28:0	0x0 RW	**Base 0 IMR10 Base (IMR10_BASE):** Specifies bits 38:10 of the start address of IMR10 region. IMR region size must be a strict poweroftwo at least 1KB and naturally aligned to the size. These bits are compared with the result of the IMR10MASK[28:0] applied to bits 38:10 of the incoming address to determine if an access falls within the IMR10 defined region.

44.3.73 B_CR_BIMR10MASK_0_0_0_MCHBAR—Offset 69B4h

This register, along with IMR10BASE, IMR10RAC and IMR10WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR10RAC and IMR10WAC registers.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 69B4h

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**Asset Classification AC[2]: GT Implicit Writeback Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback data HITM data from GT to be returned to the requestor. When set to 0, inhibits HITM data from GT from being returned to the requestor. HITM data from IA cores may be returned to the requestor depending on the setting of the IA_IWB_EN bit.
30	0x0 RW	**Asset Classification AC[1]: IA Implicit Writeback Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback data HITM data from IA cores to be returned to the requestor. When set to 0, inhibits HITM data from IA cores from being returned to the requestor. HITM data from GT may be returned to the requestor depending on the setting of the GT_IWB_EN bit.
29	0x0 RO	**RESERVED_0:** Reserved
28:0	0x0 RW	**Mask 0 IMR10 Mask (IMR10_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR10BASE[28:0] value. A match indicates that the incoming address falls within the IMR10 region.

44.3.74 IMR10 Control Policy (B_CR_BIMR10CP_0_0_0_MCHBAR)—Offset 69B8h

This register controls the access policy to the Read Access Policy BIMR10RAC, the Write Access Policy BIMR10WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [MCHBAR] + 69B8h

Default: 00000C0061010202h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
63:0	0xc0061010202 RW	**IMR10 Control Policy (IMR10_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR10RAC, BIMR10WAC and BIMR10CP, registers based on the value from each agent's 6bit SAI field.

44.3.75 IMR10 Read Access Policy (B_CR_BIMR10RAC_0_0_0_MCHBAR)—Offset 69C0h

This register, along with IMR10BASE, IMR10MASK and IMR10WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR10. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [MCHBAR] + 69C0h

Default: 0000000000000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
63	0x0 RW	**IMR10 Read Access Policy 63 (IMR10_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
62	0x0 RO	**IMR10 Read Access Policy 62 (IMR10_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
61	0x0 RO	**IMR10 Read Access Policy 61 (IMR10_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
60	0x0 RO	**IMR10 Read Access Policy 60 (IMR10_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.

53	0x0 RO	**IMR10 Read Access Policy 53 (IMR10_READ_POL_53):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
52	0x0 RO	**IMR10 Read Access Policy 52 (IMR10_READ_POL_52):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
51	0x0 RO	**IMR10 Read Access Policy 51 (IMR10_READ_POL_51):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
50	0x0 RW	**IMR10 Read Access Policy 50 (IMR10_READ_POL_50):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
49	0x0 RW	**IMR10 Read Access Policy 49 (IMR10_READ_POL_49):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
48	0x0 RW	**IMR10 Read Access Policy 48 (IMR10_READ_POL_48):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
47	0x0 RO	**IMR10 Read Access Policy 47 (IMR10_READ_POL_47):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
46	0x0 RO	**IMR10 Read Access Policy 46 (IMR10_READ_POL_46):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
45	0x0 RO	**IMR10 Read Access Policy 45 (IMR10_READ_POL_45):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
44	0x0 RW	**IMR10 Read Access Policy 44 (IMR10_READ_POL_44):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
43	0x0 RW	**IMR10 Read Access Policy 43 (IMR10_READ_POL_43):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
42	0x0 RW	**IMR10 Read Access Policy 42 (IMR10_READ_POL_42):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
41	0x0 RW	**IMR10 Read Access Policy 41 (IMR10_READ_POL_41):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
40	0x0 RW	**IMR10 Read Access Policy 40 (IMR10_READ_POL_40):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
39	0x0 RO	**IMR10 Read Access Policy 39 (IMR10_READ_POL_39):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
38	0x0 RW	**IMR10 Read Access Policy 38 (IMR10_READ_POL_38):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
37	0x0 RO	**IMR10 Read Access Policy 37 (IMR10_READ_POL_37):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
36	0x0 RW	**IMR10 Read Access Policy 36 (IMR10_READ_POL_36):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
35	0x0 RO	**IMR10 Read Access Policy 35 (IMR10_READ_POL_35):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
34	0x0 RW	**IMR10 Read Access Policy 34 (IMR10_READ_POL_34):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
33	0x0 RW	**IMR10 Read Access Policy 33 (IMR10_READ_POL_33):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
32	0x0 RW	**IMR10 Read Access Policy 32 (IMR10_READ_POL_32):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
31	0x0 RO	**IMR10 Read Access Policy 31 (IMR10_READ_POL_31):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
30	0x0 RW	**IMR10 Read Access Policy 30 (IMR10_READ_POL_30):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
29	0x0 RW	**IMR10 Read Access Policy 29 (IMR10_READ_POL_29):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
28	0x0 RW	**IMR10 Read Access Policy 28 (IMR10_READ_POL_28):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
27	0x0 RW	**IMR10 Read Access Policy 27 (IMR10_READ_POL_27):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
26	0x0 RW	**IMR10 Read Access Policy 26 (IMR10_READ_POL_26):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
25	0x0 RW	**IMR10 Read Access Policy 25 (IMR10_READ_POL_25):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
24	0x0 RW	**IMR10 Read Access Policy 24 (IMR10_READ_POL_24):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
23	0x0 RO	**IMR10 Read Access Policy 23 (IMR10_READ_POL_23):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
22	0x0 RO	**IMR10 Read Access Policy 22 (IMR10_READ_POL_22):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
21	0x0 RW	**IMR10 Read Access Policy 21 (IMR10_READ_POL_21):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
20	0x0 RO	**IMR10 Read Access Policy 20 (IMR10_READ_POL_20):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
19	0x0 RO	**IMR10 Read Access Policy 19 (IMR10_READ_POL_19):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
18	0x0 RO	**IMR10 Read Access Policy 18 (IMR10_READ_POL_18):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
17	0x0 RW	**IMR10 Read Access Policy 17 (IMR10_READ_POL_17):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
16	0x0 RW	**IMR10 Read Access Policy 16 (IMR10_READ_POL_16):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
15	0x0 RO	**IMR10 Read Access Policy 15 (IMR10_READ_POL_15):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
14	0x0 RO	**IMR10 Read Access Policy 14 (IMR10_READ_POL_14):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
13	0x0 RW	**IMR10 Read Access Policy 13 (IMR10_READ_POL_13):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
12	0x0 RW	**IMR10 Read Access Policy 12 (IMR10_READ_POL_12):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
11	0x0 RO	**IMR10 Read Access Policy 11 (IMR10_READ_POL_11):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
10	0x0 RO	**IMR10 Read Access Policy 10 (IMR10_READ_POL_10):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
9	0x0 RO	**IMR10 Read Access Policy 9 (IMR10_READ_POL_9):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
8	0x0 RW	**IMR10 Read Access Policy 8 (IMR10_READ_POL_8):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
7	0x0 RO	**IMR10 Read Access Policy 7 (IMR10_READ_POL_7):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
6	0x0 RO	**IMR10 Read Access Policy 6 (IMR10_READ_POL_6):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
5	0x0 RW	**IMR10 Read Access Policy 5 (IMR10_READ_POL_5):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
4	0x0 RW	**IMR10 Read Access Policy 4 (IMR10_READ_POL_4):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
3	0x0 RW	**IMR10 Read Access Policy 3 (IMR10_READ_POL_3):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
2	0x0 RW	**IMR10 Read Access Policy 2 (IMR10_READ_POL_2):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
1	0x0 RW	**IMR10 Read Access Policy 1 (IMR10_READ_POL_1):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.
0	0x0 RW	**IMR10 Read Access Policy 0 (IMR10_READ_POL_0):** Bit vector used to determine which agents are allowed read access to the IMR10 region, based on each agent's 6bit encoded SAI value.

44.3.76 IMR10 Write Access Policy (B_CR_BIMR10WAC_0_0_0_MCHBAR)—Offset 69C8h

This register along with IMR10BASE, IMR10MASK and IMR10RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR10. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [MCHBAR] + 69C8h

Default: 0000000000000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
63	0x0 RW	**IMR10 Write Access Policy 63 (IMR10_WRITE_POL_63):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
62	0x0 RO	**IMR10 Write Access Policy 62 (IMR10_WRITE_POL_62):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
61	0x0 RO	**IMR10 Write Access Policy 61 (IMR10_WRITE_POL_61):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
60	0x0 RO	**IMR10 Write Access Policy 60 (IMR10_WRITE_POL_60):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
59	0x0 RO	**IMR10 Write Access Policy 59 (IMR10_WRITE_POL_59):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
58	0x0 RO	**IMR10 Write Access Policy 58 (IMR10_WRITE_POL_58):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
57	0x0 RO	**IMR10 Write Access Policy 57 (IMR10_WRITE_POL_57):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
56	0x0 RW	**IMR10 Write Access Policy 56 (IMR10_WRITE_POL_56):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
55	0x0 RW	**IMR10 Write Access Policy 55 (IMR10_WRITE_POL_55):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
54	0x0 RW	**IMR10 Write Access Policy 54 (IMR10_WRITE_POL_54):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
53	0x0 RO	**IMR10 Write Access Policy 53 (IMR10_WRITE_POL_53):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
52	0x0 RO	**IMR10 Write Access Policy 52 (IMR10_WRITE_POL_52):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
51	0x0 RO	**IMR10 Write Access Policy 51 (IMR10_WRITE_POL_51):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
50	0x0 RW	**IMR10 Write Access Policy 50 (IMR10_WRITE_POL_50):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
49	0x0 RW	**IMR10 Write Access Policy 49 (IMR10_WRITE_POL_49):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
48	0x0 RW	**IMR10 Write Access Policy 48 (IMR10_WRITE_POL_48):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
47	0x0 RO	**IMR10 Write Access Policy 47 (IMR10_WRITE_POL_47):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
46	0x0 RO	**IMR10 Write Access Policy 46 (IMR10_WRITE_POL_46):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
45	0x0 RO	**IMR10 Write Access Policy 45 (IMR10_WRITE_POL_45):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
44	0x0 RW	**IMR10 Write Access Policy 44 (IMR10_WRITE_POL_44):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
43	0x0 RW	**IMR10 Write Access Policy 43 (IMR10_WRITE_POL_43):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
42	0x0 RW	**IMR10 Write Access Policy 42 (IMR10_WRITE_POL_42):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
41	0x0 RW	**IMR10 Write Access Policy 41 (IMR10_WRITE_POL_41):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
40	0x0 RW	**IMR10 Write Access Policy 40 (IMR10_WRITE_POL_40):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
39	0x0 RO	**IMR10 Write Access Policy 39 (IMR10_WRITE_POL_39):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
38	0x0 RW	**IMR10 Write Access Policy 38 (IMR10_WRITE_POL_38):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
37	0x0 RO	**IMR10 Write Access Policy 37 (IMR10_WRITE_POL_37):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
36	0x0 RW	**IMR10 Write Access Policy 36 (IMR10_WRITE_POL_36):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
35	0x0 RO	**IMR10 Write Access Policy 35 (IMR10_WRITE_POL_35):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
34	0x0 RW	**IMR10 Write Access Policy 34 (IMR10_WRITE_POL_34):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
33	0x0 RW	**IMR10 Write Access Policy 33 (IMR10_WRITE_POL_33):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
32	0x0 RW	**IMR10 Write Access Policy 32 (IMR10_WRITE_POL_32):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
31	0x0 RO	**IMR10 Write Access Policy 31 (IMR10_WRITE_POL_31):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.

15	0x0 RO	**IMR10 Write Access Policy 15 (IMR10_WRITE_POL_15):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
14	0x0 RO	**IMR10 Write Access Policy 14 (IMR10_WRITE_POL_14):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
13	0x0 RW	**IMR10 Write Access Policy 13 (IMR10_WRITE_POL_13):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
12	0x0 RW	**IMR10 Write Access Policy 12 (IMR10_WRITE_POL_12):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
11	0x0 RO	**IMR10 Write Access Policy 11 (IMR10_WRITE_POL_11):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
10	0x0 RO	**IMR10 Write Access Policy 10 (IMR10_WRITE_POL_10):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
9	0x0 RO	**IMR10 Write Access Policy 9 (IMR10_WRITE_POL_9):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
8	0x0 RW	**IMR10 Write Access Policy 8 (IMR10_WRITE_POL_8):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
7	0x0 RO	**IMR10 Write Access Policy 7 (IMR10_WRITE_POL_7):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
6	0x0 RO	**IMR10 Write Access Policy 6 (IMR10_WRITE_POL_6):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
5	0x0 RW	**IMR10 Write Access Policy 5 (IMR10_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
4	0x0 RW	**IMR10 Write Access Policy 4 (IMR10_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
3	0x0 RW	**IMR10 Write Access Policy 3 (IMR10_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
2	0x0 RW	**IMR10 Write Access Policy 2 (IMR10_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
1	0x0 RW	**IMR10 Write Access Policy 1 (IMR10_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.
0	0x0 RW	**IMR10 Write Access Policy 0 (IMR10_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR10 region, based on each agent's 6bit encoded SAI value.

44.3.77 IMR11 Base (B_CR_BIMR11BASE_0_0_0_MCHBAR)—Offset 69D0h

This register, along with IMR11MASK, IMR11RAC and IMR11WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR11RAC and IMR11WAC registers.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 69D0h

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.
30	0x0 RW	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents.
29	0x0 RO	**RESERVED_1:** Reserved
28:0	0x0 RW	**Base 0 IMR11 Base (IMR11_BASE):** Specifies bits 38:10 of the start address of IMR11 region. IMR region size must be a strict poweroftwo, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR11MASK[28:0] applied to bits 38:10 of the incoming address to determine if an access falls within the IMR11 defined region.

44.3.78 IMR11 Mask (B_CR_BIMR11MASK_0_0_0_MCHBAR)—Offset 69D4h

This register, along with IMR11BASE, IMR11RAC and IMR11WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR11RAC and IMR11WAC registers.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 69D4h

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**Asset Classification AC[2]: GT Implicit Writeback Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback data HITM data from GT to be returned to the requestor. When set to 0, inhibits HITM data from GT from being returned to the requestor. HITM data from IA cores may be returned to the requestor, depending on the setting of the IA_IWB_EN bit.
30	0x0 RW	**Asset Classification AC[1]: IA Implicit Writeback Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback data HITM data from IA cores to be returned to the requestor. When set to 0, inhibits HITM data from IA cores from being returned to the requestor. HITM data from GT may be returned to the requestor, depending on the setting of the GT_IWB_EN bit.
29	0x0 RO	**RESERVED_0:** Reserved
28:0	0x0 RW	**Mask 0 IMR11 Mask (IMR11_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR11BASE[28:0] value. A match indicates that the incoming address falls within the IMR11 region.

44.3.79 IMR11 Control Policy (B_CR_BIMR11CP_0_0_0_MCHBAR)—Offset 69D8h

This register controls the access policy to the Read Access Policy BIMR11RAC, the Write Access Policy BIMR11WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [MCHBAR] + 69D8h

Default: 00000C0061010202h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
63:0	0xc0061010202 RW	**IMR11 Control Policy (IMR11_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR11RAC, BIMR11WAC and BIMR11CP registers, based on the value from each agent's 6bit SAI field.

44.3.80 IMR11 Read Access Policy (B_CR_BIMR11RAC_0_0_0_MCHBAR)—Offset 69E0h

This register, along with IMR11BASE, IMR11MASK and IMR11WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR11. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [MCHBAR] + 69E0h

Default: 0000000000000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
63	0x0 RW	**IMR11 Read Access Policy 63 (IMR11_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
62	0x0 RO	**IMR11 Read Access Policy 62 (IMR11_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
61	0x0 RO	**IMR11 Read Access Policy 61 (IMR11_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
60	0x0 RO	**IMR11 Read Access Policy 60 (IMR11_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
59	0x0 RO	**IMR11 Read Access Policy 59 (IMR11_READ_POL_59):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
58	0x0 RO	**IMR11 Read Access Policy 58 (IMR11_READ_POL_58):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
57	0x0 RO	**IMR11 Read Access Policy 57 (IMR11_READ_POL_57):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
56	0x0 RW	**IMR11 Read Access Policy 56 (IMR11_READ_POL_56):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
55	0x0 RW	**IMR11 Read Access Policy 55 (IMR11_READ_POL_55):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
54	0x0 RW	**IMR11 Read Access Policy 54 (IMR11_READ_POL_54):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
53	0x0 RO	**IMR11 Read Access Policy 53 (IMR11_READ_POL_53):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
52	0x0 RO	**IMR11 Read Access Policy 52 (IMR11_READ_POL_52):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
51	0x0 RO	**IMR11 Read Access Policy 51 (IMR11_READ_POL_51):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
50	0x0 RW	**IMR11 Read Access Policy 50 (IMR11_READ_POL_50):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
49	0x0 RW	**IMR11 Read Access Policy 49 (IMR11_READ_POL_49):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
48	0x0 RW	**IMR11 Read Access Policy 48 (IMR11_READ_POL_48):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
47	0x0 RO	**IMR11 Read Access Policy 47 (IMR11_READ_POL_47):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
46	0x0 RO	**IMR11 Read Access Policy 46 (IMR11_READ_POL_46):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
45	0x0 RO	**IMR11 Read Access Policy 45 (IMR11_READ_POL_45):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
44	0x0 RW	**IMR11 Read Access Policy 44 (IMR11_READ_POL_44):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
43	0x0 RW	**IMR11 Read Access Policy 43 (IMR11_READ_POL_43):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
42	0x0 RW	**IMR11 Read Access Policy 42 (IMR11_READ_POL_42):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
41	0x0 RW	**IMR11 Read Access Policy 41 (IMR11_READ_POL_41):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
40	0x0 RW	**IMR11 Read Access Policy 40 (IMR11_READ_POL_40):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
39	0x0 RO	**IMR11 Read Access Policy 39 (IMR11_READ_POL_39):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
38	0x0 RW	**IMR11 Read Access Policy 38 (IMR11_READ_POL_38):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
37	0x0 RO	**IMR11 Read Access Policy 37 (IMR11_READ_POL_37):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
36	0x0 RW	**IMR11 Read Access Policy 36 (IMR11_READ_POL_36):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
35	0x0 RO	**IMR11 Read Access Policy 35 (IMR11_READ_POL_35):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
34	0x0 RW	**IMR11 Read Access Policy 34 (IMR11_READ_POL_34):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
33	0x0 RW	**IMR11 Read Access Policy 33 (IMR11_READ_POL_33):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
32	0x0 RW	**IMR11 Read Access Policy 32 (IMR11_READ_POL_32):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
31	0x0 RO	**IMR11 Read Access Policy 31 (IMR11_READ_POL_31):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
30	0x0 RW	**IMR11 Read Access Policy 30 (IMR11_READ_POL_30):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
29	0x0 RW	**IMR11 Read Access Policy 29 (IMR11_READ_POL_29):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
28	0x0 RW	**IMR11 Read Access Policy 28 (IMR11_READ_POL_28):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
27	0x0 RW	**IMR11 Read Access Policy 27 (IMR11_READ_POL_27):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
26	0x0 RW	**IMR11 Read Access Policy 26 (IMR11_READ_POL_26):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
25	0x0 RW	**IMR11 Read Access Policy 25 (IMR11_READ_POL_25):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
24	0x0 RW	**IMR11 Read Access Policy 24 (IMR11_READ_POL_24):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
23	0x0 RO	**IMR11 Read Access Policy 23 (IMR11_READ_POL_23):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
22	0x0 RO	**IMR11 Read Access Policy 22 (IMR11_READ_POL_22):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
21	0x0 RW	**IMR11 Read Access Policy 21 (IMR11_READ_POL_21):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
20	0x0 RO	**IMR11 Read Access Policy 20 (IMR11_READ_POL_20):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
19	0x0 RO	**IMR11 Read Access Policy 19 (IMR11_READ_POL_19):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
18	0x0 RO	**IMR11 Read Access Policy 18 (IMR11_READ_POL_18):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
17	0x0 RW	**IMR11 Read Access Policy 17 (IMR11_READ_POL_17):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
16	0x0 RW	**IMR11 Read Access Policy 16 (IMR11_READ_POL_16):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
15	0x0 RO	**IMR11 Read Access Policy 15 (IMR11_READ_POL_15):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
14	0x0 RO	**IMR11 Read Access Policy 14 (IMR11_READ_POL_14):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
13	0x0 RW	**IMR11 Read Access Policy 13 (IMR11_READ_POL_13):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
12	0x0 RW	**IMR11 Read Access Policy 12 (IMR11_READ_POL_12):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
11	0x0 RO	**IMR11 Read Access Policy 11 (IMR11_READ_POL_11):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
10	0x0 RO	**IMR11 Read Access Policy 10 (IMR11_READ_POL_10):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
9	0x0 RO	**IMR11 Read Access Policy 9 (IMR11_READ_POL_9):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
8	0x0 RW	**IMR11 Read Access Policy 8 (IMR11_READ_POL_8):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
7	0x0 RO	**IMR11 Read Access Policy 7 (IMR11_READ_POL_7):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
6	0x0 RO	**IMR11 Read Access Policy 6 (IMR11_READ_POL_6):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
5	0x0 RW	**IMR11 Read Access Policy 5 (IMR11_READ_POL_5):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
4	0x0 RW	**IMR11 Read Access Policy 4 (IMR11_READ_POL_4):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
3	0x0 RW	**IMR11 Read Access Policy 3 (IMR11_READ_POL_3):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
2	0x0 RW	**IMR11 Read Access Policy 2 (IMR11_READ_POL_2):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
1	0x0 RW	**IMR11 Read Access Policy 1 (IMR11_READ_POL_1):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.
0	0x0 RW	**IMR11 Read Access Policy 0 (IMR11_READ_POL_0):** Bit vector used to determine which agents are allowed read access to the IMR11 region, based on each agent's 6bit encoded SAI value.

44.3.81 IMR11 Write Access Policy (B_CR_BIMR11WAC_0_0_0_MCHBAR)—Offset 69E8h

This register, along with IMR11BASE, IMR11MASK and IMR11RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR11. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [MCHBAR] + 69E8h

Default: 0000000000000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
63	0x0 RW	**IMR11 Write Access Policy 63 (IMR11_WRITE_POL_63):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
62	0x0 RO	**IMR11 Write Access Policy 62 (IMR11_WRITE_POL_62):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
61	0x0 RO	**IMR11 Write Access Policy 61 (IMR11_WRITE_POL_61):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
60	0x0 RO	**IMR11 Write Access Policy 60 (IMR11_WRITE_POL_60):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
59	0x0 RO	**IMR11 Write Access Policy 59 (IMR11_WRITE_POL_59):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
58	0x0 RO	**IMR11 Write Access Policy 58 (IMR11_WRITE_POL_58):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
57	0x0 RO	**IMR11 Write Access Policy 57 (IMR11_WRITE_POL_57):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
56	0x0 RW	**IMR11 Write Access Policy 56 (IMR11_WRITE_POL_56):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
55	0x0 RW	**IMR11 Write Access Policy 55 (IMR11_WRITE_POL_55):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
54	0x0 RW	**IMR11 Write Access Policy 54 (IMR11_WRITE_POL_54):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
53	0x0 RO	**IMR11 Write Access Policy 53 (IMR11_WRITE_POL_53):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
52	0x0 RO	**IMR11 Write Access Policy 52 (IMR11_WRITE_POL_52):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
51	0x0 RO	**IMR11 Write Access Policy 51 (IMR11_WRITE_POL_51):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
50	0x0 RW	**IMR11 Write Access Policy 50 (IMR11_WRITE_POL_50):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
49	0x0 RW	**IMR11 Write Access Policy 49 (IMR11_WRITE_POL_49):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
48	0x0 RW	**IMR11 Write Access Policy 48 (IMR11_WRITE_POL_48):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
47	0x0 RO	**IMR11 Write Access Policy 47 (IMR11_WRITE_POL_47):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
46	0x0 RO	**IMR11 Write Access Policy 46 (IMR11_WRITE_POL_46):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
45	0x0 RO	**IMR11 Write Access Policy 45 (IMR11_WRITE_POL_45):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
44	0x0 RW	**IMR11 Write Access Policy 44 (IMR11_WRITE_POL_44):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
43	0x0 RW	**IMR11 Write Access Policy 43 (IMR11_WRITE_POL_43):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
42	0x0 RW	**IMR11 Write Access Policy 42 (IMR11_WRITE_POL_42):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
41	0x0 RW	**IMR11 Write Access Policy 41 (IMR11_WRITE_POL_41):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
40	0x0 RW	**IMR11 Write Access Policy 40 (IMR11_WRITE_POL_40):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
39	0x0 RO	**IMR11 Write Access Policy 39 (IMR11_WRITE_POL_39):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
38	0x0 RW	**IMR11 Write Access Policy 38 (IMR11_WRITE_POL_38):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
37	0x0 RO	**IMR11 Write Access Policy 37 (IMR11_WRITE_POL_37):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
36	0x0 RW	**IMR11 Write Access Policy 36 (IMR11_WRITE_POL_36):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
35	0x0 RO	**IMR11 Write Access Policy 35 (IMR11_WRITE_POL_35):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
34	0x0 RW	**IMR11 Write Access Policy 34 (IMR11_WRITE_POL_34):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
33	0x0 RW	**IMR11 Write Access Policy 33 (IMR11_WRITE_POL_33):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
32	0x0 RW	**IMR11 Write Access Policy 32 (IMR11_WRITE_POL_32):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
31	0x0 RO	**IMR11 Write Access Policy 31 (IMR11_WRITE_POL_31):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
30	0x0 RW	**IMR11 Write Access Policy 30 (IMR11_WRITE_POL_30):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
29	0x0 RW	**IMR11 Write Access Policy 29 (IMR11_WRITE_POL_29):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
28	0x0 RW	**IMR11 Write Access Policy 28 (IMR11_WRITE_POL_28):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
27	0x0 RW	**IMR11 Write Access Policy 27 (IMR11_WRITE_POL_27):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
26	0x0 RW	**IMR11 Write Access Policy 26 (IMR11_WRITE_POL_26):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
25	0x0 RW	**IMR11 Write Access Policy 25 (IMR11_WRITE_POL_25):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
24	0x0 RW	**IMR11 Write Access Policy 24 (IMR11_WRITE_POL_24):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
23	0x0 RO	**IMR11 Write Access Policy 23 (IMR11_WRITE_POL_23):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
22	0x0 RO	**IMR11 Write Access Policy 22 (IMR11_WRITE_POL_22):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
21	0x0 RW	**IMR11 Write Access Policy 21 (IMR11_WRITE_POL_21):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
20	0x0 RO	**IMR11 Write Access Policy 20 (IMR11_WRITE_POL_20):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
19	0x0 RO	**IMR11 Write Access Policy 19 (IMR11_WRITE_POL_19):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
18	0x0 RO	**IMR11 Write Access Policy 18 (IMR11_WRITE_POL_18):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
17	0x0 RW	**IMR11 Write Access Policy 17 (IMR11_WRITE_POL_17):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
16	0x0 RW	**IMR11 Write Access Policy 16 (IMR11_WRITE_POL_16):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
15	0x0 RO	**IMR11 Write Access Policy 15 (IMR11_WRITE_POL_15):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
14	0x0 RO	**IMR11 Write Access Policy 14 (IMR11_WRITE_POL_14):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
13	0x0 RW	**IMR11 Write Access Policy 13 (IMR11_WRITE_POL_13):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
12	0x0 RW	**IMR11 Write Access Policy 12 (IMR11_WRITE_POL_12):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
11	0x0 RO	**IMR11 Write Access Policy 11 (IMR11_WRITE_POL_11):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
10	0x0 RO	**IMR11 Write Access Policy 10 (IMR11_WRITE_POL_10):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
9	0x0 RO	**IMR11 Write Access Policy 9 (IMR11_WRITE_POL_9):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
8	0x0 RW	**IMR11 Write Access Policy 8 (IMR11_WRITE_POL_8):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
7	0x0 RO	**IMR11 Write Access Policy 7 (IMR11_WRITE_POL_7):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
6	0x0 RO	**IMR11 Write Access Policy 6 (IMR11_WRITE_POL_6):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
5	0x0 RW	**IMR11 Write Access Policy 5 (IMR11_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
4	0x0 RW	**IMR11 Write Access Policy 4 (IMR11_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
3	0x0 RW	**IMR11 Write Access Policy 3 (IMR11_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
2	0x0 RW	**IMR11 Write Access Policy 2 (IMR11_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
1	0x0 RW	**IMR11 Write Access Policy 1 (IMR11_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.
0	0x0 RW	**IMR11 Write Access Policy 0 (IMR11_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR11 region, based on each agent's 6bit encoded SAI value.

