, Function 0 • Bit 9: Corresponds to PCIe Controller C, Function 1 • Bit 10: Corresponds to PCIe Controller C, Function 2 • Bit 11: Corresponds to PCIe Controller C, Function 3 • Bit 12: Corresponds to SATA Controller • Bit 13: Corresponds to Gbe Controller • Bit 14: Corresponds to xHCI Controller • Bit 15: Corresponds to xDCI Controller • Bit 16: Corresponds to UFS Controller • Bits[19:17]: Reserved

58.3.20 IE_STS (IE_STS)—Offset 3F0h

This register contains misc fields used to record events pertaining to the Innovation Engine (IE) status. This is shadowed from PMC XRAM IEPMMISC register.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [PWRMBASE] + 3F0h

Default: 00000000h

PWRMBASE Type: PCI Configuration Register (Size: 32 bits)
PWRMBASE Reference: [B:0, D:31, F:2] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO/V	**Shadowed IEPMMISC[31:24] (SHAD_IEPMMISC_31_24):** Shadowed from PMC_XRAM_IEPMMISC
23	0x0 RO/V	**Shadowed IEPMMISC[23] (SHAD_IEPMMISC):** Shadowed IEPMMISC[23]
22	0x0 RO/V	**Shadowed Bios Authentication Result (SHAD_IE_BIOS_AUTH):** Written by IE OEM FW after it attempts to authenticate BIOS image. • 0 = BIOS authentication failed • 1 = BIOS authentication succeeded ***Note:*** This field is made available to OEM FW for its use.
21	0x0 RO/V	**Shadowed FW Authentication Result (SHAD_IE_FW_AUTH):** • 0 = IE FW authentication failed • 1 = IE FW authentication succeeded
20	0x0 RO/V	**Shadowed IE Hash Valid Fuse (SHAD_IE_HASHVALID_FUSE):** Written by IE ROM. Shadows the IE_HASHVALID_FUSE (OEM IFP) pulled by IE. • 0 = use debug Hash • 1 = use OEM Hash FYI to ME FW and BIOS.
19	0x0 RO/V	**Shadowed IE Locked (SHAD_IE_LOCKED):** Written by IE ROM. Shadows the IE_EOM_FUSE (OEM IFP) pulled by IE. • 0 = OEM in manufacturing (default) • 1 = OEM End-of-Manufacturing FYI to ME FW and BIOS.
18	0x0 RO/V	**Shadowed IE Verified Policy Fuse (SHAD_IE_VBPOLICY_FUSE):** Shadowed from PCI MMR_IE_STS
17	0x0 RO/V	**Shadowed IE Disable Strap (SHAD_IE_DISABLE_STRAP):** Written by IE ROM. Shadows the IE_DISABLE_STRAP (soft strap) pulled by IE. FYI to ME FW and BIOS.
16	0x0 RO/V	**Shadowed IE Policy Done (SHAD_IE_POLICY_DONE):** Set by IE ROM after it has set IE_DIS_HOST_WAK_SUS. This bit is a handshake from IE ROM to PMC FW. • 1) PMC FW should treat IE_POLICY_DONE (IE) similar to PATCH_DONE (Intel® ME): both are used as handshakes; the reset sequence will pause until set. Also both conditions have (chicken-out) PMC timers that, upon expiration, will cause reset to proceed regardless of the handshake. • 2) PMC FW should use IE_POLICY_DONE handshake to comprehend IE_DIS_HOST_WAK_SUS, even if S0_COMMIT was already asserted. IE ROM must set IE_DIS_HOST_WAK_SUS (to prevent boot if VB fails). ***Note:*** See description of PPS.S0_COMMIT and GENCTL.DIS_HOST_WAK_SUS for more details.
15:9	0x0 RO/V	**Shadowed IE_STS[15:9] (SHAD_IE_STS_15_9):** Shadowed from PMC XRAM IEPMMISC
8	0x0 RO/V	**Shadowed IE_CIOFF_STS (SHAD_IE_CIOFF_STS):** Shadows IE_CIOFF_STS bit in XRAM space, which is controlled by PMC FW and set when CI0-)CIoff is completed. BIOS shall poll this bit, after requesting CI0-)Cioff (indicated by IE_CIOFF_REQ). Once set BIOS should re-enumerate to remove IE devices and handoff to O/S. O/S-discovered devices should be persistent.
7:2	0x0 RO/V	**Shadowed IE_STS[7:2] (SHAD_IE_STS_7_2):** Shadowed from PMC XRAM IEPMMISC

Bit Range	Default & Access	Field Name (ID): Description
1:0	0x0 RO/V	**Shadowed IE_STS[1:0] (SHAD_IE_STS_1_0):** Shadowed from PMC XRAM IEPMMISC

58.3.21 ME_STS (ME_STS)—Offset 3F4h

This register contains misc. fields used to record events pertaining to the Intel® Management Engine status. This is shadowed from PMC XRAM MEPMMISC register.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [PWRMBASE] + 3F4h

Default: 00000000h

PWRMBASE Type: PCI Configuration Register (Size: 32 bits)
PWRMBASE Reference: [B:0, D:31, F:2] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**Reserved (RSVD_31_16):** Reserved.
15:9	0x0 RO/V	**Shadowed ME_STS[15:9] (SHAD_ME_STS_15_9):** Shadowed from PMC_XRAM MEPMMISC[15:9]
8	0x0 RO/V	**Shadowed ME_CMOFF_STS (SHAD_ME_CMOFF_STS):** Shadows ME_CMOFF_STS in XRAM space, which is controlled by PMC FW and set when CM0-)CMoff is completed. BIOS shall poll this bit, after requesting CM0-)CMoff (indicated by IE_CMOFF_REQ). Once set BIOS should re-enumerate to remove ME devices and handoff to O/S. Why? O/S-discovered devices should be persistent. Shadowed from PMC XRAM MEPMMISC[8]
7:0	0x0 RO/V	**Shadowed ME_STS[7:0] (SHAD_ME_STS_7_0):** Shadowed from PMC_XRAM MEPMMISC[7:0]

58.3.22 Static PG Related Function Disable Register 1 (ST_PG_FDIS_PMC_1)—Offset 620h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [PWRMBASE] + 620h

PWRMBASE Type: PCI Configuration Register (Size: 32 bits)
PWRMBASE Reference: [B:0, D:31, F:2] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/L	**Static Function Disable Lock (ST_FDIS_LK):** Lock control for all ST_PG_FDIS_PMC_* and NST_PG_FDIS_* registers (also self-locks when written to 1).
30:13	0x0 RO	**Reserved (RSVD_30_13):** Reserved.
12	0x0 RW/L	**EXI Function Disable (PMC Version) (EXI_FDIS_PMC):** BIOS is required to set this bit when EXI function is configured to be function disabled. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active.
11	0x0 RW/L	**NPK Function Disable (PMC Version) (NPK_FDIS_PMC):** BIOS is required to set this bit when NPK function is configured to be function disabled. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active.
10	0x0 RW/L	**IE Function Disable (PMC Version) (IE_FDIS_PMC):** BIOS is required to set this bit when IE function is configured to be function disabled. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active.
9	0x0 RW/L	**ME Function Disable (PMC Version) (ME_FDIS_PMC):** BIOS is required to set this bit when ME function is configured to be function disabled. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active.
8	0x0 RW/L	**XHCI Function Disable (PMC Version) (XHCI_FDIS_PMC):** BIOS is required to set this bit when XHCI function is configured to be function disabled. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active.
7	0x0 RW/L	**eMMC (SCC) Function Disable (PMC Version) (EMMC_FDIS_PMC):** BIOS is required to set this bit when eMMC function is configured to be function disabled. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active.
6	0x0 RW/L	**nCPM Function Disable (PMC Version) (NCPM_FDIS_PMC):** BIOS is required to set this bit when Intel® QuickAssist Technology function is configured to be function disabled. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active.
5	0x0 RW/L	**PCIE1 Function Disable (PMC Version) (PCIE1_FDIS_PMC):** BIOS is required to set this bit when PCIE Ctrl 1 function is configured to be function disabled. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active.
4	0x0 RW/L	**PCIE0 Function Disable (PMC Version) (PCIE0_FDIS_PMC):** BIOS is required to set this bit when PCIE Ctrl 0 function is configured to be function disabled. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active.
3	0x0 RW/L	**SATA1 Function Disable (PMC Version) (SATA1_FDIS_PMC):** BIOS is required to set this bit when SATA Ctrl 1 function is configured to be function disabled. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active.
2	0x0 RW/L	**SATA0 Function Disable (PMC Version) (SATA0_FDIS_PMC):** BIOS is required to set this bit when SATA Ctrl 0 function is configured to be function disabled. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active.
1	0x0 RW/L	**GBE1 Function Disable (PMC Version) (GBE1_FDIS_PMC):** BIOS is required to set this bit when GBE Ctrl 1 function is configured to be function disabled. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active.
0	0x0 RW/L	**GBE0 Function Disable (PMC Version) (GBE0_FDIS_PMC):** BIOS is required to set this bit when GBE Ctrl 0 function is configured to be function disabled. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active.

58.3.23 Non-Static PG Related Function Disable Register 1 (NST_PG_FDIS_1)—Offset 628h

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [PWRMBASE] + 628h

Default: 00000000h

PWRMBASE Type: PCI Configuration Register (Size: 32 bits)
PWRMBASE Reference: [B:0, D:31, F:2] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0x0 RO	**Reserved (RSVD_31_4):** Reserved.
3:0	0x0 RW	**LAN port disable control bits (LAN_PORT_DISABLE):** Host disable of the LAN ports, LAN_PORT_DISABLE[3:0] = Odem1[1:0] + Odem0[1:0]

58.3.24 Non-Static PG Fuse Disable Read 1 Register (N_STPG_FUSE_SS_DIS_RD_1)—Offset 640h

This register contains fuse disable based information - which is not used for static power gating (this information is provided only for host/BIOS read access).

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [PWRMBASE] + 640h

Default: 00000000h

PWRMBASE Type: PCI Configuration Register (Size: 32 bits)
PWRMBASE Reference: [B:0, D:31, F:2] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0x0 RO	**Reserved (RSVD_31_4):** Reserved.
3:0	0x0 RO/V	**LAN port Disable status (LAN_PORT_DISABLE_STATUS):** Result of all fuses and straps and control bits of the LAN port disable, LAN_PORT_DISABLE_STATUS[3:0] = Odem1[1:0] + Odem0[1:0]

58.3.25 Static PG Fuse and Soft Strap Disable Read Register 2 (STPG_FUSE_SS_DIS_RD_2)—Offset 644h

This register contains fuse and soft strap disable based information - all of which is used for static power-gating (for example, if a bit is set in this register for a particular IP, PMC keeps that IP in a power-gated state - except as noted below.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [PWRMBASE] + 644h

Default: 00000000h

PWRMBASE Type: PCI Configuration Register (Size: 32 bits)
PWRMBASE Reference: [B:0, D:31, F:2] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**Reserved (RSVD_31_16):** Reserved.
15	0x0 RO/V	**Intel® Management Engine (Intel® ME) Fuse or Soft Strap Disable (ME_FUSE_SS_DIS):** RO bit indicating if the Intel® Management Engine function is disabled through fuse/soft strap.
14	0x0 RO/V	**Innovation Engine Fuse or Soft Strap Disable (IE_FUSE_SS_DIS):** RO bit indicating if Innovation Engine function is disabled through fuse/soft strap.
13	0x0 RO/V	**USB2 Fuse or Soft Strap Disable (USB2_FUSE_SS_DIS):** RO bit indicating if USB2 function is disabled through fuse/soft strap.
12	0x0 RO/V	**LPC Fuse or Soft Strap Disable (LPC_FUSE_SS_DIS):** RO bit indicating if LPC function is disabled through fuse/soft strap.
11	0x0 RO/V	**ESPISPI Fuse or Soft Strap Disable (ESPISPI_FUSE_SS_DIS):** RO bit indicating if ESPISPI function is disabled through fuse/soft strap.
10	0x0 RO/V	**NPK Fuse or Soft Strap Disable (NPK_FUSE_SS_DIS):** RO bit indicating if NPK function is disabled through fuse/soft strap.
9	0x0 RO	**Reserved (RSVD_9):** Reserved.
8	0x0 RO/V	**eMMC Fuse or Soft Strap Disable (EMMC_FUSE_SS_DIS):** RO bit indicating if eMMC (SCC) function is disabled through fuse/soft strap.
7	0x0 RO/V	**XHCI Fuse or Soft Strap Disable (XHCI_FUSE_SS_DIS):** RO bit indicating if XHCI function is disabled through fuse/soft strap.
6	0x0 RO/V	**nCPM Fuse or Soft Strap Disable (NCPM_FUSE_SS_DIS):** RO bit indicating if Intel® QuickAssist Technology function is disabled through fuse/soft strap.
5	0x0 RO/V	**PCIE Ctrl 1 Fuse or Soft Strap Disable (PCIE1_FUSE_SS_DIS):** RO bit indicating if PCIE Ctrl 1 function is disabled through fuse or Soft strap.
4	0x0 RO/V	**PCIE Ctrl 0 Fuse or Soft Strap Disable (PCIE0_FUSE_SS_DIS):** RO bit indicating if PCIE Ctrl 0 function is disabled through fuse or Soft strap.
3	0x0 RO/V	**SATA Ctrl 1 Fuse or Soft Strap Disable (SATA1_FUSE_SS_DIS):** RO bit indicating if SATA Ctrl 1 function is disabled through fuse or Soft strap.
2	0x0 RO/V	**SATA Ctrl 0 Fuse or Soft Strap Disable (SATA0_FUSE_SS_DIS):** RO bit indicating if SATA Ctrl 0 function is disabled through fuse or Soft strap.
1	0x0 RO/V	**GBE Ctrl 1 Fuse or Soft Strap Disable (GBE1_FUSE_SS_DIS):** RO bit indicating if GBE Ctrl 1 function is disabled through fuse or Soft strap.
0	0x0 RO/V	**GBE Ctrl 0 Fuse or Soft Strap Disable (GBE0_FUSE_SS_DIS):** RO bit indicating if GBE Ctrl 0 function is disabled through fuse or Soft strap.

58.4 Registers in I/O Space—ABASE

These registers are accessed in Host I/O Space starting at the relocatable I/O address defined by the Base Address Register (BAR) ABASE described in Section 58.2.2, "ACPI Base Address (ABASE)—Offset 40h" on page 2689.

58.4.1 Power Management 1 Enables and Status (PM1_EN_STS)—Offset 0h

Type: I/O Register
(Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABASE] + 0h

ABASE Type: PCI Configuration Register (Size: 32 bits)
ABASE Reference: [B:0, D:31, F:2] + 40h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**Reserved (RSVD_31):** Reserved.
30	0x0 RW	**PCI Express Wake Disable (PCIEXP_WAKE_DIS):** This bit disables the inputs to the PCIEXP_WAKE_STS bit in the PM1 Status register from waking the system. Modification of this bit has no impact on the value of the PCIEXP_WAKE_STS bit.
29:27	0x0 RO	**Reserved (RSVD_29_27):** Reserved.
26	0x0 RW/V	**RTC Alarm Enable (RTC_EN):** This is the RTC alarm enable bit. It works in conjunction with the SCI_EN bit. When RTC_STS is set, one of the following happens: • When RTC_EN=0: No SMI# or SCI. If system was in S1-S5, no wake event occurs. • When RTC_EN=1 and SCI_EN = 1: SCI. If system was in S1-S5, then a wake event occurs before the SCI. • When RTC_EN=1 and SCI_EN = 0: SMI#. If system was in S1-S5, then a wake event occurs before the SMI#. This register bit is circuitry in the SoC RTC power well in order to allow an RTC event to wake after a power failure. It is reset only when the active-low SRTCRST_N input signal pin is asserted.
25	0x0 RO	**Reserved (RSVD_25):** Reserved.
24	0x0 RW/V	**Power Button Enable (PWRBTN_EN):** This bit is the power button enable. It works in conjunction with the SCI_EN bit. When PWRBTN_STS is set, one of the following happens: • When PWRBTN_EN=0: No SMI# or SCI. • When PWRBTN_EN=1 and SCI_EN = 1: SCI. • When PWRBTN_EN=1 and SCI_EN = 0: SMI#. ***Note:*** PWRBTN_EN has no effect on the PWRBTN_STS bit being set by the assertion of the power button. The Power Button is always enabled as a Wake event.
23:22	0x0 RO	**Reserved (RSVD_23_22):** Reserved.
21	0x0 RW	**Global Enable (GBL_EN):** The global enable bit. When both the GBL_EN and the GBL_STS are set, the SoC generates an SCI.
20:17	0x0 RO	**Reserved (RSVD_20_17):** Reserved.
16	0x0 RW	**Timer Overflow Interrupt Enable (TMROF_EN):** This is the timer overflow interrupt enable bit. It works in conjunction with the SCI_EN bit. When TMROF_STS is set, one of the following happens: • When TMROF_EN=0: No SMI# or SCI. • When TMROF_EN=1 and SCI_EN = 1: SCI. When TMROF_EN=1 and SCI_EN = 0: SMI#.

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW/1C/V	**Wake Status (WAK_STS):** This bit is set when the system is in one of the Sleep states (via the SLP_EN bit) and an enabled SoC Wake event occurs. Upon setting this bit, the SoC will transition the system to the ON state. This bit can only be set by hardware and can only be cleared by writing a one to this bit position. This bit is not affected by hard resets caused by a CF9 write, but is reset by the SoC-internal pri_pwrgood_rst_b signal.
14	0x0 RW/1C/V	**PCI Express Wake Status (PCIEXP_WAKE_STS):** This bit is set by hardware to indicate that the system woke due to a PCI Express wakeup event. This event can be caused by the PCI Express WAKE# pin being active, or one or more of the PCI Express ports being in beacon state, or receipt of a PCI Express PME message at root port.
13:12	0x0 RO	**Reserved (RSVD_13_12):** Reserved.
11	0x0 RW/1C/V	**Power Button Override (PWRBTNOR_STS):** This bit is set when any of these occur: • A Power Button Override Event occurs (i.e., the power button is pressed for at least four consecutive seconds) • The corresponding bit is received in the SMBus slave message • The Intel® ME-Initiated "Power Button Override" bit is set • The Intel® ME-Initiated "Host Reset with Power Down" is set • An internal thermal sensor catastrophic condition occurs These events cause an unconditional transition to the S5 state.
10	0x0 RW/1C/V	**RTC Status (RTC_STS):** This bit is set when the RTC generates an alarm (assertion of the IRQ8# signal), and is not affected by any other enable bit. See the RTC_EN bit in this register for the effect when RTC_STS goes active.
9	0x0 RO	**Reserved (RSVD_9):** Reserved.
8	0x0 RW/1C/V	**Power Button Status (PWRBTN_STS):** This bit is set when the PMU_PWRBTN_N input signal pin is asserted (low), independent of any other enable bit. See the PWRBTN_EN bit in this register for the effect when PWRBTN_STS goes active. PWRBTN_STS is always a wake event. This bit is only set by hardware and can be cleared by software writing a one to this bit position. This bit is not affected by hard resets caused by a CF9 write, but is reset by the SoC internal pwrgood_rst_b.
7:6	0x0 RO	**Reserved (RSVD_7_6):** Reserved.
5	0x0 RW/1C/V	**GBL Status (GBL_STS):** This bit is set when an SCI is generated due to the BIOS wanting the attention of the SCI handler. BIOS has a corresponding bit, BIOS_RLS, which will cause an SCI and set this bit. The SCI handler should then clear this bit by writing a 1 to it. This bit will not cause wake events or SMI#. This bit is not affected by SCI_EN.
4	0x0 RW/1C/V	**Bus Master Status (BM_STS):** This bit is set to 1 by the SoC when a SoC-visible bus master requests access to memory or the BM_BUSY# signal is active. This bit is cleared by the CPU writing a 1 to this bit position. This bit will not cause a wake event, SCI, or SMI.
3:1	0x0 RO	**Reserved (RSVD_3_1):** Reserved.
0	0x0 RW/1C/V	**Timer Overflow Status (TMROF_STS):** This is the timer overflow status bit.

58.4.2 Power Management 1 Control —Offset 4h

Usage: ACPI or Legacy. Not lockable. Bits 0-9, 13-31 = Primary Power Well. Bits 10-12 = RTC Power Well.

Type: I/O Register (Size: 32 bits)

BAR and Offset: [ABASE] + 4h

Default: 00000000h

ABASE Type: PCI Configuration Register (Size: 32 bits)
ABASE Reference: [B:0, D:31, F:2] + 40h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved (RSVD_31_14):** Reserved.
13	0x0 WO	**Sleep Enable (SLP_EN):** This is a write-only bit and reads to it always return a zero. Setting this bit causes the system to sequence into the Sleep state defined by the SLP_TYP field.
12:10	0x0 RW	**Sleep Type (SLP_TYP):** This 3-bit field defines the type of Sleep the system should enter when the SLP_EN bit is set to 1. These bits are in the RTC power well and are cleared when the SoC input signal pin SRTCRST_N is active. • 000: Mode = ON, Typical Mapping = S0 • 001: Reserved • 010: Reserved • 011: Reserved • 100: Reserved • 101: Reserved • 110: Mode = Suspend-To-Disk, Typical Mapping = S4 • 111: Mode = Soft Off, Typical Mapping = S5
9:3	0x0 RO	**Reserved (RSVD_9_3):** Reserved.
2	0x0 WO	**GBL_RLS:** The Global Release bit is used by the ACPI software which writes a '1' to raise an event to the BIOS software. This bit always reads as 0.
1	0x0 RW	**BM_RLD:** This bit is treated as a scratchpad bit.
0	0x0 RW	**SCI Enable (SCI_EN):** Selects the SCI interrupt or the SMI# for various events. • 0 = These events will generate an SMI#. • 1 = These events will generate an SCI.

58.4.3 Power Management 1 Timer (PM1_TMR)—Offset 8h

Usage: ACPI. Not lockable. Primary Power Well.

Type: I/O Register
(Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABASE] + 8h

ABASE Type: PCI Configuration Register (Size: 32 bits)
ABASE Reference: [B:0, D:31, F:2] + 40h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**Reserved (RSVD_31_24):** Reserved. Will always read 0.
23:0	0x0 RO/V	**Timer Value (TMR_VAL):** This read-only field returns the running count of the PM timer. This counter runs off a 3.579545 MHz clock (derived from 14.31818 MHz divided by 4). It is reset (to 0) during a PCI reset, and then continues counting as long as the system is in the S0 state. Anytime bit 22 of the timer goes HIGH to LOW (bits referenced from 0 to 23), the TMROF_STS bit is set. The High-to-Low transition will occur every 2.3435 seconds. Writes to this register have no effect.

58.4.4 SMI Control and Enable (SMI_EN)—Offset 30h

Usage: ACPI or Legacy. Not lockable. Primary Power Well.
This register is symmetrical to the SMI Status Register.

Type: I/O Register
(Size: 32 bits)

BAR and Offset: [ABASE] + 30h

Default: 00000002h

ABASE Type: PCI Configuration Register (Size: 32 bits)
ABASE Reference: [B:0, D:31, F:2] + 40h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**XHCI SMI Enable (XHCI_SMI_EN):** Software sets this bit to enable XHCI SMI events.
30	0x0 RW	**ME SMI Enable (ME_SMI_EN):** Software sets this bit to enable Intel® ME SMI# events.
29	0x0 RW	**LPSS SMI Enable (LPSS_SMI_EN):** Software sets this bit to enable LPSS SMII events.
28	0x0 RW/L	**Reserved:** Reserved.
27	0x0 RW/1S	**GPIO Unlock SMI Enable (GPIO_UNLOCK_SMI_EN):** Setting this bit will cause the SoC to generate an SMI# when the GPIO_UNLOCK_SMI_STS bit is set in the SMI_STS register. Once written to '1', this bit can only be cleared by host_prim_rst_b.
26	0x0 RO	**Reserved (RSVD_26):** Reserved.
25	0x0 RW	**SCC SMI Enable (SCC_SMI_EN):** Software sets this bit to enable SCC (eMMC) SMI events
24	0x0 RO	**Reserved (RSVD_24):** Reserved.
23	0x0 RW	**IE SMI Enable (IE_SMI_EN):** Software sets this bit to enable Innovation Engine (IE) SMI# events.
22:19	0x0 RO	**Reserved (Rsvd_22_19):** Reserved.
18	0x0 RW	**IEH (RAS Error Collector) SMI Enable (IEH_SMI_EN):** Software sets this bit to enable Internal Error Handler (IEH) SMI# events.
17	0x0 RW	**Legacy USB 2 Enable (LEGACY_USB2_EN):** Enables legacy USB 2.0 logic to cause SMI#.
16:15	0x0 RO	**Reserved (RSVD_16_15):** Reserved.
14	0x0 RW	**Periodic Enable (PERIODIC_EN):** Setting this bit will cause the SoC to generate an SMI# when the PERIODIC_STS bit is set in the SMI_STS register.
13	0x0 RW/L	**TCO Enable (TCO_EN):** • 0 = Disables TCO logic generating an SMI# • 1 = Enables the TCO logic to generate SMI# If the NMI2SMI_EN bit is set, then SMI's that are caused by NMI's (i.e. rerouted) will not be gated by the TCO_EN bit. Even if the TCO_EN bit is 0, the NMI's will still be routed to cause the SMI#. This bit can not be written once the TCO_LOCK bit (at offset 08h of TCO I/O Space) is set. This prevents unauthorized software from disabling the generation of TCO-based SMI's
12	0x0 RO	**Reserved (RSVD_12):** Reserved.
11	0x0 RW	**MCSMI Enable (MCSMI_EN):** Software sets this bit to 1 to enables the SoC to trap access to the microcontroller range (62h or 66h).

Bit Range	Default & Access	Field Name (ID): Description
10:8	0x0 RO	**Reserved (RSVD_10_8):** Reserved.
7	0x0 WO	**BIOS_RLS:** Enables the generation of an SCI interrupt for ACPI software when a '1' is written to this bit position by BIOS software. This bit always reads a zero. GBL_STS being set will cause an SCI, even if the SCI_EN bit is not set. Software must take great care not to set the BIOS_RLS bit (which causes GBL_STS to be set) if the SCI handler is not in place.
6	0x0 RW	**Software SMI Timer Enable (SWSMI_TMR_EN):** Software sets this bit to a '1' to start the Software SMI# Timer. When the timer expires (depending on the SWSMI_RATE_SEL bits), it will generate an SMI# and set the SWSMI_TMR_STS bit. The SWSMI_TMR_EN bit will remain at 1 until software sets it back to 0. Clearing the SWSMI_TMR_EN bit before the timer expires will reset the timer and the SMI# will not be generated. The default for this bit is 0.
5	0x0 RW	**APMC Enable (APMC_EN):** If set, this enables writes to the APM_CNT register to cause an SMI#
4	0x0 RW	**SMI On Sleep Enable (SMI_ON_SLP_EN):** If this bit is set, the SoC will generate an SMI# when a write access attempts to set the SLP_EN bit (in the PM1_CNT register). Furthermore, the SoC will not put the system to a sleep state. It is expected that the SMI# handler will turn off the SMI_ON_SLP_EN bit before actually setting the SLP_EN bit.
3	0x0 RW	**Legacy USB Enable (LEGACY_USB_EN):** Enables legacy USB circuit to cause SMI#.
2	0x0 RW	**BIOS Enable (BIOS_EN):** Enables the generation of SMI# when ACPI software writes a '1' to the GBL_RLS bit. ***Note:*** If the BIOS_STS bit, which gets set when software writes a 1 to GBL_RLS bit, is already a 1 at the time that BIOS_EN becomes 1, an SMI# will be generated when BIOS_EN gets set.
1	0x1 RW/1S/V	**End of SMI (EOS):** This bit controls the arbitration of the SMI signal to the processor. This bit must be set in order for the SoC to assert SMI# low to the processor after SMI# has been asserted previously.
0	0x0 RW/L	**Global SMI Enable (GBL_SMI_EN):** When set, this bit enables the generation of SMIs in the system upon any enabled SMI event. This bit is reset by a PCI reset event. If this bit is not set, no SMI# will be generated. When the SMI_LOCK bit is set, this bit cannot be changed.

58.4.5 SMI Status Register (SMI_STS)—Offset 34h

Usage: ACPI or Legacy. Not lockable. Primary Power Well.
If the corresponding _EN bit is set when the _STS bit is set, the SoC will cause an SMI# (except bits 8-10, which don't cause SMI#).

Type: I/O Register
(Size: 32 bits)

BAR and Offset: [ABASE] + 34h

Default: 00000000h

ABASE Type: PCI Configuration Register (Size: 32 bits)
ABASE Reference: [B:0, D:31, F:2] + 40h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO/V	**XHCI SMI Status (XHCI_SMI_STS):** This bit will be set when any USB 3.0 (XHCI) Host Controller is requesting an SMI.
30	0x0 RO/V	**ME SMI Status (ME_SMI_STS):** This bit will be set when the Intel® ME is requesting an SMI#.
29	0x0 RW/1C/V	**LPSS SMI Status (LPSS_SMI_STS):** This bit gets set when LPSS agent is requesting SMI #. This bit is set by hardware and cleared by software writing a 1 to this bit position
28	0x0 RO/V	**Reserved:** Reserved.
27	0x0 RW/1C/V	**GPIO Unlock SMI Status (GPIO_UNLOCK_SMI_STS):** This bit will be set of the GPIO registers lock-down logic is requesting an SMI#. Writing a '1' to this bit position clears this bit to '0'.
26	0x0 RO/V	**SPI_SMI Status (SPI_SMI_STS):** This bit will be set when the SPI logic is requesting an SMI#. This bit is read only because the sticky status and enable bits associated with this function are located in the SPI registers.
25	0x0 RW/1C/V	**SCC SMI Status (SCC_SMI_STS):** This bit gets set when SCC agent is requesting SMI#. This bit is set by hardware and cleared by software writing a 1 to this bit position.
24	0x0 RO	**Reserved (RSVD_24):** Reserved.
23	0x0 RO/V	**IE SMI Status (IE_SMI_STS):** This bit will be set when the Innovation Engine (IE) is requesting an SMI#.
22	0x0 RO/V	**INTERNAL_TT Status (INTERNAL_TT_STS):** This bit will be set if the internal thermal throttle mechanism has changed state. This bit is read only because the sticky status and enable bit associated with this function is in the other unit.
21	0x0 RO/V	**Monitor Status (MONITOR_STS):** This bit will be set if the Trap/SMI logic has caused the SMI. This will occur when the CPU or a bus master accesses an assigned register (or a sequence of accesses).
20	0x0 RO/V	**PCI_EXP_SMI Status (PCI_EXP_SMI_STS):** 1- PCI Express SMI event occurred. This could be due to a PCI Express PME event or Hot Plug Event.
19	0x0 RO/V	**RTC Update-In-Progress SMI Status (RTC_UIP_SMI_STS):** This bit will be set when the RTC Update-In-Progress signal transitions either from low-to-high or high-to-low, depending on the enables in the I/O Trap register space.
18	0x0 RO/V	**IEH Status (IEH_STS) (IEH_SMI_STS):** This non-sticky read-only bit is a logical OR of each of the SMI status bits in the Internal Error Handler (IEH) Support register ANDed with the corresponding enable bits. This bit will not be active if the enable bits are not set.
17	0x0 RO/V	**Legacy USB 2 Status (LEGACY_USB2_STS):** This non-sticky read-only bit is a logical OR of each of the SMI status bits in the USB 2.0 Legacy Support Register ANDed with the corresponding enable bits. This bit will not be active if the enable bits are not set. Writes to this bit will have no effect.

Bit Range	Default & Access	Field Name (ID): Description
16	0x0 RW/1C/V	**SMBUS_SMI Status (SMBUS_SMI_STS):** The SoC sets this bit to '1' to indicate that the SMI# was caused by: • 1. The SMBus Slave receiving a message that an SMI# should be caused, or • 2. The SMBALERT# signal goes active and the SMB_SMI_EN bit is set and the SMBALERT_DIS bit is cleared. • 3. The SMBus Slave receiving a HOST_NOTIFY message and the HOST_NOTIFY_INTREN and the SMB_SMI_EN bits are set. • 4. The SMBus Slave receiving a "SMI in S0" message. This bit is sticky. It is cleared by writing a '1' to this bit position.
15	0x0 RO/V	**SERIRQ_SMI Status (SERIRQ_SMI_STS):** • 0 = SMI# not caused by SERIRQ decoder • 1 = Indicates the SMI# was caused by the SERIRQ decoder This bit is not sticky. Writes to this bit will have no effect.
14	0x0 RW/1C/V	**Periodic Status (PERIODIC_STS):** This bit will be set at the rate determined by the PER_SMI_SEL bits. If the PERIODIC_EN bit is also set, the SoC will generate an SMI#. This bit is cleared by writing a '1' to this bit position.
13	0x0 RW/1C/V	**TCO Status (TCO_STS):** • 0 = SMI not caused by TCO logic. • 1 = Indicates SMI was caused by the TCO logic ***Note:*** Will not cause wake event. This bit is cleared by writing a '1' to this bit position.
12	0x0 RO/V	**DEVMON Status (DEVMON_STS):** This read-only bit is set when bit 0 in the DEVTRAP_STS register is set. It is not sticky, so writes to this bit will have no effect.
11	0x0 RW/1C/V	**MCSMI Status (MCSMI_STS):** This bit is set if there is an access to the power management microcontroller range (62h or 66h). If this bit is set, and the MCSMI_EN bit is also set, the SoC will generate an SMI#. This bit is set by hardware and cleared by software writing a '1' to its bit position.
10	0x0 RO/V	**GPIO SMI Status (GPIO_SMI_STS):** This bit will be a 1 if any GPIO that is enabled to trigger SMI is asserted. GPIOs that are not routed to cause an SMI will have no effect on this bit. This bit is NOT sticky. Writes to this bit will have no effect.
9	0x0 RO/V	**GPE0 Status (GPE0_STS):** There are several status/enable bit pairs in GPE0_STS/EN_127_96 that are capable of triggering SMIs. This bit is a logical OR of all of those pairs (i.e. this bit is asserted whenever at least one of those pairs has both the status and enable bit asserted). This bit is NOT sticky. Writes to this bit will have no effect. ***Note:*** The setting of this bit does not cause the SMI#.
8	0x0 RO/V	**PM1 Status Register (PM1_STS_REG):** This is an OR of the bits (except for bits 5 and 4) in the ACPI PM1 Status Reg. (offset PMBASE+00h). Not sticky. Writes to this bit have no effect. ***Note:*** The setting of this bit does not cause the SMI#.
7	0x0 RO	**Reserved (RSVD_7):** Reserved.
6	0x0 RW/1C/V	**Software SMI Timer Status (SWSMI_TMR_STS):** This bit will be set to '1' by the hardware when the Software SMI# Timer expires. This bit will remain 1 until the software writes a '1' to this bit.
5	0x0 RW/1C/V	**APM Status (APM_STS):** SMI# was generated by a write access to the APM control register and if the APMC_EN bit is set. This bit is cleared by writing a one to its bit position.
4	0x0 RW/1C/V	**SMI_ON_SLP_EN Status (SMI_ON_SLP_EN_STS):** This bit will be set by the SoC when a write access attempts to set the SLP_EN bit. This bit is cleared by writing a '1' to this bit position
3	0x0 RO/V	**Legacy USB Status (LEGACY_USB_STS):** This non-sticky read-only bit is a logical OR of each of the SMI status bits in the USB Legacy Keybd Register ANDed with the corresponding enable bits. This bit will not be active if the enable bits are not set. Writes to this bit will have no effect.

Bit Range	Default & Access	Field Name (ID): Description
2	0x0 RW/1C/V	**BIOS Status (BIOS_STS):** This bit gets set by hardware when a 1 is written by software to the GBL_RLS bit. When both BIOS_EN and the BIOS_STS bit are set, an SMI# will be generated. The BIOS_STS bit is cleared when software writes a '1' to this bit position.
1:0	0x0 RO	**Reserved (RSVD_1_0):** Reserved.

58.4.6 General Purpose Event Control (GPE_CTRL)—Offset 40h

Usage: ACPI or Legacy. Not lockable. Primary Power Well.

Type: I/O Register
(Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABASE] + 40h

ABASE Type: PCI Configuration Register (Size: 32 bits)
ABASE Reference: [B:0, D:31, F:2] + 40h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0x0 RO	**Reserved (RSVD_31_18):** Reserved.
17	0x0 RW/V	**Software GPE Control (SWGPE_CTRL):** This bit allows software to control the assertion of SWGPE_STS bit. This bit is used by hardware as the level input signal for the SWGPE_STS bit in the GPE0_STS register. When SWGPE_CTRL is 1, SWGPE_STS will be set to 1, and writes to SWGPE_STS with a value of 1 to clear SWGPE_STS will result in SWGPE_STS being set back to 1 by hardware. When SWGPE_CTRL is 0, writes to SWGPE_STS with a value of '1' will clear SWGPE_STS to 0.
16:0	0x0 RO	**Reserved (RSVD_16_0):** Reserved.

58.4.7 Device Trap Status Register (DEVTRAP_STS)—Offset 44h

Usage: Legacy only. Not lockable. Primary Power Well.
Each bit indicates if an access has occurred to the corresponding device's trap range, or for bits 6:9 if the corresponding PCI interrupt is active. Write '1' to the same bit position to clear it. This register is used by APM power management software to see if there has been system activity. The periodic SMI# timer indicates if it is the right time to read the DEVTRAP_STS register.

Type: I/O Register
(Size: 32 bits)

BAR and Offset: [ABASE] + 44h

Default: 00000000h

ABASE Type: PCI Configuration Register (Size: 32 bits)
ABASE Reference: [B:0, D:31, F:2] + 40h

Bit Range	Default & Access	Field Name (ID): Description
31:13	0x0 RO	**Reserved (RSVD_31_13):** Reserved.
12	0x0 RW/1C/V	**D12 Trap Status (D12_TRP_STS):** KBC (60/64h). • 0 = Indicates that there has been no access to this device I/O range. • 1 = This device I/O range has been accessed. Clear this bit by writing a 1 to the bit location.
11:10	0x0 RO	**Reserved (RSVD_11_10):** Reserved.
9	0x0 RW/1C/V	**D9 Trap Status (D9_TRP_STS):** PIRQ[D or H]. • 0 = The corresponding PCI interrupts have not been active. • 1 = At least one of the corresponding PCI interrupts have been active. Clear this bit by writing a 1 to the bit location.
8	0x0 RW/1C/V	**D8 Trap Status (D8_TRP_STS):** PIRQ[C or G]. • 0 = The corresponding PCI interrupts have not been active. • 1 = At least one of the corresponding PCI interrupts have been active. Clear this bit by writing a 1 to the bit location.
7	0x0 RW/1C/V	**D7 Trap Status (D7_TRP_STS):** PIRQ[B or F]. • 0 = The corresponding PCI interrupts have not been active. • 1 = At least one of the corresponding PCI interrupts have been active. Clear this bit by writing a 1 to the bit location.
6	0x0 RW/1C/V	**D6 Trap Status (D6_TRP_STS):** PIRQ[A or E]. • 0 = The corresponding PCI interrupts have not been active. • 1 = At least one of the corresponding PCI interrupts have been active. Clear this bit by writing a 1 to the bit location.
5	0x0 RW/1C/V	**D5 Trap Status (D5_TRP_STS):** This will be set if any of the following are accessed (as determined by the I/O ranges in the LPC decoder (even if the LPC forwarding is not enabled): SP1, SP2, PP, FDC. Clear this bit by writing a 1 to the bit location.
4:1	0x0 RO	**Reserved (RSVD_4_1):** Reserved.
0	0x0 RW/1C/V	**D0 Trap Status (D0_TRP_STS):** The access/SMI was due to the SATA logic. There is no corresponding bit in the DEVTRAP_EN register because the enables are in the new SATA registers.

58.4.8 PM2a Control Block (PM2A_CNT_BLK)—Offset 50h

Usage: ACPI or Legacy. Not lockable. Primary Power Well.
BIOS must describe this register as 1 byte wide to the OS.

Type: I/O Register
(Size: 32 bits)

BAR and Offset: [ABASE] + 50h

Default: 00000000h

ABASE Type: PCI Configuration Register (Size: 32 bits)
ABASE Reference: [B:0, D:31, F:2] + 40h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0x0 RO	**Reserved (RSVD_31_1):** Reserved.
0	0x0 RW	**ARB_DIS:** This bit is a scratchpad bit for legacy software compatibility.

58.4.9 Over-Clocking WDT Control (OC_WDT_CTL)—Offset 54h

This register controls the operation of the SoCs Over-Clocking Watchdog Timer.

Type: I/O Register
(Size: 32 bits)

BAR and Offset: [ABASE] + 54h

Default: 00002000h

ABASE Type: PCI Configuration Register (Size: 32 bits)
ABASE Reference: [B:0, D:31, F:2] + 40h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 WO	**Over-Clocking WDT Reload (OC_WDT_RLD):** Software can write a '1' to this bit to reload (“ping”) the SoC over-clocking watchdog timer while it is running. A write of '0' to this bit has no effect. A write of '1' to this bit while OC_WDT_EN=0, or with the clearing of OC_WDT_EN, does not start or reload the WDT (i.e. OC_WDT_EN takes precedence). The value in OC_WDT_TOV may be changed by software along with its setting of this bit. On a WDT reload, the current (potentially new) value in OC_WDT_TOV is loaded into the WDT as the new timeout value.
30:26	0x0 RO	**Reserved (RSVD_30_26):** Reserved.
25	0x0 RW/1C/V	**Over-Clocking WDT ICC Survivability Mode Timeout Status (OC_WDT_ICCSURV_STS):** This bit is set to '1' if the over-clocking WDT has timed out and triggered a global reset while running in a mode that has ICC survivability impact (OC_WDT_ICCSURV=1). It is cleared by a software write of '1' or by the pri_pwrgood_rst_b.
24	0x0 RW/1C/V	**Over-Clocking WDT Non-ICC Survivability Mode Timeout Status (OC_WDT_NO_ICCSURV_STS):** This bit is set to '1' if the over-clocking WDT has timed out and triggered a global reset while running in a mode that does not have ICC survivability impact (OC_WDT_ICCSURV=0). It is cleared by a software write of '1' or by the pri_pwrgood_rst_b.
23:16	0x0 RW	**Over-Clocking WDT Scratchpad (OC_WDT_SCRATCH):** This field is available as scratchpad space for software and has no effect on SoC hardware operation.
15	0x0 RW/L	**Over-Clocking WDT Force All (OC_WDT_FORCE_ALL):** GATE_BIT: OC_WDT_CTL.OC_WDT_CTL_LCK.HIGH When this bit is set to 1 and the OC_WDT is running, any included global reset source will behave as though the OC_WDT expired.
14	0x0 RW/V/L	**Over-Clocking WDT Enable (OC_WDT_EN):** Software sets this bit to '1' to enable the SoC over-clocking watchdog timer. While the counter is running, if it expires before being reloaded by software via the OC_WDT_RLD bit or halted by software clearing this bit, then one of the status bits will be set (which one depends on the WDT operating mode at the time - see the OC_WDT_ICCSURV bit description), and a global reset will be triggered. This bit is also set by the hardware when conditions allow the OC_WDT to self-start at power cycle reboot (effectively changes the default of this bit as seen by software).

Bit Range	Default & Access	Field Name (ID): Description
13	0x1 RW/L	**Over-Clocking WDT ICC Survivability Impact (OC_WDT_ICCSURV):** This bit determines whether OC_WDT expiration will have an impact on ICC (Integrated Clock Controller) bootstrap survivability. • 0 = Software should configure the OC_WDT to this mode if no ICC hardware auto-recovery actions are desired in the event of a timeout. A timeout in this mode will set OC_WDT_NO_ICCSURV_STS. • 1 (Default) = An OC_WDT timeout while operating in this mode causes certain ICC hardware auto-recovery actions to take place. A timeout in this mode will set OC_WDT_ICCSURV_STS.
12	0x0 RW/L	**OC_WDT_CTL Register Lock (OC_WDT_CTL_LCK):** This bit controls write-ability to this register. Encodings: • 0 = All fields of register OC_WDT_CTL operate as normal and can be updated by software. Reads to the register operate as normal. • 1 = All RW/L fields of register OC_WDT_CTL, including this lock control bit, are locked. Writes to these register fields have no effect and the register fields retain their current states. Reads to the register operate as normal. Once this bit is set, it can only be cleared by CORE well power loss.
11:10	0x0 RO	**Reserved (RSVD_11_10):** Reserved.
9:0	0x0 RW/V/L	**Over-Clocking WDT Timeout Value (OC_WDT_TOV):** Software programs the desired over-clocking WDT timeout value into this register. This timer is zero-based and has a granularity of 1 second. Example timeout values: • 000h: 1 second • 001h: 2 seconds • ... • 3FFh: ~17 minutes (1024 seconds) The value of OC_WDT_TOV may be changed by software along with its setting of the OC_WDT_RLD bit. On a WDT reload, the current (potentially new) value in OC_WDT_TOV is loaded into the WDT as the new timeout value. This field is also updated by the hardware when conditions allow the OC_WDT to self-start at power cycle reboot (effectively changes the default of this field as seen by software).

58.4.10 General Purpose Event 0 Status [31:0] (GPE0_STS_31_0)—Offset 80h

GPE0_STS bits 31:0 are assigned to certain SoC GPIO signals as GPE0_DW0. This register is symmetrical to the General Purpose Event 0 Enable [31:0] Register.

Type: I/O Register
(Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABASE] + 80h

ABASE Type: PCI Configuration Register (Size: 32 bits)
ABASE Reference: [B:0, D:31, F:2] + 40h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/1C/V	**General Purpose Event 0 Status [31:0] (GPE0_STS_31_0):** These bits are mapped to the SoC General-Purpose I/O (GPIO) signals that can generate GPE0 when properly configured.

