23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x1 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.3.121 Pad Configuration DW1 (PAD_CFG_DW1_SMB5_GBE_CLK)—Offset 4CCh

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 4CCh
Host Memory Space: SBREG_BAR + 0xC50000 + 4CCh

Default: 0000305Ah

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0xc RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x5a RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.3.122 Pad Configuration DW0 (PAD_CFG_DW0_SMB5_GBE_DATA)—Offset 4D0h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 4D0h
Host Memory Space: SBREG_BAR + 0xC50000 + 4D0h

Default: 45000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x1 RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RO	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RO	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x1 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.3.127 Pad Configuration DW1 (PAD_CFG_DW1_ERROR1_N)—Offset 4E4h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 4E4h
Host Memory Space: SBREG_BAR + 0xC50000 + 4E4h

Default: 0000005Dh

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0x0 RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x5d RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.3.128 Pad Configuration DW0 (PAD_CFG_DW0_ERROR0_N)—Offset 4E8h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 4E8h
Host Memory Space: SBREG_BAR + 0xC50000 + 4E8h

Default: 45000601h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x1 RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RO	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RO	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x1 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.3.133 Pad Configuration DW1 (PAD_CFG_DW1_MCERR_N)—Offset 4FCh

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 4FCh
Host Memory Space: SBREG_BAR + 0xC50000 + 4FCh

Default: 00000060h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0x0 RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x60 RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.3.134 Pad Configuration DW0 (PAD_CFG_DW0_SMB0_LEG_CLK)—Offset 500h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 500h
Host Memory Space: SBREG_BAR + 0xC50000 + 500h

Default: 44000600h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x0 RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description

This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RO	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RO	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.3.139 Pad Configuration DW1 (PAD_CFG_DW1_SMB0_LEG_ALRT_N)—Offset 514h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 514h
Host Memory Space: SBREG_BAR + 0xC50000 + 514h

Default: 00003063h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0xc RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x63 RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.3.140 Pad Configuration DW0 (PAD_CFG_DW0_SMB1_HOST_DATA)—Offset 518h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 518h
Host Memory Space: SBREG_BAR + 0xC50000 + 518h

Default: 45000600h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x1 RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description

This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RO	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RO	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.3.145 Pad Configuration DW1 (PAD_CFG_DW1_SMB2_PECI_DATA)—Offset 52Ch

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 52Ch
Host Memory Space: SBREG_BAR + 0xC50000 + 52Ch

Default: 00003066h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0xc RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x66 RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.3.146 Pad Configuration DW0 (PAD_CFG_DW0_SMB2_PECI_CLK)—Offset 530h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 530h
Host Memory Space: SBREG_BAR + 0xC50000 + 530h

Default: 45000600h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x1 RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description

This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RO	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RO	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.3.151 Pad Configuration DW1 (PAD_CFG_DW1_SMB4_CSME0_CLK)—Offset 544h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 544h
Host Memory Space: SBREG_BAR + 0xC50000 + 544h

Default: 00003069h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0xc RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x69 RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.3.152 Pad Configuration DW0 (PAD_CFG_DW0_SMB4_CSME0_ALRT_N)—Offset 548h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 548h
Host Memory Space: SBREG_BAR + 0xC50000 + 548h

Default: 45000600h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x1 RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.3.157 Pad Configuration DW1 (PAD_CFG_DW1_FLEX_CLK_SE0)—Offset 55Ch

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 55Ch
Host Memory Space: SBREG_BAR + 0xC50000 + 55Ch

Default: 0000006Ch

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0x0 RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x6c RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.3.158 Pad Configuration DW0 (PAD_CFG_DW0_FLEX_CLK_SE1)—Offset 560h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 560h
Host Memory Space: SBREG_BAR + 0xC50000 + 560h

Default: 45000200h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x1 RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x1 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.3.163 Pad Configuration DW1 (PAD_CFG_DW1_GPIO_5)—Offset 574h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 574h
Host Memory Space: SBREG_BAR + 0xC50000 + 574h

Default: 0000006Fh

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0x0 RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x6f RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.3.164 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_6)—Offset 578h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 578h
Host Memory Space: SBREG_BAR + 0xC50000 + 578h

Default: 45000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x1 RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description

This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x1 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.3.169 Pad Configuration DW1 (PAD_CFG_DW1_SATA0_LED_N)—Offset 58Ch

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 58Ch
Host Memory Space: SBREG_BAR + 0xC50000 + 58Ch

Default: 00000072h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0x0 RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x72 RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.3.170 Pad Configuration DW0 (PAD_CFG_DW0_SATA1_LED_N)—Offset 590h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 590h
Host Memory Space: SBREG_BAR + 0xC50000 + 590h

Default: 45000700h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x1 RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x1 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.3.175 Pad Configuration DW1 (PAD_CFG_DW1)—Offset 5A4h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 5A4h
Host Memory Space: SBREG_BAR + 0xC50000 + 5A4h

Default: 00000075h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0x0 RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x75 RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.3.176 Pad Configuration DW0 (PAD_CFG_DW0_SATA0_SDOUT)—Offset 5A8h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 5A8h
Host Memory Space: SBREG_BAR + 0xC50000 + 5A8h

Default: 45000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x1 RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x1 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.3.181 Pad Configuration DW1 (PAD_CFG_DW1_UART1_RXD)—Offset 5BCh

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 5BCh
Host Memory Space: SBREG_BAR + 0xC50000 + 5BCh

Default: 00003019h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0xc RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x19 RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.3.182 Pad Configuration DW0 (PAD_CFG_DW0_UART1_TXD)—Offset 5C0h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 5C0h
Host Memory Space: SBREG_BAR + 0xC50000 + 5C0h

Default: 45000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x1 RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description

This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x1 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.3.187 Pad Configuration DW1 (PAD_CFG_DW1_GPIO_9)—Offset 5D4h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 5D4h
Host Memory Space: SBREG_BAR + 0xC50000 + 5D4h

Default: 0000001Ch

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0x0 RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x1c RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.3.188 Pad Configuration DW0 (PAD_CFG_DW0_TCK)—Offset 5D8h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 5D8h
Host Memory Space: SBREG_BAR + 0xC50000 + 5D8h

Default: 44000600h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x0 RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RO	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RO	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RO	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RO	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.3.193 Pad Configuration DW1 (PAD_CFG_DW1_TMS)—Offset 5ECh

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 5ECh
Host Memory Space: SBREG_BAR + 0xC50000 + 5ECh

Default: 0400301Fh

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0xc RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x1f RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.3.194 Pad Configuration DW0 (PAD_CFG_DW0_TDI)—Offset 5F0h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 5F0h
Host Memory Space: SBREG_BAR + 0xC50000 + 5F0h

Default: 44000600h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x0 RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RO	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RO	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RO	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RO	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.3.199 Pad Configuration DW1 (PAD_CFG_DW1_CX_PRDY_N)—Offset 604h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 604h
Host Memory Space: SBREG_BAR + 0xC50000 + 604h

Default: 00003022h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0xc RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x22 RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.3.200 Pad Configuration DW0 (PAD_CFG_DW0_CX_PREQ_N)—Offset 608h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 608h
Host Memory Space: SBREG_BAR + 0xC50000 + 608h

Default: 44000600h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x0 RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RO	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RO	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.3.205 Pad Configuration DW1 (PAD_CFG_DW1_CTBTRIGOUT)—Offset 61Ch

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 61Ch
Host Memory Space: SBREG_BAR + 0xC50000 + 61Ch

Default: 04000025h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0x0 RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x25 RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.3.206 Pad Configuration DW0 (PAD_CFG_DW0_DFX_SPARE2)—Offset 620h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 620h
Host Memory Space: SBREG_BAR + 0xC50000 + 620h

Default: 44000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x0 RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RO	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RO	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x1 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.3.211 Pad Configuration DW1 (PAD_CFG_DW1_DFX_SPARE4)—Offset 634h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 634h
Host Memory Space: SBREG_BAR + 0xC50000 + 634h

Default: 00000028h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0x0 RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x28 RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.3.212 Pad Configuration DW0 (PAD_CFG_DW0_SUSPWRDNACK)—Offset 638h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 638h
Host Memory Space: SBREG_BAR + 0xC50000 + 638h

Default: 44000600h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x0 RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.3.217 Pad Configuration DW1 (PAD_CFG_DW1_ADR_TRIGGER)—Offset 64Ch

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 64Ch
Host Memory Space: SBREG_BAR + 0xC50000 + 64Ch

Default: 0000002Bh

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0x0 RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x2b RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.3.218 Pad Configuration DW0 (PAD_CFG_DW0_PMU_SLP_S45_N)—Offset 650h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 650h
Host Memory Space: SBREG_BAR + 0xC50000 + 650h

Default: 44000600h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x0 RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RO	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RO	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.3.223 Pad Configuration DW1 (PAD_CFG_DW1_PMU_WAKE_N)—Offset 664h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 664h
Host Memory Space: SBREG_BAR + 0xC50000 + 664h

Default: 0000302Eh

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0xc RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x2e RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.3.224 Pad Configuration DW0 (PAD_CFG_DW0_PMU_PWRBTN_N)—Offset 668h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 668h
Host Memory Space: SBREG_BAR + 0xC50000 + 668h

Default: 45000600h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x1 RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RO	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RO	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.3.229 Pad Configuration DW1 (PAD_CFG_DW1_PMU_PLTRST_N)—Offset 67Ch

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 67Ch
Host Memory Space: SBREG_BAR + 0xC50000 + 67Ch

Default: 00000031h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0x0 RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x31 RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.3.230 Pad Configuration DW0 (PAD_CFG_DW0_SUS_STAT_N)—Offset 680h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 680h
Host Memory Space: SBREG_BAR + 0xC50000 + 680h

Default: 44000600h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x0 RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RO	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RO	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.3.235 Pad Configuration DW1 (PAD_CFG_DW1_SPI_CS0_N)—Offset 694h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 694h
Host Memory Space: SBREG_BAR + 0xC50000 + 694h

Default: 00003C34h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0xf RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x34 RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.3.236 Pad Configuration DW0 (PAD_CFG_DW0_SPI_CS1_N)—Offset 698h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 698h
Host Memory Space: SBREG_BAR + 0xC50000 + 698h

Default: 44000600h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x0 RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RO	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RO	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.3.241 Pad Configuration DW1 (PAD_CFG_DW1_SPI_MISO_IO1)—Offset 6ACh

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 6ACh
Host Memory Space: SBREG_BAR + 0xC50000 + 6ACh

Default: 00003C37h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0xf RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x37 RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.3.242 Pad Configuration DW0 (PAD_CFG_DW0_SPI_IO2)—Offset 6B0h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 6B0h
Host Memory Space: SBREG_BAR + 0xC50000 + 6B0h

Default: 44000600h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x0 RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description

This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RO	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RO	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.3.247 Pad Configuration DW1 (PAD_CFG_DW1_SPI_CLK)—Offset 6C4h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 6C4h
Host Memory Space: SBREG_BAR + 0xC50000 + 6C4h

Default: 00003C3Ah

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0xf RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x3a RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.3.248 Pad Configuration DW0 (PAD_CFG_DW0_SPI_CLK_LOOPBK)—Offset 6C8h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 6C8h
Host Memory Space: SBREG_BAR + 0xC50000 + 6C8h

Default: 44000600h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x0 RO	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description

This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RO	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RO	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.3.253 Pad Configuration DW1 (PAD_CFG_DW1_ESPI_IO1)—Offset 6DCh

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 6DCh
Host Memory Space: SBREG_BAR + 0xC50000 + 6DCh

Default: 00003C3Dh

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0xf RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x3d RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.3.254 Pad Configuration DW0 (PAD_CFG_DW0_ESPI_IO2)—Offset 6E0h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 6E0h
Host Memory Space: SBREG_BAR + 0xC50000 + 6E0h

Default: 45000A00h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x1 RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description

This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RO	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RO	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.3.259 Pad Configuration DW1 (PAD_CFG_DW1_ESPI_CS0_N)—Offset 6F4h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 6F4h
Host Memory Space: SBREG_BAR + 0xC50000 + 6F4h

Default: 00000040h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0x0 RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x40 RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.3.260 Pad Configuration DW0 (PAD_CFG_DW0_ESPI_CLK)—Offset 6F8h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 6F8h
Host Memory Space: SBREG_BAR + 0xC50000 + 6F8h

Default: 45000A00h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x1 RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.3.265 Pad Configuration DW1 (PAD_CFG_DW1_ESPI_ALRT0_N)—Offset 70Ch

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 70Ch
Host Memory Space: SBREG_BAR + 0xC50000 + 70Ch

Default: 00000043h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0x0 RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x43 RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.3.266 Pad Configuration DW0 (PAD_CFG_DW0_GPIO_10)—Offset 710h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 710h
Host Memory Space: SBREG_BAR + 0xC50000 + 710h

Default: 45000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x1 RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RO	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RO	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.3.271 Pad Configuration DW1 (PAD_CFG_DW1_ESPI_CLK_LOOPBK)—Offset 724h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 724h
Host Memory Space: SBREG_BAR + 0xC50000 + 724h

Default: 00000046h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0x0 RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x46 RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.3.272 Pad Configuration DW0 (PAD_CFG_DW0_EMMC_CMD)—Offset 728h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 728h
Host Memory Space: SBREG_BAR + 0xC50000 + 728h

Default: 45000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x1 RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x1 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.3.277 Pad Configuration DW1 (PAD_CFG_DW1_EMMC_CLK)—Offset 73Ch

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 73Ch
Host Memory Space: SBREG_BAR + 0xC50000 + 73Ch

Default: 00000049h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0x0 RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x49 RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.3.278 Pad Configuration DW0 (PAD_CFG_DW0_EMMC_D0)—Offset 740h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 740h
Host Memory Space: SBREG_BAR + 0xC50000 + 740h

Default: 45000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x1 RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description

This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x1 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.3.283 Pad Configuration DW1 (PAD_CFG_DW1_EMMC_D2)—Offset 754h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 754h
Host Memory Space: SBREG_BAR + 0xC50000 + 754h

Default: 0000004Ch

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0x0 RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x4c RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.3.284 Pad Configuration DW0 (PAD_CFG_DW0_EMMC_D3)—Offset 758h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 758h
Host Memory Space: SBREG_BAR + 0xC50000 + 758h

Default: 45000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x1 RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x1 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.3.289 Pad Configuration DW1 (PAD_CFG_DW1_EMMC_D5)—Offset 76Ch

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 76Ch
Host Memory Space: SBREG_BAR + 0xC50000 + 76Ch

Default: 0000004Fh

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0x0 RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x4f RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

65.3.290 Pad Configuration DW0 (PAD_CFG_DW0_EMMC_D6)—Offset 770h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 770h
Host Memory Space: SBREG_BAR + 0xC50000 + 770h

Default: 45000300h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x1 RW	**Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below: • 00 = Powergood (i.e. sticky reset) • 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b) • 10 = GPIO Reset (i.e. host reset: host_rst_b) • 11 = Reserved; tied to inactive (i.e. '1' for active low reset) For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion.
29	0x0 RW	**RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0). • 0 = Raw RX pad state directly from CFIO RX buffer • 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings)
28	0x0 RW	**RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV. • 0 = No Override • 1 = RX drive 1 internally
27	0x0 RO	**Reserved (RSVD_0):** Reserved.
26:25	0x2 RW	**RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller. • 0h = Level • 1h = Edge • 2h = Drive '0' • 3h = Reserved (implement as setting 0h)
24	0x1 RW	**Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not. This field only makes sense when the RX buffer is configured as an input and is not disabled. • 0 = Select synchronized, non filtered RX pad state • 1 = Select synchronized, filtered RX pad state The selected RX pad state can be further subjected to polarity inversion through RXINV
23	0x0 RW	**RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel. This bit does not affect GPIORXState. During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI. • 0 = No inversion • 1 = Inversion

Bit Range	Default & Access	Field Name (ID): Description
22:21	0x0 RO	**RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode). Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0. • 0 = Function defined in Pad Mode controls TX and RX Enables • 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally • 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally • 3 = Function controls TX Enabled and RX is always enabled
20	0x0 RW	**GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause peripheral IRQ • 1 = Routing can cause peripheral IRQ ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s).
19	0x0 RW	**GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SCI • 1 = Routing can cause SCI ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU.
18	0x0 RW	**GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause SMI. • 1 = Routing can cause SMI. ***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s).
17	0x0 RW	**GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect. • 0 = Routing does not cause NMI. • 1 = Routing can cause NMI. ***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit.
16:13	0x0 RO	**Reserved (RSVD_1):** Reserved.
12:10	0x0 RW	**Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad. Bits [12:10] decode: • 0 = GPIO controls the Pad • 1 = Function 1, if applicable, controls the Pad • 2 = Function 2, if applicable, controls the Pad • ... • 7 = Function 7, if applicable, controls the Pad
9	0x1 RW	**GPIO RX Disable (GPIORXDIS):** • 0 = Enable the input buffer (active low enable) of the pad • 1 = Disable the input buffer of the pad. ***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP.
8	0x0 RW	**GPIO TX Disable (GPIOTXDIS):** • 0 = Enable the output buffer (active low enable) of the pad • 1 = Disable the output buffer of the pad; i.e. Hi-Z
7:2	0x0 RO	**Reserved (RSVD_2):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RO	**GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings.
0	0x0 RW	**GPIO TX State (GPIOTXSTATE):** • 0 = Drive a level '0' to the TX output pad • 1 = Drive a level '1' to the TX output pad

65.3.295 Pad Configuration DW1 (PAD_CFG_DW1_GPIO_3)—Offset 784h

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xC5] + 784h
Host Memory Space: SBREG_BAR + 0xC50000 + 784h

Default: 00000052h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**.
13:10	0x0 RW	**Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to: • 0h = none • 2h = 5k weak Pull-Down • 4h = 20k weak Pull-Down • 8h = none • 9h = 1k weak Pull-Up • Ah = 5k weak Pull-Up • Bh = 2k weak Pull-Up • Ch = 20k weak Pull-Up • Dh = 1k and 2k weak Pull-Up • Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad. • All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction. The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily.
9:8	0x0 RO	**Reserved**.
7:0	0x52 RO	**Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad. • 0 = Interrupt Line 0 • 1 = Interrupt Line 1 Up to the max IOxAPIC IRQ supported by the SoC.

§ §

66 SMBus - PECI

66.1 Introduction and Index

Much of the programming-related information and register descriptions for the SMBus-PECI are in Section 30, "SMBus Controller - Platform Environment Control Interface" on page 795.

The legend for the register access codes are described in Chapter 43, "Introduction."

§ §

67 Interrupt Steering and Control

67.1 Introduction and Index

The host-accessible registers for Interrupt Steering and Control are described here. The legend for the register access codes are described in Chapter 43, “Introduction.”

67.1.1 Sideband Registers

An index of the Sideband registers that are accessible to the Host are listed here. Each is accessible in Host Memory Space using the Sideband Base Address Register (SBREG_BAR). See Section 3.4.1, "Using SBREG_BAR Method" on page 187.

Table 67-1. Summary of Sideband Registers—0xD0

Offset (hex)	Default Value (hex)	Register Name (Register Symbol)
3100	80	"PIRQA Routing Control (PARC)—Offset 3100h" on page 3741
3101	80	"PIRQB Routing Control (PBRC)—Offset 3101h" on page 3742

67.2 Sideband Registers

The Sideband registers accessible to the Host are described here. They are accessible in Host Memory Space starting at the Sideband Base Address Register (SBREG_BAR). See Section 3.4.1, "Using SBREG_BAR Method" on page 187.

67.2.1 PIRQA Routing Control (PARC)—Offset 3100h

PIRQA Routing Control Register.

Type: Sideband Register
(Size: 8 bits)

Sideband Port and Offset: [Port: 0xD0] + 3100h
Host Memory Space: SBREG_BAR + 0xD00000 + 3100h

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7	0x1 RW	**Interrupt Routing Enable (REN):** When cleared, PIRQA is routed to one of the legacy interrupts specified in bits [3:0] of this register. When set, the PIRQA is not routed to the internal 8259 Programmable Interrupt Controller (PIC). **Power Well:** Core
6:4	0x0 RO	**Reserved (RSVD):** Reserved **Power Well:** Core
3:0	0x0 RW	**IRQ Routing (IR):** IRQ destination for PIRQA • 0000 - Reserved • 0001 - Reserved • 0010 - Reserved • 0011 - IRQ3 • 0100 - IRQ4 • 0101 - IRQ5 • 0110 - IRQ6 • 0111 - IRQ7 • 1000 - Reserved • 1001 - IRQ9 • 1010 - IRQ10 • 1011 - IRQ11 • 1100 - IRQ12 • 1101 - Reserved • 1110 - IRQ14 • 1111 - IRQ15 **Power Well:** Core

67.2.2 PIRQB Routing Control (PBRC)—Offset 3101h

PIRQB Routing Control Register. It has the same programming values as PARC.

Type: Sideband Register
(Size: 8 bits)

Sideband Port and Offset: [Port: 0xD0] + 3101h
Host Memory Space: SBREG_BAR + 0xD00000 + 3101h

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7	0x1 RW	**Interrupt Routing Enable (REN):** When cleared, PIRQB is routed to one of the legacy interrupts specified in bits [3:0] of this register. When set, the PIRQB is not routed to the internal 8259 Programmable Interrupt Controller (PIC). **Power Well:** Core
6:4	0x0 RO	**Reserved (RSVD):** Reserved **Power Well:** Core
3:0	0x0 RW	**IRQ Routing (IR):** IRQ destination for PIRQB • 0000 - Reserved • 0001 - Reserved • 0010 - Reserved • 0011 - IRQ3 • 0100 - IRQ4 • 0101 - IRQ5 • 0110 - IRQ6 • 0111 - IRQ7 • 1000 - Reserved • 1001 - IRQ9 • 1010 - IRQ10 • 1011 - IRQ11 • 1100 - IRQ12 • 1101 - Reserved • 1110 - IRQ14 • 1111 - IRQ15 **Power Well:** Core

67.2.3 PIRQC Routing Control (PCRC)—Offset 3102h

PIRQC Routing Control Register. It has the same programming values as PARC.

Type: Sideband Register
(Size: 8 bits)

Sideband Port and Offset: [Port: 0xD0] + 3102h
Host Memory Space: SBREG_BAR + 0xD00000 + 3102h

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7	0x1 RW	**Interrupt Routing Enable (REN):** When cleared, PIRQC is routed to one of the legacy interrupts specified in bits [3:0] of this register. When set, the PIRQC is not routed to the internal 8259 Programmable Interrupt Controller (PIC). **Power Well:** Core
6:4	0x0 RO	**Reserved (RSVD):** Reserved **Power Well:** Core
3:0	0x0 RW	**IRQ Routing (IR):** IRQ destination for PIRQC • 0000 - Reserved • 0001 - Reserved • 0010 - Reserved • 0011 - IRQ3 • 0100 - IRQ4 • 0101 - IRQ5 • 0110 - IRQ6 • 0111 - IRQ7 • 1000 - Reserved • 1001 - IRQ9 • 1010 - IRQ10 • 1011 - IRQ11 • 1100 - IRQ12 • 1101 - Reserved • 1110 - IRQ14 • 1111 - IRQ15 **Power Well:** Core

67.2.4 PIRQD Routing Control (PDRC)—Offset 3103h

PIRQD Routing Control Register. It has the same programming values as PARC.

Type: Sideband Register
(Size: 8 bits)

Sideband Port and Offset: [Port: 0xD0] + 3103h
Host Memory Space: SBREG_BAR + 0xD00000 + 3103h

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7	0x1 RW	**Interrupt Routing Enable (REN):** When cleared, PIRQD is routed to one of the legacy interrupts specified in bits [3:0] of this register. When set, the PIRQD is not routed to the internal 8259 Programmable Interrupt Controller (PIC). **Power Well:** Core
6:4	0x0 RO	**Reserved (RSVD):** Reserved **Power Well:** Core
3:0	0x0 RW	**IRQ Routing (IR):** IRQ destination for PIRQD • 0000 - Reserved • 0001 - Reserved • 0010 - Reserved • 0011 - IRQ3 • 0100 - IRQ4 • 0101 - IRQ5 • 0110 - IRQ6 • 0111 - IRQ7 • 1000 - Reserved • 1001 - IRQ9 • 1010 - IRQ10 • 1011 - IRQ11 • 1100 - IRQ12 • 1101 - Reserved • 1110 - IRQ14 • 1111 - IRQ15 **Power Well:** Core

67.2.5 PIRQE Routing Control (PERC)—Offset 3104h

PIRQE Routing Control Register. It has the same programming values as PARC.

Type: Sideband Register
(Size: 8 bits)

Sideband Port and Offset: [Port: 0xD0] + 3104h
Host Memory Space: SBREG_BAR + 0xD00000 + 3104h

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7	0x1 RW	**Interrupt Routing Enable (REN):** When cleared, PIRQE is routed to one of the legacy interrupts specified in bits [3:0] of this register. When set, the PIRQE is not routed to the internal 8259 Programmable Interrupt Controller (PIC). **Power Well:** Core
6:4	0x0 RO	**Reserved (RSVD):** Reserved **Power Well:** Core
3:0	0x0 RW	**IRQ Routing (IR):** IRQ destination for PIRQE • 0000 - Reserved • 0001 - Reserved • 0010 - Reserved • 0011 - IRQ3 • 0100 - IRQ4 • 0101 - IRQ5 • 0110 - IRQ6 • 0111 - IRQ7 • 1000 - Reserved • 1001 - IRQ9 • 1010 - IRQ10 • 1011 - IRQ11 • 1100 - IRQ12 • 1101 - Reserved • 1110 - IRQ14 • 1111 - IRQ15 **Power Well:** Core

67.2.6 PIRQF Routing Control (PFRC)—Offset 3105h

PIRQF Routing Control Register. It has the same programming values as PARC.

Type: Sideband Register
(Size: 8 bits)

Sideband Port and Offset: [Port: 0xD0] + 3105h
Host Memory Space: SBREG_BAR + 0xD00000 + 3105h

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7	0x1 RW	**Interrupt Routing Enable (REN):** When cleared, PIRQF is routed to one of the legacy interrupts specified in bits [3:0] of this register. When set, the PIRQF is not routed to the internal 8259 Programmable Interrupt Controller (PIC). **Power Well:** Core
6:4	0x0 RO	**Reserved (RSVD):** Reserved **Power Well:** Core
3:0	0x0 RW	**IRQ Routing (IR):** IRQ destination for PIRQF • 0000 - Reserved • 0001 - Reserved • 0010 - Reserved • 0011 - IRQ3 • 0100 - IRQ4 • 0101 - IRQ5 • 0110 - IRQ6 • 0111 - IRQ7 • 1000 - Reserved • 1001 - IRQ9 • 1010 - IRQ10 • 1011 - IRQ11 • 1100 - IRQ12 • 1101 - Reserved • 1110 - IRQ14 • 1111 - IRQ15 **Power Well:** Core

67.2.7 PIRQG Routing Control (PGRC)—Offset 3106h

PIRQG Routing Control Register. It has the same programming values as PARC.

Type: Sideband Register
(Size: 8 bits)

Sideband Port and Offset: [Port: 0xD0] + 3106h
Host Memory Space: SBREG_BAR + 0xD00000 + 3106h

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7	0x1 RW	**Interrupt Routing Enable (REN):** When cleared, PIRQG is routed to one of the legacy interrupts specified in bits [3:0] of this register. When set, the PIRQG is not routed to the internal 8259 Programmable Interrupt Controller (PIC). **Power Well:** Core
6:4	0x0 RO	**Reserved (RSVD):** Reserved **Power Well:** Core
3:0	0x0 RW	**IRQ Routing (IR):** IRQ destination for PIRQG • 0000 - Reserved • 0001 - Reserved • 0010 - Reserved • 0011 - IRQ3 • 0100 - IRQ4 • 0101 - IRQ5 • 0110 - IRQ6 • 0111 - IRQ7 • 1000 - Reserved • 1001 - IRQ9 • 1010 - IRQ10 • 1011 - IRQ11 • 1100 - IRQ12 • 1101 - Reserved • 1110 - IRQ14 • 1111 - IRQ15 **Power Well:** Core

67.2.8 PIRQH Routing Control (PHRC)—Offset 3107h

PIRQH Routing Control Register. It has the same programming values as PARC.

Type: Sideband Register
(Size: 8 bits)

Sideband Port and Offset: [Port: 0xD0] + 3107h
Host Memory Space: SBREG_BAR + 0xD00000 + 3107h

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7	0x1 RW	**Interrupt Routing Enable (REN):** When cleared, PIRQH is routed to one of the legacy interrupts specified in bits [3:0] of this register. When set, the PIRQH is not routed to the internal 8259 Programmable Interrupt Controller (PIC). **Power Well:** Core
6:4	0x0 RO	**Reserved (RSVD):** Reserved **Power Well:** Core
3:0	0x0 RW	**IRQ Routing (IR):** IRQ destination for PIRQH • 0000 - Reserved • 0001 - Reserved • 0010 - Reserved • 0011 - IRQ3 • 0100 - IRQ4 • 0101 - IRQ5 • 0110 - IRQ6 • 0111 - IRQ7 • 1000 - Reserved • 1001 - IRQ9 • 1010 - IRQ10 • 1011 - IRQ11 • 1100 - IRQ12 • 1101 - Reserved • 1110 - IRQ14 • 1111 - IRQ15 **Power Well:** Core

67.2.9 Message Decoder Control (MSGDC)—Offset 3120h

Message Decoder Control Register

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xD0] + 3120h
Host Memory Space: SBREG_BAR + 0xD00000 + 3120h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RO	**Reserved (RSVD1):** Reserved **Power Well:** Core
11:8	0x0 RW	**INTA-D Default Decoder PIR Mapping (INTDDPIR):** Specifies the PIR register to use for the INTA-D Default Decoder state. PIR registers map INTA-D state to PRIQA-H. This value is only used when INTDDEN is set. ***Note:*** Acceptable values include any valid PIR register number (i.e. 0-12) or the value of 13. The value of 13, which behaves similar to the PIR direct connect source IDs, maps INTA to PIRQA, INTB maps to PIRQB, INTC maps to PIRQC and INTD maps to PIRQD and has no programmable option to change it. **Power Well:** Core
7:3	0x0 RO	**Reserved (RSVD2):** Reserved **Power Well:** Core
2	0x0 RW	**NMI Default Decoder Enable (NMIDDEN):** When set, the NMI decode logic will accept ASSERT_NMI/DEASSERT_NMI messages from unknown sources (sources not specified with the NMI_SRC_ID and (if OPC_ASRT/DSRTNMI == OPC_ASRT/DASRTIOCHK which is the default case) IOCHK_SRC_ID parameters). When cleared, NMI messages from unknown sources will be dropped. **Power Well:** Core
1	0x0 RW	**INTAD Default Decoder Enable (INTDDEN):** When set, the INTA-D decoder logic will accept ASSERT_INTA-D/DEASSERT_INTA-D messages from unknown sources (source not specified with the IPIR0-12_SRC_ID and PIRDC_SRC_ID parameters). When cleared, INTA-D messages from unknown sources will be dropped. **Power Well:** Core
0	0x0 RW	**IRQN Default Decoder Enable (IRQDDEN):** When set, the IRQN decoder logic will accept ASSERT_IRQN/DEASSERT_IRQN messages from unknown source (source not specified with the SIRQ_SINGLE_CAUSE_SRC_ID and SIRQ_MULTI_CAUSE_SRC_ID parameters). When cleared, IRQN messages from unknown sources will be dropped. **Power Well:** Core

67.2.10 PCI Interrupt Route 0 (PIR0)—Offset 3140h

PCI Interrupt Route 0 Register

Type: Sideband Register
(Size: 16 bits)

Sideband Port and Offset: [Port: 0xD0] + 3140h
Host Memory Space: SBREG_BAR + 0xD00000 + 3140h

Default: 3210h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RO	**Reserved (RSVD):** Reserved **Power Well:** Core
14:12	0x3 RW	**Interrupt D Pin Route (IDR):** Indicates which PIRQ internal to the SoC is connected to the INTD#. • 0h - PIRQA# • 1h - PIRQB# • 2h - PIRQC# • 3h - PIRQD# • 4h - PIRQE# • 5h - PIRQF# • 6h - PIRQG# • 7h - PIRQH# **Power Well:** Core
11	0x0 RO	**Reserved (RSVD_1):** Reserved **Power Well:** Core
10:8	0x2 RW	**Interrupt C Pin Route (ICR):** See the IDR description. This field applies to INTC#. **Power Well:** Core
7	0x0 RO	**Reserved (RSVD_2):** Reserved **Power Well:** Core
6:4	0x1 RW	**Interrupt B Pin Route (IBR):** See the IDR description. This field applies to INTB#. **Power Well:** Core
3	0x0 RO	**Reserved (RSVD_3):** Reserved **Power Well:** Core

67.2.23 General Interrupt Control (GIC)—Offset 31FCh

FEC10000h - FEC3FFFFh is allocated to PCIe when Port I/OxAPIC Enable (PAE) bit is set.