44.3.82 IMR12 Base (B_CR_BIMR12BASE_0_0_0_MCHBAR)—Offset 69F0h

This register, along with IMR12MASK, IMR12RAC and IMR12WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR12RAC and IMR12WAC registers.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 69F0h

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.
30	0x0 RW	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents.
29	0x0 RO	**RESERVED_1:** Reserved
28:0	0x0 RW	**Base 0 IMR12 Base (IMR12_BASE):** Specifies bits 38:10 of the start address of IMR12 region. IMR region size must be a strict poweroftwo, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR12MASK[28:0] applied to bits 38:10 of the incoming address to determine if an access falls within the IMR12 defined region.

44.3.83 IMR12 Mask (B_CR_BIMR12MASK_0_0_0_MCHBAR)—Offset 69F4h

This register, along with IMR12BASE, IMR12RAC and IMR12WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR12RAC and IMR12WAC registers.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 69F4h

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**Asset Classification AC[2]: GT Implicit Writeback Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback HITM data from GT to be returned to the requestor. When set to 0, inhibits HITM data from GT from being returned to the requestor. HITM data from IA cores may be returned to the requestor, depending on the setting of the IA_IWB_EN bit.
30	0x0 RW	**Asset Classification AC[1]: IA Implicit Writeback Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback data HITM data from IA cores to be returned to the requestor. When set to 0, inhibits HITM data from IA cores from being returned to the requestor. HITM data from GT may be returned to the requestor, depending on the setting of the GT_IWB_EN bit.
29	0x0 RO	**RESERVED_0:** Reserved
28:0	0x0 RW	**Mask 0 IMR12 Mask (IMR12_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR12BASE[28:0] value. A match indicates that the incoming address falls within the IMR12 region.

44.3.84 IMR12 Control Policy (B_CR_BIMR12CP_0_0_0_MCHBAR)—Offset 69F8h

This register controls the access policy to the Read Access Policy BIMR12RAC, the Write Access Policy BIMR12WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [MCHBAR] + 69F8h

Default: 00000C0061010202h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
63:0	0xc0061010202 RW	**IMR12 Control Policy (IMR12_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR12RAC, BIMR12WAC and BIMR12CP registers, based on the value from each agent's 6bit SAI field.

44.3.85 IMR12 Read Access Policy (B_CR_BIMR12RAC_0_0_0_MCHBAR)—Offset 6A00h

This register, along with IMR12BASE, IMR12MASK and IMR12WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR12. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [MCHBAR] + 6A00h

Default: 0000000000000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
63	0x0 RW	**IMR12 Read Access Policy 63 (IMR12_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
62	0x0 RO	**IMR12 Read Access Policy 62 (IMR12_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
61	0x0 RO	**IMR12 Read Access Policy 61 (IMR12_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
60	0x0 RO	**IMR12 Read Access Policy 60 (IMR12_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
59	0x0 RO	**IMR12 Read Access Policy 59 (IMR12_READ_POL_59):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
58	0x0 RO	**IMR12 Read Access Policy 58 (IMR12_READ_POL_58):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
57	0x0 RO	**IMR12 Read Access Policy 57 (IMR12_READ_POL_57):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
56	0x0 RW	**IMR12 Read Access Policy 56 (IMR12_READ_POL_56):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
55	0x0 RW	**IMR12 Read Access Policy 55 (IMR12_READ_POL_55):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
54	0x0 RW	**IMR12 Read Access Policy 54 (IMR12_READ_POL_54):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
53	0x0 RO	**IMR12 Read Access Policy 53 (IMR12_READ_POL_53):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
52	0x0 RO	**IMR12 Read Access Policy 52 (IMR12_READ_POL_52):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
51	0x0 RO	**IMR12 Read Access Policy 51 (IMR12_READ_POL_51):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
50	0x0 RW	**IMR12 Read Access Policy 50 (IMR12_READ_POL_50):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
49	0x0 RW	**IMR12 Read Access Policy 49 (IMR12_READ_POL_49):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
48	0x0 RW	**IMR12 Read Access Policy 48 (IMR12_READ_POL_48):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
47	0x0 RO	**IMR12 Read Access Policy 47 (IMR12_READ_POL_47):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
46	0x0 RO	**IMR12 Read Access Policy 46 (IMR12_READ_POL_46):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
45	0x0 RO	**IMR12 Read Access Policy 45 (IMR12_READ_POL_45):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
44	0x0 RW	**IMR12 Read Access Policy 44 (IMR12_READ_POL_44):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
43	0x0 RW	**IMR12 Read Access Policy 43 (IMR12_READ_POL_43):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
42	0x0 RW	**IMR12 Read Access Policy 42 (IMR12_READ_POL_42):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
41	0x0 RW	**IMR12 Read Access Policy 41 (IMR12_READ_POL_41):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.

25	0x0 RW	**IMR12 Read Access Policy 25 (IMR12_READ_POL_25):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
24	0x0 RW	**IMR12 Read Access Policy 24 (IMR12_READ_POL_24):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
23	0x0 RO	**IMR12 Read Access Policy 23 (IMR12_READ_POL_23):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
22	0x0 RO	**IMR12 Read Access Policy 22 (IMR12_READ_POL_22):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
21	0x0 RW	**IMR12 Read Access Policy 21 (IMR12_READ_POL_21):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
20	0x0 RO	**IMR12 Read Access Policy 20 (IMR12_READ_POL_20):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
19	0x0 RO	**IMR12 Read Access Policy 19 (IMR12_READ_POL_19):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
18	0x0 RO	**IMR12 Read Access Policy 18 (IMR12_READ_POL_18):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
17	0x0 RW	**IMR12 Read Access Policy 17 (IMR12_READ_POL_17):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
16	0x0 RW	**IMR12 Read Access Policy 16 (IMR12_READ_POL_16):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
15	0x0 RO	**IMR12 Read Access Policy 15 (IMR12_READ_POL_15):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
14	0x0 RO	**IMR12 Read Access Policy 14 (IMR12_READ_POL_14):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
13	0x0 RW	**IMR12 Read Access Policy 13 (IMR12_READ_POL_13):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
12	0x0 RW	**IMR12 Read Access Policy 12 (IMR12_READ_POL_12):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
11	0x0 RO	**IMR12 Read Access Policy 11 (IMR12_READ_POL_11):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
10	0x0 RO	**IMR12 Read Access Policy 10 (IMR12_READ_POL_10):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
9	0x0 RO	**IMR12 Read Access Policy 9 (IMR12_READ_POL_9):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
8	0x0 RW	**IMR12 Read Access Policy 8 (IMR12_READ_POL_8):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
7	0x0 RO	**IMR12 Read Access Policy 7 (IMR12_READ_POL_7):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
6	0x0 RO	**IMR12 Read Access Policy 6 (IMR12_READ_POL_6):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
5	0x0 RW	**IMR12 Read Access Policy 5 (IMR12_READ_POL_5):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
4	0x0 RW	**IMR12 Read Access Policy 4 (IMR12_READ_POL_4):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
3	0x0 RW	**IMR12 Read Access Policy 3 (IMR12_READ_POL_3):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
2	0x0 RW	**IMR12 Read Access Policy 2 (IMR12_READ_POL_2):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
1	0x0 RW	**IMR12 Read Access Policy 1 (IMR12_READ_POL_1):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.
0	0x0 RW	**IMR12 Read Access Policy 0 (IMR12_READ_POL_0):** Bit vector used to determine which agents are allowed read access to the IMR12 region, based on each agent's 6bit encoded SAI value.

44.3.86 IMR12 Write Access Policy (B_CR_BIMR12WAC_0_0_0_MCHBAR)—Offset 6A08h

This register, along with IMR12BASE, IMR12MASK and IMR12RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR12. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [MCHBAR] + 6A08h

Default: 0000000000000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
63	0x0 RW	**IMR12 Write Access Policy 63 (IMR12_WRITE_POL_63):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
62	0x0 RO	**IMR12 Write Access Policy 62 (IMR12_WRITE_POL_62):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
61	0x0 RO	**IMR12 Write Access Policy 61 (IMR12_WRITE_POL_61):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
60	0x0 RO	**IMR12 Write Access Policy 60 (IMR12_WRITE_POL_60):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
59	0x0 RO	**IMR12 Write Access Policy 59 (IMR12_WRITE_POL_59):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
58	0x0 RO	**IMR12 Write Access Policy 58 (IMR12_WRITE_POL_58):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
57	0x0 RO	**IMR12 Write Access Policy 57 (IMR12_WRITE_POL_57):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
56	0x0 RW	**IMR12 Write Access Policy 56 (IMR12_WRITE_POL_56):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
55	0x0 RW	**IMR12 Write Access Policy 55 (IMR12_WRITE_POL_55):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
54	0x0 RW	**IMR12 Write Access Policy 54 (IMR12_WRITE_POL_54):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
53	0x0 RO	**IMR12 Write Access Policy 53 (IMR12_WRITE_POL_53):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
52	0x0 RO	**IMR12 Write Access Policy 52 (IMR12_WRITE_POL_52):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
51	0x0 RO	**IMR12 Write Access Policy 51 (IMR12_WRITE_POL_51):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
50	0x0 RW	**IMR12 Write Access Policy 50 (IMR12_WRITE_POL_50):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
49	0x0 RW	**IMR12 Write Access Policy 49 (IMR12_WRITE_POL_49):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
48	0x0 RW	**IMR12 Write Access Policy 48 (IMR12_WRITE_POL_48):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
47	0x0 RO	**IMR12 Write Access Policy 47 (IMR12_WRITE_POL_47):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
46	0x0 RO	**IMR12 Write Access Policy 46 (IMR12_WRITE_POL_46):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
45	0x0 RO	**IMR12 Write Access Policy 45 (IMR12_WRITE_POL_45):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
44	0x0 RW	**IMR12 Write Access Policy 44 (IMR12_WRITE_POL_44):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
43	0x0 RW	**IMR12 Write Access Policy 43 (IMR12_WRITE_POL_43):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
42	0x0 RW	**IMR12 Write Access Policy 42 (IMR12_WRITE_POL_42):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
41	0x0 RW	**IMR12 Write Access Policy 41 (IMR12_WRITE_POL_41):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
40	0x0 RW	**IMR12 Write Access Policy 40 (IMR12_WRITE_POL_40):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
39	0x0 RO	**IMR12 Write Access Policy 39 (IMR12_WRITE_POL_39):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
38	0x0 RW	**IMR12 Write Access Policy 38 (IMR12_WRITE_POL_38):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
37	0x0 RO	**IMR12 Write Access Policy 37 (IMR12_WRITE_POL_37):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
36	0x0 RW	**IMR12 Write Access Policy 36 (IMR12_WRITE_POL_36):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
35	0x0 RO	**IMR12 Write Access Policy 35 (IMR12_WRITE_POL_35):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
34	0x0 RW	**IMR12 Write Access Policy 34 (IMR12_WRITE_POL_34):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
33	0x0 RW	**IMR12 Write Access Policy 33 (IMR12_WRITE_POL_33):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
32	0x0 RW	**IMR12 Write Access Policy 32 (IMR12_WRITE_POL_32):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
31	0x0 RO	**IMR12 Write Access Policy 31 (IMR12_WRITE_POL_31):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
30	0x0 RW	**IMR12 Write Access Policy 30 (IMR12_WRITE_POL_30):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
29	0x0 RW	**IMR12 Write Access Policy 29 (IMR12_WRITE_POL_29):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
28	0x0 RW	**IMR12 Write Access Policy 28 (IMR12_WRITE_POL_28):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
27	0x0 RW	**IMR12 Write Access Policy 27 (IMR12_WRITE_POL_27):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
26	0x0 RW	**IMR12 Write Access Policy 26 (IMR12_WRITE_POL_26):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
25	0x0 RW	**IMR12 Write Access Policy 25 (IMR12_WRITE_POL_25):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
24	0x0 RW	**IMR12 Write Access Policy 24 (IMR12_WRITE_POL_24):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
23	0x0 RO	**IMR12 Write Access Policy 23 (IMR12_WRITE_POL_23):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
22	0x0 RO	**IMR12 Write Access Policy 22 (IMR12_WRITE_POL_22):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
21	0x0 RW	**IMR12 Write Access Policy 21 (IMR12_WRITE_POL_21):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
20	0x0 RO	**IMR12 Write Access Policy 20 (IMR12_WRITE_POL_20):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
19	0x0 RO	**IMR12 Write Access Policy 19 (IMR12_WRITE_POL_19):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
18	0x0 RO	**IMR12 Write Access Policy 18 (IMR12_WRITE_POL_18):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
17	0x0 RW	**IMR12 Write Access Policy 17 (IMR12_WRITE_POL_17):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
16	0x0 RW	**IMR12 Write Access Policy 16 (IMR12_WRITE_POL_16):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
15	0x0 RO	**IMR12 Write Access Policy 15 (IMR12_WRITE_POL_15):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
14	0x0 RO	**IMR12 Write Access Policy 14 (IMR12_WRITE_POL_14):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
13	0x0 RW	**IMR12 Write Access Policy 13 (IMR12_WRITE_POL_13):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
12	0x0 RW	**IMR12 Write Access Policy 12 (IMR12_WRITE_POL_12):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
11	0x0 RO	**IMR12 Write Access Policy 11 (IMR12_WRITE_POL_11):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
10	0x0 RO	**IMR12 Write Access Policy 10 (IMR12_WRITE_POL_10):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
9	0x0 RO	**IMR12 Write Access Policy 9 (IMR12_WRITE_POL_9):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
8	0x0 RW	**IMR12 Write Access Policy 8 (IMR12_WRITE_POL_8):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
7	0x0 RO	**IMR12 Write Access Policy 7 (IMR12_WRITE_POL_7):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
6	0x0 RO	**IMR12 Write Access Policy 6 (IMR12_WRITE_POL_6):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
5	0x0 RW	**IMR12 Write Access Policy 5 (IMR12_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
4	0x0 RW	**IMR12 Write Access Policy 4 (IMR12_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
3	0x0 RW	**IMR12 Write Access Policy 3 (IMR12_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
2	0x0 RW	**IMR12 Write Access Policy 2 (IMR12_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
1	0x0 RW	**IMR12 Write Access Policy 1 (IMR12_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.
0	0x0 RW	**IMR12 Write Access Policy 0 (IMR12_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR12 region, based on each agent's 6bit encoded SAI value.

44.3.87 IMR13 Base (B_CR_BIMR13BASE_0_0_0_MCHBAR)—Offset 6A10h

This register, along with IMR13MASK, IMR13RAC and IMR13WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR13RAC and IMR13WAC registers.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 6A10h

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.
30	0x0 RW	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents.
29	0x0 RO	**RESERVED_1:** Reserved
28:0	0x0 RW	**Base 0 IMR13 Base (IMR13_BASE):** Specifies bits 38:10 of the start address of IMR13 region. IMR region size must be a strict poweroftwo, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR13MASK[28:0] applied to bits 38:10 of the incoming address to determine if an access falls within the IMR13 defined region.

44.3.88 IMR13 Mask (B_CR_BIMR13MASK_0_0_0_MCHBAR)—Offset 6A14h

This register, along with IMR13BASE, IMR13RAC and IMR13WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR13RAC and IMR13WAC registers.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 6A14h

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**Asset Classification AC[2]: GT Implicit Writeback Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback HITM data from GT to be returned to the requestor. When set to 0, inhibits HITM data from GT from being returned to the requestor. HITM data from IA cores may be returned to the requestor depending on the setting of the IA_IWB_EN bit.
30	0x0 RW	**Asset Classification AC[1]: IA Implicit Writeback Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback data HITM data from IA cores to be returned to the requestor. When set to 0, inhibits HITM data from IA cores from being returned to the requestor. HITM data from GT may be returned to the requestor depending on the setting of the GT_IWB_EN bit.
29	0x0 RO	**RESERVED_0:** Reserved
28:0	0x0 RW	**Mask 0 IMR13 Mask (IMR13_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR13BASE[28:0] value. A match indicates that the incoming address falls within the IMR13 region.

44.3.89 IMR13 Control Policy (B_CR_BIMR13CP_0_0_0_MCHBAR)—Offset 6A18h

This register controls the access policy to the Read Access Policy BIMR13RAC, the Write Access Policy BIMR13WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [MCHBAR] + 6A18h

Default: 00000C0061010202h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
63:0	0xc0061010202 RW	**IMR13 Control Policy (IMR13_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR13RAC, BIMR13WAC and BIMR13CP registers, based on the value from each agent's 6bit SAI field.

44.3.90 IMR13 Read Access Policy (B_CR_BIMR13RAC_0_0_0_MCHBAR)—Offset 6A20h

This register, along with IMR13BASE, IMR13MASK and IMR13WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR13. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [MCHBAR] + 6A20h

Default: 0000000000000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
63	0x0 RW	**IMR13 Read Access Policy 63 (IMR13_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
62	0x0 RO	**IMR13 Read Access Policy 62 (IMR13_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
61	0x0 RO	**IMR13 Read Access Policy 61 (IMR13_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
60	0x0 RO	**IMR13 Read Access Policy 60 (IMR13_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
59	0x0 RO	**IMR13 Read Access Policy 59 (IMR13_READ_POL_59):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
58	0x0 RO	**IMR13 Read Access Policy 58 (IMR13_READ_POL_58):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
57	0x0 RO	**IMR13 Read Access Policy 57 (IMR13_READ_POL_57):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.

52	0x0 RO	**IMR13 Read Access Policy 52 (IMR13_READ_POL_52):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
51	0x0 RO	**IMR13 Read Access Policy 51 (IMR13_READ_POL_51):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
50	0x0 RW	**IMR13 Read Access Policy 50 (IMR13_READ_POL_50):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
49	0x0 RW	**IMR13 Read Access Policy 49 (IMR13_READ_POL_49):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
48	0x0 RW	**IMR13 Read Access Policy 48 (IMR13_READ_POL_48):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
47	0x0 RO	**IMR13 Read Access Policy 47 (IMR13_READ_POL_47):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
46	0x0 RO	**IMR13 Read Access Policy 46 (IMR13_READ_POL_46):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
45	0x0 RO	**IMR13 Read Access Policy 45 (IMR13_READ_POL_45):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
44	0x0 RW	**IMR13 Read Access Policy 44 (IMR13_READ_POL_44):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
43	0x0 RW	**IMR13 Read Access Policy 43 (IMR13_READ_POL_43):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
42	0x0 RW	**IMR13 Read Access Policy 42 (IMR13_READ_POL_42):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
41	0x0 RW	**IMR13 Read Access Policy 41 (IMR13_READ_POL_41):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
40	0x0 RW	**IMR13 Read Access Policy 40 (IMR13_READ_POL_40):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
39	0x0 RO	**IMR13 Read Access Policy 39 (IMR13_READ_POL_39):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
38	0x0 RW	**IMR13 Read Access Policy 38 (IMR13_READ_POL_38):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
37	0x0 RO	**IMR13 Read Access Policy 37 (IMR13_READ_POL_37):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
36	0x0 RW	**IMR13 Read Access Policy 36 (IMR13_READ_POL_36):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
35	0x0 RO	**IMR13 Read Access Policy 35 (IMR13_READ_POL_35):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
34	0x0 RW	**IMR13 Read Access Policy 34 (IMR13_READ_POL_34):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
33	0x0 RW	**IMR13 Read Access Policy 33 (IMR13_READ_POL_33):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
32	0x0 RW	**IMR13 Read Access Policy 32 (IMR13_READ_POL_32):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
31	0x0 RO	**IMR13 Read Access Policy 31 (IMR13_READ_POL_31):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
30	0x0 RW	**IMR13 Read Access Policy 30 (IMR13_READ_POL_30):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
29	0x0 RW	**IMR13 Read Access Policy 29 (IMR13_READ_POL_29):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
28	0x0 RW	**IMR13 Read Access Policy 28 (IMR13_READ_POL_28):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
27	0x0 RW	**IMR13 Read Access Policy 27 (IMR13_READ_POL_27):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
26	0x0 RW	**IMR13 Read Access Policy 26 (IMR13_READ_POL_26):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
25	0x0 RW	**IMR13 Read Access Policy 25 (IMR13_READ_POL_25):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
24	0x0 RW	**IMR13 Read Access Policy 24 (IMR13_READ_POL_24):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
23	0x0 RO	**IMR13 Read Access Policy 23 (IMR13_READ_POL_23):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
22	0x0 RO	**IMR13 Read Access Policy 22 (IMR13_READ_POL_22):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
21	0x0 RW	**IMR13 Read Access Policy 21 (IMR13_READ_POL_21):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
20	0x0 RO	**IMR13 Read Access Policy 20 (IMR13_READ_POL_20):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
19	0x0 RO	**IMR13 Read Access Policy 19 (IMR13_READ_POL_19):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
18	0x0 RO	**IMR13 Read Access Policy 18 (IMR13_READ_POL_18):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
17	0x0 RW	**IMR13 Read Access Policy 17 (IMR13_READ_POL_17):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
16	0x0 RW	**IMR13 Read Access Policy 16 (IMR13_READ_POL_16):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
15	0x0 RO	**IMR13 Read Access Policy 15 (IMR13_READ_POL_15):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
14	0x0 RO	**IMR13 Read Access Policy 14 (IMR13_READ_POL_14):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
13	0x0 RW	**IMR13 Read Access Policy 13 (IMR13_READ_POL_13):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
12	0x0 RW	**IMR13 Read Access Policy 12 (IMR13_READ_POL_12):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
11	0x0 RO	**IMR13 Read Access Policy 11 (IMR13_READ_POL_11):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
10	0x0 RO	**IMR13 Read Access Policy 10 (IMR13_READ_POL_10):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
9	0x0 RO	**IMR13 Read Access Policy 9 (IMR13_READ_POL_9):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
8	0x0 RW	**IMR13 Read Access Policy 8 (IMR13_READ_POL_8):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
7	0x0 RO	**IMR13 Read Access Policy 7 (IMR13_READ_POL_7):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
6	0x0 RO	**IMR13 Read Access Policy 6 (IMR13_READ_POL_6):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
5	0x0 RW	**IMR13 Read Access Policy 5 (IMR13_READ_POL_5):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
4	0x0 RW	**IMR13 Read Access Policy 4 (IMR13_READ_POL_4):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
3	0x0 RW	**IMR13 Read Access Policy 3 (IMR13_READ_POL_3):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
2	0x0 RW	**IMR13 Read Access Policy 2 (IMR13_READ_POL_2):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
1	0x0 RW	**IMR13 Read Access Policy 1 (IMR13_READ_POL_1):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.
0	0x0 RW	**IMR13 Read Access Policy 0 (IMR13_READ_POL_0):** Bit vector used to determine which agents are allowed read access to the IMR13 region, based on each agent's 6bit encoded SAI value.