58.4.11 General Purpose Event 0 Status [63:32] (GPE0_STS_63_32)—Offset 84h

GPE0_STS bits 63:32 are assigned to certain SoC GPIO signals as GPE0_DW1. This register is symmetrical to the General Purpose Event 0 Enable [63:32] Register.

Type: I/O Register
(Size: 32 bits)

BAR and Offset: [ABASE] + 84h

Default: 00000000h

ABASE Type: PCI Configuration Register (Size: 32 bits)
ABASE Reference: [B:0, D:31, F:2] + 40h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/1C/V	**General Purpose Event 0 Status [63:32] (GPE0_STS_63_32):** These bits are mapped to the SoC General-Purpose I/O (GPIO) signals that can generate GPE0 when properly configured.

58.4.12 General Purpose Event 0 Status [95:64] (GPE0_STS_95_64)—Offset 88h

GPE0_STS bits 95:64 are assigned to certain SoC GPIO signals as GPE0_DW2. This register is symmetrical to the General Purpose Event 0 Enable [95:64] Register.

Type: I/O Register
(Size: 32 bits)

BAR and Offset: [ABASE] + 88h

Default: 00000000h

ABASE Type: PCI Configuration Register (Size: 32 bits)
ABASE Reference: [B:0, D:31, F:2] + 40h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/1C/V	**General Purpose Event 0 Status [95:64] (GPE0_STS_95_64):** These bits are mapped to the SoC General-Purpose I/O (GPIO) signals that can generate GPE0 when properly configured.

58.4.13 General Purpose Event 0 Status [127:96] (GPE0_STS_127_96)—Offset 8Ch

This register is symmetrical to the General Purpose Event 0 Enable [127:96] Register. Unless indicated otherwise below, if the corresponding _EN bit is set, then when the STS bit get set, the SoC generates a Wake Event. Once back in an S0 state (or if already in an S0 state when the event occurs), the SoC also generates an SCI if the SCIEN bit is set, or an SMI# if the SCIEN bit is not set and GBL_SMI_EN is set.

Type: I/O Register
(Size: 32 bits)

BAR and Offset: [ABASE] + 8Ch

Default: 00000000h

ABASE Type: PCI Configuration Register (Size: 32 bits)
ABASE Reference: [B:0, D:31, F:2] + 40h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0x0 RO	**Reserved (RSVD_31_19):** Reserved.
18	0x0 RW/1C/V	**Wake Alarm Device Timer Status (WADT_STS):** This bit is set whenever the any of the wake alarm device timers signal a timer expiration.
17	0x0 RW/1C/V	**USB Connection in/after DeepSx Status (USB_CON_DSX_STS):** This bit is set when a connection event occurs on any unmasked USB port while in DeepSx or while in Sx immediately after DeepSx. ***Note:*** This bit will be set regardless of the value of the DSX_CFG.USB_CON_DSX_MODE bit.
16	0x0 RW/1C/V	**GPIO[27] Status (GP27_STS):** This bit is set whenever GPIO[27] is seen asserted low. Note that unlike the GPI[n]_STS bits, GPIO[27] is always monitored as an input for the purpose of setting this bit, regardless of the actual GPIO configuration.
15	0x0 RW/1C/V	**GPIO Tier2 SCI Status (GPIO_TIER2_SCI_STS):** This bit is a logical OR of sci_wake from tier 2 GPIO's. reset_type = host_deep_rst_b
14	0x0 RW/1C/V	**Reserved:** Reserved.
13	0x0 RW/1C/V	**Power Management Event Bus 0 Status (PME_B0_STS):** This bit will be set to 1 by the SoC when any internal device with PCI Power Management capabilities on bus 0 asserts the equivalent of the PME# signal. Additionally, if the PME_B0_EN and SCI_EN bits are set, and the system is in an S0 state, then the setting of the PME_B0_STS bit will generate an SCI (or SMI# if SCI_EN is not set). If the PME_B0_EN bit is set, and the system is in an S1-S4 state (or S5 state due to SLP_TYP and SLP_EN), then the setting of the PME_B0_STS bit will generate a wake event. If the system is in an S5 state due to power button override, then the PME_B0_STS bit will not cause a wake event or SCI. This bit is cleared by a software write of '1'. Internal devices which can set this bit: • Integrated LAN • SATA • EHCI (USB 2.0) • XHCI (USB 3.0) • Intel® ME Maskable Host Wake
12	0x0 RW/1C/V	**ME SCI Status (ME_SCI_STS):** This bit will be set when the Intel® ME is requesting an SCI. Software must clear the ME source of the SCI before clearing this bit. ***Note:*** This source is not able to cause a wake event.
11	0x0 RW/1C/V	**Power Management Event Status (PME_STS):** This bit will be set to 1 by hardware when the PME# signal goes active. Additionally, if the PME_EN and SCI_EN bits are set, and system is in an S0 state, then the setting of the PME_STS bit will generate an SCI (or SMI# if SCI_EN is not set). If the PME_EN bit is set, and the system is in an S1-S4 state (or S5 state due to SLP_TYP and SLP_EN), then the setting of the PME_STS bit will generate a wake event. If the system is in an S5 state due to power button override, then PME_STS will not cause a wake event or SCI. This bit is cleared by writing a 1 to this bit position.
10	0x0 RO	**Reserved (RSVD_10):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
9	0x0 RW/1C/V	**PCI Express Status (PCI_EXP_STS):** This bit will be set to 1 by hardware to indicate that: • The PME event message was received on one or more of the PCI-Express Ports • An Assert PMEGPE message received from the MCH via DMI ***Note:*** The PCI WAKE# pin and the PCI-Express Beacons have no impact on this bit. Software attempts to clear this bit by writing a 1 to this bit position. If the PCI_EXP_STS bit went active due to an Assert PMEGPE message, then a Deassert PMEGPE message must be received prior to the software write in order for the bit to be cleared. If the bit is not cleared and the corresponding PCI_EXP_EN bit is set, the level-triggered SCI will remain active.
8	0x0 RW/1C/V	**RI Status (RI_STS):** This bit will be set to1 by hardware when the RI# input signal goes active. This bit can be reset by writing a 1 to this bit position.
7	0x0 RW/1C/V	**SMBus Wake Status (SMB_WAK_STS):** This bit is set to 1 by the hardware to indicate that the wake event was caused by the SoC's SMBus logic. This could be due to either the SMBus slave unit receiving a message or the SMBALERT# signal going active.
6	0x0 RW/1C/V	**TCOSCI Status (TCOSCI_STS):** This bit will be set to 1 by hardware when the TCO logic or Thermal Sensor logic causes an SCI. This bit can be reset by writing a one to this bit position.
5:4	0x0 RO	**Reserved (RSVD_5_4):** Reserved.
3	0x0 RW/1C/V	**IE SCI Status (IE_SCI_STS):** This bit will be set when the Innovative Engine (IE) is requesting an SCI. Software must clear the IE source of the SCI before clearing this bit. ***Note:*** This source is not able to cause a wake event.
2	0x0 RW/1C/V	**Software GPE Status (SWGPE_STS):** The SWGPE_CTRL bit (bit 1 of GPE_CTRL reg) acts as a level input to this bit.
1	0x0 RW/1C/V	**Hot Plug Status (HOT_PLUG_STS):** This bit is set to 1 by hardware when a PCI-Express hot-plug event occurs. This will cause an SCI if the HOT_PLUG_EN and SCI_EN bits are set. This bit is cleared by writing a '1' to this bit position. The following events cause this bit to set: • Assert_GPE message received from any of the PCI Express ports in the SoC • Assert_HPGPE message received from any of the PCI Express ports in the SoC
0	0x0 RO	**Reserved (RSVD_0):** Reserved.

58.4.14 General Purpose Event 0 Enable [31:0] (GPE0_EN_31_0)—Offset 90h

GPE0_EN bits 31:0 are assigned to certain SoC GPIO signals as GPE0_DW0. This register is symmetrical to the General Purpose Event 0 Status [31:0] Register.

Type: I/O Register
(Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABASE] + 90h

ABASE Type: PCI Configuration Register (Size: 32 bits)
ABASE Reference: [B:0, D:31, F:2] + 40h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**General Purpose Event 0 Enable [31:0] (GPE0_EN_31_0):** See Chapter 26, "Customer General-Purpose I/O (GPIO)."

58.4.15 General Purpose Event 0 Enable [63:32] (GPE0_EN_63_32)—Offset 94h

GPE0_EN bits 63:32 are assigned to certain SoC GPIO signals as GPE0_DW1. This register is symmetrical to the General Purpose Event 0 Status [63:32] Register.

Type: I/O Register
(Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABASE] + 94h

ABASE Type: PCI Configuration Register (Size: 32 bits)
ABASE Reference: [B:0, D:31, F:2] + 40h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**General Purpose Event 0 Enable [63:32] (GPE0_EN_63_32):** See Chapter 26, "Customer General-Purpose I/O (GPIO)."

58.4.16 General Purpose Event 0 Enable [95:64] (GPE0_EN_95_64)—Offset 98h

GPE0_EN bits 95:64 are assigned to certain SoC GPIO signals as GPE0_DW2. This register is symmetrical to the General Purpose Event 0 Status [95:64] Register.

Type: I/O Register
(Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABASE] + 98h

ABASE Type: PCI Configuration Register (Size: 32 bits)
ABASE Reference: [B:0, D:31, F:2] + 40h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**General Purpose Event 0 Enable [95:64] (GPE0_EN_95_64):** See Chapter 26, "Customer General-Purpose I/O (GPIO)."

58.4.17 General Purpose Event 0 Enable [127:96] (GPE0_EN_127_96)—Offset 9Ch

This register is symmetrical to the General Purpose Event 0 Status [127:96] Register.

Type: I/O Register
(Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABASE] + 9Ch

ABASE Type: PCI Configuration Register (Size: 32 bits)
ABASE Reference: [B:0, D:31, F:2] + 40h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0x0 RO	**Reserved (RSVD_31_19):** Reserved.
18	0x0 RW	**Wake Alarm Device Timer Enable (WADT_EN):** Used to enable the setting of the WADT_STS bit to generate wake/SMI#/SCI.
17	0x0 RW	**USB Connection in/after DeepSx Enable (USB_CON_DSX_EN):** Used to enable the setting of the USB_CON_DSX_STS bit to generate wake/SMI#/SCI.
16	0x0 RW	**GPIO[27] Enable (GP27_EN):** Used to enable the setting of the GP27_STS bit to generate wake/SMI#/SCI. Host wake events from the PHY through GP27 cannot be disabled by clearing this bit. ***Note:*** GPIO[27] is a valid host wake event from Deep-Sx. But the wake enable configuration must persist even after a G3. To make this happen, this bit is in the SoC RTC power well.
15	0x0 RW/V	**GPIO Tier2 SCI EN (GPIO_TIER2_SCI_EN):** Used to enable the setting of GPIO_TIER2_SCI_STS to generate wake/SCI# reset_type =host_deep_rst_b
14	0x0 RW/V	**Reserved:** Reserved.
13	0x0 RW/V	**PME_B0 Enable (PME_B0_EN):** Enables the setting of the PME_B0_STS bit to generate a wake event and/or an SCI or SMI#. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active.
12	0x0 RW/V	**ME SCI Enable (ME_SCI_EN):** Used to enable the setting of the ME_SCI_STS bit to generate a SCI.
11	0x0 RW/V	**Power Management Event Enable (PME_EN):** Enables the setting of the PME_STS to generate a wake event and/or an SCI. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active.
10	0x0 RO	**Reserved (RSVD_10):** Reserved.
9	0x0 RW/V	**PCI Express Enable (PCI_EXP_EN):** Enables the SoC to cause an SCI when PCI_EXP_STS bit is set. This is used to allow the PCI Express ports to cause an SCI due to wake/PME events.
8	0x0 RW/V	**RI Enable (RI_EN):** When RI_EN and RI_STS are both set, a Wake event will occur. If RI_EN is not set, then when RI_STS is set, no Wake event will occur. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active.
7	0x0 RO	**Reserved (RSVD_7):** Reserved. ***Note:*** For the SoC, the SMBus slave will always be enabled as a wake event, as will the SMBALERT# signal.
6	0x0 RW/V	**TCOSCI Enable (TCOSCI_EN):** When TCOSCI_EN and TCOSCI_STS are both set, an SCI will be generated.
5:4	0x0 RO	**Reserved (RSVD_5_4):** Reserved.
3	0x0 RW/V	**IE SCI Enable (IE_SCI_EN):** Used to enable the setting of the IE_SCI_STS bit to generate a SCI.

Bit Range	Default & Access	Field Name (ID): Description
2	0x0 RW/V	**Software GPE Enable (SWGPE_EN):** This bit, when set to 1, enables the SW GPE function. • If SWGPE_CTRL is written to a 1, hardware will set SWGPE_STS (acts as a level input). • If SWGPE_STS, SWGPE_EN, and SCI_EN are all 1's, an SCI will be generated. • If SWGPE_STS = 1, SWGPE_EN = 1, SCI_EN = 0, and GBL_SMI_EN = 1, then an SMI# will be generated.
1	0x0 RW/V	**Hot Plug Enable (HOT_PLUG_EN):** Enables the SoC to cause an SCI when the HOT_PLUG_STS bit is set. This is used to allow the PCI Express ports to cause an SCI due to hot-plug events. The following events cause HOT_PLUG_STS bit to set: • Assert_GPE message received from any of the PCI Express ports in the SoC • Assert_HPGPE message received from any of the PCI Express ports in the SoC
0	0x0 RO	**Reserved (RSVD_0):** Reserved.

58.5 Registers in I/O Space—Fixed Addresses

This register is accessed in Host I/O Space through a fixed I/O address.

58.5.1 Reset Control Register (RST_CNT)

Type: I/O Register
(Size: 8 bits)

Fixed Address in Host I/O Space: CF9h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:4	0x0 RO	**Reserved (RSVD_7_4):** Reserved.
3	0x0 RW	**Full Reset (FULL_RST):** When this bit is set to 1 and bit 1 is set to 1 (indicating Hard Reset, not Soft Reset), and the RST_CPU bit (bit 2) is written from 0 to 1, the SoC performs a full reset, including driving signal pins PMU_SLP_S3_N and PMU_SLP_S45_N active (low) for at least 3, and no more than 5, seconds. When this bit is set, it also causes the full power cycle (PMU_SLP_S3_N and PMU_SLP_S45_N assertion) in response to PMU_RESETBUTTON_N, COREPWROK, and Watchdog Timer reset sources.
2	0x0 RW	**Reset CPU (RST_CPU):** This bit will cause either a hard or soft reset to the CPU depending on the state of the SYS_RST bit (bit 1 in this same register). The software will cause the reset by setting bit 2 from a 0 to a 1.
1	0x0 RW	**System Reset (SYS_RST):** This bit determines the type of reset caused via RST_CPU (bit 2 of this register). • If SYS_RST is 0 when RST_CPU goes from 0 to 1, then the SoC will force an internal Initialize (INIT#) signal to the CPU but system can hang due to the security concern with this internal initialize (INIT#) enabled. • If SYS_RST is 1 when RST_CPU goes from 0 to 1, then the SoC will force PCI Reset active for about 1 ms, however the PMU_SLP_S3_N and PMU_SLP_S45_N signals assertions are dependent on the value of the FULL_RST (bit 3 of this register).
0	0x0 RO	**Reserved (RSVD_0):** Reserved.

58.6 Sideband Registers

The Sideband registers accessible to the Host are described here. They are accessible in Host Memory Space starting at the Sideband Base Address Register (SBREG_BAR). See Section 3.4.1, "Using SBREG_BAR Method" on page 187.

58.6.1 Advanced Power Management Status and Control Port (APM_STS_CNT)—Offset B0h

Usage: Legacy only. Not lockable. Primary Power Well.

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x82] + B0h
Host Memory Space: SBREG_BAR + 0x820000 + B0h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RW	**APM Status Port (APM_STS):** Used to pass data between the OS and the SMI handler. Basically, this is a scratchpad register and is not effected by any other register or function (other than a PCI reset).
23:16	0x0 RW	**Advanced Power Management Control Port (APM_CNT):** Used to pass an APM command between the OS and the SMI handler. Writes to this port not only store data in the APMC register, but also generates an SMI# when the APMC_EN bit is set.
15:0	0x0 RO	**Reserved (RSVD_15_0):** Reserved.

58.6.2 Misc SB Reg0 (MISC_SBR0)—Offset B4h

Misc SB Reg0

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x82] + B4h
Host Memory Space: SBREG_BAR + 0x820000 + B4h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0x0 RO	**Reserved (RSVD_31_9):** Reserved.
8	0x0 RW	**North Completed (NORTH_COMPLETED):** North Completed • 0: Punit has not completed north preparation for Asynchronous DRAM Refresh (ADR) • 1: Punit has completed north preparation for ADR Set by Pcode through CRWt once Pcode has put DIMM in Self-refresh.
7:5	0x0 RO	**Reserved (RSVD_7_5):** Reserved.
4:1	0x0 RO/V	**FINAL DDR SPEED set by PMC FW (FINAL_DDR_SPEED):** FINAL_DDR_SPEED set by PMC firmware (CURRENT_SPD_SPEED): • 0xxxx = undefined, use max DDR mem config (fuse) as IDI speed • 1000 = DDR1600, 400MHz IDI freq • 1001 = DDR1866, 466MHz IDI freq • 1010 = DDR2133, 533MHz IDI freq • 1011 = DDR2400, 600Mhz IDI freq • 1100 = DDR2666, 667MHz IDI freq

Bit Range	Default & Access	Field Name (ID): Description
0	0x0 RW/1C/V	**SPD_RESET_PCODE:** SPD_RESET_PCODE (SPD_RESET_PCODE) • 0= PMC indicates to Pcode that this is NOT a SPD Reset. • 1= PMC indicates to Pcode that this is a SPD ResetSet by PMC firmware during the SPD Reset clocking flow.

§ §

59 SMBus - Legacy - B0, D31, F4

59.1 Introduction and Index

The host-accessible registers for the SMBus are described here.

To determine the number of devices/functions available refer to the following:

- Table 1-1, “Features by product SKU - Server and Cloud Storage SKUs 0 through 4”
- Table 1-2, “Features by Product SKU - Network and Enterprise Storage SKUs 5 through 10”
- Table 1-3, “Features by Product SKU - Extended Temperature SKUs 11 through 14”.

The legend for the register access codes are described in Chapter 43, “Introduction.”

59.1.1 Registers in Configuration Space

These registers are discovered in Host Configuration Space starting at Bus 0, Device 31 (decimal), Function 4. The offset addresses are listed.

Table 59-1. Summary of PCI Configuration Registers—0/31/4

Offset (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
0	2	8086	"Vendor ID (VID)—Offset 0h" on page 2755
2	2	19DF	"Device ID (DID)—Offset 2h" on page 2755
4	2	0000	"Command (CMD)—Offset 4h" on page 2756
6	2	0280	"Device Status (DS)—Offset 6h" on page 2757
8	1	00	"Revision ID (RID)—Offset 8h" on page 2758
9	1	00	"Programming Interface (PI)—Offset 9h" on page 2758
A	1	05	"Sub Class Code (SCC)—Offset Ah" on page 2758
B	1	0C	"Base Class Code (BCC)—Offset Bh" on page 2758
10	4	00000004	"SMBus Memory Base Address_31_0 (SMBMBAR_31_0)—Offset 10h" on page 2759
14	4	00000000	"SMBus Memory Base Address_63_32 (SMBMBAR_63_32)—Offset 14h" on page 2759
20	4	00000001	"SMB Base Address (SBA)—Offset 20h" on page 2760
2C	2	0000	"SVID—Offset 2Ch" on page 2760
2E	2	0000	"SID—Offset 2Eh" on page 2760
3C	1	00	"Interrupt Line (INTLN)—Offset 3Ch" on page 2761
3D	3	01	"Interrupt Pin (INTPN)—Offset 3Dh" on page 2761
40	1	00	"Host Configuration (HCFG)—Offset 40h" on page 2762
50	4	00000001	"TCO Base Address (TCOBASE)—Offset 50h" on page 2763
54	4	00000000	"TCO Control (TCOCTL)—Offset 54h" on page 2763
64	4	08080000	"Host_Timing (HTIM)—Offset 64h" on page 2764
F8	4	01000F1C	"Manufacturer's ID (MANID)—Offset F8h" on page 2765

59.1.2 Registers in Memory Space—SMBMBAR

An index of the registers that are accessible in Host Memory Space is shown here.

Table 59-2. Summary of Memory Mapped I/O Registers—SMBMBAR

Offset (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
0	2	00	"Host Status Register Address (HSTS)—Offset 0h" on page 2766
2	1	00	"Host Control Register (HCTL)—Offset 2h" on page 2767
3	1	00	"Host Command Register (HCMD)—Offset 3h" on page 2769
4	1	00	"Transmit Slave Address Register (TSA)—Offset 4h" on page 2769
5	1	00	"Data 0 Register (HD0)—Offset 5h" on page 2769
6	1	00	"Data 1 Register (HD1)—Offset 6h" on page 2770
7	1	00	"Host Block Data (HBD)—Offset 7h" on page 2770
8	1	00	"Packet Error Check Data Register (PEC)—Offset 8h" on page 2771
9	1	44	"Receive Slave Address Register (RSA)—Offset 9h" on page 2771
A	2	0000	"Slave Data Register (SD)—Offset Ah" on page 2772
C	1	00	"Auxiliary Status (AUXS)—Offset Ch" on page 2773
D	1	00	"Auxiliary Control (AUXC)—Offset Dh" on page 2774
E	1	04	"SMLINK_PIN_CTL Register (SMLC)—Offset Eh" on page 2775
F	1	04	"SMBUS_PIN_CTL Register (SMBC)—Offset Fh" on page 2776
10	1	00	"Slave Status Register (SSTS)—Offset 10h" on page 2777
11	3	00	"Slave Command Register (SCMD)—Offset 11h" on page 2778
14	2	00	"Notify Device Address Register (NDA)—Offset 14h" on page 2779
16	1	00	"Notify Data Low Byte Register (NDLB)—Offset 16h" on page 2779
17	1	00	"Notify Data High Byte Register (NDHB)—Offset 17h" on page 2779

59.1.3 Registers in I/O Space—SBA

An index of the registers that are accessible in Host I/O Space is shown here.

Table 59-3. Summary of I/O Registers—SBA

Offset (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
0	2	00	"Host Status Register Address (HSTS)—Offset 0h" on page 2780
2	1	00	"Host Control Register (HCTL)—Offset 2h" on page 2781
3	1	00	"Host Command Register (HCMD)—Offset 3h" on page 2783
4	1	00	"Transmit Slave Address Register (TSA)—Offset 4h" on page 2783
5	1	00	"Data 0 Register (HD0)—Offset 5h" on page 2783
6	1	00	"Data 1 Register (HD1)—Offset 6h" on page 2784
7	1	00	"Host Block Data (HBD)—Offset 7h" on page 2784
8	1	00	"Packet Error Check Data Register (PEC)—Offset 8h" on page 2785
9	1	44	"Receive Slave Address Register (RSA)—Offset 9h" on page 2785
A	2	0000	"Slave Data Register (SD)—Offset Ah" on page 2786
C	1	00	"Auxiliary Status (AUXS)—Offset Ch" on page 2787
D	1	00	"Auxiliary Control (AUXC)—Offset Dh" on page 2788
E	1	04	"SMLINK_PIN_CTL Register (SMLC)—Offset Eh" on page 2789
F	1	04	"SMBUS_PIN_CTL Register (SMBC)—Offset Fh" on page 2790
10	1	00	"Slave Status Register (SSTS)—Offset 10h" on page 2791
11	3	00	"Slave Command Register (SCMD)—Offset 11h" on page 2792
14	2	00	"Notify Device Address Register (NDA)—Offset 14h" on page 2793
16	1	00	"Notify Data Low Byte Register (NDLB)—Offset 16h" on page 2793
17	1	00	"Notify Data High Byte Register (NDHB)—Offset 17h" on page 2793

59.1.4 Registers in I/O Space—TCOBASE

An index of the registers that are accessible in Host I/O Space is shown here.

Table 59-4. Summary of I/O Registers—TCOBASE

Offset (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
0	2	0004	"TCO_RLD Register (TRLD)—Offset 0h" on page 2794
2	1	00	"TCO_DAT_IN Register (TDI)—Offset 2h" on page 2794
3	1	00	"TCO_DAT_OUT Register (TDO)—Offset 3h" on page 2795
4	2	0000	"TCO1_STS Register (TSTS1)—Offset 4h" on page 2795
6	2	0000	"TCO2_STS Register (TSTS2)—Offset 6h" on page 2797
8	2	0000	"TCO1_CNT Register (TCTL1)—Offset 8h" on page 2798
A	2	0008	"TCO2_CNT Register (TCTL2)—Offset Ah" on page 2799
10	1	03	"LEGACY_ELIM Register (LE)—Offset 10h" on page 2800
12	2	0004	"TCO_TMR Register (TTMR)—Offset 12h" on page 2800

59.1.5 Sideband Registers—Host SMBus Private Configuration

An index of the Sideband registers that are accessible to the Host are listed here. Each is accessible in Host Memory Space using the Sideband Base Address Register (SBREG_BAR). See Section 3.4.1, "Using SBREG_BAR Method" on page 187.

Table 59-5. Summary of Sideband Registers—0xCF

Offset (hex)	Default Value (hex)	Register Name (Register Symbol)
0	00000000	"TCO Configuration (TCOCFG)—Offset 0h" on page 2801
C	00000000	"General Control (GC)—Offset Ch" on page 2802
10	00000009	"Power Control Enable (PCE)—Offset 10h" on page 2803

59.1.6 Sideband Registers—CLTT SMBus Configuration Control

An index of the Sideband registers that are accessible to the Host are listed here. Each is accessible in Host Memory Space using the Sideband Base Address Register (SBREG_BAR). See Section 3.4.1, "Using SBREG_BAR Method" on page 187.

Table 59-6. Summary of Sideband Registers—0xCC

Offset (hex)	Default Value (hex)	Register Name (Register Symbol)
10	00000000	"Ch0 Dimm0 Cfg Status (C0D0CFGSTS)—Offset 10h" on page 2805
14	01000000	"Ch0 Dimm1 Cfg Status (C0D1CFGSTS)—Offset 14h" on page 2805
18	00000000	"Ch0 Dimm2 Cfg Status (C0D2CFGSTS)—Offset 18h" on page 2806
1C	00000000	"Ch0 Dimm3 Cfg Status (C0D3CFGSTS)—Offset 1Ch" on page 2806
20	02000000	"Ch1 Dimm0 Cfg Status (C1D0CFGSTS)—Offset 20h" on page 2807
24	03000000	"Ch1 Dimm1 Cfg Status (C1D1CFGSTS)—Offset 24h" on page 2807
28	00000000	"Ch1 Dimm2 Cfg Status (C1D2CFGSTS)—Offset 28h" on page 2808
2C	00000000	"Ch1 Dimm3 Cfg Status (C1D3CFGSTS)—Offset 2Ch" on page 2808
30	00000000	"Ch0 Dimm Temp Status (C0TEMPSTS0)—Offset 30h" on page 2809
34	00000000	"Ch0 Dimm Temp Status (C0TEMPSTS1)—Offset 34h" on page 2809
38	00000000	"Ch1 Dimm Temp Status (C1TEMPSTS0)—Offset 38h" on page 2809
3C	00000000	"Ch1 Dimm Temp Status (C1TEMPSTS1)—Offset 3Ch" on page 2810
40	00	"Host Configuration (HCFG)—Offset 40h" on page 2810

59.2 Registers in Configuration Space

59.2.1 Vendor ID (VID)—Offset 0h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:31, F:4] + 0h

Default: 8086h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x8086 RO	**Vendor ID (VID):** Value indicates Intel as the vendor. **Power Well:** Core

59.2.2 Device ID (DID)—Offset 2h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:31, F:4] + 2h

Default: 19DFh

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x19df RO/V	**Device ID (DID):** Indicates the device number assigned by the SIG. **Power Well:** Core

59.2.3 Command (CMD)—Offset 4h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:31, F:4] + 4h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
10	0x0 RW	**Interrupt Disable (INTD):** • 1 = Disables SMBus to assert its PIRQB# signal. Defaults to 0. **Power Well:** Core
9	0x0 RO	**Fast Back to Back Enable (FBE):** Reserved as 0. Read Only. **Power Well:** Core
8	0x0 RW	**SERR# Enable (SERRE):** • 1 = Enables SERR# generation. **Power Well:** Core
7	0x0 RO	**Wait Cycle Control (WCC):** Reserved as 0. Read Only. **Power Well:** Core
6	0x0 RW	**Parity Error Response (PER):** • 1 = Sets Detected Parity Error bit when parity error is detected. **Power Well:** Core
5	0x0 RO	**VGA Palette Snoop (VGAPS):** Reserved as 0. Read Only. **Power Well:** Core
4	0x0 RO	**Postable Memory Write Enable (PMWE):** Reserved as 0. Read Only. **Power Well:** Core
3	0x0 RO	**Special Cycle Enable (SCE):** Reserved as 0. Read Only. **Power Well:** Core
2	0x0 RO	**Bus Master Enable (BME):** Reserved as 0. Read Only. **Power Well:** Core
1	0x0 RW	**Memory Space Enable (MSE):** • 1= Enables memory mapped config space. **Power Well:** Core
0	0x0 RW	**I/O Space Enable (IOSE):** • 1= enables access to the SM Bus I/O space registers as defined by the Base Address Register. **Power Well:** Core

59.2.4 Device Status (DS)—Offset 6h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:31, F:4] + 6h

Default: 0280h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW/1C	**Detected Parity Error (DPE):** Reserved. **Power Well:** Core
14	0x0 RW/1C	**Signaled System Error (SSE):** Reserved. **Power Well:** Core
13	0x0 RO	**Received Master Abort (RMA):** Reserved as 0. **Power Well:** Core
12	0x0 RO	**Received Target Abort (RTA):** Reserved as 0. **Power Well:** Core
11	0x0 RO	**Signaled Target-Abort Status (STA):** Reserved as 0. **Power Well:** Core
10:9	0x1 RO	**DEVSEL# Timing Status (DEVT):** This 2-bit field defines the timing for DEVSEL# assertion. **Power Well:** Core
8	0x0 RO	**Data Parity Error Detected (DPED):** Reserved as 0. **Power Well:** Core
7	0x1 RO	**Fast Back-to-Back Capable (FBC):** Reserved as 1. **Power Well:** Core
6	0x0 RO	**User Definable Features (UDF):** Reserved as 0. **Power Well:** Core
5	0x0 RO	**66 MHz Capable (C_66M):** Reserved as 0. **Power Well:** Core
4	0x0 RO	**Capabilities List Indicator (CLI):** Hardwired to 0 because there are no capability list structures in this function. **Power Well:** Core
3	0x0 RO	**Interrupt Status (INTS):** This bit indicates that an interrupt is pending. It is independent from the state of the Interrupt Enable bit in the command register. **Power Well:** Core
2:0	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core

59.2.5 Revision ID (RID)—Offset 8h

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:31, F:4] + 8h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO	**Revision ID (RID):** The value reported in this register depends on the global revision ID. **Power Well:** Core

59.2.6 Programming Interface (PI)—Offset 9h

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:31, F:4] + 9h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO	**Programming Interface (PI):** Programming interface. **Power Well:** Core

59.2.7 Sub Class Code (SCC)—Offset Ah

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:31, F:4] + Ah

Default: 05h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x5 RO	**Sub Class Code (SCC):** A value of 05h indicates that this device is a SM Bus serial controller. **Power Well:** Core

59.2.8 Base Class Code (BCC)—Offset Bh

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:31, F:4] + Bh

Default: 0Ch

Bit Range	Default & Access	Field Name (ID): Description
7:0	0xc RO	**Base Class Code (BCC):** A value of 0Ch indicates that this device is a serial controller. **Power Well:** Core

59.2.9 SMBus Memory Base Address_31_0 (SMBMBAR_31_0)—Offset 10h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:4] + 10h

Default: 00000004h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RW	**Base Address (BA):** Provides the 32 byte system memory base address. **Power Well:** Core
7:4	0x0 RO	**Hardwired_0:** Hardwired to 0. **Power Well:** Core
3	0x0 RO	**Prefetchable (PREF):** Hardwired to 0. Indicated that SMBMBAR is not prefetchable. **Power Well:** Core
2:1	0x2 RO	**Address Range (ADDRNG):** Indicates that this SMBMBAR can be located anywhere in 64 bit address space. **Power Well:** Core
0	0x0 RO	**Memory Space Indicator (MSI):** Indicates that the SMB logic is memory mapped. **Power Well:** Core

59.2.10 SMBus Memory Base Address_63_32 (SMBMBAR_63_32)—Offset 14h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:4] + 14h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Base Address (BA):** Bits 63-32 of SMBus Memory Base Address. **Power Well:** Core

59.2.11 SMB Base Address (SBA)—Offset 20h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:4] + 20h

Default: 00000001h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
15:5	0x0 RW	**Base Address (BA):** Provides the 32 byte t system I/O base address for the SMB logic. **Power Well:** Core
4:1	0x0 RO	**Reserved (RSVD_1):** Reserved. **Power Well:** Core
0	0x1 RO	**IO Space Indicator (IOSI):** This read-only bit always is 1, indicating that the SMB logic is I/O mapped. **Power Well:** Core

59.2.12 SVID—Offset 2Ch

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:31, F:4] + 2Ch

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x0 RW/O	**SVID:** BIOS sets the value in this register to identify the Subsystem Vendor ID. The SMBus SVID register, in combination with the SMBus Subsystem ID register, enables the operating system to distinguish each subsystem from the others. ***Note:*** The software can write to this register only once per core well reset. Writes should be done as a single 16-bit cycle. **Power Well:** Core

59.2.13 SID—Offset 2Eh

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:31, F:4] + 2Eh

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x0 RW/O	**SID:** BIOS can write to this register to identify the Subsystem ID. The SID register, in combination with the SVID, enable the operating system to distinguish each subsystem from other(s). ***Note:*** The software can write to this register only once per core well reset. Writes should be done as a single 16-bit cycle. **Power Well:** Core

59.2.14 Interrupt Line (INTLN)—Offset 3Ch

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:31, F:4] + 3Ch

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Interrupt Line (INTLN):** This data is not used by the hardware. It is to communicate to software the interrupt line that the interrupt pin is connected to PIRQB#. **Power Well:** Core

59.2.15 Interrupt Pin (INTPN)—Offset 3Dh

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:31, F:4] + 3Dh

Default: 01h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x1 RO	**Interrupt Pin (INTPN):** This defines the interrupt pin to be used by the SMBus controller. Bits: Pins • 0h: No Interrupt • 1h: INTA# • 2h: INTB# • 3h: INTC# • 4h: INTD# • 5h-Fh: Reserved BIOS **Power Well:** Core

59.2.16 Host Configuration (HCFG)—Offset 40h

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:31, F:4] + 40h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:5	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
4	0x0 RW/1L	**SPD Write Disable (SPDWD):** No SMB registers should be accessed while HSTS.HBSY bit is set, the same will apply to SPD write disable. **Power Well:** Core
3	0x0 RW	**SSRESET:** Soft SMBUS Reset: When this bit is 1, the SMBus state machine and logic is reset. The HW will reset this bit to 0 when reset operation is completed. **Power Well:** Core
2	0x0 RW	**I2C_EN (I2CEN):** When this bit is 1, the SMBus Host is enabled to communicate with I2C devices. This will change the formatting of some commands. When this bit is 0, behavior is for SMBus. **Power Well:** Core
1	0x0 RW	**SMB_SMI_EN (SSEN):** When this bit is set, any source of an SMB interrupt will instead be routed to generate an SMI#. Refer to Section 28.8, "Interrupts and SMI" on page 722 (Interrupts/SMI#) for details. **Power Well:** Core
0	0x0 RW	**HST_EN (HSTEN):** When set, the SMB Host Controller interface is enabled to execute commands. The HST_INT_EN bit needs to be enabled in order for the SMB Host Controller to interrupt or SMI#. Additionally, the SMB Host Controller will not respond to any new requests until all interrupt requests have been cleared. **Power Well:** Core

59.2.17 TCO Base Address (TCOBASE)—Offset 50h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:4] + 50h

Default: 00000001h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
15:5	0x0 RW/L	**TCO Base Address (TCOBA):** Provides the 32 bytes of I/O space for TCO logic, mappable anywhere in the 64k I/O space on 32-byte boundaries. **Power Well:** Core
4:1	0x0 RO	**Reserved (RSVD_1):** Reserved. **Power Well:** Core
0	0x1 RO	**I/O Space (IOS):** Indicates an I/O Space. **Power Well:** Core

59.2.18 TCO Control (TCOCTL)—Offset 54h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:4] + 54h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
8	0x0 RW	**TCO Base Enable (TCO_BASE_EN):** When set, decode of the I/O range pointed to by the TCO base register is enabled. **Power Well:** Core
7:1	0x0 RO	**Reserved (RSVD_1):** Reserved. **Power Well:** Core
0	0x0 RW/O	**TCO Base Lock (TCO_BASE_LOCK):** When set to 1, this bit locks down the TCO Base Address Register (TCOBASE) at offset 50h. The Base Address Field becomes read-only. This bit becomes locked when a value of 1b is written to it. Writes of 0 to this bit are always ignored. Once locked by writing 1, the only way to clear this bit is to perform a platform reset. **Power Well:** Core

59.2.19 Host_Timing (HTIM)—Offset 64h

Setting these timing parameters will affect the SMBus host PHY layer. These values should only be changed when the SMBus is idle.

These timings are based off the 10MHz PHY clock. A higher frequency PHY clock will scale the timings accordingly. This register is in the suspend well.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:4] + 64h

Default: 08080000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x8 RW	**Thigh:** The time value in this field will be added/subtracted to the Thigh timing parameter as defined in SMB 2.0 spec. • 00000000: -7 Clocks (-700ns) • 00000001: -6 Clocks (-600ns) • ---- • 00000111: -1 Clock (-100ns) • 00001000: +0 Clock (0ns) • 00001001: +1 Clock (+100ns) • ---- • 11111111: +247 Clocks (+24700ns) ***Note:*** These are offsets that control the range of the nominal Thigh value in the PHY layers **Power Well:** SUS

59.2.20 Manufacturer's ID (MANID)—Offset F8h

This reflects the value of the Manufacturers ID which provides information on the details of the chip revision.

Note: A single Manufacturers ID is implemented based on information in the Fuse block and distributed to the devices via a message.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:4] + F8h

Default: 01000F1Ch

Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
27:24	0x1 RO/V	**Dot Portion of Process ID (DPID):** Indicates the dot process as x.8. **Power Well:** Core
23:16	0x0 RO/V	**Stepping ID (SID):** This field is incremented for each stepping of the part. ***Note:*** This field can be used by software to differentiate steppings when the Revision ID may not change. **Power Well:** Core
15:8	0xf RO/V	**Manufacturer (MaFa):** 0Fh = Intel. **Power Well:** Core
7:0	0x1C RO/V	**Process/Dot (PD):** Indicates that the process base is 1271. **Power Well:** Core

59.3 Registers in Memory Space—SMBMBAR

These registers are accessed in Host Memory Space starting at the relocatable memory address defined by the Base Address Register (BAR) SMBMBAR.

59.3.1 Host Status Register Address (HSTS)—Offset 0h

All status bits are set by hardware and cleared by the software writing a one to the particular bit position. Writing a zero to any bit position has no affect.

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [SMBMBAR] + 0h

SMBMBAR Type: PCI Configuration Register (Size: 64 bits)
SMBMBAR Reference: [B:0, D:31, F:4] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RW/1C	**BYTE_DONE_STS (BDS):** This bit will be set to 1 when the host controller has received a byte (for Block Read commands) or if it has completed transmission of a byte (for Block Write commands) when the 32-byte buffer is not being used. **Power Well:** Core
6	0x0 RW/1C	**In Use Status (IUS):** After a full PCI reset, a read to this bit returns a 0. After the first read, subsequent reads will return a 1. A write of a 1 to this bit will reset the next read value to 0. Writing a 0 to this bit has no effect. **Power Well:** Core
5	0x0 RW/1C	**SMBALERT_STS (SMSTS):** SoC sets this bit to a 1 to indicates source of the interrupt or SMI# was the SMBAlert# signal. Software resets this bit by writing a 1 to this location. This bit should also be cleared by RSMRST# (but not PLTRST#). **Power Well:** Core
4	0x0 RW/1C	**Failed (FAIL):** When set, this indicates that the source of the interrupt or SMI# was a failed bus transaction. This is set in response to the KILL bit being set to terminate the host transaction. **Power Well:** Core
3	0x0 RW/1C	**Bus Error (BERR):** When set, this indicates the source of the interrupt or SMI# was a transaction collision. **Power Well:** Core
2	0x0 RW/1C	**Device Error (DERR):** When set, this indicates that the source of the interrupt or SMI# was due one of the following: • Illegal Command Field Unclaimed Cycle (host initiated) • Host Device Time-out Error. CRC Error **Power Well:** Core
1	0x0 RW/1C	**Interrupt (INTR):** When set, this indicates that the source of the interrupt or SMI# was the successful completion of its last command. **Power Well:** Core
0	0x0 RW/1C	**Host Busy (HBSY):** A 1 indicates that the SMBus Host is running a command from the host interface. No SMB registers should be accessed while this bit is set. **Power Well:** Core

59.3.2 Host Control Register (HCTL)—Offset 2h

Note: A read to this register will clear the pointer in the 32-byte buffer.

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [SMBMBAR] + 2h

SMBMBAR Type: PCI Configuration Register (Size: 64 bits)
SMBMBAR Reference: [B:0, D:31, F:4] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RW	**PEC_EN:** When set to 1, this bit causes the host controller to perform the SMBus transaction with the Packet Error Checking phase appended. For writes, the value of the PEC byte is transferred from the PEC Register. For reads, the PEC byte is loaded in to the PEC Register. **Power Well:** Core
6	0x0 RW	**START:** This write-only bit is used to initiate the command described in the SMB_CMD field. All registers should be setup prior to writing a 1 to this bit position. This bit always reads zero. **Power Well:** Core
5	0x0 RW	**LAST_BYTE:** Used for I2C Read commands as an indication that the next byte will be the last one to be received for that block. **Power Well:** Core
4:2	0x0 RW	**SMB_CMD:** As shown by the bit encoding below, indicates which command the SMBus Host is to perform. If enabled, the SMBus Host will generate an interrupt or SMI# when the command has completed If the value is for a non-supported or reserved command, the SMBus Host will set the device error (DEV_ERR) status bit and generate an interrupt when the START bit is set. The SMBus Controller will perform no command, and will not operate until DEV_ERR is cleared. Val - Command Description: • 000 - Quick: The slave address and read/write value (bit 0) are stored in the tx slave address register. • 001 - Byte: This command uses the transmit slave address and command registers. Bit 0 of the slave address register determines if this is a read or write command. • 010 - Byte Data: This command uses the transmit slave address, command, and DATA0 registers. Bit 0 of the slave address register determines if this is a read or write command. If it is a read, the DATA0 register will contain the read data. • 011 - Word Data: This command uses the transmit slave address, command, DATA0 and DATA1 registers. Bit 0 of the slave address register determines if this is a read or write command. If it is a read, after the command completes the DATA0 and DATA1 registers will contain the read data. • 100 - Process Call: This command uses the transmit slave address, command, DATA0 and DATA1 registers. Bit 0 of the slave address register determines if this is a read or write command. After the command completes, the DATA0 and DATA1 registers will contain the read data. • 101 - Block: This command uses the transmit slave address, command, and DATA0 registers, and the Block Data Byte register. For block write, the count is stored in the DATA0 register and indicates how many bytes of data will be transferred. For block reads, the count is received and stored in the DATA0 register. Bit 0 of the slave address register selects if this is a read or write command. For writes, data is retrieved from the first n (where n is equal to the specified count) addresses of the SRAM array. For reads, the data is stored in the Block Data Byte register. • 110 - I2C Read: This command uses the transmit slave address, command, DATA0, DATA1 registers, and the Block Data Byte register. The read data is stored in the Block Data Byte register. The SoC will continue reading data until the NAK is received. • 111 - Block-Process: This command uses the transmit slave address, command, DATA0 and the Block Data Byte register. For block write, the count is stored in the DATA0 register and indicates how many bytes of data will be transferred. For block read, the count is received and stored in the DATA0 register. Bit 0 of the slave address register always indicate a write command. For writes, data is retrieved from the first m (where m is equal to the specified count) addresses of the SRAM array. For reads, the data is stored in the Block Data Byte register. ***Note:*** E32B bit in the Auxiliary Control Register must be set for this command to work. **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RW	**KILL:** When set, kills the current host transaction taking place, sets the FAILED status bit, and asserts the interrupt (or SMI#) selected by the SMB_INTRSEL field. This bit, once set, must be cleared to allow the SMB Host Controller to function normally. **Power Well:** Core
0	0x0 RW	**INTREN:** Enable the generation of an interrupt or SMI# upon the completion of the command. **Power Well:** Core

59.3.3 Host Command Register (HCMD)—Offset 3h

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [SMBMBAR] + 3h

SMBMBAR Type: PCI Configuration Register (Size: 64 bits)
SMBMBAR Reference: [B:0, D:31, F:4] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Host Command Register (HCMD):** This eight bit field is transmitted by the host controller in the command field of the SMB protocol during the execution of any command. **Power Well:** Core

59.3.4 Transmit Slave Address Register (TSA)—Offset 4h

This register is transmitted by the host controller in the slave address field of the SMB protocol. This is the address of the target.