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xD0] + 31FCh
Host Memory Space: SBREG_BAR + 0xD00000 + 31FCh

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0x0 RO	**Reserved (RSVD):** Reserved **Power Well:** Core
21	0x0 RW	**CF9 Completion Dependency Disable (CF9NODEP):** When set, the completion ordering between the Non-Posted IO Write causing CF9 Request to PMC and the GO_S1_SENT indication is disabled. In other words, the IO Write completion can be issued before PMC indicates the GO_S1_SENT indication. When cleared, the completion for the IO Write is only sent after the GO_S1_SENT indication asserts. **Power Well:** Core
20	0x0 RW	**INIT# VLW Message Completion Dependacy Disable (INITVMNODEP):** When sent, the completion ordering between the Non-Posted IO Write which causes an INIT and the Non-Posted VLW message which signals the INIT is broken. In other words, the IO Write completion can be sent out before the VLW completion is received. When cleared, the completion for the IO Write is only be sent AFTER the completion for the VLW is received. **Power Well:** Core
19	0x0 RW	**INIT# VLW Message Disable (INITVMDIS):** Disable INIT# VLW message. When set, if other type of VLW message to be sent, the VLWValue Bit[5] under VLW Vendor Defined Message should always be 0 - no active edge on INIT#. When clear, the INIT# information will be conveyed as normal. **Power Well:** Core
18	0x0 RO	**Reserved (RSVD):** Reserved **Power Well:** Core
17	0x0 RW	**Alternate Access Mode Enable (AME):** When set, read only registers can be written, and write only registers can be read. **Power Well:** Core
16	0x0 RW	**Shutdown Policy Select (SDPS):** When cleared (default) the PCH will update INIT# in response to the shutdown Vendor Defined Message (VDM). When set to 1, PCH will treat the shutdown VDM similar to receiving a CF9h I/O write, and will drive PLTRST# active. See Section 16.13 Reset Behavior for variations on whether power is cycled due to this reset source depending on the programming of other bits. BIOS guide note: This register is reset any time PLTRST# asserts. **Power Well:** Core
15:9	0x0 RW	**MAX_IRQ_ENTRY_SIZE (MAXIRQSIZE):** This field indicates the size of the IOxAPIC entry. The default size is 120 entries. • 0000000: 120 entry size • 0000001: 24 entry size (Legacy mode) • 0000010 - 1111111: Reserved **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
8	0x0 RW	**Server Error Reporting Mode (SERM):** When set, the CPU Complex is the final target of all host space errors. In this mode, if the PCH detects a fatal, non-fatal, or correctable error on DMI or PSFs, it sends one of ERR_FATAL, ERR_NONFATAL, or ERR_CORR to CPU Complex. When cleared, the SoC is the final target of all host space errors. **Power Well:** Core
7:2	0x0 RW	**Reserved (RSVD2):** Scratch pad: These bits are reserved for future use. **Power Well:** Core
1	0x0 RW	**INIT# VLW Message Disable Mode (INITVMDISMODE):** This policy bit dictates the INIT# handling when INITVMDIS is configured to 1. When set to 1 and INITVMDIS = 1, the INIT# events will be dropped such that upon clearing the INITVMDIS = 0 later, no INIT# VLW Message is released. When set to 0 (default) and INITVMDIS = 1, the INIT# events will be masked such that upon clearing the INITVMDIS = 0 later, the INIT# VLW Message is released. **Power Well:** Core
0	0x0 RO/P	**CPU Shutdown Status (CPUSDSTS):** This bit is set to 1 if the CPU sends the Shutdown Special cycle message. The Shutdown Message is recognized as an INIT# event if the Shutdown Policy Select = 0. Otherwise the SoC treats the Shutdown Special cycle as a request for CF9 Hard Reset. This is a sticky Read Only bit that is only reset by a loss of core power. **Power Well:** Core

67.2.24 Interrupt Polarity Control 0 (IPC0)—Offset 3200h

Interrupt Polarity Control 0 Register

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xD0] + 3200h
Host Memory Space: SBREG_BAR + 0xD00000 + 3200h

Default: 00FF0000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0xff0000 RW	**IRQ 31-0 Active High Polarity Disable (IPC0_IRQxAHPOLDIS):** IRQ 31-0 Active High Polarity Disable (IPC0.IRQxAHPOLDIS): When set to 1, the interrupt polarity associated with IRQ31 down to IRQ0 is inverted to appear as Active Low to IOxAPIC. When set to 0, the interrupt is appears as Active High to IOxAPIC. **Power Well:** Core

67.2.25 Interrupt Polarity Control 1 (IPC1)—Offset 3204h

Interrupt Polarity Control 1 Register

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xD0] + 3204h
Host Memory Space: SBREG_BAR + 0xD00000 + 3204h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**IRQ 63-32 Active High Polarity Disable (IPC1_IRQAHPOLDIS):** IRQ 63-32 Active High Polarity Disable (IPC1.IRQAHPOLDIS): When set to 1, the interrupt polarity associated with IRQ63 down to IRQ32 is inverted to appear as Active Low to IOxAPIC. When set to 0, the interrupt is appears as Active High to IOxAPIC. **Power Well:** Core

67.2.26 Interrupt Polarity Control 2 (IPC2)—Offset 3208h

Interrupt Polarity Control 2 Register

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xD0] + 3208h
Host Memory Space: SBREG_BAR + 0xD00000 + 3208h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**IRQ 95-64 Active High Polarity Disable (IPC2_IRQAHPOLDIS):** IRQ 95-64 Active High Polarity Disable (IPC2.IRQAHPOLDIS): When set to 1, the interrupt polarity associated with IRQ95 down to IRQ64 is inverted to appear as Active Low to IOxAPIC. When set to 0, the interrupt is appears as Active High to IOxAPIC. **Power Well:** Core

67.2.27 Interrupt Polarity Control 3 (IPC3)—Offset 320Ch

Interrupt Polarity Control 3 Register

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xD0] + 320Ch
Host Memory Space: SBREG_BAR + 0xD00000 + 320Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**Reserved (RSVD):** Reserved **Power Well:** Core
23:0	0x0 RW	**IRQ 119-96 Active High Polarity Disable (IPC3_IRQAHPOLDIS):** IRQ 119-96 Active High Polarity Disable (IPC3.IRQAHPOLDIS): When set to 1, the interrupt polarity associated with IRQ119 down to IRQ96 is inverted to appear as Active Low to IOxAPIC. When set to 0, the interrupt is appears as Active High to IOxAPIC. **Power Well:** Core

67.2.28 Interrupt Blocking Control (IBC)—Offset 3220h

Interrupt Blocking Control Register

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xD0] + 3220h
Host Memory Space: SBREG_BAR + 0xD00000 + 3220h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**IRQ 23-0 IRQx Interrupt Disable (IRQxDIS):** When set to 1, any interrupts associated with IRQ23 down to IRQ0 originating from ASSERT_IRQn sideband messages are blocked from reaching the 8259 and IOxAPIC interrupt controllers. When set to 0, interrupts are allowed to pass to the interrupt controllers. SIRQ_NUM_OF_SHAREABLE parameter value will affect the bits function.bit SIRQ_NUM_OF_SHAREABLE-1:0] will act as IRQxDIS function, bit [31:SIRQ_NUM_OF_SHAREABLE] will be reserved. **Power Well:** Core

67.2.29 Interrupt Edge-Trigger Extension 0 (IETE0)—Offset 3230h

Interrupt Edge-Trigger Extension 0 Register

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xD0] + 3230h
Host Memory Space: SBREG_BAR + 0xD00000 + 3230h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**IRQ 31-0 Disable Edge-Triggered Interrupt Extension (IETE31_0):** When set, DSn bits corresponding to Edge-triggered interrupts gets cleared if the interrupt source is de-asserted before interrupt gets serviced (this is backward compatible with previous architectures). When cleared, the IOxAPIC DSn bit corresponding to Edge-triggered interrupts stays asserted (i.e. extended) even when interrupt source is de-asserted before interrupt gets serviced. **Power Well:** Core

67.2.30 Interrupt Edge-Trigger Extension 1 (IETE1)—Offset 3234h

Interrupt Edge-Trigger Extension 1 Register

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xD0] + 3234h
Host Memory Space: SBREG_BAR + 0xD00000 + 3234h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**IRQ 63-32 Disable Edge-Triggered Interrupt Extension (IETE63_32):** When set, DSn bits corresponding to Edge-triggered interrupts gets cleared if the interrupt source is de-asserted before interrupt gets serviced (this is backward compatible with previous architectures). When cleared, the IOxAPIC DSn bit corresponding to Edge-triggered interrupts stays asserted (i.e. extended) even when interrupt source is de-asserted before interrupt gets serviced. **Power Well:** Core

67.2.31 Interrupt Edge-Trigger Extension 2 (IETE2)—Offset 3238h

Interrupt Edge-Trigger Extension 2 Register

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xD0] + 3238h
Host Memory Space: SBREG_BAR + 0xD00000 + 3238h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**IRQ 95-64 Disable Edge-Triggered Interrupt Extension (IETE95_64):** When set, DSn bits corresponding to Edge-triggered interrupts gets cleared if the interrupt source is de-asserted before interrupt gets serviced (this is backward compatible with previous architectures). When cleared the IOxAPIC DSn bit corresponding to Edge-triggered interrupts stays asserted (i.e. extended) even when interrupt source is de-asserted before interrupt gets serviced. **Power Well:** Core

67.2.32 Interrupt Edge-Trigger Extension 3 (IETE3)—Offset 323Ch

Interrupt Edge-Trigger Extension 3 Register

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xD0] + 323Ch
Host Memory Space: SBREG_BAR + 0xD00000 + 323Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**Reserved (RSVD1):** Reserved **Power Well:** Core
23:0	0x0 RW	**IRQ 119-96 Disable Edge-Triggered Interrupt Extension (IETE119_96):** When set, DSn bits corresponding to Edge-triggered interrupts gets cleared if the interrupt source is de-asserted before interrupt gets serviced (this is backward compatible with previous architectures). When cleared the IOxAPIC DSn bit corresponding to Edge-triggered interrupts stays asserted (i.e. extended) even when interrupt source is de-asserted before interrupt gets serviced. **Power Well:** Core

67.2.33 ITSS Power Reduction Control (ITSSPRC)—Offset 3300h

Power controls for the entire interrupt and timer subsystem.

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xD0] + 3300h
Host Memory Space: SBREG_BAR + 0xD00000 + 3300h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0x0 RO	**Reserved (RSVD):** Reserved **Power Well:** Core
4	0x0 RW	**PGCB Dynamic Clock Gating Enable (PGCBDCGE):** When set, the ITSS enables dynamic clock gating of the PGCB clock domain. BIOS is requested to program this field to 1. **Power Well:** Core
3	0x0 RW	**HPET Dynamic Clock Gating Enable (HPETDCGE):** When set, the HPET enables dynamic clock gating. BIOS is requested to program this field to 1. **Power Well:** Core
2	0x0 RW	**8254 Static Clock Gating Enable (CGE8254):** When set, the 8254 Programmable Interval Timer is disabled statically. This bit shall be set by BIOS if the 8254 feature is not needed in the system or before BIOS hands off the system that supports C11. Normal operation of 8254 requires this bit to 0. **Power Well:** Core
1	0x0 RW	**Sideband Dynamic Clock Gating Enable (SBDCGE):** Setting this bit will enable all dynamic clock gating of the Sideband Clock domain. BIOS is requested to program this field to 1. **Power Well:** Core
0	0x0 RW	**PCI Dynamic Clock Gating Enable (PCIDCGE):** Setting this bit will enable dynamic clock gating for the ITSS Core Logic that uses PCI Clock. BIOS is requested to program this field to 1. **Power Well:** Core

67.2.34 SIDE Clock Timing (SIDECT)—Offset 3304h

SIDE Clock Timing Register

Type: Sideband Register
(Size: 16 bits)

Sideband Port and Offset: [Port: 0xD0] + 3304h
Host Memory Space: SBREG_BAR + 0xD00000 + 3304h

Default: 0033h

Bit Range	Default & Access	Field Name (ID): Description
15:7	0x0 RO	**Reserved (RSVD1):** Reserved **Power Well:** Core
6:4	0x3 RW	**Clock Request Hold-Off (CLKREQHO):** Defines the amount of idle time required between locking for power gate preparation and deassertion of the prim_clkreq signal. This field defines the exponent such that the actual delay = 2^ CLKREQHO. **WARNING:** This value should not be updated unless the Sideband Interface Clock Gating Enable (ITSSPRC.SBDCGE) control register bit is set to 0. **Power Well:** Core
3	0x0 RO	**Reserved (RSVD2):** Reserved **Power Well:** Core
2:0	0x3 RW	**Clock Gating Hold-Off (CLKGATEHO):** Defines the amount of idle time required before local clock gating will be engaged (if enabled). This field defines the exponent such that the actual delay = 2^ CLGATEHO. **WARNING:** This value should not be updated unless the Sideband Interface Clock Gating Enable (ITSSPRC.SBDCGE) control register bit is set to 0. **Power Well:** Core

67.2.35 IPCI Clock Timing (IPCICT)—Offset 3306h

IPCI Clock Timing Register

Type: Sideband Register
(Size: 16 bits)

Sideband Port and Offset: [Port: 0xD0] + 3306h
Host Memory Space: SBREG_BAR + 0xD00000 + 3306h

Default: 0033h

Bit Range	Default & Access	Field Name (ID): Description
15:7	0x0 RO	**Reserved (RSVD1):** Reserved **Power Well:** Core
6:4	0x3 RW	**Clock Request Hold-Off (CLKREQHO):** Defines the amount of idle time required between locking for power gate preparation and deassertion of the prim_clkreq signal. This field defines the exponent such that the actual delay = 2^ CLKREQHO. **WARNING:** This value should not be updated unless the PCI Dynamic Clock Gate Enable (ITSSPRC.PCIDCGE) control register bit is set to 0. **Power Well:** Core
3	0x0 RO	**Reserved (RSVD2):** Reserved **Power Well:** Core
2:0	0x3 RW	**Clock Gating Hold-Off (CLKGATEHO):** Defines the amount of idle time required before local clock gating will be engaged (if enabled). This field defines the exponent such that the actual delay = 2^ CLGATEHO. **WARNING:** This value should not be updated unless the PCI Dynamic Clock Gate Enable (ITSSPRC.PCIDCGE) control register bit is set to 0. **Power Well:** Core

67.2.36 PGCB Clock Timing (PGCBCT)—Offset 3308h

PGCB Clock Timing Register

Type: Sideband Register
(Size: 16 bits)

Sideband Port and Offset: [Port: 0xD0] + 3308h
Host Memory Space: SBREG_BAR + 0xD00000 + 3308h

Default: 0003h

Bit Range	Default & Access	Field Name (ID): Description
15:4	0x0 RO	**Reserved (RSVD1):** Reserved **Power Well:** Core
3:0	0x3 RW	**Clock Gating Hold-Off (CLKGATEHO):** Specifies the minimum number of delay clocks the PGCB clock gate sequencing should wait, before enabling the PGCB clock to be gated at the trunk-level. **WARNING:** This value should not be updated unless the PGCB Dynamic Clock Gate Enable (ITSSPRC.PGCBDCGE) control register bit is set to 0. **Power Well:** Core

67.2.37 Uncorrectable Error Mask (UEM)—Offset 3320h

When set, the corresponding error is masked, and the reported error will cause no action. When cleared, the corresponding error is enabled. This register is only reset by a loss of core power.

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xD0] + 3320h
Host Memory Space: SBREG_BAR + 0xD00000 + 3320h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0x0 RO	**Reserved (RSVD4):** Reserved **Power Well:** Core
22	0x0 RW/P	**Uncorrectable Internal Error Mask (UIE):** Mask for uncorrectable internal errors (to be used for parity errors). **Power Well:** Core
21	0x0 RO	**Reserved (RSVD3):** Reserved **Power Well:** Core
20	0x0 RW/P	**Unsupported Request Error Mask (URE):** Mask for uncorrectable errors **Power Well:** Core
19:17	0x0 RO	**Reserved (RSVD2):** Reserved **Power Well:** Core
16	0x0 RW/P	**Unexpected Completion Mask (UC):** Mask for unexpected completions. **Power Well:** Core
15:0	0x0 RO	**Reserved (RSVD1):** Reserved **Power Well:** Core

67.2.38 Uncorrectable Error Severity (UEV)—Offset 3324h

This register gives the option to make an uncorrectable error fatal or non-fatal. An error is fatal if the bit is set. An error is non-fatal is the bit is cleared. This register is only reset by a loss of core power.

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xD0] + 3324h
Host Memory Space: SBREG_BAR + 0xD00000 + 3324h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0x0 RO	**Reserved (RSVD4):** Reserved **Power Well:** Core
22	0x0 RW/P	**Uncorrectable Internal Error Severity (UIE):** Severity for uncorrectable internal errors (to be used for parity errors). **Power Well:** Core
21	0x0 RO	**Reserved (RSVD3):** Reserved **Power Well:** Core
20	0x0 RW/P	**Unsupported Request Error Severity (URE):** Severity for uncorrectable errors **Power Well:** Core
19:17	0x0 RO	**Reserved (RSVD2):** Reserved **Power Well:** Core
16	0x0 RW/P	**Unexpected Completion Severity (UC):** Severity for unexpected completions. **Power Well:** Core
15:0	0x0 RO	**Reserved (RSVD1):** Reserved **Power Well:** Core

67.2.39 Correctable Error Mask (CEM)—Offset 3328h

When set, the corresponding error is masked and the reported error will cause no action. When cleared, the corresponding error is enabled. This register is only reset by a loss of core power.

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xD0] + 3328h
Host Memory Space: SBREG_BAR + 0xD00000 + 3328h

Default: 00002000h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved (RSVD2):** Reserved **Power Well:** Core
13	0x1 RW/P	**Advisory Non-Fatal Error Mask (ANFEM):** When set, masks Advisory Non-Fatal errors from signaling ERR_COR to the device control register. Set by default to enable compatibility with software that does not comprehend Role-Based Error Reporting. **Power Well:** Core
12:0	0x0 RO	**Reserved (RSVD1):** Reserved **Power Well:** Core

67.2.40 NMI Control (NMI)—Offset 3330h

NMI Control Register

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xD0] + 3330h
Host Memory Space: SBREG_BAR + 0xD00000 + 3330h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0x0 RO	**Reserved (RSVD):** Reserved **Power Well:** Core
5	0x0 RW/1C	**NMI VLW Delivery Status (NMI_VLW_STS):** A writable status bit which is set whenever a VLW message that assert NMI is successfully sent and the associated completion is received. Its intent is to enable a pooling mechanism for software to enforce NMI_NOW message ordering. Once set, writing the bit to1 will clear the status. Writing the bit to 0 has no effect. **Power Well:** Core
4	0x0 RO/V	**NMI Status (NMI_STS):** RO status bit indicating the current NMI status. The bit will be set to (1b1) if any NMI source is asserted and NMI2SMI_EN is set to (1b0). ***Note:*** In models *not* compiled with the USE_NMI_CTRL_REG, the value of NMI2SMI_EN will come from the mu1_smnmi2smi_en interface pin rather than the NMI2SMI_EN control register bit. **Power Well:** Core
3	0x0 RO/V	**NMI-to-SMI Status (NMI2SMI_STS):** RO status bit indicating the current NMI2SMI status. The bit will be set (1b1) if any NMI source is asserted and NMI2SMI_EN is set (1b1). ***Note:*** In models *not* compiled with the USE_NMI_CTRL_REG, the value of NMI2SMI_EN will come from the mu1_smnmi2smi_en interface pin rather than the NMI2SMI_EN control register bit. **Power Well:** Core
2	0x0 RW	**NMI-to-SMI Enable (NMI2SMI_EN):** Setting to 1b1 causes NMIs to be sent as ASSERT_SMI/ DEASSERT_SMI messages to PMC instead of the regular NMI messages. Setting to 1b0 maintains the regular NMI routing (as VLW and VM). Bits NMI_NOW and NMI2SMI_EN can't be configured on same cycle. **Power Well:** Core
1	0x0 RO/V	**NMI NOW Status (NMI_NOW_STS):** RO status bit indicating the current state of NMI_NOW. See NMI_NOW. **Power Well:** Core
0	0x0 WO	**NMI Now Command (NMI_NOW):** Writing 1b1 to NMI_NOW inverts the NMI NOW Status (NMI_NOW_STS) value. The first time NMI_NOW is written sets the NMI_NOW_STS and initiates an NMI. The next write clears the NMI_NOW_STS and allows initiating NMI by the next write to NMI_NOW. Writing 1b0 to NMI_NOW has no effect. Bits NMI_NOW and NMI2SMI_EN can't be configured on same cycle. **Power Well:** Core

67.2.41 Master Message Control (MMC)—Offset 3334h

Master Message Control Register

Type: Sideband Register
(Size: 16 bits)

Sideband Port and Offset: [Port: 0xD0] + 3334h
Host Memory Space: SBREG_BAR + 0xD00000 + 3334h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:1	0x0 RO	**Reserved (RSVD):** Reserved **Power Well:** Core
0	0x0 RW/V	**Master Message Enable (MSTRMSG_EN):** When set, allows ITSS to release any pending/in progress IOAPIC MWr, HPET MWr, VLW_EVT or the ERR Messages to the IOSF SB. When cleared, ITSS prevents these messages from being issued to the IOSF SB. The Master Message Enable sets to 1 when: • BIOS SW write to 1 • ITSS receives the IOSF SB MSTR_MSG_EN Message. The Master Message Enable clears to 0 when: • BIOS SW write to 0 • ITSS receives the IOSF SB MSTR_MSG_DIS Message • ITSS receives the RESET_PREP Message • ITSS receives the FORCEPWRGOK Message ***Note:*** This bit supersedes the INITVMDIS policy bit. For example, if MSTRMSGEN = 0 but INITVMDIS = 0, INIT# VLW message is disallowed. **Power Well:** Core

67.2.42 Master Message Status (MMSTS)—Offset 3336h

Master Message Status Register

Type: Sideband Register
(Size: 16 bits)

Sideband Port and Offset: [Port: 0xD0] + 3336h
Host Memory Space: SBREG_BAR + 0xD00000 + 3336h

Default: 0001h

Bit Range	Default & Access	Field Name (ID): Description
15:1	0x0 RO	**Reserved (RSVD):** Reserved Field **Power Well:** Core
0	0x1 RO/V	**Master Message Locked (MSTRMSGLOC_STS):** Sets when the Master Message Enable (MSTRMSG_EN) bit is set to 0 and all Sideband Message Mastering has stopped. Clears when MSTRMSG_EN==1. This bit has no direct effect on hardware and is used as a semaphore bit to indicate Message Mastering on IOSF SB is busy/not complete. **Power Well:** Core

67.2.43 HPET Offload Scale Value (HOFFVAL)—Offset 3400h

HPET Offload Scale Value Register

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xD0] + 3400h
Host Memory Space: SBREG_BAR + 0xD00000 + 3400h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RO	**Reserved (RSVD):** Reserved **Power Well:** Core
27:0	0x0 RW/P	**Offload Scale Value (VAL):** Offload Scale Value (VAL): Indicates the lower 28 bits of the value that should be added to the slow clock counter during RTC offload of the HPET timers. **Power Well:** Core

§ §

68 PHY - High-Speed I/O

68.1 Introduction and Index

The host-accessible registers for the PHY circuitry for the High-Speed I/O (HSIO) interface. Only the registers associated with customer PHY Tuning are shown. The HSIO interface is comprised of the:

- PCI Express* HSIO Lanes
- SATA HSIO Lanes
- USB 3.0 HSIO Lanes

The SoC has 20 HSIO Lanes maximum and are configured as shown in the Chapter 10, "Flexible I/O Adapter (FIA) Overview."

To determine the number of HSIO lanes and interface types available refer to the following:

- Table 1-1, "Features by product SKU - Server and Cloud Storage SKUs 0 through 4"
- Table 1-2, "Features by Product SKU - Network and Enterprise Storage SKUs 5 through 10"
- Table 1-3, "Features by Product SKU - Extended Temperature SKUs 11 through 14".

The legend for the register access codes are described in Chapter 43, "Introduction."

Please refer to the document #568853 for the detail about how to tune the registers for HSIO interfaces.

68.1.1 Sideband Registers

An index of the Sideband registers that are accessible to the Host are listed here. Each is accessible in Host Memory Space using the Sideband Base Address Register (SBREG_BAR). See Section 3.4.1, "Using SBREG_BAR Method".

Table 68-1. Summary of Sideband Registers (Lane 0 of 19) — 0xBA

Offset from Sideband Port BAh (hex)	Memory-Mapped I/O offset from SBREG_BAR (hex)	Default Value (hex)	Register Name (Register Symbol)
28	BA_0028	01020180	"PCS_DWORD10 (pcs_dword10)—Offset 28h" on page 3788
94	BA_0094	28292A00	"TX_DWORD5 (tx_dword5)—Offset 94h" on page 3789
98	BA_0098	151F2020	"TX_DWORD6 (tx_dword6)—Offset 98h" on page 3790
9C	BA_009C	022A0000	"TX_DWORD7 (tx_dword7)—Offset 9Ch" on page 3791
CC	BA_00CC	201F0000	"TX_DWORD19 (tx_dword19)—Offset CCh" on page 3792

68.2 Sideband Registers

The Sideband registers accessible to the Host are described here. They are accessible in Host Memory Space starting at the Sideband Base Address Register (SBREG_BAR). See Section 3.4.1, "Using SBREG_BAR Method".

68.2.1 PCS_DWORD10 (pcs_dword10)—Offset 28h

PCS_DWORD10 for HSIO Lane 0 is shown here. This register description applies to the PCS_DWORD10 for other 19 HSIO Lanes. See Table 68-2, "Summary of Sideband Registers (Lane 1 of 19) — 0xBA" through Table 68-20, "Summary of Sideband Registers (Lane 19 of 19) — 0xBB" for the applicable Sideband Ports and offset values.

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: 0xBA + 28h
Host Memory Space: SBREG_BAR + 0xBA0000 + 28h

Default: 01020180

Bit Range	Default & Access	Field Name (ID): Description
31:7	0x0 RO	**Reserved**
6:5	0x0 RW	**reg_cfg_data_dynclkgate_mode_1_0:** • 00 - Susclk gating and laneclkreq disabled • 01 - Reserved • 10 - Reserved • 11 - Susclk gating enabled and laneclkreq enabled
4:0	0x0 RO	**Reserved**

68.2.2 TX_DWORD5 (tx_dword5)—Offset 94h

TX_DWORD5 for HSIO Lane 0 is shown here. This register description applies to the TX_DWORD5 for other 19 HSIO Lanes. See Table 68-2, "Summary of Sideband Registers (Lane 1 of 19) — 0xBA" through Table 68-20, "Summary of Sideband Registers (Lane 19 of 19) — 0xBB" for the applicable Sideband Ports and offset values.

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: 0xBA + 94h
Host Memory Space: SBREG_BAR + 0xBA0000 + 94h

Default: 28292A00h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0x0 RO	**Reserved**
21:16	0x29 RW	**ow2tapgen2deemph3p5_5_0:** Tx De-emphasis -3.5dB Setting for Rate1. When Tx is operating in 2-Tap mode, these bits define the 3.5dB de-emphasis setting, i.e. factor (X/64) of slices to use in main-R1. These bits are valid only when rate=2'b01 (typically gen2).
15:14	0x0 RO	**Reserved**
13:8	0x2a RW	**ow2tapgen1deemph3p5_5_0:** Tx De-emphasis -3.5dB Setting for Rate0. When Tx is operating in 2-Tap mode, these bits define the 3.5dB de-emphasis setting, i.e. factor (X/64) of slices to use in main-R1. These bits are valid only when rate=2'b00 (typically gen1).
7:0	0x0 RO	**Reserved**

68.2.3 TX_DWORD6 (tx_dword6)—Offset 98h

TX_DWORD6 for HSIO Lane 0 is shown here. This register description applies to the TX_DWORD6 for other 19 HSIO Lanes. See Table 68-2, "Summary of Sideband Registers (Lane 1 of 19) — 0xBA" through Table 68-20, "Summary of Sideband Registers (Lane 19 of 19) — 0xBB" for the applicable Sideband Ports and offset values.