44.3.91 IMR13 Write Access Policy (B_CR_BIMR13WAC_0_0_0_MCHBAR)—Offset 6A28h

This register, along with IMR13BASE, IMR13MASK and IMR13RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR13. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [MCHBAR] + 6A28h

Default: 0000000000000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
63	0x0 RW	**IMR13 Write Access Policy 63 (IMR13_WRITE_POL_63):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
62	0x0 RO	**IMR13 Write Access Policy 62 (IMR13_WRITE_POL_62):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
61	0x0 RO	**IMR13 Write Access Policy 61 (IMR13_WRITE_POL_61):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
60	0x0 RO	**IMR13 Write Access Policy 60 (IMR13_WRITE_POL_60):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
59	0x0 RO	**IMR13 Write Access Policy 59 (IMR13_WRITE_POL_59):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
58	0x0 RO	**IMR13 Write Access Policy 58 (IMR13_WRITE_POL_58):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
57	0x0 RO	**IMR13 Write Access Policy 57 (IMR13_WRITE_POL_57):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
56	0x0 RW	**IMR13 Write Access Policy 56 (IMR13_WRITE_POL_56):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
55	0x0 RW	**IMR13 Write Access Policy 55 (IMR13_WRITE_POL_55):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
54	0x0 RW	**IMR13 Write Access Policy 54 (IMR13_WRITE_POL_54):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
53	0x0 RO	**IMR13 Write Access Policy 53 (IMR13_WRITE_POL_53):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
52	0x0 RO	**IMR13 Write Access Policy 52 (IMR13_WRITE_POL_52):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
51	0x0 RO	**IMR13 Write Access Policy 51 (IMR13_WRITE_POL_51):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
50	0x0 RW	**IMR13 Write Access Policy 50 (IMR13_WRITE_POL_50):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
49	0x0 RW	**IMR13 Write Access Policy 49 (IMR13_WRITE_POL_49):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
48	0x0 RW	**IMR13 Write Access Policy 48 (IMR13_WRITE_POL_48):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
47	0x0 RO	**IMR13 Write Access Policy 47 (IMR13_WRITE_POL_47):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
46	0x0 RO	**IMR13 Write Access Policy 46 (IMR13_WRITE_POL_46):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
45	0x0 RO	**IMR13 Write Access Policy 45 (IMR13_WRITE_POL_45):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
44	0x0 RW	**IMR13 Write Access Policy 44 (IMR13_WRITE_POL_44):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
43	0x0 RW	**IMR13 Write Access Policy 43 (IMR13_WRITE_POL_43):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
42	0x0 RW	**IMR13 Write Access Policy 42 (IMR13_WRITE_POL_42):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
41	0x0 RW	**IMR13 Write Access Policy 41 (IMR13_WRITE_POL_41):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
40	0x0 RW	**IMR13 Write Access Policy 40 (IMR13_WRITE_POL_40):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
39	0x0 RO	**IMR13 Write Access Policy 39 (IMR13_WRITE_POL_39):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
38	0x0 RW	**IMR13 Write Access Policy 38 (IMR13_WRITE_POL_38):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
37	0x0 RO	**IMR13 Write Access Policy 37 (IMR13_WRITE_POL_37):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
36	0x0 RW	**IMR13 Write Access Policy 36 (IMR13_WRITE_POL_36):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
35	0x0 RO	**IMR13 Write Access Policy 35 (IMR13_WRITE_POL_35):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
34	0x0 RW	**IMR13 Write Access Policy 34 (IMR13_WRITE_POL_34):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
33	0x0 RW	**IMR13 Write Access Policy 33 (IMR13_WRITE_POL_33):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
32	0x0 RW	**IMR13 Write Access Policy 32 (IMR13_WRITE_POL_32):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
31	0x0 RO	**IMR13 Write Access Policy 31 (IMR13_WRITE_POL_31):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
30	0x0 RW	**IMR13 Write Access Policy 30 (IMR13_WRITE_POL_30):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
29	0x0 RW	**IMR13 Write Access Policy 29 (IMR13_WRITE_POL_29):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
28	0x0 RW	**IMR13 Write Access Policy 28 (IMR13_WRITE_POL_28):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.

24	0x0 RW	**IMR13 Write Access Policy 24 (IMR13_WRITE_POL_24):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
23	0x0 RO	**IMR13 Write Access Policy 23 (IMR13_WRITE_POL_23):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
22	0x0 RO	**IMR13 Write Access Policy 22 (IMR13_WRITE_POL_22):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
21	0x0 RW	**IMR13 Write Access Policy 21 (IMR13_WRITE_POL_21):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
20	0x0 RO	**IMR13 Write Access Policy 20 (IMR13_WRITE_POL_20):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
19	0x0 RO	**IMR13 Write Access Policy 19 (IMR13_WRITE_POL_19):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
18	0x0 RO	**IMR13 Write Access Policy 18 (IMR13_WRITE_POL_18):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
17	0x0 RW	**IMR13 Write Access Policy 17 (IMR13_WRITE_POL_17):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
16	0x0 RW	**IMR13 Write Access Policy 16 (IMR13_WRITE_POL_16):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
15	0x0 RO	**IMR13 Write Access Policy 15 (IMR13_WRITE_POL_15):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
14	0x0 RO	**IMR13 Write Access Policy 14 (IMR13_WRITE_POL_14):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
13	0x0 RW	**IMR13 Write Access Policy 13 (IMR13_WRITE_POL_13):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
12	0x0 RW	**IMR13 Write Access Policy 12 (IMR13_WRITE_POL_12):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
11	0x0 RO	**IMR13 Write Access Policy 11 (IMR13_WRITE_POL_11):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
10	0x0 RO	**IMR13 Write Access Policy 10 (IMR13_WRITE_POL_10):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
9	0x0 RO	**IMR13 Write Access Policy 9 (IMR13_WRITE_POL_9):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
8	0x0 RW	**IMR13 Write Access Policy 8 (IMR13_WRITE_POL_8):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
7	0x0 RO	**IMR13 Write Access Policy 7 (IMR13_WRITE_POL_7):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
6	0x0 RO	**IMR13 Write Access Policy 6 (IMR13_WRITE_POL_6):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
5	0x0 RW	**IMR13 Write Access Policy 5 (IMR13_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
4	0x0 RW	**IMR13 Write Access Policy 4 (IMR13_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
3	0x0 RW	**IMR13 Write Access Policy 3 (IMR13_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
2	0x0 RW	**IMR13 Write Access Policy 2 (IMR13_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
1	0x0 RW	**IMR13 Write Access Policy 1 (IMR13_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.
0	0x0 RW	**IMR13 Write Access Policy 0 (IMR13_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR13 region, based on each agent's 6bit encoded SAI value.

44.3.92 IMR14 Base (B_CR_BIMR14BASE_0_0_0_MCHBAR)—Offset 6A30h

This register, along with IMR14MASK, IMR14RAC and IMR14WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR14RAC and IMR14WAC registers.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 6A30h

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.
30	0x0 RW	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents.
29	0x0 RO	**RESERVED_1:** Reserved
28:0	0x0 RW	**Base 0 IMR14 Base (IMR14_BASE):** Specifies bits 38:10 of the start address of IMR14 region. IMR region size must be a strict poweroftwo, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR14MASK[28:0] applied to bits 38:10 of the incoming address to determine if an access falls within the IMR14 defined region.

44.3.93 IMR14 Mask (B_CR_BIMR14MASK_0_0_0_MCHBAR)—Offset 6A34h

This register, along with IMR14BASE, IMR14RAC and IMR14WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR14RAC and IMR14WAC registers.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 6A34h

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**Asset Classification AC[2]: GT Implicit Writeback Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback HITM data from GT to be returned to the requestor. When set to 0, inhibits HITM data from GT from being returned to the requestor. HITM data from IA cores may be returned to the requestor depending on the setting of the IA_IWB_EN bit.
30	0x0 RW	**Asset Classification AC[1]: IA Implicit Writeback Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback data HITM data from IA cores to be returned to the requestor. When set to 0, inhibits HITM data from IA cores from being returned to the requestor. HITM data from GT may be returned to the requestor, depending on the setting of the GT_IWB_EN bit.
29	0x0 RO	**RESERVED_0:** Reserved
28:0	0x0 RW	**Mask 0 IMR14 Mask (IMR14_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR14BASE[28:0] value. A match indicates that the incoming address falls within the IMR14 region.

44.3.94 IMR14 Control Policy (B_CR_BIMR14CP_0_0_0_MCHBAR)—Offset 6A38h

This register controls the access policy to the Read Access Policy BIMR14RAC, the Write Access Policy BIMR14WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [MCHBAR] + 6A38h

Default: 00000C0061010202h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
63:0	0xc0061010202 RW	**IMR14 Control Policy (IMR14_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR14RAC, BIMR14WAC and BIMR14CP registers, based on the value from each agent's 6bit SAI field.

44.3.95 IMR14 Read Access Policy (B_CR_BIMR14RAC_0_0_0_MCHBAR)—Offset 6A40h

This register, along with IMR14BASE, IMR14MASK and IMR14WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR14. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [MCHBAR] + 6A40h

Default: 0000000000000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
63	0x0 RW	**IMR14 Read Access Policy 63 (IMR14_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
62	0x0 RO	**IMR14 Read Access Policy 62 (IMR14_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
61	0x0 RO	**IMR14 Read Access Policy 61 (IMR14_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
60	0x0 RO	**IMR14 Read Access Policy 60 (IMR14_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
59	0x0 RO	**IMR14 Read Access Policy 59 (IMR14_READ_POL_59):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
58	0x0 RO	**IMR14 Read Access Policy 58 (IMR14_READ_POL_58):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
57	0x0 RO	**IMR14 Read Access Policy 57 (IMR14_READ_POL_57):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
56	0x0 RW	**IMR14 Read Access Policy 56 (IMR14_READ_POL_56):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
55	0x0 RW	**IMR14 Read Access Policy 55 (IMR14_READ_POL_55):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
54	0x0 RW	**IMR14 Read Access Policy 54 (IMR14_READ_POL_54):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
53	0x0 RO	**IMR14 Read Access Policy 53 (IMR14_READ_POL_53):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
52	0x0 RO	**IMR14 Read Access Policy 52 (IMR14_READ_POL_52):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
51	0x0 RO	**IMR14 Read Access Policy 51 (IMR14_READ_POL_51):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
50	0x0 RW	**IMR14 Read Access Policy 50 (IMR14_READ_POL_50):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
49	0x0 RW	**IMR14 Read Access Policy 49 (IMR14_READ_POL_49):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
48	0x0 RW	**IMR14 Read Access Policy 48 (IMR14_READ_POL_48):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
47	0x0 RO	**IMR14 Read Access Policy 47 (IMR14_READ_POL_47):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
46	0x0 RO	**IMR14 Read Access Policy 46 (IMR14_READ_POL_46):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
45	0x0 RO	**IMR14 Read Access Policy 45 (IMR14_READ_POL_45):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
44	0x0 RW	**IMR14 Read Access Policy 44 (IMR14_READ_POL_44):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
43	0x0 RW	**IMR14 Read Access Policy 43 (IMR14_READ_POL_43):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
42	0x0 RW	**IMR14 Read Access Policy 42 (IMR14_READ_POL_42):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
41	0x0 RW	**IMR14 Read Access Policy 41 (IMR14_READ_POL_41):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
40	0x0 RW	**IMR14 Read Access Policy 40 (IMR14_READ_POL_40):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
39	0x0 RO	**IMR14 Read Access Policy 39 (IMR14_READ_POL_39):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
38	0x0 RW	**IMR14 Read Access Policy 38 (IMR14_READ_POL_38):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
37	0x0 RO	**IMR14 Read Access Policy 37 (IMR14_READ_POL_37):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
36	0x0 RW	**IMR14 Read Access Policy 36 (IMR14_READ_POL_36):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
35	0x0 RO	**IMR14 Read Access Policy 35 (IMR14_READ_POL_35):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
34	0x0 RW	**IMR14 Read Access Policy 34 (IMR14_READ_POL_34):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
33	0x0 RW	**IMR14 Read Access Policy 33 (IMR14_READ_POL_33):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
32	0x0 RW	**IMR14 Read Access Policy 32 (IMR14_READ_POL_32):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
31	0x0 RO	**IMR14 Read Access Policy 31 (IMR14_READ_POL_31):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
30	0x0 RW	**IMR14 Read Access Policy 30 (IMR14_READ_POL_30):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
29	0x0 RW	**IMR14 Read Access Policy 29 (IMR14_READ_POL_29):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
28	0x0 RW	**IMR14 Read Access Policy 28 (IMR14_READ_POL_28):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
27	0x0 RW	**IMR14 Read Access Policy 27 (IMR14_READ_POL_27):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
26	0x0 RW	**IMR14 Read Access Policy 26 (IMR14_READ_POL_26):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
25	0x0 RW	**IMR14 Read Access Policy 25 (IMR14_READ_POL_25):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
24	0x0 RW	**IMR14 Read Access Policy 24 (IMR14_READ_POL_24):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
23	0x0 RO	**IMR14 Read Access Policy 23 (IMR14_READ_POL_23):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
22	0x0 RO	**IMR14 Read Access Policy 22 (IMR14_READ_POL_22):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
21	0x0 RW	**IMR14 Read Access Policy 21 (IMR14_READ_POL_21):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
20	0x0 RO	**IMR14 Read Access Policy 20 (IMR14_READ_POL_20):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
19	0x0 RO	**IMR14 Read Access Policy 19 (IMR14_READ_POL_19):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
18	0x0 RO	**IMR14 Read Access Policy 18 (IMR14_READ_POL_18):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
17	0x0 RW	**IMR14 Read Access Policy 17 (IMR14_READ_POL_17):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
16	0x0 RW	**IMR14 Read Access Policy 16 (IMR14_READ_POL_16):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
15	0x0 RO	**IMR14 Read Access Policy 15 (IMR14_READ_POL_15):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
14	0x0 RO	**IMR14 Read Access Policy 14 (IMR14_READ_POL_14):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
13	0x0 RW	**IMR14 Read Access Policy 13 (IMR14_READ_POL_13):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
12	0x0 RW	**IMR14 Read Access Policy 12 (IMR14_READ_POL_12):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
11	0x0 RO	**IMR14 Read Access Policy 11 (IMR14_READ_POL_11):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
10	0x0 RO	**IMR14 Read Access Policy 10 (IMR14_READ_POL_10):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
9	0x0 RO	**IMR14 Read Access Policy 9 (IMR14_READ_POL_9):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
8	0x0 RW	**IMR14 Read Access Policy 8 (IMR14_READ_POL_8):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
7	0x0 RO	**IMR14 Read Access Policy 7 (IMR14_READ_POL_7):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
6	0x0 RO	**IMR14 Read Access Policy 6 (IMR14_READ_POL_6):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
5	0x0 RW	**IMR14 Read Access Policy 5 (IMR14_READ_POL_5):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
4	0x0 RW	**IMR14 Read Access Policy 4 (IMR14_READ_POL_4):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
3	0x0 RW	**IMR14 Read Access Policy 3 (IMR14_READ_POL_3):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
2	0x0 RW	**IMR14 Read Access Policy 2 (IMR14_READ_POL_2):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
1	0x0 RW	**IMR14 Read Access Policy 1 (IMR14_READ_POL_1):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.
0	0x0 RW	**IMR14 Read Access Policy 0 (IMR14_READ_POL_0):** Bit vector used to determine which agents are allowed read access to the IMR14 region, based on each agent's 6bit encoded SAI value.

44.3.96 IMR14 Write Access Policy (B_CR_BIMR14WAC_0_0_0_MCHBAR)—Offset 6A48h

This register, along with IMR14BASE IMR14MASK and IMR14RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR14. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [MCHBAR] + 6A48h

Default: 0000000000000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
63	0x0 RW	**IMR14 Write Access Policy 63 (IMR14_WRITE_POL_63):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
62	0x0 RO	**IMR14 Write Access Policy 62 (IMR14_WRITE_POL_62):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
61	0x0 RO	**IMR14 Write Access Policy 61 (IMR14_WRITE_POL_61):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
60	0x0 RO	**IMR14 Write Access Policy 60 (IMR14_WRITE_POL_60):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
59	0x0 RO	**IMR14 Write Access Policy 59 (IMR14_WRITE_POL_59):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
58	0x0 RO	**IMR14 Write Access Policy 58 (IMR14_WRITE_POL_58):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
57	0x0 RO	**IMR14 Write Access Policy 57 (IMR14_WRITE_POL_57):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
56	0x0 RW	**IMR14 Write Access Policy 56 (IMR14_WRITE_POL_56):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
55	0x0 RW	**IMR14 Write Access Policy 55 (IMR14_WRITE_POL_55):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
54	0x0 RW	**IMR14 Write Access Policy 54 (IMR14_WRITE_POL_54):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
53	0x0 RO	**IMR14 Write Access Policy 53 (IMR14_WRITE_POL_53):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
52	0x0 RO	**IMR14 Write Access Policy 52 (IMR14_WRITE_POL_52):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
51	0x0 RO	**IMR14 Write Access Policy 51 (IMR14_WRITE_POL_51):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
50	0x0 RW	**IMR14 Write Access Policy 50 (IMR14_WRITE_POL_50):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
49	0x0 RW	**IMR14 Write Access Policy 49 (IMR14_WRITE_POL_49):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
48	0x0 RW	**IMR14 Write Access Policy 48 (IMR14_WRITE_POL_48):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
47	0x0 RO	**IMR14 Write Access Policy 47 (IMR14_WRITE_POL_47):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
46	0x0 RO	**IMR14 Write Access Policy 46 (IMR14_WRITE_POL_46):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
45	0x0 RO	**IMR14 Write Access Policy 45 (IMR14_WRITE_POL_45):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
44	0x0 RW	**IMR14 Write Access Policy 44 (IMR14_WRITE_POL_44):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
43	0x0 RW	**IMR14 Write Access Policy 43 (IMR14_WRITE_POL_43):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
42	0x0 RW	**IMR14 Write Access Policy 42 (IMR14_WRITE_POL_42):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
41	0x0 RW	**IMR14 Write Access Policy 41 (IMR14_WRITE_POL_41):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
40	0x0 RW	**IMR14 Write Access Policy 40 (IMR14_WRITE_POL_40):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
39	0x0 RO	**IMR14 Write Access Policy 39 (IMR14_WRITE_POL_39):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
38	0x0 RW	**IMR14 Write Access Policy 38 (IMR14_WRITE_POL_38):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
37	0x0 RO	**IMR14 Write Access Policy 37 (IMR14_WRITE_POL_37):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
36	0x0 RW	**IMR14 Write Access Policy 36 (IMR14_WRITE_POL_36):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
35	0x0 RO	**IMR14 Write Access Policy 35 (IMR14_WRITE_POL_35):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
34	0x0 RW	**IMR14 Write Access Policy 34 (IMR14_WRITE_POL_34):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
33	0x0 RW	**IMR14 Write Access Policy 33 (IMR14_WRITE_POL_33):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
32	0x0 RW	**IMR14 Write Access Policy 32 (IMR14_WRITE_POL_32):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
31	0x0 RO	**IMR14 Write Access Policy 31 (IMR14_WRITE_POL_31):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
30	0x0 RW	**IMR14 Write Access Policy 30 (IMR14_WRITE_POL_30):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
29	0x0 RW	**IMR14 Write Access Policy 29 (IMR14_WRITE_POL_29):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
28	0x0 RW	**IMR14 Write Access Policy 28 (IMR14_WRITE_POL_28):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
27	0x0 RW	**IMR14 Write Access Policy 27 (IMR14_WRITE_POL_27):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
26	0x0 RW	**IMR14 Write Access Policy 26 (IMR14_WRITE_POL_26):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
25	0x0 RW	**IMR14 Write Access Policy 25 (IMR14_WRITE_POL_25):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
24	0x0 RW	**IMR14 Write Access Policy 24 (IMR14_WRITE_POL_24):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
23	0x0 RO	**IMR14 Write Access Policy 23 (IMR14_WRITE_POL_23):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
22	0x0 RO	**IMR14 Write Access Policy 22 (IMR14_WRITE_POL_22):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
21	0x0 RW	**IMR14 Write Access Policy 21 (IMR14_WRITE_POL_21):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
20	0x0 RO	**IMR14 Write Access Policy 20 (IMR14_WRITE_POL_20):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
19	0x0 RO	**IMR14 Write Access Policy 19 (IMR14_WRITE_POL_19):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
18	0x0 RO	**IMR14 Write Access Policy 18 (IMR14_WRITE_POL_18):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
17	0x0 RW	**IMR14 Write Access Policy 17 (IMR14_WRITE_POL_17):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
16	0x0 RW	**IMR14 Write Access Policy 16 (IMR14_WRITE_POL_16):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
15	0x0 RO	**IMR14 Write Access Policy 15 (IMR14_WRITE_POL_15):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
14	0x0 RO	**IMR14 Write Access Policy 14 (IMR14_WRITE_POL_14):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
13	0x0 RW	**IMR14 Write Access Policy 13 (IMR14_WRITE_POL_13):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
12	0x0 RW	**IMR14 Write Access Policy 12 (IMR14_WRITE_POL_12):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
11	0x0 RO	**IMR14 Write Access Policy 11 (IMR14_WRITE_POL_11):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
10	0x0 RO	**IMR14 Write Access Policy 10 (IMR14_WRITE_POL_10):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
9	0x0 RO	**IMR14 Write Access Policy 9 (IMR14_WRITE_POL_9):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
8	0x0 RW	**IMR14 Write Access Policy 8 (IMR14_WRITE_POL_8):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
7	0x0 RO	**IMR14 Write Access Policy 7 (IMR14_WRITE_POL_7):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
6	0x0 RO	**IMR14 Write Access Policy 6 (IMR14_WRITE_POL_6):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
5	0x0 RW	**IMR14 Write Access Policy 5 (IMR14_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
4	0x0 RW	**IMR14 Write Access Policy 4 (IMR14_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
3	0x0 RW	**IMR14 Write Access Policy 3 (IMR14_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
2	0x0 RW	**IMR14 Write Access Policy 2 (IMR14_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
1	0x0 RW	**IMR14 Write Access Policy 1 (IMR14_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.
0	0x0 RW	**IMR14 Write Access Policy 0 (IMR14_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR14 region, based on each agent's 6bit encoded SAI value.

44.3.97 IMR15 Base (B_CR_BIMR15BASE_0_0_0_MCHBAR)—Offset 6A50h

This register, along with IMR15MASK, IMR15RAC and IMR15WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR15RAC and IMR15WAC registers.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 6A50h

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.
30	0x0 RW	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents.
29	0x0 RO	**RESERVED_1:** Reserved
28:0	0x0 RW	**Base 0 IMR15 Base (IMR15_BASE):** Specifies bits 38:10 of the start address of IMR15 region. IMR region size must be a strict poweroftwo, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR15MASK[28:0] applied to bits 38:10 of the incoming address to determine if an access falls within the IMR15 defined region.

44.3.98 IMR15 Mask (B_CR_BIMR15MASK_0_0_0_MCHBAR)—Offset 6A54h

This register, along with IMR15BASE, IMR15RAC and IMR15WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR15RAC and IMR15WAC registers.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 6A54h

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**Asset Classification AC[2]: GT Implicit Writeback Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback HITM data from GT to be returned to the requestor. When set to 0, inhibits HITM data from GT from being returned to the requestor. HITM data from IA cores may be returned to the requestor depending on the setting of the IA_IWB_EN bit.
30	0x0 RW	**Asset Classification AC[1]: IA Implicit Writeback Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback HITM data from IA cores to be returned to the requestor. When set to 0, inhibits HITM data from IA cores from being returned to the requestor. HITM data from GT may be returned to the requestor, depending on the setting of the GT_IWB_EN bit.
29	0x0 RO	**RESERVED_0:** Reserved
28:0	0x0 RW	**Mask 0 IMR15 Mask (IMR15_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR15BASE[28:0] value. A match indicates that the incoming address falls within the IMR15 region.

44.3.99 IMR15 Control Policy (B_CR_BIMR15CP_0_0_0_MCHBAR)—Offset 6A58h

This register controls the access policy to the Read Access Policy BIMR15RAC, the Write Access Policy BIMR15WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [MCHBAR] + 6A58h

Default: 00000C0061010202h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
63:0	0xc0061010202 RW	**IMR15 Control Policy (IMR15_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR15RAC, BIMR15WAC and BIMR15CP registers, based on the value from each agent's 6bit SAI field.