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [SMBMBAR] + 4h

SMBMBAR Type: PCI Configuration Register (Size: 64 bits)
SMBMBAR Reference: [B:0, D:31, F:4] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:1	0x0 RW	**ADDRESS (ADDR):** 7-bit address of the targeted slave. ***Note:*** Writes to TSA values of A0h - AEh are blocked depending on the setting of the SPD write disable bit in HCFG - HostConfiguration. **Power Well:** Core
0	0x0 RW	**RW:** Direction of the host transfer. • 1 = Read. • 0 = Write. **Power Well:** Core

59.3.5 Data 0 Register (HD0)—Offset 5h

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [SMBMBAR] + 5h

SMBMBAR Type: PCI Configuration Register (Size: 64 bits)
SMBMBAR Reference: [B:0, D:31, F:4] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**DATA0/COUNT (DATA0_COUNT):** This field contains the eight bit data sent in the DATA0 field of the SMB protocol. For block write commands, this register reflects the number of bytes to transfer. This register should be programmed to a value between 1 and 32 for block counts. A count of 0 or a count above 32 will result in unpredictable behavior. The host controller does not check or log illegal block counts. **Power Well:** Core

59.3.6 Data 1 Register (HD1)—Offset 6h

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [SMBMBAR] + 6h

SMBMBAR Type: PCI Configuration Register (Size: 64 bits)
SMBMBAR Reference: [B:0, D:31, F:4] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**DATA1:** This eight bit register is transmitted in the DATA1 field of the SMB protocol during the execution of any command. **Power Well:** Core

59.3.7 Host Block Data (HBD)—Offset 7h

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [SMBMBAR] + 7h

SMBMBAR Type: PCI Configuration Register (Size: 64 bits)
SMBMBAR Reference: [B:0, D:31, F:4] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Block Data (BDTA):** This is either a register, or a pointer into a 32- byte block array, depending upon whether the E32B bit is set in the Auxiliary Control register. When the E32B bit is cleared, this is a register containing a byte of data to be sent on a block write or read from on a block read, just as it behaved on the SoC. When the E32B bit is set, reads and writes to this register are used to access the 32-byte block data storage array. An internal index pointer is used to address the array, which is reset to 0 by reading the HCTL register (offset 02h). The index pointer then increments automatically upon each access to this register. The transfer of block data into (read) or out of (write) this storage array during an SMBus transaction always starts at index address 0. When the E2B bit is set, for writes, software will write up to 32-bytes to this register as part of the setup for the command. After the Host Controller has sent the Address, Command, and Byte Count fields, it will send the bytes in the SRAM pointed to by this register. When the E2B bit is cleared for writes, software will place a single byte in this register. After the host controller has sent the address, command, and byte count fields, it will send the byte in this register. If there is more data to send, software will write the next series of bytes to the SRAM pointed to by this register and clear the DONE_STS bit. The controller will then send the next byte. During the time between the last byte being transmitted to the next byte being transmitted, the controller will insert wait-states on the interface. When the E2B bit is set for reads, after receiving the byte count into the Data0 register, the first series of data bytes go into the SRAM pointed to by this register. If the byte count has been exhausted or the 32-byte SRAM has been filled, the controller will generate an SMI# or interrupt (depending on configuration) and set the DONE_STS bit. Software will then read the data. During the time between when the last byte is read from the SRAM to when the DONE_STS bit is cleared, the controller will insert wait states on the interface. **Power Well:** Core

59.3.8 Packet Error Check Data Register (PEC)—Offset 8h

Note: This register may reside in either the core well or the suspend well.

To simplify the implementation, this register will be in the suspend well with the suspend well version of PCI reset (URST33B). This register contains the 8-bit CRC value that is used as the Packet Error Check on SMBus.

For writes, this register is written by software prior to running the command.

For reads, this register is read by software after the read command is completed on SMBus.

Type: Memory Mapped I/O Register (Size: 8 bits)

BAR and Offset: [SMBMBAR] + 8h

Default: 00h

SMBMBAR Type: PCI Configuration Register (Size: 64 bits)
SMBMBAR Reference: [B:0, D:31, F:4] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**PEC_DATA:** This 8-bit register is written with the SMBus PEC data prior to a write transaction. For read transactions, the PEC data is loaded from the SMBus into this register and is then read by software. Software must ensure that the INUSE_STS bit is properly maintained to avoid having this field over-written by a write transaction following a read transaction. **Power Well:** Core

59.3.9 Receive Slave Address Register (RSA)—Offset 9h

Type: Memory Mapped I/O Register (Size: 8 bits)

BAR and Offset: [SMBMBAR] + 9h

Default: 44h

SMBMBAR Type: PCI Configuration Register (Size: 64 bits)
SMBMBAR Reference: [B:0, D:31, F:4] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Resume
6:0	0x44 RW	**SLAVE_ADDR[6:0] (SA_6_0):** This field is the slave address that the SoC decodes for read and write cycles. The default is not 0 so that it can respond even before the CPU comes up (or if the CPU is dead). This register is reset by RSMRST#, but not by PLTRST#. **Power Well:** Resume

59.3.10 Slave Data Register (SD)—Offset Ah

Type: Memory Mapped I/O Register (Size: 16 bits)

Default: 0000h

BAR and Offset: [SMBMBAR] + Ah

SMBMBAR Type: PCI Configuration Register (Size: 64 bits)
SMBMBAR Reference: [B:0, D:31, F:4] + 10h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x0 RO/V	**SLAVE_DATA[15:0] (SD_15_0):** This field is the 16-bit data value written by the external SMBus master. The CPU can then read the value from this register. This register is reset by RSMRST#, but not by PLTRST#. • SLAVE_DATA [15:8] corresponds to the Data Message Byte 1 at Slave Write Register 5 in the table. • SLAVE_DATA [7:0] corresponds to the Data Message Byte 0 at Slave Write Register 4 in the table. **Power Well:** Resume

59.3.11 Auxiliary Status (AUXS)—Offset Ch

All bits in this register are in the core well.

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [SMBMBAR] + Ch

SMBMBAR Type: PCI Configuration Register (Size: 64 bits)
SMBMBAR Reference: [B:0, D:31, F:4] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:5	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
4	0x0 RO/V	**SMT3EN:** Register value determines if SMT3 is enabled and connected on SMLink1. Disabled means the device is not connected to the pins. • 0: Disable. • 1: Enable. **Power Well:** Core
3	0x0 RO/V	**SMT2EN:** Register value determines if SMT2 is enabled and connected on SMLink0. Disabled means the device is not connected to the pins. • 0: Disable. • 1: Enable. **Power Well:** Core
2	0x0 RO/V	**SMT1EN:** Register value determines if SMT1 is enabled and connected on SMBus. Disabled means the device is not connected to the pins. • 0: Disables. • 1: Enable. **Power Well:** Core
1	0x0 RO	**Reserved (RSVD_1):** Reserved. **Power Well:** Core
0	0x0 RW/1C	**CRC Error (CRCE):** This bit is set if a received message contained a CRC error. When this bit is set, the DERR bit of the host status register will also be set. This bit will be set by the controller if a software abort occurs in the middle of the CRC portion of the cycle or an abort happens after the SMBus Controller has received the final data bit transmitted by the external slave. **Power Well:** Core

59.3.12 Auxiliary Control (AUXC)—Offset Dh

All bits in this register are in the resume well.

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [SMBMBAR] + Dh

SMBMBAR Type: PCI Configuration Register (Size: 64 bits)
SMBMBAR Reference: [B:0, D:31, F:4] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:2	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Resume
1	0x0 RW	**Enable 32-byte Buffer (E32B):** When set, the Host Block Data register is a pointer into a 32-byte buffer, as opposed to a single register. This enables the block commands to transfer or receive up to 32-bytes before the controller generates an interrupt. **Power Well:** Resume
0	0x0 RW	**Automatically Append CRC (AAC):** When set, the SMBus Controller will automatically append the CRC. This bit must not be changed during SM Bus transactions, or undetermined behavior will result. It should be programmed only once during the lifetime of the function. **Power Well:** Resume

59.3.13 SMLINK_PIN_CTL Register (SMLC)—Offset Eh

Note: This register is in the resume well and is reset by RSMRST#.

Type: Memory Mapped I/O Register (Size: 8 bits)

BAR and Offset: [SMBMBAR] + Eh

Default: 04h

SMBMBAR Type: PCI Configuration Register (Size: 64 bits)
SMBMBAR Reference: [B:0, D:31, F:4] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Resume
2	0x1 RW	**SMLINK_CLK_CTL:** • 0 = SMBus Controller will drive the SMLINK[0] pin low, independent of what the other SMLINK logic would otherwise indicate for the SMLINK(0) pin. • 1 = The SMLINK[0] pin is Not overdriven low. The other SMLINK logic controls the state of the pin. **Power Well:** Resume
1	0x0 RO/V	**SMLINK[1]_CUR_STS (SMLINK1_CUR_STS):** This bit has a default value that is dependent on an external signal level. This returns the value on the SMLINK[1] pin. It will be 1 to indicate high, 0 to indicate low. This allows software to read the current state of the pin. **Power Well:** Resume
0	0x0 RO/V	**SMLINK[0]_CUR_STS (SMLINK0_CUR_STS):** This bit has a default value that is dependent on an external signal level. This returns the value on the SMLINK[0] pin. It will be 1 to indicate high, 0 to indicate low. This allows software to read the current state of the pin. **Power Well:** Core

59.3.14 SMBUS_PIN_CTL Register (SMBC)—Offset Fh

Note: This register is in the resume well and is reset by RSMRST#.

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 04h

BAR and Offset: [SMBMBAR] + Fh

SMBMBAR Type: PCI Configuration Register (Size: 64 bits)
SMBMBAR Reference: [B:0, D:31, F:4] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Resume
2	0x1 RW	**SMBCLK_CTL:** • 0 = SMBus Controller will drive the SMBCLK pin low, independent of what the other SMB logic would otherwise indicate for the SMBCLK pin. • 1 = The SMBCLK pin is Not overdriven low. The other SMBus logic controls the state of the pin. **Power Well:** Resume
1	0x0 RO/V	**SMBDATA_CUR_STS:** This bit has a default value that is dependent on an external signal level. This returns the value on the SMBDATA pin. It will be 1 to indicate high, 0 to indicate low. This allows software to read the current state of the pin. **Power Well:** Resume
0	0x0 RO/V	**SMBCLK_CUR_STS:** This bit has a default value that is dependent on an external signal level. This returns the value on the SMBCLK pin. It will be 1 to indicate high, 0 to indicate low. This allows software to read the current state of the pin. **Power Well:** Resume

59.3.15 Slave Status Register (SSTS)—Offset 10h

All bits in this register are implemented in the 64 kHz clock domain. Therefore, software must poll the register until a write takes effect before assuming that a write has completed internally.

Type: Memory Mapped I/O Register (Size: 8 bits)

BAR and Offset: [SMBMBAR] + 10h

Default: 00h

SMBMBAR Type: PCI Configuration Register (Size: 64 bits)
SMBMBAR Reference: [B:0, D:31, F:4] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:1	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Resume
0	0x0 RW/1C	**HOST_NOTIFY_STS (HNS):** The SMBus Controller sets this bit to a 1 when it has completely received a successful Host Notify Command on the SMBus pins. Software reads this bit to determine that the source of the interrupt or SMI# was the reception of the Host Notify Command. Software clears this bit after reading any information needed from the Notify address and data registers by writing a 1 to this bit. ***Note:*** The controller will allow the Notify Address and Data registers to be over-written once this bit has been cleared. When this bit is 1, the SMBus Controller will NACK the first byte (host address) of any new Host Notify commands on the SMBus. Writing a 0 to this bit has no effect. **Power Well:** Resume

59.3.16 Slave Command Register (SCMD)—Offset 11h

All bits in this register are implemented in the 64 kHz clock domain. Therefore, software must poll the register until a write takes effect before assuming that a write has completed internally. Also, software must confirm the prior written value before writing to the register again.

Type: Memory Mapped I/O Register (Size: 8 bits)

BAR and Offset: [SMBMBAR] + 11h

Default: 00h

SMBMBAR Type: PCI Configuration Register (Size: 64 bits)
SMBMBAR Reference: [B:0, D:31, F:4] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Resume
2	0x0 RW	**SMBALERT_DIS (SMB_D):** Software sets this bit to 1 to block the generation of the interrupt or SMI# due to the SMBALERT# source. This bit is logically inverted and ANDed with the SMBALERT_STS bit. The resulting signal is distributed to the SMI# and/or interrupt generation logic. This bit does not effect the wake logic. **Power Well:** Resume
1	0x0 RW	**HOST_NOTIFY_WKEN (HNW):** Software sets this bit to 1 to enable the reception of a Host Notify command as a wake event. When enabled this event is ORed in with the other SMBus wake events and is reflected in the SMB_WAK_STS bit of the General Purpose Event 0 Status register. **Power Well:** Resume
0	0x0 RW	**HOST_NOTIFY_INTREN (HNI):** Software sets this bit to 1 to enable the generation of interrupt or SMI# when HOST_NOTIFY_STS is 1. This enable does not affect the setting of the HOST_NOTIFY_STS bit. When the interrupt is generated, either PIRQB or SMI# is generated, depending on the value of the SMB_SMI_EN bit (D31, F3, Off40h, B1). If the HOST_NOTIFY_STS bit is set when this bit is written to a 1, then the interrupt (or SMI#) will be generated. The interrupt (or SMI#) is logically generated by ANDing the STS and INTREN bits. **Power Well:** Resume

59.3.17 Notify Device Address Register (NDA)—Offset 14h

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [SMBMBAR] + 14h

SMBMBAR Type: PCI Configuration Register (Size: 64 bits)
SMBMBAR Reference: [B:0, D:31, F:4] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:1	0x0 RO/V	**DEVICE_ADDRESS (Dev_Addr):** This field contains the 7-bit device address received during the Host Notify protocol of the SMBus 2.0 specification. Software should only consider this field valid when the HOST_NOTIFY_STS bit is set to 1. **Power Well:** Resume
0	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Resume

59.3.18 Notify Data Low Byte Register (NDLB)—Offset 16h

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [SMBMBAR] + 16h

SMBMBAR Type: PCI Configuration Register (Size: 64 bits)
SMBMBAR Reference: [B:0, D:31, F:4] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO	**DATA_LOW_BYTE (DLB):** This field contains the first (low) byte of data received during the Host Notify protocol of the SMBus 2.0 specification. Software should only consider this field valid when the HOST_NOTIFY_STS bit is set to 1. **Power Well:** Resume

59.3.19 Notify Data High Byte Register (NDHB)—Offset 17h

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [SMBMBAR] + 17h

SMBMBAR Type: PCI Configuration Register (Size: 64 bits)
SMBMBAR Reference: [B:0, D:31, F:4] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO	**DATA_HIGH_BYTE (DHB):** This field contains the second (high) byte of data received during the Host Notify protocol of the SMBus 2.0 specification. Software should only consider this field valid when the HOST_NOTIFY_STS bit is set to 1. **Power Well:** Resume

59.4 Registers in I/O Space—SBA

These registers are accessed in Host I/O Space starting at the relocatable I/O address defined by the Base Address Register (BAR) SBA.

59.4.1 Host Status Register Address (HSTS)—Offset 0h

All status bits are set by hardware and cleared by the software writing a one to the particular bit position. Writing a zero to any bit position has no affect.

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [SBA] + 0h

SBA Type: PCI Configuration Register (Size: 32 bits)
SBA Reference: [B:0, D:31, F:4] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RW/1C	**BYTE_DONE_STS (BDS):** This bit will be set to 1 when the host controller has received a byte (for Block Read commands) or if it has completed transmission of a byte (for Block Write commands) when the 32-byte buffer is not being used. **Power Well:** Core
6	0x0 RW/1C	**In Use Status (IUS):** After a full PCI reset, a read to this bit returns a 0. After the first read, subsequent reads will return a 1. A write of a 1 to this bit will reset the next read value to 0. Writing a 0 to this bit has no effect. **Power Well:** Core
5	0x0 RW/1C	**SMBALERT_STS (SMSTS):** The SoC sets this bit to a 1 to indicates source of the interrupt or SMI# was the SMBAlert# signal. Software resets this bit by writing a 1 to this location. This bit should also be cleared by RSMRST# (but not PLTRST#). **Power Well:** Core
4	0x0 RW/1C	**Failed (FAIL):** When set, this indicates that the source of the interrupt or SMI# was a failed bus transaction. This is set in response to the KILL bit being set to terminate the host transaction. **Power Well:** Core
3	0x0 RW/1C	**Bus Error (BERR):** When set, this indicates the source of the interrupt or SMI# was a transaction collision. **Power Well:** Core
2	0x0 RW/1C	**Device Error (DERR):** When set, this indicates that the source of the interrupt or SMI# was due one of the following: • Illegal Command Field Unclaimed Cycle (host initiated) • Host Device Time-out Error. CRC Error **Power Well:** Core
1	0x0 RW/1C	**Interrupt (INTR):** When set, this indicates that the source of the interrupt or SMI# was the successful completion of its last command. **Power Well:** Core
0	0x0 RW/1C	**Host Busy (HBSY):** A 1 indicates that the SMBus Host is running a command from the host interface. No SMB registers should be accessed while this bit is set. **Power Well:** Core

59.4.2 Host Control Register (HCTL)—Offset 2h

Note: A read to this register will clear the pointer in the 32-byte buffer.

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [SBA] + 2h

SBA Type: PCI Configuration Register (Size: 32 bits)
SBA Reference: [B:0, D:31, F:4] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RW	**PEC_EN:** When set to 1, this bit causes the host controller to perform the SMBus transaction with the Packet Error Checking phase appended. For writes, the value of the PEC byte is transferred from the PEC Register. For reads, the PEC byte is loaded in to the PEC Register. When this bit is cleared to 0, the SMBus host controller does not perform the transaction with the PEC phase appended. This bit must be written prior to the write in which the START bit is set. **Power Well:** Core
6	0x0 RW	**START:** This write-only bit is used to initiate the command described in the SMB_CMD field. All registers should be setup prior to writing a 1 to this bit position. This bit always reads zero. The HOST_BUSY bit in the Host Status register (offset 00h) can be used to identify when the SMBus Controller has finished the command. **Power Well:** Core
5	0x0 RW	**LAST_BYTE:** Used for I2C Read commands as an indication that the next byte will be the last one to be received for that block. The algorithm and usage model for this bit will be as follows (assume a message of n bytes): • A. When the software sees the BYTE_DONE_STS bit set (bit 7 in the SMBus Host Status Register) for each of bytes 1 through n-2 of the message, the software should then read the Block Data Byte Register to get the byte that was just received. • B. After reading each of bytes 1 to n-2 of the message, the software will then clear the BYTE_DONE_STS bit. • C. After receiving byte n-1 of the message, the software will then set the LAST BYTE bit. The software will then clear the BYTE_DONE_STS bit. • D. The SoC will then receive the last byte of the message (byte n). However, the controller state machine will see the LAST BYTE bit set, and instead of sending an ACK after receiving the last byte, it will instead send a NAK. • E. After receiving the last byte (byte n), the software will still clear the BYTE_DONE_STS bit. However, the LAST_BYTE bit will be irrelevant at that point. ***Note:*** This bit may be set when the TCO timer causes the SECOND_TO_STS bit to be set. See the TCO2_STS Register in Volume 1, bit 1 for more details on that bit. The SMBus device driver should clear the LAST_BYTE bit (if it is set) before starting any new command. ***Note:*** In addition to I2C Read Commands, the LAST_BYTE bit will also cause Block Read/Write cycles to stop prematurely (at the end of the next byte). **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
4:2	0x0 RW	**SMB_CMD:** As shown by the bit encoding below, indicates which command the SMBus Host is to perform. If enabled, the SoC will generate an interrupt or SMI# when the command has completed If the value is for a non-supported or reserved command, the SoC will set the device error (DEV_ERR) status bit and generate an interrupt when the START bit is set. The controller will perform no command, and will not operate until DEV_ERR is cleared. Val - Command Description: • 000 - Quick: The slave address and read/write value (bit 0) are stored in the tx slave address register. • 001 - Byte: This command uses the transmit slave address and command registers. Bit 0 of the slave address register determines if this is a read or write command. • 010 - Byte Data: This command uses the transmit slave address, command, and DATA0 registers. Bit 0 of the slave address register determines if this is a read or write command. If it is a read, the DATA0 register will contain the read data. • 011 - Word Data: This command uses the transmit slave address, command, DATA0 and DATA1 registers. Bit 0 of the slave address register determines if this is a read or write command. If it is a read, after the command completes the DATA0 and DATA1 registers will contain the read data. • 100 - Process Call: This command uses the transmit slave address, command, DATA0 and DATA1 registers. Bit 0 of the slave address register determines if this is a read or write command. After the command completes, the DATA0 and DATA1 registers will contain the read data. • 101 - Block: This command uses the transmit slave address, command, and DATA0 registers, and the Block Data Byte register. For block write, the count is stored in the DATA0 register and indicates how many bytes of data will be transferred. For block reads, the count is received and stored in the DATA0 register. Bit 0 of the slave address register selects if this is a read or write command. For writes, data is retrieved from the first n (where n is equal to the specified count) addresses of the SRAM array. For reads, the data is stored in the Block Data Byte register. • 110 - I2C Read: This command uses the transmit slave address, command, DATA0, DATA1 registers, and the Block Data Byte register. The read data is stored in the Block Data Byte register. The SMBus Controller will continue reading data until the NAK is received. • 111 - Block-Process: This command uses the transmit slave address, command, DATA0 and the Block Data Byte register. For block write, the count is stored in the DATA0 register and indicates how many bytes of data will be transferred. For block read, the count is received and stored in the DATA0 register. Bit 0 of the slave address register always indicate a write command. For writes, data is retrieved from the first m (where m is equal to the specified count) addresses of the SRAM array. For reads, the data is stored in the Block Data Byte register. ***Note:*** E32B bit in the Auxiliary Control Register must be set for this command to work. **Power Well:** Core
1	0x0 RW	**KILL:** When set, kills the current host transaction taking place, sets the FAILED status bit, and asserts the interrupt (or SMI#) selected by the SMB_INTRSEL field. This bit, once set, must be cleared to allow the SMB Host Controller to function normally. **Power Well:** Core
0	0x0 RW	**INTREN:** Enable the generation of an interrupt or SMI# upon the completion of the command. **Power Well:** Core

59.4.3 Host Command Register (HCMD)—Offset 3h

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [SBA] + 3h

SBA Type: PCI Configuration Register (Size: 32 bits)
SBA Reference: [B:0, D:31, F:4] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Host Command Register (HCMD):** This eight bit field is transmitted by the host controller in the command field of the SMB protocol during the execution of any command. **Power Well:** Core

59.4.4 Transmit Slave Address Register (TSA)—Offset 4h

This register is transmitted by the host controller in the slave address field of the SMB protocol. This is the address of the target.

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [SBA] + 4h

SBA Type: PCI Configuration Register (Size: 32 bits)
SBA Reference: [B:0, D:31, F:4] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7:1	0x0 RW	**ADDRESS (ADDR):** 7-bit address of the targeted slave. ***Note:*** Writes to TSA values of A0h - AEh are blocked depending on the setting of the SPD write disable bit in HCFG - HostConfiguration. **Power Well:** Core
0	0x0 RW	**RW:** Direction of the host transfer. • 1 = Read. • 0 = Write. **Power Well:** Core

59.4.5 Data 0 Register (HD0)—Offset 5h

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [SBA] + 5h

SBA Type: PCI Configuration Register (Size: 32 bits)
SBA Reference: [B:0, D:31, F:4] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**DATA0/COUNT (DATA0_COUNT):** This field contains the eight bit data sent in the DATA0 field of the SMB protocol. For block write commands, this register reflects the number of bytes to transfer. This register should be programmed to a value between 1 and 32 for block counts. A count of 0 or a count above 32 will result in unpredictable behavior. The host controller does not check or log illegal block counts. **Power Well:** Core

59.4.6 Data 1 Register (HD1)—Offset 6h

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [SBA] + 6h

SBA Type: PCI Configuration Register (Size: 32 bits)
SBA Reference: [B:0, D:31, F:4] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**DATA1:** This eight bit register is transmitted in the DATA1 field of the SMB protocol during the execution of any command. **Power Well:** Core

59.4.7 Host Block Data (HBD)—Offset 7h

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [SBA] + 7h

SBA Type: PCI Configuration Register (Size: 32 bits)
SBA Reference: [B:0, D:31, F:4] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Block Data (BDTA):** This is either a register, or a pointer into a 32- byte block array, depending upon whether the E32B bit is set in the Auxiliary Control register. When the E32B bit is cleared, this is a register containing a byte of data to be sent on a block write or read from on a block read, just as it behaved on the SoC. When the E32B bit is set, reads and writes to this register are used to access the 32-byte block data storage array. An internal index pointer is used to address the array, which is reset to 0 by reading the HCTL register (offset 02h). The index pointer then increments automatically upon each access to this register. The transfer of block data into (read) or out of (write) this storage array during an SMBus transaction always starts at index address 0. When the E2B bit is set, for writes, software will write up to 32-bytes to this register as part of the setup for the command. After the Host Controller has sent the Address, Command, and Byte Count fields, it will send the bytes in the SRAM pointed to by this register. When the E2B bit is cleared for writes, software will place a single byte in this register. After the host controller has sent the address, command, and byte count fields, it will send the byte in this register. If there is more data to send, software will write the next series of bytes to the SRAM pointed to by this register and clear the DONE_STS bit. The controller will then send the next byte. During the time between the last byte being transmitted to the next byte being transmitted, the controller will insert wait-states on the interface. When the E2B bit is set for reads, after receiving the byte count into the Data0 register, the first series of data bytes go into the SRAM pointed to by this register. If the byte count has been exhausted or the 32-byte SRAM has been filled, the controller will generate an SMI# or interrupt (depending on configuration) and set the DONE_STS bit. Software will then read the data. During the time between when the last byte is read from the SRAM to when the DONE_STS bit is cleared, the controller will insert wait states on the interface. **Power Well:** Core

59.4.8 Packet Error Check Data Register (PEC)—Offset 8h

Note: This register may reside in either the core well or the suspend well.

To simplify the implementation, this register will be in the suspend well with the suspend well version of PCI reset (URST33B). This register contains the 8-bit CRC value that is used as the Packet Error Check on SMBus. For writes, this register is written by software prior to running the command. For reads, this register is read by software after the read command is completed on SMBus.

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [SBA] + 8h

SBA Type: PCI Configuration Register (Size: 32 bits)
SBA Reference: [B:0, D:31, F:4] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**PEC_DATA:** This 8-bit register is written with the SMBus PEC data prior to a write transaction. For read transactions, the PEC data is loaded from the SMBus into this register and is then read by software. Software must ensure that the INUSE_STS bit is properly maintained to avoid having this field over-written by a write transaction following a read transaction. **Power Well:** Core

59.4.9 Receive Slave Address Register (RSA)—Offset 9h

Type: I/O Register
(Size: 8 bits)

Default: 44h

BAR and Offset: [SBA] + 9h

SBA Type: PCI Configuration Register (Size: 32 bits)
SBA Reference: [B:0, D:31, F:4] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Resume
6:0	0x44 RW	**SLAVE_ADDR[6:0] (SA_6_0):** This field is the slave address that the SMBus Host decodes for read and write cycles. The default is not 0 so that it can respond even before the CPU comes up (or if the CPU is dead). This register is reset by RSMRST#, but not by PLTRST#. **Power Well:** Resume

59.4.10 Slave Data Register (SD)—Offset Ah

Type: I/O Register
(Size: 16 bits)

Default: 0000h

BAR and Offset: [SBA] + Ah

SBA Type: PCI Configuration Register (Size: 32 bits)
SBA Reference: [B:0, D:31, F:4] + 20h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x0 RO/V	**SLAVE_DATA[15:0] (SD_15_0):** This field is the 16-bit data value written by the external SMBus master. The CPU can then read the value from this register. This register is reset by RSMRST#, but not by PLTRST#. • SLAVE_DATA [15:8] corresponds to the Data Message Byte 1 at Slave Write Register 5 in the table. • SLAVE_DATA [7:0] corresponds to the Data Message Byte 0 at Slave Write Register 4 in the table. **Power Well:** Resume

59.4.11 Auxiliary Status (AUXS)—Offset Ch

All bits in this register are in the core well.

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [SBA] + Ch

SBA Type: PCI Configuration Register (Size: 32 bits)
SBA Reference: [B:0, D:31, F:4] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7:5	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
4	0x0 RO/V	**SMT3EN:** Register value determines if SMT3 is enabled and connected on SMLink1. Disabled means the device is not connected to the pins. • 0: Disable. • 1: Enable. **Power Well:** Core
3	0x0 RO/V	**SMT2EN:** Register value determines if SMT2 is enabled and connected on SMLink0. Disabled means the device is not connected to the pins. • 0: Disable. • 1: Enable. **Power Well:** Core
2	0x0 RO/V	**SMT1EN:** Register value determines if SMT1 is enabled and connected on SMBus. Disabled means the device is not connected to the pins. • 0: Disables. • 1: Enable. **Power Well:** Core
1	0x0 RO	**Reserved (RSVD_1):** Reserved. **Power Well:** Core
0	0x0 RW/1C	**CRC Error (CRCE):** This bit is set if a received message contained a CRC error. When this bit is set, the DERR bit of the host status register will also be set. This bit will be set by the controller if a software abort occurs in the middle of the CRC portion of the cycle or an abort happens after SMBus Host has received the final data bit transmitted by external slave. **Power Well:** Core

59.4.12 Auxiliary Control (AUXC)—Offset Dh

All bits in this register are in the resume well.

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [SBA] + Dh

SBA Type: PCI Configuration Register (Size: 32 bits)
SBA Reference: [B:0, D:31, F:4] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7:2	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Resume
1	0x0 RW	**Enable 32-byte Buffer (E32B):** When set, the Host Block Data register is a pointer into a 32-byte buffer, as opposed to a single register. This enables the block commands to transfer or receive up to 32-bytes before the SoC generates an interrupt. **Power Well:** Resume
0	0x0 RW	**Automatically Append CRC (AAC):** When set, the SoC will automatically append the CRC. This bit must not be changed during SM Bus transactions, or undetermined behavior will result. It should be programmed only once during the lifetime of the function. **Power Well:** Resume

59.4.13 SMLINK_PIN_CTL Register (SMLC)—Offset Eh

Note: This register is in the resume well and is reset by RSMRST#.

Type: I/O Register
(Size: 8 bits)

Default: 04h

BAR and Offset: [SBA] + Eh

SBA Type: PCI Configuration Register (Size: 32 bits)
SBA Reference: [B:0, D:31, F:4] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Resume
2	0x1 RW	**SMLINK_CLK_CTL:** • 0 = SMBus Controller will drive the SMLINK[0] pin low, independent of what the other SMLINK logic would otherwise indicate for the SMLINK(0) pin. • 1 = The SMLINK[0] pin is Not overdriven low. The other SMLINK logic controls the state of the pin. **Power Well:** Resume
1	0x0 RO/V	**SMLINK[1]_CUR_STS (SMLINK1_CUR_STS):** This bit has a default value that is dependent on an external signal level. This returns the value on the SMLINK[1] pin. It will be 1 to indicate high, 0 to indicate low. This allows software to read the current state of the pin. **Power Well:** Resume
0	0x0 RO/V	**SMLINK[0]_CUR_STS (SMLINK0_CUR_STS):** This bit has a default value that is dependent on an external signal level. This returns the value on the SMLINK[0] pin. It will be 1 to indicate high, 0 to indicate low. This allows software to read the current state of the pin. **Power Well:** Core

59.4.14 SMBUS_PIN_CTL Register (SMBC)—Offset Fh

Note: This register is in the resume well and is reset by RSMRST#.

Type: I/O Register
(Size: 8 bits)

Default: 04h

BAR and Offset: [SBA] + Fh

SBA Type: PCI Configuration Register (Size: 32 bits)
SBA Reference: [B:0, D:31, F:4] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Resume
2	0x1 RW	**SMBCLK_CTL:** • 0 = SMBus Controller will drive the SMBCLK pin low, independent of what the other SMB logic would otherwise indicate for the SMBCLK pin. • 1 = The SMBCLK pin is Not overdriven low. The other SMBus logic controls the state of the pin. **Power Well:** Resume
1	0x0 RO/V	**SMBDATA_CUR_STS:** This bit has a default value that is dependent on an external signal level. This returns the value on the SMBDATA pin. It will be 1 to indicate high, 0 to indicate low. This allows software to read the current state of the pin. **Power Well:** Resume
0	0x0 RO/V	**SMBCLK_CUR_STS:** This bit has a default value that is dependent on an external signal level. This returns the value on the SMBCLK pin. It will be 1 to indicate high, 0 to indicate low. This allows software to read the current state of the pin. **Power Well:** Resume

59.4.15 Slave Status Register (SSTS)—Offset 10h

All bits in this register are implemented in the 64 kHz clock domain. Therefore, software must poll the register until a write takes effect before assuming that a write has completed internally.

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [SBA] + 10h

SBA Type: PCI Configuration Register (Size: 32 bits)
SBA Reference: [B:0, D:31, F:4] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7:1	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Resume
0	0x0 RW/1C	**HOST_NOTIFY_STS (HNS):** The SMBus Controller sets this bit to a 1 when it has completely received a successful Host Notify Command on the SMBus pins. Software reads this bit to determine that the source of the interrupt or SMI# was the reception of the Host Notify Command. Software clears this bit after reading any information needed from the Notify address and data registers by writing a 1 to this bit. ***Note:*** The SMBus Controller will allow the Notify Address and Data registers to be over-written once this bit has been cleared. When this bit is 1, the SMBus Controller will NACK the first byte (host address) of any new Host Notify commands on the SMBus. Writing a 0 to this bit has no effect. **Power Well:** Resume

59.4.16 Slave Command Register (SCMD)—Offset 11h

All bits in this register are implemented in the 64 kHz clock domain. Therefore, software must poll the register until a write takes effect before assuming that a write has completed internally. Also, software must confirm the prior written value before writing to the register again.

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [SBA] + 11h

SBA Type: PCI Configuration Register (Size: 32 bits)
SBA Reference: [B:0, D:31, F:4] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Resume
2	0x0 RW	**SMBALERT_DIS (SMB_D):** Software sets this bit to 1 to block the generation of the interrupt or SMI# due to the SMBALERT# source. This bit is logically inverted and ANDed with the SMBALERT_STS bit. The resulting signal is distributed to the SMI# and/or interrupt generation logic. This bit does not effect the wake logic. **Power Well:** Resume
1	0x0 RW	**HOST_NOTIFY_WKEN (HNW):** Software sets this bit to 1 to enable the reception of a Host Notify command as a wake event. When enabled this event is ORed in with the other SMBus wake events and is reflected in the SMB_WAK_STS bit of the General Purpose Event 0 Status register. **Power Well:** Resume
0	0x0 RW	**HOST_NOTIFY_INTREN (HNI):** Software sets this bit to 1 to enable the generation of interrupt or SMI# when HOST_NOTIFY_STS is 1. This enable does not affect the setting of the HOST_NOTIFY_STS bit. When the interrupt is generated, either PIRQB or SMI# is generated, depending on the value of the SMB_SMI_EN bit (D31, F3, Off40h, B1). If the HOST_NOTIFY_STS bit is set when this bit is written to a 1, then the interrupt (or SMI#) will be generated. The interrupt (or SMI#) is logically generated by ANDing the STS and INTREN bits. **Power Well:** Resume

59.4.17 Notify Device Address Register (NDA)—Offset 14h

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [SBA] + 14h

SBA Type: PCI Configuration Register (Size: 32 bits)
SBA Reference: [B:0, D:31, F:4] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7:1	0x0 RO/V	**DEVICE_ADDRESS (Dev_Addr):** This field contains the 7-bit device address received during the Host Notify protocol of the SMBus 2.0 specification. Software should only consider this field valid when the HOST_NOTIFY_STS bit is set to 1. **Power Well:** Resume
0	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Resume

59.4.18 Notify Data Low Byte Register (NDLB)—Offset 16h

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [SBA] + 16h

SBA Type: PCI Configuration Register (Size: 32 bits)
SBA Reference: [B:0, D:31, F:4] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO	**DATA_LOW_BYTE (DLB):** This field contains the first (low) byte of data received during the Host Notify protocol of the SMBus 2.0 specification. Software should only consider this field valid when the HOST_NOTIFY_STS bit is set to 1. **Power Well:** Resume

59.4.19 Notify Data High Byte Register (NDHB)—Offset 17h

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [SBA] + 17h

SBA Type: PCI Configuration Register (Size: 32 bits)
SBA Reference: [B:0, D:31, F:4] + 20h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO	**DATA_HIGH_BYTE (DHB):** This field contains the second (high) byte of data received during the Host Notify protocol of the SMBus 2.0 specification. Software should only consider this field valid when the HOST_NOTIFY_STS bit is set to 1. **Power Well:** Resume

59.5 Registers in I/O Space—TCOBASE

These registers are accessed in Host I/O Space starting at the relocatable I/O address defined by the Base Address Register (BAR) TCOBASE described in Section 59.2.17, "TCO Base Address (TCOBASE)—Offset 50h" on page 2763.

59.5.1 TCO_RLD Register (TRLD)—Offset 0h

Type: I/O Register
(Size: 16 bits)

Default: 0004h

BAR and Offset: [TCOBASE] + 0h

TCOBASE Type: PCI Configuration Register (Size: 32 bits)
TCOBASE Reference: [B:0, D:31, F:4] + 50h

Bit Range	Default & Access	Field Name (ID): Description
15:10	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
9:0	0x4 RW	**TCORLD:** Reading this register will return the current count of the TCO timer. Writing any value to this register will reload the timer to prevent the timeout. **Power Well:** Core

59.5.2 TCO_DAT_IN Register (TDI)—Offset 2h

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [TCOBASE] + 2h

TCOBASE Type: PCI Configuration Register (Size: 32 bits)
TCOBASE Reference: [B:0, D:31, F:4] + 50h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**TCO_DAT_IN (TDI):** Data Register for passing commands from the OS to the SMI handler. Writes to this register will cause an SMI and set the OS_TCO_SMI bit in the TCO_STS register. **Power Well:** Core

59.5.3 TCO_DAT_OUT Register (TDO)—Offset 3h

Type: I/O Register
(Size: 8 bits)

Default: 00h

BAR and Offset: [TCOBASE] + 3h

TCOBASE Type: PCI Configuration Register (Size: 32 bits)
TCOBASE Reference: [B:0, D:31, F:4] + 50h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**TCO_DAT_OUT (TDO):** Data Register for passing commands from the SMI handler to the OS. Writes to this register will set the TCO_INT_STS bit in the TCO_STS register. It also causes an interrupt, as selected by the TCO_IRQ_SEL bits. **Power Well:** Core

59.5.4 TCO1_STS Register (TSTS1)—Offset 4h

Unless otherwise indicated, these bits are sticky and are cleared by writing a 1 to the corresponding bit position.

Type: I/O Register
(Size: 16 bits)

Default: 0000h

BAR and Offset: [TCOBASE] + 4h

TCOBASE Type: PCI Configuration Register (Size: 32 bits)
TCOBASE Reference: [B:0, D:31, F:4] + 50h

Bit Range	Default & Access	Field Name (ID): Description
15:14	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
13	0x0 RO	**TCO Slave Select (TCO_SLVSEL):** This register bit indicates the value of TCO Slave Select Soft Strap. Refer to the Section 19, "Serial Peripheral Interface (SPI)" on page 592 for details. **Power Well:** Core
12	0x0 RW/1C	**CPUSERR_STS:** Reserved **Power Well:** Core
11	0x0 RO	**Reserved (RSVD_1):** Reserved. **Power Well:** Core
10	0x0 RW/1C	**CPUSMI_STS:** Reserved **Power Well:** Core
9	0x0 RW/1C	**CPUSCI_STS:** Reserved **Power Well:** Core
8	0x0 RW/1C	**BIOSWR_STS:** The SoC sets this bit to 1 and generates and SMI# to indicate an illegal attempt to write to the BIOS. (The BIOS write could be either to FirmwareHUB (FWH) or SPI Flash). This occurs when either: • a) The WP bit (10.1.7.4 bit 0) is changed from 0 to 1 and the LE bit (10.1.7.4 bit 1) is also set. • b) Any write is attempted to the BIOS and the WP bit is also set. **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RW/1C	**NEWCENTURY_STS:** This bit will be set when the year rolls over from 1999 to 2000. If the bit is already 1, it will remain 1. This bit can be cleared either by software writing a 1 back to the bit position, or by RTEST# going active. When this bit is set, an SMI# will be generated. However, this will not be a wake event. ***Note:*** This bit 7 is not valid when the RTC battery is first put in (or if the RTC battery does not provide sufficient power when the system is unplugged). **Power Well:** Core
6:4	0x0 RO	**Reserved (RSVD_2):** Reserved. **Power Well:** Core
3	0x0 RW/1C	**TIMEOUT:** Bit set to 1 by the SoC to indicate that the SMI was caused by TCO timer reaching 0. ***Note:*** The SMI handler should clear this bit to prevent an immediate re-entry to the SMI handler. **Power Well:** Core
2	0x0 RW/1C	**TCO_INT_STS:** Bit set to 1 when SMI handler caused the interrupt by writing to the TCO_DAT_OUT register. **Power Well:** Core
1	0x0 RW/1C	**OS_TCO_SMI:** Bit set to 1 when OS code caused an SMI# by writing to the TCO_DAT_IN register. **Power Well:** Core
0	0x0 RO/V	**NMI2SMI_STS:** This bit is set when an SMI# occurs because an event occurred that would otherwise have caused an NMI. **Power Well:** Core

59.5.5 TCO2_STS Register (TSTS2)—Offset 6h

Type: I/O Register
(Size: 16 bits)

Default: 0000h

BAR and Offset: [TCOBASE] + 6h

TCOBASE Type: PCI Configuration Register (Size: 32 bits)
TCOBASE Reference: [B:0, D:31, F:4] + 50h

Bit Range	Default & Access	Field Name (ID): Description
15:5	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Resume
4	0x0 RW/1C	**SMLINK_SLAVE_SMI_STS:** Reserved **Power Well:** Resume
3:2	0x0 RO	**Reserved (RSVD_1):** Reserved. **Power Well:** Resume
1	0x0 RW/1C	**SECOND_TO_STS:** The SoC sets this bit to 1 to indicate that the TIMEOUT bit had been (or is currently) set and a second timeout occurred before the TCO_RLD register was written. If this bit is set and the NO_REBOOT config bit is 0, then the SoC will reboot the system after the second timeout. The reboot is done by asserting PLTRST#. This bit is only cleared by writing a 1 to this bit or by a RSMRST#. **Power Well:** Resume
0	0x0 RW/1C	**INTRD_DET:** Intruder Detect. Bit set to 1 by the SoC to indicate that an intrusion was detected. This is latched. This bit is cleared by writing a 1 to this bit or by RTEST#. This bit is backed in the RTC Well. ***Note:*** If the INTRUDER# signal is active when the software attempts to clear the INTRD_DET bit, the bit will remain as a 1, and the SMI# will be generated again immediately. **Power Well:** Resume

59.5.6 TCO1_CNT Register (TCTL1)—Offset 8h

Type: I/O Register
(Size: 16 bits)

Default: 0000h

BAR and Offset: [TCOBASE] + 8h

TCOBASE Type: PCI Configuration Register (Size: 32 bits)
TCOBASE Reference: [B:0, D:31, F:4] + 50h

Bit Range	Default & Access	Field Name (ID): Description
15:13	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
12	0x0 RW	**TCO_LOCK:** When set to 1, this bit prevents writes from changing the TCO_EN bit (in offset 30h of Power Management I/O space). Once this bit is set to 1, it can not be cleared by software writing a 0 to this bit location. A core-well reset is required to change this bit from 1 to 0. This bit defaults to 0. **Power Well:** Core
11	0x0 RW	**TCO_TMR_HALT:** 1 = The TCO timer will halt. It will not count, and thus cannot reach a value that would cause an SMI# or to cause the SECOND_TO_STS bit to be set. This will also prevent rebooting. • 0 = The TCO timer is enabled to count. This is the default. **Power Well:** Core
10	0x0 RW	**SEND_NOW:** Reserved. **Power Well:** Core
9	0x0 RW	**NMI2SMI_EN:** Setting this bit "1" forces all NMIs to instead cause an SMI#, and will be reported in the TCO1_STS register. This bit is set and the NMI_EN# bit is set to "0", the NMI# will be routed to cause an SMI#. No NMI# will be caused. However, if the GL_SMI_EN bit is not set, then no SMI# will be generated either. If this bit is set but the NMI_EN# bit is set to "1", then no NMI nor SMI# will be generated. The following shows the possible combination: • NMI_EN#, GBL_SMI_EN 00: No SMI# based on NMI events (since no EMI# at all because SMI_EN =0) • NMI_EN#, GBL_SMI_EN 01: SMI# will be caused based on NMI events • NMI_EN#, GBL_SMI_EN 10: No SMI# at all because SMI_EN is 0 • NMI_EN#, GBL_SMI_EN 11: No SMI# based on NMI events because NMI_EN#=1 **Power Well:** Core
8	0x0 RW	**NMI_NOW:** Writing a 1 to this bit causes an NMI. this allows the BIOS or SMI handler to force entry to the NMI handler. The NMI handler is expected to clear this bit. Another NMI will not be generated until the bit is cleared by writing a 1 back to the same bit position. **Power Well:** Core
7:0	0x0 RO	**Reserved (RSVD_1):** Reserved. **Power Well:** Core

59.5.7 TCO2_CNT Register (TCTL2)—Offset Ah

Type: I/O Register
(Size: 16 bits)

Default: 0008h

BAR and Offset: [TCOBASE] + Ah

TCOBASE Type: PCI Configuration Register (Size: 32 bits)
TCOBASE Reference: [B:0, D:31, F:4] + 50h

Bit Range	Default & Access	Field Name (ID): Description
15:6	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Resume
5:4	0x0 RW	**OS_POLICY:** OS-based software writes to these bits to select the policy that the BIOS will use after the platform resets due the WDT. The following convention is recommended for the BIOS and OS: • 00 Boot normally. • 01 Shut down. • 10 Don’t load OS. Hold in pre-boot state and use LAN to determine next step. • 11 Reserved Implementation. ***Note:*** These are just scratch pad bits. They should not be reset when the TCO logic resets the platform due to Watchdog Timer. **Power Well:** Resume
3	0x1 RW	**SMB_ALERT_DISABLE:** Disables GP/SMBALERT# as an alert source for the heartbeats and the SMBus slave. At reset (RSMRST# pin assertion only), this bit is set and the muxed GP/SMBALERT# are disabled. **Power Well:** Resume
2:1	0x0 RW	**INTRD_SEL:** Selects the action to take if the INTRUDER# signal goes active. • 11 Reserved. • 01 Interrupt. For IRQ routing see Section 59.6.1, “TCO Configuration (TCOCFG)—Offset 0h” on page 2801. • 10 SMI#. • 00 INTRUDER# doesn't cause SMI# or interrupt. **Power Well:** Resume
0	0x0 RO	**Reserved (RSVD_1):** Reserved. **Power Well:** Resume

59.5.8 LEGACY_ELIM Register (LE)—Offset 10h

Type: I/O Register
(Size: 8 bits)

Default: 03h

BAR and Offset: [TCOBASE] + 10h

TCOBASE Type: PCI Configuration Register (Size: 32 bits)
TCOBASE Reference: [B:0, D:31, F:4] + 50h

Bit Range	Default & Access	Field Name (ID): Description
7:2	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
1	0x1 RW	**IRQ12_CAUSE:** When software sets the bit to 1, IRQ12 will be high (asserted). When software sets the bit to 0, IRQ12 will be low (not asserted). Default for this bit is 1. **Power Well:** Core
0	0x1 RW	**IRQ1_CAUSE:** When software sets the bit to 1, IRQ1 will be high (asserted). When software sets the bit to 0, IRQ1 will be low (not asserted). Default for this bit is 1. **Power Well:** Core

59.5.9 TCO_TMR Register (TTMR)—Offset 12h

Type: I/O Register
(Size: 16 bits)

Default: 0004h

BAR and Offset: [TCOBASE] + 12h

TCOBASE Type: PCI Configuration Register (Size: 32 bits)
TCOBASE Reference: [B:0, D:31, F:4] + 50h

Bit Range	Default & Access	Field Name (ID): Description
15:10	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
9:0	0x4 RW	**TCOTMR:** Value that is loaded into the timer each time the TCO_RLD register is written. Values of 0000h or 0001h will be ignored and should not be attempted. The timer is clocked at approximately 0.6 seconds, and thus allows timeouts ranging from 1.2 second to 613.8 seconds. ***Note:*** The timer has an error of +/- 1 tick (0.6s). **Power Well:** Core

59.6 Sideband Registers—Host SMBus Private Configuration

The Sideband registers accessible to the Host are described here. They are accessible in Host Memory Space starting at the Sideband Base Address Register (SBREG_BAR). See Section 3.4.1, "Using SBREG_BAR Method" on page 187.