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: 0xBA + 98h
Host Memory Space: SBREG_BAR + 0xBA0000 + 98h

Default: 151F2020h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0x0 RO	**Reserved**
21:16	0x1f RW	**ow2tapgen3deemph6p0_5_0:** Tx De-emphasis -6.0dB Setting for Rate2. When Tx is operating in 2-Tap mode, these bits define the 6.0dB de-emphasis setting, i.e. factor (X/64) of slices to use in main-R1. These bits are valid only when rate=2'b10 (typically gen3).
15:14	0x0 RO	**Reserved**
13:8	0x20 RW	**ow2tapgen2deemph6p0_5_0:** Tx De-emphasis -6.0dB Setting for Rate1. When Tx is operating in 2-Tap mode, these bits define the 6.0dB de-emphasis setting, i.e. factor (X/64) of slices to use in main-R1. These bits are valid only when rate=2'b01 (typically gen2).
7:0	0x0 RO	**Reserved**

68.2.4 TX_DWORD7 (tx_dword7)—Offset 9Ch

TX_DWORD7 for HSIO Lane 0 is shown here. This register description applies to the TX_DWORD7 for other 19 HSIO Lanes. See Table 68-2, "Summary of Sideband Registers (Lane 1 of 19) — 0xBA" through Table 68-20, "Summary of Sideband Registers (Lane 19 of 19) — 0xBB" for the applicable Sideband Ports and offset values.

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: 0xBA + 9Ch
Host Memory Space: SBREG_BAR + 0xBA0000 + 9Ch

Default: 022A0000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RO	**Reserved**
29:24	0x20	**Omargom011_5_0:** Tx Margin011 factor (X/64) of slices to use for full swing level.
23:22	0x0 RO	**Reserved**
21:16	0x2A	**Omargom010_5_0:** Tx Margin010 factor (X/64) of slices to use for full swing level.
15:14	0x0 RO	**Reserved**
13:8	0x0	**Omargom001_5_0:** Tx Margin001 factor (X/64) of slices to use for full swing level.
7:6	0x0 RO	**Reserved**
5:0	0x0	**Omargom000_5_0:** Tx Margin000 factor (x/64) of slices to use for full swing level.

68.2.5 TX_DWORD19 (tx_dword19)—Offset CCh

TX_DWORD19 for HSIO Lane 0 is shown here. This register description applies to the TX_DWORD19 for other 19 HSIO Lanes. See Table 68-2, "Summary of Sideband Registers (Lane 1 of 19) — 0xBA" through Table 68-20, "Summary of Sideband Registers (Lane 19 of 19) — 0xBB" for the applicable Sideband Ports and offset values.

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: 0xBA + CCh
Host Memory Space: SBREG_BAR + 0xBA0000 + CCh

Default: 201F0000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0x0 RO	**Reserved**
0	0x0 RW	**o_calccont:** initiate calculation of swing-control while '1' the calculation is done consecutively.

68.2.6 RX_DWORD20 (rx_dword20)—Offset 150h

RX_DWORD20 for HSIO Lane 0 is shown here. This register description applies to the RX_DWORD20 for other 19 HSIO Lanes. See Table 68-2, "Summary of Sideband Registers (Lane 1 of 19) — 0xBA" through Table 68-20, "Summary of Sideband Registers (Lane 19 of 19) — 0xBB" for the applicable Sideband Ports and offset values.

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: 0xBA + 150h
Host Memory Space: SBREG_BAR + 0xBA0000 + 150h

Default: 003F3F3Fh

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RO	**Reserved**
29:24	0x0 RW	**icfgctledatatap_fullrate_5_0:** FULL rate CTLE Tap Co-efficients override in non-adaptive system.
23:0	0x0 RO	**Reserved**

68.2.7 RX_DWORD21 (rx_dword21)—Offset 154h

RX_DWORD21 for HSIO Lane 0 is shown here. This register description applies to the RX_DWORD21 for other 19 HSIO Lanes. See Table 68-2, "Summary of Sideband Registers (Lane 1 of 19) — 0xBA" through Table 68-20, "Summary of Sideband Registers (Lane 19 of 19) — 0xBB" for the applicable Sideband Ports and offset values.

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: 0xBA + 154h
Host Memory Space: SBREG_BAR + 0xBA0000 + 154h

Default: 80C00000h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**Reserved**
13:8	0x0 RW	**icfgctledatatap_quatrate_5_0:** QUARTER rate CTLE Tap Co-efficients override in non-adaptive system.
7:4	0x0 RO	**Reserved**
5:0	0x0 RW	**icfgctledatatap_halfrate_5_0:** HALF rate CTLE Tap Co-efficients override in non-adaptive system.

68.2.8 RX_DWORD25 (rx_dword25)—Offset 164h

RX_DWORD25 for HSIO Lane 0 is shown here. This register description applies to the RX_DWORD25 for other 19 HSIO Lanes. See Table 68-2, "Summary of Sideband Registers (Lane 1 of 19) — 0xBA" through Table 68-20, "Summary of Sideband Registers (Lane 19 of 19) — 0xBB" for the applicable Sideband Ports and offset values.

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: 0xBA + 164h
Host Memory Space: SBREG_BAR + 0xBA0000 + 164h

Default: 00005400h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0x0 RO	**Reserved**
20:16	0x0 RW	**ctle_adapt_offset_cfg_4_0:** The 2s complement value to be added to the CTLE coefficient after its training.
15:0	0x0 RO	**Reserved**

68.2.9 RX_DWORD26 (rx_dword26)—Offset 168h

RX_DWORD26 for HSIO Lane 0 is shown here. This register description applies to the RX_DWORD26 for other 19 HSIO Lanes. See Table 68-2, "Summary of Sideband Registers (Lane 1 of 19) — 0xBA" through Table 68-20, "Summary of Sideband Registers (Lane 19 of 19) — 0xBB" for the applicable Sideband Ports and offset values.

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: 0xBA + 168h
Host Memory Space: SBREG_BAR + 0xBA0000 + 168h

Default: B800822Ah

Bit Range	Default & Access	Field Name (ID): Description
31:17	0x0 RO	**Reserved**
16	0x0 RW	**sata_eq_dis:** chicken bit disable SATA3 doing equation by default. • 1: disable eq • 0: run eq
15:0	0x0 RO	**Reserved**

§ §

69 Model-Specific Registers (MSR)

69.1 Introduction and Index

The host-accessible registers for the Model-Specific Registers (MSR) are described here.

To determine the number of processor cores, L2 Cache units, and Memory Controllers refer to the following:

- Table 1-1, “Features by product SKU - Server and Cloud Storage SKUs 0 through 4”
- Table 1-2, “Features by Product SKU - Network and Enterprise Storage SKUs 5 through 10”
- Table 1-3, “Features by Product SKU - Extended Temperature SKUs 11 through 14”

The legend for the register access codes are described in Chapter 43, “Introduction.”

Table 69-1. Model Specific Register (MSR) Index (Sheet 1 of 5)

MSR Address	MSR Name
006h	(006h) IA32_MONITOR_FILTER_SIZE on page 3801
017h	(017h) IA32_PLATFORM_ID on page 3802
01Bh	(01Bh) IA32_APIC_BASE on page 3802
02Eh	(02Eh) MSR_PIC_MSG_CONTROL on page 3803
033h	(033h) MSR_MEMORY_CONTROL on page 3803
034h	(034h) MSR_SMI_COUNT on page 3803
035h	(035h) CORE_THREAD_COUNT on page 3804
039h	(039h) MSR_THREAD_ID on page 3804
03Bh	(03Bh) IA32_TSC_ADJUST on page 3804
04Eh	(04Eh) MSR_PPIN_CTL on page 3805
04Fh	(04Fh) MSR_PPIN on page 3805
052h	(052h) SMM_MCA_CONTROL on page 3805
079h	(079h) IA32_BIOS_UPDT_TRIG on page 3806
07Ah	(07Ah) MSR_SGX_FEATURE_ACTIVATION on page 3806
08Bh	(08Bh) IA32_BIOS_SIGN_ID on page 3806
09Bh	(09Bh) IA32_SMM_MONITOR_CTL on page 3806
09Eh	(09Eh) IA32_SMBASE on page 3807
0C1h	(0C1h) IA32_PMC0 on page 3807
0C2h	(0C2h) IA32_PMC1 on page 3807
0C3h	(0C3h) IA32_PMC2 on page 3807
0C4h	(0C4h) IA32_PMC3 on page 3807
0CEh	(0CEh) MSR_PLATFORM_INFO on page 3808
0E2h	(0E2h) MSR_PKG_CST_CONFIG_CONTROL on page 3810
0E4h	(0E4h) MSR_PMG_IO_CAPTURE_BASE on page 3811
0E7h	(0E7h) IA32_MPERF on page 3811
0E8h	(0E8h) IA32_APERF on page 3811
0FEh	(0FEh) IA32_MTRRCAP on page 3812
120h	(120h) POWER_MISC on page 3812
121h	(121h) EMULATE_PM_TMR on page 3813
139h	(139h) INITIAL_BOOT_BLOCK_COMPLETE on page 3813
13Ch	(13Ch) FEATURE_CONFIG on page 3813
140h	(140h) FEATURE_ENABLES on page 3814
15Ch	(15Ch) PERMEM_CONFIG_INFO on page 3814
15Dh	(15Dh) PERMEM_CTRLR_INDEX on page 3814
15Eh	(15Eh) PERMEM_CTRLR_ID on page 3814
174h	(174h) IA32_SYSENTER_CS on page 3815
175h	(175h) IA32_SYSENTER_ESP on page 3815
176h	(176h) IA32_SYSENTER_EIP on page 3815
179h	(179h) IA32_MCG_CAP on page 3816

Table 69-1. Model Specific Register (MSR) Index (Sheet 2 of 5)

MSR Address	MSR Name
17Ah	(17Ah) IA32_MCG_STATUS on page 3816
17Dh	(17Dh) MSR_SMM_MCA_CAP on page 3817
17Fh	(17Fh) MSR_ERROR_CONTROL on page 3817
186h	(186h) IA32_PERFEVTSEL0 on page 3818
187h	(187h) IA32_PERFEVTSEL1 on page 3818
188h	(188h) IA32_PERFEVTSEL2 on page 3818
189h	(189h) IA32_PERFEVTSEL3 on page 3819
198h	(198h) IA32_PERF_STATUS on page 3819
199h	(199h) IA32_PERF_CTL on page 3819
19Ah	(19Ah) IA32_CLOCK_MODULATION on page 3820
19Bh	(19Bh) IA32_THERM_INTERRUPT on page 3820
19Ch	(19Ch) IA32_THERM_STATUS on page 3821
19Dh	(19Dh) MSR_THERM2_CTL on page 3822
1A0h	(1A0h) IA32_MISC_ENABLE on page 3823
1A1h	(1A1h) PACKAGE_THERM_MARGINBD on page 3824
1A2h	(1A2h) MSR_TEMPERATURE_TARGET on page 3824
1A4h	(1A4h) MSR_MISC_FEATURE_CONTROL on page 3824
1A6h	(1A6h) MSR_OFFCORE_RSP_0 on page 3825
1A7h	(1A7h) MSR_OFFCORE_RSP_1 on page 3825
1A8h	(1A8h) THREAD_SW_DEFEATURE on page 3825
1AAh	(1AAh) MSR_MISC_PWR_MGMT on page 3825
1ADh	(1ADh) MSR_TURBO_RATIO_LIMIT on page 3826
1AEh	(1AEh) MSR_TURBO_RATIO_LIMIT1 on page 3826
1B0h	(1B0h) IA32_ENERGY_PERF_BIAS on page 3826
1B1h	(1B1h) IA32_PACKAGE_THERM_STATUS on page 3827
1B2h	(1B2h) IA32_PACKAGE_THERM_INTERRUPT on page 3828
1C6h	(1C6h) DEBUG_RESOURCE_STATUS on page 3828
1C8h	(1C8h) MSR_LBR_SELECT on page 3829
1C9h	(1C9h) MSR_LASTBRANCH_TOS on page 3829
1D9h	(1D9h) IA32_DEBUGCTL on page 3830
1E3h	(1E3h) DEBUG_ERR_INJ_CTL on page 3830
1E4h	(1E4h) DEBUG_ERR_INJ_CTL2 on page 3831
1E6h	(1E6h) PIC_DEBUG_MODES on page 3832
1F0h	(1F0h) VLW_CAPABILITY on page 3834
1FCh	(1FCh) MSR_POWER_CTL on page 3835
281h	(281h) IA32_MC1_CTL2 (L2 Cache) on page 3836
282h	(282h) IA32_MC2_CTL2 (FEC) on page 3836
283h	(283h) IA32_MC3_CTL2 (MEC) on page 3836
284h	(284h) IA32_MC4_CTL2 (SA) on page 3836
285h	(285h) IA32_MC5_CTL2 (PMU) on page 3837

Table 69-1. Model Specific Register (MSR) Index (Sheet 3 of 5)

MSR Address	MSR Name
286h	(286h) IA32_MC6_CTL2 (SA) on page 3837
287h	(287h) IA32_MC7_CTL2 (MEM 0) on page 3837
288h	(288h) IA32_MC8_CTL2 (MEM 1) on page 3838
2E0h	(2E0h) NO_EVICT_MODE on page 3838
2FFh	(2FFh) IA32_MTRR_DEF_TYPE on page 3838
300h	(300h) MSR_SGXOWNER0 on page 3839
301h	(301h) MSR_SGXOWNER1 on page 3839
309h	(309h) IA32_FIXED_CTR0 on page 3839
30Ah	(30Ah) IA32_FIXED_CTR1 on page 3839
30Bh	(30Bh) IA32_FIXED_CTR2 on page 3839
345h	(345h) IA32_PERF_CAPABILITIES on page 3840
38Dh	(38Dh) IA32_FIXED_CTR_CTRL on page 3840
38Eh	(38Eh) IA32_PERF_GLOBAL_STATUS on page 3841
38Fh	(38Fh) IA32_PERF_GLOBAL_CTRL on page 3842
390h	(390h) IA32_PERF_GLOBAL_STATUS_RESET on page 3843
391h	(391h) IA32_PERF_GLOBAL_STATUS_SET on page 3844
392h	(392h) IA32_PERF_GLOBAL_INUSE on page 3844
3F1h	(3F1h) IA32_PEBS_ENABLE on page 3845
3F8h	(3F8h) MSR_PKG_C3_RESIDENCY on page 3845
3F9h	(3F9h) MSR_PKG_C6_RESIDENCY on page 3845
3FCh	(3FCh) MSR_CORE_C3_RESIDENCY on page 3845
3FDh	(3FDh) MSR_CORE_C6_RESIDENCY on page 3846
3FEh	(3FEh) MSR_CORE_C7_RESIDENCY on page 3846
400h	(400h) IA32_MC0_CTL (BIU) on page 3846
401h	(401h) IA32_MC0_STATUS on page 3847
402h	(402h) IA32_MC0_ADDR (BIU) on page 3848
404h	(404h) IA32_MC1_CTL (L2 Cache) on page 3848
405h	(405h) IA32_MC1_STATUS (L2 Cache) on page 3849
406h	(406h) IA32_MC1_ADDR (L2 Cache) on page 3851
408h	(408h) IA32_MC2_CTL (FEC) on page 3851
409h	(409h) IA32_MC2_STATUS (FEC) on page 3852
40Ah	(40Ah) IA32_MC2_ADDR (FEC) on page 3854
40Ch	(40Ch) IA32_MC3_CTL (MEC) on page 3854

69.2 Model Specific Registers (MSRs)

69.2.1 (006h) IA32_MONITOR_FILTER_SIZE

OS or BIOS can program to the maximum line size in the system. CPUID will return the maximum line size of the processor and the system for the purposes of Monitor and MWait. Software can use this information to pad data appropriately to avoid cross-cluster hot-spots.

MSR Address: 006h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:16	Thread	0h	RW	Reserved.
15:0	Thread	0h	RW	**FILTER_MAXIMUM_LINE_SIZE —** OS or BIOS can program to the maximum line size in the system. CPUID will return the maximum line size of the processor and the system for the purposes of Monitor and MWait. Software can use this information to pad data appropriately to avoid cross-cluster hot-spots.

69.2.2 (017h) IA32_PLATFORM_ID

Used for selecting which patch to use. Indicates the platform that the processor is intended for. This MSR is used for microcode update loading purpose only. For all other device identification purposes it is recommended that System BIOS use PCI based Device Identification register.

MSR Address: 17h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:53	Package	0h	RSV	Reserved.
52:50	Package	0h	RW	**PLATFORM_ID —** This field is loaded from SoC fuses.
49:0	Package	0h	RSV	Reserved.

69.2.3 (01Bh) IA32_APIC_BASE

Register used to implement the APICBASE MSR. Contains the base address for all the APIC registers along with certain APIC control and state bits. The xAPIC Base Register holds the APIC base address, permitting the relocation of the APIC memory map.

MSR Address: 01Bh				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:40	Thread	0h	Rsvd0	Reserved.
39:12	Thread	0h	RW	**APIC_BASE —** Bits 39:12 of the physical APIC register base address. WRMSR will GP fault on writes of 1 to 35:32 for PA32 parts.
11	Thread	0h	RW	**APEN —** APIC enable bit. If bit is 0, then the SoC APIC is disabled. If the bit is 1, then APIC is enabled.
10	Thread	0h	RW	**EXTENDED_MODE_ENABLE —** Enable/Disable for APIC Extensions.
9	Thread	0h	Rsvd0	Reserved.
8	Thread	0h	RW	**BSP —** Bit used to indicate that the processor is the Boot Strap Processor (BSP). BIOS must clear this bit if the processor is not going to be the System BSP (SBSP).
7:0	Thread	0h	Rsvd0	Reserved.

69.2.4 (02Eh) MSR_PIC_MSG_CONTROL

MSR used to enable/disable TPR messages. See NHM-B bug 2425138. Controls APIC TPR Update messages from the processor's Local APIC. By default at reset, TPR Update messages are disabled so they are not queued up while not being serviced. However, it is the BIOS' responsibility to enable TPR Update messages before any Local APIC mode transitions occur.

MSR Address: 02Eh				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31:11	-	-	-	Reserved.
10	Module	0h	RO	**TPR_MSG_OFF —** Prevents all TPR / IntPrioUpd messages from being generated, including those generated from APIC ID/LogID/DFR writes and Enable changes. WRMSR only allows clearing of this bit. Any attempt to set it (if already clear) will be ignored.
9:0	-	-	-	Reserved.

69.2.5 (033h) MSR_MEMORY_CONTROL

DCU_TEST_CTL MSR. Ucode mirrors the appropriate split lock disable bit and this entry is used only to generate the proper address defines. This register is used to disable split locks, which are locked instructions that split a cache line.

MSR Address: 033h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31	Thread	0h	RW	**SPLIT_LOCK_DISABLE —** If set to 1, disables split locks. If clear to 0, enables split locks. Setting this bit will cause split locks to be non-atomic, despite the lock attribute of the instruction.
30:0	-	-	-	Reserved.

69.2.6 (034h) MSR_SMI_COUNT

SLM PerfMon:Number of times SMISystem Management Mode (SMM) was entered.

MSR Address: 034h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:32	Thread	0h	RW	Reserved.
31:0	Thread	0h	RO	**SMM_ENTRY_COUNT —** Holds a running count of SMI events since the last reset.

69.2.7 (035h) CORE_THREAD_COUNT

This MSR is shared in the processor package and used to determine the current count of enabled Cores and Threads. This register reflects the actual number of enabled Cores and Threads based on the factory configurations and BIOS modifications. The Core Count and ThreadCount fields reflect the enabled cores and threads based on the factory-configured core.

MSR Address: 035h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31:16	Package	-	RO	**CORE_COUNT —** The Core Count reflects the enabled cores based on the factory-configured core count and the value of the RESOLVED_CORES_MASK register at reset time.
15:0	Package	-	RO	**THREAD_COUNT —** The Thread Count reflects the enabled threads based on the factory-configured thread count and the value of the RESOLVED_CORES_MASK register at reset time.

69.2.8 (039h) MSR_THREAD_ID

On P4, external software is allowed to set bits 31:5 to an arbitrary value to support clustered systems.

MSR Address: 039h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31:8	Thread	0h	Rsvd0	**RESERVED —** reserved
7:0	Thread	0h	RW	**APIC_ID —** From the local APIC ID. Read only unless PIC debug mode is enabled.

69.2.9 (03Bh) IA32_TSC_ADJUST

UTSC_THREAD_OFFSET is Used to read the thread specific offset to Time Stamp counter base value in RDTSC computation. This helps in synchronizing between the cores for TSC calibration. This feature is available only when CPUID.(EAX=7):EBX[1] is 1.

MSR Address: 03Bh				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:0	Thread	0h	RW	**THREAD_OFFSET —** A read from this MSR would return the thread's offset to TSC base value, that is used in computing RDTSC return value. A write to this MSR would write only the thread's offset to the TSC value and not update the actual counter value.

69.2.10 (04Eh) MSR_PPIN_CTL

Protected Processor Inventory Number (PPIN) Enable Control The reset value is 0. It will not survive warm reset.

MSR Address: 04Eh				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31:2	-	-	-	Reserved.
1	Package	0h	RW	**ENABLE —** Indication to SW about presence of PPIN 0 - PPIN not present. Read of PPIN MSR results in a #GP. 1 - PPIN present. Read of PPIN MSR by SW is allowed.
0	Package	0h	RW	**LOCK —** Bit indicates if PPIN_CTL is locked 0 - Not locked (SW free to write to PPIN_CTL). 1 - Locked (SW can no longer write to PPIN_CTL).

69.2.11 (04Fh) MSR_PPIN

MSR for PPIN feature. Access to MSR_PPIN is permitted only if MSR_PPIN_CTL[1:0]='10b'

MSR Address: 4Fh				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:0	Package	0h	RO	**VALUE —** The 64 bit inventory number.

69.2.12 (052h) SMM_MCA_CONTROL

Allows System Management mode (SMM) firmware to intercept Corrected and UCNA (Uncorrected, No Action) errors.

MSR Address: 052h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31:10	-	-	-	Reserved.
9	Thread	0h	RW	**PEND_SMI_ON_MCA —** Pend SMI on MCA
8:2	-	-	-	Reserved.
1	Thread	0h	rsvd0	**UCNA_RD_STATUS_IN_SMM_ONLY —** The SoC design has no UCNA errors.
0	Thread	0h	RW	**CERR_RD_STATUS_IN_SMM_ONLY —** Only read valid correctable errors status when in SMM. Otherwise read 0 if V=1 and UC=0.

69.2.13 (079h) IA32_BIOS_UPDT_TRIG

Used to trigger the loading of the Microcode Update to the processor. Refer to the 'Microcode Update' section of the BIOS Writer's Guide for further information on the Microcode Update loading. Attempts to read this MSR will result in a GP fault. The IA32_BIOS_UPDT_TRIG register is not shared across cores in the same physical processor. BIOS must load the microcode update for each thread in a processor package.

MSR Address: 079h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:0	Core	0h	WO	**DATA —** Any data write will cause the microcode update loader to get triggered.

69.2.14 (07Ah) MSR_SGX_FEATURE_ACTIVATION

MSR Address: 07Ah				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31:1	-	-	-	Reserved.
0	Core	0h	RW	**SE —** Secure Enclaves Feature Activation

69.2.15 (08Bh) IA32_BIOS_SIGN_ID

Microcode Update Signature.

MSR Address: 08Bh				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:32	Thread	0h	RW	**PATCH_SIGN_ID —** Microcode Update Signature.
31:0	Thread	0h	Rsvd0	Reserved.

69.2.16 (09Bh) IA32_SMM_MONITOR_CTL

This MSR is writeable only in System Management Mode (SMM), else the SoC generates #GP.

MSR Address: 09Bh				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:32	Thread	0h	RW	Reserved.
31:12	Thread	0h	RW	**MSEG_BASE_PAGE_FRAME_ADR —** VMX MSEG base page frame address
11:3	Thread	0h	RW	Reserved.
2	Thread	0h	RW	**VMXOFFCTRL —** VMX Off Control. When this bit is set, VMXOFF will unmask SMI events.
1	Thread	0h	RW	**CSTATE_SMI_OPTIN —** C-state SMI VMX opt in. Can only be set by WRMSR if IA32_FEATURE_CONTROL_MSR.C_STATE_SMI and LOCK
0	Thread	0h	RW	**VALID —** When set, this bit indicates that the MSR contents are valid.

69.2.17 (09Eh) IA32_SMBASE

Read only MSR. WRMSR will always #GP. RDMSR will GP if not in SMM mode.

MSR Address: 09Eh				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:32	-	-	-	**Reserved (RSVD) —** Reserved.
31:0	Thread	0h	RO	**DATA —** Register which contains the current SMM base value for the processor. The RESET event handler should set it to 0x00030000, which is the default value. When RSM executes, it reads the SMM base slot value in SMM memory and loads it into this register.

69.2.18 (0C1h) IA32_PMC0

Performance Counter Register 0. This register is available only if CPUID (EAX=0Ah):EAX[15:8] > 0.

MSR Address: 0C1h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:0	Thread	-	-	**DATA** — Refer to the Intel® 64 and IA-32 Architectures Software Developer's Manual for a detailed description and usage of this MSR.

69.2.19 (0C2h) IA32_PMC1

Performance Counter Register 1. This register is available only if CPUID (EAX=0Ah):EAX[15:8] > 1.

MSR Address: 0C2h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:0	Thread	-	-	**DATA** — Refer to the Intel® 64 and IA-32 Architectures Software Developer's Manual for a detailed description and usage of this MSR.

69.2.20 (0C3h) IA32_PMC2

Performance Counter Register 2. This register is available only if CPUID (EAX=0Ah):EAX[15:8] > 2.

MSR Address: 0C3h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:0	Thread	-	-	**DATA** — Refer to the Intel® 64 and IA-32 Architectures Software Developer's Manual for a detailed description and usage of this MSR.

69.2.21 (0C4h) IA32_PMC3

Performance Counter Register 3. This register is available only if CPUID (EAX=0Ah):EAX[15:8] > 3.

MSR Address: 0C4h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:0	Thread	-	-	**DATA** — Refer to the Intel® 64 and IA-32 Architectures Software Developer's Manual for a detailed description and usage of this MSR.

69.2.22 (0CEh) MSR_PLATFORM_INFO

This contains information about platforms frequency capabilities that the CPU reports.

MSR Address: CEh				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:56	Package	0h	RO	Reserved.
55:48	Package	1h	RW	**MIN_OPERATING_RATIO —** Min supported ratio in units of 100MHz Confirm with Jeff
47:40	Package	0h	RW	**MAX_EFFICIENCY_RATIO —** Maximum Efficiency Ratio. This is given in units of 100 MHz.
39:38	Package	0h	RO	Reserved.
37	Package	0h	RW	**TIMED_MWAIT_ENABLE —** Timed MWAIT enable
36	Package	0h	RO	Reserved.
35	Package	0h	RW	**PFAT_ENABLE —** Platform Firmware Armoring Technology (PFAT). 0 indicates the PFAT feature is not available. 1indicates the PFAT feature is available.
34:33	Package	0h	RW	**CONFIG_TDP_LEVELS —** Configurable TDP. Indicates the number of configurable TDP levels supported. 00 - Config TDP not supported 01 - One additional TDP level supported 10 - Two additional TDP levels supported
32	Package	0h	RW	**LPM_SUPPORT** — Low Power Mode Support. When set to 1, indicates that BIOS may program IA32_PERF_CTL to levels below the max efficiency ratio down to Minimum Ratio bits [55:48]. 0 - Low Power mode not supported 1 - Low Power mode supported Determined by fuse.
31	Package	1h	RW	**CPUID_FAULTING_EN —** CPUID Faulting Capability. When set to 1 indicates that the processor supports raising a #GP if CPUID is executed when not in SMM and the CPL > 0. When this bit is set, it indicates that MSR 140h FEATURE_ENABLES bit 0 can be written by a VMM.
30	Package	1h	RW	**PRG_TJ_OFFSET_EN —** Programmable TCC Activation Offset. When set to 1, indicates that the TCC Activation Offset field in MSR_TEMPERATURE_TARGET is valid and programmable. When set to 0, indicates it's not programmable. When this bit is 0, an attempt to write to MSR_TEMPERATURE_TARGET bits [27:24] will result in a GP fault.
29	Package	1h	RW	**PRG_TDP_LIMIT_EN —** Programmable TDP Limits for Turbo Mode. When set to 1, indicates that TDP Limits for Turbo mode are programmable, and when set to 0, indicates TDP Limits for Turbo mode are not programmable. When this bit is 0, an attempt to write to PP0_POWER_LIMIT, PP1_POWER_LIMIT and PACKAGE_POWER_LIMIT MSR will result in a GP fault.
28	Package	1h	RW	**PRG_TURBO_RATIO_EN —** Programmable Ratio Limits for Turbo Mode. When set to 1, indicates Programmable Ratio Limits for Turbo Mode are enabled, and when set to 0, indicates Programmable Ratio Limits for Turbo Mode are disabled.
27	Package	0h	RW	**SAMPLE_PART —** Sample. A value of 1 indicates the processor is a preproduction sample and a property of Intel, a value of 0 indicates the part is intended for production.
26	Package	0h	RW	**DCU_16K_MODE_AVAIL —** DCU Mode Select Support. When set to 1. indicates that DCU Mode Selection is supported, and when set to 0, indicates that DCU Mode Selection is not available and the processor will remain in the default DCU mode.
25	Package	0h	RO	Reserved.
24	Package	0h	RW	**OCVOLT_OVRD_EN —** When set to 1, indicates that this part supports Voltage override overclocking. When this bit is 0 the processor does not support overclocking Voltage overrides.
23	Package	0h	RW	**PPIN_CAP —** When set to 1, indicates that Protected Processor Inventory Number (PPIN) feature is supported.
22:17	Package	0h	RO	Reserved.

MSR Address: CEh				
Bit	**Scope**	**Default**	**Attribute**	**Description**
16	Package	1h	RO	**SMM_SAVE_CAP —** SMM Save Capability. When set to 1 indicates this feature exists.
15:8	Package	0h	RW	**MAX_NON_TURBO_LIM_RATIO —** Maximum Non Turbo Ratio. Contains the max non-turbo ratio. This is the ratio of the frequency that invariant TSC runs at. Frequency = ratio * 100 MHz. ***Note:*** The Maximum Non-Turbo Ratio is adjusted to the flexible limit ratio (as specified in the FLEX_RATIO MSR 194h FLEX_RATIO field bits [15:8]) if flexible limit is enabled (by setting the FLEX_RATIO MSR 194h FLEX_EN field bit[16]=1. In case of Configurable TDP feature, the maximum of the available TDP levels is reported in this field.
7:0	Package	0h	RO	Reserved.

69.2.23 (0E2h) MSR_PKG_CST_CONFIG_CONTROL

Power Management - C-states configuration. Note the presence of the LOCK bit (15). When set, locks bits 15-0 of this register for further writes, until the next reset occurs.