44.3.100 IMR15 Read Access Policy (B_CR_BIMR15RAC_0_0_0_MCHBAR)—Offset 6A60h

This register, along with IMR15BASE, IMR15MASK and IMR15WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR15. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [MCHBAR] + 6A60h

Default: 0000000000000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
63	0x0 RW	**IMR15 Read Access Policy 63 (IMR15_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
62	0x0 RO	**IMR15 Read Access Policy 62 (IMR15_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
61	0x0 RO	**IMR15 Read Access Policy 61 (IMR15_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
60	0x0 RO	**IMR15 Read Access Policy 60 (IMR15_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
59	0x0 RO	**IMR15 Read Access Policy 59 (IMR15_READ_POL_59):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
58	0x0 RO	**IMR15 Read Access Policy 58 (IMR15_READ_POL_58):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
57	0x0 RO	**IMR15 Read Access Policy 57 (IMR15_READ_POL_57):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
56	0x0 RW	**IMR15 Read Access Policy 56 (IMR15_READ_POL_56):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
55	0x0 RW	**IMR15 Read Access Policy 55 (IMR15_READ_POL_55):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
54	0x0 RW	**IMR15 Read Access Policy 54 (IMR15_READ_POL_54):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
53	0x0 RO	**IMR15 Read Access Policy 53 (IMR15_READ_POL_53):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
52	0x0 RO	**IMR15 Read Access Policy 52 (IMR15_READ_POL_52):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
51	0x0 RO	**IMR15 Read Access Policy 51 (IMR15_READ_POL_51):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
50	0x0 RW	**IMR15 Read Access Policy 50 (IMR15_READ_POL_50):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
49	0x0 RW	**IMR15 Read Access Policy 49 (IMR15_READ_POL_49):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
48	0x0 RW	**IMR15 Read Access Policy 48 (IMR15_READ_POL_48):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
47	0x0 RO	**IMR15 Read Access Policy 47 (IMR15_READ_POL_47):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
46	0x0 RO	**IMR15 Read Access Policy 46 (IMR15_READ_POL_46):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
45	0x0 RO	**IMR15 Read Access Policy 45 (IMR15_READ_POL_45):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
44	0x0 RW	**IMR15 Read Access Policy 44 (IMR15_READ_POL_44):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
43	0x0 RW	**IMR15 Read Access Policy 43 (IMR15_READ_POL_43):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
42	0x0 RW	**IMR15 Read Access Policy 42 (IMR15_READ_POL_42):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
41	0x0 RW	**IMR15 Read Access Policy 41 (IMR15_READ_POL_41):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
40	0x0 RW	**IMR15 Read Access Policy 40 (IMR15_READ_POL_40):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
39	0x0 RO	**IMR15 Read Access Policy 39 (IMR15_READ_POL_39):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
38	0x0 RW	**IMR15 Read Access Policy 38 (IMR15_READ_POL_38):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
37	0x0 RO	**IMR15 Read Access Policy 37 (IMR15_READ_POL_37):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
36	0x0 RW	**IMR15 Read Access Policy 36 (IMR15_READ_POL_36):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
35	0x0 RO	**IMR15 Read Access Policy 35 (IMR15_READ_POL_35):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
34	0x0 RW	**IMR15 Read Access Policy 34 (IMR15_READ_POL_34):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
33	0x0 RW	**IMR15 Read Access Policy 33 (IMR15_READ_POL_33):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
32	0x0 RW	**IMR15 Read Access Policy 32 (IMR15_READ_POL_32):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
31	0x0 RO	**IMR15 Read Access Policy 31 (IMR15_READ_POL_31):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
30	0x0 RW	**IMR15 Read Access Policy 30 (IMR15_READ_POL_30):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
29	0x0 RW	**IMR15 Read Access Policy 29 (IMR15_READ_POL_29):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
28	0x0 RW	**IMR15 Read Access Policy 28 (IMR15_READ_POL_28):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
27	0x0 RW	**IMR15 Read Access Policy 27 (IMR15_READ_POL_27):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
26	0x0 RW	**IMR15 Read Access Policy 26 (IMR15_READ_POL_26):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
25	0x0 RW	**IMR15 Read Access Policy 25 (IMR15_READ_POL_25):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
24	0x0 RW	**IMR15 Read Access Policy 24 (IMR15_READ_POL_24):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
23	0x0 RO	**IMR15 Read Access Policy 23 (IMR15_READ_POL_23):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
22	0x0 RO	**IMR15 Read Access Policy 22 (IMR15_READ_POL_22):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
21	0x0 RW	**IMR15 Read Access Policy 21 (IMR15_READ_POL_21):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
20	0x0 RO	**IMR15 Read Access Policy 20 (IMR15_READ_POL_20):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
19	0x0 RO	**IMR15 Read Access Policy 19 (IMR15_READ_POL_19):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
18	0x0 RO	**IMR15 Read Access Policy 18 (IMR15_READ_POL_18):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
17	0x0 RW	**IMR15 Read Access Policy 17 (IMR15_READ_POL_17):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
16	0x0 RW	**IMR15 Read Access Policy 16 (IMR15_READ_POL_16):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
15	0x0 RO	**IMR15 Read Access Policy 15 (IMR15_READ_POL_15):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
14	0x0 RO	**IMR15 Read Access Policy 14 (IMR15_READ_POL_14):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
13	0x0 RW	**IMR15 Read Access Policy 13 (IMR15_READ_POL_13):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
12	0x0 RW	**IMR15 Read Access Policy 12 (IMR15_READ_POL_12):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
11	0x0 RO	**IMR15 Read Access Policy 11 (IMR15_READ_POL_11):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
10	0x0 RO	**IMR15 Read Access Policy 10 (IMR15_READ_POL_10):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
9	0x0 RO	**IMR15 Read Access Policy 9 (IMR15_READ_POL_9):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
8	0x0 RW	**IMR15 Read Access Policy 8 (IMR15_READ_POL_8):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
7	0x0 RO	**IMR15 Read Access Policy 7 (IMR15_READ_POL_7):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
6	0x0 RO	**IMR15 Read Access Policy 6 (IMR15_READ_POL_6):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
5	0x0 RW	**IMR15 Read Access Policy 5 (IMR15_READ_POL_5):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
4	0x0 RW	**IMR15 Read Access Policy 4 (IMR15_READ_POL_4):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
3	0x0 RW	**IMR15 Read Access Policy 3 (IMR15_READ_POL_3):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
2	0x0 RW	**IMR15 Read Access Policy 2 (IMR15_READ_POL_2):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
1	0x0 RW	**IMR15 Read Access Policy 1 (IMR15_READ_POL_1):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.
0	0x0 RW	**IMR15 Read Access Policy 0 (IMR15_READ_POL_0):** Bit vector used to determine which agents are allowed read access to the IMR15 region, based on each agent's 6bit encoded SAI value.

44.3.101 IMR15 Write Access Policy (B_CR_BIMR15WAC_0_0_0_MCHBAR)—Offset 6A68h

This register, along with IMR15BASE, IMR15MASK and IMR15RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR15. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [MCHBAR] + 6A68h

Default: 0000000000000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
63	0x0 RW	**IMR15 Write Access Policy 63 (IMR15_WRITE_POL_63):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
62	0x0 RO	**IMR15 Write Access Policy 62 (IMR15_WRITE_POL_62):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
61	0x0 RO	**IMR15 Write Access Policy 61 (IMR15_WRITE_POL_61):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
60	0x0 RO	**IMR15 Write Access Policy 60 (IMR15_WRITE_POL_60):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
59	0x0 RO	**IMR15 Write Access Policy 59 (IMR15_WRITE_POL_59):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
58	0x0 RO	**IMR15 Write Access Policy 58 (IMR15_WRITE_POL_58):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
57	0x0 RO	**IMR15 Write Access Policy 57 (IMR15_WRITE_POL_57):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
56	0x0 RW	**IMR15 Write Access Policy 56 (IMR15_WRITE_POL_56):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
55	0x0 RW	**IMR15 Write Access Policy 55 (IMR15_WRITE_POL_55):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
54	0x0 RW	**IMR15 Write Access Policy 54 (IMR15_WRITE_POL_54):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
53	0x0 RO	**IMR15 Write Access Policy 53 (IMR15_WRITE_POL_53):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
52	0x0 RO	**IMR15 Write Access Policy 52 (IMR15_WRITE_POL_52):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
51	0x0 RO	**IMR15 Write Access Policy 51 (IMR15_WRITE_POL_51):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
50	0x0 RW	**IMR15 Write Access Policy 50 (IMR15_WRITE_POL_50):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
49	0x0 RW	**IMR15 Write Access Policy 49 (IMR15_WRITE_POL_49):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
48	0x0 RW	**IMR15 Write Access Policy 48 (IMR15_WRITE_POL_48):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
47	0x0 RO	**IMR15 Write Access Policy 47 (IMR15_WRITE_POL_47):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
46	0x0 RO	**IMR15 Write Access Policy 46 (IMR15_WRITE_POL_46):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
45	0x0 RO	**IMR15 Write Access Policy 45 (IMR15_WRITE_POL_45):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
44	0x0 RW	**IMR15 Write Access Policy 44 (IMR15_WRITE_POL_44):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
43	0x0 RW	**IMR15 Write Access Policy 43 (IMR15_WRITE_POL_43):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
42	0x0 RW	**IMR15 Write Access Policy 42 (IMR15_WRITE_POL_42):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
41	0x0 RW	**IMR15 Write Access Policy 41 (IMR15_WRITE_POL_41):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
40	0x0 RW	**IMR15 Write Access Policy 40 (IMR15_WRITE_POL_40):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
39	0x0 RO	**IMR15 Write Access Policy 39 (IMR15_WRITE_POL_39):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
38	0x0 RW	**IMR15 Write Access Policy 38 (IMR15_WRITE_POL_38):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
37	0x0 RO	**IMR15 Write Access Policy 37 (IMR15_WRITE_POL_37):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
36	0x0 RW	**IMR15 Write Access Policy 36 (IMR15_WRITE_POL_36):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
35	0x0 RO	**IMR15 Write Access Policy 35 (IMR15_WRITE_POL_35):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
34	0x0 RW	**IMR15 Write Access Policy 34 (IMR15_WRITE_POL_34):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
33	0x0 RW	**IMR15 Write Access Policy 33 (IMR15_WRITE_POL_33):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
32	0x0 RW	**IMR15 Write Access Policy 32 (IMR15_WRITE_POL_32):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
31	0x0 RO	**IMR15 Write Access Policy 31 (IMR15_WRITE_POL_31):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
30	0x0 RW	**IMR15 Write Access Policy 30 (IMR15_WRITE_POL_30):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
29	0x0 RW	**IMR15 Write Access Policy 29 (IMR15_WRITE_POL_29):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
28	0x0 RW	**IMR15 Write Access Policy 28 (IMR15_WRITE_POL_28):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
27	0x0 RW	**IMR15 Write Access Policy 27 (IMR15_WRITE_POL_27):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
26	0x0 RW	**IMR15 Write Access Policy 26 (IMR15_WRITE_POL_26):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
25	0x0 RW	**IMR15 Write Access Policy 25 (IMR15_WRITE_POL_25):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
24	0x0 RW	**IMR15 Write Access Policy 24 (IMR15_WRITE_POL_24):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
23	0x0 RO	**IMR15 Write Access Policy 23 (IMR15_WRITE_POL_23):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
22	0x0 RO	**IMR15 Write Access Policy 22 (IMR15_WRITE_POL_22):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
21	0x0 RW	**IMR15 Write Access Policy 21 (IMR15_WRITE_POL_21):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
20	0x0 RO	**IMR15 Write Access Policy 20 (IMR15_WRITE_POL_20):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
19	0x0 RO	**IMR15 Write Access Policy 19 (IMR15_WRITE_POL_19):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
18	0x0 RO	**IMR15 Write Access Policy 18 (IMR15_WRITE_POL_18):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
17	0x0 RW	**IMR15 Write Access Policy 17 (IMR15_WRITE_POL_17):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
16	0x0 RW	**IMR15 Write Access Policy 16 (IMR15_WRITE_POL_16):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
15	0x0 RO	**IMR15 Write Access Policy 15 (IMR15_WRITE_POL_15):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
14	0x0 RO	**IMR15 Write Access Policy 14 (IMR15_WRITE_POL_14):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
13	0x0 RW	**IMR15 Write Access Policy 13 (IMR15_WRITE_POL_13):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
12	0x0 RW	**IMR15 Write Access Policy 12 (IMR15_WRITE_POL_12):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
11	0x0 RO	**IMR15 Write Access Policy 11 (IMR15_WRITE_POL_11):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
10	0x0 RO	**IMR15 Write Access Policy 10 (IMR15_WRITE_POL_10):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
9	0x0 RO	**IMR15 Write Access Policy 9 (IMR15_WRITE_POL_9):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
8	0x0 RW	**IMR15 Write Access Policy 8 (IMR15_WRITE_POL_8):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
7	0x0 RO	**IMR15 Write Access Policy 7 (IMR15_WRITE_POL_7):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
6	0x0 RO	**IMR15 Write Access Policy 6 (IMR15_WRITE_POL_6):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
5	0x0 RW	**IMR15 Write Access Policy 5 (IMR15_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
4	0x0 RW	**IMR15 Write Access Policy 4 (IMR15_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
3	0x0 RW	**IMR15 Write Access Policy 3 (IMR15_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
2	0x0 RW	**IMR15 Write Access Policy 2 (IMR15_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
1	0x0 RW	**IMR15 Write Access Policy 1 (IMR15_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.
0	0x0 RW	**IMR15 Write Access Policy 0 (IMR15_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR15 region, based on each agent's 6bit encoded SAI value.

44.3.102 IMR16 Base (B_CR_BIMR16BASE_0_0_0_MCHBAR)—Offset 6A70h

This register, along with IMR16MASK, IMR16RAC and IMR16WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR16RAC and IMR16WAC registers.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 6A70h

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.
30	0x0 RW	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents.
29	0x0 RO	**RESERVED_1:** Reserved
28:0	0x0 RW	**Base 0 IMR16 Base (IMR16_BASE):** Specifies bits 38:10 of the start address of IMR16 region. IMR region size must be a strict poweroftwo, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR16MASK[28:0] applied to bits 38:10 of the incoming address, to determine if an access falls within the IMR16 defined region.

44.3.103 IMR16 Mask (B_CR_BIMR16MASK_0_0_0_MCHBAR)—Offset 6A74h

This register, along with IMR16BASE, IMR16RAC and IMR16WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR16RAC and IMR16WAC registers.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 6A74h

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**Asset Classification AC[2]: GT Implicit Writeback Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback data HITM data from GT to be returned to the requestor. When set to 0, inhibits HITM data from GT from being returned to the requestor. HITM data from IA cores may be returned to the requestor, depending on the setting of the IA_IWB_EN bit.
30	0x0 RW	**Asset Classification AC[1]: IA Implicit Writeback Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback HITM data from IA cores to be returned to the requestor. When set to 0, inhibits HITM data from IA cores from being returned to the requestor. HITM data from GT may be returned to the requestor depending on the setting of the GT_IWB_EN bit.
29	0x0 RO	**RESERVED_0:** Reserved
28:0	0x0 RW	**Mask 0 IMR16 Mask (IMR16_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR16BASE[28:0] value. A match indicates that the incoming address falls within the IMR16 region.

44.3.104 IMR16 Control Policy (B_CR_BIMR16CP_0_0_0_MCHBAR)—Offset 6A78h

This register controls the access policy to the Read Access Policy BIMR16RAC, the Write Access Policy BIMR16WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [MCHBAR] + 6A78h

Default: 00000C0061010202h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
63:0	0xc0061010202 RW	**IMR16 Control Policy (IMR16_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR16RAC, BIMR16WAC and BIMR16CP registers, based on the value from each agent's 6bit SAI field.

44.3.105 IMR16 Read Access Policy (B_CR_BIMR16RAC_0_0_0_MCHBAR)—Offset 6A80h

This register, along with IMR16BASE, IMR16MASK and IMR16WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR16. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [MCHBAR] + 6A80h

Default: 0000000000000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

5	0x0 RW	**IMR16 Write Access Policy 5 (IMR16_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
4	0x0 RW	**IMR16 Write Access Policy 4 (IMR16_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
3	0x0 RW	**IMR16 Write Access Policy 3 (IMR16_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
2	0x0 RW	**IMR16 Write Access Policy 2 (IMR16_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
1	0x0 RW	**IMR16 Write Access Policy 1 (IMR16_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.
0	0x0 RW	**IMR16 Write Access Policy 0 (IMR16_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR16 region, based on each agent's 6bit encoded SAI value.

44.3.107 IMR17 Base (B_CR_BIMR17BASE_0_0_0_MCHBAR)—Offset 6A90h

This register, along with IMR17MASK, IMR17RAC and IMR17WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR17RAC and IMR17WAC registers.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 6A90h

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.
30	0x0 RW	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents.
29	0x0 RO	**RESERVED_1:** Reserved
28:0	0x0 RW	**Base 0 IMR17BASE (IMR17_BASE):** Specifies bits 38:10 of the start address of IMR17 region. IMR region size must be a strict poweroftwo, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR17MASK[28:0] applied to bits 38:10 of the incoming address to determine if an access falls within the IMR17 defined region.

44.3.108 IMR17 Mask (B_CR_BIMR17MASK_0_0_0_MCHBAR)—Offset 6A94h

This register, along with IMR17BASE, IMR17RAC and IMR17WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR17RAC and IMR17WAC registers.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 6A94h

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**Asset Classification AC[2]: GT Implicit Writeback Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback HITM data from GT to be returned to the requestor. When set to 0, inhibits HITM data from GT from being returned to the requestor. HITM data from IA cores may be returned to the requestor, depending on the setting of the IA_IWB_EN bit.
30	0x0 RW	**Asset Classification AC[1]: IA Implicit Writeback Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback data HITM data from IA cores to be returned to the requestor. When set to 0, inhibits HITM data from IA cores from being returned to the requestor. HITM data from GT may be returned to the requestor depending on the setting of the GT_IWB_EN bit.
29	0x0 RO	**RESERVED_0:** Reserved
28:0	0x0 RW	**Mask 0 IMR17 Mask (IMR17_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR17BASE[28:0] value. A match indicates that the incoming address falls within the IMR17 region.

44.3.109 IMR17 Control Policy (B_CR_BIMR17CP_0_0_0_MCHBAR)—Offset 6A98h

This register controls the access policy to the Read Access Policy BIMR17RAC, the Write Access Policy BIMR17WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [MCHBAR] + 6A98h

Default: 00000C0061010202h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
63:0	0xc0061010202 RW	**IMR17 Control Policy (IMR17_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR17RAC, BIMR17WAC and BIMR17CP registers, based on the value from each agent's 6bit SAI field.

44.3.110 IMR17 Read Access Policy (B_CR_BIMR17RAC_0_0_0_MCHBAR)—Offset 6AA0h

This register, along with IMR17BASE, IMR17MASK and IMR17WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR17. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [MCHBAR] + 6AA0h

Default: 0000000000000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
63	0x0 RW	**IMR17 Read Access Policy 63 (IMR17_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
62	0x0 RO	**IMR17 Read Access Policy 62 (IMR17_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
61	0x0 RO	**IMR17 Read Access Policy 61 (IMR17_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
60	0x0 RO	**IMR17 Read Access Policy 60 (IMR17_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.

40	0x0 RW	**IMR17 Read Access Policy 40 (IMR17_READ_POL_40):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
39	0x0 RO	**IMR17 Read Access Policy 39 (IMR17_READ_POL_39):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
38	0x0 RW	**IMR17 Read Access Policy 38 (IMR17_READ_POL_38):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
37	0x0 RO	**IMR17 Read Access Policy 37 (IMR17_READ_POL_37):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
36	0x0 RW	**IMR17 Read Access Policy 36 (IMR17_READ_POL_36):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
35	0x0 RO	**IMR17 Read Access Policy 35 (IMR17_READ_POL_35):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
34	0x0 RW	**IMR17 Read Access Policy 34 (IMR17_READ_POL_34):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
33	0x0 RW	**IMR17 Read Access Policy 33 (IMR17_READ_POL_33):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
32	0x0 RW	**IMR17 Read Access Policy 32 (IMR17_READ_POL_32):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
31	0x0 RO	**IMR17 Read Access Policy 31 (IMR17_READ_POL_31):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
30	0x0 RW	**IMR17 Read Access Policy 30 (IMR17_READ_POL_30):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
29	0x0 RW	**IMR17 Read Access Policy 29 (IMR17_READ_POL_29):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
28	0x0 RW	**IMR17 Read Access Policy 28 (IMR17_READ_POL_28):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
27	0x0 RW	**IMR17 Read Access Policy 27 (IMR17_READ_POL_27):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
26	0x0 RW	**IMR17 Read Access Policy 26 (IMR17_READ_POL_26):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
25	0x0 RW	**IMR17 Read Access Policy 25 (IMR17_READ_POL_25):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
24	0x0 RW	**IMR17 Read Access Policy 24 (IMR17_READ_POL_24):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
23	0x0 RO	**IMR17 Read Access Policy 23 (IMR17_READ_POL_23):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
22	0x0 RO	**IMR17 Read Access Policy 22 (IMR17_READ_POL_22):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
21	0x0 RW	**IMR17 Read Access Policy 21 (IMR17_READ_POL_21):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
20	0x0 RO	**IMR17 Read Access Policy 20 (IMR17_READ_POL_20):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
19	0x0 RO	**IMR17 Read Access Policy 19 (IMR17_READ_POL_19):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
18	0x0 RO	**IMR17 Read Access Policy 18 (IMR17_READ_POL_18):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
17	0x0 RW	**IMR17 Read Access Policy 17 (IMR17_READ_POL_17):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
16	0x0 RW	**IMR17 Read Access Policy 16 (IMR17_READ_POL_16):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
15	0x0 RO	**IMR17 Read Access Policy 15 (IMR17_READ_POL_15):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
14	0x0 RO	**IMR17 Read Access Policy 14 (IMR17_READ_POL_14):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
13	0x0 RW	**IMR17 Read Access Policy 13 (IMR17_READ_POL_13):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
12	0x0 RW	**IMR17 Read Access Policy 12 (IMR17_READ_POL_12):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
11	0x0 RO	**IMR17 Read Access Policy 11 (IMR17_READ_POL_11):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
10	0x0 RO	**IMR17 Read Access Policy 10 (IMR17_READ_POL_10):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
9	0x0 RO	**IMR17 Read Access Policy 9 (IMR17_READ_POL_9):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
8	0x0 RW	**IMR17 Read Access Policy 8 (IMR17_READ_POL_8):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
7	0x0 RO	**IMR17 Read Access Policy 7 (IMR17_READ_POL_7):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
6	0x0 RO	**IMR17 Read Access Policy 6 (IMR17_READ_POL_6):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
5	0x0 RW	**IMR17 Read Access Policy 5 (IMR17_READ_POL_5):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
4	0x0 RW	**IMR17 Read Access Policy 4 (IMR17_READ_POL_4):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
3	0x0 RW	**IMR17 Read Access Policy 3 (IMR17_READ_POL_3):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
2	0x0 RW	**IMR17 Read Access Policy 2 (IMR17_READ_POL_2):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
1	0x0 RW	**IMR17 Read Access Policy 1 (IMR17_READ_POL_1):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.
0	0x0 RW	**IMR17 Read Access Policy 0 (IMR17_READ_POL_0):** Bit vector used to determine which agents are allowed read access to the IMR17 region, based on each agent's 6bit encoded SAI value.

44.3.111 IMR17 Write Access Policy (B_CR_BIMR17WAC_0_0_0_MCHBAR)—Offset 6AA8h

This register, along with IMR17BASE, IMR17MASK and IMR17RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with a SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR17. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [MCHBAR] + 6AA8h

Default: 0000000000000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
63	0x0 RW	**IMR17 Write Access Policy 63 (IMR17_WRITE_POL_63):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
62	0x0 RO	**IMR17 Write Access Policy 62 (IMR17_WRITE_POL_62):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
61	0x0 RO	**IMR17 Write Access Policy 61 (IMR17_WRITE_POL_61):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
60	0x0 RO	**IMR17 Write Access Policy 60 (IMR17_WRITE_POL_60):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
59	0x0 RO	**IMR17 Write Access Policy 59 (IMR17_WRITE_POL_59):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
58	0x0 RO	**IMR17 Write Access Policy 58 (IMR17_WRITE_POL_58):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
57	0x0 RO	**IMR17 Write Access Policy 57 (IMR17_WRITE_POL_57):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
56	0x0 RW	**IMR17 Write Access Policy 56 (IMR17_WRITE_POL_56):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
55	0x0 RW	**IMR17 Write Access Policy 55 (IMR17_WRITE_POL_55):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
54	0x0 RW	**IMR17 Write Access Policy 54 (IMR17_WRITE_POL_54):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
53	0x0 RO	**IMR17 Write Access Policy 53 (IMR17_WRITE_POL_53):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
52	0x0 RO	**IMR17 Write Access Policy 52 (IMR17_WRITE_POL_52):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
51	0x0 RO	**IMR17 Write Access Policy 51 (IMR17_WRITE_POL_51):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
50	0x0 RW	**IMR17 Write Access Policy 50 (IMR17_WRITE_POL_50):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
49	0x0 RW	**IMR17 Write Access Policy 49 (IMR17_WRITE_POL_49):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
48	0x0 RW	**IMR17 Write Access Policy 48 (IMR17_WRITE_POL_48):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
47	0x0 RO	**IMR17 Write Access Policy 47 (IMR17_WRITE_POL_47):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
46	0x0 RO	**IMR17 Write Access Policy 46 (IMR17_WRITE_POL_46):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
45	0x0 RO	**IMR17 Write Access Policy 45 (IMR17_WRITE_POL_45):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
44	0x0 RW	**IMR17 Write Access Policy 44 (IMR17_WRITE_POL_44):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
43	0x0 RW	**IMR17 Write Access Policy 43 (IMR17_WRITE_POL_43):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
42	0x0 RW	**IMR17 Write Access Policy 42 (IMR17_WRITE_POL_42):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
41	0x0 RW	**IMR17 Write Access Policy 41 (IMR17_WRITE_POL_41):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
40	0x0 RW	**IMR17 Write Access Policy 40 (IMR17_WRITE_POL_40):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
39	0x0 RO	**IMR17 Write Access Policy 39 (IMR17_WRITE_POL_39):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
38	0x0 RW	**IMR17 Write Access Policy 38 (IMR17_WRITE_POL_38):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
37	0x0 RO	**IMR17 Write Access Policy 37 (IMR17_WRITE_POL_37):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
36	0x0 RW	**IMR17 Write Access Policy 36 (IMR17_WRITE_POL_36):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
35	0x0 RO	**IMR17 Write Access Policy 35 (IMR17_WRITE_POL_35):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
34	0x0 RW	**IMR17 Write Access Policy 34 (IMR17_WRITE_POL_34):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
33	0x0 RW	**IMR17 Write Access Policy 33 (IMR17_WRITE_POL_33):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
32	0x0 RW	**IMR17 Write Access Policy 32 (IMR17_WRITE_POL_32):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
31	0x0 RO	**IMR17 Write Access Policy 31 (IMR17_WRITE_POL_31):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
30	0x0 RW	**IMR17 Write Access Policy 30 (IMR17_WRITE_POL_30):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
29	0x0 RW	**IMR17 Write Access Policy 29 (IMR17_WRITE_POL_29):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
28	0x0 RW	**IMR17 Write Access Policy 28 (IMR17_WRITE_POL_28):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
27	0x0 RW	**IMR17 Write Access Policy 27 (IMR17_WRITE_POL_27):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
26	0x0 RW	**IMR17 Write Access Policy 26 (IMR17_WRITE_POL_26):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
25	0x0 RW	**IMR17 Write Access Policy 25 (IMR17_WRITE_POL_25):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
24	0x0 RW	**IMR17 Write Access Policy 24 (IMR17_WRITE_POL_24):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
23	0x0 RO	**IMR17 Write Access Policy 23 (IMR17_WRITE_POL_23):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
22	0x0 RO	**IMR17 Write Access Policy 22 (IMR17_WRITE_POL_22):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
21	0x0 RW	**IMR17 Write Access Policy 21 (IMR17_WRITE_POL_21):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
20	0x0 RO	**IMR17 Write Access Policy 20 (IMR17_WRITE_POL_20):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
19	0x0 RO	**IMR17 Write Access Policy 19 (IMR17_WRITE_POL_19):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
18	0x0 RO	**IMR17 Write Access Policy 18 (IMR17_WRITE_POL_18):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
17	0x0 RW	**IMR17 Write Access Policy 17 (IMR17_WRITE_POL_17):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
16	0x0 RW	**IMR17 Write Access Policy 16 (IMR17_WRITE_POL_16):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
15	0x0 RO	**IMR17 Write Access Policy 15 (IMR17_WRITE_POL_15):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
14	0x0 RO	**IMR17 Write Access Policy 14 (IMR17_WRITE_POL_14):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
13	0x0 RW	**IMR17 Write Access Policy 13 (IMR17_WRITE_POL_13):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
12	0x0 RW	**IMR17 Write Access Policy 12 (IMR17_WRITE_POL_12):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
11	0x0 RO	**IMR17 Write Access Policy 11 (IMR17_WRITE_POL_11):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
10	0x0 RO	**IMR17 Write Access Policy 10 (IMR17_WRITE_POL_10):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
9	0x0 RO	**IMR17 Write Access Policy 9 (IMR17_WRITE_POL_9):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
8	0x0 RW	**IMR17 Write Access Policy 8 (IMR17_WRITE_POL_8):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
7	0x0 RO	**IMR17 Write Access Policy 7 (IMR17_WRITE_POL_7):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
6	0x0 RO	**IMR17 Write Access Policy 6 (IMR17_WRITE_POL_6):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
5	0x0 RW	**IMR17 Write Access Policy 5 (IMR17_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
4	0x0 RW	**IMR17 Write Access Policy 4 (IMR17_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
3	0x0 RW	**IMR17 Write Access Policy 3 (IMR17_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
2	0x0 RW	**IMR17 Write Access Policy 2 (IMR17_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
1	0x0 RW	**IMR17 Write Access Policy 1 (IMR17_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.
0	0x0 RW	**IMR17 Write Access Policy 0 (IMR17_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR17 region, based on each agent's 6bit encoded SAI value.