59.6.1 TCO Configuration (TCOCFG)—Offset 0h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xCF] + 0h
Host Memory Space: SBREG_BAR + 0xCF0000 + 0h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
7	0x0 RW	**TCO IRQ Enable (IE):** When set, TCO IRQ is enabled, as selected by the TCO_IRQ_SEL field. When cleared, TCO IRQ is disabled. **Power Well:** Core
6:3	0x0 RO	**Reserved (RSVD_1):** Reserved. **Power Well:** Core
2:0	0x0 RW	**TCO IRQ Select (IS):** Specifies on which IRQ the TCO will internally appear. If not using the APIC, the TCO interrupt must be routed to IRQ9-11, and that interrupt is not sharable with the SERIRQ stream, but is shareable with other PCI interrupts. If using the APIC, the TCO interrupt can also be mapped to IRQ20-23, and can be shared with other interrupts. Bits TCO Map • 000 IRQ9 (maps to 8259 and APIC). • 001 IRQ10 (maps to 8259 and APIC). • 010 IRQ11 (maps to 8259 and APIC). • 011 Reserved 100 IRQ20 (maps to APIC). • 101 IRQ21 (maps to APIC). • 110 IRQ22 (maps to APIC). • 111 IRQ23 (maps to APIC). If the TCO IRQ is programmed to be routed to both the 8259 and the APIC, only one of these interrupt controllers should be enabled to service the interrupt. When setting the these bits, the TCO IRQ Enable (IE) bit must be cleared to prevent glitching. When the interrupt is mapped to APIC interrupts 9, 10 or 11, the APIC should be programmed for active-high reception. When the interrupt is mapped to APIC interrupts 20 through 23, the APIC should be programmed for active-low reception. **Power Well:** Core

59.6.2 General Control (GC)—Offset Ch

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xCF] + Ch
Host Memory Space: SBREG_BAR + 0xCF0000 + Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
2	0x0 RW	**SMB Static Clock Gating Enable (SMBSCGE):** SMB cluster static clock gating is enabled. ***Note:*** Setting this bit will also clock gate all the TCO logic functionality. **Power Well:** Core
1	0x0 RW	**No Reboot (NR):** This bit is set when the "No TCO Reboot Enable" SoC Hard Pin Strap pin (pin name GPIO[12]) is sampled high on the rising edge of the active-low RSMRST_N SoC signal pin. This bit may be set or cleared by software if the Hard Pin Strap is sampled low but may not override the strap when it indicates No TCO Reboot. When set, the TCO Watchdog Timer counts down and generates the SMI# on the first timeout, but will not reboot on the second timeout. **Power Well:** Core
0	0x0 RW	**Function Disable (FD):** When set to one, this disables the PCI configuration register space for the SMBus device. **Power Well:** Core

59.6.3 Power Control Enable (PCE)—Offset 10h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xCF] + 10h
Host Memory Space: SBREG_BAR + 0xCF0000 + 10h

Default: 00000009h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
5	0x0 RW	**Hardware Autonomous Enable (HAE):** When set, the SMB will automatically engage power gating when it has reached its idle condition. **Power Well:** Core
4	0x0 RO	**Reserved (RSVD_1):** Reserved. **Power Well:** Core
3	0x1 RO	**Sleep Enable (SE):** When this bit is clear, the SMB will never assert Sleep to the retention flops. If set, then SMB may assert Sleep during power gating. **Power Well:** Core
2	0x0 RO	**D3-Hot Enable (D3HE):** No support for D3 Hot power gating. **Power Well:** Core
1	0x0 RO	**I3 Enable (I3E):** No support for S0i3 power gating. **Power Well:** Core
0	0x1 RW	**PMC Request Enable (PMCRE):** When set to 1, the SMB will engage power gating if it is idle and the power-gating request is granted by the PMC. **Power Well:** Core

59.7 Sideband Registers—CLTT SMBus Configuration Control

The Sideband registers accessible to the Host are described here. They are accessible in Host Memory Space starting at the Sideband Base Address Register (SBREG_BAR). See Section 3.4.1, "Using SBREG_BAR Method" on page 187.

59.7.1 CLTT Status (CLTT_STS)—Offset 0h

CLTT Status

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xCC] + 0h
Host Memory Space: SBREG_BAR + 0xCC0000 + 0h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
1	0x0 RO/V	**Done (DONE):** Indicates that HW has completed the SMBusCmd. **Power Well:** Core
0	0x0 RO/V	**Busy (BUSY):** Indicates that HW is busy completing an SMBusCmd. **Power Well:** Core

59.7.2 Ch0 Dimm0 Cfg Status (C0D0CFGSTS)—Offset 10h

Memory Channel 0 DIMM 0 Configuration and Status Register.

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xCC] + 10h
Host Memory Space: SBREG_BAR + 0xCC0000 + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**Valid (VALID):** Channel DIMM is Populated. **Power Well:** Core
30:24	0x0 RW	**Slave ID (SLAVE_ID):** SMBus Slave ID. **Power Well:** Core
23:16	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
15:0	0x0 RO/V	**Read_Data (READ_DATA):** Data retrieved from SMBus. **Power Well:** Core

59.7.3 Ch0 Dimm1 Cfg Status (C0D1CFGSTS)—Offset 14h

Memory Channel 0 DIMM 1 Configuration and Status Register.

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xCC] + 14h
Host Memory Space: SBREG_BAR + 0xCC0000 + 14h

Default: 01000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**Valid (VALID):** Channel DIMM is Populated. **Power Well:** Core
30:24	0x1 RW	**Slave ID (SLAVE_ID):** SMBus Slave ID. **Power Well:** Core
23:16	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
15:0	0x0 RO/V	**Read_Data (READ_DATA):** Data retrieved from SMBus. **Power Well:** Core

59.7.4 Ch0 Dimm2 Cfg Status (C0D2CFGSTS)—Offset 18h

Memory Channel 0 DIMM 2 Configuration and Status Register.

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xCC] + 18h
Host Memory Space: SBREG_BAR + 0xCC0000 + 18h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**Valid (VALID):** Channel DIMM is Populated. **Power Well:** Core
30:24	0x0 RW	**Slave ID (SLAVE_ID):** SMBus Slave ID. **Power Well:** Core
23:16	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
15:0	0x0 RO/V	**Read_Data (READ_DATA):** Data retrieved from SMBus. **Power Well:** Core

59.7.5 Ch0 Dimm3 Cfg Status (C0D3CFGSTS)—Offset 1Ch

Memory Channel 0 DIMM 3 Configuration and Status Register.

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xCC] + 1Ch
Host Memory Space: SBREG_BAR + 0xCC0000 + 1Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**Valid (VALID):** Channel DIMM is Populated. **Power Well:** Core
30:24	0x0 RW	**Slave ID (SLAVE_ID):** SMBus Slave ID. **Power Well:** Core
23:16	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
15:0	0x0 RO/V	**Read_Data (READ_DATA):** Data retrieved from SMBus. **Power Well:** Core

59.7.6 Ch1 Dimm0 Cfg Status (C1D0CFGSTS)—Offset 20h

Memory Channel 1 DIMM 0 Configuration and Status Register.

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xCC] + 20h
Host Memory Space: SBREG_BAR + 0xCC0000 + 20h

Default: 02000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**Valid (VALID):** Channel DIMM is Populated. **Power Well:** Core
30:24	0x2 RW	**Slave ID (SLAVE_ID):** SMBus Slave ID. **Power Well:** Core
23:16	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
15:0	0x0 RO/V	**Read_Data (READ_DATA):** Data retrieved from SMBus. **Power Well:** Core

59.7.7 Ch1 Dimm1 Cfg Status (C1D1CFGSTS)—Offset 24h

Memory Channel 1 DIMM 1 Configuration and Status Register.

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xCC] + 24h
Host Memory Space: SBREG_BAR + 0xCC0000 + 24h

Default: 03000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**Valid (VALID):** Channel DIMM is Populated. **Power Well:** Core
30:24	0x3 RW	**Slave ID (SLAVE_ID):** SMBus Slave ID. **Power Well:** Core
23:16	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
15:0	0x0 RO/V	**Read_Data (READ_DATA):** Data retrieved from SMBus. **Power Well:** Core

59.7.8 Ch1 Dimm2 Cfg Status (C1D2CFGSTS)—Offset 28h

Memory Channel 1 DIMM 2 Configuration and Status Register.

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xCC] + 28h
Host Memory Space: SBREG_BAR + 0xCC0000 + 28h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**Valid (VALID):** Channel DIMM is Populated. **Power Well:** Core
30:24	0x0 RW	**Slave ID (SLAVE_ID):** SMBus Slave ID. **Power Well:** Core
23:16	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
15:0	0x0 RO/V	**Read_Data (READ_DATA):** Data retrieved from SMBus. **Power Well:** Core

59.7.9 Ch1 Dimm3 Cfg Status (C1D3CFGSTS)—Offset 2Ch

Memory Channel 1 DIMM 3 Configuration and Status Register.

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xCC] + 2Ch
Host Memory Space: SBREG_BAR + 0xCC0000 + 2Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**Valid (VALID):** Channel DIMM is Populated. **Power Well:** Core
30:24	0x0 RW	**Slave ID (SLAVE_ID):** SMBus Slave ID. **Power Well:** Core
23:16	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
15:0	0x0 RO/V	**Read_Data (READ_DATA):** Data retrieved from SMBus. **Power Well:** Core

59.7.10 Ch0 Dimm Temp Status (C0TEMPSTS0)—Offset 30h

Memory Channel 0 DIMM TSOD Temperature Status Register. This register is protected by SAI WAC #1 and can be locked by CLTT_SMBUS_Mode (CSMBM) register Bit[1].

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xCC] + 30h
Host Memory Space: SBREG_BAR + 0xCC0000 + 30h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW/V/L	**Read_Temp_Data1 (READ_TEMP_DATA1):** Read_Temp_Data1: Data retrieved from DIMM1. **Power Well:** Core
15:0	0x0 RW/V/L	**Read_Temp_Data0 (READ_TEMP_DATA0):** Read_Temp_Data0: Data retrieved from DIMM0. **Power Well:** Core

59.7.11 Ch0 Dimm Temp Status (C0TEMPSTS1)—Offset 34h

Memory Channel 0 DIMM TSOD Temperature Status Register. This register is protected by SAI WAC #1 and can be locked by CLTT_SMBUS_Mode (CSMBM) register Bit[1].

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xCC] + 34h
Host Memory Space: SBREG_BAR + 0xCC0000 + 34h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW/V/L	**Read_Temp_Data3 (READ_TEMP_DATA3):** Read_Temp_Data3: Data retrieved from DIMM3. **Power Well:** Core
15:0	0x0 RW/V/L	**Read_Temp_Data2 (READ_TEMP_DATA2):** Read_Temp_Data2: Data retrieved from DIMM2. **Power Well:** Core

59.7.12 Ch1 Dimm Temp Status (C1TEMPSTS0)—Offset 38h

Memory Channel 1 DIMM TSOD Temperature Status Register. This register is protected by SAI WAC #1 and can be locked by CLTT_SMBUS_Mode (CSMBM) register Bit[1].

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xCC] + 38h
Host Memory Space: SBREG_BAR + 0xCC0000 + 38h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW/V/L	**Read_Temp_Data1 (READ_TEMP_DATA1):** Read_Temp_Data1: Data retrieved from DIMM1. **Power Well:** Core
15:0	0x0 RW/V/L	**Read_Temp_Data0 (READ_TEMP_DATA0):** Read_Temp_Data0: Data retrieved from DIMM0. **Power Well:** Core

59.7.13 Ch1 Dimm Temp Status (C1TEMPSTS1)—Offset 3Ch

Memory Channel 1 DIMM TSOD Temperature Status Register. This register is protected by SAI WAC #1 and can be locked by CLTT_SMBUS_Mode (CSMBM) register Bit[1].

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xCC] + 3Ch
Host Memory Space: SBREG_BAR + 0xCC0000 + 3Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW/V/L	**Read_Temp_Data3 (READ_TEMP_DATA3):** Read_Temp_Data3: Data retrieved from DIMM3. **Power Well:** Core
15:0	0x0 RW/V/L	**Read_Temp_Data2 (READ_TEMP_DATA2):** Read_Temp_Data2: Data retrieved from DIMM2. **Power Well:** Core

59.7.14 Host Configuration (HCFG)—Offset 40h

Type: Sideband Register
(Size: 8 bits)

Sideband Port and Offset: [Port: 0xCC] + 40h
Host Memory Space: SBREG_BAR + 0xCC0000 + 40h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:5	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
4	0x0 RW/O	**SPD Write Disable (SPD_WRITE_DISABLE):** Reserved. **Power Well:** Core
3	0x0 RW/V	**SSRESET:** Soft SMBUS Reset: When this bit is 1, the SMBus state machine and logic is reset. The HW will reset this bit to 0 when reset operation is completed. **Power Well:** Core
2	0x0 RW	**I2C_EN:** When this bit is 1, the SMB Controller is enabled to communicate with I2C devices. This will change the formatting of some commands. When this bit is 0, behavior is for SMBus. **Power Well:** Core
1	0x0 RW	**SMB_SMI_EN:** When this bit is set, any source of an SMB interrupt will instead be routed to generate an SMI#. Refer to Section 6.7 (Interrupts/SMI#) for details. **Power Well:** Core
0	0x0 RW/V	**HST_EN:** When set, the SMB Host Controller interface is enabled to execute commands. The HST_INT_EN bit needs to be enabled in order for the SMB Host Controller to interrupt or SMI#. Additionally, the SMB Host Controller will not respond to any new requests until all interrupt requests have been cleared. **Power Well:** Core

§ §

60 SPI Controller - B0, D31, F5

60.1 Introduction and Index

The host-accessible registers for the SPI Controller are described here.

To determine the number of devices and functions available refer to the following:

- Table 1-1, "Features by product SKU - Server and Cloud Storage SKUs 0 through 4"
- Table 1-2, "Features by Product SKU - Network and Enterprise Storage SKUs 5 through 10"
- Table 1-3, "Features by Product SKU - Extended Temperature SKUs 11 through 14".

The legend for the register access codes are described in Chapter 43, "Introduction."

60.1.1 Host Configuration Space

These registers are discovered in Host Configuration Space starting at Bus 0, Device 31 (decimal), Function 5. The offset addresses and default values are listed.

Table 60-1. Summary of PCI Configuration Registers—0/31/5

Offset (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
0	4	19E08086	"Device ID and Vendor ID (BIOS_SPI_DID_VID)—Offset 0h" on page 2815
4	4	00000400	"Status and Command (BIOS_SPI_STS_CMD)—Offset 4h" on page 2816
8	4	0C800000	"Revision ID (BIOS_SPI_CC_RID)—Offset 8h" on page 2818
C	4	00000000	"BIST, Header Type, Latency Timer, Cache Line Size (BIOS_SPI_BIST_HTYPE_LT_CLS)—Offset Ch" on page 2818
10	4	00000000	"SPI BAR0 MMIO (BIOS_SPI_BAR0)—Offset 10h" on page 2819
28	4	00000000	"Cardbus CIS Pointer (BIOS_SPI_CCP)—Offset 28h" on page 2819
2C	4	00000000	"Subsystem and Vendor ID (BIOS_SPI_SID_SVID)—Offset 2Ch" on page 2819
30	4	00000000	"Expansion ROM Base Address (BIOS_SPI_XRBAR)—Offset 30h" on page 2820
34	4	00000000	"Capabilities List Pointer (BIOS_SPI_CAPP)—Offset 34h" on page 2820
D0	4	00000000	"SPI Unsupported Request Status (BIOS_SPI_UR_STS_CTL)—Offset D0h" on page 2820
D8	4	0000FFCF	"BIOS Decode Enable (BIOS_SPI_BDE)—Offset D8h" on page 2821
DC	4	00000028	"BIOS Control (BIOS_SPI_BC)—Offset DCh" on page 2823

60.1.2 Host Memory Space—BIOS_SPI_BAR0

An index of the registers that are accessible in Host Memory Space is shown here.

Table 60-2. Summary of Memory Mapped I/O Registers—BIOS_SPI_BAR0

Offset (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
0	4	00000000	"SPI BIOS MMIO PRI (BIOS_BFPREG)—Offset 0h" on page 2825
4	4	00002000	"Hardware Sequencing Flash Status and Control (BIOS_HSFSTS_CTL)—Offset 4h" on page 2826
8	4	00000000	"Flash Address (BIOS_FADDR)—Offset 8h" on page 2828
C	4	00000000	"Discrete Lock Bits (BIOS_DLOCK)—Offset Ch" on page 2829
10	4	00000000	"Flash Data 0 (BIOS_FDATA0)—Offset 10h" on page 2830
14	4	00000000	"Flash Data 1 (BIOS_FDATA1)—Offset 14h" on page 2830
18	4	00000000	"Flash Data 2 (BIOS_FDATA2)—Offset 18h" on page 2830
1C	4	00000000	"Flash Data 3 (BIOS_FDATA3)—Offset 1Ch" on page 2831
20	4	00000000	"Flash Data 4 (BIOS_FDATA4)—Offset 20h" on page 2831
24	4	00000000	"Flash Data 5 (BIOS_FDATA5)—Offset 24h" on page 2831
28	4	00000000	"Flash Data 6 (BIOS_FDATA6)—Offset 28h" on page 2832
2C	4	00000000	"Flash Data 7 (BIOS_FDATA7)—Offset 2Ch" on page 2832
30	4	00000000	"Flash Data 8 (BIOS_FDATA8)—Offset 30h" on page 2832
34	4	00000000	"Flash Data 9 (BIOS_FDATA9)—Offset 34h" on page 2833
38	4	00000000	"Flash Data 10 (BIOS_FDATA10)—Offset 38h" on page 2833
3C	4	00000000	"Flash Data 11 (BIOS_FDATA11)—Offset 3Ch" on page 2833
40	4	00000000	"Flash Data 12 (BIOS_FDATA12)—Offset 40h" on page 2834
44	4	00000000	"Flash Data 13 (BIOS_FDATA13)—Offset 44h" on page 2834
48	4	00000000	"Flash Data 14 (BIOS_FDATA14)—Offset 48h" on page 2834
4C	4	00000000	"Flash Data 15 (BIOS_FDATA15)—Offset 4Ch" on page 2834
50	4	000042C2	"Flash Region Access Permissions (BIOS_FRACC)—Offset 50h" on page 2835
54	4	00007FFF	"Flash Region 0 (BIOS_FREG0)—Offset 54h" on page 2836
58	4	00007FFF	"Flash Region 1 (BIOS_FREG1)—Offset 58h" on page 2836
5C	4	00007FFF	"Flash Region 2 (BIOS_FREG2)—Offset 5Ch" on page 2837
60	4	00007FFF	"Flash Region 3 (BIOS_FREG3)—Offset 60h" on page 2837
64	4	00007FFF	"Flash Region 4 (BIOS_FREG4)—Offset 64h" on page 2838
68	4	00007FFF	"Flash Region 5 (BIOS_FREG5)—Offset 68h" on page 2838
6C	4	00007FFF	"Flash Region 6 (BIOS_FREG6)—Offset 6Ch" on page 2839
70	4	00007FFF	"Flash Region 7 (BIOS_FREG7)—Offset 70h" on page 2839
74	4	00007FFF	"Flash Region 8 (BIOS_FREG8)—Offset 74h" on page 2840
78	4	00007FFF	"Flash Region 9 (BIOS_FREG9)—Offset 78h" on page 2840
7C	4	00000000	"Flash Region 10 (BIOS_FREG10)—Offset 7Ch" on page 2841
80	4	00000000	"Flash Region 11 (BIOS_FREG11)—Offset 80h" on page 2841
84	4	00000000	"Flash Protected Range 0 (BIOS_FPR0)—Offset 84h" on page 2842
88	4	00000000	"Flash Protected Range 1 (BIOS_FPR1)—Offset 88h" on page 2843
8C	4	00000000	"Flash Protected Range 2 (BIOS_FPR2)—Offset 8Ch" on page 2844

Table 60-2. Summary of Memory Mapped I/O Registers—BIOS_SPI_BAR0 (Continued)

Offset (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
90	4	00000000	"Flash Protected Range 3 (BIOS_FPR3)—Offset 90h" on page 2845
94	4	00000000	"Flash Protected Range 4 (BIOS_FPR4)—Offset 94h" on page 2846

A0	4	FE000000	"Software Sequencing Flash Status and Control (BIOS_SSFSTS_CTL)—Offset A0h" on page 2848
A4	4	00000000	"Prefix Opcode and Opcode Type Configuration (BIOS_PREOP_OPTYPE)—Offset A4h" on page 2850
A8	4	00000000	"Opcode Menu0 Configuration (BIOS_OPMENU0)—Offset A8h" on page 2851
AC	4	00000000	"Opcode Menu1 Configuration (BIOS_OPMENU1)—Offset ACh" on page 2852
B0	4	00000000	"Secondary Flash Region Access Permissions (BIOS_SFRACC)—Offset B0h" on page 2852
B4	4	00000000	"Flash Descriptor Observability Control (BIOS_FDOC)—Offset B4h" on page 2853
B8	4	00000000	"Flash Descriptor Observability Data (BIOS_FDOD)—Offset B8h" on page 2854
C0	4	00000000	"Additional Flash Control (BIOS_AFC)—Offset C0h" on page 2854
C4	4	00002000	"Vendor Specific Component Capabilities for Component 0 (BIOS_SFDP0_VSCC0)—Offset C4h" on page 2855
C8	4	00002000	"Vendor Specific Component Capabilities for Component 1 (BIOS_SFDP1_VSCC1)—Offset C8h" on page 2858
CC	4	00000000	"Parameter Table Index (BIOS_PTINX)—Offset CCh" on page 2860
D0	4	00000000	"Parameter Table Data (BIOS_PTDATA)—Offset D0h" on page 2861
D4	4	00000000	"SPI Bus Requester Status (BIOS_SBRS)—Offset D4h" on page 2862
E0	4	00000000	"Flash Region 12 (BIOS_FREG12)—Offset E0h" on page 2863
E4	4	00000000	"Flash Region 13 (BIOS_FREG13)—Offset E4h" on page 2863
E8	4	00000000	"Flash Region 14 (BIOS_FREG14)—Offset E8h" on page 2864
EC	4	00000000	"Flash Region 15 (BIOS_FREG15)—Offset ECh" on page 2864
F0	4	00000000	"Set Strap Msg Lock (SSML)—Offset F0h" on page 2865
F4	4	00000000	"Set Strap Msg Control (SSMC)—Offset F4h" on page 2865
F8	4	00000000	"Set Strap Msg Data (SSMD)—Offset F8h" on page 2866
108	4	00000000	"RPMC SFDP Table (BIOS_RPMC0_D0)—Offset 108h" on page 2866
10C	4	00000000	"RPMC SFDP Table (BIOS_RPMC1_D0)—Offset 10Ch" on page 2867
110	4	00000000	"RPMC SFDP Table (BIOS_RPMC0_D1)—Offset 110h" on page 2867
114	4	00000000	"RPMC SFDP Table (BIOS_RPMC1_D1)—Offset 114h" on page 2867
118	4	000000C2	"BIOS Master Read Access Permissions (BIOS_BM_RAP)—Offset 118h" on page 2868
11C	4	00000042	"BIOS Master Write Access Permissions (BIOS_BM_WAP)—Offset 11Ch" on page 2868
1B0	4	00000000	"IE Flash Protected Range 0 (BIOS_IE_PR0)—Offset 1B0h" on page 2869
1B4	4	00000000	"IE Flash Protected Range 1 (BIOS_IE_PR1)—Offset 1B4h" on page 2870
1B8	4	00000000	"IE Flash Protected Range 2 (BIOS_IE_PR2)—Offset 1B8h" on page 2871
1BC	4	00000000	"IE Flash Protected Range 3 (BIOS_IE_PR3)—Offset 1BCh" on page 2872
1C0	4	00000000	"IE Flash Protected Range 4 (BIOS_IE_PR4)—Offset 1C0h" on page 2873

60.2 Registers in Configuration Space

60.2.1 Device ID and Vendor ID (BIOS_SPI_DID_VID)—Offset 0h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:5] + 0h

Default: 19E08086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x19e0 RO/V	**Device Identification (DID):**
15:0	0x8086 RO	**Vendor Identification (VID):** This field identifies the manufacturer of the device. Valid vendor identifiers are allocated by the PCI SIG to ensure uniqueness. 0x8086 indicates Intel.

60.2.2 Status and Command (BIOS_SPI_STS_CMD)—Offset 4h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:5] + 4h

Default: 00000400h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/1C/V	**Detected Parity Error (DPE):** Detected Parity Error (DPE).
30	0x0 RW/1C/V	**Signaled System Error (SSE):** Signaled System Error (SSE).
29	0x0 RO	**Received Master Abort (RMA):** Received Master Abort (RMA).
28	0x0 RO	**Received Target Abort (RTA):** Received Target Abort (RTA).
27	0x0 RW/1C/V	**Signaled Target Abort (STA):** Signaled Target Abort (STA).
26:25	0x0 RO	**Devsel Timing (DEVT):** Devsel Timing (DEVT).
24	0x0 RO	**Master Data Parity Error (MDPE):** Master Data Parity Error (MDPE).
23	0x0 RO	**Fast Back to Back Capable (FBTBC):** Fast Back to Back Capable (FBTBC).
22	0x0 RO	**Reserved (RSVD0):** Reserved (RSVD).
21	0x0 RO	**66 MHz Capable (MCAP):** Not 66MHz Capable Device.
20	0x0 RO	**Capabilities List (CAPL):** Capabilities List.
19	0x0 RO	**Interrupt Status (INTS):** Interrupt Status.
18:11	0x0 RO	**Reserved (RSVD1):** Reserved.
10	0x1 RO	**Interrupt Disable (INTD):** Interrupt Disable.
9	0x0 RO	**Fast Back to Back Enable (FBTBEN):** Fast Back to Back Enable.
8	0x0 RW	**System Error Enable (SERREN):** System Error Enable.
7	0x0 RO	**Reserved (RSVD):** Reserved.
6	0x0 RW	**Parity Error Response (PERRR):** Parity Error Response.
5	0x0 RO	**VGA Palette Snoop (VGAPS):** VGA Palette Snoop.
4	0x0 RO	**Memory Write and Invalidate Enable (MWRIEN):** Memory Write and Invalidate Enable.
3	0x0 RO	**Special Cycles (SPCYC):** Special Cycles.

Bit Range	Default & Access	Field Name (ID): Description
2	0x0 RW	**Bus Master Enable (BME):** Bus Master Enable.
1	0x0 RW	**Memory Space Enable (MSE):** Memory Space Enable.
0	0x0 RO	**IO Space Enable (IOSE):** IO Space Enable.

60.2.3 Revision ID (BIOS_SPI_CC_RID)—Offset 8h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:5] + 8h

Default: 0C800000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0xc RO/V	**Base Class Code (BCC):** Base Class Code.
23:16	0x80 RO/V	**Sub-Class Code (SCC):** Sub-Class Code.
15:8	0x0 RO/V	**Programming Interface (PI):** Programming Interface.
7:0	0x0 RO/V	**Revision ID (RID):** Indicates the part revision.

60.2.4 BIST, Header Type, Latency Timer, Cache Line Size (BIOS_SPI_BIST_HTYPE_LT_CLS)—Offset Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:5] + Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**Reserved (RSVD):** Reserved.
23	0x0 RO/V	**Multi-function Device (MFD):** Multi-function Device.
22:16	0x0 RO	**Header Type (HTYPE):** Header Type.
15:8	0x0 RO	**Latency Timer (LT):** Latency Timer.
7:0	0x0 RO	**Cacheline Size (CLSZ):** Cacheline Size.

60.2.5 SPI BAR0 MMIO (BIOS_SPI_BAR0)—Offset 10h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:5] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RW	**Memory BAR (MEMBAR):** Software programs this register with the base address of the device's memory region. The Host/BIOS MMIO registers in the flash controller are offset from this BAR.
11:4	0x0 RO	**Memory Size (MEMSIZE):** Hardwired to 0 to indicate 4KB of memory space.
3	0x0 RO	**Prefetchable (PREFETCH):** A device can mark a range as prefetchable if there are no side effects on reads, the device returns all bytes on reads regardless of the byte enables. Hardwired to 1 to indicate the device's memory space as prefetchable.
2:1	0x0 RO	**Type (TYP):** Hardwired to 0 to indicate that Base register is 32 bits wide and mapping can be done anywhere in the 32-bit Memory Space.
0	0x0 RO	**Memory Space Indicator (MEMSPACE):** Hardwired to 0 to identify a Memory BAR.

60.2.6 Cardbus CIS Pointer (BIOS_SPI_CCP)—Offset 28h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:5] + 28h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO	**Reserved (RSVD):** Reserved.

60.2.7 Subsystem and Vendor ID (BIOS_SPI_SID_SVID)—Offset 2Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:5] + 2Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW/O	**Subsystem ID (SSID):** Subsystem ID.
15:0	0x0 RW/O	**Subsystem Vendor ID (SSVID):** Subsystem Vendor ID.

60.2.8 Expansion ROM Base Address (BIOS_SPI_XRBAR)—Offset 30h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:5] + 30h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO	**Reserved (RSVD):** Reserved.

60.2.9 Capabilities List Pointer (BIOS_SPI_CAPP)—Offset 34h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:5] + 34h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**Reserved (RSVD):** Reserved.
7:0	0x0 RO	**Capabilities Pointer (CAPP):** Indicates the pointer for the first entry in the capabilities list.

60.2.10 SPI Unsupported Request Status (BIOS_SPI_UR_STS_CTL)—Offset D0h

See the IOSF Specification for required behavior.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:5] + D0h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RO	**Reserved (RSVD):** Reserved.
1	0x0 RW/1C/V	**Unsupported Request Detected (URD):** Set to 1 by hardware upon detecting an Unsupported Request that is not considered an Advisory Non-Fatal error. Cleared to 0 when software writes a 1 to this register.
0	0x0 RW	**Unsupported Request Reporting Enabled (URRE):** If set to 1 by software, the flash controller generates a DoSERR sideband message when the URD bit transitions from 0 to 1.

60.2.11 BIOS Decode Enable (BIOS_SPI_BDE)—Offset D8h

This register only effects BIOS decode if BIOS is resident on SPI.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:5] + D8h

Default: 0000FFCFh

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**Reserved (RSVD):**
15	0x1 RO	**F8-FF Enable (EF8):** Enables decoding of 512K of the following BIOS range: • Data space: FFF80000h - FFFFFFFFh
14	0x1 RW	**F0-F8 Enable (EF0):** Enables decoding of 512K of the following BIOS range: • Data space: FFF00000h - FFF7FFFFh
13	0x1 RW	**E8-EF Enable (EE8):** Enables decoding of 512K of the following BIOS range: • Data space: FFE80000h - FFEFFFFFh
12	0x1 RW	**E0-E8 Enable (EE0):** Enables decoding of 512K of the following BIOS range: • Data space: FFE00000h - FFE7FFFFh
11	0x1 RW	**D8-DF Enable (ED8):** Enables decoding of 512K of the following BIOS range: • Data space: FFD80000h - FFDFFFFFh
10	0x1 RW	**D0-D7 Enable (ED0):** Enables decoding of 512K of the following BIOS range: • Data space: FFD00000h - FFD7FFFFh
9	0x1 RW	**C8-CF Enable (EC8):** Enables decoding of 512K of the following BIOS range: • Data space: FFC80000h - FFCFFFFFh
8	0x1 RW	**C0-C7 Enable (EC0):** Enables decoding of 512K of the following BIOS range: • Data space: FFC00000h - FFC7FFFFh
7	0x1 RW	**Legacy F Segment Enable (LFE):** This enables the decoding of the legacy 64KB range at F0000h - FFFFFh ***Note:*** Decode for the BIOS legacy F segment is enabled by the LFE bit only, it is not affected by the GEN_PMCON_1.iA64_EN bit.
6	0x1 RW	**Legacy E Segment Enable (LEE):** This enables the decoding of the legacy 64KB range at E0000h - EFFFFh ***Note:*** Decode for the BIOS legacy E segment is enabled by the LEE bit only, it is not affected by the GEN_PMCON_1.iA64_EN bit.
5:4	0x0 RO	**Reserved (RSVD_1):** Reserved.
3	0x1 RW	**70-7F Enable (E70):** Enables decoding of 1 MB of the following BIOS range: • Data space: FF700000h - FF7FFFFFh
2	0x1 RW	**60-6F Enable (E60):** Enables decoding of 1 MB of the following BIOS range: • Data space: FF600000h - FF6FFFFFh

Bit Range	Default & Access	Field Name (ID): Description
1	0x1 RW	**50-5F Enable (E50):** Enables decoding of 1 MB of the following BIOS range: • Data space: FF500000h - FF5FFFFFh
0	0x1 RW	**40-4F Enable (E40):** Enables decoding of 1 MB of the following BIOS range: • Data space: FF400000h - FF4FFFFFh

60.2.12 BIOS Control (BIOS_SPI_BC)—Offset DCh

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:31, F:5] + DCh

Default: 00000028h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RO	**Reserved (RSVD):** Reserved.
11	0x0 RW/L	**Async SMI Enable for BIOS Write Protection (ASE_BWP):** When set to '1' the flash controller will generate an SMI when it blocks a BIOS write or erase due to WPD=0. The value in this field can be written by software as long as the BIOS Interface Lock-Down (BILD) is not set.
10	0x0 RO/V	**Asynchronous SMI Status (SPI_ASYNC_SS):** Status indication that the SPI Flash Controller has asserted an asynchronous SMI. Hardware clears the bit when it sends the De-assert SMI message. • 0 = Default state • 1 = SPI flash controller asserted asynchronous SMI
9	0x0 RW/L	Reserved.
8	0x0 RW/1C/V	**Synchronous SMI Status (SPI_SYNC_SS):** Status indication that the SPI Flash Controller has asserted a synchronous SMI. Hardware clears the bit when it sends the De-assert Synchronous SMI message. • 0 = Default state • 1 = SPI flash controller asserted Synchronous SMI
7	0x0 RW/L	**BIOS Interface Lock-Down (BILD):** When set, prevents TS and BBS from being changed. This bit can only be written from 0 to 1 once.
6	0x0 RW/V/L	**Boot BIOS Strap (BBS):** This field determines the destination of accesses to the BIOS memory range. For the default, “Functional Strap” section of Signal Description chapter for details. Bit Description • 0 = SPI • 1 = LPC The value in this field can be overwritten by software as long as the BIOS Interface Lock-Down (BILD) is not set
5	0x1 RW/L	**Enable InSMM.STS (EISS):** When this bit is set, the BIOS region is not writable until the CPU sets the InSMM.STS bit. If this bit [5] is set, then WPD must be a '1' and InSMM.STS must be '1' also in order to write to BIOS region of SPI Flash. If this bit [5] is clear, then the InSMM.STS is a don't care. This bit is locked by LE.
4	0x0 RO/V	**Top Swap Status (TSS):** This bit provides a read-only path to view the state of the Top Swap bit. It is duplicated here to be consistent with the LPC version of the BC register.

Bit Range	Default & Access	Field Name (ID): Description
3:2	0x2 RW	**SPI Read Configuration (SRC):** These bits are located in PCI Config space to allow them to be set early in the boot flow. This 2-bit field controls two policies related to BIOS reads on the SPI interface: Bit 3- Prefetch Enable Bit 2- Cache Disable Settings are summarized below: Bits 3:2 Description • 00 No prefetching, but caching enabled. Direct Memory reads load the read buffer cache with "valid" data, allowing repeated reads to the same range to complete quickly • 01 No prefetching and no caching. One-to-one correspondence of host BIOS reads to SPI cycles. This value can be used to invalidate the cache. • 10 Prefetching and Caching enabled. This mode is used for long sequences of short reads to consecutive addresses (i.e. shadowing). • 11 Illegal. Caching must be enabled when Prefetching is enabled. This eliminates the need for a complex prefetch-flushing mechanism.
1	0x0 RW/L	**Lock Enable (LE):** When set, setting the WPD bit will cause SMI. When cleared, setting the WPD bit will not cause SMI. Once set, this bit can only be cleared by a PLTRST#. When this bit is set, EISS - bit [5] of this register is locked down.
0	0x0 RW	**Write Protect Disable (WPD):** When set, access to the BIOS space is enabled for both read and write cycles to BIOS. When cleared, only read cycles are permitted to the FWH or SPI flash. When this bit is written from a '0' to a '1' and the LE bit is also set, an SMI# is generated. This ensures that only SMM code can update BIOS.

60.3 Registers in Memory Space—BIOS_SPI_BAR0

These registers are accessed in Host Memory Space starting at the relocatable memory address defined by the Base Address Register (BAR) BIOS_SPI_BAR0.

60.3.1 SPI BIOS MMIO PRI (BIOS_BFPREG)—Offset 0h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [BIOS_SPI_BAR0] + 0h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO/V	**Shadowed BIOS Region Select (SBRS):**
30:16	0x0 RO/V	**BIOS Flash Primary Region Limit (PRL):** This specifies address bits 26:12 for the Primary Region Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG1.Region Limit, or the Flash Descriptor.FLREG6.Region Limit depending on the BFPREG.SBRS bit.
15	0x0 RO	**Reserved (RSVD):** Reserved.
14:0	0x0 RO/V	**BIOS Flash Primary Region Base (PRB):** This specifies address bits 26:12 for the Primary Region Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG1.Region Base, or the Flash Descriptor.FLREG6.Region Base depending on the BFPREG.SBRS bit.

60.3.2 Hardware Sequencing Flash Status and Control (BIOS_HSFSTS_CTL)—Offset 4h

Note: If operating in Non-Descriptor mode, hardware sequencing is not allowed.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [BIOS_SPI_BAR0] + 4h

Default: 00002000h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**Flash SPI SMI# Enable (FSMIE):** When set to 1, the SPI asserts an SMI# request whenever the Flash Cycle Done but is 1.
30	0x0 RO	Reserved.
29:24	0x0 RW	**Flash Data Byte Count (FDBC):** The field specifies the number of bytes to shift in or out during the data portion of the SPI cycle. The contents of this register are 0s based with 0b representing 1 byte and 3Fh representing 64 bytes. The number of bytes transferred is the value of this field plus 1. The field is ignored for the Block Erase command.
23:22	0x1 RO	Reserved.
21	0x0 RW	**Write Enable Type (WET):** Write Enable Type (WET) • 0 - Use 06h as the write enable instruction • 1 - Use 50h as the write enable instruction
20:17	0x0 RW	**FLASH Cycle (FCYCLE):** This field defines the Flash SPI cycle type generated to the FLASH when the FGO but is set as defined below: • 0 - Read (1 up to 64 bytes by setting FDBC) • 1 - Reserved • 2 - Write (1 up to 64 bytes by setting FDBC) • 3 - 4k Block Erase • 4 - 64K Sector Erase • 5 - Read SFDP • 6 - Read JEDEC ID • 7 - Write Status • 8 - Read Status • 9 - RPMC Op1 • A - RPMC Op2 Flash controller hardware automatically inserts a write enable opcode prior to write and erase operations. Hardware automatically polls for device not-busy using read status after write and erase operations. Flash controller hardware automatically polls for device not-ready using read status and RPMC Op2 after RPMC Op1 operations. Read status is repeated until the device is not-busy, then RPMC Op2 is repeated until the device is not-busy. If the device does not support 64k erase size (or if it doesn't support SFDP) then only 4k is allowed. ***Note:*** If reserved 1 is programmed to this field, flash controller will handle it as if it is 0 (Read).
16	0x0 RW/1S/V	Flash Cycle Go (FGO): A write to this register with a 1 in this but initiates a request to the Flash SPI Arbiter to start a cycle. This register is cleared by hardware when the cycle is granted by the SPU arbiter to run the cycle on the SPI bus. When the cycle is complete, the FDONE bit is set. Software is forbidden to write to any register in the HSFLCTL register between the FGO bit getting set and the FDONE bit being cleared. Any attempt to violate this rule will be ignored by hardware. Hardware allows other bits in this register to be programmed for the same transaction when writing this bit to 1. This saves an additional memory write. This but always returns 0 on reads.

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW/L	**Flash Configuration Lock-Down (FLOCKDN):** When set to 1, those Flash Program Registers that are locked down by this FLOCKDN but cannot be written. Once set to 1, this but can only be cleared by a hardware reset.
14	0x0 RO/V	**Flash Descriptor Valid (FDV):** This bit is set to a 1 if the Flash Controller read the correct Flash Descriptor Signature. If the Flash Descriptor Valid bit is not 1, software cannot use the Hardware Sequencing registers, but must use the software sequencing registers. Any attempt to use the Hardware Sequencing registers will result in the FCERR bit being set.
13	0x1 RO/V	**Flash Descriptor Override Pin-Strap Status (FDOPSS):** This register reflects the value the Flash Descriptor Override Pin-Strap. • 1 - No override • 0 - The Flash Descriptor Override strap is set
12	0x0 RW/L	**PRR3 PRR4 Lock-Down (PRR34_LOCKDN):** When set to 1, the BIOS PRR3 and PRR4 registers cannot be written. Once set to 1, this bit can only be cleared by a hardware reset.
11	0x0 RW/L	**Flash Configuration Lock-Down (WRSDIS):** • 0 - Write status operation may be used using Hardware Sequencing • 1 - Write status is not allowed as a Hardware Sequencing Operation. The flash controller will block the operation and set the FCERR but when software sets the “go” bit.
10:6	0x0 RO	Reserved.
5	0x0 RO/V	**SPI Cycle In Progress (H_SCIP):** hardware sets this bit when software sets the Flash Cycle Go (FGO) bit in the Hardware Sequencing Flash Control register. This bit remains set until the cycle completes on the SPI interface. Hardware automatically sets and clears this bit so that software can determine when read data is valid and/or when it is safe to begin programming the next command. Software must only program the next command when this bit is 0.
4:0	0x0 RO	Reserved.

60.3.3 Flash Address (BIOS_FADDR)—Offset 8h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [BIOS_SPI_BAR0] + 8h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0x0 RO	**Reserved (RSVD):** Reserved.
26:0	0x0 RW	**Flash Linear Address (FLA):** The FLA is the starting byte linear address of a SPI Read or Write cycle or an address within a Block for the Block Erase command. The Flash Linear Address must fall within a region for which BIOS has access permissions. Hardware must convert the FLA into a Flash Physical Address (FPA) before running this cycle on the SPI bus. When operating in non-descriptor mode bit [26:24] is ignored and the FLA [23:0] is the FPA.