MSR Address: 0E2h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:32	Core	-	-	Reserved.
31	Core	0h	RW	**TIMED_MWAIT_ENABLE —** When set, enables Timed MWAIT feature. When this bit is cleared, all MWAIT timer configurations issued as a part of MWAIT will raise a #GP exception.
30	Core	0h	RW	**ENPKGCUNDEMOTION —** Enable Package Cstate Un-Demotion. Its the enable to consider cases where demotion was the incorrect decision in determining Cstate depth.
29	Core	0h	RW	**ENPKGCAUTODEMOTION —** Enable Package Cstate Auto-Demotion. It enables use of history of past pkg Cstate depth and residence, as a factor in determining Cstate depth.
28	Core	0h	RW	**ENC1UNDEMOTION —** Enable Un-Demotion from Demoted C1.
27	Core	0h	RW	**ENC3UNDEMOTION —** Enable Un-Demotion from Demoted C3.
26	Core	0h	RW	**C1_STATE_AUTO_DEMOTION_ENABLE —** When set, SoC will conditionally demote C3/C6/C7 requests to C1 based on uncore auto-demote information.
25	Core	0h	RW	**C3_STATE_AUTO_DEMOTION_ENABLE —** When set, SoC will conditionally demote C6/C7 requests to C3 based on uncore auto-demote information.
24:16	Core	-	-	Reserved.
15	Core	0h	RW-O	**CST_CFG_LOCK —** When set, locks bits [15:0] of this register for further writes, until the next reset occurs.
14:11	Core	-	-	Reserved.
10	Core	0h	RW-L	**IO_MWAIT_REDIRECTION —** When set, will map I/O_read instructions sent to I/O registers at MSR_PMG_IO_CAPTURE_BASE[15:0] to MWAIT instructions.
9:8	Core	-	-	Reserved.
7:4	Core	0h	RW	**MAX_CORE_C_STATE —** The possible values are: 0000 - Reserved 0001 - C1 0010 - C3 0011 - C6
3:0	Core	0h	RW-L	**PACK_LIM —** Limits the resolved package Cstate to be less than or equal to the encoded state: • 0x0 = No Pkg States [Self-Refresh] • 0x1 = No S0Ix [L2 Voltage Reduction] • 0x2 = No Limit [Default] This field will also indirectly impact the possible module Cstate. A limit of C1 means that the module cannot leave C0, as C1 is a core-only Cstate. C3 and C6, will restrict the possible module Cstate to that respective value. If the state is unlimited or C7 and deeper, then the module can enter C7. The states C8, C9, and C10 and synonyms for S0i1, S0i2, and S0i3, respectively.

69.2.24 (0E4h) MSR_PMG_IO_CAPTURE_BASE

Power Management I/O base address for I/O trapping to C-states.

See http://biosbits.org.

MSR Address: 0E4h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:19	Core	-	-	Reserved.
18:16	Core	0h	RW	**CST_RANGE —** The I/O-port block size in which I/O-redirection will be executed (0-7). Should be programmed based on the number of LVLx registers existing in the SoC.
15:0	Core	0h	RW	**LVL2B —** The SoC compares I/O-read zone to this base address to determine if an MWAIT(C2/3/4) needs to be issued instead of the I/O-read. Should be programmed to the SoC Plevel_2 I/O address.

69.2.25 (0E7h) IA32_MPERF

Maximum Performance Frequency Clock Count register. IA32_MPERF and IA32_APERF MSRs do not have any meaning by themselves separately. Only IA32_APERF/ IA32_MPERF ratio is architectural.

MSR Address: 0E7h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:0	Thread	0h	RW	**C0_MCNT —** C0 maximum-frequency clock count: Increments at maximum clock frequency (as allowed by the Resolved Ratio) when core is in C0. Cleared by a write to this field.

69.2.26 (0E8h) IA32_APERF

Actual Performance Frequency Clock Count register. IA32_MPERF and IA32_APERF MSRs do not have any meaning by themselves separately. Only IA32_APERF/ IA32_MPERF ratio is architectural.

MSR Address: 0E8h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:0	Thread	0h	RW	**C0_ACNT —** C0 actual-frequency clock count: Accumulates core clock counts at the coordinated clock frequency when core is in C0. Cleared by a write to this field.

69.2.27 (0FEh) IA32_MTRRCAP

Read-only register containing MTRR feature identification for the processor. Should be used in conjunction with the CPUID[EDX] bit 12 to determine MTRR capabilities. This MSR is read only. The SoC generates #GP on any write.

MSR Address: 0FEh				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31:13	Core	-	-	Reserved.
12	Core	0h	RO	**PRMRR —** PRMRRs are supported: Reports 1 if PRMRR is fuse enabled.
11	Core	0h	RO	**SMRR —** SMRR: 1 indicates supported.
10	Core	0h	RO	**WRITE —** Write-Combining memory type supported if set.
9	Core	-	-	Reserved.
8	Core	0h	RO	**FIX —** Fixed range registers supported if set.
7:0	Core	0h	RO	**VCNT —** Number of variable range registers.

69.2.28 (120h) POWER_MISC

Miscellaneous power controls used for eHALT enables.

MSR Address: 120h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31:9	-	-	-	Reserved.
8	Thread	0h	RW	**WBINVAL_DL1 —** Used by BIOS to flush DL1->L2.
7	-	-	-	Reserved.
6	Thread	0h	RW	**ENABLE_IA_UNTRUSTED_MODE —** Post boot, BIOS will set this boot to clear the default IA_Boot mode and enter IA Untrusted Mode.
5:4	-	-	-	Reserved.
3	Thread	0h	RW	**ENABLE_INDP_AUTOCM —** Enable Independent Pstate Auto Clock Modulation: Writing 1 to this bit will allow automatic clock modulation based on it's core specific requested ratio if requested ratio is lower than the resolved module ratio. This setting does not apply if requested ratio is lower than minimum ratio supported by core PLL.
2	Thread	0h	RW	**ENABLE_ULFM_AUTOCM —** Enable UltraLowFreqMode Auto Clock Modulation: Writing 1 to this bit will allow automatic clock modulation based on it's core specific requested ratio if the resolved module ratio equals the minimum ratio supported by core PLL.
1:0	-	-	-	Reserved.

69.2.29 (121h) EMULATE_PM_TMR

Emulate PM_TMR.

MSR Address: 121h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:32	Thread	0h	RW	**MULTIPLIER —** Constant programmed by BIOS to translate CTC to target frequency (14.31818/4).
31:17	-	-	-	Reserved.
16	Thread	0h	RW	**PM_TMR_BLK_VALID —** Indicates that the MSR has been programmed by BIOS, and thus enables internal emulation of the PM_TMR.
15:0	Thread	0h	RW	**PM_TMR_BLK_BASE —** Base I/O port address of the PM_TMR.

69.2.30 (139h) INITIAL_BOOT_BLOCK_COMPLETE

Write-only MSR. WRMSR causes #GP if SECURE_BOOT_CAPABILITY_ENABLE == 0.

MSR Address: 139h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31:1	-	-	-	Reserved.
0	Thread	0h	WO	**BIOS_RDY_FOR_MISC_EVENTS —** WMRSR ignores writes of 0. A write of 1 will set CPU_BIOS_RDY_FOR_MISC_INTERRUPTS in SEC.

69.2.31 (13Ch) FEATURE_CONFIG

This MSR is visible only if CPUID.(EAX=01h):ECX[25]=1, which indicates the processor was manufactured with AES-NI enabled. Note that when AES-NI is disabled, a #UD exception will be raised if software attempts to execute one of the AES-NI instructions.

MSR Address: 13Ch				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31:2	-	-	-	Reserved.
1	Core	0h	RW	**AESNI_DISABLE —** This bit disables Advanced Encryption Standard feature on this processor core. To disable AES, System BIOS must write 11b to this MSR. Writes of 00b, 01b or 10b to this MSR will result in AES enable. WRMSR will GP if the lock bit is set.
0	Core	0h	RW	**AESNI_LOCK —** 1 = Locked. When set, locks this MSR from being written, writes o this bit will result in GP(0) until an S5 reset occurs. BIOS must ensure this lock bit is set before boot to OS.

69.2.32 (140h) FEATURE_ENABLES

Miscellaneous enables for thread-specific features.

MSR Address: 140h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31:1	-	-	-	Reserved.
0	Thread	0h	RW	**CPUID_GP_ON_CPL_GT_0 —** Causes CPUID to #GP if current privilege level (CPL) is greater than 0 and not in SMM. BIOS should not set this bit. This bit should only be configured by a VMM.

69.2.33 (15Ch) PERMEM_CONFIG_INFO

Specifies the maximum number of memory controllers on the platform capable of supporting memory persistence.

MSR Address: 15Ch				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31:8	-	-	-	Reserved.
7:0	Thread	0h	RO	**NUMBER_OF_PCOMMIT_ADDRESSES —** Maximum number of different PCOMMIT addresses.

69.2.34 (15Dh) PERMEM_CTRLR_INDEX

Index into the list of persistent memory addresses which is accessed when the PERMEM_CTRLR_ID MSR is read/written.

MSR Address: 15Dh				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63	Thread	0h	RW	**LOCK —** When set, WRMSR to PERMEM_CTRL_ID will #GP. WRMSR to clear this bit outside SMM will #GP. That means that once locked, it can be unlocked only from SMM. This bit is cleared on reset.
62:2	-	-	-	Reserved.
1:0	Thread	0h	RW	**INDEX —** Can be programmed to any value in the range 0 to N-1 where N is the value reported in 7:0 of PERMEM_CONFIG_INFO. For the SoC, N=4, and so this is a 2-bit field to allow the remaining fields to be checked by the MSR pla.

69.2.35 (15Eh) PERMEM_CTRLR_ID

Specifies the maximum number of memory controllers on the platform capable of supporting memory persistence.

MSR Address: 15Eh				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:40	-	-	-	Reserved.
39:6	Thread	0h	RW	**IDENTIFIER —** Value written to this field uniquely identifies a persistent memory controller, whose index is in PERMEM_CTRLR_INDEX. Unused indices must be programmed with a reserved value of 0.
5:0	-	-	-	Reserved.

69.2.36 (174h) IA32_SYSENTER_CS

Refer to the Intel® 64 and IA-32 Architectures Software Developer's Manual for a detailed description and usage of this MSR.

MSR Address: 174h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:32	-	-	-	Reserved.
31:0	Thread	0h	RW	**DATA —** To be defined in the Intel® 64 and IA-32 Architectures Software Developer's Manual.

69.2.37 (175h) IA32_SYSENTER_ESP

Refer to the Intel® 64 and IA-32 Architectures Software Developer's Manual for a detailed description and usage of this MSR.

MSR Address: 175h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:0	Thread	0h	RW	**DATA —** To be defined in the Intel® 64 and IA-32 Architectures Software Developer's Manual.

69.2.38 (176h) IA32_SYSENTER_EIP

Refer to the Intel® 64 and IA-32 Architectures Software Developer's Manual for a detailed description and usage of this MSR.

MSR Address: 176h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:0	Thread	0h	RW	**DATA —** To be defined in the Intel® 64 and IA-32 Architectures Software Developer's Manual.

69.2.39 (179h) IA32_MCG_CAP

MCA Capability Control Register. This MSR is read only. The SoC generates #GP on any write.

MSR Address: 179h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31:24	-	-	-	Reserved.
23:16	Thread	0h	RO	**NUMBER_OF_EXTENDED_MACHINE_CHECK_REGISTERS —** Indicates the number of extended machine check state registers present on this processor.
15:12	-	-	-	Reserved.
11	Thread	0h	RO	**MCG_YELLOW_GREEN —** Indicates that this processor implements "yellow/ green" health reporting.
10	Thread	0h	RO	**MCB_CMCI_P —** Correct MC Error counting / signaling is supported.
9	Thread	0h	RO	**EXTENDED_MACHINE_CHECK_MSRS_SUPPORTED —** Indicates that this processor implements the extended machine check state registers found starting at MSR address 180H. The SoC does not implement these extended registers.
8	Thread	0h	RO	**IMCG_CTL_IS_PRESENT —** Indicates that this processor implements the IA32_MCG_CTL MSR. The SoC does not implement this MSR.
7:0	Thread	0h	RO	**NUMBER_OF_HARDWARE_REPORTING_BANKS_AVAILABLE —** Indicates the number of error-reporting banks available on this processor.

69.2.40 (17Ah) IA32_MCG_STATUS

The Machine Check Status register is used to determine the current state of the machine check architecture of the processor after an error has occurred.

MSR Address: 17Ah				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31:3	-	-	-	Reserved.
2	Thread	0h	RW	**MCIP —** Machine Check In Progress. When set, indicates that a machine check has been generated. If a second machine check is detected while this bit is still set, the processor will enter a shutdown state. Software can write this bit, and should write it to 0 after processing a machine check exception.
1	Thread	0h	RW	**EIPV —** Error IP valid. When set, indicates that the instruction pointed to by the instruction pointer pushed on the stack when the machine check was generated is directly associated with the error.
0	Thread	0h	RW	**RIPV —** Restart IP valid. When set, indicates that the program execution can be restarted reliably at the instruction pointed to by the instruction pointer pushed on the stack when the machine check was generated. When cleared, the program cannot be reliably restarted.

69.2.41 (17Dh) MSR_SMM_MCA_CAP

This register is only accessible while in SMM. Attempting to read or write this register outside of SMM will cause a #GP exception to be raised. This register indicates support for enhanced SMM features. It also reports which Machine-Check banks support enhanced MCA.

MSR Address: 17Dh				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:60	-	-	-	Reserved.
59	Thread	0h	SMM-RO	**LONG_FLOW_INDICATION —** Set to indicate SMM long flow indicator support.
58	Thread	0h	SMM-RO	**SMM_CODE_ACCESS_CHK —** Set to 1 if the SMM code access check feature is supported and the SMM_FEATURE_CONTROL register (MSR 4E0h) is supported.
57	Thread	0h	SMM-RO	**SMM_CPU_SVRSTR —** 0 for the SoC. Set to 1 if the SAVE/RESTORE feature is supported and the SMM_FEATURE_CONTROL register (MSR 4E0h) is supported.
56	Thread	0h	SMM-RO	**TARGETED_SMI —** 0 for the SoC. Set to 1 if the thread supports targeted SMI and the SMM_ENABLE register (MSR 4E1h) is supported.
55	Thread	0h	SMM-RO	**ERROR_SPOOFING —** 0 for the SoC. Set if Error Spoofing and Enhanced MCA are supported.
54	Thread	0h	SMM-RO	**SMM_PROT_MODE —** 0 for the SoC. Set if SMM Protected Mode is supported.
53:32	-	-	-	Reserved.
31:0	Thread	0h	SMM-RO	**BANK_SUPPORT —** ENHANCED_MCA only, so 0 for the SoC. One bit per bank. If bit is set, then the corresponding bank supports enhanced MCA.

69.2.42 (17Fh) MSR_ERROR_CONTROL

Error Control Register. This register allows BIOS to control certain error logging features and their behaviors on the processor.

A #GP Fault will occur when doing a read of this MSR and the ERROR_CONTROL MSR is not available.A non-architectural, package-scoped MSR intended for use by BIOS. The bit will be saved and restored in C7+ states. The reset value for the bit is 0. It will not survive warm reset.

MSR Address: 17Fh				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31:5	-	-	-	Reserved.
4	Package	0h	RW	**CMCI_DISABLE —** When set to 1, disables corrected machine check interrupt entirely, cleared upon each reset. BIOS may use this bit to disable CMCI. Typically useful if OEM offers BIOS based PFA (Predicted Failure Analysis) or "Health Monitoring" capability. BIOS will require error polling, e.g., periodic SMI. Must be set during the BIOS initialization. Once it is set: • Any read to IA32_MCG_CAP[10] bit will result in 0. Indicating that processor does not support CMCI. Any read to IA32_MCi_CTL2[30] bit will result in 0. Indicating that CMCI signaling is not available in machine check bank 'i'.Any write to it will result in no change (read-only).
3:0	-	-	-	Reserved.

69.2.43 (186h) IA32_PERFEVTSEL0

Performance Event Selection Register 0. This register is available only if CPUID. (EAX=0Ah):EAX[15:8] > 0

MSR Address: 186h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:32	-	-	-	Reserved.
31:24	Thread	0h	RW	**COUNT_MASK —** When CMASK is not zero, the corresponding performance counter increments each cycle if the event count is greater than or equal to the CMASK.
23	Thread	0h	RW	**INVERT_FLAG —** Invert the CMASK.
22	Thread	0h	RW	**ENABLE_FLAG —** When set, performance counting is enabled in the performance-monitoring counter; when clear, the counter is disabled.
21	Thread	0h	RW	**MYTHREAD_ALLTHREAD —** 0 = Count events associated with this logical processor 1 = Count event on any logical processor in that core, or for uncore events, any logical processor in the module.
20	Thread	0h	RW	**INT_APIC_ENABLE_FLAG —** When set, the processor generates an exception through its local APIC on counter overflow for this counter's thread.
19	Thread	0h	RW	**PIN_CONTROL_FLAG —** Enables pin control.
18	Thread	0h	RW	**EDGE_DETECT_FLAG —** Enables edge detection if set.
17	Thread	0h	RW	**OS_MODE_FLAG —** Counts while in privilege level is ring 0.
16	Thread	0h	RW	**USER_MODE_FLAG —** Counts while in privilege level is not ring 0.
15:8	Thread	0h	RW	**EVENT_MASK —** Further qualifies the event selected in the event select field.of cache states
7:0	Thread	0h	RW	**EVENT_ID —** Selects the event to be monitored

69.2.44 (187h) IA32_PERFEVTSEL1

Performance Event Selection Register 0. This register is available only if CPUID. (EAX=0Ah):EAX[15:8] > 1

MSR Address: 187h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:0	Thread	0h	RW	**DATA —** Refer to the description of IA32_PERFEVTSEL0.

69.2.45 (188h) IA32_PERFEVTSEL2

Performance Event Selection Register 0. This register is available only if CPUID. (EAX=0Ah):EAX[15:8] > 2

MSR Address: 188h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:0	Thread	0h	RW	**DATA —** Refer to the description of IA32_PERFEVTSEL0.

69.2.46 (189h) IA32_PERFEVTSEL3

Performance Event Selection Register 0. This register is available only if CPUID. (EAX=0Ah):EAX[15:8] > 3

MSR Address: 189h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:0	Thread	0h	RW	**DATA —** Refer to the description of IA32_PERFEVTSEL0.

69.2.47 (198h) IA32_PERF_STATUS

Performance Status MSR.

MSR Address: 198h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:48	-	-	-	Reserved.
47:32	Module	0h	RO	**CORE_VOLTAGE —** Voltage in 3.13 format.
31:16	-	-	-	Reserved.
15:8	Module	0h	RO	**PLLRATIO —** Current performance State Value bits 15:8.Ratio of the core pll.
7:0	-	-	-	Reserved.

69.2.48 (199h) IA32_PERF_CTL

Performance Control MSR. SW makes request for a new Performance state (P-State) by writing this MSR.

MSR Address: 199h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:33	-	-	-	Reserved.
32	Thread	0h	RW	**TURBO_DISABLE —** 1 = Turbo Mode disabled, 0=Turbo Mode enabled. Note: This Turbo Mode Disable exists on each logical processor. Turbo Mode setting of a core does not impact Turbo Mode of the package. BIOS should not use this Turbo Mode Disable since it does not change the Turbo Mode feature flag. This Turbo Mode Disable is intended for OS use only.
31:16	-	-	-	Reserved.
15:8	Thread	0h	RW	**P_REQ —** Requested P-state ratio value for this logical processor.
7:0	-	-	-	Reserved.

69.2.49 (19Ah) IA32_CLOCK_MODULATION

Thread T-State Request

MSR Address: 19Ah				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31:5	-	-	-	**Reserved (RSVD) —** Reserved.
4	Thread	0h	RW	**THROTTLE_ACTIVE —** Enables ondemand software controlled clock modulation when set disables softwarecontrolled clock modulation when clear.
3:0	Thread	0h	RW	**T_STATE_REQ —** Selects the ondemand clock modulation duty cycle. This field is only active when the ondemand clock modulation enable flag is set.

69.2.50 (19Bh) IA32_THERM_INTERRUPT

Intel® Thermal Monitor Interrupt Control Register for the digital thermometer. When any of the interrupt enables are set, SW must configure the interrupt type to be delivered. SW writes the Thermal Local Vector Table (TLVT) entry of the local APIC to specify the interrupt type to be delivered.

MSR Address: 19Bh				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31:25	-	-	-	Reserved.
24	Core	0h	RW	**SPARE_PWR_LIMIT_ENABLE —** Reserved for Power Limit Notification Enable.
23	Core	0h	RW	**THRESHOLD_2_INT_ENABLE —** Threshold 2 Interrupt Enable R/W. This bit allows the BIOS to enable the generation of an interrupt on the transition of threshold 2 in any direction. A value 0 default disables interrupts and a value 1 enables interrupts..
22:16	Core	0h	RW	**THRESHOLD_2_REL_TEMP —** Specifies temperature Threshold 2 value as an offset below TJ_{MAX} temperature. Compares against temperature reported value in the status register IA32_CR_THERM_STATUSDIG_TEMP_READOUT value.
15	Core	0h	RW	**THRESHOLD_1_INT_ENABLE —** Threshold 1 Interrupt Enable R/W. This bit allows the BIOS to enable the generation of an interrupt on the transition of threshold 1 in any direction. A value 0 default disables interrupts and a value 1 enables interrupts.
14:8	Core	0h	RW	**THRESHOLD_1_REL_TEMP —** Specifies temperature Threshold 1 value as an offset below TJ_{MAX} temperature. Compares against temperature reported value in the status register IA32_CR_THERM_STATUSDIG_TEMP_READOUT value.
7:5	-	-	-	Reserved.
4	Core	0h	RW	**OUT_OF_SPEC_INT_ENABLE —** This bit allows the BIOS to enable the generation of an interrupt on the transition to the OutofSpec condition. The OutofSpec temperature is specified as an offset from TJ_{MAX} in CPU_THERM_CFG1OUT_OF_SPEC_THRESHOLD..If OVERHEAT_OFF_FUSE will ignore OOS condition.
3	-	-	-	Reserved.
2	Core	0h	RW	**PROCHOT_INT_ENABLE —** This bit allows the BIOS to enable the interrupt on the transition of the external PROCHOT pin. If set a thermal interrupt is generated on either the rising or falling edge of PROCHOT.0 disable interrupt. 1 enable interrupt.
1	Core	0h	RW	**LOW_TEMP_INT_ENABLE —** This bit allows the BIOS to enable the generation of an interrupt on the transition from hightemperature to a lowtemperature where high temperature is dictated by the thermal monitor trip threshold. 0 disable interrupt. 1 enable interrupt
0	Core	0h	RW	**HIGH_TEMP_INT_ENABLE —** This bit allows the BIOS to enable the generation of an interrupt on the transition from lowtemperature to a hightemperature threshold where high temperature is dictated by the thermal monitor trip threshold. 0 disable interrupt. 1 enable interrupt.

69.2.51 (19Ch) IA32_THERM_STATUS

Intel® Thermal Monitor CPU Core thermal status register.

MSR Address: 19Ch				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31	Core	0h	RO	**VALID —** Set if temperature is within the valid thermal sensor range.
30:27	Core	1h	RO	**RESOLUTION —** Supported resolution in degrees C.
26:23	-	-	-	Reserved.
22:16	Core	0h	RO	**TEMPERATURE —** This is a temperature offset in degrees C from the TJ_{MAX} temperature. See the READING_VALID field in the thermal status register for further details on how to interpret this field. Note that behavior of this field is also affected by CPU_THERM_SENS_CFGGROUP_TEMP. The power controller will read sensor data from each CPU core and update this field.
15:12	-	-	-	Reserved.
11	Core	0h	RW_0C	**POWER_LIMITATION_LOG —** PWR_LIMIT Log. This bit is set by firmware and cleared by software.
10	Core	0h	RO	**POWER_LIMITATION_STATUS —** PWR_LIMIT Status.
9	Core	0h	RW_0C	**THRESHOLD2_LOG —** Sticky log bit that asserts on a 0 to 1 or a 1 to 0 transition of the THERMAL_THRESHOLD2_STATUS bit. This bit is set by firmware and cleared by SW.
8	Core	0h	RO	**THRESHOLD2_STATUS —** Indicates that the current temperature reported in DIG_TEMP_READOUT is higher than or equal to Threshold 2 temperature.
7	Core	0h	RW_0C	**THRESHOLD1_LOG —** Sticky log bit that asserts on a 0 to 1 or a 1 to 0 transition of the THERMAL_THRESHOLD1_STATUS bit. This bit is set by firmware and cleared by SW.
6	Core	0h	RO	**THRESHOLD1_STATUS —** Indicates that the current temperature reported in DIG_TEMP_READOUT is higher than or equal to Threshold 1 temperature.
5	Core	0h	RW_0C	**OUT_OF_SPEC_LOG —** Sticky log bit indicating that the processor operating out of its thermal specification since the last time this bit was cleared. This bit is set by firmware on a 0 to 1 transition of OUT_OF_SPEC_STATUS.
4	Core	0h	RO	**OUT_OF_SPEC_STATUS —** Status bit indicating that the processor is operating out of its thermal specification. Once set this bit will be cleared once the temperature decreases back to cold condition.
3	Core	0h	RW_0C	**PROCHOT_LOG —** Sticky log bit indicating that PROCHOT has been asserted since the last time this bit was cleared by SW. This bit is set by firmware on a 0 to 1 transition of PROCHOT_EVENT.
2	Core	0h	RO	**PROCHOT_STATUS —** Status bit indicating that PROCHOT is currently being asserted.
1	Core	0h	RW_0C	**THERMAL_MONITOR_LOG —** Sticky log bit indicating that the core has seen a thermal monitor event since the last time SW cleared this bit. This bit is set by Firmware on a 0 to 1 transition of THERMAL_MONITOR_STATUS.
0	Core	0h	RO	**THERMAL_MONITOR_STATUS —** Status bit indicating that the Thermal Monitor has tripped and is currently thermally throttling.

69.2.52 (19Dh) MSR_THERM2_CTL

Refer to the Intel® 64 and IA-32 Architectures Software Developer's Manual for a detailed description and usage of this MSR.

MSR Address: 19Dh				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:32	-	-	-	Reserved.
31:0	Thread	0h	Rsvd0	**DATA —** Refer to the Intel® 64 and IA-32 Architectures Software Developer's Manual for a detailed description and usage of this MSR.

69.2.53 (1A0h) IA32_MISC_ENABLE

Miscellaneous Enables Register holds enable bits for miscellaneous features.

MSR Address: 1A0h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:39	-	-	-	Reserved.
38	Package	0h	RW	**TURBO_DISABLE —** Disables turbo mode.
37:35	-	-	-	Reserved.
34	Thread	0h	RW	**NX_DISABLE —** When set to a 1, disables the Execute Disable Bit feature (XD Bit).
33:24	-	-	-	Reserved.
23	Thread	0h	RW	**DISABLE_ECHOING_TPR_MESSAGES —** This MSR field maps to PIC_CR_DEBUG_MODES.TPR_MSG_OFF
22	Thread	0h	RW	**BOOT_NT4 —** Setting this bit causes CPUID to pretend leaves 4 and 5 don't exist and that the max defined leaf is 3.
21:19	-	-	-	Reserved.
18	Thread	0h	RW	**ENABLE_MONITOR_FSM —** Reset sets this bit. SW Enables MONITOR/MWAIT FSM in BLS.
17	-	-	-	Reserved.
16	Package	0h	RW	**ENABLE_GV3 —** Setting this bit enables the Geyserville3 mechanism. The software can set the processor operating point by writing the proper VID and frequency ratio into the CLK_GEYSIII_CONTROL register. Default value is 0 (disabled). This bit is affected by fuse settings, and can be set to 1 only if FB_GV3_DISABLE_FUSE is '0 . This bit is write protected by the GV_SEL_LOCK bit.
15:13	-	-	-	Reserved.
12	Core	0h	RO	**PEBS_UNAVAILABLE —** Based Sampling debug feature. RDMSR ucode returns !EMON_AVAILABLE. Written value is ignored.
11	Core	0h	Rsvd0	**BTS_UNAVAILABLE —** If set the processor does not support Branch Trace Stores. WRMSR prevents setting this bit.
10:8	-	-	-	Reserved.
7	Core	0h	RW	**EMON_AVAILABLE —** RDMSR gets this bit from PM_CR_DEBUG_DEFEATURE.PERFMON_AVAIL. WRMSR masks writes to this bit. This bit prevents public software access to the emon / performance counter registers. When set, these regs are available and read/write. When clear, the registers.
6:4	-	-	-	Reserved.
3	Package	0h	RW	**THERMAL_MONITOR_ENABLE —** This value from PCU_CR_FIRM_CONFIG. Global TM EN. This is a union of bits 3, 13 (ENABLE_TT2) and 36 (ENABLE_EMTTM). A value = 0 (default) indicates disabled, and a value = 1 indicates enabled. Activation is possible only if FB_THERM_THROT_DIS_FUSE is '0'".
2	-	-	-	Reserved.
1	-	-	-	Reserved.
0	Thread	0h	RW	**FAST_STRINGS —** Enable fast strings.

69.2.54 (1A1h) PACKAGE_THERM_MARGINBD

This register can be read to get the average Thermal margin above Tspec.

MSR Address: 1A1h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31:16	-	-	-	Reserved.
15:0	Package	0h	RO	**THERM_MARGIN —** Thermal margin in 8.8 format .

69.2.55 (1A2h) MSR_TEMPERATURE_TARGET

Legacy register holding temperature related constants for Platform use. This register is updated by FW based on fuse values.

MSR Address: 1A2h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31	-	-	-	Reserved.
30:24	Package	0h	RW	**TJ_MAX_TCC_OFFSET —** This field allows platform SW to configure a Tjmax_offset such that thermal throttling is activated at fused_Tjmax Tjmax_TCC_offset. FW reads this field to control thermal throttling activation at temperature lower than fused Tjmax.
23:16	Package	5Ah	RO	**REF_TEMP —** Tjmax a.k.a. Throttle Temperature TCC activation temperature or Prochot Temperature or REF_TEMP This is the maximum junction temperature at which thermal throttling aka thermal monitor is activated. FW updates this register based on FUSE_TJMAX. This field is read only by all other SW.
15:8	Package	0h	RO	**FAN_TEMP_TARGET_OFFSET —** Fan Temperature Target Offset a.k.a. TControl indicates the relative offset from the Thermal Monitor Trip Temperature at which fans should be engaged. FUSE_TEMP_TARGET 1.
7:0	-	-	-	Reserved.

69.2.56 (1A4h) MSR_MISC_FEATURE_CONTROL

Miscellaneous Feature Control Register.