44.3.112 IMR18 Base (B_CR_BIMR18BASE_0_0_0_MCHBAR)—Offset 6AB0h

This register, along with IMR18MASK, IMR18RAC and IMR18WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation, if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR18RAC and IMR18WAC registers.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 6AB0h

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.
30	0x0 RW	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents.
29	0x0 RO	**RESERVED_1:** Reserved
28:0	0x0 RW	**Base 0 IMR18 Base (IMR18_BASE):** Specifies bits 38:10 of the start address of IMR18 region. IMR region size must be a strict poweroftwo, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR18MASK[28:0] applied to bits 38:10 of the incoming address, to determine if an access falls within the IMR18 defined region.

44.3.113 IMR18 Mask (B_CR_BIMR18MASK_0_0_0_MCHBAR)—Offset 6AB4h

This register, along with IMR18BASE, IMR18RAC and IMR18WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR18RAC and IMR18WAC registers.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 6AB4h

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**Asset Classification AC[2]: GT Implicit Writeback Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback data HITM data from GT to be returned to the requestor. When set to 0, inhibits HITM data from GT from being returned to the requestor. HITM data from IA cores may be returned to the requestor depending on the setting of the IA_IWB_EN bit.
30	0x0 RW	**Asset Classification AC[1]: IA Implicit Writeback Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback data HITM data from IA cores to be returned to the requestor. When set to 0, inhibits HITM data from IA cores from being returned to the requestor. HITM data from GT may be returned to the requestor depending on the setting of the GT_IWB_EN bit.
29	0x0 RO	**RESERVED_0:** Reserved
28:0	0x0 RW	**Mask 0 IMR18 Mask (IMR18_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR18BASE[28:0] value. A match indicates that the incoming address falls within the IMR18 region.

44.3.114 IMR18 Control Policy (B_CR_BIMR18CP_0_0_0_MCHBAR)—Offset 6AB8h

This register controls the access policy to the Read Access Policy BIMR18RAC, the Write Access Policy BIMR18WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [MCHBAR] + 6AB8h

Default: 00000C0061010202h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
63:0	0xc0061010202 RW	**IMR18 Control Policy (IMR18_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR18RAC, BIMR18WAC and BIMR18CP registers, based on the value from each agent's 6bit SAI field.

44.3.115 IMR18 Read Access Policy (B_CR_BIMR18RAC_0_0_0_MCHBAR)—Offset 6AC0h

This register, along with IMR18BASE, IMR18MASK and IMR18WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR18. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [MCHBAR] + 6AC0h

Default: 0000000000000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
63	0x0 RW	**IMR18 Read Access Policy 63 (IMR18_READ_POL_63):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
62	0x0 RO	**IMR18 Read Access Policy 62 (IMR18_READ_POL_62):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
61	0x0 RO	**IMR18 Read Access Policy 61 (IMR18_READ_POL_61):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
60	0x0 RO	**IMR18 Read Access Policy 60 (IMR18_READ_POL_60):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
59	0x0 RO	**IMR18 Read Access Policy 59 (IMR18_READ_POL_59):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
58	0x0 RO	**IMR18 Read Access Policy 58 (IMR18_READ_POL_58):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
57	0x0 RO	**IMR18 Read Access Policy 57 (IMR18_READ_POL_57):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
56	0x0 RW	**IMR18 Read Access Policy 56 (IMR18_READ_POL_56):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
55	0x0 RW	**IMR18 Read Access Policy 55 (IMR18_READ_POL_55):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
54	0x0 RW	**IMR18 Read Access Policy 54 (IMR18_READ_POL_54):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
53	0x0 RO	**IMR18 Read Access Policy 53 (IMR18_READ_POL_53):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
52	0x0 RO	**IMR18 Read Access Policy 52 (IMR18_READ_POL_52):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
51	0x0 RO	**IMR18 Read Access Policy 51 (IMR18_READ_POL_51):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
50	0x0 RW	**IMR18 Read Access Policy 50 (IMR18_READ_POL_50):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
49	0x0 RW	**IMR18 Read Access Policy 49 (IMR18_READ_POL_49):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
48	0x0 RW	**IMR18 Read Access Policy 48 (IMR18_READ_POL_48):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
47	0x0 RO	**IMR18 Read Access Policy 47 (IMR18_READ_POL_47):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
46	0x0 RO	**IMR18 Read Access Policy 46 (IMR18_READ_POL_46):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
45	0x0 RO	**IMR18 Read Access Policy 45 (IMR18_READ_POL_45):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
44	0x0 RW	**IMR18 Read Access Policy 44 (IMR18_READ_POL_44):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
43	0x0 RW	**IMR18 Read Access Policy 43 (IMR18_READ_POL_43):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
42	0x0 RW	**IMR18 Read Access Policy 42 (IMR18_READ_POL_42):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
41	0x0 RW	**IMR18 Read Access Policy 41 (IMR18_READ_POL_41):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
40	0x0 RW	**IMR18 Read Access Policy 40 (IMR18_READ_POL_40):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
39	0x0 RO	**IMR18 Read Access Policy 39 (IMR18_READ_POL_39):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
38	0x0 RW	**IMR18 Read Access Policy 38 (IMR18_READ_POL_38):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
37	0x0 RO	**IMR18 Read Access Policy 37 (IMR18_READ_POL_37):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
36	0x0 RW	**IMR18 Read Access Policy 36 (IMR18_READ_POL_36):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
35	0x0 RO	**IMR18 Read Access Policy 35 (IMR18_READ_POL_35):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
34	0x0 RW	**IMR18 Read Access Policy 34 (IMR18_READ_POL_34):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.

13	0x0 RW	**IMR18 Read Access Policy 13 (IMR18_READ_POL_13):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
12	0x0 RW	**IMR18 Read Access Policy 12 (IMR18_READ_POL_12):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
11	0x0 RO	**IMR18 Read Access Policy 11 (IMR18_READ_POL_11):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
10	0x0 RO	**IMR18 Read Access Policy 10 (IMR18_READ_POL_10):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
9	0x0 RO	**IMR18 Read Access Policy 9 (IMR18_READ_POL_9):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
8	0x0 RW	**IMR18 Read Access Policy 8 (IMR18_READ_POL_8):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
7	0x0 RO	**IMR18 Read Access Policy 7 (IMR18_READ_POL_7):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
6	0x0 RO	**IMR18 Read Access Policy 6 (IMR18_READ_POL_6):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
5	0x0 RW	**IMR18 Read Access Policy 5 (IMR18_READ_POL_5):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
4	0x0 RW	**IMR18 Read Access Policy 4 (IMR18_READ_POL_4):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
3	0x0 RW	**IMR18 Read Access Policy 3 (IMR18_READ_POL_3):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
2	0x0 RW	**IMR18 Read Access Policy 2 (IMR18_READ_POL_2):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
1	0x0 RW	**IMR18 Read Access Policy 1 (IMR18_READ_POL_1):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.
0	0x0 RW	**IMR18 Read Access Policy 0 (IMR18_READ_POL_0):** Bit vector used to determine which agents are allowed read access to the IMR18 region, based on each agent's 6bit encoded SAI value.

44.3.116 IMR18 Write Access Policy (B_CR_BIMR18WAC_0_0_0_MCHBAR)—Offset 6AC8h

This register, along with IMR18BASE, IMR18MASK and IMR18RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR18. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [MCHBAR] + 6AC8h

Default: 0000000000000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

44.3.117 IMR19 Base (B_CR_BIMR19BASE_0_0_0_MCHBAR)—Offset 6AD0h

This register, along with IMR19MASK, IMR19RAC and IMR19WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR19RAC and IMR19WAC registers.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 6AD0h

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**IMR Enable (IMR_EN):** Enables access checking for the IMR region.
30	0x0 RW	**Asset Classification AC[0]: Trace Enable (TR_EN):** Enables snooping of transactions to the IMR region by tracing agents.
29	0x0 RO	**RESERVED_1:** Reserved
28:0	0x0 RW	**Base 0 IMR19 Base (IMR19_BASE):** Specifies bits 38:10 of the start address of IMR19 region. IMR region size must be a strict poweroftwo, at least 1KB, and naturally aligned to the size. These bits are compared with the result of the IMR19MASK[28:0] applied to bits 38:10 of the incoming address to determine if an access falls within the IMR19 defined region.

44.3.118 IMR19 Mask (B_CR_BIMR19MASK_0_0_0_MCHBAR)—Offset 6AD4h

This register, along with IMR19BASE, IMR19RAC and IMR19WAC, defines an isolated region of memory that can be masked to prohibit certain system agents from accessing memory. When an agent sends a request to the B-Unit, whether snooped or not, an IMR may optionally prevent that transaction from changing the state of memory or from getting correct data in response to the operation if the agent's SAI field does not specify the correct Policy. The IMR's Policy is configured by the IMR19RAC and IMR19WAC registers.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 6AD4h

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**Asset Classification AC[2]: GT Implicit Writeback Enable (GT_IWB_EN):** Enables implicit writebacks to protected region from GT caching agent. When set to 1, enables implicit writeback data HITM data from GT to be returned to the requestor. When set to 0, inhibits HITM data from GT from being returned to the requestor. HITM data from IA cores may be returned to the requestor depending on the setting of the IA_IWB_EN bit.
30	0x0 RW	**Asset Classification AC[1]: IA Implicit WB Enable (IA_IWB_EN):** Enables implicit writebacks to protected region from IA caching agent. When set to 1, enables implicit writeback data HITM data from IA cores to be returned to the requestor. When set to 0, inhibits HITM data from IA cores from being returned to the requestor. HITM data from GT may be returned to the requestor depending on the setting of the GT_IWB_EN bit.
29	0x0 RO	**RESERVED_0:** Reserved
28:0	0x0 RW	**Mask 0 IMR19 Mask (IMR19_MASK):** These bits are ANDed with bits 38:10 of the incoming address to determine if the combined result matches the IMR19BASE[28:0] value. A match indicates that the incoming address falls within the IMR19 region.

44.3.119 IMR19 Control Policy (B_CR_BIMR19CP_0_0_0_MCHBAR)—Offset 6AD8h

This register controls the access policy to the Read Access Policy BIMR19RAC, the Write Access Policy BIMR19WAC, and, self-referentially, to itself. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine both read access and write access.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [MCHBAR] + 6AD8h

Default: 00000C0061010202h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
63:0	0xc0061010202 RW	**IMR19 Control Policy (IMR19_CTRL_POL):** Bit vector used to determine which agents are allowed access to the BIMR19RAC, BIMR19WAC, BIMR19CP registers, based on the value from each agent's 6bit SAI field.

44.3.120 IMR19 Read Access Policy (B_CR_BIMR19RAC_0_0_0_MCHBAR)—Offset 6AE0h

This register, along with IMR19BASE, IMR19MASK and IMR19WAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR19. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine read access.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [MCHBAR] + 6AE0h

Default: 0000000000000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

15	0x0 RO	**IMR19 Read Access Policy 15 (IMR19_READ_POL_15):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
14	0x0 RO	**IMR19 Read Access Policy 14 (IMR19_READ_POL_14):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
13	0x0 RW	**IMR19 Read Access Policy 13 (IMR19_READ_POL_13):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
12	0x0 RW	**IMR19 Read Access Policy 12 (IMR19_READ_POL_12):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
11	0x0 RO	**IMR19 Read Access Policy 11 (IMR19_READ_POL_11):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
10	0x0 RO	**IMR19 Read Access Policy 10 (IMR19_READ_POL_10):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
9	0x0 RO	**IMR19 Read Access Policy 9 (IMR19_READ_POL_9):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
8	0x0 RW	**IMR19 Read Access Policy 8 (IMR19_READ_POL_8):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
7	0x0 RO	**IMR19 Read Access Policy 7 (IMR19_READ_POL_7):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
6	0x0 RO	**IMR19 Read Access Policy 6 (IMR19_READ_POL_6):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
5	0x0 RW	**IMR19 Read Access Policy 5 (IMR19_READ_POL_5):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
4	0x0 RW	**IMR19 Read Access Policy 4 (IMR19_READ_POL_4):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
3	0x0 RW	**IMR19 Read Access Policy 3 (IMR19_READ_POL_3):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
2	0x0 RW	**IMR19 Read Access Policy 2 (IMR19_READ_POL_2):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
1	0x0 RW	**IMR19 Read Access Policy 1 (IMR19_READ_POL_1):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.
0	0x0 RW	**IMR19 Read Access Policy 0 (IMR19_READ_POL_0):** Bit vector used to determine which agents are allowed read access to the IMR19 region, based on each agent's 6bit encoded SAI value.

44.3.121 IMR19 Write Access Policy (B_CR_BIMR19WAC_0_0_0_MCHBAR)—Offset 6AE8h

This register, along with IMR19BASE, IMR19MASK and IMR19RAC, defines an isolated region of memory that can be masked to prohibit certain agents from accessing memory. It is programmed with an SAI Policy that indicates which agents in the system are allowed to perform read operations to IMR19. The requesting agent's 6bit encoded SAI value is used as an index into this register's bits to determine write access.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [MCHBAR] + 6AE8h

Default: 0000000000000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

34	0x0 RW	**IMR19 Write Access Policy 34 (IMR19_WRITE_POL_34):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
33	0x0 RW	**IMR19 Write Access Policy 33 (IMR19_WRITE_POL_33):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
32	0x0 RW	**IMR19 Write Access Policy 32 (IMR19_WRITE_POL_32):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
31	0x0 RO	**IMR19 Write Access Policy 31 (IMR19_WRITE_POL_31):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
30	0x0 RW	**IMR19 Write Access Policy 30 (IMR19_WRITE_POL_30):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
29	0x0 RW	**IMR19 Write Access Policy 29 (IMR19_WRITE_POL_29):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
28	0x0 RW	**IMR19 Write Access Policy 28 (IMR19_WRITE_POL_28):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
27	0x0 RW	**IMR19 Write Access Policy 27 (IMR19_WRITE_POL_27):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
26	0x0 RW	**IMR19 Write Access Policy 26 (IMR19_WRITE_POL_26):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
25	0x0 RW	**IMR19 Write Access Policy 25 (IMR19_WRITE_POL_25):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
24	0x0 RW	**IMR19 Write Access Policy 24 (IMR19_WRITE_POL_24):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
23	0x0 RO	**IMR19 Write Access Policy 23 (IMR19_WRITE_POL_23):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
22	0x0 RO	**IMR19 Write Access Policy 22 (IMR19_WRITE_POL_22):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.

Bit Range	Default & Access	Field Name (ID): Description
21	0x0 RW	**IMR19 Write Access Policy 21 (IMR19_WRITE_POL_21):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
20	0x0 RO	**IMR19 Write Access Policy 20 (IMR19_WRITE_POL_20):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
19	0x0 RO	**IMR19 Write Access Policy 19 (IMR19_WRITE_POL_19):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
18	0x0 RO	**IMR19 Write Access Policy 18 (IMR19_WRITE_POL_18):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
17	0x0 RW	**IMR19 Write Access Policy 17 (IMR19_WRITE_POL_17):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
16	0x0 RW	**IMR19 Write Access Policy 16 (IMR19_WRITE_POL_16):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
15	0x0 RO	**IMR19 Write Access Policy 15 (IMR19_WRITE_POL_15):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
14	0x0 RO	**IMR19 Write Access Policy 14 (IMR19_WRITE_POL_14):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
13	0x0 RW	**IMR19 Write Access Policy 13 (IMR19_WRITE_POL_13):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
12	0x0 RW	**IMR19 Write Access Policy 12 (IMR19_WRITE_POL_12):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
11	0x0 RO	**IMR19 Write Access Policy 11 (IMR19_WRITE_POL_11):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
10	0x0 RO	**IMR19 Write Access Policy 10 (IMR19_WRITE_POL_10):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
9	0x0 RO	**IMR19 Write Access Policy 9 (IMR19_WRITE_POL_9):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
8	0x0 RW	**IMR19 Write Access Policy 8 (IMR19_WRITE_POL_8):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
7	0x0 RO	**IMR19 Write Access Policy 7 (IMR19_WRITE_POL_7):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
6	0x0 RO	**IMR19 Write Access Policy 6 (IMR19_WRITE_POL_6):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
5	0x0 RW	**IMR19 Write Access Policy 5 (IMR19_WRITE_POL_5):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
4	0x0 RW	**IMR19 Write Access Policy 4 (IMR19_WRITE_POL_4):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
3	0x0 RW	**IMR19 Write Access Policy 3 (IMR19_WRITE_POL_3):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
2	0x0 RW	**IMR19 Write Access Policy 2 (IMR19_WRITE_POL_2):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
1	0x0 RW	**IMR19 Write Access Policy 1 (IMR19_WRITE_POL_1):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.
0	0x0 RW	**IMR19 Write Access Policy 0 (IMR19_WRITE_POL_0):** Bit vector used to determine which agents are allowed write access to the IMR19 region, based on each agent's 6bit encoded SAI value.

44.3.122 TPM Selector (B_CR_TPM_SELECTOR_0_0_0_MCHBAR)—Offset 6C24h

Specifies where the TPM lives in the platform. B-Unit uses this register to source decode for requests whose addresses fall within the fixed address range for the TPM.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 6C24h

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RO	**Reserved (RESERVED_0):** Reserved.
1:0	0x0 RW	**TPM Selector (TPM_SELECTOR):** • 0h: SoC doesn't support - fTPM enabled. Target of TPM accesses is the Intel ME. • 1h: SPI TPM enabled. Target of TPM accesses is SPI. • 2h: LPC TPM enabled. Target of TPM accesses is LPC. • 3h: All TPMs disabled. Target of TPM accesses is the Error Handler.

44.3.123 Default VTd BAR (B_CR_DEFVTDBAR_0_0_0_MCHBAR)—Offset 6C80h

BIOS must write DEFVTDBAR and then immediately follow it up with a read to DEFVTDBAR to ensure that all copies of DEFVTDBAR in the system are updated.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [MCHBAR] + 6C80h

Default: 0000000000000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
63:40	0x0 RO	**Reserved (RESERVED_0):** Reserved.
39	0x0 RO	**Reserved**
38:12	0x0 RW	**Default IOMMU VTd Config Space Base (DEFVTDBAR):** If DEFVTDBAR is enabled, this field corresponds to bits 38:12 of the base address default IOMMU VTd configuration space. BIOS will program this register resulting in a base address for a 4KB block of contiguous memory address space. This register ensures that a naturally aligned 4KB space is allocated within the first 512GB of addressable memory space. System Software uses this base address to program the default VTd IOMMU register set. If DEFVTDBAR is enabled and incoming Request Address[38:12] matches DEFVTDBAR[38:12] the request targets the Default VTd BAR.
11:2	0x0 RO	**Reserved (RESERVED_1):** Reserved.
1	0x0 RW	**Lock Register Content (LOCK):** Locks the contents of the register including itself.
0	0x0 RW/L	**DEFVTDBAR Enable (DEFVTDBAREN):** • 0: DEFVTDBAR is disabled and does not claim any memory • 1: DEFVTDBAR memory mapped accesses are claimed and decoded appropriately. This bit will remain 0 if VTd capability is disabled.

44.3.124 B-Unit Arbiter Control BARBCTRL0 (B_CR_BARBCTRL0)—Offset 6D4Ch

Specifies the weighting for Agents 03 used by the B-Unit's Badmit Arbiter. The value specified in the Agent Weight field is used by the Badmit arbiters weight counters to determine the number of requests from an agent that are allowed to be granted before updating the requester's age register.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 6D4Ch

Default: 04040404h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RO	**Reserved (RESERVED_0):** Reserved.
29:24	0x4 RW	**Agent 3 Weight (AGENT3_WEIGHT):** Arbiter weight for Agent 3.
23:22	0x0 RO	**Reserved (RESERVED_1):** Reserved.
21:16	0x4 RW	**Agent 2 Weight (AGENT2_WEIGHT):** Arbiter weight for Agent 2.
15:14	0x0 RO	**Reserved (RESERVED_2):** Reserved.
13:8	0x4 RW	**Agent 1 Weight (AGENT1_WEIGHT):** Arbiter weight for Agent 1.
7:6	0x0 RO	**Reserved (RESERVED_3):** Reserved.
5:0	0x4 RW	**Agent 0 Weight (AGENT0_WEIGHT):** Arbiter weight for Agent 0.

44.3.125 B-Unit Arbiter Control BARBCTRL1 (B_CR_BARBCTRL1)—Offset 6D50h

Specifies the weighting for Agents 4-7 used by the B-Unit's Badmit Arbiter. The value specified in the Agent Weight field is used by the Badmit arbiter's weight counters to determine the number of requests from an agent that are allowed to be granted before updating the requester's age register.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 6D50h

Default: 04040404h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RO	**Reserved (RESERVED_0):** Reserved.
29:24	0x4 RW	**Agent 7 Weight (AGENT7_WEIGHT):** Arbiter weight for Agent 7.
23:22	0x0 RO	**Reserved (RESERVED_1):** Reserved.
21:16	0x4 RW	**Agent 6 Weight (AGENT6_WEIGHT):** Arbiter weight for Agent 6.
15:14	0x0 RO	**Reserved (RESERVED_2):** Reserved.
13:8	0x4 RW	**Agent 5 Weight (AGENT5_WEIGHT):** Arbiter weight for Agent 5.
7:6	0x0 RO	**Reserved (RESERVED_3):** Reserved.
5:0	0x4 RW	**Agent 4 Weight (AGENT4_WEIGHT):** Arbiter weight for Agent 4.

44.3.126 B-Unit Scheduler Control (B_CR_BSCHWT0)—Offset 6D54h

Specifies the weighting for Agents 0-3 used by the B-Unit Scheduler. The value is used by the B-Unit Scheduler to determine how many requests can be granted for the agent before the agent's requests are masked by the Scheduler Arbiter, to allow other agents' requests to be granted.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 6D54h

Default: 04040404h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RO	**Reserved (RESERVED_0):** Reserved.
29:24	0x4 RW	**Agent 3 Weight (AGENT3_WEIGHT):** Arbiter weight for Agent 3.
23:22	0x0 RO	**Reserved (RESERVED_1):** Reserved.
21:16	0x4 RW	**Agent 2 Weight (AGENT2_WEIGHT):** Arbiter weight for Agent 2.
15:14	0x0 RO	**Reserved (RESERVED_2):** Reserved.
13:8	0x4 RW	**Agent 1 Weight (AGENT1_WEIGHT):** Arbiter weight for Agent 1.
7:6	0x0 RO	**Reserved (RESERVED_3):** Reserved.
5:0	0x4 RW	**Agent 0 Weight (AGENT0_WEIGHT):** Arbiter weight for Agent 0.