60.3.4 Discrete Lock Bits (BIOS_DLOCK)—Offset Ch

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [BIOS_SPI_BAR0] + Ch

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0x0 RW	**Reserved (RSVD):** Whenever modifying BIOS_DLOCK read the value of bits 31:17 and write back the value read.
16	0x0 RW/L	**SSEQ Lock-Down (SSEQLOCKDN):** IA FW Software Sequencing registers are locked when the logical OR of this bit and FLOCKDN is true. The affected registers are BIOS_SSFSTS_CTL.SCF, BIOS_PREOP_OPTYPE, BIOS_OPMENU0, and BIOS_OPMENU1. Once set to 1 this register is only cleared by host partition reset.
15:13	0x0 RW	**Reserved (RSVD):** Whenever modifying BIOS_DLOCK read the value of bits 15:13 and write back the value read.
12	0x0 RW/L	**PR4 Lock-Down (PR4LOCKDN):** IA FW PR4 register is locked when the logical OR of this bit and FLOCKDN is true. Once set to 1 this register is only cleared by host partition reset.
11	0x0 RW/L	**PR3 Lock-Down (PR3LOCKDN):** IA FW PR3 register is locked when the logical OR of this bit and FLOCKDN is true. Once set to 1 this register is only cleared by host partition reset.
10	0x0 RW/L	**PR2 Lock-Down (PR2LOCKDN):** IA FW PR2 register is locked when the logical OR of this bit and FLOCKDN is true. Once set to 1 this register is only cleared by host partition reset.
9	0x0 RW/L	**PR1 Lock-Down (PR1LOCKDN):** IA FW PR1 register is locked when the logical OR of this bit and FLOCKDN is true. Once set to 1 this register is only cleared by host partition reset.
8	0x0 RW/L	**PR0 Lock-Down (PR0LOCKDN):** IA FW PR0 register is locked when the logical OR of this bit and FLOCKDN is true. Once set to 1 this register is only cleared by host partition reset.
7:4	0x0 RW	**Reserved (RSVD):** Whenever modifying BIOS_DLOCK read the value of bits 7:4 and write back the value read.
3	0x0 RW/L	**SBMRAG Lock-Down (SBMRAGLOCKDN):** IA FW SFRACC.BMRAG register bits are locked when the logical OR of this bit and FLOCKDN is true. Once set to 1 this register is only cleared by host partition reset.
2	0x0 RW/L	**SBMWAG Lock-Down (SBMWAGLOCKDN):** IA FW SFRACC.BMWAG register bits are locked when the logical OR of this bit and FLOCKDN is true. Once set to 1 this register is only cleared by host partition reset.
1	0x0 RW/L	**BMRAG Lock-Down (BMRAGLOCKDN):** IA FW FRACC.BMRAG register bits are locked when the logical OR of this bit and FLOCKDN is true. Once set to 1 this register is only cleared by host partition reset.
0	0x0 RW/L	**BMWAG Lock-Down (BMWAGLOCKDN):** IA FW FRACC.BMWAG register bits are locked when the logical OR of this bit and FLOCKDN is true. Once set to 1 this register is only cleared by host partition reset.

60.3.5 Flash Data 0 (BIOS_FDATA0)—Offset 10h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [BIOS_SPI_BAR0] + 10h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/V	**Flash Data 0 (FD0):** This field is shifted out as the SPI Data on the Master-Out Slave-In Data pin during the data portion of the SPI cycle. This register also shifts in the data from the Master-In Slave-Out pin into this register during the data portion of the SPI cycle. The data is always shifted starting with the least significant byte, msb to lsb, followed by the next least significant byte, msb to lsb, etc. Specifically, the shift order on SPI in terms of bits within this register is: 7-6-5-4-3-2-1-0-15-14-13-?8-23-22-?16-31?24 Bit 24 is the last bit shifted out/in. There are no alignment assumptions; byte 0 always represents the value specified by the cycle address. ***Note:*** The data in this register may be modified by the hardware during any programmed SPI transaction. Direct Memory Reads do not modify the contents of this register.

60.3.6 Flash Data 1 (BIOS_FDATA1)—Offset 14h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [BIOS_SPI_BAR0] + 14h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/V	**Flash Data 1 (FD1):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD0 has completely shifted in/out.

60.3.7 Flash Data 2 (BIOS_FDATA2)—Offset 18h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [BIOS_SPI_BAR0] + 18h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/V	**Flash Data 2 (FD2):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD1 has completely shifted in/out.

60.3.8 Flash Data 3 (BIOS_FDATA3)—Offset 1Ch

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [BIOS_SPI_BAR0] + 1Ch

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/V	**Flash Data 3 (FD3):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD2 has completely shifted in/out.

60.3.9 Flash Data 4 (BIOS_FDATA4)—Offset 20h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [BIOS_SPI_BAR0] + 20h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/V	**Flash Data 4 (FD4):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD3 has completely shifted in/out.

60.3.10 Flash Data 5 (BIOS_FDATA5)—Offset 24h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [BIOS_SPI_BAR0] + 24h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/V	**Flash Data 5 (FD5):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD4 has completely shifted in/out.

60.3.11 Flash Data 6 (BIOS_FDATA6)—Offset 28h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [BIOS_SPI_BAR0] + 28h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/V	**Flash Data 6 (FD6):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD5 has completely shifted in/out.

60.3.12 Flash Data 7 (BIOS_FDATA7)—Offset 2Ch

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [BIOS_SPI_BAR0] + 2Ch

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/V	**Flash Data 7 (FD7):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD6 has completely shifted in/out.

60.3.13 Flash Data 8 (BIOS_FDATA8)—Offset 30h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [BIOS_SPI_BAR0] + 30h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/V	**Flash Data 8 (FD8):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD7 has completely shifted in/out.

60.3.14 Flash Data 9 (BIOS_FDATA9)—Offset 34h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [BIOS_SPI_BAR0] + 34h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/V	**Flash Data 9 (FD9):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD8 has completely shifted in/out.

60.3.15 Flash Data 10 (BIOS_FDATA10)—Offset 38h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [BIOS_SPI_BAR0] + 38h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/V	**Flash Data 10 (FD10):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD9 has completely shifted in/out.

60.3.16 Flash Data 11 (BIOS_FDATA11)—Offset 3Ch

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [BIOS_SPI_BAR0] + 3Ch

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/V	**Flash Data 11 (FD11):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD10 has completely shifted in/out.

60.3.17 Flash Data 12 (BIOS_FDATA12)—Offset 40h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [BIOS_SPI_BAR0] + 40h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/V	**Flash Data 12 (FD12):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD11 has completely shifted in/out.

60.3.18 Flash Data 13 (BIOS_FDATA13)—Offset 44h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [BIOS_SPI_BAR0] + 44h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/V	**Flash Data 13 (FD13):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD12 has completely shifted in/out.

60.3.19 Flash Data 14 (BIOS_FDATA14)—Offset 48h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [BIOS_SPI_BAR0] + 48h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/V	**Flash Data 14 (FD14):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD13 has completely shifted in/out.

60.3.20 Flash Data 15 (BIOS_FDATA15)—Offset 4Ch

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [BIOS_SPI_BAR0] + 4Ch

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/V	**Flash Data 15 (FD15):** Similar definition as Flash Data 0. However, this register does not begin shifting until FD14 has completely shifted in/out.

60.3.21 Flash Region Access Permissions (BIOS_FRACC)—Offset 50h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 000042C2h

BAR and Offset: [BIOS_SPI_BAR0] + 50h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RW/L	**BIOS Master Write Access Grant (BMWAG):** Each bit [31:24] corresponds to Master [7:0]. BIOS can grant one or more masters write access to the BIOS region 1 overriding the permissions in the Flash Descriptor. The contents of this register are locked by the FLOCKDN bit.
23:16	0x0 RW/L	**BIOS Master Read Access Grant (BMRAG):** Each bit [23:16] corresponds to Master [7:0]. BIOS can grant one or more masters read access to the BIOS region 1 overriding the read permissions in the Flash Descriptor. The contents of this register are locked by the FLOCKDN bit.
15:8	0x42 RO/V	**BIOS Region Write Access (BRWA):** Each bit [15:8] corresponds to Regions [7:0]. If the bit is set, this master can erase and write that particular region through register accesses. The contents of this register are that of the Flash Descriptor.Flash Master 1.Master Region Write Access OR a particular master has granted BIOS write permissions in their Master Write Access Grant register OR the Flash Descriptor Security Override strap is set. BIOS always have the write access to its own Region 1 and Region 6 by default. Thus, the reset default of this field will be read as “42h”regardless of descriptor or non-descriptor mode.
7:0	0xc2 RO/V	**BIOS Region Read Access (BRRA):** Each bit [7:0] corresponds to Regions [7:0]. If the bit is set, this master can read that particular region through register accesses. The contents of this register are that of the Flash Descriptor.Flash Master 1.Master Region Write Access OR a particular master has granted BIOS read permissions in their Master Read Access Grant register OR the Flash Descriptor Security Override strap is set. BIOS always have the read access to its own Region 1 and Region 6 by default. Thus, the reset default of this field will be read as “42h” regardless of descriptor or non-descriptor mode.

60.3.22 Flash Region 0 (BIOS_FREG0)—Offset 54h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00007FFFh

BAR and Offset: [BIOS_SPI_BAR0] + 54h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**Reserved (RSVD):** Reserved.
30:16	0x0 RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region 0 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG0.Region Limit.
15	0x0 RO	**Reserved (RSVD_1):** Reserved.
14:0	0x7fff RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region 0 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG0.Region Base.

60.3.23 Flash Region 1 (BIOS_FREG1)—Offset 58h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00007FFFh

BAR and Offset: [BIOS_SPI_BAR0] + 58h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**Reserved (RSVD):** Reserved.
30:16	0x0 RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region 1 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG1.Region Limit.
15	0x0 RO	**Reserved (RSVD_1):** Reserved.
14:0	0x7fff RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region 1 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG1.Region Base.

60.3.24 Flash Region 2 (BIOS_FREG2)—Offset 5Ch

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00007FFFh

BAR and Offset: [BIOS_SPI_BAR0] + 5Ch

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**Reserved (RSVD):** Reserved.
30:16	0x0 RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region 2 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG2.Region Limit.
15	0x0 RO	**Reserved (RSVD_1):** Reserved.
14:0	0x7fff RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region 2 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG2.Region Base.

60.3.25 Flash Region 3 (BIOS_FREG3)—Offset 60h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00007FFFh

BAR and Offset: [BIOS_SPI_BAR0] + 60h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**Reserved (RSVD):** Reserved.
30:16	0x0 RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region 3 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG3.Region Limit.
15	0x0 RO	**Reserved (RSVD_1):** Reserved.
14:0	0x7fff RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region 3 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG3.Region Base.

60.3.26 Flash Region 4 (BIOS_FREG4)—Offset 64h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00007FFFh

BAR and Offset: [BIOS_SPI_BAR0] + 64h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**Reserved (RSVD):** Reserved.
30:16	0x0 RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region 4 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG4.Region Limit.
15	0x0 RO	**Reserved (RSVD_1):** Reserved.
14:0	0x7fff RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region 4 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG4.Region Base.

60.3.27 Flash Region 5 (BIOS_FREG5)—Offset 68h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00007FFFh

BAR and Offset: [BIOS_SPI_BAR0] + 68h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**Reserved (RSVD):** Reserved.
30:16	0x0 RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region 5 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG5.Region Limit
15	0x0 RO	**Reserved (RSVD_1):** Reserved.
14:0	0x7fff RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region 5 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG5.Region Base

60.3.28 Flash Region 6 (BIOS_FREG6)—Offset 6Ch

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00007FFFh

BAR and Offset: [BIOS_SPI_BAR0] + 6Ch

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**Reserved (RSVD):** Reserved.
30:16	0x0 RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region 6 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG6.Region Limit if the Server Feature Disable Fuse 6 is '0'. If the Server Feature Disable Fuse 6 is a '1' then this field is loaded with all zeros.
15	0x0 RO	**Reserved (RSVD_1):** Reserved.
14:0	0x7fff RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region 6 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG6.Region Base if the Server Feature Disable Fuse 6 is '0'. If the Server Feature Disable Fuse 6 is a '1' then this field is loaded with all ones.

60.3.29 Flash Region 7 (BIOS_FREG7)—Offset 70h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00007FFFh

BAR and Offset: [BIOS_SPI_BAR0] + 70h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**Reserved (RSVD):** Reserved.
30:16	0x0 RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region 7 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG7.Region Limit.
15	0x0 RO	**Reserved (RSVD_1):** Reserved.
14:0	0x7fff RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region 7 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG7.Region Base.

60.3.30 Flash Region 8 (BIOS_FREG8)—Offset 74h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00007FFFh

BAR and Offset: [BIOS_SPI_BAR0] + 74h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**Reserved (RSVD):** Reserved.
30:16	0x0 RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region 8 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG8.Region Limit.
15	0x0 RO	**Reserved (RSVD_1):** Reserved.
14:0	0x7fff RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region 8 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG8.Region Base.

60.3.31 Flash Region 9 (BIOS_FREG9)—Offset 78h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00007FFFh

BAR and Offset: [BIOS_SPI_BAR0] + 78h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**Reserved (RSVD):** Reserved.
30:16	0x0 RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region 9 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG9.Region Limit.
15	0x0 RO	**Reserved (RSVD_1):** Reserved.
14:0	0x7fff RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region 9 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG9.Region Base.

60.3.32 Flash Region 10 (BIOS_FREG10)—Offset 7Ch

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [BIOS_SPI_BAR0] + 7Ch

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**Reserved (RSVD):** Reserved.
30:16	0x0 RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region 10 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG10.Region Limit.
15	0x0 RO	**Reserved (RSVD_1):** Reserved.
14:0	0x0 RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region 10 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG10.Region Base.

60.3.33 Flash Region 11 (BIOS_FREG11)—Offset 80h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [BIOS_SPI_BAR0] + 80h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**Reserved (RSVD):** Reserved.
30:16	0x0 RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region 11 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG11.Region Limit.
15	0x0 RO	**Reserved (RSVD_1):** Reserved.
14:0	0x0 RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region 11 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG11.Region Base.

60.3.34 Flash Protected Range 0 (BIOS_FPR0)—Offset 84h

This register can not be written when the FLOCKDN bit is set to 1.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [BIOS_SPI_BAR0] + 84h

Default: 00000000h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/L	**Write Protection Enable (WPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
30:16	0x0 RW/L	**Protected Range Limit (PRL):** This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range. Address bits 11:0 are assumed to be FFFh for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range.
15	0x0 RW/L	**Read Protection Enable (RPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that read directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
14:0	0x0 RW/L	**Protected Range Base (PRB):** This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 000h for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range.

60.3.35 Flash Protected Range 1 (BIOS_FPR1)—Offset 88h

This register can not be written when the FLOCKDN bit is set to 1.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [BIOS_SPI_BAR0] + 88h

Default: 00000000h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/L	**Write Protection Enable (WPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
30:16	0x0 RW/L	**Protected Range Limit (PRL):** This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range. Address bits 11:0 are assumed to be FFFh for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range.
15	0x0 RW/L	**Read Protection Enable (RPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that read directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
14:0	0x0 RW/L	**Protected Range Base (PRB):** This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 000h for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range.

60.3.36 Flash Protected Range 2 (BIOS_FPR2)—Offset 8Ch

This register can not be written when the FLOCKDN bit is set to 1.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [BIOS_SPI_BAR0] + 8Ch

Default: 00000000h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/L	**Write Protection Enable (WPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
30:16	0x0 RW/L	**Protected Range Limit (PRL):** This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range. Address bits 11:0 are assumed to be FFFh for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range.
15	0x0 RW/L	**Read Protection Enable (RPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that read directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
14:0	0x0 RW/L	**Protected Range Base (PRB):** This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 000h for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range.

60.3.37 Flash Protected Range 3 (BIOS_FPR3)—Offset 90h

This register can not be written when the PRR34_LOCKDN bit is set to 1.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [BIOS_SPI_BAR0] + 90h

Default: 00000000h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/L	**Write Protection Enable (WPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
30:16	0x0 RW/L	**Protected Range Limit (PRL):** This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range. Address bits 11:0 are assumed to be FFFh for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range.
15	0x0 RW/L	**Read Protection Enable (RPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that read directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
14:0	0x0 RW/L	**Protected Range Base (PRB):** This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 000h for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range.

60.3.38 Flash Protected Range 4 (BIOS_FPR4)—Offset 94h

This register can not be written when the PRR34_LOCKDN bit is set to 1.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [BIOS_SPI_BAR0] + 94h

Default: 00000000h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/L	**Write Protection Enable (WPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
30:16	0x0 RW/L	**Protected Range Limit (PRL):** This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range. Address bits 11:0 are assumed to be FFFh for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range.
15	0x0 RW/L	**Read Protection Enable (RPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that read directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
14:0	0x0 RW/L	**Protected Range Base (PRB):** This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 000h for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range.

60.3.39 Global Protected Range 0 (BIOS_GPR0)—Offset 98h

This register is initialized via softstraps. This protected range applies globally to all masters / flash requesters.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [BIOS_SPI_BAR0] + 98h

Default: 00000000h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO/V	**Write Protection Enable (WPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
30:16	0x0 RO/V	**Protected Range Limit (PRL):** This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range. Address bits 11:0 are assumed to be FFFh for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range.
15	0x0 RO/V	**Read Protection Enable (RPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that read directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
14:0	0x0 RO/V	**Protected Range Base (PRB):** This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 000h for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range.

60.3.40 Software Sequencing Flash Status and Control (BIOS_SSFSTS_CTL)—Offset A0h

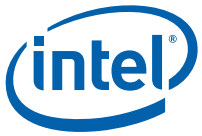
Type: Memory Mapped I/O Register (Size: 32 bits)

Default: FE000000h

BAR and Offset: [BIOS_SPI_BAR0] + A0h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0x1f RO	**Reserved (RSVD):** This field is not programmable, it is fixed at 1Fh.
26:24	0x6 RW/L	**SPI Cycle Frequency (SCF):** The listed frequencies are approximate. • 010: 17MHz • 100: 30MHz • 110: 48MHz • All Others: Reserved This register sets frequency to use for all SPI Software Sequencing cycles (write, erase, fast read, read status,.etc) except for the Read cycle which always run at 20MHz. This register is locked when the SPI Configuration Lock-Down (FLOCKDN) bit is set.
23	0x0 RW	**SPI SMI# Enable (SME):** When set to 1, the SPI asserts an SMI# request whenever the Cycle Done Status bit is 1.
22	0x0 RW	**Data Cycle (DS):** When set to 1, there is data that corresponds to this transaction. When 0, no data is delivered for this cycle, and the DBC and data fields themselves are don't cares.
21:16	0x0 RW	**Data Byte Count (DBC):** This field specifies the number of bytes to shift in or out during the data portion of the SPI cycle. The valid settings (in decimal) are any value from 0 to 63. The number of bytes transferred is the value of this field plus 1. ***Note:*** When this field is 00_0000b, then there is 1 byte to transfer and that 11_1111b means there are 64 bytes to transfer.
15	0x0 RO	**Reserved (RSVD_1):** Reserved.
14:12	0x0 RW	**Cycle Opcode Pointer (COP):** This field selects one of the programmed opcodes in the Opcode Menu to be used as the SPI Command/Opcode. In the case of an Atomic Cycle Sequence, this determines the second command.
11	0x0 RW	**Sequence Prefix Opcode Pointer (SPOP):** This field selects one of the two programmed prefix opcodes for use when performing an Atomic Cycle Sequence. A value of 0 points to the opcode in the least significant byte of the Prefix Opcodes register. By making this programmable, the ICH supports flash devices that have different opcodes for enabling writes to the data space vs. status register.
10	0x0 RW	**Atomic Cycle Sequence (ACS):** When set to 1 along with the SCGO assertion, the SoC will execute a sequence of commands on the SPI interface without allowing another master to arbitrate and interleave cycles. The sequence is composed of: • Atomic Sequence Prefix Command (8-bit opcode only) • Primary Command specified below by software (can include address and data) • Polling the Flash Status Register (opcode 05h) until bit 0 becomes 0b. The SPI Cycle in Progress bit remains set and the Cycle Done Status bit remains unset until the Busy bit in the Flash Status Register returns 0.
9	0x0 RW/1S/V	**SPI Cycle Go (SCGO):** This bit always returns 0 on reads. However, a write to this register with a '1' in this bit starts the SPI cycle defined by the other bits of this register. The "SPI Cycle in Progress" (SCIP) bit gets set by this action. Hardware must ignore writes to this bit while the Cycle In Progress bit is set. Hardware allows other bits in this register to be programmed for the same transaction when writing this bit to 1. This saves an additional memory write.
8	0x0 RO	**Reserved (RSVD_2):** Reserved.



Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RO/V	**Fast Read Supported (FAST_READ_SUPPORT):** This bit reflects the value of the Fast Read Support bit in the Flash Descriptor Component Section.
6	0x0 RO/V	**Dual Output Fast Read Supported (DUAL_FAST_READ_SUPPORT):** This bit reflects the value of the Dual Output Fast Read Support bit in the Flash Descriptor Component Section.
5	0x0 RO	**Reserved (RSVD_3):** Reserved.
4	0x0 RO/V	**Access Error Log (AEL):** This bit reflects the value of the Hardware Sequencing Status.AEL register.
3	0x0 RW/1C/V	**Flash Cycle Error (FCERR):** Hardware sets this bit to 1 when a programmed access is blocked from running on the SPI interface due to one of the protection policies or when any of the programmed cycle registers is written while a programmed access is already in progress. This bit remains asserted until cleared by software writing a 1 or hardware reset.
2	0x0 RW/1C/V	**Cycle Done Status (CYCLE_DONE_STS):** The SoC sets this bit to 1 when the SPI Cycle completes (i.e., SCIP bit is 0) after software sets the GO bit. This bit remains asserted until cleared by software writing a 1 or hardware reset. When this bit is set and the SPI SMI# Enable bit is set, an internal signal is asserted to the SMI# generation block. Software must make sure this bit is cleared prior to enabling the SPI SMI# assertion for a new programmed access.
1	0x0 RO	**Reserved (RSVD_4):** Reserved.
0	0x0 RO/V	**SPI Cycle In Progress (SCIP):** Hardware sets this bit when software sets the SPI Cycle Go bit in the Command register.

60.3.41 Prefix Opcode and Opcode Type Configuration (BIOS_PREOP_OPTYPE)—Offset A4h

This register is not writable when the Flash Configuration Lock-Down (FLOCKDN) bit is set. Entries in this register correspond to the entries in the Opcode Menu Configuration register.

Note that the definition below only provides write protection for opcodes that have addresses associated with them. Therefore, any erase or write opcodes that do not use an address should be avoided (for example, "Chip Erase" and "Auto-Address Increment Byte Program").

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [BIOS_SPI_BAR0] + A4h

Default: 00000000h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RW/L	**Opcode Type 7 (OPCODE_TYPE7):** See the description for bits 17:16.
29:28	0x0 RW/L	**Opcode Type 6 (OPCODE_TYPE6):** See the description for bits 17:16.
27:26	0x0 RW/L	**Opcode Type 5 (OPCODE_TYPE5):** See the description for bits 17:16.
25:24	0x0 RW/L	**Opcode Type 4 (OPCODE_TYPE4):** See the description for bits 17:16.
23:22	0x0 RW/L	**Opcode Type 3 (OPCODE_TYPE3):** See the description for bits 17:16.
21:20	0x0 RW/L	**Opcode Type 2 (OPCODE_TYPE2):** See the description for bits 17:16.
19:18	0x0 RW/L	**Opcode Type 1 (OPCODE_TYPE1):** See the description for bits 17:16.
17:16	0x0 RW/L	**Opcode Type 0 (OPCODE_TYPE0):** This field specifies information about the corresponding Opcode 0. This information allows the hardware to 1) know whether to use the address field and 2) provide BIOS and Shared Flash protection capabilities.The hardware implementation also uses the read vs. write information for modifying the behavior of the SPI interface logic. The encoding of the two bits is: • 00 = No Address associated with this Opcode and Read Cycle type • 01 = No Address associated with this Opcode and Write Cycle type • 10 = Address required; Read cycle type • 11 = Address required; Write cycle type
15:8	0x0 RW/L	**Prefix Opcode 1 (PREFIX_OPCODE1):** Software programs an SPI opcode into this field that is permitted to run as the first command in an atomic cycle sequence.
7:0	0x0 RW/L	**Prefix Opcode 0 (PREFIX_OPCODE0):** Software programs an SPI opcode into this field that is permitted to run as the first command in an atomic cycle sequence.

60.3.42 Opcode Menu0 Configuration (BIOS_OPMENU0)—Offset A8h

This register is not writable when the SPI Configuration Lock-Down bit (FLOCKDN) is set. Eight entries are available in this register to give BIOS a sufficient set of commands for communicating with the flash device, while also restricting what malicious software can do. This keeps the hardware flexible enough to operate with a wide variety of SPI devices.

It is recommended that BIOS avoid programming Write Enable opcodes in this menu. Malicious software could then perform writes and erases to the SPI flash without using the atomic cycle mechanism. This could cause functional failures in a shared flash environment. Write Enable opcodes should only be programmed in the Prefix Opcodes.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [BIOS_SPI_BAR0] + A8h

Default: 00000000h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RW/L	**Allowable Opcode 3 (OPCODE3):** See the description for bits 7:0.
23:16	0x0 RW/L	**Allowable Opcode 2 (OPCODE2):** See the description for bits 7:0.
15:8	0x0 RW/L	**Allowable Opcode 1 (OPCODE1):** See the description for bits 7:0.
7:0	0x0 RW/L	**Allowable Opcode 0 (OPCODE0):** Software programs an SPI opcode into this field for use when initiating SPI commands through the Control Register.

60.3.43 Opcode Menu1 Configuration (BIOS_OPMENU1)—Offset ACh

This register is not writable when the SPI Configuration Lock-Down bit (FLOCKDN) is set. Eight entries are available in this register to give BIOS a sufficient set of commands for communicating with the flash device, while also restricting what malicious software can do. This keeps the hardware flexible enough to operate with a wide variety of SPI devices.

It is recommended that BIOS avoid programming Write Enable opcodes in this menu. Malicious software could then perform writes and erases to the SPI flash without using the atomic cycle mechanism. This could cause functional failures in a shared flash environment. Write Enable opcodes should only be programmed in the Prefix Opcodes.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [BIOS_SPI_BAR0] + ACh

Default: 00000000h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RW/L	**Allowable Opcode 7 (OPCODE7):** See the description for bits 7:0.
23:16	0x0 RW/L	**Allowable Opcode 6 (OPCODE6):** See the description for bits 7:0.
15:8	0x0 RW/L	**Allowable Opcode 5 (OPCODE5):** See the description for bits 7:0.
7:0	0x0 RW/L	**Allowable Opcode 4 (OPCODE4):** Software programs an SPI opcode into this field for use when initiating SPI commands through the Control Register.

60.3.44 Secondary Flash Region Access Permissions (BIOS_SFRACC)—Offset B0h

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [BIOS_SPI_BAR0] + B0h

Default: 00000000h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RW/L	**Secondary BIOS Master Write Access Grant (SECONDARYBIOS_MWAG):** Each bit [31:29] corresponds to Master [7:0]. BIOS can grant one or more masters write access to the Secondary BIOS region 6 overriding the permissions in the Flash Descriptor. The contents of this register are locked by the FLOCKDN bit.
23:16	0x0 RW/L	**Secondary BIOS Master Read Access Grant (SECONDARYBIOS_MRAG):** Each bit [28:16] corresponds to Master [7:0]. BIOS can grant one or more masters read access to the Secondary BIOS region 6 overriding the read permissions in the Flash Descriptor. The contents of this register are locked by the FLOCKDN bit.
15:0	0x0 RO	**Reserved (RSVD):** Reserved.

60.3.45 Flash Descriptor Observability Control (BIOS_FDOC)—Offset B4h

This is a test mode only register that can be used to observe the contents of the Flash Descriptor that is stored internally in the SoC Flash Controller. The CPU Complex soft straps are not observable in SoC as these are forwarded to the CPU Complex and not stored.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [BIOS_SPI_BAR0] + B4h

Default: 00000000h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0x0 RO	**Reserved (RSVD):** Reserved.
14:12	0x0 RW	**Flash Descriptor Section Select (FDSS):** Selects which section within the loaded Flash Descriptor to observe. • 000: Flash Signature and Descriptor Map • 001: Component • 010: Region • 011: Master • 100: Soft Straps • Other: Reserved
11:2	0x0 RW	**Flash Descriptor Section Index (FDSI):** Selects the DW offset within the Flash Descriptor Section to observe.
1:0	0x0 RO	**Reserved (RSVD_1):** Reserved.

60.3.46 Flash Descriptor Observability Data (BIOS_FDOD)—Offset B8h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [BIOS_SPI_BAR0] + B8h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**Flash Descriptor Section Data (FDSD):** Returns the DW of data to observe as selected in the Flash Descriptor Observability Control.

60.3.47 Additional Flash Control (BIOS_AFC)—Offset C0h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [BIOS_SPI_BAR0] + C0h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0x0 RO	**Reserved (RSVD):** Reserved.
9:1	0x0 RW	**Reserved RW Scratch Pad (Reserved_SCRATCHPAD):** Scratch Pad bits that are R/W to be used
0	0x0 RW/V/P	**Stop Prefetch on Flush Pending (SPFP):** When set to '1', the in progress of a prefetch will be ended if subsequence access from the master of the same interface (SPXB or MBB) is detected to be a cache-miss and read cache will be flushed. When set to '0', the prefetch will be allowed to complete prior to flushing. This register is only reset on a Early boot reset of both the Host and the ME partitions.NOTE: This should change to reset on a host reset and a different SPFP bit used for the Intel® Management Engine cache. Future project fix? The reset value of this bit is determined by the SoC soft strap PCHSTRP0.SPI_SPFP.

60.3.48 Vendor Specific Component Capabilities for Component 0 (BIOS_SFDP0_VSCC0)—Offset C4h

Note: Intel is planning to deprecate support for non-SFDP capable flash devices.

VSCC registers were previously used to allow software to configure flash device-specific parameters. Since Serial Flash Discoverable Parameters were standardized in 2011 this capability is less important. For SPT, the VSCC registers will be renamed SFDP registers. If the flash controller discovers SFDP devices, then hardware will populate the appropriate register fields from the SFDP table and treat them as read-only by software. If SFDP is not discovered then the registers will remain writable by software. This change is intended to allow microarchitectural cleanup by having device parameters sourced from a single location. The SPI flash controller uses the Quad Enable Requirements (QER) data from the SFDP table to ensure that the flash device is enabled for Quad-mode prior to issuing any Quad-mode reads. If quad reads are disabled via softstraps then the flash controller may ignore QER. If the QE bit is in the flash status register, the controller reads the status register. If the QE bit is 0 then the controller sets it to 1 and writes the status register back to the flash device using a write_enable, write_status sequence.

The QER bits are used by software/firmware as follows:

1. Manufacturing time: FITC tool is used to initialize the set of vendor-specific VSCC entries in the FLUMAP portion of the descriptor, where each entry is a pair of (device ID, VSCC value).
2. Boot time: Intel® Management Engine firmware and BIOS perform the SoC register initialization.
   a. Read JEDEC ID from each flash device.
   b. Scan through VSCC tables pointed to by FLUMAP.
   c. Copy the entry from FLUMAP which matches device 0 into VSCC0, copy entry which matches device 1 into VSCC1.
3. In software sequencing, BIOS/Intel® Management Engine ensure QE bit is not cleared while doing status register write.

The flash controller uses the polling delays to set internal timers after initiating a write, erase, or RPMC operation. After the internal timer expires the flash controller begins polling the flash busy status in bit 0 of the status register. [OPEN: Move requirement to a standalone section] If the RPMC polling requirements bit is set to poll with RPMC Op2, then the flash controller issues an RPMC Op2 instead of a read status (05h). The RPMC Op2 operation uses “fast read” timing with 8 dummy bits between the address and valid data. Bit 0 of the first byte returned from RPMC Op2 is the busy bit.

The fields in this register pertain to cycles targeting addresses less than FLCOMP.C0DEN, i.e. within Component 0.

If the CPPTV bit is '0', software must configure the VSCC register appropriately. If the CPPTV bit is '1', the corresponding parameter values discovered via SFDP will be used. In most cases, software is not required to configure the VSCC register. However, if the SFDP table indicates an erase size other than 4k Byte, then software is required to program the VSCC.EO register with the correct erase opcode.

If the CPPTV bit is '0' and the VSCC register is not programmed and the Flash is operating in Flash Mode (as opposed to EEPROM mode), then software cannot use hardware sequencing. This requirement is not enforced by hardware, but is a requirement of the power-on usage model.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00002000h

BAR and Offset: [BIOS_SPI_BAR0] + C4h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO/V	**Component Property Parameter Table Valid (CPPTV):** This bit is set to a 1 if the Flash Controller detects a valid SFDP Component Property Parameter Table in Component 0. ***Note:*** If this bit is set software must not overwrite bits that were initialized by hardware via SFDP discovery.
30	0x0 RW/L	**Vendor Component Lock (VCL):** 0 = The lock bit is not set. 1 = The Vendor Component Lock bit is set. This register locks itself when set.
29	0x0 RW/V/L	**64k Erase Valid (EO_64k_VALID):** 0 = The EO_64k opcode is not valid. 1 = The EO_64k opcode is valid.
28	0x0 RW/V/L	**4k Erase Valid (EO_4k_VALID):** 0 = The EO_4k opcode is not valid. 1 = The EO_4k opcode is valid.
27	0x0 RW/L	**RPMC Supported (RPMC_SUPPORTED):** 0 = The device does not support RPMC. 1 = The device supports RPMC.
26	0x0 RW/V/L	**Deep Powerdown Supported (DEEP_PWRDN_SUPPORTED):** 0 = The device does not support Deep Powerdown. 1 = The device supports Deep Powerdown.
25	0x0 RW/V/L	**Suspend/Resume Supported (SUSPEND_RESUME_SUPPORTED):** 0 = The device does not support Suspend/Resume. 1 = The device supports Suspend/Resume.
24	0x0 RW/V/L	**Soft Reset Supported (SOFT_RST_SUPPORTED):** 0 = The device does not support Soft Reset. 1 = The device supports Soft Reset.
23:16	0x0 RW/V/L	**64k Erase Opcode (EO_64k):** This register is programmed with the Flash 64k sector erase instruction opcode for component 0. This register is locked by the Vendor Component Lock (VCL) bit or the CPPTV bit.
15:8	0x20 RW/V/L	**4k Erase Opcode (EO_4k):** This register is programmed with the Flash 4k subsector erase instruction opcode for component 0. Software must program this register if the SFDP table for this component does not show 4 k Byte erase capability. This register is locked by the Vendor Component Lock (VCL) bit or the CPPTV bit.
7:5	0x0 RW/V/L	**Quad Enable Requirements (QER):** • 000 Part does not require a Quad Enable bit to be set, either because Quad is not supported or because the manufacturer somehow permanently enables Quad capability. • 001 Part requires bit 9 in status register 2 to be set to enable quad IO. Writing one byte to status register clears all bits in register 2, therefore status register writes MUST be two bytes. • 010 Part requires bit 6 of status register 1 to be set to enable quad IO. • 011 Part requires bit 7 of the configuration register to be set to enable Quad. • 100 Part requires bit 9 in status register 2 to be set to enable quad IO. Writing one byte to the status register does not clear the second byte. This register is locked by the Vendor Component Lock (VCL) bit. If the SFDP table contains this information, the flash controller loads these bits from the table. The flash controller uses this information to prevent clearing the QE bit in the flash device's status register when WSR=1.
4	0x0 RW/V/L	**Write Enable on Write Status (WEWS):** 0 = 50h is the opcode to enable a status register write. 1 = 06h is the opcode to enable a status register write. This register is locked by the Vendor Component Lock (VCL) bit or the CPPTV bit. ***Note:*** Hardware ignores the state of this bit.

Bit Range	Default & Access	Field Name (ID): Description
3	0x0 RW/V/L	**Write Status Required (WSR):** 0 = No requirement to write to the Write Status Register prior to a write 1 = A write is required to the Write Status Register prior to write and erase to remove any protection. This is required for SST components. This register is locked by the Vendor Component Lock (VCL) bit or the CPPTV bit. ***Note:*** Hardware ignores the state of this bit.
2	0x0 RW/V/L	**Write Granularity (WG):** 0 = Reserved. 1 = 64 Byte. This register is locked by the Vendor Component Lock (VCL) bit or the CPPTV bit. ***Note:*** Hardware ignores the state of this bit.
1:0	0x0 RW/L	**Reserved (RSVD):** Reserved.

60.3.49 Vendor Specific Component Capabilities for Component 1 (BIOS_SFDP1_VSCC1)—Offset C8h

Note: Intel is planning to deprecates support for non-SFDP capable flash devices.

See 31.1, Section 4)a). The fields in this register pertain to cycles targeting addresses greater than or equal to FLCOMP.C0DEN, i.e. outside of Component 0. The lockable bits in this register are locked when either CPPTV is set to '1' by hardware or when VCL is '1'.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [BIOS_SPI_BAR0] + C8h

Default: 00002000h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO/V	**Component Property Parameter Table Valid (CPPTV):** This bit is set to a 1 if the Flash Controller detects a valid SFDP Component Property Parameter Table in Component 1. ***Note:*** If this bit is set software must not overwrite bits that were initialized by hardware via SFDP discovery.
30	0x0 RO	**Reserved (RSVD):** Reserved.
29	0x0 RW/V/L	**64k Erase Valid (EO_64k_VALID):** 0 = The EO_64k opcode is not valid. 1 = The EO_64k opcode is valid.
28	0x0 RW/V/L	**4k Erase Valid (EO_4k_VALID):** 0 = The EO_4k opcode is not valid. 1 = The EO_4k opcode is valid.
27	0x0 RW/L	**RPMC Supported (RPMC_SUPPORTED):** 0 = The device does not support RPMC. 1 = The device supports RPMC.
26	0x0 RW/V/L	**Deep Powerdown Supported (DEEP_PWRDN_SUPPORTED):** 0 = The device does not support Deep Powerdown. 1 = The device supports Deep Powerdown.
25	0x0 RW/V/L	**Suspend/Resume Supported (SUSPEND_RESUME_SUPPORTED):** 0 = The device does not support Suspend/Resume. 1 = The device supports Suspend/Resume.
24	0x0 RW/V/L	**Soft Reset Supported (SOFT_RST_SUPPORTED):** 0 = The device does not support Soft Reset. 1 = The device supports Soft Reset.
23:16	0x0 RW/V/L	**64k Erase Opcode (EO_64k):** This register is programmed with the Flash 64k sector erase instruction opcode for component 1. This register is locked by the Vendor Component Lock (VCL) bit or the CPPTV bit.
15:8	0x20 RW/V/L	**4k Erase Opcode (EO_4k):** This register is programmed with the Flash 4k subsector erase instruction opcode for component 1. Software must program this register if the SFDP table for this component does not show 4 k Byte erase capability. This register is locked by the Vendor Component Lock (VCL) bit or the CPPTV bit.

Bit Range	Default & Access	Field Name (ID): Description
7:5	0x0 RW/V/L	**Quad Enable Requirements (QER):** • 000 Part does not require a Quad Enable bit to be set, either because Quad is not supported or because the manufacturer somehow permanently enables Quad capability. • 001 Part requires bit 9 in status register 2 to be set to enable quad IO. Writing one byte to status register clears all bits in register 2, therefore status register writes MUST be two bytes. • 010 Part requires bit 6 of status register 1 to be set to enable quad IO. • 011 Part requires bit 7 of the configuration register to be set to enable Quad. • 100 Part requires bit 9 in status register 2 to be set to enable quad IO. Writing one byte to the status register does not clear the second byte. This register is locked by the Vendor Component Lock (VCL) bit. If the SFDP table contains this information, the flash controller loads these bits from the table. The flash controller uses this information to prevent clearing the QE bit in the flash device's status register when WSR=1.
4	0x0 RW/V/L	**Write Enable on Write Status (WEWS):** 0 = 50h is the opcode to enable a status register write. 1 = 06h is the opcode to enable a status register write. Must be set to '1' for Intel's Blanshard Flash Component and for Atmel. This register is locked by the Vendor Component Lock (VCL) bit or the CPPTV bit. ***Note:*** Hardware ignores the state of this bit.
3	0x0 RW/V/L	**Write Status Required (WSR):** 0 = No requirement to write to the Write Status Register prior to a write. 1 = A write is required to the Write Status Register prior to write and erase to remove any protection. This is required for SST components. This register is locked by the Vendor Component Lock (VCL) bit or the CPPTV bit. ***Note:*** Hardware ignores the state of this bit.
2	0x0 RW/V/L	**Write Granularity (WG):** 0 = Reserved. 1 = 64 Byte. This register is locked by the Vendor Component Lock (VCL) bit or the CPPTV bit. ***Note:*** Hardware ignores the state of this bit.
1:0	0x0 RW/L	**Reserved (RSVD_1):** Reserved.

60.3.50 Parameter Table Index (BIOS_PTINX)—Offset CCh

Observability control for Component Property Tables.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [BIOS_SPI_BAR0] + CCh

Default: 00000000h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**Reserved (RSVD):** Reserved.
15:14	0x0 RW	**Supported Parameter Table (SPT):** Selects which supported parameter table to observe. • 00: Component 0 Property Parameter Table. • 01: Component 1 Property Parameter Table. • 10: Reserved. • 11: Reserved.
13:12	0x0 RW	**Header or Data (HORD):** Select parameter table header DW vs Data DW. • 00: SFDP Header. • 01: Parameter Table Header. • 10: Data. • 11: Reserved.
11:2	0x0 RW	**Parameter Table DW Index (PTDWI):** Selects the DW offset within the parameter table to observe.
1:0	0x0 RO	**Reserved (RSVD_1):** Reserved.

60.3.51 Parameter Table Data (BIOS_PTDATA)—Offset D0h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [BIOS_SPI_BAR0] + D0h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**Parameter Table DW Data (PTDWD):** Returns the DW of data to observe as selected in the Parameter Table Index register. ***Note:*** The returned value of reserved fields in the SFDP header or table must be ignored by software. The flash controller may return either 0 or 1 for these fields.

60.3.52 SPI Bus Requester Status (BIOS_SBRS)—Offset D4h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [BIOS_SPI_BAR0] + D4h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO/V	**TPM access ongoing (TPM_ACC_ONG):**
30:18	0x0 RO	**Reserved (RSVD):** Reserved.
17:15	0x0 RO/V	**Master 6 Status (M6STATUS):** See description under M1STATUS.
14:12	0x0 RO/V	**Master 5 Status (M5STATUS):** See description under M1STATUS.
11:9	0x0 RO/V	**Master 4 Status (M4STATUS):** See description under M1STATUS.
8:6	0x0 RO/V	**Master 3 Status (M3STATUS):** See description under M1STATUS.
5:3	0x0 RO/V	**Master 2 Status (M2STATUS):** See description under M1STATUS.
2:0	0x0 RO/V	**Master 1 Status (M1STATUS):** Indicates whether this master has an outstanding transaction enqueued or in flight and the transaction type. • 0xx: No transaction. • 100: Flash read transaction. • 101: Flash write transaction. • 110: Flash erase transaction. • 111: Flash RPMC transaction.

60.3.53 Flash Region 12 (BIOS_FREG12)—Offset E0h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [BIOS_SPI_BAR0] + E0h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**Reserved (RSVD):** Reserved.
30:16	0x0 RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region 12 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG12.Region Limit.
15	0x0 RO	**Reserved (RSVD_1):** Reserved.
14:0	0x0 RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region 12 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG12.Region Base.

60.3.54 Flash Region 13 (BIOS_FREG13)—Offset E4h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [BIOS_SPI_BAR0] + E4h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**Reserved (RSVD):** Reserved.
30:16	0x0 RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region 13 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG13.Region Limit.
15	0x0 RO	**Reserved (RSVD_1):** Reserved.
14:0	0x0 RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region 13 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG13.Region Base.

60.3.55 Flash Region 14 (BIOS_FREG14)—Offset E8h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [BIOS_SPI_BAR0] + E8h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**Reserved (RSVD):** Reserved.
30:16	0x0 RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region 14 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG14.Region Limit.
15	0x0 RO	**Reserved (RSVD_1):** Reserved.
14:0	0x0 RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region 14 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG14.Region Base.

60.3.56 Flash Region 15 (BIOS_FREG15)—Offset ECh

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [BIOS_SPI_BAR0] + ECh

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**Reserved (RSVD):** Reserved.
30:16	0x0 RO/V	**Region Limit (RL):** This specifies address bits 26:12 for the Region 15 Limit. The value in this register is loaded from the contents in the Flash Descriptor.FLREG15.Region Limit.
15	0x0 RO	**Reserved (RSVD_1):** Reserved.
14:0	0x0 RO/V	**Region Base (RB):** This specifies address bits 26:12 for the Region 15 Base. The value in this register is loaded from the contents in the Flash Descriptor.FLREG15.Region Base.

60.3.57 Set Strap Msg Lock (SSML)—Offset F0h

Lockable: Yes

Power Well: Resume

reset_type= wrsmrst#.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [BIOS_SPI_BAR0] + F0h

Default: 00000000h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0x0 RO	**Reserved (RSVD):** Reserved.
0	0x0 RW/L	**Set_Strap Lock (SSL):** When set to '1', all of SSML, SSMC and SSMD is locked, including this Lock bit. Note that this bit is reset on CF9 resets. reset_type= wrsmrst#

60.3.58 Set Strap Msg Control (SSMC)—Offset F4h

Lockable: Yes

Power Well: DSW

reset_type= dsw_pok

The DSW bits are all cleared by dsw_pok, but must not be cleared by CF9h resets.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [BIOS_SPI_BAR0] + F4h

Default: 00000000h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0x0 RO	**Reserved (RSVD):** Reserved.
0	0x0 RW/L	**Set_Strap Mux Select (SSMS):** When set to '1', the Set strap message bits [47:32] come from the Set_Strap Msg Data register. This bit is reset by the RSMRST# pin only. When '0', the Set-Strap data continues to come from the soft straps themselves. reset_type=dsw_pok This register field is locked by the Set Strap Lock (SSML.SSL) bit.

60.3.59 Set Strap Msg Data (SSMD)—Offset F8h

Lockable: Yes
Power Well: DSW
Reset Type: dsw_pok

This register is used to provide a BIOS programmable sticky register which contains data that will be used in the Set-Strap type 1 msg on subsequent resets. The bits in the message control certain CPU features, for which see the CPU spec. These bits are in the resume well, so only reset on G3.