MSR Address: 1A4h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31:3	-	-	-	Reserved.
2	Core	0h	RW	**DCU_STREAMER_PREFETCH_DISABLE —** WMRSR maps this to MEC_CR_MODES_AND_DEFEATURES.DISABLE_PREFETCHER.
1	-	-	-	Reserved.
0	Module	0h	RW	**MLC_STREAMER_PREFETCH_DISABLE —** WMRSR maps this to EBL_CR_DEBUG_CTL1_PREF_UCODE_DISABLE.

69.2.57 (1A6h) MSR_OFFCORE_RSP_0

Refer to the Intel® 64 and IA-32 Architectures Software Developer's Manual for a detailed description and usage of this MSR.

MSR Address: 1A6h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:0	-	-	-	**DATA —** Refer to the Intel® 64 and IA-32 Architectures Software Developer's Manual for a detailed description and usage of this MSR.

69.2.58 (1A7h) MSR_OFFCORE_RSP_1

Refer to the Intel® 64 and IA-32 Architectures Software Developer's Manual for a detailed description and usage of this MSR.

MSR Address: 1A7h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:0	-	-	-	**DATA —** Refer to the Intel® 64 and IA-32 Architectures Software Developer's Manual for a detailed description and usage of this MSR.

69.2.59 (1A8h) THREAD_SW_DEFEATURE

This MSR has no functionality and exists only for compatibility purposes. Returns 0s on reads, drops writes.

MSR Address: 1A8h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31:0	Thread	0h	RW	**DATA —** Returns zeros for RDMSR. Writes are dropped for WRMSR.

69.2.60 (1AAh) MSR_MISC_PWR_MGMT

Legacy Miscellaneous Power Management Features.

MSR Address: 1AAh				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31:23	-	-	-	Reserved.
22	Package	0h	RW	**LOCK_THERM_INT —** Ties thermal interrupts from both cores. If set then thermal interrupt on one core is routed to all cores.
21:1	-	-	-	Reserved.
0	Package	0h	RW	**SINGLE_PCTL_EN —** When set (1) will cause PST commands (writes to IA32_PERF_CTL) from any cores to set the P-state target (no coordination). This means that the last that write the P-state request, is the dominant one. If not set this means that coordination between all the thread requests will be initiated and the resolved result will dominant. Default = 0 (disabled). Indicates the number of error-reporting banks available on this processor.

69.2.61 (1ADh) MSR_TURBO_RATIO_LIMIT

PUNIT_MSR: This register allows determines the ratio limits to be used to limit frequency based on cores being C6/C7. During reset the SoC initializes this register based on SoC fuses. The MSR values determine how many ratio ticks of turbo to allow based on the number of active cores.

MSR Address: 1ADh				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:56	Package	0h	RW	**RATIO_LIMIT_7 —** Ratio limit 7
55:48	Package	0h	RW	**RATIO_LIMIT_6 —** Ratio limit 6
47:40	Package	0h	RW	**RATIO_LIMIT_5 —** Ratio limit 5
39:32	Package	0h	RW	**RATIO_LIMIT_4 —** Ratio limit 4
31:24	Package	0h	RW	**RATIO_LIMIT_3 —** Ratio limit 3
23:16	Package	0h	RW	**RATIO_LIMIT_2 —** Ratio limit 2
15:8	Package	0h	RW	**RATIO_LIMIT_1 —** Ratio limit 1
7:0	Package	0h	RW	**RATIO_LIMIT_0 —** Ratio limit 0

69.2.62 (1AEh) MSR_TURBO_RATIO_LIMIT1

PUNIT_MSR: This register allows determines the core counts to be used to limit frequency based on cores being C6/C7. During reset the SoC initializes this register based on SoC fuses. The MSR values determine how many ratio ticks of turbo to allow based on the number of active cores.

MSR Address: 1AEh				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:56	Package	0h	RW	**CORE_COUNT_7 —** Core count 7
55:48	Package	0h	RW	**CORE_COUNT_6 —** Core count 6
47:40	Package	0h	RW	**CORE_COUNT_5 —** Core count 5
39:32	Package	0h	RW	**CORE_COUNT_4 —** Core count 4
31:24	Package	0h	RW	**CORE_COUNT_3 —** Core count 3
23:16	Package	0h	RW	**CORE_COUNT_2 —** Core count 2
15:8	Package	0h	RW	**CORE_COUNT_1 —** Core count 1
7:0	Package	0h	RW	**CORE_COUNT_0 —** Core count 0

69.2.63 (1B0h) IA32_ENERGY_PERF_BIAS

Not a real register. This define exists to create the MSR routine that will be used to control the energy-efficient P-State performance policy. The bits will be redirected to a corresponding field in THREAD_P_REQ. This register allows software to control the Energy efficiency Policy in the CPU. This MSR will #GP unless POWER_CTL1[PWR_PERF_PLTFRM_OVR] is set.

MSR Address: 1B0h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31:4	-	-	-	Reserved.
3:0	Package	0h	RW	**ENERGY_POLICY —** If enabled via POWER_CTL1, overrides the energy-efficient P-State performance policy field in THREAD_P_REQ

69.2.64 (1B1h) IA32_PACKAGE_THERM_STATUS

Package Thermal Status Register for tracking package level temperature changes. This MSR is visible and accessible only when CPUID.(EAX=06h):EAX[6] is set to indicate this feature is available.

MSR Address: 1B1h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31	Package	0h	RW	**VALID —** Set if temperature is within the valid thermal sensor range.
30:27	Package	1h	RO	**RESOLUTION —** Supported resolution in degrees C.
26:23	-	-	-	Reserved.
22:16	Package	0h	RO	**TEMPERATURE —** Temperature in degrees C relative to the thermal monitor trip temperature fused.
15:12	-	-	-	Reserved.
11	Package	0h	RW_0C	**POWER_LIMITATION_LOG —** Sticky log bit that asserts when either IA is running at P-state below the max P-state offset or that GT is running at P-state below its P1 frequency. Set by HW on a 0 to 1 transition of Power Limitation Status. Cleared by SW.
10	Package	0h	RO	**POWER_LIMITATION_STATUS —** Status log bit that notifies that either IA is running at P-state below the max P-state offset or that GT is running at P-state below its P1 frequency.
9	Package	0h	RW_0C	**THRESHOLD2_LOG —** Sticky log bit that asserts on a 0 to 1 or 1 to 0 transition of the Threshold1_Status bit. HW controls this transition.
8	Package	0h	RO	**THRESHOLD2_STATUS —** Indicates that the current temperature bits 22:16 in this register is higher than or equal to the Threshold1 defined in the IA32_PACKAGE_THERM_INTERRUPT MSR. Note that because temperature and thresholds are defined as negative offsets a higher number means a lower temperature.
7	Package	0h	RW_0C	**THRESHOLD1_LOG —** Sticky log bit that asserts on a 0 to 1 or 1 to 0 transition of the Threshold1_Status bit. HW controls this transition.
6	Package	0h	RO	**THRESHOLD1_STATUS —** Indicates that the current temperature bits 22:16 in this register is higher than or equal to the Threshold1 defined in the IA32_PACKAGE_THERM_INTERRUPT MSR. Note that because temperature and thresholds are defined as negative offsets a higher number means a lower temperature.
5	Package	0h	RW_0C	**OUT_OF_SPEC_LOG —** Sticky log bit indicating that the processor operating out of its thermal specification since the last time this bit was cleared. Set by HW on a 0 to 1 transition of Out_of_Spec_Status
4	Package	0h	RO	**OUT_OF_SPEC_STATUS —** Status bit indicating that the processor is operating out of its thermal specification.
3	Package	0h	RW_0C	**PROCHOT_LOG —** Sticky log bit indicating that PROCHOT has been asserted since the last time this bit was cleared by SW. Set by HW on a 0 to 1 transition of Prochot_Status.
2	Package	0h	RO	**PROCHOT_STATUS —** Status bit indicating that PROCHOT is currently being asserted.
1	Package	0h	RW_0C	**THERMAL_MONITOR_LOG —** Sticky log bit indicating that the package has seen a thermal monitor event since the last time SW cleared this bit. Set by HW on a 0 to 1 transition of Thermal_Monitor_Status.
0	Package	0h	RO	**THERMAL_MONITOR_STATUS —** Status bit indicating that any of the package thermal monitor have tripped and the package is currently thermally throttling.

69.2.65 (1B2h) IA32_PACKAGE_THERM_INTERRUPT

Thermal Limitation Interrupt Control. PCODE will read this information before generating a thermal interrupt.

MSR Address: 1B2h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31:25	-	-	-	Reserved.
24	Package	0h	RW	**POWER_INT_ENABLE —** When this bit is set a thermal interrupt will be sent upon throttling due to power limitations.
23	Package	0h	RW	**THRESHOLD_2_INT_ENABLE —** Controls the generation of a thermal interrupt whenever the Thermal Threshold 2 Temperature is crossed.
22:16	Package	0h	RW	**THRESHOLD_2_REL_TEMP —** This value indicates the offset in degrees below TJ Max Temperature that should trigger a Thermal Threshold 2 trip.
15	Package	0h	RW	**THRESHOLD_1_INT_ENABLE —** Controls the generation of a thermal interrupt whenever the Thermal Threshold 1 Temperature is crossed.
14:8	Package	0h	RW	**THRESHOLD_1_REL_TEMP —** This value indicates the offset in degrees below TJ Max Temperature that should trigger a Thermal Threshold 1 trip.
7:5	-	-	-	Reserved.
4	Package	0h	RW	**OUT_OF_SPEC_INT_ENABLE —** Thermal interrupt enable for the Out Of Spec condition which is stored in the Out Of Spec status bit in PACKAGE_THERM_STATUS.
3	-	-	-	Reserved.
2	Package	0h	RW	**PROCHOT_INT_ENABLE —** Bidirectional PROCHOT assertion interrupt enable. If set a thermal interrupt is delivered on the rising edge of PROCHOT.
1	Package	0h	RW	**LOW_TEMP_INT_ENABLE —** Enables a thermal interrupt to be generated on the transition from a hightemperature to a lowtemperature when set where high temperature is dicated by the thermal monitor trip temperature minus offset as defined in IA32_TEMPERATURE_TARGET.
0	Package	0h	RW	**HIGH_TEMP_INT_ENABLE —** Enables a thermal interrupt to be generated on the transition from a lowtemperature to a hightemperature when set where high temperature is dicated by the thermal monitor trip temperature minus offset as defined in IA32_TEMPERATURE_TARGET.

69.2.66 (1C6h) DEBUG_RESOURCE_STATUS

This MSR returns the status of debug resources.

MSR Address: 1C6h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31:2	-	-	-	Reserved.
1	Thread	0h	RO	**DEBUG_AVAILABLE —**
0	Thread	0h	RO	**DEBUG_DRX_AVAILABLE —**

69.2.67 (1C8h) MSR_LBR_SELECT

MSR_LBR_SELECT is cleared to zero at RESET, and LBR (Last Branch Record) filtering is disabled, i.e. all branches will be captured. MSR_LBR_SELECT provides bit fields to specify the conditions of subsets of branches that will not be captured in the LBR.

MSR Address: 1C8h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31:10	-	-	-	Reserved.
9	Thread	0h	RW	**LBR_CALL_STACK_EN —** Enable LBR call stack.
8	Thread	0h	RW	**FAR_BRANCH —** Filter out far branches.
7	Thread	0h	RW	**NEAR_REL_JMP —** Filter out near unconditional relative branches.
6	Thread	0h	RW	**NEAR_INDIRECT_JMP —** Filter out near unconditional indirect jumps.
5	Thread	0h	RW	**NEAR_RET —** Filter out near returns.
4	Thread	0h	RW	**NEAR_INDIRECT_CALL —** Filter out near indirect calls.
3	Thread	0h	RW	**NEAR_REL_CALL —** Filter out near relative calls.
2	Thread	0h	RW	**JCC —** Filter out taken conditional branches.
1	Thread	0h	RW	**CPL_NEQ_0 —** Filter out non-ring 0 branches.
0	Thread	0h	RW	**CPL_EQ_0 —** Filter out ring 0 branches.

69.2.68 (1C9h) MSR_LASTBRANCH_TOS

Contains an index (bits 0-3) that points to the MSR containing the most recent branch record. See MSR_LASTBRANCH_0_FROM_IP (at 0x680).

MSR Address: 1C9h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31:5	-	-	-	Reserved.
4:0	Thread	0h	RW	**TOS_POINTER —** LBR Top-of-stack.

69.2.69 (1D9h) IA32_DEBUGCTL

Refer to the Intel® 64 and IA-32 Architectures Software Developer's Manual for a detailed description and usage of this MSR.

MSR Address: 1D9h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31:15	-	-	-	Reserved.
14	Thread	0h	RW	**FREEZE_WHILE_SMM_EN —** When set, freezes perfmon and trace messages while in SMM. When set, freezes perfmon and trace messages while in SMM.
13	-	-	-	Reserved.
12	Thread	0h	RW	**FREEZE_PERFMON_ON_PMI —** When set, each ENABLE bit of the global counter control MSR are frozen (address 3BFH) on a PMI request.
11	Thread	0h	RW	**FREEZE_LBRS_ON_PMI —** When set, the LBR stack is frozen on a PMIrequest.
10	Thread	0h	RW	**BTS_OFF_USR —** When set, BTS or BTM is skipped if CPL > 0
9	Thread	0h	RW	**BTS_OFF_OS —** When set, BTS or BTM is skipped if CPL = 0.
8	Thread	0h	RW	**BTINT —** When clear, BTMs are logged in a BTS buffer in circular fashion. When this bit is set, an interrupt is generated by the BTS facility when the BTS buffer is full.
7	Thread	0h	RW	**BTS —** Setting this bit enables branch trace messages (BTMs) to be logged in a BTS buffer.
6	Thread	0h	RW	**TR —** Setting this bit to 1 enables branch trace messages to be sent.
5:2	-	-	-	Reserved.
1	Thread	0h	RW	**BTF —** Setting this bit to 1 enables the processor to treat EFLAGS.TF as single-step on branches instead of single-step on instructions.
0	Thread	0h	RW	**LBR —** Setting this bit to 1 enables the processor to record a running trace of the most recent branches taken by the processor in the LBR stack.

69.2.70 (1E3h) DEBUG_ERR_INJ_CTL

This MSR holds the capability of MCA error injection. Bit 1 for unlock MCA/ CMCI generation capability (allows event injection), bit 0 to unlock writing to MC banks. This register contains controls to enable/disable both the MB bank write capability and the MCA/CMCI signaling capability.

MSR Address: 1E3h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31:2	-	-	-	Reserved.
1	Thread	0h	RW	**MCBW_E —** CMCI/MCA signaling enable flag. If this bit is set, enables MCA and CMCI signaling through DEBUG_ERR_INJ_CTL2 register.
0	Thread	0h	RW	**MCA_CMCI_SE —** Machine check bank write capability enable flag - If this bit is set, non-zero value writes to the MCi_STATUS, MCi_MISC and MCi_ADDR registers are allowed (will not cause general-protection (#GP) exception) from SMM and ring0. If this bit is clear, regular MC bank access rules apply to the MCi_STATUS, MCi_MISC and MCi_ADDR registers (i.e, cause general-protection (#GP) exception on non-zero value writes).

69.2.71 (1E4h) DEBUG_ERR_INJ_CTL2

This register allows generating MCA or CMCI from ring0 code. This is write only (WO) register, it can be written only if DEBUG_ERR_INJ_CTL.MCA_CMCI_SE bit is set. Writing to this MSR without setting MCA_CMCI_SE bit will cause general-protection (#GP) exception. Reads to this MSR will cause general-protection (#GP) exception.

MSR Address: 1E4h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31:2	-	-	-	Reserved.
1	Thread	0h	WO	**MCA_G —** Setting this bit will cause MCA to be broadcast to all threads in the system.
0	Thread	0h	WO	**CMCI_G —** Setting this bit causes a CMCI to be generated on the both cores on the module when this MSR is written.

Note: Specifies the machine-check architecture defined error code for the machine check error condition detected. The machine-check architecture-defined error codes are guaranteed to be the same for all IA-32 processors that implement the machine-check architecture. Please refer to section 15.9 and chapter 16 of the document 325384 “Intel 64 and IA-32 Intel Architecture Software Developer's manual Volume 3: system programming guide” for the detail information.

69.2.72 (1E6h) PIC_DEBUG_MODES

MSR Address: 1E6h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31	Module	0h	RW	**SELF_IPI_OFF —** CB to disable the Self IPI feature and revert Self IPI interrupt behavior.
30	Module	0h	RW	**DISABLE_CTC_DL_SYNC —** CB to disable CTC sync with URT using the sync (Q) bit.
29	-	-	-	Reserved.
28	Module	0h	RW	**WATCHDOG_IGNORE_BUSQEMPTY —** Masks out bus queue empty from smc nuke logic.
27	Module	0h	RW	**WATCHDOG_QUICK —** Change all the above WATCHDOG setting to be on ROB Timeout[1] instead of ROB Timeout[2], cut timeout times in half to give a warning early to the other core.
26	Module	0h	RW	**DISABLE_ASYNC_MCKIND —** Disable Asynchronous MCKind from being signaled
25	Module	0h	RW	**DISABLE_ASYNC_MCERR —** Disable Asynchronous MCERR from being signaled
24	Module	0h	RW	**PSMI_ASSIST —** Prevents certain registers from changing and prevents side-effects for PSMI Modes
23	Module	0h	RW	**WATCHDOG_SMC_OTHER_REPEATED —** On ROB Timeout[2] = 1, SMC Nuke other core continuously
22	Module	0h	RW	**WATCHDOG_SMC_SAME_WAIT —** On ROB Timeout Cnt 011 to 100, SMC Nuke same core on TSC[8] Toggle
21	Module	0h	RW	**WATCHDOG_SMC_SAME_NOW —** On ROB Timeout Cnt 011 to 100, SMC Nuke same core now
20	Module	0h	RW	**WATCHDOG_SMC_OTHER_WAIT —** On ROB Timeout Cnt 011 to 100, SMC Nuke other core on TSC[8] Toggle
19	Module	0h	RW	**WATCHDOG_SMC_OTHER_NOW —** On ROB Timeout Cnt 011 to 100, SMC Nuke other core now
18:17	Module	0h	RW	**PERIODIC_SMC_TSC_SEL —** Selects Bit of TSC for Periodic SMC Nuke. 00:TSC[20]:1ms, 00:TSC[20]:1ms, 01:TSC[23]:10ms, 10:TSC[27]:100ms, 11:TSC[30]:1s
16	Module	0h	RW	**PERIODIC_SMC_EN —** Enables Periodic SMC Nukes if set
15	Module	0h	RW	**CMCI_FEATURE_DISABLE —** Setting this bit will disable the CMCI LVT
14	Module	0h	RW	**L2_CMCI_INTERNAL —** Setting this bit will not send the L2 CMCI event to Tunit and complete internally instead.
13	-	-	-	Reserved.
12	Module	0h	RW	**ID_IS_NOT_READONLY —** when set to '1 enables SW to write to ID register in APIC.
11	Module	0h	RW	**TSC_DEADLINE_CB —** CB for TSC Deadline
10	Module	0h	RW	**SV_SENTER_EN —** enables saving of internal data to SCPs during SENTER
9	Module	0h	RW	**SV_GLOBAL_ENABLE —** enables PATCH2 and PATCH3 special instructions in Unlocked units only.
8	Module	0h	RW	**DISABLE_INTPRIUPD_GENERATION —** >Disables TPR/IntPriUpd from being generated
7	Module	0h	RW	**EOI_NO_BDCST_ENABLE —** f
6	Module	0h	RW	**EOI_SUPPRESS_CB —**
5	Module	0h	RW	**ICR_MSG_OFF —**
4	Module	0h	RW	**TPR_MSG_OFF —** Disable new TPR Update message requests to the FSB TPR messages. Will be generated for changes to PIC HW/SW enables.

MSR Address: 1E6h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
3	Module	0h	RW	**PIC_REQ_OFF —** Disable new PICOMB requests to the EBC.
2	Module	0h	RW	**CCR_FREEZE_CORE1 —** When this bit is set the CCR of Core1 will be frozen
1	Module	0h	RW	**CCR_FREEZE_CORE0 —** When this bit is set the CCR of Core0 will be frozen
0	Module	0h	RW	**TSC_FREEZE —** When this bit is set its freezes the counting of the Time Stamp counter.)

69.2.73 (1F0h) VLW_CAPABILITY

This MSR reports information about the Legacy features and VLW messages that are supported.

MSR Address: 1F0h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31:7	-	-	-	Reserved.
6	Core	0h	RO	**NMI —** 1 means NMI VLW message is supported 1 = Supported, 0= Not Supported.
5	Core	0h	RO	**INIT —** 1 means INIT VLW message is supported 1 = Supported, 0= Not Supported.
4	Core	0h	RO	**SMI —** 1 means SMI VLW message is supported. This will be 0 if SMM is fuse disabled
3	-	-	-	Reserved.
2	Core	0h	RO	**INTR —** Indicates whether INTR VLW message is supported. 1 = Supported, 0= Not Supported.
1:0	-	-	-	Reserved.

69.2.74 (1FCh) MSR_POWER_CTL

Power Control Register allows enable and disable of specific power and thermal management features.

MSR Address: 1FCh				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31	-	-	-	Reserved.
30	Package	0h	RW	**CSTATE_PREWAKE_DISABLE —** This bit can be used to disable core/pkg C-state Prewake timers.
29:25	-	-	-	Reserved.
24	Package	0h	RW	**VR_THERM_ALERT_DISABLE —** When set to 1, disables the VR_THERMAL_ALERT signaling.
23	Package	0h	RW	**PROCHOT_LOCK —** When set to 1, locks bits 0, 21, 22 and 23 of this MSR. Once set, a reset is required to clear this bit.
22	Package	0h	RW	**PROCHOT_RESPONSE —** Prochhot Configurable Response Enable.
21	Package	0h	RW	**PROCHOT_OUTPUT_MODE_DISABLE —** Prochot output disable.
20	-	-	-	Reserved.
19	Package	0h	RW	**EE_TURBO_DISABLE —** Energy Efficient Turbo Disable.
18	Package	0h	RW	**PWR_PERF_PLTFRM_OVR —** When set to 0 (default), will disable access to IA32_ENERGY_PERFORMANCE_BIAS MSR 1B0h (causing a GP# fault on access). CPUID.(EAX=6):ECX[3] will read 0.
17	Package	0h	RW	**PHOLD_SR_DISABLE —** If set to '1', CPU will also prevent the memory from going to SR during the CST_PREVENTION timeout;
16:6	Package	0h	RW	**PHOLD_CST_PREVENTION_INIT —** Init value for the PHOLD_CST_PREVENTION_Timer. Values are between 0 and 1023 in 2^21*10nS resolution (matching 0 - ~21sec).
5	-	-	-	Reserved.
4	Package	0h	RW	**FAST_BRK_INT_EN —** Controls the VID swing rate for Other_Intp_Wake events detected at the iMPH. Will override a "SLOW" sideband wake indication (for C7 or PCIe).
3	Package	0h	RW	**FAST_BRK_SNP_EN —** Controls the VID swing rate for Other_Snp_Wake events detected at the iMPH. Will override a "SLOW" sideband wake indication primarily for PCIe traffic.
2	Package	0h	RW	**SAPM_IMC_C2_POLICY —** Enables Self Refresh entry when the CPU is in package-C2 (popup) state. Should be disabled only if platform traffic cannot withstand even the SR exit latency while in C2.
1	Package	0h	RW	**C1E_ENABLE —** Used to enable C1E behavior on every C1 entry (even if MWAIT C1E substate bit was not set or when using HLT).When this package-visible bit is set, it will cause CPU to switch to minimum GV point when all cores have entered C1. Frequency will switch immediately, followed by gradual voltage switching (GV3 style). This is a package visible bit stored in PCU_CR_FIRM_CONFIG[C1E_ENABLE]
0	Package	0h	RW	**ENABLE_BIDIR_PROCHOT —** Used to enable or disable the response to PROCHOT# input. When set/enabled, platform can force CPU to throttle to a lower power condition such as Pn/Pm by asserting prochot#. When clear/disabled (default), CPU ignores the status of the prochot input signal.

69.2.75 (281h) IA32_MC1_CTL2 (L2 Cache)

Bank 1 MCA Control Register 2.

MSR Address: 281h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31	Module	-	RO	Reserved.
30	Module	0h	RW	**CMCI_EN —** CMCI Enable
29:15	Module	-	RO	Reserved.
14:0	Module	0h	RW	**CORRECTED_ERROR_COUNT_THRESHOLD —** Corrected Error Count Threshold.

69.2.76 (282h) IA32_MC2_CTL2 (FEC)

MCA Address Control Register for CMCI.

MSR Address: 282h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31	Core	-	RO	Reserved.
30	Core	0h	RW	**CMCI_EN —** CMCI Enable. Software sets this bit to enable the generation of corrected machine check interrupts.
29:15	Core	-	RO	Reserved.
14:0	Core	0h	RW	**CORRECTED_ERROR_COUNT_THRESHOLD —** The Threshold Value for Corrected Error Count.

69.2.77 (283h) IA32_MC3_CTL2 (MEC)

MSR Address: 283h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31	Module	-	RO	Reserved.
30	Module	0h	Rsvd0	**CMCI_EN —** Reserved.
29:15	Module	-	RO	Reserved.
14:0	Module	0h	Rsvd0	**CORRECTED_ERROR_COUNT_THRESHOLD —** Reserved.

69.2.78 (284h) IA32_MC4_CTL2 (SA)

MSR Address: 284h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:35	Package	-	RO	Reserved.
34	Package	0h	RW	**MCE_CTL —** Controls MCE Remapping 0 MCE 1 MSMI.
33	Package	-	RO	Reserved.
32	Package	0h	RW	**CMCI_CTL —** Controls CMCI Remapping 0 CMCI 1 CSMI.
31	Package	-	RO	Reserved.
30	Package	0h	RW	**CMCI_EN —** Reserved.
29:15	Package	-	RO	Reserved.
14:0	Package	0h	RW	**THRESHOLD —** Reserved.

69.2.79 (285h) IA32_MC5_CTL2 (PMU)

MSR Address: 285h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:35	Package	-	RO	Reserved.
34	Package	0h	RW	**MCE_CTL —** Controls MCE Remapping 0 MCE 1 MSMI.
33	Package	-	RO	Reserved.
32	Package	0h	RW	**CMCI_CTL —** Controls CMCI Remapping 0 CMCI 1 CSMI.
31	Package	-	RO	Reserved.
30	Package	0h	RW	**CMCI_EN —** Reserved.
29:15	Package	-	RO	Reserved.
14:0	Package	0h	RW	**THRESHOLD —** Reserved.

69.2.80 (286h) IA32_MC6_CTL2 (SA)

MSR Address: 286h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:35	Package	-	RO	Reserved.
34	Package	0h	RW	**MCE_CTL —** Controls MCE Remapping 0 MCE 1 MSMI.
33	Package	-	RO	Reserved.
32	Package	0h	RW	**CMCI_CTL —** Controls CMCI Remapping 0 CMCI 1 CSMI.
31	Package	-	RO	Reserved.
30	Package	0h	RW	**CMCI_EN —** Reserved.
29:15	Package	-	RO	Reserved.
14:0	Package	0h	RW	**THRESHOLD —** Reserved.

69.2.81 (287h) IA32_MC7_CTL2 (MEM 0)

MSR Address: 287h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:35	Package	-	RO	Reserved.
34	Package	0h	RW	**MCE_CTL —** Controls MCE Remapping 0 MCE 1 MSMI.
33	Package	-	RO	Reserved.
32	Package	0h	RW	**CMCI_CTL —** Controls CMCI Remapping 0 CMCI 1 CSMI.
31	Package	-	RO	Reserved.
30	Package	0h	RW	**CMCI_EN —** Reserved.
29:15	Package	-	RO	Reserved.
14:0	Package	0h	RW	**THRESHOLD —** Reserved.

69.2.82 (288h) IA32_MC8_CTL2 (MEM 1)

MSR Address: 288h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:35	Package	-	RO	Reserved.
34	Package	0h	RW	**MCE_CTL —** Controls MCE Remapping 0 MCE 1 MSMI.
33	Package	-	RO	Reserved.
32	Package	0h	RW	**CMCI_CTL —** Controls CMCI Remapping 0 CMCI 1 CSMI.
31	Package	-	RO	Reserved.
30	Package	0h	RW	**CMCI_EN —** Reserved.
29:15	Package	-	RO	Reserved.
14:0	Package	0h	RW	**THRESHOLD —** Reserved.

69.2.83 (2E0h) NO_EVICT_MODE

MSR Address: 2E0h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31:2	-	-	-	Reserved.
1	Thread	0h	RW	**NEM_RUN —** BIOS sets this bit when it's done filling the NEM region and ready for using cache as RAM.
0	Thread	0h	RW	**NEM_SETUP —** BIOS sets this when it is ready to fill the NEM region, and then executes the requests to fill the NEM.

69.2.84 (2FFh) IA32_MTRR_DEF_TYPE

The IA32_MTRR_DEF_TYPE MSR sets the default properties of the regions of physical memory that are not encompassed by MTRRs.

MSR Address: 2FFh				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31:12	-	-	-	Reserved.
11	Core	0h	RW	**MTRR_ENABLE —** When set, enables all MTRRs. A value = 0 disables, and a value = 1 enables all MTRRs. Note: Global MTRR Enable is often referred to as IA32_MTRR_DEF_TYPE.E or IA32_MTRR_DEF_TYPE.GE.
10	Core	0h	RW	**FIXED_RANGE_ENABLE —** When set, enables the fixed range MTRRs. A value = 0 disables, and a value = 1 enables the Fixed MTRRs. Note: Fixed MTRR Enable is often referred to as IA32_MTRR_DEF_TYPE.F or IA32_MTRR_DEF_TYPE.FE.
9:3	-	-	RO	Reserved.
2:0	Core	0h	RW	**TYPE —** Indicates the default memory type used for those memory ranges that do not have a memory type specified in an MTRR. Note: Default MTRR Memory Type is often referred to as IA32_MTRR_DEF_TYPE.

69.2.85 (300h) MSR_SGXOWNER0

Register shared by all threads.

MSR Address: 300h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:0	Package	0h	RW	**DATA —** Data space allowed to be read/written by the SoC in byte granularity.

69.2.86 (301h) MSR_SGXOWNER1

Register shared by all threads.

MSR Address: 301h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:0	Package	0h	RW	**DATA —** Data space allowed to be read/written by the SoC in byte granularity.

69.2.87 (309h) IA32_FIXED_CTR0

IA32_FIXED_CTR0 contains a 48-bit fixed rate counter.

MSR Address: 309h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:48	-	-	-	Reserved.
47:0	Thread	0h	RW	**FIXED_COUNTER0_VALUE —** 48-bit fixed rate counter 0.

69.2.88 (30Ah) IA32_FIXED_CTR1

IA32_FIXED_CTR1 contains a 48-bit fixed rate counter.