44.3.127 B-Unit Scheduler Control (B_CR_BSCHWT1)—Offset 6D58h

Specifies the weighting for Agents 4-7 used by the B-Unit Scheduler. The value is used by the B-Unit Scheduler to determine how many requests can be granted for the agent before the agent's requests are masked by the Scheduler Arbiter to allow other agents' requests to be granted.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 6D58h

Default: 04040404h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RO	**Reserved (RESERVED_0):** Reserved.
29:24	0x4 RW	**Agent 7 Weight (AGENT7_WEIGHT):** Arbiter weight for Agent 7.
23:22	0x0 RO	**Reserved (RESERVED_1):** Reserved.
21:16	0x4 RW	**Agent 6 Weight (AGENT6_WEIGHT):** Arbiter weight for Agent 6.
15:14	0x0 RO	**Reserved (RESERVED_2):** Reserved.
13:8	0x4 RW	**Agent 5 Weight (AGENT5_WEIGHT):** Arbiter weight for Agent 5.
7:6	0x0 RO	**Reserved (RESERVED_3):** Reserved.
5:0	0x4 RW	**Agent 4 Weight (AGENT4_WEIGHT):** Arbiter weight for Agent 4.

44.3.128 B-Unit Scheduler Control (B_CR_BSCHWT2)—Offset 6D5Ch

Specifies the weighting for Agents 8-11 used by the B-Unit Scheduler. The value is used by the B-Unit Scheduler to determine how many requests can be granted for the agent before the agent's requests are masked by the Scheduler Arbiter to allow other agents' requests to be granted.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 6D5Ch

Default: 04040404h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RO	**Reserved (RESERVED_0):** Reserved.
29:24	0x4 RW	**Agent 11 Weight (AGENT11_WEIGHT):** Arbiter weight for Agent 11.
23:22	0x0 RO	**Reserved (RESERVED_1):** Reserved.
21:16	0x4 RW	**Agent 10 Weight (AGENT10_WEIGHT):** Arbiter weight for Agent 10.
15:14	0x0 RO	**Reserved (RESERVED_2):** Reserved.
13:8	0x4 RW	**Agent 9 Weight (AGENT9_WEIGHT):** Arbiter weight for Agent 9.
7:6	0x0 RO	**Reserved (RESERVED_3):** Reserved.
5:0	0x4 RW	**Agent 8 Weight (AGENT8_WEIGHT):** Arbiter weight for Agent 8.

44.3.129 B-Unit Scheduler Control (B_CR_BSCHWT3)—Offset 6D60h

Specifies the weighting for Agents 12-15 used by the B-Unit Scheduler. The value is used by the B-Unit Scheduler to determine how many requests can be granted for the agent before the agent's requests are masked by the Scheduler Arbiter to allow other agents' requests to be granted.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 6D60h

Default: 04040404h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RO	**Reserved (RESERVED_0):** Reserved.
29:24	0x4 RW	**Agent 15 Weight (AGENT15_WEIGHT):** Arbiter weight for Agent 15.
23:22	0x0 RO	**Reserved (RESERVED_1):** Reserved.
21:16	0x4 RW	**Agent 14 Weight (AGENT14_WEIGHT):** Arbiter weight for Agent 14.
15:14	0x0 RO	**Reserved (RESERVED_2):** Reserved.
13:8	0x4 RW	**Agent 13 Weight (AGENT13_WEIGHT):** Arbiter weight for Agent 13.
7:6	0x0 RO	**Reserved (RESERVED_3):** Reserved.
5:0	0x4 RW	**Agent 12 Weight (AGENT12_WEIGHT):** Arbiter weight for Agent 12.

44.3.130 B-Unit Flush Control (B_CR_BWFLUSH)—Offset 6D64h

Controls the policy used to determine when dirty entries must be flushed to DRAM. When the number of dirty entries is lower than a high watermark dirty_hwm the B-Unit will opportunistically flush data to DRAM after the write flush timeout value. When the number of dirty entries exceeds the high water mark, the B-Unit will initiate a high priority flush and push dirty data to DRAM until the count is once again below the low water mark.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: FF010000h

BAR and Offset: [MCHBAR] + 6D64h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0xff RW	**Flush Threshold (FLUSH_THRESHOLD):** All write commands are blocked at Badmit if the number of write commands in the Flush Pool exceeeds this value.
23:17	0x0 RO	**Reserved (RESERVED_0):** Reserved.
16	0x1 RO/V	**All Entries Flushed (ALL_ENTRIES_FLUSHED):** All dirty entries in the B-Unit, in both slices, have been flushed.
15:8	0x0 RW	**Dirty Low Water Mark (DIRTY_LWM):** Low water mark for dirty entries retained by the B-Unit. B-Unit will immediately attempt to flush any dirty entry, hence setting the low water mark to 0.
7:0	0x0 RW	**Dirty High Water Mark (DIRTY_HWM):** High water mark for dirty entries retained by the B-Unit. B-Unit will immediately attempt to flush any dirty entry, hence setting the low water mark to 0.

44.3.131 B-Unit Flush Weights (B_CR_BFLWT)—Offset 6D68h

Controls B-Unit alternate scheduling of reads and writes to DRAM.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000404h

BAR and Offset: [MCHBAR] + 6D68h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**Disable Flush Weights (DISABLE_FLUSH_WEIGHTS):** When set to 1, disables flush weights. Flushing of dirty entries will start when Dirty Limit is HWM, and continue until Dirty Limit is LWM. No reads will be scheduled in between.
30:14	0x0 RO	**Reserved (RESERVED_1):** Reserved.
13:8	0x4 RW	**Write Weights (WRITE_WEIGHTS):** Number of write requests sent to a PMI channel before switching to scheduling read requests, when use of flush weights is not disabled.
7:6	0x0 RO	**Reserved (RESERVED_0):** Reserved.
5:0	0x4 RW	**Read Weights (READ_WEIGHTS):** Number of read requests sent to a PMI channel before switching to scheduling write requests, when use of flush weights is not disabled.

44.3.132 Weighted Scheduling Control of High Priority ISOC and Other Requests (B_CR_BISOCWT)—Offset 6D6Ch

Controls alternate scheduling of High Priority ISOC requests and other requests.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 6D6Ch

Default: 80003F0Fh

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31	0x1 RW	**Enable ISOC Requests (ENABLE_ISOC_WEIGHTS):** When set to 1, enables switching from scheduling High Priority ISOC requests to scheduling Best Effort and Low Priority ISOC requests, based on ISOC weights and NONISOC weights.
30:14	0x0 RO	**Reserved (RESERVED_1):** Reserved.
13:8	0x3f RW	**ISOC Request Weights (ISOC_REQUEST_WEIGHTS):** Weight for high priority isochronous requests.
7:6	0x0 RO	**Reserved (RESERVED_0):** Reserved.
5:0	0xf RW	**Non ISOC Request Weights (NON_ISOC_REQUEST_WEIGHTS):** Weight for non-high priority isochronous and best effort requests.

44.3.133 B-Unit Control (B_CR_BCTRL2)—Offset 6D70h

Contains basic control information used by the B-Unit.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 000F0014h

BAR and Offset: [MCHBAR] + 6D70h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**Enable Read Invalidate Timer (ENABLE_READ_INVALIDATE_TIMER):** When set to 1, enables the BRAM to clear the RD_DONE bit and flush dirty data when a timer expires. Used when parity is not enabled, to force the B-Unit to not indefinitely cache previously read lines, and also to cause a flush of dirty data that has been written to the BRAM entry.
30:25	0x0 RO	**Reserved (RESERVED_2):** Reserved.
24	0x0 RW	**MOT Disable Stall Arbiter on Error (MOT_DISABLE_STALL_ARB_ON_ERR):** If the HH widget gets an error, allow transactions to get arbitrated.
23:16	0xf RW	**BRAM Read Invalidate Time (BRAM_READ_INVALIDATE_TIME):** Timer threshold to clear rd_done bits or flush a BRAM entry, if dirty. The value specified is in multiples of 250ns. For each time interval specified, the read done status of one BRAM entry will be cleared based on a BTAG index which is then incremented to point to the next BRAM entry.
15:8	0x0 RW	**Casual Timer (CASUAL_TIMER):** The number of clock cycles that the B-Unit waits before starting a casual dirty flush. Casual Flush feature will not be enabled by PND2 architecture. Instead, a dirty write will be made eligible for scheduling immediately.
7:5	0x0 RO	**Reserved (RESERVED_1):** Reserved.
4	0x1 RO	**Enable 64B Read (ENABLE_64B_READ):** When set, B-unit will send 64B PMI read requests for transactions requiring read access to DRAM. Must always be set to one, otherwise functional errors may occur. Not applicable to the SoC, because the SoC is always 64 byte memory accesses.
3	0x0 RW	**Demand Scrub Enable (DEMAND_SCRUB_ENABLE):** This mode causes B-Unit to automatically issue a flush to PMI, thus writing correct data back to memory for any read request that returns with a correctable data error.
2	0x1 RW	**Enable Read Done for Write (ENABLE_READ_DONE_FOR_WRITE):** Enable Any writes (IWB or normal writes) to set the read_done bit in bstat, which enables return of data from the BRAM cache instead of Memory.
1	0x0 RW	**Miss Valid Entries (MISS_VALID_ENTRIES):** This mode causes reads to clean valid B-Unit buffer entries to look like misses instead of hits. When this bit is set -- even when all requested bytes are valid and present in the BRAM data buffer -- B-Unit will send read requests over the PMI interface to re-fetch the data from DRAM, instead of returning it from the BRAM.
0	0x0 RW	**Dirty Stall (DIRTY_STALL):** This mode causes reads or writes from any requester interface to dirty valid B-Unit buffer entries to stall on the appropriate requester interface until the entry has been flushed from the B-Unit.

44.3.134 Uncorrectable Error Status Register (B_CR_UNCERRSTS_0_0_0_MCHBAR)—Offset 6E04h

Errors that have been seen in bunit. The error is only logged if the respective bit in UNCERRMSK is 0.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 6E04h

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description

44.3.143 Data Parity Header Log Low (B_CR_DPHDRLOG_LO_0_0_0_MCHBAR)—Offset 6E28h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MCHBAR] + 6E28h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**Location of Bad Data Byte (UNCDPLOG):** Reserved. **Power Well:** prst

44.3.144 Data Parity Header Log High (B_CR_DPHDRLOG_HI_0_0_0_MCHBAR)—Offset 6E2Ch

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MCHBAR] + 6E2Ch

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**Location of Bad Data Byte (UNCDPLOG):** Reserved. **Power Well:** prst

44.3.145 Data Parity Address Log Low (B_CR_DPADDRLOG_LO_0_0_0_MCHBAR)—Offset 6E30h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MCHBAR] + 6E30h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**Data Parity Address (DPADDR):** Reserved. **Power Well:** prst

44.3.146 Data Parity Address Log High (B_CR_DPADDRLOG_HI_0_0_0_MCHBAR)—Offset 6E34h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MCHBAR] + 6E34h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**Reserved (RESERVED_0):** Reserved.
7:0	0x0 RO/V	**Data Parity Address (DPADDR):** Reserved. **Power Well:** prst

44.3.147 D-Unit Error Address Log (B_CR_DERRADDRLOG_LO_0_0_0_MCHBAR)—Offset 6E38h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MCHBAR] + 6E38h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**Address (ADDR):** D-Unit error address. **Power Well:** prst

44.3.148 D-Unit Error Address Log (B_CR_DERRADDRLOG_HI_0_0_0_MCHBAR)—Offset 6E3Ch

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MCHBAR] + 6E3Ch

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD0:** Reserved
7:0	0x0 RO/V	**Data Parity Address (ADDR):** Reserved. **Power Well:** prst

44.3.149 Asymmetric Memory Region 0 (B_CR_ASYM_MEM_REGION0_0_0_0_MCHBAR)—Offset 6E40h

Specification of asymmetric memory region 0 (in slice 0) for the configuration with 2 asymmetric memory regions.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MCHBAR] + 6E40h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**Slice 0 Asymmetric Enable (SLICE0_ASYM_ENABLE):** Setting this bit to 0 disables asymmetric memory region 0; setting it to 1 enables the region.
30:28	0x0 RO	**RSVD0:** Reserved
27:20	0x0 RW	**SLICE0_ASYM_LIMIT:** Specifies bits [38:31] of the highest address of asymmetric memory region 0 (in slice 0); all the lower bits of the region's highest address are equal to 1.
19:12	0x0 RO	**RSVD1:** Reserved
11:4	0x0 RW	**Slice 0 Asymmetric Limit (SLICE0_ASYM_BASE):** Specifies bits [38:31] of the base address of asymmetric memory region 0 (in slice 0); all the lower bits of the region's base address are equal to 0.
3:0	0x0 RO	**RSVD2:** Reserved

44.3.150 Asymmetric Memory Region 1 (B_CR_ASYM_MEM_REGION1_0_0_0_MCHBAR)—Offset 6E44h

Specification of asymmetric memory region 1 (in slice 1) for the configuration with 2 asymmetric memory regions.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MCHBAR] + 6E44h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**Slice 1 Asymmetric Enable (SLICE1_ASYM_ENABLE):** Setting this bit to 0 disables asymmetric memory region 1; setting it to 1 enables the region.
30:28	0x0 RO	**RSVD0:** Reserved
27:20	0x0 RW	**SLICE1_ASYM_LIMIT:** Specifies bits [38:31] of the highest address of asymmetric memory region 1 (in slice 1); all the lower bits of the region's highest address are equal to 1.
19:12	0x0 RO	**RSVD1:** Reserved
11:4	0x0 RW	**Slice 1 Asymmetric Limit (SLICE1_ASYM_BASE):** Specifies bits [38:31] of the base address of asymmetric memory region 1 (in slice 1); all the lower bits of the region's base address are equal to 0.
3:0	0x0 RO	**RSVD2:** Reserved

44.3.151 B-Unit Machine Check Mode Low (B_CR_BMCMODE_LOW)—Offset 6E48h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000001h

BAR and Offset: [MCHBAR] + 6E48h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0x0 RO	**Reserved (RESERVED_0):** Reserved.
0	0x1 RW	**Machine Check Signal Mode (MC_SIGNAL_MODE):** When set to 1, B-Unit will not allow any transaction with uncorrectable error or subsequent memory transaction to propagate through to Requester. This will essentially hang CPU and CPU will end up with IERR shutdown. Issue: When set to zero B-Unit will allow transaction with an uncorrectable error to propagate and signal MC event to CPU if enabled in IA32_MC5_CTL. If enabled MC event will be taken by CPU cores at the end of instruction boundary after it detected by ROB **Power Well:** prst

44.3.152 B-Unit Machine Check Mode High (B_CR_BMCMODE_HIGH)—Offset 6E4Ch

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MCHBAR] + 6E4Ch

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO	**Reserved (RESERVED_0):** Reserved.

44.3.153 PWR_LIMIT_MISC_0_0_0_MCHBAR (P_CR_PWR_LIMIT_MISC_0_0_0_MCHBAR)—Offset 7014h

This register is Read Only. The register is used to report Skt power at Pn - mapped from FUSE_PN_POWER_OF_SKU and Minimal Time window - mapped from FUSE_PBM_MINIMAL_TAU_ALLOWED. Added new register for relaying IA PBM information to the use.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 7014h

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0x0 RO	**Reserved:** Reserved **Power Well:** prst
21:15	0x0 RO/V	**PBM_MINIMAL_TAU_ALLOWED:** Minimal Tau Time window allowed. **Power Well:** prst
14:0	0x0 RO/V	**PN_POWER_OF_SKU:** Package Power of SKU. **Power Well:** prst

44.3.154 CAPABILITY_ID_0_0_0_MCHBAR (P_CR_CAPABILITY_ID_0_0_0_MCHBAR)—Offset 7018h

This register is Read Only. The register is used to report to BIOS certain PM features for this Part.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 7018h

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RO	**Reserved:** Reserved **Power Well:** prst
1:0	0x0 RO/V	**FUSE_THERMAL_PROFILE:** **Power Well:** prst

44.3.155 MC_BIOS_REQ_0_0_0_MCH (P_CR_MC_BIOS_REQ_0_0_0_MCHBAR)—Offset 7020h

This register is defined to support memSS reset flow, handshake between SOC FW (aka Pcode) and BIOS MRC

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 7020h

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**RUN_BUSY:** This bit indicates that the BIOS request is pending. BIOS sets this bit together with a command in the lower bits of this register.
30:20	0x0 RW	**RSVD0:** Reserved - Future data bits for fastpath action or status indication.
19	0x0 RW	**MEM_INIT_DONE:** BIOS programs this bit after DUNIT and DDRIO configuration is complete.
18:16	0x0 RW	**Reserved**
15	0x0 RW	**CH1_DIMMS:** BIOS writes this value indicates
14	0x0 RW	**CH0_DIMMS:** BIOS writes this value indicates
13	0x0 RW	**CH1_ENABLED:** BIOS writes this value indicates if memory channel 1 has device attached or not. 1'b1 = 1 or 2 DIMMs populated.
12	0x0 RW	**CH0_ENABLED:** BIOS writes this value indicates if memory channel 1 has device attached or not. 1'b1 = 1 or 2 DIMMs populated.
11:7	0x0 RW	**Reserved**
6	0x0 RW	**DDR_TYPE_VOLTAGE:** BIOS set VDDQ Voltage: 0: DDR3 Memory Technology (VDDQ = 1.35V); 1: DDR4 Memory Technology (VDDQ = 1.25V);
5:0	0x0 RO	**RSVD0:** Reserved

44.3.156 MCA_ERROR_SRC_0_0_0_MCHBAR (P_CR_MCA_ERROR_SRC_0_0_0_MCHBAR)—Offset 702Ch

This register logs error source information i.e IERR or MCERR information for Pcode. The error fields are cleared by HW or BIOS.This register is also shadowed in the I/O space.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 702Ch

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/V	**CATERR:** Asserted by HW on IERR or MCERR assertion. **Power Well:** prst
30	0x0 RW/V	**IERR:** Asserted by HW on IERR assertion. **Power Well:** prst
29	0x0 RW/V	**MCERR:** Asserted by HW on MCERR assertion. **Power Well:** prst

7:0	0x0 RW	**RESERVED:** **Power Well:** prst

44.3.157 DDR_THERM_THRT_CTRL_0_0_0_MCHBAR (P_CR_DDR_THERM_THRT_CTRL_0_0_0_MCHBAR)—Offset 7030h

This register is used to configure thermal throttling policies for both near and far memory.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00010000h

BAR and Offset: [MCHBAR] + 7030h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0x0 RO	**RESERVED**
16	0x1 RW/V	**RESERVED**
15:10	0x0 RO	**RESERVED**
9	0x0 RW/V	**MEM_THRT_ENABLE:** When set, memory traffic is throttled if near Wide-IO or far LPDDR memory MR4 value = FM/NM_THERM_THRT_THRESHOLD, respectively. Thermal throttling is achieved by applying memory bandwidth clips in the memory subsystem.
8	0x0 RW/V	**MEM_THRT_CFG:** Configure memory throttling behavior. Policies are defined as follows: • 0 = Thermal throttling policy uses instantaneous MR4 status for FM/ NM_THERM_THRT_THRESHOLD • 1 = Thermal throttling policy uses time filtered MR4 status for FM/NM_THERM_THRT_THRESHOLD. Filtering time constant is configured in the DDR_THERM_INTERRUPT register.
7	0x0 RW/V	**NM_THERM_THRT_ENABLE:** When set, throttling is activated if near Wide I/O memory MR4 value is greater than or equal to NM_THERM_THRT_THRESHOLD
6:4	0x0 RW/V	**NM_THERM_THRT_THRESHOLD:** Configurable threshold of near Wide I/O memory MR4 value greater than or equal to which thermal throttling is activated. • Near Memory MR4 (Threshold = Enable thermal throttling) • Near Memory MR4 (Threshold = Disable thermal throttling)
3	0x0 RW/V	**FM_THERM_THRT_ENABLE:** When enabled throttling is activated if far LPDDR memory MR4 value is greater than or equal to FM_THERM_THRT_THRESHOLD. For the standard LPDDR DRAM that is only capable up to Tcasemax of 85C this bit should be set to enable far LPDDR throttling to keep DRAM within its Tcasemax spec.
2:0	0x0 RW/V	**FM_THERM_THRT_THRESHOLD:** Configurable threshold of far LPDDR memory MR4 value greater than or equal to which thermal throttling is activated. For the standard LPDDR DRAM that is only capable up to Tcasemax of 85C this field should be configured to avoid DRAM to exceed its Tcasemax spec. • Far Memory MR4 (Threshold = Enable thermal throttling) • Far Memory MR4 (Threshold = Disable thermal throttling)

44.3.158 PACKAGE_THERM_MARGIN (P_CR_PACKAGE_THERM_MARGIN_0_0_0_MCHBAR)—Offset 703Ch

Temperature margin in PECI temperature counts from the thermal profile specification. Platform fan control SW is expected to read therm_margin value to control fan or blower speed.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MCHBAR] + 703Ch

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**RESERVED**
15:0	0x0 RW	**THERM_MARGIN:** Temperature margin in PECI temperature counts from the thermal profile specification. THERM_MARGIN is in 2's complement format (8.8 format where MSB equals 1 Sign bit + 7 bits of integer temperature value and the LSB equals 8 precision bits of temperature value). A value of zero indicates the hottest CPU die temperature is on the thermal profile line. A negative value indicates gap to the thermal profile that platform SW should increase cooling capacity. A sustained negative value should be avoided as it may impact part reliability.

44.3.159 DDR_RAPL_LIMIT (P_CR_DDR_RAPL_LIMIT_0_0_0_MCHBAR)—Offset 7040h

RAPL power limit for DDR domain. This register is written by platform software and read by Pcode once per 1ms. There are actually two instances of this register: one with MSR access and one with MMIO access. There is a separate PECI/PCS command which is also analogous.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [MCHBAR] + 7040h

Default: 0000000000000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
63	0x0 RW/L	**LOCKED:** When set this entire register becomes read-only. This bit will typically be set by BIOS during boot.
62:32	0x0 RO	**Reserved:** Reserved
31:24	0x0 RO	**Reserved:** Reserved
23:22	0x0 RW/L	**LIMIT1_TIME_WINDOW_X:** The time window for RAPL is expressed in a format called TAU. TAU is specified in a mantissa+exponent format. This format is common across all RAPL interfaces for TAU. The format is specified with a 7 bit number that looks like: XXYYYYY (2 bits of mantissa followed by 5 exponent) The time window corresponding to this config is calculated as: (1+ XXb / 4) * (2^YYYYYb) The value that results from this math species the time window in units that are defined in PACKAGE_POWER_SKU_UNIT.TIME_UNIT MSR.
21:17	0x0 RW/L	**LIMIT1_TIME_WINDOW_Y:** The Tau Exponent. See TIME_WINDOW_X for more information.
16	0x0 RO	**RESERVED_0:** Reserved
15	0x0 RW/L	**LIMIT1_ENABLE:** Power Limit[0] enable bit for DDR domain.
14:0	0x0 RW/L	**LIMIT1_POWER:** Power Limit[0] for DDR domain. The power units of this field are specified by the PACKAGE_POWER_SKU_UNIT_MSR.PWR_UNIT.

44.3.160 DDR_ENERGY_STATUS (P_CR_DDR_ENERGY_STATUS_0_0_0_MCHBAR)—Offset 7048h

Reports total energy consumed in DRAM. The energy status is reported in units which are defined by PACKAGE_POWER_SKU_UNIT_MSR.ENERGY_UNIT. The counter will wrap around and continue counting from zero when it reaches its limit and therefore should be polled sufficiently frequently to avoid aliasing. Typically, software will calculate delta energy and delta time and divide the two to estimate Watts consumed over a time window. The value of this register is updated at approximately every 1ms. This energy status is what is used by DDR RAPL or OLTM control algorithms if the product supports those features.

To calculate Watts: **Watts = delta(energy) / delta(time) / 2^PACKAGE_POWER_SKU_UNIT_MSR.ENERGY_UNIT** THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 7048h

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**JOULES:** Total Joules of energy consumed by all DIMMs. Units are proportional to Joules and are defined by PACKAGE_POWER_SKU_UNIT_MSR.ENERGY_UNIT. **Power Well:** prst

44.3.161 DDR_RAPL_PERF_STATUS (P_CR_DDR_RAPL_PERF_STATUS_0_0_0_MCHBAR)—Offset 704Ch

Memory RAPL performance throttling counter. This counter accumulates time that any channel in the memory controller is bandwidth throttled due to memory RAPL constraints. This counter counts total time (in PACKAGE_POWER_SKU_UNIT_MSR.TIME_UNIT units) that any channel is throttled. If two channels are throttled, this counter increments at a 2x rate, so that for 1ms in wall clock time the counter counts 2ms. This counter does not include throttling as a result of thermal management or MEMHOT. This register is updated at approximately 1ms intervals. This counter is normalized to 'seconds' and is not subject to variation of actual DRAM clock speeds. This register is read-only for software via MMIO MSR and PECI/PCS. This register starts counting at zero from reset and continues counting forever and wraparounds may occur, so software should ensure the sample rate is sufficient to avoid aliasing. This is an unsigned value.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 704Ch

Default: 000058F0h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x58f0 RW	**DURATION:** Bandwidth throttle duration counter due to Memory RAPL. Sum across all channels in PACKAGE_POWER_SKU_UNIT_MSR.TIME_UNIT units. This data can serve as a proxy for the potential performance impacts of RAPL on memory accesses. **Power Well:** prst

44.3.162 PACKAGE_RAPL_PERF_STATUS (P_CR_PACKAGE_RAPL_PERF_STATUS_0_0_0_MCHBAR)—Offset 7050h

Counts time that any core in the IA domain is performance throttled below OS request and below the base frequency (P1) because of power limits (PL1 or PL2). Counts in time units defined by PACKAGE_POWER_SKU_UNIT_MSR.TIME_UNIT. If software uses the TURBO_ACTIVATION_RATIO or PECI ACPI P-NOTIFY, the turbo activation ratios described by those features will may elevate the effective OS request (as calculated by this counter) to max turbo. This register starts counting at zero from reset and continues counting forever and wraparounds may occur, so software should ensure the sample rate is sufficient to avoid aliasing. This is an unsigned value.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 7050h

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**COUNTS:** Time that any core in the IA domain is performance throttled below OS request and below the base frequency (P1) because of power limits (PL1 or PL2). Counts in time units defined by PACKAGE_POWER_SKU_UNIT_MSR.TIME_UNIT **Power Well:** prst

44.3.163 PRIMARY_PLANE_TURBO_POWER_POLICY (P_CR_PRIMARY_PLANE_TURBO_PLCY_0_0_0_MCHBAR)—Offset 7054h

The PRIMARY_PLANE_TURBO_POWER_POLICY and SECONDARY_PLANE_TURBO_POWER_POLICY are used together as hints to balance the power budget between the primary (IA core) and secondary (Graphics) power planes. This biasing is effectively a performance biasing, and it helps Punit firmware assess where software needs performance the most.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 7054h

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0x0 RO	**RESERVED_0:** Reserved
4:0	0x0 RW	**PRIPTP:** Performance priority Level for the IA Core (primary) power plane. A higher number implies a higher priority.