The usage model is that on each reset BIOS will check the state of the CPU. If the state is correct, then BIOS continues. If not, then BIOS writes the SSMD and SSMC registers and does a CF9 reset. On the reset the value of what was written to SSMD takes effect. Note that some mobile platforms force G3 on S5 requests. For those platforms, if the user/BIOS wants to have these bits set, there will be 2 resets on every power-on. If the platform accepts the default of '0' for these controls, then there is only one reset. The bits are in DSW and not RTC well because this allows a user upgrade, assuming the user unplugged the system before doing the upgrade, to revert to a setting of 0. This should reduce any interoperability concerns regarding user upgrades. The DSW bits are all cleared dsw_pok, and must not be cleared by CF9h resets.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [BIOS_SPI_BAR0] + F8h

Default: 00000000h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**Reserved (RSVD):** Reserved.
15:0	0x0 RW/L	**Set_Strap Data (SSD):** When SSMS is '1', then this data is sent in the Set-Strap msg Type 1 upon reset. This data is sent in the 2nd DW of data, bits[15:0]. reset_type=int_sus_pok This register field is locked by the Set Strap Lock (SSML.SSL) bit.

60.3.60 RPMC SFDP Table (BIOS_RPMC0_D0)—Offset 108h

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [BIOS_SPI_BAR0] + 108h

Default: 00000000h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**RPMC SFDP Table dword 0 Device 0 (RPMC0_D0):**

60.3.61 RPMC SFDP Table (BIOS_RPMC1_D0)—Offset 10Ch

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [BIOS_SPI_BAR0] + 10Ch

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**RPMC SFDP Table dword 1 Device 0 (RPMC1_D0):**

60.3.62 RPMC SFDP Table (BIOS_RPMC0_D1)—Offset 110h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [BIOS_SPI_BAR0] + 110h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**RPMC SFDP Table dword 0 Device 1 (RPMC0_D1):**

60.3.63 RPMC SFDP Table (BIOS_RPMC1_D1)—Offset 114h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [BIOS_SPI_BAR0] + 114h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**RPMC SFDP Table dword 0 Device 1 (RPMC1_D1):**

60.3.64 BIOS Master Read Access Permissions (BIOS_BM_RAP)—Offset 118h

This register is implemented in DNV, LBG and subsequent programs.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [BIOS_SPI_BAR0] + 118h

Default: 000000C2h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**Reserved (RSVD):** Reserved.
15:0	0xc2 RO/V	**BIOS Master Read Access Permissions (BMRAP) (BMRAP):** Each bit [15:0] corresponds to Regions [15:0]. If the bit is set, this master can read that particular region through register accesses. The contents of this register are that of the Flash Descriptor.Flash Master 1.Master Region Read Access OR a particular master has granted BIOS read permissions in their Master Read Access Grant register OR the Flash Descriptor Security Override strap is set. BIOS has read access to its own Region 1, 6 and 7 by default. Thus, the reset default of this field will be read as "C2h".

60.3.65 BIOS Master Write Access Permissions (BIOS_BM_WAP)—Offset 11Ch

This register is implemented in DNV, LBG and subsequent programs.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [BIOS_SPI_BAR0] + 11Ch

Default: 00000042h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**Reserved (RSVD):** Reserved.
15:0	0x42 RO/V	**BIOS Master Write Access Permissions (BMWAP) (BMWAP):** Each bit [15:0] corresponds to Regions [15:0]. If the bit is set, this master can erase and write that particular region through register accesses. The contents of this register are that of the Flash Descriptor.Flash Master 1.Master Region Write Access OR a particular master has granted BIOS write permissions in their Master Write Access Grant register OR the Flash Descriptor Security Override strap is set. BIOS has write access to its own Region 1 and 6 by default. Thus, the reset default of this field will be read as "42h".

60.3.66 IE Flash Protected Range 0 (BIOS_IE_PR0)—Offset 1B0h

This register can not be written when the FLOCKDN bit is set to 1.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [BIOS_SPI_BAR0] + 1B0h

Default: 00000000h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO/V	**Write Protection Enable (WPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
30:16	0x0 RO/V	**Protected Range Limit (PRL):** This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range. Address bits 11:0 are assumed to be FFFh for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range.
15	0x0 RO/V	**Read Protection Enable (RPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that read directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
14:0	0x0 RO/V	**Protected Range Base (PRB):** This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 000h for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range.

60.3.67 IE Flash Protected Range 1 (BIOS_IE_PR1)—Offset 1B4h

This register can not be written when the FLOCKDN bit is set to 1.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [BIOS_SPI_BAR0] + 1B4h

Default: 00000000h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO/V	**Write Protection Enable (WPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
30:16	0x0 RO/V	**Protected Range Limit (PRL):** This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range. Address bits 11:0 are assumed to be FFFh for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range.
15	0x0 RO/V	**Read Protection Enable (RPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that read directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
14:0	0x0 RO/V	**Protected Range Base (PRB):** This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 000h for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range.

60.3.68 IE Flash Protected Range 2 (BIOS_IE_PR2)—Offset 1B8h

This register can not be written when the FLOCKDN bit is set to 1.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [BIOS_SPI_BAR0] + 1B8h

Default: 00000000h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO/V	**Write Protection Enable (WPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
30:16	0x0 RO/V	**Protected Range Limit (PRL):** This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range. Address bits 11:0 are assumed to be FFFh for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range.
15	0x0 RO/V	**Read Protection Enable (RPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that read directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
14:0	0x0 RO/V	**Protected Range Base (PRB):** This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 000h for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range.

60.3.69 IE Flash Protected Range 3 (BIOS_IE_PR3)—Offset 1BCh

This register can not be written when the FLOCKDN bit is set to 1.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [BIOS_SPI_BAR0] + 1BCh

Default: 00000000h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO/V	**Write Protection Enable (WPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
30:16	0x0 RO/V	**Protected Range Limit (PRL):** This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range. Address bits 11:0 are assumed to be FFFh for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range.
15	0x0 RO/V	**Read Protection Enable (RPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that read directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
14:0	0x0 RO/V	**Protected Range Base (PRB):** This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 000h for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range.

60.3.70 IE Flash Protected Range 4 (BIOS_IE_PR4)—Offset 1C0h

This register can not be written when the FLOCKDN bit is set to 1.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [BIOS_SPI_BAR0] + 1C0h

Default: 00000000h

BIOS_SPI_BAR0 Type: PCI Configuration Register (Size: 32 bits)
BIOS_SPI_BAR0 Reference: [B:0, D:31, F:5] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO/V	**Write Protection Enable (WPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
30:16	0x0 RO/V	**Protected Range Limit (PRL):** This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range. Address bits 11:0 are assumed to be FFFh for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range.
15	0x0 RO/V	**Read Protection Enable (RPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that read directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared.
14:0	0x0 RO/V	**Protected Range Base (PRB):** This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 000h for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range.

§ §

61 Programmable Interval Timer - Legacy

61.1 Introduction and Index

The host-accessible registers for the Programmable Interval Timer (PIT) are described here.

The legend for the register access codes are described in Chapter 43, “Introduction.”

61.1.1 Host I/O Space—Fixed Address

An index of the registers that are accessible in Host I/O Space is shown here.

61.2 Registers in I/O Space—Fixed Addresses

Table 61-1. Summary of I/O Registers—Fixed I/O Ports

I/O Port (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
40	1	C4	"Counter 0 - Interval Timer Status Byte Format Register (C0_ITSBFR)—Offset 40h" on page 2876
42	1	C4	"Counter 2 - Interval Timer Status Byte Format Register (C2_ITSBFR)—Offset 42h" on page 2877
43	1	00	"Timer Control Word Register (TCW)—Offset 43h" on page 2878
42	1	00	"Counter 2 - Counter Access Ports Register (C2_CAPR)—Offset 42h" on page 2879
43	1	C0	"Read Back Command (RBC)—Offset 43h" on page 2880
43	1	00	"Counter Latch Command (CLC)—Offset 43h" on page 2881
61	1	00	"NMI Status and Control (NMI_STS_CNT)—Offset 61h" on page 2882

These registers are accessed in Host I/O Space through fixed I/O Port addresses.

61.2.1 Counter 0 - Interval Timer Status Byte Format Register (C0_ITSBFR)—Offset 40h

Each counter's status byte can be read following a Read Back Command. If latch status is chosen (bit 4=0, Read Back Command) as a read back option for a given counter, the next read from the counter's Counter Access Ports Register (I/O Port 40h for counter 0 and I/O Port 42h for counter 2) returns the status byte. The status byte returns the following:

Type: I/O Register
(Size: 8 bits)

I/O Port: 40h

Default: C4h

Bit Range	Default & Access	Field Name (ID): Description
7	0x1 RO	**Counter OUT Pin State (COPS):** • When this bit is a 1, the OUT pin of the counter is also a 1. • When this bit is a 0, the OUT pin of the counter is also a 0. **Power Well:** Core
6	0x1 RO	**Count Register Status (CRSTS):** This bit indicates when the last count written to the Count Register (CR) has been loaded into the counting element (CE). The exact time this happens depends on the counter mode, but until the count is loaded into the counting element (CE), the count value will be incorrect. • 0 - Count has been transferred from CR to CE and is available for reading. • 1 - Null Count. Count has not been transferred from CR to CE and is not yet available for reading. **Power Well:** Core
5:4	0x0 RO	**Read/Write Selection Status (RW_SLT_STS):** These reflect the read/write selection made through bits[5:4] of the control register. The binary codes returned during the status read match the codes used to program the counter read/write selection. • 00 - Counter Latch Command • 01 - Read/Write Least Significant Byte (LSB) • 10 - Read/Write Most Significant Byte (MSB) • 11 - Read/Write LSB then MSB **Power Well:** Core
3:1	0x2 RO	**Mode Selection Status (MD_SLT_STS):** These bits return the counter mode programming. The binary code returned matches the code used to program the counter mode, as listed under the bit function above. • 000 - Out signal on end of count (=0) • 001 - Hardware retriggerable one-shot • x10 - Rate generator (divide by n counter) • x11 - Square wave output • 100 - Software triggered strobe • 101 - Hardware triggered strobe **Power Well:** Core
0	0x0 RO	**Countdown Type Status (CDT_STS):** This bit reflects the current countdown type, ether 0 for binary countdown or a 1 for binary coded decimal (BCD) countdown. **Power Well:** Core

61.2.2 Counter 2 - Interval Timer Status Byte Format Register (C2_ITSBFR)—Offset 42h

Each counter's status byte can be read following a Read Back Command. If latch status is chosen (bit 4=0, Read Back Command) as a read back option for a given counter, the next read from the counter's Counter Access Ports Register (I/O Port 40h for counter 0 and I/O Port 42h for counter 2) returns the status byte. The status byte returns the following:

Type: I/O Register
(Size: 8 bits)

I/O Port: 42h

Default: C4h

Bit Range	Default & Access	Field Name (ID): Description
7	0x1 RO	**Counter OUT Pin State (COPS):** • When this bit is a 1, the OUT pin of the counter is also a 1. • When this bit is a 0, the OUT pin of the counter is also a 0. **Power Well:** Core
6	0x1 RO	**Count Register Status (CRSTS):** This bit indicates when the last count written to the Count Register (CR) has been loaded into the counting element (CE). The exact time this happens depends on the counter mode, but until the count is loaded into the counting element (CE), the count value will be incorrect. • 0 - Count has been transferred from CR to CE and is available for reading. • 1 - Null Count. Count has not been transferred from CR to CE and is not yet available for reading. **Power Well:** Core
5:4	0x0 RO	**Read/Write Selection Status (RW_SLT_STS):** These reflect the read/write selection made through bits[5:4] of the control register. The binary codes returned during the status read match the codes used to program the counter read/write selection. • 00 - Counter Latch Command • 01 - Read/Write Least Significant Byte (LSB) • 10 - Read/Write Most Significant Byte (MSB) • 11 - Read/Write LSB then MSB **Power Well:** Core
3:1	0x2 RO	**Mode Selection Status (MD_SLT_STS):** These bits return the counter mode programming. The binary code returned matches the code used to program the counter mode, as listed under the bit function above. • 000 - Out signal on end of count (=0) • 001 - Hardware retriggerable one-shot • x10 - Rate generator (divide by n counter) • x11 - Square wave output • 100 - Software triggered strobe • 101 - Hardware triggered strobe **Power Well:** Core
0	0x0 RO	**Countdown Type Status (CDT_STS):** This bit reflects the current countdown type, ether 0 for binary countdown or a 1 for binary coded decimal (BCD) countdown. **Power Well:** Core

61.2.3 Timer Control Word Register (TCW)—Offset 43h

This register is programmed prior to any counter being accessed to specify counter modes. Following reset, the control words for each register are undefined and each counter output is 0. Each timer must be programmed to bring it into a known state. There are two special commands that can be issued to the counters through this register, the Read Back Command and the Counter Latch Command. When these commands are chosen, several bits within this register are redefined.

Type: I/O Register (Size: 8 bits)

I/O Port: 43h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0x0 WO	**Counter Select (CNT_SLT):** The Counter Selection bits select the counter the control word acts upon as shown below. The Read Back Command is selected when bits[7:6] are both 1. • 00 - Counter 0 select • 01 - Reserved • 10 - Counter 2 select • 11 - Read Back Command **Power Well:** Core
5:4	0x0 WO	**Read/Write Select: (RW_SLT):** These bits are the read/write control bits. The actual counter programming is done through the counter port (40h for counter 0 and 42h for counter 2). • 00 - Counter Latch Command • 01 - Read/Write Least Significant Byte (LSB) • 10 - Read/Write Most Significant Byte (MSB) • 11 - Read/Write LSB then MSB **Power Well:** Core
3:1	0x0 WO	**Counter Mode Selection (CNT_MD_SLTN):** These bits select one of six possible modes of operation for the selected counter. • 000 - Out signal on end of count (=0) • 001 - Hardware retriggerable one-shot • x10 - Rate generator (divide by n counter) • x11 - Square wave output • 100 - Software triggered strobe • 101 - Hardware triggered strobe **Power Well:** Core
0	0x0 WO	**Binary/BCD Countdown Select (B_BCD_CNTDWN_SLT):** • 0 - Binary countdown is used. The largest possible binary count is 2^{16} • 1 - Binary coded decimal (BCD) count is used.The largest possible BCD count is 10^4 **Power Well:** Core

61.2.4 Counter 2 - Counter Access Ports Register (C2_CAPR)—Offset 42h

Type: I/O Register
(Size: 8 bits)

I/O Port: 42h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW/V	**Counter Port (CP):** Each counter port address is used to program the 16-bit Count Register. The order of programming, either LSB only, MSB only, or LSB then MSB, is defined with the Interval Counter Control Register at I/O Port 43h. The counter port is also used to read the current count from the Count Register, and return the status of the counter programming following a Read Back Command. **Power Well:** Core

61.2.5 Read Back Command (RBC)—Offset 43h

The Read Back Command is used to determine the count value, programmed mode, and current states of the OUT pin and Null count flag of the selected counter or counters.

Type: I/O Register (Size: 8 bits)

I/O Port: 43h

Default: C0h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0x3 WO	**Read Back Command (RBC):** Must be 11 to select the Read Back Command (RBC). Otherwise, see "Counter Latch Command (CLC)—Offset 43h" on page 2881. **Power Well:** Core
5	0x0 WO	**Latch Count of Selected Counters (LCSC):** • 0 - Current count value of the selected counters will be latched • 1 - Current count will not be latched **Power Well:** Core
4	0x0 WO	**Latch Status of Selected Counters (LSSC):** • 0 - Status of the selected counters will be latched • 1 - Status will not be latched **Power Well:** Core
3	0x0 WO	**Counter 2 Select (CNT_2_SLT):** When set to 1, Counter 2 count and/or status will be latched **Power Well:** Core
2	0x0 WO	**Reserved (RSVD):** Reserved **Power Well:** Core
1	0x0 WO	**Counter 0 Select (CNT_0_SLT):** When set to 1, Counter 0 count and/or status will be latched. **Power Well:** Core
0	0x0 WO	**Reserved (RSVD_1):** Must be 0. **Power Well:** Core

61.2.6 Counter Latch Command (CLC)—Offset 43h

The Counter Latch Command latches the current count value. This command is used to insure that the count read from the counter is accurate.

Type: I/O Register (Size: 8 bits)

I/O Port: 43h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0x0 WO	**Counter Selection (CNT_SLT):** These bits select the counter for latching. • 00 - Counter 0 • 01 - Reserved • 10 - Counter 2 ***Note:*** If 11 is written, then the write is interpreted as a Read Back Command (RBC). See "Read Back Command (RBC)—Offset 43h" on page 2880. **Power Well:** Core
5:4	0x0 WO	**Counter Latch Command (CLC):** Write 00 to select the Counter Latch Command. **Power Well:** Core
3:0	0x0 WO	**Reserved (RSVD):** Must be 0. **Power Well:** Core

61.2.7 NMI Status and Control (NMI_STS_CNT)—Offset 61h

NMI Status and Control Register

Type: I/O Register
(Size: 8 bits)

I/O Port: 61h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RO	**SERR# NMI Source Status (SERR_NMI_STS):** This bit is set by any of the sources of the internal SERR signal of the SoC. This includes SERR assertions forwarded from the secondary PCI bus, error from a PCIe port, or internal Bus 0 functions that generate SERR#. Bit 2 must be cleared in this register in order for this bit to be set. This interrupt source is enabled by setting bit 2 to 0. To reset the interrupt, set bit 2 to 1 and then set it to 0. This bit is read-only. When writing to port 61h, this bit must be 0. **Power Well:** Core
6	0x0 RO	**IOCHK# NMI Source Status (IOCHK_NMI_STS):** This bit is set if an ISA/LPC agent (via SERIRQ) asserts IOCHK# and bit 3 is cleared in this register. This interrupt source is enabled by setting bit 3 to 0. To reset the interrupt, set bit 3 to 1 and then set it to 0. This bit is read-only. When writing to port 61h, this bit must be a 0. **Power Well:** Core
5	0x0 RO	**Timer Counter 2 OUT Status (TMR2_OUT_STS):** This bit reflects the current state of the 8254 Counter 2 output. Counter 2 must be programmed following any PCI reset for this bit to have a determinate value. When writing to port 61h, this bit must be a 0. **Power Well:** Core
4	0x0 RO	**Reserved (RSVD):** Will return 0 when read. Writes to this bit will be ignored. **Power Well:** Core
3	0x0 RW	**IOCHK# NMI Enable (IOCHK_NMI_EN):** • When this bit is a 1, IOCHK# NMIs are disabled and cleared. • When this bit is a 0, IOCHK# NMIs are enabled. **Power Well:** Core
2	0x0 RW	**PCI SERR# Enable (PCI_SERR_EN):** • When this bit is a 1, the SERR# NMIs are disabled and cleared. • When this bit is a 0, SERR# NMIs are enabled. **Power Well:** Core
1	0x0 RW	**Reserved (RSVD):** Unused **Power Well:** Core
0	0x0 RW	**Timer Counter 2 Enable (TIM_CNT2_EN):** When this bit is a 0, Counter 2 counting is disabled. Counting is enabled when this bit is 1. **Power Well:** Core

§ §

62 Real Time Clock - Legacy

62.1 Introduction and Index

The host-accessible registers for the Real Time Clock are described here.

The legend for the register access codes are described in Chapter 43, "Introduction."

62.1.1 Host I/O Space—Fixed Address

An index of the registers that are accessible in Host I/O Space is shown here. For a description of the RTC Configuration (RC) register see "RTC Configuration (RC)—Offset 3400h" on page 2900.

Table 62-1. Summary of I/O Registers—Fixed Address

I/O Port (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
70 (also 74)	1	80	"NMI Enable (and Real Time Clock Index) (NMI_EN)—Port 70h" on page 2888
71 (also 75)	1	n/a	"Real Time Clock Data—Port 71h" on page 2889
If RTC Configuration (RC) bit 2 = 0			
72 (also 76)	1	80	(Alias) "NMI Enable (and Real Time Clock Index) (NMI_EN)—Port 70h" on page 2888
73 (also 77)	1	n/a	(Alias) "Real Time Clock Data—Port 71h" on page 2889
If RTC Configuration (RC) bit 2 = 1			
72 (also 76)	1	0	"Real Time Clock Index to Extended RAM—Port 72h" on page 2889
73 (also 77)	1	n/a	"Real Time Clock Data—Port 73h" on page 2889

62.1.2 Host I/O Space—RTC Standard Static RAM Bank (Indexed Data)

An index of the registers that are accessible in Host I/O Space is shown here. The Index Value is provided by the RTC Standard RAM Index Register. If the Upper 128 Byte Enable (UE) bit is = 0, the Index value is aliased to the RTC Extended RAM Index Register. For the UE bit of the RC register see "RTC Configuration (RC)—Offset 3400h" on page 2900.

Table 62-2. Summary of RTC Standard Static RAM Bank — Indexed Data

Index Value (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
0	1	00	"Seconds (Sec)—Index 0h" on page 2890
1	1	00	"Seconds Alarm (Sec_Alarm)—Index 1h" on page 2890
2	1	00	"Minutes—Index 2h" on page 2890
3	1	00	"Minutes Alarm (Minutes_Alarm)—Index 3h" on page 2891
4	1	00	"Hours—Index 4h" on page 2891
5	1	00	"Hours Alarm (Hours_Alarm)—Index 5h" on page 2891
6	1	00	"Day of Week (Day_of_Week)—Index 6h" on page 2892
7	1	00	"Day of Month (Day_of_Month)—Index 7h" on page 2892
8	1	00	"Month—Index 8h" on page 2892
9	1	00	"Year—Index 9h" on page 2893
A	1	20	"Register A (Register_A)—Index Ah" on page 2894
B	1	80	"Register B - General Configuration (Register_B)—Index Bh" on page 2895
C	1	00	"Register C - Flag Register (Register_C)—Index Ch" on page 2897
D	1	80	"Register D - Flag Register (Register_D)—Index Dh" on page 2898
E through 7F	1 (each access)	n/a	"User RAM—Index Eh through 7Fh" on page 2898

62.1.3 Host I/O Space—RTC Extended Static RAM Bank (Indexed Data)

An index of the registers that are accessible in Host I/O Space is shown here. The Index Value is provided by the RTC Extended RAM Index Register if the Upper 128 Byte Enable (UE) bit is = 1. For the UE bit of the RC register see "RTC Configuration (RC)—Offset 3400h" on page 2900.

Table 62-3. Summary of RTC Extended Static RAM Bank — Indexed Data

Index Value (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
0 through 7F	1 (each access)	n/a	"User RAM—Index 0h through 7Fh" on page 2899

62.1.4 Sideband Registers

An index of the Sideband registers that are accessible to the Host are listed here. Each is accessible in Host Memory Space using the Sideband Base Address Register (SBREG_BAR). See Section 3.4.1, "Using SBREG_BAR Method" on page 187.

Table 62-4. Summary of Sideband Registers—0xD1

Offset (hex)	Default Value (hex)	Register Name (Register Symbol)
3400	00000000	"RTC Configuration (RC)—Offset 3400h" on page 2900
3414	00	"Backed Up Control (BUC)—Offset 3414h" on page 2901
3F04	00000000	"RTC Update In Progress SMI Control (UIPSMI)—Offset 3F04h" on page 2902
3418	00000000	"RTC Dynamic Clock Gating Control (RTCDCG)—Offset 3418h" on page 2903

62.2 Registers in I/O Space—Fixed Addresses

These registers are accessed in Host I/O Space through fixed I/O addresses.

62.2.1 NMI Enable (and Real Time Clock Index) (NMI_EN)—Port 70h

This register is write-only for normal operation. In Alternate-Access mode, this register can be read to find the NMI Enable status and the RTC index value.

Alternate-Access Mode is enabled by setting Alternate Access Mode Enable (AME), bit 17 of the 32-bit General Interrupt Control (GIC) register in relocatable Memory Space at offset D0_31FCh from SBREG_BAR.

When the Upper 128 Byte Enable (UE) bit of the RTC Configuration (RC) Register = 0, The NMI_EN register is aliased to I/O Ports 72h and 76h. See "RTC Configuration (RC)—Offset 3400h" on page 2900.

I/O Writes to 72h, 74h, and 76h do not affect the NMI Enable bit (bit 7 of 70h).

Type: I/O Register (Size: 8 bits)

I/O Port: 70h (aliased 74h. If UE = 0, also aliased to 72h and 76h)

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7	0x1 RW/V	**NMI_EN# (NMI_EN):** When this bit is a 1, all NMI sources are disabled. When this bit is a 0, NMI sources are enabled. I/O Writes to 72h, 74h, and 76h do not affect the state of NMI_EN.
6:0	0x0 RW/V	**Real Time Clock Index (Address) (RTC_INDX):** This data goes to the RTC to select which register or CMOS RAM address is being accessed. **Power Well:** RTC

62.2.2 Real Time Clock Data—Port 71h

RTC data located at index address defined by RTC_INDX.

When the Upper 128 Byte Enable (UE) bit of the RTC Configuration (RC) Register = 0, The NMI_EN register is aliased to I/O Ports 73h and 77h. See "RTC Configuration (RC)—Offset 3400h" on page 2900.

Type: I/O Register
(Size: 8 bits)

I/O Port: 71h (aliased 75h. If UE = 0, also aliased to 73h and 77h)

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Real Time Clock Data:** This is the data located at RTC_INDX. The data is either an RTC register or CMOS RAM. **Power Well:** RTC

62.2.3 Real Time Clock Index to Extended RAM—Port 72h

This register is accessible only when the Upper 128 Byte Enable (UE) bit of the RTC Configuration (RC) Register = 1. If UE = 0, see "NMI Enable (and Real Time Clock Index) (NMI_EN)—Port 70h" on page 2888. For the RC register see "RTC Configuration (RC)—Offset 3400h" on page 2900.

Type: I/O Register
(Size: 8 bits)

I/O Port: 72h (aliased 76h)

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RO	**Reserved:** Reserved.
6:0	0x0 RW	**Real Time Clock Extended Index (Address)** This data goes to the RTC to select which Extended CMOS RAM address is being accessed. **Power Well:** RTC

62.2.4 Real Time Clock Data—Port 73h

RTC data located at index address defined by the Real Time Clock Extended Index register. This register is accessible only when the Upper 128 Byte Enable (UE) bit of the RTC Configuration (RC) Register = 1. If UE = 0, see "Real Time Clock Data—Port 71h" on page 2889. For the RC register see "RTC Configuration (RC)—Offset 3400h" on page 2900.

Type: I/O Register
(Size: 8 bits)

I/O Port: 73h (aliased 77h)

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Real Time Clock Data:** This is the data located at the Extended RAM address defined by the Real Time Clock Extended Index register. The data is Extended CMOS RAM. **Power Well:** RTC

62.3 Registers in Host I/O Space—RTC Standard Static RAM Bank (Indexed Data)

62.3.1 Seconds (Sec)—Index 0h

RTC Index: 00h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores current time second.

Type: RTC Standard Static RAM (Size: 8 bits) **Index:** 0h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Seconds (Sec):** Time Seconds **Power Well:** RTC

62.3.2 Seconds Alarm (Sec_Alarm)—Index 1h

RTC Index: 01h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores Seconds Alarm.

Type: RTC Standard Static RAM (Size: 8 bits) **Index:** 1h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Seconds Alarm (Sec_Alarm):** Sec_Alarm **Power Well:** RTC

62.3.3 Minutes—Index 2h

RTC Index: 02h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores current time Minutes.

Type: RTC Standard Static RAM (Size: 8 bits) **Index:** 2h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Minutes:** Time Minutes **Power Well:** RTC

62.3.4 Minutes Alarm (Minutes_Alarm)—Index 3h

RTC Index: 03h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores Alarm Minutes.

Type: RTC Standard Static RAM (Size: 8 bits) **Index:** 3h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Minutes Alarm (Minutes_Alarm):** Alarm Minutes **Power Well:** RTC

62.3.5 Hours—Index 4h

RTC Index: 04h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores current time Hours.

Type: RTC Standard Static RAM (Size: 8 bits) **Index:** 4h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Hours:** Time Hours **Power Well:** RTC

62.3.6 Hours Alarm (Hours_Alarm)—Index 5h

RTC Index: 05h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores Alarm Hours.

Type: RTC Standard Static RAM (Size: 8 bits) **Index:** 5h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Hours Alarm (Hours_Alarm):** Alarm Hours **Power Well:** RTC

62.3.7 Day of Week (Day_of_Week)—Index 6h

RTC Index: 06h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores current Day of Week.

Type: RTC Standard Static RAM (Size: 8 bits)

Index: 6h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Day of Week (Day_of_Week):** This field indicates current Day of Week **Power Well:** RTC

62.3.8 Day of Month (Day_of_Month)—Index 7h

RTC Index: 07h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores current Day of Month.

Type: RTC Standard Static RAM (Size: 8 bits)

Index: 7h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Day of Month (Day_of_Month):** This field indicates current Day of Month **Power Well:** RTC

62.3.9 Month—Index 8h

RTC Index: 08h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores current Month.

Type: RTC Standard Static RAM (Size: 8 bits)

Index: 8h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Month:** This field indicates current Month **Power Well:** RTC

62.3.10 Year—Index 9h

RTC Index: 09h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores current Year.

Type: RTC Standard Static RAM (Size: 8 bits)

Index: 9h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Year:** This field indicates current Year **Power Well:** RTC

62.3.11 Register A (Register_A)—Index Ah

RTC Index: 0Ah Attribute: Read/Write Default Value: Undefined Size: 8-bit Lockable: No Power Well: RTC This register is used for general configuration of the RTC functions. None of the bits are affected by RSMRST# or any other reset signal.

Type: RTC Standard Static RAM (Size: 8 bits)

Index: Ah

Default: 20h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RW	**UPDATE IN PROGRESS (UIP):** This bit may be monitored as a status flag. When asserted as a 1, the update is soon to occur or is in progress. If 0, the update cycle will not start for at least 488 s. The time, calendar, and alarm information in RAM is always available when the UIP bit is 0. The ICH provides the ability to generate SMI# based on either the 0-to-1 or 1-to-0 transition of this bit. This can be useful for work-arounds and debug in silicon. **Power Well:** RTC
6:4	0x2 RW	**Division Chain Select (DV_2_0):** These three bits control the divider chain for the oscillator, and are not affected by RSMRST# or any other reset signal. DV(2) corresponds to bit 6. • 010 Normal Operation • 11X Divider Reset • 101 Bypass 15 stages (test mode only) • 100 Bypass 10 stages (test mode only) • 011 Bypass 5 stages (test mode only) • 001 Invalid • 000 Invalid **Power Well:** RTC
3:0	0x0 RW	**Rate Select (RS_3_0):** Selects one of 13 taps of the 15 stage divider chain. The selected tap can generate a periodic interrupt if the PIE bit is set in Register B. Otherwise this tap will set the PF flag of Register C. If the periodic interrupt is not to be used, these bits should all be set to zero. RS3 corresponds to bit 3. The Periodic Rate is as follows: • 0000 Interrupt never toggles • 0001 3.90625 ms • 0010 7.8125 ms • 0011 122.070 s • 0100 244.141 s • 0101 488.281 s • 0110 976.5625 s • 0111 1.953125 ms • 1000 3.90625 ms • 1001 7.8125 ms • 1010 15.625 ms • 1011 31.25 ms • 1100 62.5 ms • 1101 125 ms • 1110 250 ms • 1111 500 ms **Power Well:** RTC

62.3.12 Register B - General Configuration (Register_B)—Index Bh

RTC Index: 0Bh Attribute: Read/Write Default Value: U0U00UUU Size: 8-bit Lockable: No Power Well: RTC

Type: RTC Standard Static RAM (Size: 8 bits) **Index:** Bh

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7	0x1 RW	**Update Cycle Inhibit (SET):** Enables/Inhibits the update cycles. When SET is 0, update cycle occurs normally once each second. If set to one, a current update cycle will abort and subsequent update cycles will not occur until SET is returned to zero. When set is one, the BIOS may initialize time and calendar bytes safely. This bit is not affected by RSMRST# nor any other reset signal. ***Note:*** Software must ensure this bit is at least transitioned from '1' to '0' once whenever the RTC coin battery is inserted. This is to ensure that the internal RTC time updates occur properly. **Power Well:** RTC
6	0x0 RW	**Periodic Interrupt Enable (PIE):** If set to 1, the Periodic Interrupt Enable (PIE) bit allows an interrupt to occur with a time base set with the RS bits of register A. This bit is cleared by RSMRST#, but not on any other reset **Power Well:** RTC
5	0x0 RW	**Alarm Interrupt Enable (AIE):** If set to one, the Alarm Interrupt Enable (AIE) bit allows an interrupt to occur when the AF is one as set from an alarm match from the update cycle. An alarm can occur once a second, one an hour, once a day, or once a month. This bit is cleared by RTEST# #, but not on any other reset **Power Well:** RTC
4	0x0 RW	**Update-ended Interrupt Enable: (UIE):** If set to one, the Update-ended Interrupt Enable (UIE) bit allows an interrupt to occur when the update cycle ends. This bit is cleared by RSMRST#, but not on any other reset **Power Well:** RTC
3	0x0 RW	**Square Wave Enable (SQWE):** The Square Wave Enable bit serves no function in this device, yet is left in this register bank to provide compatibility with the Motorola 146818B. There is not SQW pin on this device. This bit is cleared by RSMRST#, but not on any other reset. **Power Well:** RTC
2	0x0 RW	**Data Mode (DM):** The Data Mode (DM) bit specifies either binary or BCD data representation. A one denotes binary, and zero denotes BCD. This bit is not affected by RSMRST# nor any other reset signal. **Power Well:** RTC
1	0x0 RW	**Hour Format (HOURFORM):** This bit indicates the hour byte format. If one, twenty-four hour mode is selected. If zero, twelve-hour mode is selected. In twelve hour mode, the seventh bit represents AM as zero and PM as one. This bit is not affected by RSMRST# nor any other reset signal. **Power Well:** RTC

Bit Range	Default & Access	Field Name (ID): Description
0	0x0 RW	**Daylight Savings Enable (DSE):** The Daylight Savings Enable bit triggers two special hour updates per year when set to one. One is on the first Sunday in April, where time increments from 1:59:59 AM to 3:00:00 AM. The other is the last Sunday in October when the time first reaches 1:59:59 AM, it is changed to 1:00:00 AM. The time must increment normally for at least two update cycles (seconds) previous to these conditions for the time change to occur properly. These special update conditions do not occur when the DSE bit is set to zero. The days for the hour adjustment are those specified in United States federal law as of 1987, which is different than previous years. This bit is not affected by RSMRST# nor any other reset signal. If BUC.DSO bit is set, the DSE bit continues to be a R/W bit, but Daylight Saving is disabled regardless of the DSE bit. **Power Well:** RTC

62.3.13 Register C - Flag Register (Register_C)—Index Ch

RTC Index: 0Ch Attribute: Read-Only (Writes have no effect). Default Value: 00U00000 Size: 8-bit Lockable: No Power Well: RTC

Type: RTC Standard Static RAM (Size: 8 bits)

Index: Ch

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RO	**Interrupt Request Flag (IRQF):** Interrupt Request Flag = PF * PIE + AF * AIE + UF * UFE. This also causes the RTC Interrupt to be asserted. This bit is cleared upon RSMRST# or a read of Register C. **Power Well:** RTC
6	0x0 RO	**Periodic Interrupt Flag (PF):** Periodic interrupt Flag will be one when the tap as specified by the RS bits of register A is one. If no taps are specified, this flag bit will remain at zero. This bit is cleared upon RSMRST# or a read of Register C. **Power Well:** RTC
5	0x0 RO	**Alarm Flag (AF):** Alarm Flag will be high after all Alarm values match the current time. This bit is cleared upon RTEST# or a read of Register C. **Power Well:** RTC
4	0x0 RO	**Update-ended Flag (UF):** Updated-ended flag will be high immediately following an update cycle for each second. The bit is cleared upon RSMRST# or a read of Register C. **Power Well:** RTC
3:0	0x0 RO	**Reserved (RSVD):** Will always report 0 **Power Well:** RTC

62.3.14 Register D - Flag Register (Register_D)—Index Dh

RTC Index: 0Dh Attribute: Read/Write Default Value: 10UUUUUU Size: 8-bit Lockable: No Power Well: RTC

Type: RTC Standard Static RAM (Size: 8 bits)

Index: Dh

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7	0x1 RW	**Valid RAM and Time Bit (VRT):** This bit is hard-wired to 1 in the RTC power well. This bit should always be written as a 0 for write cycle, however it will return a 1 for read cycles. **Power Well:** RTC
6	0x0 RW	**Reserved (RSVD):** This bit always returns a 0 and should be set to 0 for write cycles. **Power Well:** RTC
5:0	0x0 RW	**Date Alarm (Date_Alarm):** These bits store the date of month alarm value. If set to 000000, then a dont care state is assumed. The host must configure the dates alarm for these bits to do anything, yet they can be written at any time. If the date alarm is not enabled, these bits will return zeros to mimic the functionality of the Motorola 146818B. These bits are not affected by any reset assertion. **Power Well:** RTC

62.3.15 User RAM—Index Eh through 7Fh

Access to 114 bytes of user Static RAM located in the RTC Power Well of the SoC.

Type: RTC Standard Static RAM (Size: 8 bits)

Index: Dh through 7Fh

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7:0	n/a RW	**User RAM Data:** **Power Well:** RTC

62.4 Registers in Host I/O Space—RTC Extended Static RAM Bank (Indexed Data)

62.4.1 User RAM—Index 0h through 7Fh

Access to 128 bytes of user Static RAM located in the RTC Power Well of the SoC.

Type: RTC Standard Static RAM (Size: 8 bits)

Index: 0h through 7Fh

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7:0	n/a RW	**User RAM Data:** **Power Well:** RTC

62.5 Sideband Registers

The Sideband registers accessible to the Host are described here. They are accessible in Host Memory Space starting at the Sideband Base Address Register (SBREG_BAR). See Section 3.4.1, "Using SBREG_BAR Method" on page 187.

62.5.1 RTC Configuration (RC)—Offset 3400h

All bits in this register are in the Primary Well and cleared by host_side_rst_b.

Type: Sideband Register (Size: 32 bits)

Sideband Port and Offset: [Port: 0xD1] + 3400h
Host Memory Space: SBREG_BAR + 0xD10000 + 3400h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/1L	**Bios Interface Lock-Down (BILD):** When set, prevents RTC version of TS (BUC.TS) from being changed. This bit can only be written from 0 to 1 once. This BILD bit has different function compared to the LPC and SPI version but BIOS should set all the corresponding bits after reset in order to lock down the BIOS interface correctly. **Power Well:** Core
30:7	0x0 RO	**Reserved (RSVD_1):** Reserved **Power Well:** Core
6	0x0 RW	**RTC High Power Mode HW Disable (HPM_HW_DIS):** When set to 1 the internal VRM that generates the rtc well supply voltage in SUS mode is disabled when SLP_S0# is asserted to '0'. (via irtcdswen pin to RTC EBB). When 0, HW control of the RTC internal VRM is disabled. **Power Well:** Core
5	0x0 RW	**RTC High Power Mode SW Disable (HPM_SW_DIS):** When set to 1 the internal VRM that generates the rtc well supply voltage in SUS mode is disabled (via irtcdswen pin to RTC EBB). When 0 the internal VRM powers the rtc well when RSMRST# is '1'. (default) **Power Well:** Core
4	0x0 RW/1L	**Upper 128 Byte Lock (UL):** When set, bytes 38h-3Fh in the upper 128 byte bank of RTC RAM are locked and cannot be accessed. Writes will be dropped and reads will not return any guaranteed data. Bit reset on system reset. **Power Well:** Core
3	0x0 RW/1L	**Lower 128 Byte Lock (LL):** When set, bytes 38h-3Fh in the lower 128 byte bank of RTC RAM are locked and cannot be accessed. Writes will be dropped and reads will not return any guaranteed data. Bit reset on system reset. **Power Well:** Core
2	0x0 RW	**Upper 128 Byte Enable (UE):** When set, the upper 128 byte bank of RTC RAM can be accessed. **Power Well:** Core
1:0	0x0 RO	**Reserved (RSVD_2):** Reserved **Power Well:** Core

62.5.2 Backed Up Control (BUC)—Offset 3414h

All bits in this register are in the RTC well and only cleared by RTEST.

Type: Sideband Register
(Size: 8 bits)

Sideband Port and Offset: [Port: 0xD1] + 3414h
Host Memory Space: SBREG_BAR + 0xD10000 + 3414h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RO	**Reserved (RSVD_1):** Reserved **Power Well:** RTC
6	0x0 RW	**Reserved (RSVD_2):** Reserved **Power Well:** RTC
5	0x0 RW	**LAN Disable (LanDisable):** • '0': LAN is Enabled '1': LAN is Disabled. It will not claim any configuration cycles on SPXB or MBB nor initiate any cycles on SPXB or MBB. When the RTC backup copy of the LAN Disable Fuse is set, this register is Read Only. • '1'. If the RTC backup copy of the LAN Disable Fuse is not set, this register is reset to 0 on RTEST#. If the Function Disable SUS Well Lockdown register is set, this bit can not be changed by software. **Power Well:** RTC
4	0x0 RW	**Daylight Savings Override (SDO):** • When this bit is a '1', the DSE bit in the RTC Register B bit(0) is a RW bit but has no effect where daylight savings is hard-disabled internally. • When this bit is a '0', the DSE bit in the RTC register B bit(0) is a RW bit that is configurable by software to enable the daylight savings. System BIOS shall configure this bit accordingly during the boot process before RTC time is initialized. **Power Well:** RTC
3	0x0 RW	**NetDetect Enable (NDE):** • If this bit is '1' and the South MLink Enable bit is '0' (ME PM RTCPMCFG.SMLEN), then the GPIO(14) input signal is muxed onto the South MLink MLCLK pin as a NetDetect Request signal to the wireless LAN component. • If the South MLink Enable bit is a '1', then the South MLink MLCLK pin is used as MLCLK, independent of the value of this register. • If both the South MLink Enable bit is '0' and this NetDetect Enable bit is '0', then the South MLink MLCLK pin is tri-stated. This register is in the RTC well instead of the SUS well to maintain state if the SUS well power is removed in S4. **Power Well:** RTC
2	0x0 RW	**Reserved (RSVD_3):** Reserved **Power Well:** RTC
1	0x0 RO	**Reserved (RSVD_4):** Reserved **Power Well:** RTC
0	0x0 RW	**Top Swap (TS):** This should be set by BIOS when the corresponding TS bit in the LPC controller is set in order to properly restore the state of that field after reset since they are not preserved in an RTC well bit in those devices. If SoC is strapped for Top-Swap (GNT(3)# is low at rising edge of PWROK), then this bit cannot be cleared by software. The strap jumper should be removed and the system rebooted. **Power Well:** RTC

62.5.3 RTC Update In Progress SMI Control (UIPSMI)—Offset 3F04h

This register exists in the RTC power well.

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xD1] + 3F04h
Host Memory Space: SBREG_BAR + 0xD10000 + 3F04h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0x0 RO	**Reserved (RSVD_1):** Reserved **Power Well:** Core
17	0x0 RW/1C	**RTC UIP Low-to-High (UIP_L2H):** This sticky status bit is set whenever the RTC Update-In-Progress signal transitions from low to high (i.e., at the start of an update). **Power Well:** Core
16	0x0 RW/1C	**RTC UIP High-to-Low (UIP_H2L):** This sticky status bit is set whenever the RTC Update-In-Progress signal transitions from high to low (i.e., at the start of an update). **Power Well:** Core
15:2	0x0 RO	**Reserved (RSVD_2):** Reserved **Power Well:** Core
1	0x0 RW	**RTC UIP Low-to-High SMI Enable (UIP_L2H_SMI_en):** When this bit is set, a '1' in bit 17 will assert the internal SMI signal to the Power Management SMI logic **Power Well:** Core
0	0x0 RW	**RTC UIP High-to-Low SMI Enable (UIP_H2L_SMI_en):** When this bit is set, a '1' in bit 16 will assert the internal SMI signal to the Power Management SMI logic **Power Well:** Core

62.5.4 RTC Dynamic Clock Gating Control (RTCDCG)—Offset 3418h

All bits in this register are in the Primary Well and cleared by host_side_rst_b.

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xD1] + 3418h
Host Memory Space: SBREG_BAR + 0xD10000 + 3418h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**Reserved (RSVD_2):** Reserved **Power Well:** RTC
7:3	0x0 RW	**Reserved (RSVD_1):** Reserved for future use **Power Well:** Core
2	0x0 RW	**pgcb_clk (12MHz) Dynamic Clock Gate Enable (RTCPGCBDCGEN):** • 0 - Disable dynamic clock gate on pgcb_clk (Default) • 1 - Enable dynamic clock gate on pgcb_clk **Power Well:** Core
1	0x0 RW	**ipciclk_clk (24MHz) Dynamic Clock Gate Enable (RTCPCICLKDCGEN):** • 0 - Disable dynamic clock gate on ipci_clk (Default) • 1 - Enable dynamic clock gate on ipci_clk **Power Well:** Core
0	0x0 RW	**rosc_side_clk (120MHz) Dynamic Clock Gate Enable (RTCROSIDEDCGEN):** • 0 - Disable dynamic clock gate on rosc_side_clk (Default) • 1 - Enable dynamic clock gate on rosc_side_clk **Power Well:** Core

§ §

63 High Precision Event Timer - Legacy

63.1 Introduction and Index

The host-accessible registers for the High Precision Event Timer are described here.

The legend for the register access codes are described in Chapter 43, "Introduction."

63.1.1 Host Memory Space—Fixed Address

An index of the registers that are accessible in Host Memory Space is shown here.

Table 63-1. Summary of Memory Mapped I/O Registers—0xFED00000

Offset (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
10	8	0000000000000000	"General Config Register (GEN_CFG)—Offset 10h" on page 2906
20	8	0000000000000000	"General Interrupt Status Register (GEN_INT_STS)—Offset 20h" on page 2907

63.2 Registers in Memory Space—Fixed Addresses

These registers are accessed in Host Memory Space through fixed memory addresses.

63.2.1 General Config Register (GEN_CFG)—Offset 10h

Software can read the various bytes in this register using 32-bit or 64-bit accesses. 32-bit accesses may only be done to offset 010h or 014h. 64-bit accesses may only be done to 010h.