MSR Address: 30Ah				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:48	-	-	-	Reserved.
47:0	Thread	0h	RW	**FIXED_COUNTER1_VALUE —** 48-bit fixed rate counter 1.

69.2.89 (30Bh) IA32_FIXED_CTR2

IA32_FIXED_CTR2 contains a 48-bit fixed rate counter.

MSR Address: 30Bh				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:48	-	-	-	Reserved.
47:0	Thread	0h	RW	**FIXED_COUNTER2_VALUE —** 48-bit fixed rate counter 2.

69.2.90 (345h) IA32_PERF_CAPABILITIES

This register enumerates the existence of certain debug features in PerfMon.

MSR Address: 345h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31:14	-	-	-	Reserved.
13	Core	0h	RO	**FULLWIDTHCNTRS —** Full width of counter writable via IA32_A_PMCx.
12	Core	0h	RO	**SMMFREEZE —** Freeze while SMM is supported
11:8	Core	0h	RO	**PEBS_REC_FORMAT —** PEBS Record Format.
7	Core	0h	RO	**PEBS_SAVE_ARCH_REGS —** When set, PEBS will save architectural register and state information according to the encoded value of the PEBSRecordFormat field.
6	Core	0h	RO	**PEBS_TRAP —** PEBS Record Format.
5:0	Core	0h	RO	**LBR_FORMAT —** Last Branch Record Format. 0=32-bit, 1=64-bit LIP, 2=64-bit EIP.

69.2.91 (38Dh) IA32_FIXED_CTR_CTRL

This register provides enables for the fixed performance counters and enables for PMI. This register also provides the control for the counts to be for single thread or both threads in a core.

MSR Address: 38Dh				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31:12	-	-	-	Reserved.
11	Thread	0h	RW	**CTR_2_PMI_ENABLE —** When this bit is set fixed counter 0 will count instructions retired for both threads.
10	Thread	0h	RW	**CTR_2_BOTH_THREAD_ENABLE —** When this bit is set fixed counter 0 will count instructions retired for both threads.
9:8	Thread	0h	RW	**CTR_2_ENABLE —** This bit field is the local enable for the Fixed counter 2. Disabling these bits will cause the counters to halt. Counter is enabled by setting CPL Level: 00 - Disable 01 - Ring 0 (OS) 10 - Ring 1,2,3 (User) 11 - All ring levels (OS or User) when CPL changes to one of the above the counter gets enabled.
7	Thread	0h	RW	**CTR_1_PMI_ENABLE —** When this bit is set fixed counter 0 will count instructions retired for both threads.
6	Thread	0h	RW	**CTR_1_BOTH_THREAD_ENABLE —** When this bit is set fixed counter 0 will count instructions retired for both threads.
5:4	Thread	0h	RW	**CTR_1_ENABLE —** This bit field is the local enable for the Fixed counter 2. Disabling these bits will cause the counters to halt. Counter is enabled by setting CPL Level: 00 - Disable 01 - Ring 0 (OS) 10 - Ring 1,2,3 (User) 11 - All ring levels (OS or User) when CPL changes to one of the above the counter gets enabled.
3	Thread	0h	RW	**CTR_0_PMI_ENABLE —** When this bit is set fixed counter 0 will count instructions retired for both threads.
2	Thread	0h	RW	**CTR_0_BOTH_THREAD_ENABLE —** When this bit is set fixed counter 0 will count instructions retired for both threads.
1:0	Thread	0h	RW	**CTR_0_ENABLE —** This bit field is the local enable for the Fixed counter 2. Disabling these bits will cause the counters to halt. Counter is enabled by setting CPL Level: 00 - Disable 01 - Ring 0 (OS) 10 - Ring 1,2,3 (User) 11 - All ring levels (OS or User) when CPL changes to one of the above the counter gets enabled.

69.2.92 (38Eh) IA32_PERF_GLOBAL_STATUS

Global Performance Counter Status.

MSR Address: 38Eh				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63	Thread	0h	RO	**COND_CHG —** Status bits of this register has changed.
62	Thread	0h	RO	**PEBS_BUFFER_OVERFLOW —** DS SAVE area Buffer overflow status.
61	-	-	-	Reserved.
60	Thread	0h	RO	**ASCI —** Set if any of the perfmon counters are suppressed.
59	Thread	0h	RO	**COUNTERS_FROZEN —**
58	Thread	0h	RO	**LBRS_FROZEN —**
57:56	-	-	-	Reserved.
55	Thread	0h	RO	**RTIT_TOPA_PMI —** RTIT Table of Physical Addresses PMI. Allows software to differentiate between legacy PMI sources.
54:35	-	-	-	Reserved.
34	Thread	0h	RO	**FIXED_PERFMON_COUNTER_2_OVERFLOW —** Overflow status of IA32_FIXED_CTR2
33	Thread	0h	RO	**FIXED_PERFMON_COUNTER_1_OVERFLOW —** Overflow status of IA32_FIXED_CTR1
32	Thread	0h	RO	**FIXED_PERFMON_COUNTER_0_OVERFLOW —** Overflow status of IA32_FIXED_CTR0
31:4	-	-	-	Reserved.
3	Thread	0h	RO	**GP_PERFMON_COUNTER_3_OVERFLOW —** Overflow status of IA32_PMC3.
2	Thread	0h	RO	**GP_PERFMON_COUNTER_2_OVERFLOW —** Overflow status of IA32_PMC2.
1	Thread	0h	RO	**GP_PERFMON_COUNTER_1_OVERFLOW —** Overflow status of IA32_PMC1.
0	Thread	0h	RO	**GP_PERFMON_COUNTER_0_OVERFLOW —** Overflow status of IA32_PMC0.

69.2.93 (38Fh) IA32_PERF_GLOBAL_CTRL

Counter increments while the result of ANDing respective enable bit in this MSR with the corresponding OS or USR bits in the general-purpose or fixed counter control MSR is true.

MSR Address: 38Fh				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:35	-	-	-	Reserved.
34	Thread	0h	RW	**ENABLE_FIXED_PERFMON_COUNTER_2 —** Global Enable for Fixed Counter 2. Both this enable and the local enable for the fixed counter needs to be asserted for the fixed counter to be counting.
33	Thread	0h	RW	**ENABLE_FIXED_PERFMON_COUNTER_1 —** Global Enable for Fixed Counter 1. Both this enable and the local enable for the fixed counter needs to be asserted for the fixed counter to be counting.
32	Thread	0h	RW	**ENABLE_FIXED_PERFMON_COUNTER_0 —** Global Enable for Fixed Counter 0. Both this enable and the local enable for the fixed counter needs to be asserted for the fixed counter to be counting.
31:4	-	-	-	Reserved.
3	Thread	0h	RW	**ENABLE_GP_PERFMON_COUNTER_3 —** Global Enable for PerfMon Counter 3. If either the global or local enable are not asserted, the counter will be disabled. The global enable allows for simultaneous enabling or disabling of all or some of the Core PerfMon counters.
2	Thread	0h	RW	**ENABLE_GP_PERFMON_COUNTER_2 —** Global Enable for PerfMon Counter 2. If either the global or local enable are not asserted, the counter will be disabled. The global enable allows for simultaneous enabling or disabling of all or some of the Core PerfMon counters.
1	Thread	0h	RW	**ENABLE_GP_PERFMON_COUNTER_1 —** Global Enable for PerfMon Counter 1. If either the global or local enable are not asserted, the counter will be disabled. The global enable allows for simultaneous enabling or disabling of all or some of the Core PerfMon counters.
0	Thread	0h	RW	**ENABLE_GP_PERFMON_COUNTER_0 —** Global Enable for PerfMon Counter 0. If either the global or local enable are not asserted, the counter will be disabled. The global enable allows for simultaneous enabling or disabling of all or some of the Core PerfMon counters.

69.2.94 (390h) IA32_PERF_GLOBAL_STATUS_RESET

Global Perfmon Overflow clear register.

MSR Address: 390h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63	Thread	0h	WO	**CLR_CONDCHG —** If set, clears the conditions changed in the status register.
62	Thread	0h	WO	**CLEAR_PEBS_BUFFER_OVERFLOW —** Clears related bit in IA32_CR_PERF_GLOBAL_STATUS.
61	-	-	-	Reserved.
60	Thread	0h	WO	**CLEAR_ASCI —** Clear ASCI in status register.
59	Thread	0h	WO	**CLEAR_COUNTERS_FROZEN —** Clears IA32_PERF_GLOBAL_STATUS[59].
58	Thread	0h	WO	**CLEAR_LBRS_FROZEN —** Clears IA32_PERF_GLOBAL_STATUS[58].
57:56	-	-	-	Reserved.
55	Thread	0h	WO	**CLEAR_RTIT_TOPA_PMI —** RTIT Table of Physical Addresses PMI. Allows software to differentiate between legacy PMI sources.
54:35	-	-	-	Reserved.
34	Thread	0h	WO	**CLEAR_FIXED_PERFMON_COUNTER_2_OVERFLOW —** Set to 1 to Clear OVF_FIXED_CTR2 bit.
33	Thread	0h	WO	**CLEAR_FIXED_PERFMON_COUNTER_1_OVERFLOW —** Set to 1 to Clear OVF_FIXED_CTR1 bit.
32	Thread	0h	WO	**CLEAR_FIXED_PERFMON_COUNTER_0_OVERFLOW —** Set to 1 to Clear OVF_FIXED_CTR0 bit.
31:4	-	-	-	Reserved.
3	Thread	0h	WO	**CLEAR_PERFMON_COUNTER_3_OVERFLOW —** Set to 1 to Clear OVF_PMC3 bit.
2	Thread	0h	WO	**CLEAR_PERFMON_COUNTER_2_OVERFLOW —** Set to 1 to Clear OVF_PMC2 bit.
1	Thread	0h	WO	**CLEAR_PERFMON_COUNTER_1_OVERFLOW —** Set to 1 to Clear OVF_PMC1 bit.
0	Thread	0h	WO	**CLEAR_PERFMON_COUNTER_0_OVERFLOW —** Set to 1 to Clear OVF_PMC0 bit.

69.2.95 (391h) IA32_PERF_GLOBAL_STATUS_SET

This register is used to enumerate the availability of PerfMon resources for use.

MSR Address: 391h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63	Thread	0h	WO	**SET_COND_CHNGD —** Sets IA32_PERF_GLOBAL_STATUS[63].
62	Thread	0h	WO	**SET_PEBS_BUFFER_OVFLW —** Sets IA32_PERF_GLOBAL_STATUS[62].
61	-	-	-	Reserved.
60	Thread	0h	WO	**SET_ASCI —** Set the ASCI bit
59	Thread	0h	WO	**SET_COUNTERS_FROZEN —** Sets IA32_PERF_GLOBAL_STATUS[59].
58	Thread	0h	WO	**SET_LBRS_FROZEN —** Sets IA32_PERF_GLOBAL_STATUS[58].
57:56	-	-	-	Reserved.
55	Thread	0h	WO	**SET_RTIT_TOPA_PMI —** Sets IA32_PERF_GLOBAL_STATUS[55].
54:35	-	-	-	Reserved.
34	Thread	0h	WO	**SET_FIX2_OVFLW —** Sets IA32_PERF_GLOBAL_STATUS[34].
33	Thread	0h	WO	**SET_FIX1_OVFLW —** Sets IA32_PERF_GLOBAL_STATUS[33].
32	Thread	0h	WO	**SET_FIX0_OVFLW —** Sets IA32_PERF_GLOBAL_STATUS[32].
31:4	-	-	-	Reserved.
3	Thread	0h	WO	**SET_CNTR3_OVFLW —** Sets IA32_PERF_GLOBAL_STATUS[3].
2	Thread	0h	WO	**SET_CNTR2_OVFLW —** Sets IA32_PERF_GLOBAL_STATUS[2].
1	Thread	0h	WO	**SET_CNTR1_OVFLW —** Sets IA32_PERF_GLOBAL_STATUS[1].
0	Thread	0h	WO	**SET_CNTR0_OVFLW —** Sets IA32_PERF_GLOBAL_STATUS[0].

69.2.96 (392h) IA32_PERF_GLOBAL_INUSE

This register is used to enumerate the availability of PerfMon resources for use.

MSR Address: 392h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63	Thread	0h	RO	**PMI_PROGRAMMED —** Set if any of the Fixed or GP counters have PMI Enabled.
62	Thread	0h	RO	**PEBS_PROGRAMMED —** PEBS_ENABLE[0].
61:35	-	-	-	Reserved.
34	Thread	0h	RO	**IA32_FIXED_CTR2_PROGRAMMED —** BITWISE_OR(Fixed_Ctr_Ctrl[9:8]).
33	Thread	0h	RO	**IA32_FIXED_CTR1_PROGRAMMED —** BITWISE_OR(Fixed_Ctr_Ctrl[5:4]).
32	Thread	0h	RO	**IA32_FIXED_CTR0_PROGRAMMED —** BITWISE_OR(Fixed_Ctr_Ctrl[1:0]).
31:4	-	-	-	Reserved.
3	Thread	0h	RO	**IA32_PMC3_PROGRAMMED —** BITWISE_OR(Event_Select3[7:0]).
2	Thread	0h	RO	**IA32_PMC2_PROGRAMMED —** BITWISE_OR(Event_Select2[7:0]).
1	Thread	0h	RO	**IA32_PMC1_PROGRAMMED —** BITWISE_OR(Event_Select1[7:0]).
0	Thread	0h	RO	**IA32_PMC0_PROGRAMMED —** BITWISE_OR(Event_Select0[7:0]).

69.2.97 (3F1h) IA32_PEBS_ENABLE

Precise Event Based Sampling (PEBS) controlling MSR.

MSR Address: 3F1h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31:1	-	-	-	Reserved.
0	Thread	0h	RW	**PEBS_ENABLE —** When set, enables Precise Event Based Sampling.

69.2.98 (3F8h) MSR_PKG_C3_RESIDENCY

Time spent in the Package C-State. It is given in units compatible to P1 clock frequency Guaranteed / Maximum Core Non-Turbo Frequency. This time will be updated by the SoC PCODE only after the C-State exit the update of this register has lower priority than actually ensuring that the C-State exit occurs.

MSR Address: 3F8h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:60	-	-	-	Reserved.
59:0	Package	0h	RW	**COUNTER —** Counter Value.

69.2.99 (3F9h) MSR_PKG_C6_RESIDENCY

Time spent in the Package C-State. It is given in units compatible to P1 clock frequency Guaranteed / Maximum Core Non-Turbo Frequency. This time will be updated by the SoC PCODE only after the C-State exit the update of this register has lower priority than actually ensuring that the C-State exit occurs.

MSR Address: 3F9h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:60	-	-	-	Reserved.
59:0	Package	0h	RW	**COUNTER —** Counter Value.

69.2.100 (3FCh) MSR_CORE_C3_RESIDENCY

The MSR_CORE_C3_RESIDENCY exists to assist in the debug of OEM platform power issues. This timer is not architectural which means it is not for use by OS or BIOS; and not guaranteed to be on future products or in the same MSR locations if it is available.

MSR Address: 3FCh				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:0	Core	0h	RW	**RESIDENCY —** This value will be accumulated by the SoC. This is in the CTC time-domain. A RDMSR will be required to convert this using "P" to get into the TSC time-domain.

69.2.101 (3FDh) MSR_CORE_C6_RESIDENCY

The MSR_CORE_C6_RESIDENCY exists to assist in the debug of OEM platform power issues. This timer is not architectural which means it is not for use by OS or BIOS; and not guaranteed to be on future products or in the same MSR locations if it is available.

MSR Address: 3FDh				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:0	Core	0h	RW	**RESIDENCY —** This value will be accumulated by the SoC. This is in the CTC time-domain. A RDMSR will be required to convert this using "P" to get into the TSC time-domain.

69.2.102 (3FEh) MSR_CORE_C7_RESIDENCY

The MSR_CORE_C7_RESIDENCY exists to assist in the debug of OEM platform power issues. This timer is not architectural which means it is not for use by OS or BIOS; and not guaranteed to be on future products or in the same MSR locations if it is available.

MSR Address: 3FEh				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:0	Thread	-	-	**DATA —** Reserved for possible future use.

69.2.103 (400h) IA32_MC0_CTL (BIU)

MSR Address: 400h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:8	Module	-	-	Reserved.
7:0	Core	0h	RW	**EN_IFU_ERR_SIGALING -** Enable IFU MCA error signaling. When bit is set, IFU errors will result in assertion of CATERR#. Otherwise, CATERR# is not asserted.

69.2.104 (401h) IA32_MC0_STATUS

MCA Status Register. WRMSR microcode

The SoC generates #GP on non-zero writes.

MSR Address: 401h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63	Module	0h	RW	**VALID —** Valid
62	Module	0h	RW	**OVERFLOW —** Overflow
61	Module	0h	RW	**MCERR —** MCERR
60	Module	0h	RW	**EN —** Reserved.
59	Module	-	-	Reserved.
58	Module	0h	RW	**ADDRV —** Addrv
57	Module	0h	RW	**PCC —** XQ_ERR
56:38	Module	-	-	Reserved.
37:32	Module	0h	RW	**BGF_ERROR —** Data driven sticky bit
31:30	Module	-	-	Reserved.
29	Module	0h	RW	**MCERR_INBOUND —** MCERR observed bit
28	Module	0h	RW	**MCERR_OUTBOUND —** MCERR driven sticky bit
27:25	Module	0h	RW	**ERROR_TYPE —** Error type is valid when ADDRV is set: • 001 - Inbound Data Error • 010 - Outbound Data Error • 011 - Transaction Error
24:18	Module	0h	RW	**IDI_OPCODE —** XQ error request
17:12	Module	-	-	Reserved.
11	Module	0h	RW	**MCACOD_IDI —** MCA COD bit1
10	Module	0h	RW	**MCACOD_ROB —** MCA COD ROB
9:6	Module	-	-	Reserved.
5:4	Module	0h	RW	**MCACOD_REQ —** MCA COD req bits
3:2	Module	-	-	Reserved.
1:0	Module	0h	RW	**MCACOD —** MCA COD bits

69.2.105 (402h) IA32_MC0_ADDR (BIU)

MCA Address Register. WRMSR microcode

The SoC generates #GP on non-zero writes.

MSR Address: 402h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:40	Module	-	-	Reserved.
39:0	Module	0h	RW	**BITS0TO35 —** Bits 0 to 39 for the MCA address register.

69.2.106 (404h) IA32_MC1_CTL (L2 Cache)

MSR Address: 404h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:2	Module	-	-	Reserved.
1	Module	0h	RW	**PIC —** Enables reporting of MCA errors to Hard Error.
0	Module	0h	RW	**DATA —** Enables reporting of MCA errors to Hard Error.

69.2.107 (405h) IA32_MC1_STATUS (L2 Cache)

L2 MCA Status Register. WRMSR microcode

The SoC generates #GP on non-zero writes.

MSR Address: 405h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63	Module	0h	RW	**MC_VALID_BIT —** MC is valid due to any ECC error detected.
62	Module	0h	RW	**MC_OVWR_BIT —** New ECC error overwriting old ECC error.
61	Module	0h	RW	**MC_UC_BIT —** Uncorrectable ECC error detected.
60	Module	0h	RW	**MC_EN_BIT —** Any ECC error detected.
59	Module	-	-	Reserved.
58	Module	0h	RW	**MC_ADDRV_BIT —** Address/State/LRU had ECC error.
57	Module	0h	RW	**MC_PCC_BIT —** Processor Context Corruption, always 1 with an uncorrectable error.
56:55	Module	-	-	Reserved.
54	Module	0h	RW	**MC_YELLOW_BIT —** Indicates parts health.
53	Module	0h	RW	**MC_GREEN_BIT —** Indicates parts health only when SINGLE_MCA_LOGGING_MODE_RANGE = 00.
52	Module	0h	RW	**MC_ERROR_COUNT_OVERFLOW_BIT —** Counting filtered correctable MCA errors.
51:38	Module	0h	RW	**MC_ERROR_COUNT —** Counting filtered correctable MCA errors.
37:36	Module	-	-	Reserved.
35	Module	0h	RW	**MCFH —** MCA Fast hit error.
34	Module	0h	RW	**MCAC —** MCA Core ID.
33:31	Module	-	-	Reserved.
30	Module	0h	RW	**MCSBF —** Fuse disable sbf pass through.
29:25	Module	-	-	Reserved.
24:23	Module	0h	RW	**MSCOD —** Model Specific error code, in addition to MCA code. Array with error: • 00 - Data • 01 - Tag • 10 - State

MSR Address: 405h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
22:20	Module	-	-	Reserved.
19:16	Module	0h	RW	**MCAW —** MCA Way.
15:0	Core	-	RWS-O	**MCACOD —** Machine Check Architecture Error Code Refer to Intel® 64 and IA-32 Architectures Software Developer Manual, Volume 3A: System Programming Guide, Part 1. Bit[15:11] can be any value between 0x0-0x1f. Bit [8] will set to 0x1 when Cache Hierarchy Error. For the lower 8 bits, the compound error code format: bRRRR TTLL RRRR: Cache Hierarchy Error RRRR. • b0000: Generic Error • b0001: Generic Read • b0010: Generic Write • b0011: Data Read • b0100: Data Write • b0101: Instruction Fetch • b0110: Prefetch • b0111: Eviction • b1000: Snoop • b1001-B1111: Reserved RRRR TT: Cache Hierarchy Error TT. • b00: Instruction • b01: Data • b10: Generic TT • b11: Reserved TT LL: Cache Hierarchy Error LL • b00: Level 0 (core L1 cache) • b01: Level 1 (core L2 cache) • b10: Level 2 (L3/LLC cache) • b11: Generic LL For Simple Error, bit[2:0]: • b000: No Error • b001: Unclassified Error • b010: Microcode ROM Parity Error • b011: External Error • b100: FRC Error • b101: Internal Parity Error • b110-b111: Simple Error Following are examples of supported codes: • 0x0174 - Eviction Error (e.g. WBINVD) • 0x0134 - L1 Data Read Error • 0x0144 - L1 Data Store Error • 0x0164 - L1 Data Prefetch Error • 0x0184 - L1 Data Snoop Error

69.2.108 (406h) IA32_MC1_ADDR (L2 Cache)

L2 MCA Address Register. WRMSR microcode

The SoC generates #GP on non-zero writes.

MSR Address: 406h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:40	Module	-	-	Reserved.
39:0	Module	0h	RW	**MCA_ADDR —** MCA Address MCA Control Register.

69.2.109 (408h) IA32_MC2_CTL (FEC)

Reserved for future use.

MSR Address: 408h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:4	-	-	-	**RSVD_63_4** - Reserved
3:1	Core	0h	RW	**EN_DTLB_ERR_SIGNALING** - Enable DTLB error reporting. When bit is set DTLB errors will result in assertion of CATERR#. Otherwise, CATERR# is not asserted.
0	Core	0h	RW	**EN_DCU_ERR_SIGNALING** - Enable DCU error reporting. When bit is set DCU errors will result in assertion of CATERR#. Otherwise, CATERR# is not asserted.

69.2.110 (409h) IA32_MC2_STATUS (FEC)

MCA Status Register.Only a write of all 0s is allowed by WRMSR microcode.

MSR Address: 409h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63	Core	0h	RW	**VAL —** Valid bit - Indicates the information in this register is for a valid error report.
62	Core	0h	RW	**OVER —** Machine check overflow - Indicates that there was another error already written to this register which is still in the handler (i.e., the VAL bit was already set when this error occurred).
61	Core	0h	RW	**UC —** Uncorrected Error - Signifies the error being reported went uncorrected.
60	Core	0h	RW	**EN —** MCI_CTL register has the associated Error Enable bit set.
59	Core	-	-	Reserved.
58	Core	0h	RW	**ADDRV —** MCI_ADDR register holds valid data.
57	Core	0h	RW	**PCC —** Processor Context Corrupt - Indicates that the processor state may have been corrupted by this MCA event.
56:53	Core	-	-	Reserved.
52:38	Core	0h	RW	**CORRECTED_ERROR_COUNT —** Indicates the number of corrected errors.

MSR Address: 409h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
37:32	Core	-	-	Reserved.
31:16	Core	0h	RW	**MSCOD** - Model Specific Error Code • 0x0000 - Tag Parity Error • 0x0001 - Data Parity Error • 0x0010 - Tag Parity Error • 0x0011 - Data Parity Error • 0x0004 - Internal Error
15:0	Core	-	RWS-O	**MCACOD** - Machine Check Architecture Code Refer to Intel® 64 and IA-32 Architectures Software Developer Manual, Volume 3A: System Programming Guide, Part 1. Bit[15:11] can be any value between 0x0-0x1f. Bit[8] will set to 0x1 when Cache Hierarchy Error. For the lower 8 bits, the compound error code Format: bRRRR TTLL RRRR: Cache Hierarchy Error RRRR. • b0000: Generic Error • b0001: Generic Read • b0010: Generic Write • b0011: Data Read • b0100: Data Write • b0101: Instruction Fetch • b0110: Prefetch • b0111: Eviction • b1000: Snoop • b1001-b1111: Reserved RRRR TT: Cache Hierarchy Error TT. • b00: Instruction • b01: Data • b10: Generic TT • b11: Reserved TT LL: Cache Hierarchy Error LL • b00: Level 0 (core L1 cache) • b01: Level 1 (core L2 cache) • b10: Level 2 (L3/LLC cache) • b11: Generic LL For Simple Error, bit[2:0]: • b000: No Error • b001: Unclassified Error • b010: Microcode ROM Parity Error • b011: External Error • b100: FRC Error • b101: Internal Parity Error • b110-b111: Simple Error Following are examples of supported codes: • 0x0174 - Eviction Error (e.g. WBINVD) • 0x0134 - L1 Data Read Error • 0x0144 - L1 Data Store Error • 0x0164 - L1 Data Prefetch Error • 0x0184 - L1 Data Snoop Error

69.2.111 (40Ah) IA32_MC2_ADDR (FEC)

MCA Address Register. Only a write of all 0s is allowed by WRMSR microcode.

MSR Address: 40Ah				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:48	Core	-	-	Reserved.
47:0	Core	0h	RW	**ADDRESS —** Linear Address[47:0] for I$ or ITAG and Physical Address [39:0] for SNOOP ITAG PARITY ERROR.

69.2.112 (40Ch) IA32_MC3_CTL (MEC)

MCA Control Register. MRM b1598713:Dont #GP on writing ones to the upper part of MCi_CTL because the software model always write one to the whole 64bit.

MSR Address: 40Ch				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:2	Core	-	-	Reserved.
1	Core	0h	RW	**L1_TAG_PERR_UNCORR —** Enable uncorrectable data cache errors.
0	Core	0h	RW	**L1_DATA_PERR_UNCORR —** Enable uncorrectable tag array errors.

69.2.113 (40Dh) IA32_MC3_STATUS (MEC)

MCA Status Register. WRMSR microcode

The SoC generates #GP on non-zero writes.

MSR Address: 40Dh				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63	Core	0h	RW	**VAL —** Valid bit for the bank.
62	Core	0h	RW	**OVER —** Bank overflowed (you missed one).
61	Core	0h	RW	**UC —** Error was uncorrectable.
60	Core	0h	RW	**EN —** Error was enabled.
59	Core	-	-	Reserved.
58	Core	0h	RW	**ADDRV —** Address is valid.
57	Core	0h	RW	**PCC —** Processor context corrupt.
56:21	Core	-	-	Reserved.
20:16	Core	0h	RW	**MODEL_SPECIFIC_ERROR_CODE —** Model specific error code.
15:0	Core	0h	RW	**MCA_ERROR_CODE —** Machine check error code.

69.2.114 (40Eh) IA32_MC3_ADDR (MEC)

MCA Address Register. WRMSR microcode

The SoC generates #GP on non-zero writes.

MSR Address: 40Eh				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:40	Core	-	-	Reserved.
39:0	Core	0h	RW	**ADDRESS —** The address in the address register.

69.2.115 (410h) IA32_MC4_CTL (SA)

Machine Check Architecture Control MSR.

MSR Address: 410h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63	Package	0h	RO	**EE63** — Error Enable 63
62	Package	0h	RO	**EE62** — Error Enable 62
61	Package	0h	RO	**EE61** — Error Enable 61
60	Package	0h	RO	**EE60** — Error Enable 60

0	Package	0h	RO	**EE00 —** Error Enable 00

69.2.116 (411h) IA32_MC4_STATUS (SA)

Machine Check Architecture Status MSR.

MSR Address: 411h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63	Core	0h	RW	**VAL —** Valid bit - Indicates the information in this register is for a valid error report.
62	Core	0h	RW	**OVER —** Machine check overflow - Indicates that there was another error already written to this register which is still in the handler (i.e., the VAL bit was already set when this error occurred).
61	Core	0h	RW	**UC —** Uncorrected Error - Signifies the error being reported went uncorrected.
60	Core	0h	RW	**EN —** MCI_CTL register has the associated Error Enable bit set.
59	Core	-	-	Reserved.
58	Core	0h	RW	**ADDRV —** MCI_ADDR register holds valid data.
57	Core	0h	RW	**PCC —** Processor Context Corrupt - Indicates that the processor state may have been corrupted by this MCA event.
56:53	Core	-	-	Reserved.
52:38	Core	0h	RW	**CORRECTED_ERROR_COUNT —** Indicates the number of corrected errors.

MSR Address: 411h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
37:32	Core	-	-	Reserved.
31:16	Core	0h	RW	**MSCOD** - Model Specific Error Code • 0x0000 - Tag Parity Error • 0x0001 - Data Parity Error • 0x0010 - Tag Parity Error • 0x0011 - Data Parity Error • 0x0004 - Internal Error
15:0	Core	-	RWS-O	**MCACOD** - Machine Check Architecture Code Refer to Intel® 64 and IA-32 Architectures Software Developer Manual, Volume 3A: System Programming Guide, Part 1. Bit[15:11] can be any value between 0x0-0x1f. Bit[8] will set to 0x1 when Cache Hierarchy Error. For the lower 8 bits, the compound error code Format: bRRRR TTLL RRRR: Cache Hierarchy Error RRRR. • b0000: Generic Error • b0001: Generic Read • b0010: Generic Write • b0011: Data Read • b0100: Data Write • b0101: Instruction Fetch • b0110: Prefetch • b0111: Eviction • b1000: Snoop • b1001-b1111: Reserved RRRR TT: Cache Hierarchy Error TT. • b00: Instruction • b01: Data • b10: Generic TT • b11: Reserved TT LL: Cache Hierarchy Error LL • b00: Level 0 (core L1 cache) • b01: Level 1 (core L2 cache) • b10: Level 2 (L3/LLC cache) • b11: Generic LL For Simple Error, bit[2:0]: • b000: No Error • b001: Unclassified Error • b010: Microcode ROM Parity Error • b011: External Error • b100: FRC Error • b101: Internal Parity Error • b110-b111: Simple Error Following are examples of supported codes: • 0x0174 - Eviction Error (e.g. WBINVD) • 0x0134 - L1 Data Read Error • 0x0144 - L1 Data Store Error • 0x0164 - L1 Data Prefetch Error • 0x0184 - L1 Data Snoop Error

69.2.117 (412h) IA32_MC4_ADDR (SA)

Machine Check Architecture Address MSR.