44.3.164 SECONDARY_PLANE_TURBO_POWER_POLICY (P_CR_SECONDARY_PLANE_TURBO_PLCY_0_0_0_MCHBAR)—Offset 7058h

The PRIMARY_PLANE_TURBO_POWER_POLICY and SECONDARY_PLANE_TURBO_POWER_POLICY are used together as hints to balance the power budget between the primary (IA core) and secondary (Graphics) power planes. This biasing is effectively a performance biasing, and it helps Punit firmware assess where software needs performance the most.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 7058h

Default: 00000010h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0x0 RO	**RESERVED_0:** Reserved
4:0	0x10 RW	**SECPTP:** Performance priority Level for the Graphics (secondary) power plane. A higher number implies a higher priority.

44.3.165 PRIMARY_PLANE_ENERGY_STATUS (P_CR_PRIMARY_PLANE_ENERGY_STATUS_0_0_0_MCHBAR)—Offset 705Ch

Reports total energy consumed across all IA cores. The energy status is reported in units which are defined by PACKAGE_POWER_SKU_UNIT_MSR.ENERGY_UNIT. The counter will wrap around and continue counting from zero when it reaches its limit and therefore should be polled sufficiently frequently to avoid aliasing. Typically, software will calculate delta energy and delta time and divide the two to estimate Watts consumed over a time window. The value of this register is updated at approximately every 1ms.

To calculate Watts: **Watts = delta(energy) / delta(time) / 2^PACKAGE_POWER_SKU_UNIT_MSR.ENERGY_UNIT** THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 705Ch

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**DATA:** Contains an accumulated value of the energy consumed in the primary power plane. To find the energy consumed in a given time window, software should subtract the two energy readings. Software will have to take care of counter wrapping around when it overflows. Units are proportional to Joules exact precision is defined by PACKAGE_POWER_SKU_UNIT_MSR.ENERGY_UNIT

44.3.166 SECONDARY_PLANE_ENERGY_STATUS (P_CR_SECONDARY_PLANE_ENERGY_STATUS_0_0_0_MCHBAR)—Offset 7060h

Reports total energy consumed across all IA cores. The energy status is reported in units which are defined by PACKAGE_POWER_SKU_UNIT_MSR.ENERGY_UNIT. The counter will wrap around and continue counting from zero when it reaches its limit and therefore should be polled sufficiently frequently to avoid aliasing. Typically, software will calculate delta energy and delta time and divide the two to estimate Watts consumed over a time window. The value of this register is updated at approximately every 1ms.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 7060h

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**DATA:** Contains an accumulated value of the energy consumed in the secondary power plane. To find the energy consumed in a given time window, software should subtract the two energy readings. Software will have to take care of counter wrapping around when it overflows. Units are proportional to Joules exact precision is defined by PACKAGE_POWER_SKU_UNIT_MSR.ENERGY_UNIT

44.3.167 PACKAGE_POWER_SKU_UNIT (P_CR_PACKAGE_POWER_SKU_UNIT_0_0_0_MCHBAR)—Offset 7068h

Defines units for calculating SKU power, current, energy, resistance and timing parameters.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 330A0E08h

BAR and Offset: [MCHBAR] + 7068h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0x3 RW	**RESISTANCE_UNIT:** Used to define the units of resistance for control registers that describe parameters in ohms such as VR_CURRENT_CONFIG. The actual unit value is calculated by 1mohm / 2^RESISTANCE_UNIT. The default value of 3 corresponds to 0.125mohm.
27:24	0x3 RW	**CURRENT_UNIT:** Used to define the units of amps in control registers such as VR_CURRENT_CONFIG. The actual unit value is calculated by 1A / 2^CURRENT_UNIT. The default value of 3 corresponds to 0.125A.
23:20	0x0 RO	**RESERVED_2:** Reserved
19:16	0xa RW	**TIME_UNIT:** Used for to define the time units in registers such as PL1, PL2, PL3 and PL4. The actual unit value is calculated by 1s / 2^TIME_UNIT. The default value of 10 corresponds to 0.977ms.
15:13	0x0 RO	**RESERVED_1:** Reserved
12:8	0xe RW	**ENERGY_UNIT:** Used to define the units of energy reporting registers such as PACKAGE_ENERGY_STATUS. The actual unit value is calculated by 1 J / 2^ENERGY_UNIT. The default value of 14 corresponds to ~61uJ per bit.
7:4	0x0 RO	**RESERVED_0:** Reserved
3:0	0x8 RW	**PWR_UNIT:** Used to define the units of power control registers such as PL1, PL2, PL3 and PL4. The actual unit value is calculated by 1 W / 2^PWR_UNIT. The default value of 8 corresponds to 3.9mW per bit.

44.3.168 PACKAGE_ENERGY_STATUS (P_CR_PACKAGE_ENERGY_STATUS_0_0_0_MCHBAR)—Offset 706Ch

Reports total energy consumed across the entire SOC / Package. The energy status is reported in units which are defined by PACKAGE_POWER_SKU_UNIT_MSR.ENERGY_UNIT. The counter will wrap around and continue counting from zero when it reaches its limit and therefore should be polled sufficiently frequently to avoid aliasing. Typically, software will calculate delta energy and delta time and divide the two to estimate Watts consumed over a time window. The value of this register is updated at approximately every 1ms. This energy status is what is used by RAPL PL1, PL2 and PL3 control algorithms.

To calculate Watts: **Watts = delta(energy) / delta(time) / 2^PACKAGE_POWER_SKU_UNIT_MSR.ENERGY_UNIT** THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 706Ch

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**DATA:** Contains accumulated energy consumed by the entire CPU. This counter will wrap around and keep counting when the counter overflows. Units are proportional to Joules exact precision is defined by PACKAGE_POWER_SKU_UNIT_MSR.ENERGY_UNIT

44.3.169 GT_PERF_STATUS (P_CR_GT_PERF_STATUS_0_0_0_MCHBAR)—Offset 7070h

Contains the voltage and ratio status for GT. This register is mapped to GT_PERF_STATUS_0_0_0_MCHBAR.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 7070h

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0x0 RO	**RSVD0:** Reserved
25:17	0x0 RO/V	**RP_STATE_RATIO_SLICE:** Ratio of the current RP-state, in 16.6Mhz 1xclks. When the graphics engine is in RC6, this field is zeroed out. For the SoC the Unslice and Slice run at the same ratio.
16:8	0x0 RO/V	**RP_STATE_RATIO_UNSLICE:** Ratio of the current RP-state, in 16.6Mhz 1xclks. When the graphics engine is in RC6, this field is zeroed out. For the SoC the Unslice and Slice run at the same ratio.
7:0	0x0 RO/V	**RP_STATE_VOLTAGE:** RP-State Voltage GT Target Voltage in U1.7 Volts

44.3.170 TEMPERATURE_TARGET (P_CR_TEMPERATURE_TARGET_0_0_0_MCHBAR)—Offset 7074h

This register contains information about the fan speed control target temperature as well as details on the reference temperature for IA core DTS relative temperature reading.

MSR_Name: TEMPERATURE_TARGET **MSR_Addr**: 0x1A2

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 7074h

Default: 005A0000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**RESERVED_1:** Reserved
30:24	0x0 RW	**TJ_MAX_TCC_OFFSET:** This field allows platform software to configure the temperature at which thermal monitor engages to be lower than the manufacturing configured maximum constraint. This field is programmed in 1'C units. E.g., if the default silicon configured maximum temperature is 100'C and this field is configured to 10, then the silicon will engage thermal throttling algorithms at 90'C
23:16	0x5a RO/V	**REF_TEMP:** Tjmax a.k.a. Thermal Monitor activation temperature or Prochot Temperature. This is the maximum junction temperature at which thermal throttling aka thermal monitor is activated. This temperature is the maximum temperature at which the silicon is capable of operating at. All IA core digital thermal sensor readings are reported as a relative negative offset from this reference temperature, such that a read-on of zero implies the cores are running at this temperature.
15:8	0x0 RO/V	**FAN_TEMP_TARGET_OFFSET:** Fan Temperature Target Offset a.k.a. TControl indicates the relative offset from the the Thermal Monitor Trip Temperature at which fans should be engaged.
7:0	0x0 RO	**RESERVED_0:** Reserved

44.3.171 BIOS_RESET_CPL (P_CR_BIOS_RESET_CPL_0_0_0_MCHBAR)—Offset 7078h

This register is used as a means for BIOS to communicate staging to the Punit / Pcode. The exact definition and utility of each bit may differ across products. The general philosophy is that when BIOS is done with stage0, it writes the RST_CPL0 bit and then waits for the PCODE_INIT_DONE0 bit to be set before proceeding to the next step.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 7078h

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**RESERVED0:** reserved
15	0x0 RO/V	**PCODE_INIT_DONE7:** Pcode sets this bit when it has completed this stage, BIOS must wait for this bit to be set before proceeding to the next stage. Stage validity is product-specific and this stage may not be applicable to this product.
14	0x0 RO/V	**PCODE_INIT_DONE6:** Pcode sets this bit when it has completed this stage, BIOS must wait for this bit to be set before proceeding to the next stage. Stage validity is product-specific and this stage may not be applicable to this product.
13	0x0 RO/V	**PCODE_INIT_DONE5:** Pcode sets this bit when it has completed this stage, BIOS must wait for this bit to be set before proceeding to the next stage. Stage validity is product-specific and this stage may not be applicable to this product.
12	0x0 RO/V	**PCODE_INIT_DONE4:** Pcode sets this bit when it has completed this stage, BIOS must wait for this bit to be set before proceeding to the next stage. Stage validity is product-specific and this stage may not be applicable to this product.
11	0x0 RO/V	**PCODE_INIT_DONE3:** Pcode sets this bit when it has completed this stage, BIOS must wait for this bit to be set before proceeding to the next stage. Stage validity is product-specific and this stage may not be applicable to this product.
10	0x0 RO/V	**PCODE_INIT_DONE2:** Pcode sets this bit when it has completed this stage, BIOS must wait for this bit to be set before proceeding to the next stage. Stage validity is product-specific and this stage may not be applicable to this product.
9	0x0 RO/V	**PCODE_INIT_DONE1:** Pcode sets this bit when it has completed this stage, BIOS must wait for this bit to be set before proceeding to the next stage. Stage validity is product-specific and this stage may not be applicable to this product.
8	0x0 RO/V	**PCODE_INIT_DONE:** Pcode has completed its actions in response to Stage0 BIOS Reset complete. Between BIOS Stage0 complete and Pcode Stage0 complete, Pcode will apply all power savings configurations to PCS and will set up C_STATE_LATENCY control MSR settings for IRTL management.
7	0x0 RW	**RST_CPL7:** reset complete
6	0x0 RW	**RST_CPL6:** BIOS sets this bit when it has completed this stage, Pcode must wait for this bit to be set before proceeding to the next stage. Stage validity is product-specific and this stage may not be applicable to this product.
5	0x0 RW	**RST_CPL5:** BIOS sets this bit when it has completed this stage, Pcode must wait for this bit to be set before proceeding to the next stage. Stage validity is product-specific and this stage may not be applicable to this product.
4	0x0 RW	**RST_CPL4:** BIOS sets this bit when it has completed this stage, Pcode must wait for this bit to be set before proceeding to the next stage. Stage validity is product-specific and this stage may not be applicable to this product.
3	0x0 RW	**RST_CPL3:** BIOS sets this bit when it has completed this stage, Pcode must wait for this bit to be set before proceeding to the next stage. Stage validity is product-specific and this stage may not be applicable to this product.

Bit Range	Default & Access	Field Name (ID): Description
2	0x0 RW	**RST_CPL2:** BIOS sets this bit when it has completed this stage, Pcode must wait for this bit to be set before proceeding to the next stage. Stage validity is product-specific and this stage may not be applicable to this product.
1	0x0 RW	**RST_CPL1:** BIOS sets this bit when it has completed this stage, Pcode must wait for this bit to be set before proceeding to the next stage. Stage validity is product-specific and this stage may not be applicable to this product.
0	0x0 RW	**RST_CPL:** Set by BIOS to indicate that all power management configurations as part of reset are complete. This must include Punit patch load done as well as all relevant Punit power management register and mailbox configurations done. Once this bit is set, Punit will allow normal power management to start. Before setting this bit, P-states and C-states support is disabled. BIOS should wait before receiving the Pcode Stage0 reset complete before proceeding with any further steps.

44.3.172 BIOS_MAILBOX_DATA (P_CR_BIOS_MAILBOX_DATA_0_0_0_MCHBAR)—Offset 7080h

Data register for the BIOStoPCODE mailbox. This mailbox is implemented as a means for accessing statistics and implementing BIOS-Pcode handshakes. This register is used in conjunction with BIOS_MAILBOX_INTERFACE.

THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 7080h

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/V	**DATA:** This field contains the data associated with specific commands.

44.3.173 BIOS_MAILBOX_INTERFACE (P_CR_BIOS_MAILBOX_INTERFACE_0_0_0_MCHBAR)—Offset 7084h

Control and Status register for the BIOS to Pcode mailbox. This mailbox is implemented as a means for accessing statistics and implementing BIOS-Pcode handshakes. This register is used in conjunction with BIOS_MAILBOX_DATA.

THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 7084h

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/1S/V	**RUN_BUSY:** SW may write to the two mailbox registers only when RUN_BUSY is clear(0). Setting RUN_BUSY to 1 will pend a Fast Path event to Pcode. After setting this bit SW will poll this bit until it is cleared. Pcode will clear RUN_BUSY after updating the mailbox registers with the result and error code.
30:29	0x0 RO	**RSVD0:** Reserved
28:8	0x0 RW/V	**ADDRESS:** This field is used to specify an additional parameter to extend the command when needed.
7:0	0x0 RW/V	**COMMAND:** This field contains the SW request command or the Pcode response code depending on the setting of RUN_BUSY.

44.3.174 CORE_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR (P_CR_CORE_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR)—Offset 7088h

PUNIT_MMIO: Core Frequency Capabilities This register describes the frequency capabilities of the IA cores. Units are 100MHz multiplied by the ratio. Minimum and maximum ratio fields are initialized by pCode at reset. Last resolved ratio is updated upon changes to the processing system frequency. The efficient ratio is determined by firmware and may be updated dynamically depending on firmware support.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MCHBAR] + 7088h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO/V	**LAST_RESOLVED_FREQ:** Last resolved ratio for the IA cores. Units are 100MHz multiplied by the ratio. This value is updated dynamically whenever the IA core frequency changes.
23:16	0x0 RO/V	**MAX_SUPPORTED_FREQ:** Maximum ratio for the IA cores. Units are 100MHz multiplied by the ratio.
15:8	0x0 RO/V	**EFFICIENT_FREQ:** Firmware-calculated efficient ratio for the IA cores. Units are 100MHz multiplied by the ratio.
7:0	0x0 RO/V	**MIN_SUPPORTED_FREQ:** Minimum supported ratio for the IA cores. Units are 100MHz multiplied by the ratio.

44.3.175 GRAPHICS_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR (P_CR_GRAPHICS_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR)—Offset 708Ch

PUNIT_MMIO: Graphics Engine Frequency Capabilities This register describes the frequency capabilities of the integrated graphics engine. Units are 50MHz multiplied by the ratio. Minimum and maximum ratio fields are initialized by pCode at reset. Last resolved ratio is updated upon changes to the integrated graphics engine frequency. The efficient ratio is determined by firmware and may be updated dynamically depending on firmware support.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MCHBAR] + 708Ch

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO/V	**LAST_RESOLVED_FREQ:** Last resolved ratio for the integrated graphics engine. Units are 50MHz multiplied by the ratio. This value is updated dynamically whenever the graphics engine frequency changes.
23:16	0x0 RO/V	**MAX_SUPPORTED_FREQ:** Maximum supported ratio for the integrated graphics engine. Units are 50MHz multiplied by the ratio.
15:8	0x0 RO/V	**EFFICIENT_FREQ:** Firmware-calculated efficient ratio for the integrated graphics engine. Units are 50MHz multiplied by the ratio.
7:0	0x0 RO/V	**MIN_SUPPORTED_FREQ:** Minimum supported ratio for the integrated graphics engine. Units are 50MHz multiplied by the ratio.

44.3.176 SYSTEM_AGENT_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR (P_CR_SYSTEM_AGENT_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR)—Offset 7090h

PUNIT_MMIO: System Agent Frequency Capabilities This register describes the frequency capabilities of the System Agent. Units are 16.666MHz multiplied by the ratio. Last resolved ratio is updated upon changes to the System Agent frequency.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MCHBAR] + 7090h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO/V	**LAST_RESOLVED_RATIO:** Last resolved System Agent ratio, in units of 16.666MHz.
23:16	0x0 RO/V	**RESERVED_2:** Reserved
15:8	0x0 RO/V	**RESERVED_1:** Reserved
7:0	0x0 RO/V	**RESERVED_0:** Reserved

44.3.177 FAR_MEMORY_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR (P_CR_FAR_MEMORY_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR)—Offset 7094h

This register reports out the DDR far memory frequency. The actual capabilities of the SOC with respect to DDR frequency is described in the MEMSS_FREQUENCY_CAPABILITIES register.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MCHBAR] + 7094h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO/V	**LAST_RESOLVED_RATIO:** This field reports out the DDR far memory frequency in integer multiple. This register reflects what BIOS has programmed as the default DDR frequency
23:16	0x0 RO/V	**RESERVED_2:** Reserved
15:8	0x0 RO/V	**RESERVED_1:** Reserved
7:0	0x0 RO/V	**RESERVED_0:** Reserved

44.3.178 NEAR_MEMORY_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR (P_CR_NEAR_MEMORY_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR)—Offset 7098h

This register reports out the Wide I/O near memory frequency. A value of zero indicates there is no Wide I/O DRAM present. The actual capabilities of the SOC with respect to Wide I/O frequency is described in the MEMSS_FREQUENCY_CAPABILITIES register.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MCHBAR] + 7098h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO/V	**LAST_RESOLVED_RATIO:** This field reports out the Wide I/O near memory frequency in integer multiple of 133.33MHz. This register reflects what BIOS has programmed as the default Wide I/O near memory frequency
23:16	0x0 RO/V	**RESERVED_2:** Reserved
15:8	0x0 RO/V	**RESERVED_1:** Reserved
7:0	0x0 RO/V	**RESERVED_0:** Reserved

44.3.179 PACKAGE_POWER_SKU (P_CR_PACKAGE_POWER_SKU_0_0_0_MCHBAR)—Offset 70A0h

This register describes the power SKU of the part and limits on time window and power limit configuration allowed in the RAPL PL1 and PL2 configuration registers.

Type: Memory Mapped I/O Register (Size: 64 bits)

Default: 0012024000600118h

BAR and Offset: [MCHBAR] + 70A0h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
63:55	0x0 RO	**RESERVED_3:** Reserved
54:48	0x12 RW	**PKG_MAX_WIN:** The maximal time window allowed to be programmed for RAPL PL1 and PL2 controls for the SKU. Higher values will be clamped to this value. The bits of this field describe parameters for a mathematical equation for time window configuration. This field is split into two sub-fields: • x = bits[6:5] • y = bits[4:0] Time window equation: **time_window = PACKAGE_POWER_SKU_UNIT.TIME_UNIT * ((1+x/4)^y)** **Power Well:** prst
47	0x0 RO	**RESERVED_2:** Reserved
46:32	0x240 RW	**PKG_MAX_PWR:** The maximal package power setting allowed for the SKU. Higher values will be clamped to this value. The maximum setting is typical not guaranteed. The default value for this field is determined by fuses. The units for this value are defined in PACKAGE_POWER_SKU_MSR[PWR_UNIT]. **Power Well:** prst
31	0x0 RO	**RESERVED_1:** Reserved
30:16	0x60 RW	**PKG_MIN_PWR:** The minimal package power setting allowed for the SKU. Lower values may not be achievable by run-time RAPL PL1 and PL2 control algorithms. **Power Well:** prst
15	0x0 RO	**RESERVED_0:** Reserved
14:0	0x118 RW	**PKG_TDP:** The TDP package power setting allowed for the SKU. The units for this value are defined in PACKAGE_POWER_SKU_MSR[PWR_UNIT].

44.3.180 PACKAGE_RAPL_LIMIT (P_CR_PACKAGE_RAPL_LIMIT_0_0_0_MCHBAR)—Offset 70A8h

Package RAPL Power Limit allows a software agent to define power limitation for the package domain. Power limitation is defined in terms of average power usage (Watts) over a time window specified. Two power limits and associated time windows can be specified. These power limits are commonly referred to as PL1 (long time window) and PL2 (short time window). Each power limit provides independent clamping control that would permit the processor cores to go below OS-requested state to meet the power limits. A lock mechanism allow the software agent to enforce power limit settings. Once the lock bit is set, the power limit settings are static and un-modifiable until next RESET.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [MCHBAR] + 70A8h

Default: 0000000000000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
63	0x0 RW/L	**PKG_PWR_LIM_LOCK:** When set all settings in this register are locked and are treated as Read Only. This lock control is persistent until the next reset. This bit will typically set by BIOS during boot time or resume from Sx.
62:56	0x0 RO	**RESERVED_1:** Reserved
55:49	0x0 RW/L	**PKG_PWR_LIM_2_TIME:** Time window for Power Limit 1 (PL2). This describes the control window of the power limit. This time window is described in an RC time constant format, which means that if 1s is programmed, the power limit constraint really applies at more like 5s. The maximal time window is bounded by PACKAGE_POWER_SKU_MSR.PKG_MAX_WIN. There is no constraint on the minimum programmable time window, however at very short time windows the control algorithms may not be effective. The bits of this field describe parameters for a mathematical equation for time window configuration. This field is split into two sub-fields: • x = bits[6:5] • y = bits[4:0] Time window equation: **time_window = PACKAGE_POWER_SKU_UNIT.TIME_UNIT * ((1+x/4)^y)**
48	0x0 RW/VL	**PKG_CLMP_LIM_2:** Clamp mode control for PL2. • 0 = PL2 power control is prevented from forcing P-states below the base frequency / P1 for any domain in the SOC. • 1 = PL2 power control will take all actions necessary to meet the power target, even if that involves running at clock frequencies below the base frequency / P1 level. In order to ensure proper SOC cooling, it is generally recommended that the clamp mode is always enabled.
47	0x0 RW/VL	**PKG_PWR_LIM_2_EN:** Enable for Power Limit 2 (PL2). Setting this bit activates the power limit and time window defined for PL2.
46:32	0x0 RW/L	**PKG_PWR_LIM_2:** Sets the average power usage limit of the package domain corresponding to the PL2 time window. The power units of this field are specified by the PACKAGE_POWER_SKU_UNIT_MSR.PWR_UNIT. This power limit must be configured by software before it will engage. The PL2 limit is most commonly associated with long time windows (1s and longer), although there are no explicit constraints on what software configures.
31:24	0x0 RO	**RESERVED_0:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
23:17	0x0 RW/L	**PKG_PWR_LIM_1_TIME:** Time window for Power Limit 1 (PL1). This describes the control window of the power limit. This time window is described in an RC time constant format, which means that if 1s is programmed, the power limit constraint really applies at more like 5s. The maximal time window is bounded by PACKAGE_POWER_SKU_MSR.PKG_MAX_WIN. There is no constraint on the minimum programmable time window, however at very short time windows the control algorithms may not be effective. The bits of this field describe parameters for a mathematical equation for time window configuration. This field is split into two sub-fields: • x = bits[6:5] • y = bits[4:0] Time window equation: **time_window = PACKAGE_POWER_SKU_UNIT.TIME_UNIT * ((1+x/4)^y)**
16	0x0 RW/VL	**PKG_CLMP_LIM_1:** Clamp mode control for PL1. • 0 = PL1 power control is prevented from forcing P-states below the base frequency / P1 for any domain in the SOC. • 1 = PL1 power control will take all actions necessary to meet the power target, even if that involves running at clock frequencies below the base frequency / P1 level. In order to ensure proper SOC cooling, it is generally recommended that the clamp mode is always enabled.
15	0x0 RW/VL	**PKG_PWR_LIM_1_EN:** Enable for Power Limit 1 (PL1). Setting this bit activates the power limit and time window defined for PL1.
14:0	0x0 RW/L	**PKG_PWR_LIM_1:** Sets the average power usage limit of the package domain corresponding to the PL1 time window. The power units of this field are specified by the PACKAGE_POWER_SKU_UNIT_MSR.PWR_UNIT. This power limit must be configured by software before it will engage. The PL1 limit is most commonly associated with long time windows (1s and longer), although there are no explicit constraints on what software configures.