Type: Memory Mapped I/O Register (Size: 64 bits)

Address: [0xFED00000] + 10h

Default: 0000000000000000h

Bit Range	Default & Access	Field Name (ID): Description
63:2	0x0 RO	**Reserved (RSV_63_2):** These bits will return 0 when read. Writes will have no effect. **Power Well:** Core
1	0x0 RW	**Legacy Rout (LEG_RT_CNF)** If the LEG_RT_CNF bit is set, then the interrupts will be routed as follows: • **Timer 0** will be routed to IRQ0 in 8259 or IRQ2 in the I/O APIC • **Timer 1** will be routed to IRQ8 in 8259 or IRQ8 in the I/O APIC • **Timer 2-7** will be routed as per the routing in that timer config register. If the LEG_RT_CNF bit is set, the individual routing bits for timers 0 and 1 (APIC or FSB) will have no impact. Otherwise, if the LEG_RT_CNF bit is not set, the individual routing bits for each of the timers are used. **Power Well:** Core
0	0x0 RW	**Overall Enable (ENABLE_CNF):** This bit must be set to enable any of the timers to generate interrupts. If this bit is 0, then the main counter will halt (will not increment) and no interrupts will be caused by any of these timers. This bit will default to 0. BIOS can set it to 1 or 0. **Power Well:** Core

63.2.2 General Interrupt Status Register (GEN_INT_STS)—Offset 20h

Software can read the various bytes in this register using 32-bit or 64-bit accesses. 32-bit accesses may only be done to offset 020h or 024h. 64-bit accesses may only be done to 020h.

Type: Memory Mapped I/O Register (Size: 64 bits)

Address: [0xFED00000] + 20h

Default: 0000000000000000h

Bit Range	Default & Access	Field Name (ID): Description
63:8	0x0 RO	**Reserved (RSV):** These bits will return 0 when read. Writes will have no effect. **Power Well:** Core
7	0x0 RW/1C	**Timer 7 Interrupt Active (T07_INT_STS)** Same functionality as Timer 0 Interrupt Active (T00_INT_STS). **Power Well:** Core
6	0x0 RW/1C	**Timer 6 Interrupt Active (T06_INT_STS)** Same functionality as Timer 0 Interrupt Active (T00_INT_STS). **Power Well:** Core
5	0x0 RW/1C	**Timer 5 Interrupt Active (T05_INT_STS)** Same functionality as Timer 0 Interrupt Active (T00_INT_STS). **Power Well:** Core
4	0x0 RW/1C	**Timer 4 Interrupt Active (T04_INT_STS)** Same functionality as Timer 0 Interrupt Active (T00_INT_STS). **Power Well:** Core
3	0x0 RW/1C	T**imer 3 Interrupt Active (T03_INT_STS)** Same functionality as Timer 0 Interrupt Active (T00_INT_STS). **Power Well:** Core
2	0x0 RW/1C	**Timer 2 Interrupt Active (T02_INT_STS)** Same functionality as Timer 0 Interrupt Active (T00_INT_STS). **Power Well:** Core
1	0x0 RW/1C	**Timer 1 Interrupt Active (T01_INT_STS)** Same functionality as Timer 0 Interrupt Active (T00_INT_STS). **Power Well:** Core
0	0x0 RW/1C	**Timer 0 Interrupt Active (T00_INT_STS)** The functionality of this bit depends on whether the edge or level-triggered mode is used for this timer: • If set to edge triggered mode: This bit will always read as 0 and writes will have no effect. • If set to level-triggered mode: This bit will be set by hardware if the corresponding timer interrupt is active. Once the bit is set, it can be cleared by software writing a 1 to the same bit position. Writes of 0 to this bit will have no effect. For example if the bit is already set, a write of 0 will not clear the bit. This bit defaults to 0. **Power Well:** Core

§ §

64 PIC and I/O APIC Controllers

64.1 Introduction and Index

The host-accessible registers for the PIC and I/O APIC Controller are described here.

The legend for the register access codes are described in Chapter 43, "Introduction."

64.1.1 Host Configuration Space

These registers are discovered in Host Configuration Space starting at Bus 0, Device 31 (decimal), Function 1. The offset addresses are listed.

Table 64-1. Summary of PCI Configuration Registers—0/31/1

Offset (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
64	2	0000	"IOxAPIC Configuration (IOAC)—Offset 64h" on page 2913

64.1.2 Host Memory Space—Fixed Address

An index of the registers that are accessible in Host Memory Space is shown here.

The IOxAPIC Interrupt Message table is located in Host Memory Space starting at address FEE0_0000h. Construction of the address for a table entry is shown in Table 64-2.

Table 64-2. IOxAPIC Interrupt Message Address

Address Bit	Short Description	Description
31:20	FEEh	Hardwired as FEEh
19:12	Destination ID	Destination ID of the local APIC - from DID field of the interrupt RTE
11:4	Extended Destination ID	Extended destination ID of the local APIC - from EDID field of the interrupt RTE
3	Redirection Hint	Redirection Hint - '1" If the DLM field = “Lowest Priority” (001) for the interrupt RTE. Otherwise '0'
2	Destination Mode	Used by the Local APIC to determine whether it is the destination of the Interrupt Message
1:0	00	Hardwired as 00 - Interrupt Message data is written as a Double Word (32 bits)

For the description of an IOxAPIC Interrupt Message, see Section 64.3.3, “IOxAPIC Interrupt Messages for Local APIC—FEE0_0000h” on page 2914.

Also located in Host Memory Space are the 32-bit IOxAPIC Index (IDX), Window (WDW), and End-of-Interrupt (EOI) registers. See Table 64-3, “Summary of Memory-Mapped Registers—Fixed Addresses” on page 2910.

For the information accessible through the IOxAPIC Index/Window mechanism, see Table 64-4, “Summary of IOxAPIC Index/Window-Accessed Registers” on page 2911.

Table 64-3. Summary of Memory-Mapped Registers—Fixed Addresses

Address (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
FECO_0000	4	00000000	“Index Register (IDX)—FEC0_0000h” on page 2914
FECO_0010	4	00000000	“Window Register (WDW)—FEC0_0010h” on page 2914

Table 64-4. Summary of IOxAPIC Index/Window-Accessed Registers

Index (IDX) Value (hex)	Double-Word Accesses	Default Value (hex)	Contents of Window (WDW) Register Name (Register Symbol)
1	1	00770020	"Version (VS)—Offset 1h" on page 2917
2 through F	1	00000000	Reserved
10, 11	2	0000000000010000	"Redirection Table Entry 0 (RTE0)—Offset 10h" on page 2918
12, 13	2	0000000000010000	"Redirection Table Entry 1 (RTE1)—Offset 12h" on page 2920
14, 15	2	0000000000010000	"Redirection Table Entry 2 (RTE2)—Offset 14h" on page 2922
through	...	...	...
FC, FD	2	0000000000010000	"Redirection Table Entry 118 (RTE118)—Offset FCh" on page 2924
FE, FF	2	0000000000010000	"Redirection Table Entry 119 (RTE119)—Offset FEh" on page 2926

64.1.3 Host I/O Space—Fixed Address

An index of the registers that are accessible in Host I/O Space is shown here.

Table 64-5. Summary of I/O Registers—Fixed Location

I/O Port Address (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
20	1	11	"Master Initialization Command Word 1 (MICW1)—I/O Port 20h" on page 2928
21	1	00	"Master Initialization Command Word 2 (MICW2)—I/O Port 21h" on page 2929
21	1	07	"Master Initialization Command Word 3 (MICW3)—I/O Port 21h" on page 2929
21	1	00	"Master Initialization Command Word 4 (MICW4)—I/O Port 21h" on page 2930
21	1	00	"Master Operational Control Word 1 (MOCW1)—I/O Port 21h" on page 2930
20	1	00	"Master Operational Control Word 2 (MOCW2)—I/O Port 20h" on page 2931
20	1	08	"Master Operational Control Word 3 (MOCW3)—I/O Port 20h" on page 2932
A0	1	11	"Slave Initialization Command Word 1 (SICW1)—I/O Port A0h" on page 2933
A1	1	00	"Slave Initialization Command Word 2 (SICW2)—I/O Port A1h" on page 2934
A1	1	07	"Slave Initialization Command Word 3 (SICW3)—I/O Port A1h" on page 2934
A1	1	00	"Slave Initialization Command Word 4 (SICW4)—I/O Port A1h" on page 2935
A1	1	00	"Slave Operational Control Word 1 (SOCW1)—I/O Port A1h" on page 2935
A0	1	00	"Slave Operational Control Word 2 (SOCW2)—I/O Port A0h" on page 2936
A0	1	08	"Slave Operational Control Word 3 (SOCW3)—I/O Port A0h" on page 2937
4D0	1	00	"Master Edge/Level Control (ELCR1)—I/O Port 4D0h" on page 2938
4D1	1	00	"Slave Edge/Level Control (ELCR2)—I/O Port 4D1h" on page 2938

64.2 Registers in Configuration Space

64.2.1 IOxAPIC Configuration (IOAC)—Offset 64h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:31, F:1] + 64h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:9	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
8	0x0 RW	**Address Enable (AE):** When set, the P2SB will decode the IOxAPIC Host Root memory-address range selected by bits 7:0 below. **Power Well:** Core
7:0	0x0 RW	**APIC Range Select (ASEL):** These eight bits define the eight address bits 19:12 for the IOxAPIC range. The default value of 00h enables compatibility with prior Intel products as an initial value. This value must not be changed by software unless the IOxAPIC Address Enable (AE) bit is cleared. **Power Well:** Core

64.3 Registers in Memory Space—Fixed Addresses

These registers are accessed in Host Memory Space through fixed memory addresses.

64.3.1 Index Register (IDX)—FEC0_0000h

This 8-bit register selects which indirect register appears in the window register to be manipulated by software. Software will program this register to select the desired APIC internal register.

Type: Memory-Mapped I/O Register (Size: 32 bits)

Address: FEC0_0000h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
7:0	0x0 RW	**Index Register (IDX):** Index Register for APIC **Power Well:** Core

64.3.2 Window Register (WDW)—FEC0_0010h

This 32-bit register specifies the data to be read or written to the register pointed to by the IDX register. This register can be accessed only in DWord quantities.

Type: Memory-Mapped I/O Register (Size: 32 bits)

Address: FEC0_0010h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/V	**Window Register (WDW):** Window Register for APIC **Power Well:** Core

64.3.3 IOxAPIC Interrupt Messages for Local APIC—FEE0_0000h

The 32-bit IOxAPIC Interrupt Messages sent to the Local APICs are written in Host Memory Space starting at address FEE0_0000h through address FEEF_FFFCh. Each message has the following data format.

Type: Memory-Mapped I/O Register (Size: 32 bits)

Address: FEE0_0000h through FEEF_FFCh

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**Reserved:** Reserved. Hardwired as 0.
15	0x0 RO	**Trigger Mode:** From the TM field of the Redirection Table Entry (RTE). • '0' indicates the interrupt is edge sensitive. • '1' indicates the interrupt is level sensitive.

Bit Range	Default & Access	Field Name (ID): Description
14	0x0 RO	**Delivery Status:** Is always '1' indicating an "Assert Message" cycle.
13:12	0x0 RO	**Reserved:** Reserved. Hardwired as 0.
11	0x0 RO	**Destination Mode:** From the DSM field of the RTE. Used by the Local APIC to determine whether it is the destination of the message.
10:8	0x0 RO	**Delivery Mode:** From the DLM field of the RTE. Establishes how the APICs listed in the destination field should act upon reception of this signal. Certain Delivery Modes will only operate as intended when used in conjunction with a specific trigger mode.
7:0	0x0 RO	**Vector:** From the VCT field of the RTE. Defines the Interrupt Vector for this interrupt. Values range between 10h and FEh.

64.4 Registers Accessed through IOxAPIC IDX and WDW

These registers are accessed through the IOxAPIC Index/Window mechanism. For each Index (IDX) value, one double-word is accessible in the Window (WDW) register.

64.4.1 Version (VS)—Offset 1h

Type: IOxAPIC IDX/WDW (Size: 32 bits)

IDX: 1h

Default: 00770020h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**Reserved (RSVD):** Reserved **Power Well:** Core
23:16	0x77 RW/O	**Maximum Redirection Entries (MRE):** This is the entry number (0 being the lowest entry) of the highest entry in the redirection table. The default value is 77h to indicate a maximum of 120 (decimal) Redirection Table Entries. This field is Read-Write-Once. BIOS must write to this field after PLTRST# to lockdown the value. This allows BIOS to utilize some of the entries for its own purpose and thus advertising fewer IOxAPIC Redirection Table Entries to the Operating System. BIOS may to program this field up to 77h (maximum 120 entries). **Power Well:** Core
15	0x0 RO	**Pin Assertion Register Supported (PRQ):** The default value indicates that the IOxAPIC does not implement the Pin Assertion Register. **Power Well:** Core
14:8	0x0 RO	**Reserved (RSVD_1):** Reserved **Power Well:** Core
7:0	0x20 RO	**Version (VS):** Identifies the implementation version as IOxAPIC. **Power Well:** Core

64.4.2 Redirection Table Entry 0 (RTE0)—Offset 10h

Type: IOxAPIC IDX/WDW (Size: 64 bits)

IDX: 10h, 11h

Default: 0000000000010000h

Bit Range	Default & Access	Field Name (ID): Description
63:56	0x0 RW	**Destination ID (DID):** Destination ID of the local APIC **Power Well:** Core
55:48	0x0 RW	**Extended Destination ID (EDID):** Extended destination ID of the local APIC. **Power Well:** Core
47:17	0x0 RO	**Reserved (RSVD):** Reserved **Power Well:** Core
16	0x1 RW	**Mask (MSK):** When set, interrupts are not delivered nor held pending. When cleared, and edge or level on this interrupt results in the delivery of the interrupt. **Power Well:** Core
15	0x0 RW	**Trigger Mode (TM):** When cleared, the interrupt is edge sensitive. When set, the interrupt is level sensitive. **Power Well:** Core
14	0x0 RO/V	**Remote IRR (RIRR):** This is used for level triggered interrupts - its meaning is undefined for edge triggered interrupts. This bit is set when IOxAPIC sends the level interrupt message to the CPU. This bit is cleared when an EOI message is received that matches the VCT field. This bit is never set for SMI, NMI, INIT, or ExtINT delivery modes. **Power Well:** Core
13	0x0 RW	**Polarity (POL):** This specifies the polarity of each interrupt input. When cleared, the signal is active high. When set, the signal is active low. **Power Well:** Core
12	0x0 RO/V	**Delivery Status (DS):** This field contains the current status of the delivery of this interrupt. When set, an interrupt is pending and not yet delivered. When cleared, there is no activity for this entry **Power Well:** Core
11	0x0 RW	**Destination Mode (DSM):** This field is used by the local APIC to determine whether it is the destination of the message. **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
10:8	0x0 RW	**Delivery Mode (DLM):** This field specifies how the APICs listed in the destination field should act upon reception of this signal. Certain Delivery Modes will only operate as intended when used in conjunction with a specific trigger mode. These encodings are: • 000 - Fixed • 001 - Lowest Priority • 010 - SMI (Not supported) • 011 - Reserved • 100 - NMI (Not supported) • 101 - INIT (Not supported) • 110 - Reserved • 111 - ExtINT **Power Well:** Core
7:0	0x0 RW	**Vector (VCT):** This field contains the interrupt vector for this interrupt. Values range between 10h and FEh. **Power Well:** Core

64.4.3 Redirection Table Entry 1 (RTE1)—Offset 12h

Type: IOxAPIC IDX/WDW (Size: 64 bits)

IDX: 12h, 13h

Default: 0000000000010000h

Bit Range	Default & Access	Field Name (ID): Description
63:56	0x0 RW	**Destination ID (DID):** Destination ID of the local APIC **Power Well:** Core
55:48	0x0 RW	**Extended Destination ID (EDID):** Extended destination ID of the local APIC. **Power Well:** Core
47:17	0x0 RO	**Reserved (RSVD):** Reserved **Power Well:** Core
16	0x1 RW	**Mask (MSK):** When set, interrupts are not delivered nor held pending. When cleared, and edge or level on this interrupt results in the delivery of the interrupt. **Power Well:** Core
15	0x0 RW	**Trigger Mode (TM):** When cleared, the interrupt is edge sensitive. When set, the interrupt is level sensitive. **Power Well:** Core
14	0x0 RO/V	**Remote IRR (RIRR):** This is used for level triggered interrupts - its meaning is undefined for edge triggered interrupts. This bit is set when IOxAPIC sends the level interrupt message to the CPU. This bit is cleared when an EOI message is received that matches the VCT field. This bit is never set for SMI, NMI, INIT, or ExtINT delivery modes. **Power Well:** Core
13	0x0 RW	**Polarity (POL):** This specifies the polarity of each interrupt input. When cleared, the signal is active high. When set, the signal is active low. **Power Well:** Core
12	0x0 RO/V	**Delivery Status (DS):** This field contains the current status of the delivery of this interrupt. When set, an interrupt is pending and not yet delivered. When cleared, there is no activity for this entry **Power Well:** Core
11	0x0 RW	**Destination Mode (DSM):** This field is used by the local APIC to determine whether it is the destination of the message. **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
10:8	0x0 RW	**Delivery Mode (DLM):** This field specifies how the APICs listed in the destination field should act upon reception of this signal. Certain Delivery Modes will only operate as intended when used in conjunction with a specific trigger mode. These encodings are: • 000 - Fixed • 001 - Lowest Priority • 010 - SMI (Not supported) • 011 - Reserved • 100 - NMI (Not supported) • 101 - INIT (Not supported) • 110 - Reserved • 111 - ExtINT **Power Well:** Core
7:0	0x0 RW	**Vector (VCT):** This field contains the interrupt vector for this interrupt. Values range between 10h and FEh. **Power Well:** Core

64.4.4 Redirection Table Entry 2 (RTE2)—Offset 14h

Type: IOxAPIC IDX/WDW (Size: 64 bits)

IDX: 14h, 15h

Default: 0000000000010000h

Bit Range	Default & Access	Field Name (ID): Description
63:56	0x0 RW	**Destination ID (DID):** Destination ID of the local APIC **Power Well:** Core
55:48	0x0 RW	**Extended Destination ID (EDID):** Extended destination ID of the local APIC. **Power Well:** Core
47:17	0x0 RO	**Reserved (RSVD):** Reserved **Power Well:** Core
16	0x1 RW	**Mask (MSK):** When set, interrupts are not delivered nor held pending. When cleared, and edge or level on this interrupt results in the delivery of the interrupt. **Power Well:** Core
15	0x0 RW	**Trigger Mode (TM):** When cleared, the interrupt is edge sensitive. When set, the interrupt is level sensitive. **Power Well:** Core
14	0x0 RO/V	**Remote IRR (RIRR):** This is used for level triggered interrupts - its meaning is undefined for edge triggered interrupts. This bit is set when IOxAPIC sends the level interrupt message to the CPU. This bit is cleared when an EOI message is received that matches the VCT field. This bit is never set for SMI, NMI, INIT, or ExtINT delivery modes. **Power Well:** Core
13	0x0 RW	**Polarity (POL):** This specifies the polarity of each interrupt input. When cleared, the signal is active high. When set, the signal is active low. **Power Well:** Core

64.5 Registers in I/O Space—Fixed Addresses

These registers are accessed in Host I/O Space through fixed I/O Port addresses.

64.5.1 Master Initialization Command Word 1 (MICW1)—I/O Port 20h

A write to Initialization Command Word 1 (ICW1) starts the interrupt controller initialization sequence, during which the following occurs:

1. The Interrupt Mask register is cleared.
2. IRQ7 input is assigned priority 7.
3. The slave mode address is set to 7.
4. Special Mask Mode is cleared and Status Read is set to IRR.

Once this write occurs, the controller expects writes to ICW2, ICW3, and ICW4 to complete the initialization sequence.

Type: I/O Register (Size: 8 bits)

I/O Port Address: 20h

Default: 11h

Bit Range	Default & Access	Field Name (ID): Description
7:5	0x0 WO	**ICW/OCW select (ICW_OCW_SLT1):** These bits are MCS-85 specific, and not needed. Should be programmed to 000 **Power Well:** Core
4	0x1 WO	**ICW/OCW select (ICW_OCW_SLT2):** This bit must be a 1 to select ICW1 and enable the ICW2, ICW3, and ICW4 sequence. **Power Well:** Core
3	0x0 WO	**Edge/Level Bank Select (LTIM):** Disabled. Replaced by the edge/level triggered control registers (ELCR). **Power Well:** Core
2	0x0 WO	**ADI-IGNORED (ADI):** Ignored by the SoC. Should be programmed to 0. **Power Well:** Core
1	0x0 WO	**Single or Cascade (SNGL):** Must be programmed to a 0 to indicate two controllers operating in cascade mode. **Power Well:** Core
0	0x1 WO	**ICW4 Write Required (IC4):** This bit must be programmed to a 1 to indicate that ICW4 needs to be programmed. **Power Well:** Core

64.5.2 Master Initialization Command Word 2 (MICW2)—I/O Port 21h

ICW2 is used to initialize the interrupt controller with the five most significant bits of the interrupt vector address. The value programmed for bits[7:3] is used by the CPU to define the base address in the interrupt vector table for the interrupt routines associated with each IRQ on the controller. Typical ISA ICW2 values are 08h for the master controller and 70h for the slave controller.

Type: I/O Register
(Size: 8 bits)

I/O Port Address: 21h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0x0 WO	**Interrupt Vector Base Address (IVBA):** Bits [7:3] define the base address in the interrupt vector table for the interrupt routines associated with each interrupt request level input. **Power Well:** Core
2:0	0x0 WO	**Interrupt Request Level (IRL):** When writing ICW2, these bits should all be 0. During an interrupt acknowledge cycle, these bits are programmed by the interrupt controller with the interrupt to be serviced. This is combined with bits [7:3] to form the interrupt vector driven onto the data bus during the second INTA# cycle. The code is a three bit binary code: Code Master Interrupt Slave Interrupt • 000 IRQ0 IRQ8 • 001 IRQ1 IRQ9 • 010 IRQ2 IRQ10 • 011 IRQ3 IRQ11 • 100 IRQ4 IRQ12 • 101 IRQ5 IRQ13 • 110 IRQ6 IRQ14 • 111 IRQ7 IRQ15 **Power Well:** Core

64.5.3 Master Initialization Command Word 3 (MICW3)—I/O Port 21h

Type: I/O Register
(Size: 8 bits)

I/O Port Address: 21h

Default: 07h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0x0 WO	**MICW3 [7:3] (MICW3_7_3):** These bits must be programmed to zero. **Power Well:** Core
2	0x1 WO	**Cascaded Controller Connection (CCC):** This bit must always be programmed to a 1 to indicate the slave controller for interrupts 8 - 15 is cascaded on IRQ2. **Power Well:** Core
1:0	0x3 WO	**MICW [1:0] (MICW3_1_0):** These bits must be programmed to zero. **Power Well:** Core

64.5.4 Master Initialization Command Word 4 (MICW4)—I/O Port 21h

Type: I/O Register
(Size: 8 bits)

I/O Port Address: 21h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:5	0x0 WO	**Reserved (RSVD):** Must be 0. **Power Well:** Core
4	0x0 WO	**Special Fully Nested Mode (SFNM):** Should normally be disabled by writing a 0 to this bit. If SFNM=1, the special fully nested mode is programmed. **Power Well:** Core
3	0x0 WO	**Buffered Mode (BUF):** Must be cleared for non-buffered mode. Writing 1 will result in undefined behavior. **Power Well:** Core
2	0x0 WO	**Master/Slave in Buffered Mode (MSBM):** Not used. Should always be programmed to 0. **Power Well:** Core
1	0x0 WO	**Automatic End of Interrupt (AEOI):** This bit should normally be programmed to 0. This is the normal end of interrupt. If this bit is 1, the automatic end of interrupt mode is programmed. AEOI is discussed in Section 13.1.7.2 **Power Well:** Core
0	0x0 WO	**Microprocessor Mode (MM):** This bit must be written to 1 to indicate that the controller is operating in an Intel Architecture-based system. Writing 0 will result in undefined behavior.1 **Power Well:** Core

64.5.5 Master Operational Control Word 1 (MOCW1)—I/O Port 21h

Type: I/O Register
(Size: 8 bits)

I/O Port Address: 21h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Interrupt Request Mask (IRM):** When a 1 is written to any bit in this register, the corresponding IRQ line is masked. When a 0 is written to any bit in this register, the corresponding IRQ mask bit is cleared, and interrupt requests will again be accepted by the controller. Masking IRQ2 on the master controller will also mask the interrupt requests from the slave controller. **Power Well:** Core

64.5.6 Master Operational Control Word 2 (MOCW2)—I/O Port 20h

Following a part reset or ICW initialization, the controller enters the fully nested mode of operation. Non-specific EOI without rotation is the default. Both rotation mode and specific EOI mode are disabled following initialization.

Type: I/O Register
(Size: 8 bits)

I/O Port Address: 20h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:5	0x0 WO	**Rotate and EOI Codes (REOI):** R, SL, EOI - These three bits control the Rotate and End of Interrupt modes and combinations of the two. A chart of these combinations is listed above under the bit definition. • 000 Rotate in Auto EOI Mode (Clear) • 001 Non-specific EOI command • 010 No Operation • 011 *Specific EOI Command • 100 Rotate in Auto EOI Mode (Set) • 101 Rotate on Non-Specific EOI Command • 110 *Set Priority Command • 111 *Rotate on Specific EOI Command • *L0 - L2 Are Used **Power Well:** Core
4:3	0x0 WO	**OCW2 Select (O2S):** When selecting OCW2, bits 4:3 = 00 **Power Well:** Core
2:0	0x0 WO	**Interrupt Level Select (L2, L1, L0) (ILSLT):** L2, L1, and L0 determine the interrupt level acted upon when the SL bit is active. A simple binary code, outlined above, selects the channel for the command to act upon. When the SL bit is inactive, these bits do not have a defined function, programming L2, L1 and L0 to 0 is sufficient in this case. **Power Well:** Core

64.5.7 Master Operational Control Word 3 (MOCW3)—I/O Port 20h

Type: I/O Register
(Size: 8 bits)

I/O Port Address: 20h

Default: 08h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RO	**Reserved (RSVD):** Must be 0. **Power Well:** Core
6	0x0 WO	**Special Mask Mode (SMM):** If this bit is set, the Special Mask Mode can be used by an interrupt service routine to dynamically alter the system priority structure while the routine is executing, through selective enabling/ disabling of the other channel's mask bits. Bit 6, the ESMM bit, must be set for this bit to have any meaning. **Power Well:** Core
5	0x0 WO	**Enable Special Mask Mode (ESMM):** **Power Well:** Core
4:3	0x1 WO	**OCW3 Select (O3S):** When selecting OCW3, bits 4:3 = 01 **Power Well:** Core
2	0x0 WO	**Poll Mode Command (PMC):** When cleared, poll command is not issued. When set, the next I/O read to the interrupt controller is treated as an interrupt acknowledge cycle. An encoded byte is driven onto the data bus, representing the highest priority level requesting service. **Power Well:** Core
1:0	0x0 WO	**Register Read Command (RRC):** . To retain the current selection (read ISR or read IRR), always write a 0 to bit 1 when programming this register. The selected register can be read repeatedly without reprogramming OCW3. To select a new status register, OCW3 must be reprogrammed prior to attempting the read. Value Command • 00 No Action • 01 No Action • 10 Read IRQ Register • 11 Read IS Register **Power Well:** Core

64.5.8 Slave Initialization Command Word 1 (SICW1)—I/O Port A0h

A write to Initialization Command Word 1 starts the interrupt controller initialization sequence, during which the following occurs: 1. The Interrupt Mask register is cleared. 2. IRQ7 input is assigned priority 7. 3. The slave mode address is set to 7. 4. Special Mask Mode is cleared and Status Read is set to IRR. Once this write occurs, the controller expects writes to ICW2, ICW3, and ICW4 to complete the initialization sequence.

Type: I/O Register (Size: 8 bits)

I/O Port Address: A0h

Default: 11h

Bit Range	Default & Access	Field Name (ID): Description
7:5	0x0 WO	**ICW/OCW select (ICW_OCW_SLT1):** These bits are MCS-85 specific, and not needed. Should be programmed to 000 **Power Well:** Core
4	0x1 WO	**ICW/OCW select (ICW_OCW_SLT2):** This bit must be a 1 to select ICW1 and enable the ICW2, ICW3, and ICW4 sequence. **Power Well:** Core
3	0x0 WO	**Edge/Level Bank Select (LTIM):** Disabled. Replaced by the edge/level triggered control registers (ELCR). **Power Well:** Core
2	0x0 WO	**ADI-IGNORED (ADI):** Ignored by the SoC. Should be programmed to 0. **Power Well:** Core
1	0x0 WO	**Single or Cascade (SNGL):** Must be programmed to a 0 to indicate two controllers operating in cascade mode. **Power Well:** Core
0	0x1 WO	**ICW4 Write Required (IC4):** This bit must be programmed to a 1 to indicate that ICW4 needs to be programmed. **Power Well:** Core

64.5.9 Slave Initialization Command Word 2 (SICW2)—I/O Port A1h

ICW2 is used to initialize the interrupt controller with the five most significant bits of the interrupt vector address. The value programmed for bits[7:3] is used by the CPU to define the base address in the interrupt vector table for the interrupt routines associated with each IRQ on the controller. Typical ISA ICW2 values are 08h for the master controller and 70h for the slave controller.

Type: I/O Register
(Size: 8 bits)

I/O Port Address: A1h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0x0 WO	**Interrupt Vector Base Address (IVBA):** Bits [7:3] define the base address in the interrupt vector table for the interrupt routines associated with each interrupt request level input. **Power Well:** Core
2:0	0x0 WO	**Interrupt Request Level (IRL):** When writing ICW2, these bits should all be 0. During an interrupt acknowledge cycle, these bits are programmed by the interrupt controller with the interrupt to be serviced. This is combined with bits [7:3] to form the interrupt vector driven onto the data bus during the second INTA# cycle. The code is a three bit binary code: Code Master Interrupt Slave Interrupt • 000 IRQ0 IRQ8 • 001 IRQ1 IRQ9 • 010 IRQ2 IRQ10 • 011 IRQ3 IRQ11 • 100 IRQ4 IRQ12 • 101 IRQ5 IRQ13 • 110 IRQ6 IRQ14 • 111 IRQ7 IRQ15 **Power Well:** Core

64.5.10 Slave Initialization Command Word 3 (SICW3)—I/O Port A1h

Type: I/O Register
(Size: 8 bits)

I/O Port Address: A1h

Default: 07h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0x0 WO	**Reserved (RSVD):** Must be 0. **Power Well:** Core
2:0	0x7 WO	**Slave Identification Code (SIC):** This field must be programmed to 02h to match the code broadcast by the master controller during the INTA# sequence. **Power Well:** Core

64.5.11 Slave Initialization Command Word 4 (SICW4)—I/O Port A1h

Type: I/O Register
(Size: 8 bits)

I/O Port Address: A1h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:5	0x0 WO	**Reserved (RSVD):** Must be 0. **Power Well:** Core
4	0x0 WO	**Special Fully Nested Mode (SFNM):** Should normally be disabled by writing a 0 to this bit. If SFNM=1, the special fully nested mode is programmed. **Power Well:** Core
3	0x0 WO	**Buffered Mode (BUF):** Must be cleared for non-buffered mode. Writing 1 will result in undefined behavior. **Power Well:** Core
2	0x0 WO	**Master/Slave in Buffered Mode (MSBM):** Not used. Should always be programmed to 0. **Power Well:** Core
1	0x0 WO	**Automatic End of Interrupt (AEOI):** This bit should normally be programmed to 0. This is the normal end of interrupt. If this bit is 1, the automatic end of interrupt mode is programmed. AEOI is discussed in Section 13.1.7.2 **Power Well:** Core
0	0x0 WO	**Microprocessor Mode (MM):** This bit must be written to 1 to indicate that the controller is operating in an Intel Architecture-based system. Writing 0 will result in undefined behavior.1 **Power Well:** Core

64.5.12 Slave Operational Control Word 1 (SOCW1)—I/O Port A1h

Type: I/O Register
(Size: 8 bits)

I/O Port Address: A1h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Interrupt Request Mask (IRM):** When a 1 is written to any bit in this register, the corresponding IRQ line is masked. When a 0 is written to any bit in this register, the corresponding IRQ mask bit is cleared, and interrupt requests will again be accepted by the controller. Masking IRQ2 on the master controller will also mask the interrupt requests from the slave controller. **Power Well:** Core

64.5.13 Slave Operational Control Word 2 (SOCW2)—I/O Port A0h

Following a part reset or ICW initialization, the controller enters the fully nested mode of operation. Non-specific EOI without rotation is the default. Both rotation mode and specific EOI mode are disabled following initialization.

Type: I/O Register
(Size: 8 bits)

I/O Port Address: A0h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:5	0x0 WO	**Rotate and EOI Codes (REOI):** R, SL, EOI - These three bits control the Rotate and End of Interrupt modes and combinations of the two. A chart of these combinations is listed above under the bit definition. • 000 Rotate in Auto EOI Mode (Clear) • 001 Non-specific EOI command • 010 No Operation • 011 *Specific EOI Command • 100 Rotate in Auto EOI Mode (Set) • 101 Rotate on Non-Specific EOI Command • 110 *Set Priority Command • 111 *Rotate on Specific EOI Command *L0 - L2 Are Used **Power Well:** Core
4:3	0x0 WO	**OCW2 Select (O2S):** When selecting OCW2, bits 4:3 = 00 **Power Well:** Core
2:0	0x0 WO	**Interrupt Level Select (L2, L1, L0) (ILSLT):** L2, L1, and L0 determine the interrupt level acted upon when the SL bit is active. A simple binary code, outlined above, selects the channel for the command to act upon. When the SL bit is inactive, these bits do not have a defined function, programming L2, L1 and L0 to 0 is sufficient in this case. **Power Well:** Core

64.5.14 Slave Operational Control Word 3 (SOCW3)—I/O Port A0h

Type: I/O Register
(Size: 8 bits)

I/O Port Address: A0h

Default: 08h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RO	**Reserved (RSVD):** Must be 0. **Power Well:** Core
6	0x0 WO	**Special Mask Mode (SMM):** If this bit is set, the Special Mask Mode can be used by an interrupt service routine to dynamically alter the system priority structure while the routine is executing, through selective enabling/ disabling of the other channel's mask bits. Bit 6, the ESMM bit, must be set for this bit to have any meaning. **Power Well:** Core
5	0x0 WO	**Enable Special Mask Mode (ESMM):** **Power Well:** Core
4:3	0x1 WO	**OCW3 Select (O3S):** When selecting OCW3, bits 4:3 = 01 **Power Well:** Core
2	0x0 WO	**Poll Mode Command (PMC):** When cleared, poll command is not issued. When set, the next I/O read to the interrupt controller is treated as an interrupt acknowledge cycle. An encoded byte is driven onto the data bus, representing the highest priority level requesting service. **Power Well:** Core
1:0	0x0 WO	**Register Read Command (RRC):** To retain the current selection (read ISR or read IRR), always write a 0 to bit 1 when programming this register. Value Command • 00 No Action • 01 No Action • 10 Read IRQ Register • 11 Read IS Register **Power Well:** Core

64.5.15 Master Edge/Level Control (ELCR1)—I/O Port 4D0h

Master Edge/Level Control Register

Type: I/O Register
(Size: 8 bits)

I/O Port Address: 4D0h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0x0 RW	**Edge Level Control (ELC_7_3):** In edge mode, (bit cleared), the interrupt is recognized by a low to high transition. In level mode (bit set), the interrupt is recognized by a high level. **Power Well:** Core
2:0	0x0 RO	**Reserved (RSVD):** The cascade channel(IRQ2), heart beat timer (IRQ0), and keyboard controller (IRQ1), cannot be put into level mode **Power Well:** Core

64.5.16 Slave Edge/Level Control (ELCR2)—I/O Port 4D1h

Slave Edge/Level Control Register

Type: I/O Register
(Size: 8 bits)

I/O Port Address: 4D1h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0x0 RW	**Edge Level Control (ELC_15_14):** In edge mode, (bit cleared), the interrupt is recognized by a low to high transition. In level mode (bit set), the interrupt is recognized by a high level. Bit 7 applies to IRQ15, and bit 6 to IRQ14. **Power Well:** Core
5	0x0 RW	**Edge Level Control (ELC_13):** In edge mode, (bit cleared), the interrupt is recognized by a low to high transition. In level mode (bit set), the interrupt is recognized by a high level. This bit applies to IRQ13. **Power Well:** Core
4:1	0x0 RW	**Edge Level Control (ELC_12_9):** In edge mode, (bit cleared), the interrupt is recognized by a low to high transition. In level mode (bit set), the interrupt is recognized by a high level. Bit 4 applies to IRQ12, bit 3 to IRQ11, bit 2 to IRQ10, and bit 1 to IRQ9. **Power Well:** Core
0	0x0 RO	**Reserved (RSVD):** The Real Time Clock (IRQ8#) cannot be programmed for level mode. **Power Well:** Core

§ §

65 Customer General-Purpose I/O Controller

65.1 Introduction and Index

The host-accessible registers for the Customer General-Purpose I/O Controller are described here. Also, the registers that allow the selection of one of a number of shared, signal functions are also described here.

Besides the Host, the customer general-purpose I/O controller are also accessible through Intel® ME Configuration Space and IE configuration Space using their own Bus, Device and Function Numbers.

The legend for the register access codes are described in Chapter 43, "Introduction."

Note: The following statement needs to be noted when referring to register Table 65-1 and Table 65-2:

The internal pull-up resistor option is not supported for 1.8V GPIOs.
The internal pull-down resistor option is not supported for 3.3V GPIOs.

65.1.1 Sideband Registers—Configurable I/O Signals

An index of the Sideband Registers that are accessible to the Host are listed here. Each is accessible in Host Memory Space using the Sideband Base Address Register (SBREG_BAR). See Section 3.4.1, "Using SBREG_BAR Method."

Table 65-1. Summary of Sideband Registers, Part 1 of 2—Sideband Port 0xC2 (Sheet 1 of 4)

Offset (hex)	Default Value (hex)	Register Name (Register Symbol)
C	00000400	"Pad Base Address (PADBAR)—Offset Ch" on page 2953
10	00021000	"Miscellaneous Configuration (MISCCFG)—Offset 10h" on page 2954
20	00000000	"Pad Ownership (PAD_OWN_NORTH_ALL_0)—Offset 20h" on page 2955
24	00000000	"Pad Ownership (PAD_OWN_NORTH_ALL_1)—Offset 24h" on page 2957
28	00000000	"Pad Ownership (PAD_OWN_NORTH_ALL_2)—Offset 28h" on page 2959
2C	00000000	"Pad Ownership (PAD_OWN_NORTH_ALL_3)—Offset 2Ch" on page 2961
30	00000000	"Pad Ownership (PAD_OWN_NORTH_ALL_4)—Offset 30h" on page 2963
34	00000000	"Pad Ownership (PAD_OWN_NORTH_ALL_5)—Offset 34h" on page 2965

65.2 Sideband Registers, Part 1 of 2—Sideband Port 0xC2

65.2.1 Pad Base Address (PADBAR)—Offset Ch

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC2] + Ch
Host Memory Space: SBREG_BAR + 0xC20000 + Ch

Default: 00000400h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**Reserved (RSVD_0):** Reserved.
15:0	0x400 RO	**Pad Base Address (PADBAR):** This field provides the starting byte-align address of Pad0 register sets within a Community. It is meant for software to discover from where the very first Pad register (i.e. Pad0 register) starts to compute the next Pad address offsets.

65.2.2 Miscellaneous Configuration (MISCCFG)—Offset 10h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC2] + 10h
Host Memory Space: SBREG_BAR + 0xC20000 + 10h

Default: 00021000h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**Reserved (Reserved1):** Reserved
19:16	0x2 RW	**GPIO Group to GPE_DW0 assignment encoding (GPE0_DW2):** This register assigns a specific GPIO Group to the ACPI GPE0[95:64]. The setting is SoC specific.
15:12	0x1 RW	**GPIO Group to GPE_DW0 assignment encoding (GPE0_DW1):** This register assigns a specific GPIO Group to the ACPI GPE0[63:32]. The setting is SoC specific.
11:8	0x0 RW	**GPIO Group to GPE_DW0 assignment encoding (GPE0_DW0):** GPIO Group to GPE_DW0 assignment encoding (GPE0_DW0[3:0]): This register assigns a specific GPIO Group to the ACPI GPE0[31:0]. The setting is SoC specific.
7:5	0x0 RW	**Reserved (Reserved2):** Reserved
4	0x0 RW	**NCSI Outbound Signal Staging Control (NCSI_STAGE_EN):** NCSI Signal Staging Control: This register controls the bypass/staging logic for the GBE NCSI output signals - when 1, the signals will be staged with NCSI_ARB_CLK; when 0, the flops will be bypassed.
3	0x0 RW	**GPIO Driver IRQ Route (GPIO_DRIVER_IRQ_ROUTE):** GPIO Driver IRQ_ROUTE[1:0]: Specifies the APIC IRQ globally for all pads within the current community (GPI_IS with corresponding GPI_IE enable). • 0 = IRQ14 • 1 = IRQ15
2	0x0 RW	**GSX Static Local Clock Gating (GSXSLCGEN):** GSX Static Local Clock Gating (GSXSLCGEn) Specify whether the GSX controller should be statically clock gated for power saving if it is not enabled (even though the capability is available). • 0 = Disable dynamic local clock gating • 1 = Enable dynamic local clock gating
1	0x0 RW	**GPIO Dynamic Partition Clock Gating Enable (GPDPCGEN):** GPIO Dynamic Partition Clock Gating Enable (GPDPCGEn) Specify whether the GPIO Community should take part in partition clock gating • 0 = Disable participation in dynamic partition clock gating • 1 = Enable participation in dynamic partition clock gating
0	0x0 RW	**GPIO Dynamic Local Clock Gating Enable (GPDLCGEN):** GPIO Dynamic Local Clock Gating Enable (GPDLCGEn) Specify whether the GPIO Community should perform local clock gating • 0 = Disable dynamic local clock gating • 1 = Enable dynamic local clock gating

65.2.3 Pad Ownership (PAD_OWN_NORTH_ALL_0)—Offset 20h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC2] + 20h
Host Memory Space: SBREG_BAR + 0xC20000 + 20h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RO	**Reserved (RSVD_0):** Reserved.
29:28	0x0 RW	**Pad Ownership (PAD_OWN_GBE1_SDP3):** This register can be written by the Intel® Management Engine (Intel® ME) GPIO Function only.** Write access without Intel® ME GPIO Function SAI shall be dropped. There is no SAI restriction on register read. Encoding: • 00 = Host GPIO ACPI Mode or GPIO Driver Mode. Host software (ACPI or GPIO Driver) has ownership of the pad. In Host GPIO Driver Mode (refer to HOSTSW_OWN), GPIO input event update is limited to GPI_INT_STS update only. Otherwise in Host ACPI Mode, updates are limited to GPI_GPE_STS, GPI_NMI_STS and/or GPI_SMI_STS. No read/write restriction to the Pad Configuration register set during host ownership. During host ownership, Intel® ME, IE and ISH do not own this pad and are not notified of the GPIO input event. • 01 = Intel® ME GPIO Mode. The Intel® ME has ownership of the pad. All accesses to Pad Configuration register set must be verified with Intel® ME GPIO Function SAI **. Non-posted cycle access without Intel® ME SAI shall result in Unsuccessful Completion status. Posted cycle access without Intel® ME SAI shall be dropped. In Intel® ME GPIO Mode, the host related status registers related to the pad (refer to host ownership above) are masked from being updated by GPIO input event. If IOSF-SB Virtual Wire message generation is enabled for this pad, GPIO hardware sends the Virtual Wire message to Intel® ME GPIO Function. Only the Intel® ME GPIO Function is notified of the GPIO input event. • 10 = ISH GPIO Mode. Same description as Intel® ME GPIO Mode above except verifying ISH GPIO Function SAI for pad related register accesses and the Virtual Wire message is delivered to the ISH GPIO Function. • 11 = IE GPIO Mode. Same description as Intel® ME GPIO Mode above except verifying IE GPIO Function SAI for pad related register accesses and the Virtual Wire message is delivered to the IE GPIO Function. **During DFx mode, Secure DFx can write to the PAD_OWN.
27:26	0x0 RO	**Reserved (RSVD_1):** Reserved.
25:24	0x0 RW	**Pad Ownership (PAD_OWN_GBE0_SDP3):** See Description for bits [29:28] of this register.
23:22	0x0 RO	**Reserved (RSVD_2):** Reserved.
21:20	0x0 RW	**Pad Ownership (PAD_OWN_GBE1_SDP2):** See Description for bits [29:28] of this register.
19:18	0x0 RO	**Reserved (RSVD_3):** Reserved.
17:16	0x0 RW	**Pad Ownership (PAD_OWN_GBE0_SDP2):** See Description for bits [29:28] of this register.
15:14	0x0 RO	**Reserved (RSVD_4):** Reserved.
13:12	0x0 RW	**Pad Ownership (PAD_OWN_GBE1_SDP1):** See Description for bits [29:28] of this register.
11:10	0x0 RO	**Reserved (RSVD_5):** Reserved.
9:8	0x0 RW	**Pad Ownership (PAD_OWN_GBE0_SDP1):** See Description for bits [29:28] of this register.
7:6	0x0 RO	**Reserved (RSVD_6):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
5:4	0x0 RW	**Pad Ownership (PAD_OWN_GBE1_SDP0):** See Description for bits [29:28] of this register.
3:2	0x0 RO	**Reserved (RSVD_7):** Reserved.
1:0	0x0 RW	**Pad Ownership (PAD_OWN_GBE0_SDP0):** See Description for bits [29:28] of this register.