MSR Address: 412h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:0	Package	0h	RW	**ENH_MCA_AVAIL —** Available when enhanced MCA is in use.

69.2.118 (413h) IA32_MC4_MISC (SA)

PCU Machine Check Architecture Misc MSR.

MSR Address: 413h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:9	Package	0h	RW	**MODEL_SPECIFIC_INFO —** Available when enhanced MCA is in use.
8:6	Package	0h	RW	**ADDRESS_MODE —** This field contains the address mode for the recorded address. The options are: • 000 -> Segment Offset • 001 -> Linear Address • 010 -> Physical Address
5:0	Package	0h	RW	**RECOVERABLE_ADDRESS_LSB —** This field contains the LSB of the recoverable error address.

69.2.119 (414h) IA32_MC5_CTL (PMU)

Machine Check Architecture Control MSR.

MSR Address: 414h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63	Package	0h	RO	**EE63** — Error Enable 63
62	Package	0h	RO	**EE62** — Error Enable 62
61	Package	0h	RO	**EE61** — Error Enable 61
60	Package	0h	RO	**EE60** — Error Enable 60
59	Package	0h	RO	**EE59** — Error Enable 59

0	Package	0h	RO	**EN_PCU_HW_ERR —** Error Enable 00

69.2.120 (415h) IA32_MC5_STATUS (PMU)

Machine Check Architecture Status MSR.

MSR Address: 415h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63	Package	0h	RW	**VAL —** MCi_STATUS Register Valid.
62	Package	0h	RW	**OVER —** Error Overflow.
61	Package	0h	RW	**UC —** Uncorrected Error.
60	Package	0h	RW	**EN —** Error Reporting Enabled.
59	Package	0h	RW	**MISCV —** MCi_MISC Register Valid.
58	Package	0h	RW	**ADDRV —** MCi_ADDR Register Valid.
57	Package	0h	RW	**PCC —** Processor Context Corrupted.
56	Package	0h	RW	**S —** Signaling an uncorrected recoverable (UCR) error - When MCG_CAP11 or MCG_CAP24 are not set, these bits are reserved or model specific.
55	Package	0h	RW	**AR —** Recovery Action Required for UCR Error - When MCG_CAP11 or MCG_CAP24 are not set, these bits are reserved or model specific.
54:53	Package	0h	RW	**TES —** Threshold-Based Error Status - When MCG_CAP11 is not set, these bits are model specific.
52:38	Package	0h	RW	**CORRECTED_ERROR_COUNT —** Corrected error count.
37:32	Package	0h	RW	**OTHER_INFO —** Other information.
31:16	Package	0h	RW	**MSCOD —** Model specific Error Code.
15:0	Package	0h	RW	**MCACOD —** MCA Error Code.

69.2.121 (416h) IA32_MC5_ADDR (PMU)

Machine Check Architecture Address MSR.

MSR Address: 416h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:0	Package	0h	RW	**ENH_MCA_AVAIL —** Available when enhanced MCA is in use.

69.2.122 (417h) IA32_MC5_MISC (PMU)

PCU Machine Check Architecture Misc MSR.

MSR Address: 417h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:9	Package	0h	RW	**MODEL_SPECIFIC_INFO —** Available when enhanced MCA is in use.
8:6	Package	0h	RW	**ADDRESS_MODE —** This field contains the address mode for the recorded address. The options are: • 000 -> Segment Offset • 001 -> Linear Address • 010 -> Physical Address
5:0	Package	0h	RW	**RECOVERABLE_ADDRESS_LSB —** This field contains the LSB of the recoverable error address.

69.2.123 (418h) IA32_MC6_CTL (SA)

Machine Check Architecture Control MSR.

MSR Address: 418h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63	Package	0h	RO	**EE63** — Error Enable 63
62	Package	0h	RO	**EE62** — Error Enable 62
61	Package	0h	RO	**EE61** — Error Enable 61
60	Package	0h	RO	**EE60** — Error Enable 60
59	Package	0h	RO	**EE59** — Error Enable 59

69.2.127 (41Dh) IA32_MC7_STATUS (MEM 0)

Machine Check Architecture Status MSR.

MSR Address: 41Dh				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63	Package	0h	RW	**VAL —** MCi_STATUS Register Valid.
62	Package	0h	RW	**OVER —** Error Overflow.
61	Package	0h	RW	**UC —** Uncorrected Error.
60	Package	0h	RW	**EN —** Error Reporting Enabled.
59	Package	0h	RW	**MISCV —** MCi_MISC Register Valid.
58	Package	0h	RW	**ADDRV —** MCi_ADDR Register Valid.
57	Package	0h	RW	**PCC —** Processor Context Corrupted.
56	Package	0h	RW	**S —** Signaling an uncorrected recoverable (UCR) error - When MCG_CAP11 or MCG_CAP24 are not set, these bits are reserved or model specific.
55	Package	0h	RW	**AR —** Recovery Action Required for UCR Error - When MCG_CAP11 or MCG_CAP24 are not set, these bits are reserved or model specific.
54:53	Package	0h	RW	**TES —** Threshold-Based Error Status - When MCG_CAP11 is not set, these bits are model specific.
52:38	Package	0h	RW	**CORRECTED_ERROR_COUNT —** Corrected error count.
37:32	Package	0h	RW	**OTHER_INFO —** Other information.
31:16	Package	0h	RW-O	**MSCOD —** Model specific Error Code. • 0x0200 - BT Timeout Error • 0x0100 - Internal Parity • 0x0080 - Internal Parity • 0x0040 - Internal Parity • 0x0020 - Internal Parity • 0x0010 - RTID Error • 0x0008 - Internal Error • 0x0004 - Partial Write Error • 0x0002 - Data Buffer Parity Error • 0x0001 - Memory Read Error • All others reserved.
15:0	Package	0h	-	**MCCOD —** Specifies the machine check architecture defined error code for the machine check error condition detected. Data Read Error: 0000 0000 1001 CCCC; Generic Error: 0000 0000 1000 CCCC; (HADB Parity, RTID out Range, BGF, etc.) Write Error: 0000 0000 1010 CCCC; (Partial Write, etc.) Replace CCCC with channel number. • Ch 0 = 0000b • Ch 1 = 0001b • Ch 2 = 0010b • Ch 3 = 0011b If the channel number can not be specified, such as request from Cbo and RTID out of range, use encode 1111.

69.2.128 (41Fh) IA32_MC7_MISC (MEM 0)

PCU Machine Check Architecture Misc MSR.

MSR Address: 41Fh				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:9	Package	0h	RW	**MODEL_SPECIFIC_INFO —** Available when enhanced MCA is in use.
8:6	Package	0h	RW	**ADDRESS_MODE —** This field contains the address mode for the recorded address. The options are: • 000 -> Segment Offset • 001 -> Linear Address • 010 -> Physical Address
5:0	Package	0h	RW	**RECOVERABLE_ADDRESS_LSB —** This field contains the LSB of the recoverable error address.

69.2.129 (420h) IA32_MC8_CTL (MEM 1)

Machine Check Architecture Control MSR.

MSR Address: 420h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63	Package	0h	RO	**EE63** — Error Enable 63

0	Package	0h	RO	**EE00 —** Error Enable 00

69.2.130 (421h) IA32_MC8_STATUS (MEM 1)

Machine Check Architecture Status MSR.

MSR Address: 421h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63	Package	0h	RW	**VAL —** MCi_STATUS Register Valid.
62	Package	0h	RW	**OVER —** Error Overflow.
61	Package	0h	RW	**UC —** Uncorrected Error.
60	Package	0h	RW	**EN —** Error Reporting Enabled.
59	Package	0h	RW	**MISCV —** MCi_MISC Register Valid.
58	Package	0h	RW	**ADDRV —** MCi_ADDR Register Valid.
57	Package	0h	RW	**PCC —** Processor Context Corrupted.
56	Package	0h	RW	**S —** Signaling an uncorrected recoverable (UCR) error - When MCG_CAP11 or MCG_CAP24 are not set, these bits are reserved or model specific.
55	Package	0h	RW	**AR —** Recovery Action Required for UCR Error - When MCG_CAP11 or MCG_CAP24 are not set, these bits are reserved or model specific.
54:53	Package	0h	RW	**TES —** Threshold-Based Error Status - When MCG_CAP11 is not set, these bits are model specific.
52:38	Package	0h	RW	**CORRECTED_ERROR_COUNT —** Corrected error count.
37:32	Package	0h	RW	**OTHER_INFO —** Other information.
31:16	Package	0h	RW	**MSCOD —** Model specific Error Code.
15:0	Package	0h	RW	**MCACOD —** MCA Error Code.

69.2.131 (423h) IA32_MC8_MISC (MEM 1)

PCU Machine Check Architecture Misc MSR.

MSR Address: 423h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:9	Package	0h	RW	**MODEL_SPECIFIC_INFO —** Available when enhanced MCA is in use.
8:6	Package	0h	RW	**ADDRESS_MODE —** This field contains the address mode for the recorded address. The options are: • 000 -> Segment Offset • 001 -> Linear Address • 010 -> Physical Address
5:0	Package	0h	RW	**RECOVERABLE_ADDRESS_LSB —** This field contains the LSB of the recoverable error address.

69.2.132 (4C1h) IA32_A_PMC0

Refer to the Intel® 64 and IA-32 Architectures Software Developer's Manual for complete details on MSRs related to Performance Monitoring.

MSR Address: 4C1h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:0	Core	-	-	**DATA —** Refer to the Intel® 64 and IA-32 Architectures Software Developer's Manual for complete details on MSRs related to Performance Monitoring.

69.2.133 (4C2h) IA32_A_PMC1

Refer to the Intel® 64 and IA-32 Architectures Software Developer's Manual for complete details on MSRs related to Performance Monitoring.

MSR Address: 4C2h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:0	Core	-	-	**DATA —** Refer to the Intel® 64 and IA-32 Architectures Software Developer's Manual for complete details on MSRs related to Performance Monitoring.

69.2.134 (4C3h) IA32_A_PMC2

Refer to the Intel® 64 and IA-32 Architectures Software Developer's Manual for complete details on MSRs related to Performance Monitoring.

MSR Address: 4C3h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:0	Core	-	-	**DATA —** Refer to the Intel® 64 and IA-32 Architectures Software Developer's Manual for complete details on MSRs related to Performance Monitoring.

69.2.135 (4C4h) IA32_A_PMC3

Refer to the Intel® 64 and IA-32 Architectures Software Developer's Manual for complete details on MSRs related to Performance Monitoring.

MSR Address: 4C4h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:0	Core	-	-	**DATA —** Refer to the Intel® 64 and IA-32 Architectures Software Developer's Manual for a complete details on MSRs related to Performance Monitoring.

69.2.136 (4E0h) MSR_SMM_FEATURE_CONTROL

This MSR holds enable bits for on-chip storage of SMM and Code Access Check Violation features. This MSR can be written only from within SMM but can be read by SMM and non SMM code. This MSR is cleared only on cold reset.

MSR Address: 4E0h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:3	Package	-	-	Reserved.
2	Package	0h	RW	**SMM_CODE_CHK_EN —** If 1, generate unrecoverable MCHK on code fetch outside SMRR. If 0, do not report any errors for code fetch outside SMRR.
1	Package	-	-	Reserved.
0	Package	0h	RW	**LOCK —** If Lock = 1, CPU will drop writes to the MSR If Lock = 0, CPU will allow update to b[2:0].

69.2.137 (4E2h) MSR_SMM_DELAYED

This MSR contains bit per logical processor indicating whether the logical processor is in the middle of long flow and hence will delay servicing of SMI. SMI will be serviced after the long flow completes execution.

MSR Address: 4E2h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:16	Package	-	-	Reserved.
15:0	Package	0h	SMM-RO	**LOG_PROC_STATE —** Each bit represents a logical processor of its state in a long flow of internal operation which delays servicing an interrupt. The corresponding bit will be set at the start of long events such as: - Microcode Update Load - C6 - WBINVD - Ratio Change - Throttle The bit is automatically cleared at the end of each long event. The reset value of this field is 0. Only bit positions below N = CPUID.(EAX=0BH, ECX=PKG_LVL):EBX[15:0] can be updated.

69.2.138 (4E3h) MSR_SMM_BLOCKED

This MSR contains bit per logical processor indicating whether the logical processor is in state where SMIs are blocked and hence will not be able to service SMI. SMI can be serviced after the logical processor exits the state in which SMIs are blocked.

MSR Address: 4E3h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:16	Package	-	-	Reserved.
15:0	Package	FFFFh	SMM-RO	**LOG_PROC —** Each bit represents a logical processor of its blocked state to service an SMI. The corresponding bit will be set if the logical processor is in one of the following states: - Wait For SIPI - SENTER Sleep The reset value of this field is 0FFFH. Only bit positions below N = CPUID.(EAX=0BH, ECX=PKG_LVL):EBX[15:0] can be updated.

69.2.139 (500h) IA32_SGX_SVN_STATUS

MSR Address: 500h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31:24	-	-	-	Reserved.
23:16	Package	0h	RO	**SINIT_SE_SVN —** Since the SoC does not support SINIT, this bit field is always 0. 0
15:1	-	-	-	Reserved.
0	Package	0h	RO	**LOCK —** If 1, indicates that a non-faulting Intel® SGX instruction has been executed. If 0, indicates that the processor will allow a properly signed Authenticated Code Modules (ACMs) to launch.

69.2.140 (503h) MSR_SGX_DEBUG_MODE

This MSR does not survive warm reset.

MSR Address: 503h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31:2	-	-	-	Reserved.
1	Package	0h	RO	**NPK_ACTIVE —** This read-only field indicates that the Intel® Trace Hub is active.
0	Package	0h	RW	**NPK_REQUEST —** When software sets this bit, a request is triggered to the Intel® Trace Hub to clear the Intel® Software Guard Extensions (Intel® SGX) keys.

69.2.141 (560h) IA32_RTIT_OUTPUT_BASE

This MSR is used to configure the output region of internally-buffered packets. The size of the address field is determined by the maximum physical address width (MAXPHYADDR), as reported by CPUID.80000008H:EAX[7:0].

The processor updates this MSR while when packet generation is enabled, and those updates are asynchronous to instruction execution. Therefore, the values in this MSR should be considered unreliable unless packet generation is disabled (IA32_RTIT_CTL.TraceEn = 0).

This MSR can be written only when IA32_RTIT_CTL.TraceEn is 0; otherwise WRMSR causes a general-protection fault (#GP).

MSR Address: 560h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:0	Core	-	-	**DATA —** Refer to the Intel® 64 and IA-32 Architectures Software Developer's Manual for details on this register, including supported fields.

69.2.142 (561h) IA32_RTIT_OUTPUT_MASK_PTRS

This MSR holds the pointers that indicate the ToPA entry that is currently in use and the offset into that entry's output region to which packets are being written.

The processor updates this MSR while when packet generation is enabled, and those updates are asynchronous to instruction execution. Therefore, the values in this MSR should be considered unreliable unless packet generation is disabled (IA32_RTIT_CTL.TraceEn = 0).

This MSR can be written only when IA32_RTIT_CTL.TraceEn is 0; otherwise WRMSR causes a general-protection fault (#GP).

MSR Address: 561h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:0	Core	-	-	**DATA —** Refer to the Intel® 64 and IA-32 Architectures Software Developer's Manual for details on this register, including supported fields.

69.2.143 (570h) IA32_RTIT_CTL

The primary enable and control MSR for trace packet generation.

MSR Address: 570h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:0	Core	-	-	**DATA —** Refer to the Intel® 64 and IA-32 Architectures Software Developer's Manual for details on this register, including supported fields.

69.2.144 (571h) ARR_CR_RTIT_STATUSIA32_RTIT_STATUS

The IA32_RTIT_STATUS MSR is readable and writable by software, but some bits (ContextEn, TriggerEn) are read-only and cannot be directly modified. The WRMSR instruction ignores these bits in the source operand (attempts to modify these bits are ignored and do not cause WRMSR to fault).

This MSR can only be written when IA32_RTIT_CTL.TraceEn is 0; otherwise WRMSR causes a general-protection fault (#GP). The processor does not modify the value of this MSR while TraceEn is 0 (software can modify it with WRMSR).

MSR Address: 571h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:0	Core	-	-	**DATA —** Refer to the Intel® 64 and IA-32 Architectures Software Developer's Manual for details on this register, including supported fields.

69.2.145 (572h) IA32_RTIT_CR3_MATCH

CR3 matches IA32_RTIT_CR3_MATCH if the two registers are identical for bits 63:5; the lower 5 bits of CR3 and IA32_RTIT_CR3_MATCH are not compared.

This MSR can be written only when IA32_RTIT_CTL.TraceEn is 0; otherwise WRMSR causes a general-protection fault (#GP). IA32_RTIT_CR3_MATCH[4:0] are reserved and must be 0; an attempt to set those bits using WRMSR causes a #GP.

MSR Address: 572h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:0	Core	-	-	**DATA —** Refer to the Intel® 64 and IA-32 Architectures Software Developer's Manual for details on this register, including supported fields.

69.2.146 (580h) IA32_RTIT_ADDR0_A

Region ADDR0 start address. MSR used to support EIP filtering.

MSR Address: 580h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:48	Thread	0h	RO	**IP0_SIGN_EXT —** On a creg read, bit 47 is sign extended into bits 63:48. This state is not stored.
47:0	Thread	0h	RW	**IP0_ADDR —** Holds the base Linear Instruction Pointer (address) for the region defined as ADDR0.

69.2.147 (581h) IA32_RTIT_ADDR0_B

Region ADDR0 end address. MSR used to support EIP filtering.

MSR Address: 581h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:48	Thread	0h	RO	**IP0_SIGN_EXT —** On a read, bit 47 is sign extended into bits 63:48. This state is not stored.
47:0	Thread	0h	RW	**IP0_ADDR —** Holds the limit Linear Instruction Pointer (address) for the region defined as ADDR0.

69.2.148 (582h) IA32_RTIT_ADDR1_A

Region ADDR1 start address. MSR used to support EIP filtering.

MSR Address: 582h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:48	Thread	0h	RO	**IP1_SIGN_EXT —** On a read, bit 47 is sign extended into bits 63:48. This state is not stored.
47:0	Thread	0h	RW	**IP1_ADDR —** Holds the base Linear Instruction Pointer (address) for the region defined as ADDR1.

69.2.149 (583h) IA32_RTIT_ADDR1_B

Region ADDR1 end address. MSR used to support EIP filtering.

MSR Address: 583h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:48	Thread	0h	RO	**IP1_SIGN_EXT —** On a read, bit 47 is sign extended into bits 63:48. This state is not stored.
47:0	Thread	0h	RW	**IP1_ADDR —** Holds the limit Linear Instruction Pointer (address) for the region defined as ADDR1.

69.2.150 (600h) IA32_DS_AREA

Points to the linear address of the first byte of the DS buffer management area, which is used to manage the BTS and PEBS buffers. Refer to the IA-32 Intel® Architecture Software Developer's Manual for a detailed description and usage of this MSR and the Debug Store (DS) Mechanism.

MSR Address: 600h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:0	Thread	0h	RW	**DATA —** The linear address of the first byte of the DS buffer management area. Useful bits in this field depend on the address methodology in use when the register state is saved.

69.2.151 (601h) MSR_VR_CURRENT_CONFIG

This register is used to limit the current consumption of the Primary power Plane. Primary Plane refers to the Vccin power rail. The processor will read this value during Reset Phase 4. On each slow loop, the maximum current possible will be calculated and the processor will send the appropriate PS Code according to the thresholds in this register. Set power state amp thresholds to 0A in order to disable that power state.

MSR Address: 601h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:56	-	-	-	Reserved.
55:48	Package	0h	RW	**IUNIT_LL_RES —** Load line resistance in 1/2 mOhm steps for the IUNIT domain. IUNIT IccMax current will be multiplied by IUNIT_LL_RES resistance to calculate the voltage guardband necessary to manage for an IUNIT didt droop.
47:40	Package	0h	RW	**GT_LL_RES —** Load line resistance in 1/2 mOhm steps for the GT domain. GT IccMax current will be multiplied by GT_LL_RES resistance to calculate the voltage guardband necessary to manage for GT didt droop.
39:32	Package	0h	RW	**GLM_LL_RES —** Load line resistance in 1/2 mOhm steps for the GLM domain. GLM IccMax current will be multiplied by GLM_LL_RES resistance to calculate the voltage guardband necessary to manage for GLM didt droop.
31:26	-	-	-	Reserved.
25:13	Package	0h	RW	**VCCGI_PS1_ICCMAX —** Peak current supported by the VR on the VGI rail when in PS1 mode. A value of 0 indicates VR support 0A of current in PS1 which will effectively disable PS1 use. Units given in PACKAGE_POWER_SKU_UNIT.CURRENT_UNIT.
12:0	Package	0h	RW	**VCCGI_PS0_ICCMAX —** Peak current supported by the VR on the VGI rail. Assumes VR is in the highest power state possible (PS0). Units given in PACKAGE_POWER_SKU_UNIT.CURRENT_UNIT.

69.2.152 (603h) MSR_VR_MISC_CONFIG

Input voltage regulator configuration parameters.

MSR Address: 603h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:2	-	-	-	Reserved.
1	Package	1h	RW	**IDLE_ENTRY_RAMP_RATE —** Controls the VR ramp rate on package Cstate entry events. 1 fast 0 slow. If Decay is set it has priority.
0	Package	1h	RW	**IDLE_EXIT_RAMP_RATE —** Controls the VR ramp rate on package Cstate wake events. 1 fast 0 slow.

69.2.153 (606h) MSR_RAPL_POWER_UNIT

Defines units for calculating SKU power and timing parameters. PCODE will update the contents of this register.

MSR Address: 606h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31:28	Package	3h	RW	**RESISTANCE_UNIT —** Specifies the number of decimal bits in which current units in this register are specified. 0: steps of 1 Ohm 1: steps of 0.5 Ohms 2: steps of 0.25 Ohms etc...
27:24	Package	3h	RW	**CURRENT_UNIT —** Specifies the number of decimal bits in which current units in this register are specified. 0: steps of 1 A 1: steps of 0.5 Amps 2: steps of 0.25 A etc...
23:20	Package	-	-	Reserved.
19:16	Package	Ah	RW	**TIME_UNIT —** Time Units used for power control registers. The actual unit value is calculated by 1 s / 2^(TIME_UNIT). The default value of Ah corresponds to 976 µs.
15:13	Package	-	-	Reserved.
12:8	Package	Eh	RW	**ENERGY_UNIT —** Energy Units used for power control registers. The actual unit value is calculated by 1 J / 2^(ENERGY_UNIT). The default value of 14 decimal corresponds to Ux.14 number.
7:4	Package	-	-	Reserved.
3:0	Package	8h	RW	**PWR_UNIT —** Power Units used for power control registers. The actual unit value is calculated by 1 W / 2^(PWR_UNIT). The default value of 0110b corresponds to 1/64 W.

69.2.154 (610h) MSR_PKG_POWER_LIMIT

The Package Power Limit Register allows platform BIOS to limit the power consumption of the processor to the specified values. POWER_LIMIT_1 and POWER_LIMIT_1_TIME are used to specify sustained long duration power limits and are around the TDP value of the processor. POWER_LIMIT_2 is used to specify the short duration power limit. The specified Power Limits are programmable only if bit 29 in PLATFORM_INFO (MSR CEh) is set. If this bit is not set then writes to this MSR will result in a GP fault.The Integrated Graphics driver CPM driver BIOS and OS can balance the power budget between the Primary Power Plane IA and the Secondary Power Plane GT via PRIMARY_PLANE_TURBO_POWER_LIMIT_MSR and SECONDARY_PLANE_TURBO_POWER_LIMIT_MSR.

MSR Address: 610h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63	Package	0h	RW_L	**PKG_PWR_LIM_LOCK —** When set all settings in this register are locked and are treated as Read Only. This bit will typically set by BIOS during boot time or resume from Sx.
62:56	Package	-	-	Reserved.
55:49	Package	0h	RW_L	**PKG_PWR_LIM_2_TIME** — This indicates the short duration time window over which Power_Limit_2 value should be maintained. This field is made up of two numbers from the following equation. The processor power consumption will be controlled to the Power_Limit_2 value over an exponential weighted moving average of the time window. Time Window = (float) ((1+(X/4)) * (2 ^ Y)) Where: X = POWER_LIMIT_2_TIME[55:54] Y = POWER_LIMIT_2_TIME[53:49] The unit of measurement for this field is available from PACKAGE_POWER_SKU_UNIT (MSR 606h). It is recommended that system BIOS not update this value during runtime.
48	Package	0h	RW_L	**PKG_CLMP_LIM_2 —** When set, allows processor to go below the OS requested P States in order to maintain the power below Power_Limit_2 value specified below. Both RAPL clamp bits CRITICAL_POWER_CLAMP_[2-1] are set to 1.
47	Package	0h	RW_L	**PKG_PWR_LIM_2_EN —** When set, enables processor to apply control policies such that the package power does not exceed Power_Limit_2 value. BIOS must set Power_Limit_2_EN for proper turbo mode operation and set Power_Limit_2 field of this MSR to an appropriate value.
46:32	Package	0h	RW_L	**PKG_PWR_LIM_2 —** Short Duration Power limit value which the package must not exceed. This field is specified in the units as identified by the PACKAGE_POWER_SKU_UNIT (MSR 606h). Note: BIOS must enable Power_Limit_2 to enable Short Duration Power Limit for the processor. Recommended default value is 1.2 times the Long Duration Power Limit value (Power_Limit_1).
31:24	Package	-	-	Reserved.
23:17	Package	0h	RW_L	**PKG_PWR_LIM_1_TIME —** This indicates the time window over which Power_Limit_1 value should be maintained. This field is made up of two numbers from the following equation. The processor power consumption will be controlled to the Power_Limit_1 value over an exponential weighted moving average of the time window. Time Window = (float) ((1+(X/4)) * (2 ^ Y)) Where: X = POWER_LIMIT_1_TIME[23:22] Y = POWER_LIMIT_1_TIME[21:17] The unit of measurement for this field is available from PACKAGE_POWER_SKU_UNIT (MSR 606h). The maximum allowed value in this field is defined in PACKAGE_POWER_SKU (MSR 614h) PACKAGE_MAX_TIME field. It is recommended that system BIOS not update this value during runtime.

MSR Address: 610h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
16	Package	0h	RW_L	**PKG_CLMP_LIM_1 —** When set, allows processor to go below the OS requested P States in order to maintain the power below Power_Limit_1 value specified below. Both RAPL clamp bits CRITICAL_POWER_CLAMP_[2-1] are set to 1.
15	Package	0h	RW_L	**PKG_PWR_LIM_1_EN —** When set, enables processor to apply control policies such that the package average power does not exceed Power_Limit_1 value over over an exponential weighted moving average of the time window. This bit is always enabled indicating Power_Limit_1 is always active. Because the processor must maintain the power consumption to the TDP value, Power_Limit_1 is always enabled.
14:0	Package	0h	RW_L	**PKG_PWR_LIM_1 —** Average Power limit value which the package must not exceed over a time window as specified by Power_Limit_1_TIME field above. The processor power consumption will be controlled to the Power_Limit_1 value over an exponential weighted moving average of the time window. This field is specified in the units as identified by the PACKAGE_POWER_SKU_UNIT (MSR 606h). Initial value varies based on the SKU. It is recommended that system BIOS not update this value during runtime.

69.2.155 (614h) MSR_PKG_POWER_INFO

Defines allowed SKU power and timing parameters. PCODE will update the contents of this register.

MSR Address: 614h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:55	Package	-	-	Reserved.
54:48	Package	12h	RW	**PKG_MAX_WIN —** The maximal time window allowed for the SoC product SKU. Higher values will be clamped to this value. The unit of measurement is defined in PACKAGE_POWER_SKU_UNIT_MSRTIME_UNIT.
47	Package	-	-	Reserved.
46:32	Package	240h	RW	**PKG_MAX_PWR —** The maximal package power setting allowed for the SoC product SKU. Higher values will be clamped to this value. The maximum setting is typical not guaranteed. The default value for this field is determined by the SoC product SKU. The units for this value are defined in PACKAGE_POWER_SKU_MSRPWR_UNIT.
31	Package	-	-	Reserved.
30:16	Package	60h	RW	**PKG_MIN_PWR —** The minimal package power setting allowed for the SoC product SKU. Lower values will be clamped to this value. The minimum setting is typical not guaranteed. The default value for this field is determined by the SoC product SKU. The units for this value are defined in PACKAGE_POWER_SKU_MSRPWR_UNIT.
15	Package	-	-	Reserved.
14:0	Package	118h	RW	**PKG_TDP —** The package's Thermal Design Power (TDP) allowed for this part. The value is in the units identified in POWER_UNIT field in PACKAGE_POWER_SKU_UNIT (MSR 606h).

69.2.156 (615h) PPL3_CONTROL

PL3 Control MSR.

MSR Address: 615h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63	Package	0h	RW_L	**LOCK —** Lock this MSR until next reset: 0 - unlocked 1 - locked
62:48	-	-	-	Reserved.
47	Package	0h	RW_L	**PL4_ENABLE —** Power Limit 4 Enable: 0 => Algorithm disabled 1 => Algorithm enabled
46:32	Package	0h	RW_L	**PMAX —** Power Limit 'PL4' or Pmax power limit in the units as described PACAKGE_POWER_SKU_UNIT MSR.
31	-	-	-	Reserved.
30:24	Package	0h	RW_L	**DUTY_CYCLE —** Expressed in percentage (%). Clipped to a max value of 100%.
23:17	Package	0h	RW_L	**TIME_WINDOW —** Duration over which duty cycle control will be maintained. (xxYYYY format)
16	-	-	-	Reserved.
15	Package	0h	RW_L	**PL3_ENABLE —** Power Limit 3 Enable: 0 => Algorithm disabled 1 => Algorithm enabled
14:0	Package	0h	RW_L	**POWER_LIMIT —** PL3 or PAppMax power level. A power reading above this will be interpreted as a violation (in increments of 1/8th Watt).

69.2.157 (618h) MSR_DRAM_POWER_LIMIT

RAPL power limit for the DDR domain. This register is written by platform software and read by the SoC once per 1 ms. There are actually two instances of this register: one with MSR access and one with MMIO access. There is a separate PECI command which is also analogous.

MSR Address: 618h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63	Package	0h	RW	**LOCKED —** When set this entire register becomes Read-Only. This bit will typically be set by BIOS during boot.
62:24	-	-	-	Reserved.
23:22	Package	0h	RW	**LIMIT1_TIME_WINDOW_X —** Power Limit0 time window X value for DDR domain. Actual time_window for RAPL is: 1/1024 seconds 1x/4 2y.
21:17	Package	0h	RW	**LIMIT1_TIME_WINDOW_Y —** Power Limit0 time window Y value for DDR domain. Actual time_window for RAPL is: 1/1024 seconds 1x/4 2y.
16	Package	-	-	Reserved.
15	Package	0h	RW	**LIMIT1_ENABLE —** Power Limit0 enable bit for DDR domain.
14:0	Package	0h	RW	**LIMIT1_POWER —** Power Limit0 for DDR domain. Units Watts Format11.3 Resolution0.125W Range02047.875W.

69.2.158 (61Ch) MSR_DRAM_POWER_INFO

This register defines allowed DRAM power and timing parameters, and provides DRAM power range information for RAPL usage. It is recommended to program "DRAM_POWER_INFO" CSR and leave MSR_DRAM_POWER_INFO unlocked for OS software to modify.

MSR Address: 61Ch				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63	Package	0h	RO	**LOCK —** Lock bit to lock the Register.
62:55	-	-	-	Reserved.
54:48	Package	28h	RO	**DRAM_MAX_WIN —** The maximal time window allowed for the DRAM. Higher values will be clamped to this value. x = PKG_MAX_WIN[54:53] y = PKG_MAX_WIN[52:48] The timing interval window is Floating Point number given by 1.x*power(2,y). The unit of measurement is defined in DRAM_POWER_INFO_UNIT_MSR[TIME_UNIT].
47	-	-	-	Reserved.
46:32	Package	258h	RO	**DRAM_MAX_PWR —** The maximal power setting allowed for DRAM. Higher values will be clamped to this value. The maximum setting is typical (not guaranteed). The units for this value are defined in DRAM_POWER_INFO_UNIT_MSR[PWR_UNIT].
31	-	-	-	Reserved.
30:16	Package	78h	RO	**DRAM_MIN_PWR —** The minimal power setting allowed for DRAM. Lower values will be clamped to this value. The minimum setting is typical (not guaranteed). The units for this value are defined in DRAM_POWER_INFO_UNIT_MSR[PWR_UNIT].
15	-	-	-	Reserved.
14:0	Package	118h	RO	**DRAM_TDP —** The Spec power allowed for DRAM The TDP setting is typical (not guaranteed). The units for this value are defined in DRAM_POWER_INFO_UNIT_MSR[PWR_UNIT].

69.2.159 (633h) MSR_PKGC_IRTL3

The coordinated PackageAdditive above the core Interrupt Response Time is used for BIOS runtime control. This setting affects the selected package state. It is reflected to the IOS as part of the PM_REQ message for PMC usage as well. This register may be changed dynamically due to platform events AC/DC etc.The coordinated PackageAdditive above the core Interrupt Response Time is used for BIOS runtime control. This setting affects the selected package state. It is reflected to the IOS as part of the PM_REQ message for PMC usage as well. This register may be changed dynamically due to platform events AC/DC etc.

MSR Address: 633h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:16	Package	-	-	Reserved.
15	Package	0h	RW	**VALID —** This field qualifies the validity of the Value field in this register.
14:13	Package	-	-	Reserved.
12:10	Package	0h	RW	**MULTIPLIER —** This field indicates the unit of measurement that is defined for the Value field in this register.
9:0	Package	0h	RW	**VALUE —** The Interrupt Response Time Limit is given in units defined in the Multiplier field of this register.

69.2.160 (634h) MSR_PKGC_IRTL4

The coordinated PackageAdditive above the core Interrupt Response Time is used for BIOS runtime control. This setting affects the selected package state. It is reflected to the IOS as part of the PM_REQ message for PMC usage as well. This register may be changed dynamically due to platform events AC/DC etc.

MSR Address: 634h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:16	Package	-	-	Reserved.
15	Package	0h	RW	**VALID —** This field qualifies the validity of the Value field in this register.
14:13	Package	-	-	Reserved.
12:10	Package	0h	RW	**MULTIPLIER —** This field indicates the unit of measurement that is defined for the Value field in this register.
9:0	Package	0h	RW	**VALUE —** The Interrupt Response Time Limit is given in units defined in the Multiplier field of this register.

69.2.161 (635h) MSR_PKGC_IRTL5

The coordinated PackageAdditive above the core Interrupt Response Time is used for BIOS runtime control. This setting affects the selected package state. It is reflected to the IOS as part of the PM_REQ message for PMC usage as well. This register may be changed dynamically due to platform events AC/DC etc.

MSR Address: 635h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:16	Package	-	-	Reserved.
15	Package	0h	RW	**VALID —** This field qualifies the validity of the Value field in this register.
14:13	Package	-	-	Reserved.
12:10	Package	0h	RW	**MULTIPLIER —** This field indicates the unit of measurement that is defined for the Value field in this register.
9:0	Package	0h	RW	**VALUE —** The Interrupt Response Time Limit is given in units defined in the Multiplier field of this register.

69.2.162 (639h) MSR_PP0_ENERGY_STATUS

Reports total energy consumed. The counter will wrap around and continue counting when it reaches its limit. The energy status is reported in units which are defined in the ENERGY_UNIT field of MSR_RAPL_POWER_UNIT. Software will read this value and subtract the difference from last value read. The value of this register is updated every 1 ms.

MSR Address: 639h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:32	Package	-	-	Reserved.
31:0	Package	0h	RO	**Total Energy Consumed —** The unsigned integer value represents the total amount of energy consumed since the last time this register was cleared. The unit of this field is specified by the ENERGY_UNIT field of MSR_RAPL_POWER_UNIT.

69.2.163 (641h) MSR_PP1_ENERGY_STATUS

Reports total energy consumed. The counter will wrap around and continue counting when it reaches its limit. The energy status is reported in units which are defined in the ENERGY_UNIT field of MSR_RAPL_POWER_UNIT. Software will read this value and subtract the difference from last value read. The value of this register is updated every 1 ms.

MSR Address: 641h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:32	Package	-	-	Reserved.
31:0	Package	0h	RO	**Total Energy Consumed —** The unsigned integer value represents the total amount of energy consumed since the last time this register was cleared. The unit of this field is specified by the ENERGY_UNIT field of MSR_RAPL_POWER_UNIT.

69.2.164 (64Ch) MSR_TURBO_ACTIVATION_RATIO

This register is programmed by System BIOS to indicate the new maximum non-turbo ratio to be used by the processor. Attempts to write to this MSR when the PLATFORM_INFO[34:33] == 0 may result in a #GP fault.

MSR Address: 64Ch				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:32	Package	-	-	Reserved.
31	Package	0h	RW_L	**TURBO_ACTIVATION_RATIO_LOCK —** When this bit is set it indicates that the contents of this register are locked. This bit is cleared only on a reset.
30:8	Package	-	-	Reserved.
7:0	Package	0h	RW_L	**MAX_NON_TURBO_RATIO —** System BIOS can program this field to indicate the new Max non turbo ratio (in units of 100 MHz). All P state requests above this ratio are considered as Max Turbo ratio request. Note: A value of 0 indicates that the feature is disabled.

69.2.165 (64Fh) MSR_CORE_PERF_LIMIT_REASONS

Interface to allow software to determine what is causing resolved frequency to be clamped below the requested frequency.

MSR Address: 64Fh				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31	Package	0h	RW_0C	**QOS_LOG —** Set by the SoC and cleared by software.
30	Package	0h	RW_0C	**MAX_EFFICIENCY_FREQ_LOG —** Set by the SoC and cleared by software.
29	Package	0h	RW_0C	**MCT_LOG —** Set by the SoC and cleared by software.
28	Package	0h	RW_0C	**EDP_LOG —** Set by the SoC and cleared by software.
27	Package	0h	RW_0C	**MULTI_CORE_TURBO_LOG —** Set by the SoC and cleared by software.
26	Package	0h	RW_0C	**VR_THERMALERT_LOG —** Set by the SoC and cleared by software.
25	Package	0h	RW_0C	**IA_UTILIZATION_LOG —** Set by the SoC and cleared by software.
24	Package	0h	RW_0C	**DEV3_LOG —** Set by the SoC and cleared by software.
23	Package	0h	RW_0C	**DEV2_LOG —** Set by the SoC and cleared by software.
22:20	Package	-	-	Reserved.
19	Package	0h	RW_0C	**PL2_LOG —** Set by the SoC and cleared by software.
18	Package	0h	RW_0C	**PL1_LOG —** Set by the SoC and cleared by software.
17	Package	0h	RW_0C	**THERMAL_LOG —** Set by the SoC and cleared by software.
16	Package	0h	RW_0C	**PROCHOT_LOG —** Set by the SoC and cleared by software.
15	Package	0h	RO	**QOS_STATUS —** Frequency is limited below the operating system or driver Quality-of-Service floor.
14	Package	0h	RO	**MAX_EFFICIENCY_FREQ_STATUS —** Frequency is limited below the maximum efficiency frequency.
13	Package	0h	RO	**MCT_STATUS —** Frequency is limited due to ratio change transition attenuation (MCT, prevents frequent ratio changes due to core C-state entry/exit).
12	Package	0h	RO	**EDP_STATUS —** Frequency is limited due to a package-level EDP constraint.
11	Package	0h	RO	**MULTI_CORE_TURBO_STATUS —** Frequency is limited due to effective multi-core turbo constraints, if applicable.
10	Package	0h	RO	**VR_THERMALERT_STATUS — F**requency is limited due to a VR thermal excursion.
9	Package	0h	RO	**IA_UTILIZATION_STATUS —** Frequency is limited due to autonomous utilization-based P-state control, if supported.
8	Package	0h	RO	**DEV3_STATUS —** Frequency is limited due to Dev3 driver override.
7	Package	0h	RO	**DEV2_STATUS —** Frequency is limited due to Dev2 driver override.
6:4	Package	-	-	Reserved.
3	Package	0h	RO	**PL2_STATUS —** Frequency is limited due to a package-level PL2 excursion.
2	Package	0h	RO	**PL1_STATUS —** Frequency is limited due to a package-level PL1 excursion.
1	Package	0h	RO	**THERMAL_STATUS —** Frequency is limited due to thermal excursion.
0	Package	0h	RO	**PROCHOT_STATUS —** Frequency is limited due to external PROCHOT assertion, if supported.

69.2.166 (80Fh) IA32_X2APIC_SIVR

The spurious interrupt vector register has been extended for both legacy and extended xAPIC mode with a mechanism that enables software to perform directed EOIs to specific IOxAPICs in the system. Bit 12 of the spurious interrupt vector register controls the generation of the EOI broadcast. When this bit is set, broadcast EOIs will not be generated. Support for this feature can be detected by means of bit 24 in the Local xAPIC Version register. The feature is supported if this bit is set to 1.

MSR Address: 80Fh				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:13	Thread	-	-	Reserved.
12	Thread	0h	RW	**DIRECTED_EOI_EN —** This bit controls the generation of the EOI broadcast. When this bit is set, broadcast EOIs will not be generated.
11:9	Thread	-	-	Reserved.
8	Thread	0h	RW	**SOFTWARE_ENABLE —** • 1 = enabled • 0 = disabled
7:0	Thread	0h	RW	**SPURIOUS_VECTOR —** Vector number of the spurious vector.

69.2.167 (828h) IA32_X2APIC_ESR

Extended xAPIC Error Status Register.

MSR Address: 828h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:8	Thread	-	-	Reserved.
7	Thread	0h	RW	**ILLEGAL_REGISTER_ADDRESS —** APIC register access detected with an illegal address.
6	Thread	0h	RW	**RECEIVE_ILLEGAL_VECTOR —** Interrupt received with an illegal vector.
5	Thread	0h	RW	**SEND_ILLEGAL_VECTOR —** IPI with illegal vector attempted from ICR write.
4	Thread	0h	Rsvd0	**REDIRECTABLE_IPI —** IPI with illegal Low Priority delivery mode attempted from ICR write.
3	Thread	0h	Rsvd0	**RECEIVE_ACCEPT_ERROR —** Set when the local APIC detects that the message it received was not accepted by any APIC on the APIC bus, including itself.
2	Thread	0h	Rsvd0	**SEND_ACCEPT_ERROR —** Set when the local APIC detects that a message it sent was not accepted by any APIC on the APIC bus.
1	Thread	0h	Rsvd0	**RECEIVE_CHECKSUM_ERROR —** Set when the local APIC detects a checksum error for a message that it received on the APIC bus.
0	Thread	0h	Rsvd0	**SEND_CHECKSUM_ERROR —** Set when the local APIC detects a checksum error for a message that it sent on the APIC bus.

69.2.168 (82Fh) IA32_X2APIC_LVT_CMCI

The Corrected Machine Check Interrupt LVT Register is an extension of the xAPIC in both legacy and extended xAPIC modes.

MSR Address: 82Fh				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:17	Thread	-	-	Reserved.
16	Thread	0h	RW	**MASK —** A value of 1 indicates that the interrupt is masked.
15:13	Thread	-	-	Reserved.
12	Thread	0h	RO	**DELIVERY_STATUS —** Delivery Status: • 0b - Idle • 1b - Pending
11	Thread	-	-	Reserved.
10:8	Thread	0h	RW	**DELIVERY_MODE —** Delivery Mode: • 000b - Fixed priority • 001b - Lowest Priority • 010b - SMI • 011b - Reserved • 100b - NMI • 101b - INIT • 110b - Startup • 111b - Reserved
7:0	Thread	0h	RW	**VECTOR —** PIC Correctable MCA Interrupt Vector.

69.2.169 (830h) IA32_X2APIC_ICR

Extended xAPIC Interrupt Command Register.

MSR Address: 830h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:32	Thread	0h	RW	**DESTINATION_FIELD —** 32-bit destination ID of the IPI.
31:20	Thread	-	-	Reserved.
19:18	Thread	0h	RW	**DESTINATION_SHORTHAND —** Destination Shorthand: • 00b - No shorthand • 01b - Self • 10b - All including self • 11b - All excluding self
17:13	Thread	-	-	Reserved.
12	Thread	0h	RO	**DELIVERY_STATUS —** Delivery Status: • 0b - Idle • 1b - Pending
11	Thread	0h	RW	**DESTINATION_MODE —** Destination Mode: • 0b - Physical • 1b - Logical
10:8	Thread	0h	RW	**DELIVERY_MODE —** Delivery Mode: • 000b - Fixed priority • 001b - Lowest Priority • 010b - SMI • 011b - Reserved • 100b - NMI • 101b - INIT • 110b - Startup • 111b - Reserved
7:0	Thread	0h	RW	**VECTOR —** 4-K aligned interrupt vector address.

69.2.170 (832h) IA32_X2APIC_LVT_TIMER

Extended xAPIC LVT Entry for the xAPIC Timer.

MSR Address: 832h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:19	Thread	-	-	Reserved.
18:17	Thread	0h	RW	**TIMER_MODE —** Timer mode: • 00b - One shot • 01b - Periodic • 10b - TSC Deadline • 11b - Reserved
16	Thread	0h	RW	**MASK —** Mask” • 0b - Not masked • 1b - Masked
15:13	Thread	-	-	Reserved.
12	Thread	0h	RO	**DELIVERY_STATUS —** Delivery Status: • 0b - Idle • 1b - Pending
11:8	Thread	-	-	Reserved.
7:0	Thread	0h	RW	**VECTOR —** PIC Timer Interrupt Vector.

69.2.171 (833h) IA32_X2APIC_LVT_THERMAL

Extended xAPIC LVT Entry for the Thermal Interrupt.

MSR Address: 833h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:17	Thread	-	-	Reserved.
16	Thread	0h	RW	**MASK —** Mask” • 0b - Not masked • 1b - Masked
15:13	Thread	-	-	Reserved.
12	Thread	0h	RO	**DELIVERY_STATUS —** Delivery Status: • 0b - Idle • 1b - Pending
11	Thread	-	-	Reserved.
10:8	Thread	0h	RW	**DELIVERY_MODE —** Delivery Mode: • 000b - Fixed priority • 001b - Lowest Priority • 010b - SMI • 011b - Reserved • 100b - NMI • 101b - INIT • 110b - Startup • 111b - Reserved
7:0	Thread	0h	RW	**VECTOR —** PIC Thermal Interrupt Vector.

69.2.172 (834h) IA32_X2APIC_LVT_PMI

Extended xAPIC LVT Entry for PerfMon Interrupt.

MSR Address: 834h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:17	Thread	-	-	Reserved.
16	Thread	0h	RW	**MASK —** Mask” • 0b - Not masked • 1b - Masked
15:13	Thread	-	-	Reserved.
12	Thread	0h	RO	**DELIVERY_STATUS —** Delivery Status: • 0b - Idle • 1b - Pending
11	Thread	-	-	Reserved.
10:8	Thread	0h	RW	**DELIVERY_MODE —** Delivery Mode: • 000b - Fixed priority • 001b - Lowest Priority • 010b - SMI • 011b - Reserved • 100b - NMI • 101b - INIT • 110b - Startup • 111b - Reserved
7:0	Thread	0h	RW	**VECTOR —** PIC PerfMon Interrupt Vector.

69.2.173 (835h) IA32_X2APIC_LVT_LINT0

Extended xAPIC LVT Entry for Lint Pin 0 Interrupt.

MSR Address: 835h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:17	Thread	-	-	Reserved.
16	Thread	0h	RW	**MASK —** Mask” • 0b - Not masked • 1b - Masked
15	Thread	0h	RW	**TRIGGER_MODE —** Trigger Mode: • 0b - Edge • 1b - Level
14	Thread	0h	RO	**REMOTE_IRR —** For fixed mode, level-triggered interrupts this flag is set when the local APIC accepts the interrupt for servicing and is reset when an EOI command is received from the processor. The meaning of this flag is undefined for edge-triggered interrupts and other delivery modes.
13	Thread	0h	RW	**POLARITY —** 0: active high, 1: active low
12	Thread	0h	RO	**DELIVERY_STATUS —** Delivery Status: • 0b - Idle • 1b - Pending
11	Thread	-	-	Reserved.
10:8	Thread	0h	RW	**DELIVERY_MODE —** Delivery Mode: • 000b - Fixed priority • 001b - Lowest Priority • 010b - SMI • 011b - Reserved • 100b - NMI • 101b - INIT • 110b - Startup • 111b - Reserved
7:0	Thread	0h	RW	**VECTOR —** PIC Lint Pin 0 Interrupt Vector.

69.2.174 (836h) IA32_X2APIC_LVT_LINT1

Extended xAPIC LVT Entry for Lint Pin 0 Interrupt.

MSR Address: 836h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:17	Thread	-	-	Reserved.
18:17	Thread	0h	Rsvd0	**TIMER_MODE —** fill description here
16	Thread	0h	RW	**MASK —** Mask” • 0b - Not masked • 1b - Masked
15	Thread	0h	RW	**TRIGGER_MODE —** Trigger Mode: • 0b - Edge • 1b - Level
14	Thread	0h	RO	**REMOTE_IRR —** For fixed mode, level-triggered interrupts this flag is set when the local APIC accepts the interrupt for servicing and is reset when an EOI command is received from the processor. The meaning of this flag is undefined for edge-triggered interrupts and other delivery modes.
13	Thread	0h	RW	**POLARITY —** 0: active high, 1: active low
12	Thread	0h	RO	**DELIVERY_STATUS —** Delivery Status: • 0b - Idle • 1b - Pending
11	Thread	-	-	Reserved.
10:8	Thread	0h	RW	**DELIVERY_MODE —** Delivery Mode: • 000b - Fixed priority • 001b - Lowest Priority • 010b - SMI • 011b - Reserved • 100b - NMI • 101b - INIT • 110b - Startup • 111b - Reserved
7:0	Thread	0h	RW	**VECTOR —** PIC Lint Pin 1 Interrupt Vector.

69.2.175 (837h) IA32_X2APIC_LVT_ERROR

Extended xAPIC LVT Entry for Error Interrupt.

MSR Address: 837h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:17	Thread	-	-	Reserved.
16	Thread	0h	RW	**MASK —** Mask” • 0b - Not masked • 1b - Masked
15:13	Thread	-	-	Reserved.
12	Thread	0h	RO	**DELIVERY_STATUS —** fill description here
11:8	Thread	-	-	Reserved.
7:0	Thread	0h	RW	**VECTOR —** PIC Error Interrupt Vector.

69.2.176 (838h) IA32_X2APIC_INIT_COUNT

Extended xAPIC Timer Initial Count register.

MSR Address: 838h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:32	Thread	-	-	Reserved.
31:0	Thread	0h	RW	**INIT_COUNT_REGISTER_VALUE —** APIC LVT Interrupt Timer Initial Count.

69.2.177 (839h) IA32_X2APIC_CUR_COUNT

Extended xAPIC Timer Current Count register.

MSR Address: 839h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:32	Thread	-	-	Reserved.
31:0	Thread	0h	RW	**CURRENT_COUNT_REGISTER_VALUE —** APIC LVT Interrupt Timer Current Count.

69.2.178 (83Eh) IA32_X2APIC_DIV_CONF

Extended xAPIC Timer Divide Config register.

MSR Address: 83Eh				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:4	Thread	-	-	Reserved.
3	Thread	0h	RW	**CFGCNT_HI —** This corresponds to the value in the Divide Config Register in the APIC.
2	Thread	-	-	Reserved.
1:0	Thread	0h	RW	**CFGCNT_LO —** This corresponds to the value in the Divide Config Register in the APIC.

69.2.179 (83Fh) IA32_X2APIC_SELF_IPI

Extended xAPIC mode provides a new fast self IPI interface. System software only specifies the vector associated with the interrupt.

MSR Address: 83Fh				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:8	Thread	-	-	Reserved.
7:0	Thread	0h	RW	**VECTOR —** Self IPI Vector.

69.2.180 (C80h) IA32_DEBUG_FEATURE

Silicon Debug Feature Control.

MSR Address: C80h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:32	Package	-	-	Reserved.
31	Package	0h	RO	**DEBUG_OCCURRED —** This "sticky bit" is set by hardware to indicate the status of bit 0. Default is 0.
30	Package	0h	RW	**LOCK —** If 1, locks any further change to the MSR. The lock bit is set automatically on the first SMI assertion even if not explicitly set by BIOS. Default is 0. Once set, the lock remains until a cold reset.
29:1	-	-	-	Reserved.
0	Package	0h	RW	**ENABLE —** BIOS sets this bit to 1 to enable Silicon Debug Features. Default is 0.

69.2.181 (C8Fh) IA32_PQR_ASSOC

Resource Association Register.

MSR Address: C8Fh				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:34	Core	-	-	Reserved.
33:32	Core	0h	RW	**COS —** COS Selector - core 0; It is programmed to specify which L2_QOS mask should apply to this logical processor.
31:0	Core	-	-	Reserved.

69.2.182 (D10h) IA32_L2_QOS_MASK_0

L2 Class Of Service Mask - COS 0.

MSR Address: D10h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:8	Module	-	-	Reserved.
7:0	Module	0h	RW	**WAY_MASK —** Bit vector of available L2 ways for COS 0 enforcement. For a 512KB L2 cache, each bit in IA32_L2_QOS_MASK_*[7:0] corresponds to 1 way. For a 1 MB and 2 MB L2 cache, each bit in IA32_L2_QOS_MASK_*[7:0] corresponds to 2 way. So bit 0 corresponds to ways 0, 1. Bit 1 corresponds to ways 2, 3. And so on.

69.2.183 (D11h) IA32_L2_QOS_MASK_1

L2 Class Of Service Mask - COS 1.

MSR Address: D11h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:8	Module	-	-	Reserved.
7:0	Module	0h	RW	**WAY_MASK —** Bit vector of available L2 ways for COS 1 enforcement. For a 512KB L2 cache, each bit in IA32_L2_QOS_MASK_*[7:0] corresponds to 1 way. For a 1 MB and 2 MB L2 cache, each bit in IA32_L2_QOS_MASK_*[7:0] corresponds to 2 way. So bit 0 corresponds to ways 0, 1. Bit 1 corresponds to ways 2, 3. And so on.

69.2.184 (D12h) IA32_L2_QOS_MASK_2

L2 Class Of Service Mask - COS 2.

MSR Address: D12h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:8	Module	-	-	Reserved.
7:0	Module	0h	RW	**WAY_MASK —** Bit vector of available L2 ways for COS 2 enforcement. For a 512KB L2 cache, each bit in IA32_L2_QOS_MASK_*[7:0] corresponds to 1 way. For a 1 MB and 2 MB L2 cache, each bit in IA32_L2_QOS_MASK_*[7:0] corresponds to 2 way. So bit 0 corresponds to ways 0, 1. Bit 1 corresponds to ways 2, 3. And so on.

69.2.185 (D13h) IA32_L2_QOS_MASK_3

L2 Class Of Service Mask - COS 3.

MSR Address: D13h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:8	Module	-	-	Reserved.
7:0	Module	0h	RW	**WAY_MASK —** Bit vector of available L2 ways for COS 3 enforcement. For a 512KB L2 cache, each bit in IA32_L2_QOS_MASK_*[7:0] corresponds to 1 way. For a 1 MB and 2 MB L2 cache, each bit in IA32_L2_QOS_MASK_*[7:0] corresponds to 2 way. So bit 0 corresponds to ways 0, 1. Bit 1 corresponds to ways 2, 3. And so on.

69.2.186 (D90h) IA32_BNDCFGS

Bound Configuration Supervisor State of Intel® Memory Protection Extensions (Intel® MPX) configuration.

MSR Address: D90h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:12	Thread	0h	RW	**ADDRESS_BD —** Base Address of Bound Directory.
11:2	Thread	-	-	Reserved.
1	Thread	0h	RW	**BNDPRESERVE —** Preserve the bounds registers for near branch instructions in the absence of the BND prefix.
0	Thread	0h	RW	**ENABLE —** Enable Intel® MPX in supervisor mode.

69.2.187 (DA0h) IA32_XSS

Extended Supervisor State Mask.

MSR Address: DA0h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31:9	-	-	-	Reserved.
8	Thread	0h	RW	**RTIT —** Trace Packet Configuration State. This bit controls whether XSAVES/ XRSTORS can save/load RTIT state.
7:0	-	-	-	Reserved.

69.2.188 (C0000080h) IA32_EFER

Extended Feature Enable Register (EFER). This MSR may only be accessed when CPUID.(EAX=80000001h):EDX[20] or EDX[29] is set. Features of this register are to be enabled by the OS. BIOS may examine this register, but should not modify the contents of this register.

MSR Address: C0000080h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
31:12	Thread	-	-	Reserved.
11	Thread	0h	RW	**NXE —** Execute Disable Bit Enable. When set enables the Execute Disable Bit capability. This feature is only usable when the Physical Address Extension paging mechanism is engaged. The OS will control this bit, BIOS must not modify this bit.
10	Thread	0h	RW	**LMA —** IA-32e Mode Active (Long Mode Active). When set, the processor is in IA-32e mode (Long Mode) and is either running in compatibility mode or 64- bit mode. If LMA = 0 (Default), the processor is running in legacy mode and behaves like a standard 32-bit IA-32 processor.
9	Thread	-	-	Reserved.
8	Thread	0h	RW	**LME —** IA-32e Mode Enable (Long Mode Enable). When set enables the processor IA-32e mode operation. IA-32e mode is not activated until PAE mode paging is enabled. The OS will control this bit, BIOS must not modify this bit.
7:1	Thread	-	-	Reserved.
0	Thread	0h	RW	**SCE —** SYSCALL Enable. Enables SYSCALL/SYSRET instructions in 64-bit mode. It is the responsibility of the OS to enable SYSCALL/SYSRET for 64-bit operation. The OS will control this bit, BIOS must not modify this bit.

69.2.189 (C0000081h) IA32_STAR

System-Call Target Address Register (STAR). Refer to the Intel® 64 and IA-32 Architectures Software Developer's Manual for a detailed description and usage of this MSR.

MSR Address: C0000081h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:48	Thread	0h	RW	**SYSRET_CS_SS —** SYSRET CS and SS Selector.
47:32	Thread	0h	RW	**SYSCALL_CS_SS —** SYSCALL CS and SS Selector.
31:0	Thread	0h	RW	**SYSCALL_LEGACY_EIP —** SYSCALL legacy EIP Selector.

69.2.190 (C0000082h) IA32_LSTAR

IA-32e Mode System-Call Target Address Register. Refer to the Intel® 64 and IA-32 Architectures Software Developer's Manual for a detailed description and usage of this MSR.

MSR Address: C0000082h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:0	Thread	0h	RW	**TARGET_RIP —** Target RIP for 64-bit Mode Calling Program.

69.2.191 (C0000083h) IA32_CSTAR

IA-32e Mode System-Call Target Address. Refer to the Intel® 64 and IA-32 Architectures Software Developer's Manual for a detailed description and usage of this MSR.

MSR Address: C0000083h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:0	Thread	0h	RW	**SYSCALL_TARGET_ADDR —** IA-32e Mode System Call Target Address.

69.2.192 (C0000084h) IA32_FMASK

System-Call Flag Mask. Refer to the Intel® 64 and IA-32 Architectures Software Developer's Manual for a detailed description and usage of this MSR.

MSR Address: C0000084h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:32	Thread	-	-	Reserved.
31:0	Thread	0h	RW	**SYSCALL_FLAG_MASK —** System Call Flag Mask. If CPUID (EAX=80000001h):EDX[29] is set.

69.2.193 (C0000100h) IA32_FS_BASE

FS base MSR. Refer to the Intel® 64 and IA-32 Architectures Software Developer's Manual for a detailed description and usage of this MSR.

MSR Address: C0000100h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:0	Thread	0h	RW	**FS_BASE —** Map of BASE Address of FS. If CPUID (EAX=80000001h):EDX[29] is set.

69.2.194 (C0000101h) IA32_GS_BASE

GS base MSR. Refer to the Intel® 64 and IA-32 Architectures Software Developer's Manual for a detailed description and usage of this MSR.

MSR Address: C0000101h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:0	Thread	0h	RW	**GS_BASE —** Map of BASE Address of GS. If CPUID (EAX=80000001h):EDX[29] is set.

69.2.195 (C0000102h) IA32_KERNEL_GS_BASE

Swap Target of BASE Address of GS.

MSR Address: C0000102h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:0	Thread	0h	RW	**GS_BASE_SWAP_TARGET —** Swap Target of BASE Address of GS.

69.2.196 (C0000103h) IA32_TSC_AUX

Auxiliary Time-Stamp Counter (TSC).

MSR Address: C0000103h				
Bit	**Scope**	**Default**	**Attribute**	**Description**
63:32	Thread	-	-	Reserved.
31:0	Thread	0h	RW	**AUX —** Auxiliary signature of Time-Stamp Counter.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits,General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