65.2.4 Pad Ownership (PAD_OWN_NORTH_ALL_1)—Offset 24h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC2] + 24h
Host Memory Space: SBREG_BAR + 0xC20000 + 24h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RO	**Reserved (RSVD_0):** Reserved.
29:28	0x0 RW	**Pad Ownership (PAD_OWN_NCSI_CLK_IN):** This register can be written by the Intel® Management Engine (Intel® ME) GPIO Function only.** Write access without Intel® ME GPIO Function SAI shall be dropped. There is no SAI restriction on register read. Encoding: • 00 = Host GPIO ACPI Mode or GPIO Driver Mode. Host software (ACPI or GPIO Driver) has ownership of the pad. In Host GPIO Driver Mode (refer to HOSTSW_OWN), GPIO input event update is limited to GPI_INT_STS update only. Otherwise in Host ACPI Mode, updates are limited to GPI_GPE_STS, GPI_NMI_STS and/or GPI_SMI_STS. No read/write restriction to the Pad Configuration register set during host ownership. During host ownership, Intel® ME, IE and ISH do not own this pad and are not notified of the GPIO input event. • 01 = Intel® ME GPIO Mode. The Intel® ME has ownership of the pad. All accesses to Pad Configuration register set must be verified with Intel® ME GPIO Function SAI **. Non-posted cycle access without Intel® ME SAI shall result in Unsuccessful Completion status. Posted cycle access without Intel® ME SAI shall be dropped. In Intel® ME GPIO Mode, the host related status registers related to the pad (refer to host ownership above) are masked from being updated by GPIO input event. If IOSF-SB Virtual Wire message generation is enabled for this pad, GPIO hardware sends the Virtual Wire message to Intel® ME GPIO Function. Only the Intel® ME GPIO Function is notified of the GPIO input event. • 10 = ISH GPIO Mode. Same description as Intel® ME GPIO Mode above except verifying ISH GPIO Function SAI for pad related register accesses and the Virtual Wire message is delivered to the ISH GPIO Function. • 11 = IE GPIO Mode. Same description as Intel® ME GPIO Mode above except verifying IE GPIO Function SAI for pad related register accesses and the Virtual Wire message is delivered to the IE GPIO Function. **During DFx mode, Secure DFx can write to the PAD_OWN.
27:26	0x0 RO	**Reserved (RSVD_1):** Reserved.
25:24	0x0 RW	**Pad Ownership (PAD_OWN_NCSI_RXD0):** See Description for bits [29:28] of this register.
23:22	0x0 RO	**Reserved (RSVD_2):** Reserved.
21:20	0x0 RW	**Pad Ownership (PAD_OWN_GBE1_I2C_DATA):** See Description for bits [29:28] of this register.
19:18	0x0 RO	**Reserved (RSVD_3):** Reserved.
17:16	0x0 RW	**Pad Ownership (PAD_OWN_GBE1_I2C_CLK):** See Description for bits [29:28] of this register.
15:14	0x0 RO	**Reserved (RSVD_4):** Reserved.
13:12	0x0 RW	**Pad Ownership (PAD_OWN_GBE0_I2C_DATA):** See Description for bits [29:28] of this register.
11:10	0x0 RO	**Reserved (RSVD_5):** Reserved.
9:8	0x0 RW	**Pad Ownership (PAD_OWN_GBE0_I2C_CLK):** See Description for bits [29:28] of this register.
7:6	0x0 RO	**Reserved (RSVD_6):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
5:4	0x0 RW	**Pad Ownership (PAD_OWN_GBE2_LED1):** See Description for bits [29:28] of this register.
3:2	0x0 RO	**Reserved (RSVD_7):** Reserved.
1:0	0x0 RW	**Pad Ownership (PAD_OWN_GBE2_LED0):** See Description for bits [29:28] of this register.

65.2.5 Pad Ownership (PAD_OWN_NORTH_ALL_2)—Offset 28h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC2] + 28h
Host Memory Space: SBREG_BAR + 0xC20000 + 28h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RO	**Reserved (RSVD_0):** Reserved.
29:28	0x0 RW	**Pad Ownership (PAD_OWN_GBE0_LED0):** This register can be written by the Intel® Management Engine (Intel® ME) GPIO Function only.** Write access without Intel® ME GPIO Function SAI shall be dropped. There is no SAI restriction on register read. Encoding: • 00 = Host GPIO ACPI Mode or GPIO Driver Mode. Host software (ACPI or GPIO Driver) has ownership of the pad. In Host GPIO Driver Mode (refer to HOSTSW_OWN), GPIO input event update is limited to GPI_INT_STS update only. Otherwise in Host ACPI Mode, updates are limited to GPI_GPE_STS, GPI_NMI_STS and/or GPI_SMI_STS. No read/write restriction to the Pad Configuration register set during host ownership. During host ownership, Intel® ME, IE and ISH do not own this pad and are not notified of the GPIO input event. • 01 = Intel® ME GPIO Mode. The Intel® ME has ownership of the pad. All accesses to Pad Configuration register set must be verified with Intel® ME GPIO Function SAI **. Non-posted cycle access without Intel® ME SAI shall result in Unsuccessful Completion status. Posted cycle access without Intel® ME SAI shall be dropped. In Intel® ME GPIO Mode, the host related status registers related to the pad (refer to host ownership above) are masked from being updated by GPIO input event. If IOSF-SB Virtual Wire message generation is enabled for this pad, GPIO hardware sends the Virtual Wire message to Intel® ME GPIO Function. Only the Intel® ME GPIO Function is notified of the GPIO input event. • 10 = ISH GPIO Mode. Same description as Intel® ME GPIO Mode above except verifying ISH GPIO Function SAI for pad related register accesses and the Virtual Wire message is delivered to the ISH GPIO Function. • 11 = IE GPIO Mode. Same description as Intel® ME GPIO Mode above except verifying IE GPIO Function SAI for pad related register accesses and the Virtual Wire message is delivered to the IE GPIO Function. **During DFx mode, Secure DFx can write to the PAD_OWN.

31:9	0x0 RO	**Reserved (RSVD_0):** Reserved.
8	0x0 RW	**Pad Config Lock TXState (PADCFGLOCKTX_MEMHOT_N):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1= Lock the following register fields as read-only (RO): • Pad Configuration registers (exclude GPIOTXState) • GPI_NMI_EN Register (if implemented) • GPI_SMI_EN Register (if implemented) • GPI_GPE_EN Register (if implemented) • Bit assignment: • Bit0 = pad 0 • Bit1 = pad 1 • Bit2 = pad 2 • ... • Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown.
7	0x0 RW	**Pad Config Lock TXState (PADCFGLOCKTX_PROCHOT_N):** See Description for bit [8] of this register.

65.2.19 Reserved[0-5] (RSVD6[0-5])—Offset 128h, Count 6, Stride 4h

65.2.20 GPI General Purpose Events Status (GPI_GPE_STS_NORTH_ALL_0)—Offset 140h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC2] + 140h
Host Memory Space: SBREG_BAR + 0xC20000 + 140h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/1C	**GPI General Purpose Events Status (GPI_GPE_STS_PCIE_CLKREQ3_N):** These bits are set any time the corresponding GPIO pad is set up as an input, under host ownership and the corresponding GPIO signal is high (or low if the corresponding RXINV bit is set). If the corresponding enable bit is set in the GPI_GPE_EN register, then when the GPI_GPE_STS[i] bit is set: • If the system is in an S3-S5 state, the event will also wake the system. • If the system is in an S0 state (or upon waking back to an S0 state), an SCI will be caused, depending on the GPIRoutSCI bit for the corresponding pad. These bits are sticky bits and are cleared by writing a 1 back to this bit position. The state of GPI_GPE_EN[i] does not prevent the setting of GPI_GPE_STS[i]. Each bit position correspond to 1 pad in the Community: • Bit0 = Pad0 • Bit1 = Pad1 • Bit2 = Pad2 • ... Bit N-1= Pad N-1
30	0x0 RW/1C	**GPI General Purpose Events Status (GPI_GPE_STS_PCIE_CLKREQ2_N):** See Description for bit [31] of this register.

65.2.21 GPI General Purpose Events Status (GPI_GPE_STS_NORTH_ALL_1)—Offset 144h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC2] + 144h
Host Memory Space: SBREG_BAR + 0xC20000 + 144h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0x0 RO	**Reserved (RSVD_0):** Reserved.
8	0x0 RW/1C	**GPI General Purpose Events Status (GPI_GPE_STS_MEMHOT_N):** These bits are set any time the corresponding GPIO pad is set up as an input, under host ownership and the corresponding GPIO signal is high (or low if the corresponding RXINV bit is set). If the corresponding enable bit is set in the GPI_GPE_EN register, then when the GPI_GPE_STS[i] bit is set: • If the system is in an S3-S5 state, the event will also wake the system. • If the system is in an S0 state (or upon waking back to an S0 state), an SCI will be caused, depending on the GPIRoutSCI bit for the corresponding pad. These bits are sticky bits and are cleared by writing a 1 back to this bit position. The state of GPI_GPE_EN[i] does not prevent the setting of GPI_GPE_STS[i]. Each bit position correspond to 1 pad in the Community: • Bit0 = Pad0 • Bit1 = Pad1 • Bit2 = Pad2 • ... Bit N-1= Pad N-1

0	0x0 RO	**GPI NMI Enable (GPI_NMI_EN_PCIE_CLKREQ4_N):** See Description for bit [8] of this register.

65.2.32 Pad Configuration DW0 (PAD_CFG_DW0_GBE0_SDP0)—Offset 400h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC2] + 400h
Host Memory Space: SBREG_BAR + 0xC20000 + 400h

Default: 45000200h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x1 RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RO	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RO	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.2.33 Pad Configuration DW1 (PAD_CFG_DW1_GBE0_SDP0)—Offset 404h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC2] + 404h
Host Memory Space: SBREG_BAR + 0xC20000 + 404h

Default: 00000018h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0x0 RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x18 RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.2.34 Pad Configuration DW0 (PAD_CFG_DW0_GBE1_SDP0)—Offset 408h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC2] + 408h
Host Memory Space: SBREG_BAR + 0xC20000 + 408h

Default: 45000200h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x1 RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RO	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RO	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.2.35 Pad Configuration DW1 (PAD_CFG_DW1_GBE1_SDP0)—Offset 40Ch

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC2] + 40Ch
Host Memory Space: SBREG_BAR + 0xC20000 + 40Ch

Default: 00000019h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0x0 RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. 16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.2.39 Pad Configuration DW1 (PAD_CFG_DW1_GBE1_SDP1)—Offset 41Ch

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC2] + 41Ch
Host Memory Space: SBREG_BAR + 0xC20000 + 41Ch

Default: 0000001Bh

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0x0 RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x1b RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.2.40 Pad Configuration DW0 (PAD_CFG_DW0_GBE0_SDP2)—Offset 420h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC2] + 420h
Host Memory Space: SBREG_BAR + 0xC20000 + 420h

Default: 45000200h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x1 RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RO	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RO	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.2.45 Pad Configuration DW1 (PAD_CFG_DW1_GBE0_SDP3)—Offset 434h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC2] + 434h
Host Memory Space: SBREG_BAR + 0xC20000 + 434h

Default: 0000001Eh

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0x0 RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x1e RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.2.46 Pad Configuration DW0 (PAD_CFG_DW0_GBE1_SDP3)—Offset 438h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC2] + 438h
Host Memory Space: SBREG_BAR + 0xC20000 + 438h

Default: 45000200h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x1 RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RO	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RO	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.2.51 Pad Configuration DW1 (PAD_CFG_DW1_GBE2_LED1)—Offset 44Ch

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC2] + 44Ch
Host Memory Space: SBREG_BAR + 0xC20000 + 44Ch

Default: 00000021h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0x0 RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x21 RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.2.52 Pad Configuration DW0 (PAD_CFG_DW0_GBE0_I2C_CLK)—Offset 450h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC2] + 450h
Host Memory Space: SBREG_BAR + 0xC20000 + 450h

Default: 45000600h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x1 RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RO	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RO	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.2.53 Pad Configuration DW1 (PAD_CFG_DW1_GBE0_I2C_CLK)—Offset 454h

Type: Sideband Register
(Size: 32 bits)

16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.2.57 Pad Configuration DW1 (PAD_CFG_DW1_GBE1_I2C_CLK)—Offset 464h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC2] + 464h
Host Memory Space: SBREG_BAR + 0xC20000 + 464h

Default: 00002824h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0xa RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x24 RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.2.58 Pad Configuration DW0 (PAD_CFG_DW0_GBE1_I2C_DATA)—Offset 468h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC2] + 468h
Host Memory Space: SBREG_BAR + 0xC20000 + 468h

Default: 45000600h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x1 RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RO	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RO	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x1 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.2.63 Pad Configuration DW1 (PAD_CFG_DW1_NCSI_CLK_IN)—Offset 47Ch

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC2] + 47Ch
Host Memory Space: SBREG_BAR + 0xC20000 + 47Ch

Default: 00003027h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0xc RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x27 RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.2.64 Pad Configuration DW0 (PAD_CFG_DW0_NCSI_RXD1)—Offset 480h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC2] + 480h
Host Memory Space: SBREG_BAR + 0xC20000 + 480h

Default: 45000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x1 RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RO	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RO	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x1 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x1 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.2.69 Pad Configuration DW1 (PAD_CFG_DW1_NCSI_ARB_IN)—Offset 494h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC2] + 494h
Host Memory Space: SBREG_BAR + 0xC20000 + 494h

Default: 0000102Ah

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0x4 RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x2a RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.2.70 Pad Configuration DW0 (PAD_CFG_DW0_NCSI_TX_EN)—Offset 498h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC2] + 498h
Host Memory Space: SBREG_BAR + 0xC20000 + 498h

Default: 45000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x1 RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RO	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RO	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x1 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x1 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.2.75 Pad Configuration DW1 (PAD_CFG_DW1_NCSI_TXD1)—Offset 4ACh

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC2] + 4ACh
Host Memory Space: SBREG_BAR + 0xC20000 + 4ACh

Default: 0000002Dh

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0x0 RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x2d RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.2.76 Pad Configuration DW0 (PAD_CFG_DW0_NCSI_ARB_OUT)—Offset 4B0h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC2] + 4B0h
Host Memory Space: SBREG_BAR + 0xC20000 + 4B0h

Default: 45000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x1 RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RO	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RO	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x1 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.2.81 Pad Configuration DW1 (PAD_CFG_DW1_GBE0_LED1)—Offset 4C4h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC2] + 4C4h
Host Memory Space: SBREG_BAR + 0xC20000 + 4C4h

Default: 00000030h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0x0 RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x30 RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.2.82 Pad Configuration DW0 (PAD_CFG_DW0_GBE1_LED0)—Offset 4C8h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC2] + 4C8h
Host Memory Space: SBREG_BAR + 0xC20000 + 4C8h

Default: 45000600h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x1 RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RO	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RO	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.2.87 Pad Configuration DW1 (PAD_CFG_DW1_GPIO_0)—Offset 4DCh

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC2] + 4DCh
Host Memory Space: SBREG_BAR + 0xC20000 + 4DCh

Default: 00000033h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0x0 RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x33 RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.2.88 Pad Configuration DW0 (PAD_CFG_DW0_PCIE_CLKREQ0_N)—Offset 4E0h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC2] + 4E0h
Host Memory Space: SBREG_BAR + 0xC20000 + 4E0h

Default: 45000600h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x1 RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RO	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RO	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.2.93 Pad Configuration DW1 (PAD_CFG_DW1_PCIE_CLKREQ2_N)—Offset 4F4h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC2] + 4F4h
Host Memory Space: SBREG_BAR + 0xC20000 + 4F4h

Default: 00000036h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0x0 RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x36 RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.2.94 Pad Configuration DW0 (PAD_CFG_DW0_PCIE_CLKREQ3_N)—Offset 4F8h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC2] + 4F8h
Host Memory Space: SBREG_BAR + 0xC20000 + 4F8h

Default: 45000600h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x1 RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RO	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RO	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.2.99 Pad Configuration DW1 (PAD_CFG_DW1_GPIO_1)—Offset 50Ch

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC2] + 50Ch
Host Memory Space: SBREG_BAR + 0xC20000 + 50Ch

Default: 00000039h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0x0 RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x39 RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.2.100 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_2)—Offset 510h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC2] + 510h
Host Memory Space: SBREG_BAR + 0xC20000 + 510h

Default: 45000200h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x1 RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.2.101 Pad Configuration DW1 (PAD_CFG_DW1_GPIO_2)—Offset 514h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC2] + 514h

16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.2.105 Pad Configuration DW1 (PAD_CFG_DW1_SVID_DATA)—Offset 524h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC2] + 524h
Host Memory Space: SBREG_BAR + 0xC20000 + 524h

Default: 0000003Ch

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0x0 RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x3c RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.2.106 Pad Configuration DW0 (PAD_CFG_DW0_SVID_CLK)—Offset 528h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC2] + 528h
Host Memory Space: SBREG_BAR + 0xC20000 + 528h

Default: 44000600h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x0 RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RO	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RO	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.2.111 Pad Configuration DW1 (PAD_CFG_DW1_PROCHOT_N)—Offset 53Ch

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC2] + 53Ch
Host Memory Space: SBREG_BAR + 0xC20000 + 53Ch

Default: 0000303Fh

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0xc RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x3f RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.2.112 Pad Configuration DW0 (PAD_CFG_DW0_MEMHOT_N)—Offset 540h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC2] + 540h
Host Memory Space: SBREG_BAR + 0xC20000 + 540h

Default: 44000600h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x0 RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RO	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RO	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.2.113 Pad Configuration DW1 (PAD_CFG_DW1_MEMHOT_N)—Offset 544h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC2] + 544h
Host Memory Space: SBREG_BAR + 0xC20000 + 544h

Default: 00003040h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0xc RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x40 RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.3 Sideband Registers, Part 2 of 2—Sideband Port 0xC5

65.3.1 Pad Base Address (PADBAR)—Offset 0Ch

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + Ch
Host Memory Space: SBREG_BAR + 0xC50000 + 0Ch

Default: 00000400h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**Reserved (RSVD_0):** Reserved
15:0	0x400 RO	**Pad Base Address (PADBAR):** This field provides the starting byte-align address of Pad0 register sets within a Community. It is meant for software to discover from where the very first Pad register (i.e. Pad0 register) starts to compute the next Pad address offsets.

65.3.2 Miscellaneous Configuration (MISCCFG)—Offset 10h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 10h
Host Memory Space: SBREG_BAR + 0xC50000 + 10h

Default: 00021000h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**Reserved (RSVD_1):** Reserved
19:16	0x2 RW	**GPIO Group to GPE_DW0 assignment encoding (GPE0_DW2):** This register assigns a specific GPIO Group to the ACPI GPE0[95:64].
15:12	0x1 RW	**GPIO Group to GPE_DW0 assignment encoding (GPE0_DW1):** GPIO Group to GPE_DW0 assignment encoding (GPE0_DW1[3:0]) : This register assigns a specific GPIO Group to the ACPI GPE0[63:32].
11:8	0x0 RW	**GPIO Group to GPE_DW0 assignment encoding (GPE0_DW0):** GPIO Group to GPE_DW0 assignment encoding (GPE0_DW0[3:0]) : This register assigns a specific GPIO Group to the ACPI GPE0[31:0].
7:5	0x0 RW	**Reserved (Re2):** Reserved
4	0x0 RW	**NCSI Inbound Signal Staging Control (NCSI_STAGE_EN):** This register controls the bypass/ staging logic for the GBE NCSI input signals - when 1, the signals will be staged with NCSI_ARB_CLK; when 0, the flops will be bypassed.
3	0x0 RW	**GPIO Driver IRQ Route (GPIO_DRIVER_IRQ_ROUTE):** GPIO Driver IRQ_ROUTE[1:0]: Specifies the APIC IRQ globally for all pads within the current community (GPI_IS with corresponding GPI_IE enable). • 0 = IRQ14 • 1 = IRQ15
2	0x0 RW	**GSX Static Local Clock Gating (GSXSLCGEN):** GSX Static Local Clock Gating (GSXSLCGEn) Specify whether the GSX controller should be statically clock gated for power saving if it is not enabled (even though the capability is available). • 0 = Disable dynamic local clock gating • 1 = Enable dynamic local clock gating
1	0x0 RW	**GPIO Dynamic Partition Clock Gating Enable (GPDPCGEN):** GPIO Dynamic Partition Clock Gating Enable (GPDPCGEn) Specify whether the GPIO Community should take part in partition clock gating • 0 = Disable participation in dynamic partition clock gating • 1 = Enable participation in dynamic partition clock gating
0	0x0 RW	**GPIO Dynamic Local Clock Gating Enable (GPDLCGEN):** GPIO Dynamic Local Clock Gating Enable (GPDLCGEn) Specify whether the GPIO Community should perform local clock gating. • 0 = Disable dynamic local clock gating • 1 = Enable dynamic local clock gating

65.3.3 Pad Ownership (PAD_OWN_SOUTH_DFX_0)—Offset 20h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 20h
Host Memory Space: SBREG_BAR + 0xC50000 + 20h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RO	**Reserved (RSVD_0):** Reserved.
29:28	0x0 RW	**Pad Ownership (PAD_OWN_DFX_PORT5):** This register can be written by the Intel® Management Engine (Intel® ME) GPIO Function only.** Write access without Intel® ME GPIO Function SAI shall be dropped. There is no SAI restriction on register read. Encoding: • 00 = Host GPIO ACPI Mode or GPIO Driver Mode. Host software (ACPI or GPIO Driver) has ownership of the pad. In Host GPIO Driver Mode (refer to HOSTSW_OWN), GPIO input event update is limited to GPI_INT_STS update only. Otherwise in Host ACPI Mode, updates are limited to GPI_GPE_STS, GPI_NMI_STS and/or GPI_SMI_STS. No read/write restriction to the Pad Configuration register set during host ownership. During host ownership, Intel® ME, IE and ISH do not own this pad and are not notified of the GPIO input event. • 01 = Intel® ME GPIO Mode. The Intel® ME has ownership of the pad. All accesses to Pad Configuration register set must be verified with Intel® ME GPIO Function SAI **. Non-posted cycle access without Intel® ME SAI shall result in Unsuccessful Completion status. Posted cycle access without Intel® ME SAI shall be dropped. In Intel® ME GPIO Mode, the host related status registers related to the pad (refer to host ownership above) are masked from being updated by GPIO input event. If IOSF-SB Virtual Wire message generation is enabled for this pad, GPIO hardware sends the Virtual Wire message to Intel® ME GPIO Function. Only the Intel® ME GPIO Function is notified of the GPIO input event. • 10 = ISH GPIO Mode. Same description as Intel® ME GPIO Mode above except verifying ISH GPIO Function SAI for pad related register accesses and the Virtual Wire message is delivered to the ISH GPIO Function. • 11 = IE GPIO Mode. Same description as Intel® ME GPIO Mode above except verifying IE GPIO Function SAI for pad related register accesses and the Virtual Wire message is delivered to the IE GPIO Function. **During DFx mode, Secure DFx can write to the PAD_OWN.
27:26	0x0 RO	**Reserved (RSVD_1):** Reserved.
25:24	0x0 RW	**Pad Ownership (PAD_OWN_DFX_PORT4):** See Description for bits [29:28] of this register.
23:22	0x0 RO	**Reserved (RSVD_2):** Reserved.
21:20	0x0 RW	**Pad Ownership (PAD_OWN_DFX_PORT3):** See Description for bits [29:28] of this register.

65.3.6 Pad Ownership (PAD_OWN_SOUTH_GROUP0_0)—Offset 2Ch

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 2Ch
Host Memory Space: SBREG_BAR + 0xC50000 + 2Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RO	**Reserved (RSVD_0):** Reserved.
29:28	0x0 RW	**Pad Ownership (PAD_OWN_SMB5_GBE_CLK):** This register can be written by the Intel® Management Engine (Intel® ME) GPIO Function only.** Write access without Intel® ME GPIO Function SAI shall be dropped. There is no SAI restriction on register read. Encoding: • 00 = Host GPIO ACPI Mode or GPIO Driver Mode. Host software (ACPI or GPIO Driver) has ownership of the pad. In Host GPIO Driver Mode (refer to HOSTSW_OWN), GPIO input event update is limited to GPI_INT_STS update only. Otherwise in Host ACPI Mode, updates are limited to GPI_GPE_STS, GPI_NMI_STS and/or GPI_SMI_STS. No read/write restriction to the Pad Configuration register set during host ownership. During host ownership, Intel® ME, IE and ISH do not own this pad and are not notified of the GPIO input event. • 01 = Intel® ME GPIO Mode. The Intel® ME has ownership of the pad. All accesses to Pad Configuration register set must be verified with Intel® ME GPIO Function SAI **. Non-posted cycle access without Intel® ME SAI shall result in Unsuccessful Completion status. Posted cycle access without Intel® ME SAI shall be dropped. In Intel® ME GPIO Mode, the host related status registers related to the pad (refer to host ownership above) are masked from being updated by GPIO input event. If IOSF-SB Virtual Wire message generation is enabled for this pad, GPIO hardware sends the Virtual Wire message to Intel® ME GPIO Function. Only the Intel® ME GPIO Function is notified of the GPIO input event. • 10 = ISH GPIO Mode. Same description as Intel® ME GPIO Mode above except verifying ISH GPIO Function SAI for pad related register accesses and the Virtual Wire message is delivered to the ISH GPIO Function. • 11 = IE GPIO Mode. Same description as Intel® ME GPIO Mode above except verifying IE GPIO Function SAI for pad related register accesses and the Virtual Wire message is delivered to the IE GPIO Function. **During DFx mode, Secure DFx can write to the PAD_OWN.

65.3.27 Pad Configuration Lock (PADCFGLOCK_SOUTH_GROUP1_1)—Offset B0h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + B0h
Host Memory Space: SBREG_BAR + 0xC50000 + B0h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0x0 RO	**Reserved (RSVD_0):** Reserved.
9	0x0 RW	**Pad Config Lock (PADCFGLOCK_GPIO_3):** PadCfgLock locks specific register fields in the pad specific registers (in Community or Pad) from being configured. The registers affected become Read-Only and software writes to these registers have no effect. This field is meaningful and takes effect only if the pad is owned by host (refer to PAD_OWN register). Pads under other ownership are not affected by the PadCfgLock. 0 = Unlock 1= Lock the following register fields as read-only (RO): • Pad Configuration registers (exclude GPIOTXState) • GPI_NMI_EN Register (if implemented) • GPI_SMI_EN Register (if implemented) • GPI_GPE_EN Register (if implemented) • Bit assignment: • Bit0 = pad 0 • Bit1 = pad 1 • Bit2 = pad 2 • ... • Bit N-1= pad N-1 When PadCfgLock[n] is written from a '1' to a '0' (unlock), a synchronous SMI# is generated if enabled. This ensures that only SMM code can change the above GPIO registers after the lockdown.

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 1CCh
Host Memory Space: SBREG_BAR + 0xC50000 + 1CCh

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/1C	**GPI NMI Status (GPI_NMI_STS_EMMC_STROBE):** This bit is set to '1' by hardware when an edge event is detected (See RxEdCfg, RxInv) on pad and all the following conditions are true: • The corresponding pad is used in GPIO input mode (PMode) • The corresponding GPIONMIRout is set to '1', i.e. programmed to route as NMI The corresponding GPIOOwn[2:0] is '000' (i.e. ACPI GPIO Mode). • The corresponding GPI_NMI_EN is set Writing a value of '1' will clear the bit while writing a value of '0' has no effect. • 0 = There is no NMI event • 1 = There is an NMI event Bit assignment: • Bit0 = pad 0 • Bit1 = pad 1 • Bit2 = pad 2 • ... • Bit N-1= pad N-1 For pads which do not support NMI, the corresponding bit is read-only zero.
30	0x0 RW/1C	**GPI NMI Status (GPI_NMI_STS_EMMC_CMD):** See Description for bit [31] of this register.
29	0x0 RO	**GPI NMI Status (GPI_NMI_STS_ESPI_CLK_LOOPBK):** See Description for bit [31] of this register.
28	0x0 RW/1C	**GPI NMI Status (GPI_NMI_STS_GPIO_11):** See Description for bit [31] of this register.
27	0x0 RW/1C	**GPI NMI Status (GPI_NMI_STS_GPIO_10):** See Description for bit [31] of this register.
26	0x0 RW/1C	**GPI NMI Status (GPI_NMI_STS_ESPI_ALRT0_N):** See Description for bit [31] of this register.
25	0x0 RO	**GPI NMI Status (GPI_NMI_STS_ESPI_RST_N):** See Description for bit [31] of this register.
24	0x0 RO	**GPI NMI Status (GPI_NMI_STS_ESPI_CLK):** See Description for bit [31] of this register.
23	0x0 RO	**GPI NMI Status (GPI_NMI_STS_ESPI_CS0_N):** See Description for bit [31] of this register.
22	0x0 RO	**GPI NMI Status (GPI_NMI_STS_ESPI_IO3):** See Description for bit [31] of this register.
21	0x0 RO	**GPI NMI Status (GPI_NMI_STS_ESPI_IO2):** See Description for bit [31] of this register.
20	0x0 RO	**GPI NMI Status (GPI_NMI_STS_ESPI_IO1):** See Description for bit [31] of this register.
19	0x0 RO	**GPI NMI Status (GPI_NMI_STS_ESPI_IO0):** See Description for bit [31] of this register.
18	0x0 RO	**GPI NMI Status (GPI_NMI_STS_SPI_CLK_LOOPBK):** See Description for bit [31] of this register.
17	0x0 RO	**GPI NMI Status (GPI_NMI_STS_SPI_CLK):** See Description for bit [31] of this register.

Bit Range	Default & Access	Field Name (ID): Description
16	0x0 RO	**GPI NMI Status (GPI_NMI_STS_SPI_IO3):** See Description for bit [31] of this register.
15	0x0 RO	**GPI NMI Status (GPI_NMI_STS_SPI_IO2):** See Description for bit [31] of this register.
14	0x0 RO	**GPI NMI Status (GPI_NMI_STS_SPI_MISO_IO1):** See Description for bit [31] of this register.
13	0x0 RO	**GPI NMI Status (GPI_NMI_STS_SPI_MOSI_IO0):** See Description for bit [31] of this register.
12	0x0 RO	**GPI NMI Status (GPI_NMI_STS_SPI_CS1_N):** See Description for bit [31] of this register.
11	0x0 RO	**GPI NMI Status (GPI_NMI_STS_SPI_CS0_N):** See Description for bit [31] of this register.
10	0x0 RO	**GPI NMI Status (GPI_NMI_STS_SLP_S0IX_N):** See Description for bit [31] of this register.
9	0x0 RO	**GPI NMI Status (GPI_NMI_STS_SUS_STAT_N):** See Description for bit [31] of this register.
8	0x0 RO	**GPI NMI Status (GPI_NMI_STS_PMU_PLTRST_N):** See Description for bit [31] of this register.
7	0x0 RO	**GPI NMI Status (GPI_NMI_STS_PMU_RESETBUTTON_N):** See Description for bit [31] of this register.
6	0x0 RO	**GPI NMI Status (GPI_NMI_STS_PMU_PWRBTN_N):** See Description for bit [31] of this register.
5	0x0 RO	**GPI NMI Status (GPI_NMI_STS_PMU_WAKE_N):** See Description for bit [31] of this register.
4	0x0 RO	**GPI NMI Status (GPI_NMI_STS_PMU_SLP_S3_N):** See Description for bit [31] of this register.
3	0x0 RO	**GPI NMI Status (GPI_NMI_STS_PMU_SLP_S45_N):** See Description for bit [31] of this register.
2	0x0 RW/1C	**GPI NMI Status (GPI_NMI_STS_ADR_TRIGGER):** See Description for bit [31] of this register.
1	0x0 RO	**GPI NMI Status (GPI_NMI_STS_PMU_SUSCLK):** See Description for bit [31] of this register.
0	0x0 RO	**GPI NMI Status (GPI_NMI_STS_SUSPWRDNACK):** See Description for bit [31] of this register.

65.3.65 NMI Status (GPI_NMI_STS_SOUTH_GROUP1_1)—Offset 1D0h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 1D0h
Host Memory Space: SBREG_BAR + 0xC50000 + 1D0h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0x0 RO	**Reserved (RSVD_0):** Reserved.
9	0x0 RW/1C	**GPI NMI Status (GPI_NMI_STS_GPIO_3):** This bit is set to '1' by hardware when an edge event is detected (See RxEdCfg, RxInv) on pad and all the following conditions are true: • The corresponding pad is used in GPIO input mode (PMode) • The corresponding GPIONMIRout is set to '1', i.e. programmed to route as NMI The corresponding GPIOOwn[2:0] is '000' (i.e. ACPI GPIO Mode). • The corresponding GPI_NMI_EN is set Writing a value of '1' will clear the bit while writing a value of '0' has no effect. • 0 = There is no NMI event • 1 = There is an NMI event Bit assignment: • Bit0 = pad 0 • Bit1 = pad 1 • Bit2 = pad 2 • ... • Bit N-1= pad N-1 For pads which do not support NMI, the corresponding bit is read-only zero.
8	0x0 RW/1C	**GPI NMI Status (GPI_NMI_STS_EMMC_D7):** See Description for bit [9] of this register.
7	0x0 RW/1C	**GPI NMI Status (GPI_NMI_STS_EMMC_D6):** See Description for bit [9] of this register.
6	0x0 RW/1C	**GPI NMI Status (GPI_NMI_STS_EMMC_D5):** See Description for bit [9] of this register.
5	0x0 RW/1C	**GPI NMI Status (GPI_NMI_STS_EMMC_D4):** See Description for bit [9] of this register.

3	0x0 RW/1C	**GPI NMI Status (GPI_NMI_STS_EMMC_D2):** See Description for bit [9] of this register.
2	0x0 RW/1C	**GPI NMI Status (GPI_NMI_STS_EMMC_D1):** See Description for bit [9] of this register.
1	0x0 RW/1C	**GPI NMI Status (GPI_NMI_STS_EMMC_D0):** See Description for bit [9] of this register.
0	0x0 RW/1C	**GPI NMI Status (GPI_NMI_STS_EMMC_CLK):** See Description for bit [9] of this register.

65.3.66 NMI Enable (GPI_NMI_EN_SOUTH_GROUP0_0)—Offset 1E4h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 1E4h
Host Memory Space: SBREG_BAR + 0xC50000 + 1E4h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**GPI NMI Enable (GPI_NMI_EN_SATA0_LED_N):** This bit is used to enable/disable the generation of NMI when the corresponding GPI_NMI_STS bit is set and its GPIROUTNMI is set. • 0 = disable NMI generation • 1 = enable NMI generation Each bit is lock-able dependent on the associated Pad Configuration register PadCfgLock setting. E.g. if the PadCfgLock of pad0 is '1', bit0 of this bit is locked down to read-only. Bit assignment: • Bit0 = Pad 0 • Bit1 = Pad 1 • Bit2 = Pad 2 • ... • Bit N-1 = Pad N-1 For pads which do not support NMI, the corresponding bit is read-only zero.
30	0x0 RW	**GPI NMI Enable (GPI_NMI_EN_GPIO_7):** See Description for bit [31] of this register.
29	0x0 RW	**GPI NMI Enable (GPI_NMI_EN_GPIO_6):** See Description for bit [31] of this register.
28	0x0 RW	**GPI NMI Enable (GPI_NMI_EN_GPIO_5):** See Description for bit [31] of this register.
27	0x0 RW	**GPI NMI Enable (GPI_NMI_EN_GPIO_4):** See Description for bit [31] of this register.
26	0x0 RW	**GPI NMI Enable (GPI_NMI_EN_FLEX_CLK_SE1):** See Description for bit [31] of this register.
25	0x0 RW	**GPI NMI Enable (GPI_NMI_EN_FLEX_CLK_SE0):** See Description for bit [31] of this register.
24	0x0 RO	**GPI NMI Enable (GPI_NMI_EN_USB_OC0_N):** See Description for bit [31] of this register.
23	0x0 RO	**GPI NMI Enable (GPI_NMI_EN_SMB4_CSME0_ALRT_N):** See Description for bit [31] of this register.
22	0x0 RO	**GPI NMI Enable (GPI_NMI_EN_SMB4_CSME0_CLK):** See Description for bit [31] of this register.
21	0x0 RO	**GPI NMI Enable (GPI_NMI_EN_SMB4_CSME0_DATA):** See Description for bit [31] of this register.
20	0x0 RO	**GPI NMI Enable (GPI_NMI_EN_SMB2_PECI_CLK):** See Description for bit [31] of this register.
19	0x0 RO	**GPI NMI Enable (GPI_NMI_EN_SMB2_PECI_DATA):** See Description for bit [31] of this register.
18	0x0 RO	**GPI NMI Enable (GPI_NMI_EN_SMB1_HOST_CLK):** See Description for bit [31] of this register.
17	0x0 RO	**GPI NMI Enable (GPI_NMI_EN_SMB1_HOST_DATA):** See Description for bit [31] of this register.
16	0x0 RO	**GPI NMI Enable (GPI_NMI_EN_SMB0_LEG_ALRT_N):** See Description for bit [31] of this register.

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RO	**GPI NMI Enable (GPI_NMI_EN_SMB0_LEG_DATA):** See Description for bit [31] of this register.
14	0x0 RO	**GPI NMI Enable (GPI_NMI_EN_SMB0_LEG_CLK):** See Description for bit [31] of this register.
13	0x0 RO	**GPI NMI Enable (GPI_NMI_EN_MCERR_N):** See Description for bit [31] of this register.
12	0x0 RO	**GPI NMI Enable (GPI_NMI_EN_IERR_N):** See Description for bit [31] of this register.
11	0x0 RO	**GPI NMI Enable (GPI_NMI_EN_ERROR0_N):** See Description for bit [31] of this register.
10	0x0 RO	**GPI NMI Enable (GPI_NMI_EN_ERROR1_N):** See Description for bit [31] of this register.
9	0x0 RO	**GPI NMI Enable (GPI_NMI_EN_ERROR2_N):** See Description for bit [31] of this register.
8	0x0 RW	**GPI NMI Enable (GPI_NMI_EN_SMB5_GBE_DATA):** See Description for bit [31] of this register.
7	0x0 RW	**GPI NMI Enable (GPI_NMI_EN_SMB5_GBE_CLK):** See Description for bit [31] of this register.
6	0x0 RW	**GPI NMI Enable (GPI_NMI_EN_UART0_TXD):** See Description for bit [31] of this register.
5	0x0 RW	**GPI NMI Enable (GPI_NMI_EN_UART0_RXD):** See Description for bit [31] of this register.
4	0x0 RO	**GPI NMI Enable (GPI_NMI_EN_PCIE_CLKREQ7_N):** See Description for bit [31] of this register.
3	0x0 RO	**GPI NMI Enable (GPI_NMI_EN_PCIE_CLKREQ6_N):** See Description for bit [31] of this register.
2	0x0 RW	**GPI NMI Enable (GPI_NMI_EN_PCIE_CLKREQ5_N):** See Description for bit [31] of this register.
1	0x0 RW	**GPI NMI Enable (GPI_NMI_EN_SMB5_GBE_ALRT_N):** See Description for bit [31] of this register.
0	0x0 RW	**GPI NMI Enable (GPI_NMI_EN_GPIO_12):** See Description for bit [31] of this register.

65.3.67 NMI Enable (GPI_NMI_EN_SOUTH_GROUP0_1)—Offset 1E8h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 1E8h
Host Memory Space: SBREG_BAR + 0xC50000 + 1E8h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description

65.3.70 Pad Configuration DW0 (PAD_CFG_DW0_DFX_PORT_CLK0)—Offset 400h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 400h
Host Memory Space: SBREG_BAR + 0xC50000 + 400h

Default: 44000600h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b ***Note:*** The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x0 RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RO	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RO	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.3.71 Pad Configuration DW1 (PAD_CFG_DW1_DFX_PORT_CLK0)—Offset 404h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 404h
Host Memory Space: SBREG_BAR + 0xC50000 + 404h

Default: 00000041h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0x0 RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x41 RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 • Up to the max IOxAPIC IRQ supported by the SoC.

65.3.72 Pad Configuration DW0 (PAD_CFG_DW0_DFX_PORT_CLK1)—Offset 408h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 408h
Host Memory Space: SBREG_BAR + 0xC50000 + 408h

Default: 44000600h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.

Default: 44000600h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x0 RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RO	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RO	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12	0x0 RW	**Pad Mode bit 2(PMODE2):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
11	0x0 RW	**Pad Mode bit 1(PMODE1):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad

Bit Range	Default & Access	Field Name (ID): Description
10	0x1 RW	**Pad Mode bit 0 (PMODE0):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.3.77 Pad Configuration DW1 (PAD_CFG_DW1_DFX_PORT1)—Offset 41Ch

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 41Ch
Host Memory Space: SBREG_BAR + 0xC50000 + 41Ch

Default: 00000044h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0x0 RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x44 RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.3.78 Pad Configuration DW0 (PAD_CFG_DW0_DFX_PORT2)—Offset 420h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 420h
Host Memory Space: SBREG_BAR + 0xC50000 + 420h

Default: 44000600h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.

0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.3.81 Pad Configuration DW1 (PAD_CFG_DW1_DFX_PORT3)—Offset 42Ch

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 42Ch
Host Memory Space: SBREG_BAR + 0xC50000 + 42Ch

Default: 00000046h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0x0 RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x46 RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.3.82 Pad Configuration DW0 (PAD_CFG_DW0_DFX_PORT4)—Offset 430h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 430h
Host Memory Space: SBREG_BAR + 0xC50000 + 430h

Default: 44000600h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x0 RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RO	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RO	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12	0x0 RW	**Pad Mode bit 2(PMODE2):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
11	0x0 RW	**Pad Mode bit 1(PMODE1):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad

Bit Range	Default & Access	Field Name (ID): Description
10	0x1 RW	**Pad Mode bit 0 (PMODE0):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bit Range	Default & Access	Field Name (ID): Description
10	0x1 RW	**Pad Mode bit 0 (PMODE0):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.3.87 Pad Configuration DW1 (PAD_CFG_DW1_DFX_PORT6)—Offset 444h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 444h
Host Memory Space: SBREG_BAR + 0xC50000 + 444h

Default: 00000049h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0x0 RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x49 RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.3.88 Pad Configuration DW0 (PAD_CFG_DW0_DFX_PORT7)—Offset 448h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 448h
Host Memory Space: SBREG_BAR + 0xC50000 + 448h

Default: 44000600h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' 3h = Reserved (implement as setting 0h)
24	0x0 RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RO	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RO	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.

This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RO	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RO	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12	0x0 RW	**Pad Mode bit 2(PMODE2):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
11	0x0 RW	**Pad Mode bit 1(PMODE1):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad

Bit Range	Default & Access	Field Name (ID): Description
10	0x1 RW	**Pad Mode bit 0 (PMODE0):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.3.93 Pad Configuration DW1 (PAD_CFG_DW1_DFX_PORT9)—Offset 45Ch

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 45Ch
Host Memory Space: SBREG_BAR + 0xC50000 + 45Ch

Default: 0000004Ch

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0x0 RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x4c RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.3.94 Pad Configuration DW0 (PAD_CFG_DW0_DFX_PORT10)—Offset 460h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 460h
Host Memory Space: SBREG_BAR + 0xC50000 + 460h

Default: 44000600h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x0 RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x0 RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RO	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RO	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12	0x0 RW	**Pad Mode bit 2(PMODE2):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
11	0x0 RW	**Pad Mode bit 1(PMODE1):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad

Bit Range	Default & Access	Field Name (ID): Description
10	0x1 RW	**Pad Mode bit 0 (PMODE0):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.3.99 Pad Configuration DW1 (PAD_CFG_DW1_DFX_PORT12)—Offset 474h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 474h
Host Memory Space: SBREG_BAR + 0xC50000 + 474h

Default: 0000004Fh

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0x0 RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x4f RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.3.100 Pad Configuration DW0 (PAD_CFG_DW0_DFX_PORT13)—Offset 478h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 478h
Host Memory Space: SBREG_BAR + 0xC50000 + 478h

Default: 44000600h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. 0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.3.103 Pad Configuration DW1 (PAD_CFG_DW1_DFX_PORT14)—Offset 484h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 484h
Host Memory Space: SBREG_BAR + 0xC50000 + 484h

Default: 00000051h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0x0 RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x51 RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.3.104 Pad Configuration DW0 (PAD_CFG_DW0_DFX_PORT15)—Offset 488h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 488h
Host Memory Space: SBREG_BAR + 0xC50000 + 488h

Default: 44000600h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x0 RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RO	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RO	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12	0x0 RW	**Pad Mode bit 2(PMODE2):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
11	0x0 RW	**Pad Mode bit 1(PMODE1):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad

Bit Range	Default & Access	Field Name (ID): Description
10	0x1 RW	**Pad Mode bit 0 (PMODE0):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. 12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.3.109 Pad Configuration DW1 (PAD_CFG_DW1_SMB5_GBE_ALRT_N)—Offset 49Ch

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 49Ch
Host Memory Space: SBREG_BAR + 0xC50000 + 49Ch

Default: 00000054h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0x0 RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x54 RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.3.110 Pad Configuration DW0 (PAD_CFG_DW0_PCIE_CLKREQ5_N)—Offset 4A0h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 4A0h
Host Memory Space: SBREG_BAR + 0xC50000 + 4A0h

Default: 45000600h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x1 RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.3.115 Pad Configuration DW1 (PAD_CFG_DW1_PCIE_CLKREQ7_N)—Offset 4B4h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 4B4h
Host Memory Space: SBREG_BAR + 0xC50000 + 4B4h

Default: 00000057h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0x0 RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x57 RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.3.116 Pad Configuration DW0 (PAD_CFG_DW0_UART0_RXD)—Offset 4B8h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 4B8h
Host Memory Space: SBREG_BAR + 0xC50000 + 4B8h

Default: 45000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x1 RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x1 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.3.117 Pad Configuration DW1 (PAD_CFG_DW1_UART0_RXD)—Offset 4BCh

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 4BCh
Host Memory Space: SBREG_BAR + 0xC50000 + 4BCh

Default: 00003058h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0xc RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved.