44.3.181 IA_PERF_LIMIT_REASONS (P_CR_IA_PERF_LIMIT_REASONS_0_0_0_MCHBAR)—Offset 70B0h

This register reports reasons for performance limitations on the IA cores. Status bits are an instantaneous indication of an active constraint. Log bits indicate that a constraint was enforced since the log bit was last cleared.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 70B0h

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/0C/V	**QOS_LOG:** Logged indication that frequency was clamped below the software-defined quality-of-service floor. This bit is set by firmware, and is clearable by software.
30	0x0 RW/0C/V	**MAX_EFFICIENCY_FREQ_LOG:** Logged indication that frequency was clamped below the firmware-calculated maximum efficiency frequency. This bit is set by firmware, and is clearable by software.
29	0x0 RW/0C/V	**MCT_LOG:** Logged indication that frequency was clamped due to ratio change transition attenuation. This bit is set by firmware, and is clearable by software.
28	0x0 RW/0C/V	**EDP_LOG:** Logged indication that frequency was clamped due to the package-level Electrical Design Point constraint. This bit is set by firmware, and is clearable by software.
27	0x0 RW/0C/V	**MULTI_CORE_TURBO_LOG:** Logged indication that frequency was clamped due to effective multi-core turbo constraints. This bit is set by firmware, and is clearable by software.
26	0x0 RW/0C/V	**VR_THERMALERT_LOG:** Logged indication that frequency was clamped due to a voltage regulator thermal excursion. This bit is set by firmware, and is clearable by software.
25	0x0 RW/0C/V	**IA_UTILIZATION_LOG:** Logged indication that frequency was clamped due to the autonomous utilization-based P-state control algorithm. This bit is set by firmware, and is clearable by software.
24	0x0 RW/0C/V	**DEV3_LOG:** Logged indication that frequency was clamped due to a Device 3 driver override. This bit is set by firmware, and is clearable by software.
23	0x0 RW/0C/V	**DEV2_LOG:** Logged indication that frequency was clamped due to a Device 2 driver override. This bit is set by firmware, and is clearable by software.
22	0x0 RW/0C/V	**SPARE6_LOG:** Spare log bit. This bit is set by firmware, and is clearable by software.
21	0x0 RW/0C/V	**SPARE5_LOG:** Spare log bit. This bit is set by firmware, and is clearable by software.
20	0x0 RW/0C/V	**SPARE4_LOG:** Spare log bit. This bit is set by firmware, and is clearable by software.
19	0x0 RW/0C/V	**PL2_LOG:** Logged indication that frequency was clamped due to a package-level PL2 excursion. This bit is set by firmware, and is clearable by software.
18	0x0 RW/0C/V	**PL1_LOG:** Logged indication that frequency was clamped due to a package-level PL1 excursion. This bit is set by firmware, and is clearable by software.
17	0x0 RW/0C/V	**THERMAL_LOG:** Logged indication that frequency was clamped due to a thermal excursion. This bit is set by firmware, and is clearable by software.
16	0x0 RW/0C/V	**PROCHOT_LOG:** Logged indication that frequency was clamped due to PROCHOT assertion. This bit is set by firmware, and is clearable by software.

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RO/V	**QOS_STATUS:** Frequency is limited below the operating system or driver Quality-of-Service floor.
14	0x0 RO/V	**MAX_EFFICIENCY_FREQ_STATUS:** Frequency is limited below the maximum efficiency frequency.
13	0x0 RO/V	**MCT_STATUS:** Frequency is limited due to ratio change transition attenuation (MCT, prevents frequent ratio changes due to core C-state entry/exit).
12	0x0 RO/V	**EDP_STATUS:** Frequency is limited due to a package-level EDP constraint.
11	0x0 RO/V	**MULTI_CORE_TURBO_STATUS:** Frequency is limited due to effective multi-core turbo constraints.
10	0x0 RO/V	**VR_THERMALERT_STATUS:** Frequency is limited due to a VR thermal excursion.
9	0x0 RO/V	**IA_UTILIZATION_STATUS:** Frequency is limited due to autonomous utilization-based P-state control.
8	0x0 RO/V	**DEV3_STATUS:** Frequency is limited due to Dev3 driver override.
7	0x0 RO/V	**DEV2_STATUS:** Frequency is limited due to Dev2 driver override.
6	0x0 RO/V	**SPARE6_STATUS:** Spare status bit.
5	0x0 RO/V	**SPARE5_STATUS:** Spare status bit.
4	0x0 RO/V	**SPARE4_STATUS:** Spare status bit.
3	0x0 RO/V	**PL2_STATUS:** Frequency is limited due to a package-level PL2 excursion.
2	0x0 RO/V	**PL1_STATUS:** Frequency is limited due to a package-level PL1 excursion.
1	0x0 RO/V	**THERMAL_STATUS:** Frequency is limited due to thermal excursion.
0	0x0 RO/V	**PROCHOT_STATUS:** Frequency is limited due to external PROCHOT assertion.

44.3.182 MEMHOT_THERM_STATUS_0_0_0_MCHBAR (P_CR_MEMHOT_THERM_STATUS_0_0_0_MCHBAR)—Offset 70D8h

Memhot indications and logging

THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 70D8h

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RO	**RESERVED:** Reserved
1	0x0 RW/0C/V	**MEMHOT_LOG:** Set to 1 on MEMHOT_N pin assertion; remains set until cleared via CR write of 1 value or chip reset.
0	0x0 RO/V	**MEMHOT_STATUS:** • 0 = MEMHOT_N pin not asserted • 1 = MEMHOT_N pin is asserted

44.3.183 MEMHOT_THERM_CONFIG_0_0_0_MCHBAR (P_CR_MEMHOT_THERM_CONFIG_0_0_0_MCHBAR)—Offset 70DCh

Configuration data for memhot.

THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 70DCh

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/L	**LOCK:** When 1, writes to other MEMHOT_THERM_CONFIG bits are not allowed
30:2	0x0 RO	**RESERVED:** Reserved
1:0	0x0 RW/L	**MEMHOT_THROT_LVL:** • 00 = MEMHOT disabled (no response to pin assertion) • 01 = THRT_MID • 10 = THRT_HI • 11 = THRT_CRIT

44.3.184 MEM_THERM_CTRL_0_0_0_MCHBAR (P_CR_MEM_THERM_CTRL_0_0_0_MCHBAR)—Offset 7200h

Configuration data for OLTT, CLTT, and MEMTRIP

THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 7200h

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD0:** Reserved
15:8	0x0 RW	**TEMP_MEMTRIP:** Temperature at which mem trip will be asserted
7:6	0x0 RO	**RSVD1:** Reserved
5	0x0 RO/V	**SMBUSACKD_FLAG:** Set by CLTT SMBus controller when DIMM temperatures are ready to be read. This bit is also used as the valid bit for the DIMM temperatures. Pcode will clear this bit when initiating a new DIMM temperature read request.
4:3	0x0 RW	**OLTT_THROT_LVL:** Throttle level when OLTT is enabled, reuses CLTT throttle levels. • 00 = no throttle • 01 = THRT_MID • 10 = THRT_HI • 11 = THRT_CRIT
2	0x0 RW	**CLTT_MODE:** • 0 = CLTT pass-thru • 1 = CLTT over SMBus (ignore if MTM_MODE = 0)
1	0x0 RW	**MEM_THERM_MGMT_MODE:** Memory thermal mgmt. mode: • 0 = OLTT, • 1 = CLTT
0	0x0 RW	**EN_MEMTRIP:** Mem_thermtrip control. • 0: THERMTRIP is CPU thermal sensor only • 1: THERMTRIP is CPU thermal sensor or mem_thermtrip

44.3.185 MEM_THERM_TEMP_CONFIG_0_0_0_MCHBAR (P_CR_MEM_THERM_TEMP_CONFIG_0_0_0_MCHBAR)—Offset 7204h

CLTT temperature thresholds

THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 7204h

Default: 00645D54h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0x0 RO	**RESERVED_0:** Reserved
26:24	0x0 RW	**TEMP_THROT_HYST:** Negative-going threshold hysteresis value. This value is subtracted from the TEMP_* threshold values to determine the point where the asserted status for that threshold will clear as temperature decreases. TEMP_THROT_HYST must be at least 1C less than the minimum delta between adjacent TEMP_* thresholds.
23:16	0x64 RW	**TEMP_HI:** High threshold temperature, 8.8.0ufp. Program so TEMP_HI) TEMP_MID.
15:8	0x5d RW	**TEMP_MID:** Middle threshold temperature, 8.8.0ufp. Program so TEMP_MID (TEMP_HI.
7:0	0x54 RW	**TEMP_LO:** Lower threshold temperature, 8.8.0ufp. Program so TEMP_LO (TEMP_MID.

44.3.186 MEM_THERM_THROT_CONFIG_0_0_0_MCHBAR (P_CR_MEM_THERM_THROT_CONFIG_0_0_0_MCHBAR)—Offset 7208h

CLTT bandwidth throttle levels

THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 7208h

Default: 00635A00h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**RESERVED_0:** Reserved
23:16	0x63 RW	**THRT_CRIT:** Throttle level in %BW (= 100, 8.8.0ufp. Default is 99% throttled.
15:8	0x5a RW	**THRT_HI:** Throttle level in %BW (THRT_CRIT, 8.8.0ufp (default is 90% throttled)
7:0	0x0 RW	**THRT_MID:** Throttle level in %BW (THRT_HI , 8.8.0ufp (default is 0% throttled)

44.3.187 MEM_THERM_STATUS_0_0_0_MCHBAR (P_CR_MEM_THERM_STATUS_0_0_0_MCHBAR)—Offset 720Ch

CLTT per-DIMM status/log info

THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 720Ch

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

6	0x0 RO/V	**MEMHOT_SMI_STATUS:** Maximum DIMM_adj_TEMP_x_y value is at or above MEM_INT_THRESHOLD1_VALUE
5	0x0 RW/0C/V	**TEMP_HI_SMI_LOG:** Set to 1 the first time TEMP_HI_SMI_STATUS is set and remains sticky until cleared via software or reset.
4	0x0 RO/V	**TEMP_HI_SMI_STATUS:** • 1: MTM is at the TEMP_HI throttle state. • 0: MTM is below the TEMP_HI throttle state.
3	0x0 RW/0C/V	**TEMP_MID_SMI_LOG:** Set to 1 the first time TEMP_MID_SMI_STATUS is set and remains sticky until cleared via software or reset.
2	0x0 RO/V	**TEMP_MID_SMI_STATUS:** • 1: MTM is at the TEMP_MID throttle state. • 0: MTM is below the TEMP_MID throttle state.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RW/0C/V	**TEMP_LO_SMI_LOG:** Set to 1 the first time TEMP_LO_SMI_STATUS is set and remains sticky until cleared via software or reset.
0	0x0 RO/V	**TEMP_LO_SMI_STATUS:** • 1: MTM is at or above the TEMP_LO throttle state. • 0: MTM is in the unthrottled state.

44.3.190 MEM_THERM_TEMP_OFST_0_0_0_MCHBAR (P_CR_MEM_THERM_TEMP_OFST_0_0_0_MCHBAR)—Offset 7218h

CLTT per-DIMM temperature offsets

THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 7218h

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RO	**RESERVED_3:** Reserved
28:24	0x0 RW	**MEM_TEMP_OFST_DDR_1_1:** 4-bit integer temperature offset value for channel1, DIMM1 TSOD.
23:21	0x0 RO	**RESERVED_2:** Reserved
20:16	0x0 RW	**MEM_TEMP_OFST_DDR_1_0:** 4-bit integer temperature offset value for channel1, DIMM0 TSOD.
15:13	0x0 RO	**RESERVED_1:** Reserved
12:8	0x0 RW	**MEM_TEMP_OFST_DDR_0_1:** 4-bit integer temperature offset value for channel0, DIMM1 TSOD.
7:5	0x0 RO	**RESERVED_0:** Reserved
4:0	0x0 RW	**MEM_TEMP_OFST_DDR_0_0:** 4-bit integer temperature offset value for channel0, DIMM0 TSOD.

44.3.191 TELEM_NEAR_MEMORY_ACTIVE_ACCUMULATOR (P_CR_TELEM_NEAR_MEMORY_ACTIVE_0_0_0_MCHBAR)—Offset 70E0h

This counter measures the total time spent with near memory active, as measured by any rank being in the active or active idle state. The inverse of this counter indicates the total time spent with all near memory in the self-refresh state. This counter counts at the crystal clock frequency divided by 16.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [MCHBAR] + 70E0h

Default: 0000000000000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
63:0	0x0 RO/V	**DATA:** This counter measures the total time spent with near memory active, as measured by any rank being in the active or active idle state. The inverse of this counter indicates the total time spent with all near memory in the self-refresh state. This counter counts at the crystal clock frequency divided by 16.

44.3.192 TELEM_FAR_MEMORY_ACTIVE_ACCUMULATOR (P_CR_TELEM_FAR_MEMORY_ACTIVE_0_0_0_MCHBAR)—Offset 70E8h

This counter measures the total time spent with far memory active, as measured by any rank being in the active or active idle state. The inverse of this counter indicates the total time spent with all far memory in the self-refresh state. This counter counts at the crystal clock frequency divided by 16.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [MCHBAR] + 70E8h

Default: 0000000000000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
63:0	0x0 RO/V	**DATA:** This counter measures the total time spent with far memory active, as measured by any rank being in the active or active idle state. The inverse of this counter indicates the total time spent with all far memory in the self-refresh state. This counter counts at the crystal clock frequency divided by 16.

44.3.193 TURBO_ACTIVATION_RATIO (P_CR_TURBO_ACTIVATION_RATIO_0_0_0_MCHBAR)—Offset 70F0h

PUNIT_MSR: Used by software to configure the P-state at which turbo activates. This feature is functionally identical to the ACPI P-state notify supported over PECI (PCS 33). Turbo activation starts at clock ratios above the turbo activation ratio threshold configured in this register.

MSR_Name: TURBO_ACTIVATION_RATIO **MSR_Addr**: 0x64C

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 70F0h

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/L	**TURBO_ACTIVATION_RATIO_LOCK:** Write to 1b to lock the setting in this register until next reset
30:8	0x0 RO	**RSVD0:** Reserved
7:0	0x0 RW/L	**MAX_NON_TURBO_RATIO:** The P-unit will treat any P-state request above this ratio as a request for maximum turbo. Zero is special encoding which disables the feature

44.3.194 C2C3TT_CFG (P_CR_C2C3TT_CFG_0_0_0_MCHBAR)—Offset 7034h

DEPRECATED. This register contains the initial snoop timer (pop-down) value. BIOS can update this value during run-time. Pcode will sample this register at slow loop. If the value has changed since the previous sample and in addition there is no valid Hysteresis parameter (HYS) from a previous PM_DMD or PM_RSP message, then Pcode will configure IMPH_CR_SNP_RELOAD[LIM] with this value. This register is not used by the SoC.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 7034h

Default: 00000032h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RO	**RSVD0:** Reserved
11:0	0x32 RW	**PPDN_INIT:** Value

44.3.195 DTS_CONFIG1_CFG (P_CR_DTS_CONFIG1_CFG_0_0_0_MCHBAR)—Offset 7110h

DEPRECATED. DTS 2.0 is not supported. Location of correction factor F and scale factor C for DTS2.0

bscherka: IVT HSD i1112231 DTS2.0 added this csr isteiner: Moved DTS registers for re-convergence

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 7110h

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RW/L	**RSVD1:** Reserved
28:16	0x0 RW/L	**C:** Scale factor C May be unlocked for select OEMs
15:13	0x0 RW/L	**RSVD:** reserved
12:0	0x0 RW/L	**F:** Correction Factor F May be unlocked for select OEMs

44.3.196 DTS_CONFIG2_CFG (P_CR_DTS_CONFIG2_CFG_0_0_0_MCHBAR)—Offset 7114h

DEPRECATED. DTS 2.0 is not supported. Location of time constant coefficients for implementation.

bscherka: IVT HSD i1112231 added this csr isteiner: Moved DTS registers for re-convergence

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 7114h

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RW/L	**RSVD1:** Reserved be4538196 - attached to correct fuse
28:16	0x0 RW/L	**AS:** Time constant coefficient AS May be unlocked for select OEMs
15:13	0x0 RW/L	**RSVD:** reserved
12:0	0x0 RW/L	**AF:** Time constant coefficient AF May be unlocked for select OEMs

44.3.197 DTS_CONFIG3_CFG (P_CR_DTS_CONFIG3_CFG_0_0_0_MCHBAR)—Offset 7118h

Location of Tcontrol_offset for DTS2.0

bscherka: IVT added HSD i1112231 isteiner: Moved DTS registers for re-convergence

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 7118h

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RO	**RSVD0:** Reserved
28	0x0 RW/L	**OFFSET_PROGRAMMED:** Bit that the offset was programmed.
27:8	0x0 RO	**RSVD1:** Reserved
7:0	0x0 RW/L	**TCONTROL_OFFSET:** Offset to modify Tcontrol for DTS2.0

44.3.198 SOUTH_IO_PORT_STATUS3 (P_CR_SOUTH_IO_PORT_STATUS3_0_0_0_MCHBAR)—Offset 711Ch

Power meter data for south IPs

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 711Ch

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0x0 RW	**RSVD:** reserved
25:24	0x0 RW	**GBE_PORTS:** Snapshot of the number of GBE lanes for power meter.
23:16	0x0 RW	**PCIE_LANES:** Snapshot of the number of PCIE lanes for power meter.
15:8	0x0 RW	**SATA_LANES:** Snapshot of the number of SATA lanes for power meter.
7:4	0x0 RW	**USB3_LANES:** Snapshot of the number of USB3 lanes for power meter.
3:0	0x0 RW	**USB2_LANES:** Snapshot of the number of USB2 lanes for power meter.

44.3.199 DRAM_BIOS_INFO (P_CR_DRAM_BIOS_INFO_0_0_0_MCHBAR)—Offset 7128h

This register provides DRAM interface information for initial boot and SPD warm reset. It is populated by Pcode and read by BIOS.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 7128h

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RW	**Reserved:** Reserved
23:16	0x0 RW	**CURRENT_VID_VALUE:** Current voltage of VDDQ SVID Rail.
15:12	0x0 RW	**RSVD1:** Reserved
11	0x0 RW	**SPD_RESET_STATUS:** This field indicates to BIOS that a SPD Warm Reset has already occurred.
10:8	0x0 RW	**DDR_CURRENT_FREQ:** This field indicates the current DDR IO clock frequency.
7:4	0x0 RW	**RSVD2:** Reserved
3	0x0 RW	**Reserved:** Reserved
2:0	0x0 RW	**DDR_MAX_FREQ_LIMIT:** This field indicates to BIOS the Maximum supported DDR frequency for this product. Pcode populates this information from fuses. For the DDR_MAX_Freg_Limit, the value always shows 4 (100b). • 000b = 1600 MHz • 001b = 1833 MHz • 010b = 2133 MHz • 011b = 2400 MHz • 100b = 2666 MHz

44.3.200 ADR_COMMAND (P_CR_ADR_COMMAND_0_0_0_MCHBAR)—Offset 712Ch

This register provides PMC Firmware the ability to trigger an ADR (Asynchronous DRAM Self-Refresh). Fast path event for Pcode to take action and flush context information to DRAMs on imminent power loss.

THIS REGISTER IS DUPLICATED IN THE PCU IO SPACE, XML CHANGES MUST BE MADE IN BOTH PLACES

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 712Ch

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD0:** Reserved
7:1	0x0 RW/V	**Reserved:** Reserved
0	0x0 RW/V	**L2_FLUSH:** Flush the L2 cache on all modules as part of the ADR flow.

44.3.201 DRAM_POWER_INFO (P_CR_DRAM_POWER_INFO_0_0_0_MCHBAR)—Offset 7130h

PUNIT_MSR: MSR for DRAM power information **MSR_Name**: DRAM_POWER_INFO
MSR_Addr: 0x61C

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [MCHBAR] + 7130h

Default: 0028000000000118h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
63	0x0 RW/L	**LOCK:** The Spec power allowed for DRAM. The TDP setting is typical (not guaranteed).
62:55	0x0 RO	**RSVD0:** Reserved
54:48	0x28 RW/L	**DRAM_MAX_WIN:** The maximal time window allowed for the DRAM. Higher values will be clamped to this value. x = PKG_MAX_WIN[54:53], y = PKG_MAX_WIN[52:48]. The timing interval window is Floating Point number given by 1.x * power(2,y).
47	0x0 RO	**RSVD1:** Reserved
46:32	0x0 RW/L	**DRAM_MAX_PWR:** The maximal power setting allowed for DRAM. Higher values will be clamped to this value. The maximum setting is typical (not guaranteed).
31	0x0 RO	**RSVD2:** Reserved
30:16	0x0 RW/L	**DRAM_MIN_PWR:** The minimal power setting allowed for DRAM. Lower values will be clamped to this value. The minimum setting is typical (not guaranteed).
15	0x0 RO	**RSVD3:** Reserved
14:0	0x118 RW/L	**DRAM_TDP:** The Spec power allowed for DRAM. The TDP setting is typical (not guaranteed).

44.3.202 PCODE_WRITE_SPARE (P_CR_PCODE_WRITE_SPARE_0_0_0_MCHBAR)—Offset 7138h

Spare register for future use

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 7138h

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**SPARE_BITS:** spare bits for stepping ID use

44.3.203 PACKAGE_TEMPERATURES_0_0_0_MCHBAR (P_CR_PACKAGE_TEMPERATURES_0_0_0_MCHBAR)—Offset 70F4h

Read-only register used for monitoring thermal status from all domains in the package.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 70F4h

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO/V	**SA_Temperature:** System agent domain max temperature in degrees C. Reported in a signed, 2's complement format with the LSB representing 1'C resolution (S8.7.0). Raw, unfiltered
23:16	0x0 RO/V	**Reserved:** Reserved
15:8	0x0 RO/V	**Reserved:** Reserved
7:0	0x0 RO/V	**IA_Temperature:** Virtual max temperature of all IA cores in degrees C. Reported in a signed, 2's complement format with the LSB representing 1'C resolution (S8.7.0). Raw, unfiltered

44.3.204 MEMSS_FREQUENCY_CAPABILITIES (P_CR_MEMSS_FREQUENCY_CAPABILITIES_0_0_0_MCHBAR)—Offset 7108h

Describes the minimum and maximum frequency capabilities of LPDDR and WideIO on this particular SOC. If the maximum supported frequency reports a zero for LPDDR or WideIO, it indicates that the respective DRAM technology is not supported on this product.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 7108h

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RW	**NUM_NM_CH:** Reserved.
29:24	0x0 RW	**WIO_FREQ:** Reserved.
23:18	0x0 RW	**LP4_FREQ_HIGH:** Reserved.
17:12	0x0 RW	**LP4_FREQ_LOW:** Reserved.
11:6	0x0 RW	**LP3_FREQ_HIGH:** Reserved.
5:0	0x0 RW	**LP3_FREQ_LOW:** Reserved.

44.3.205 PP1_C0_CORE_CLOCK_0_0_0_MCHBAR (P_CR_PP1_C0_CORE_CLOCK_0_0_0_MCHBAR)—Offset 7160h

GT RC0 residency counter. Holds the accumulated number of CS clks that GT has been in RC0.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 7160h

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**DATA:** Accumulated cycles GT has been in RC0.

44.3.206 Core Exists Vector (P_CR_CORE_EXISTS_VECTOR_0_0_0_MCHBAR)—Offset 7164h

Indication of the physical presence of IA cores in this silicon. IA core modules are defined as containing pairs of cores and an associated L2 cache. Module existence can therefore be inferred by OR'ing pairs of COREx_EXISTS in this register. This register does not reflect the impact of any software-based core disabling. It always reflects the capabilities of the silicon.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 7164h

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD0:** Reserved
15	0x0 RW	**CORE15_EXISTS:** A 1 indicates this core is enabled in the SoC.
14	0x0 RW	**CORE14_EXISTS:** A 1 indicates this core is enabled in the SoC.
13	0x0 RW	**CORE13_EXISTS:** A 1 indicates this core is enabled in the SoC.
12	0x0 RW	**CORE12_EXISTS:** A 1 indicates this core is enabled in the SoC.
11	0x0 RW	**CORE11_EXISTS:** A 1 indicates this core is enabled in the SoC.
10	0x0 RW	**CORE10_EXISTS:** A 1 indicates this core is enabled in the SoC.
9	0x0 RW	**CORE9_EXISTS:** A 1 indicates this core is enabled in the SoC.
8	0x0 RW	**CORE8_EXISTS:** A 1 indicates this core is enabled in the SoC.
7	0x0 RW	**CORE7_EXISTS:** A 1 indicates this core is enabled in the SoC.
6	0x0 RW	**CORE6_EXISTS:** A 1 indicates this core is enabled in the SoC.
5	0x0 RW	**CORE5_EXISTS:** A 1 indicates this core is enabled in the SoC.
4	0x0 RW	**CORE4_EXISTS:** A 1 indicates this core is enabled in the SoC.
3	0x0 RW	**CORE3_EXISTS:** A 1 indicates this core is enabled in the SoC.
2	0x0 RW	**CORE2_EXISTS:** A 1 indicates this core is enabled in the SoC.
1	0x0 RW	**CORE1_EXISTS:** A 1 indicates this core is enabled in the SoC.
0	0x0 RW	**CORE0_EXISTS:** A 1 indicates this core is enabled in the SoC.

44.3.207 Software Core Disable Mask (P_CR_CORE_DISABLE_MASK_0_0_0_MCHBAR)—Offset 7168h

Software may disable cores using this interface. The bit definition of this register exactly matches that defined in the CORE_EXISTS_VECTOR register. The flow is as follows:

- Cold boot
- BIOS reads CORE_EXISTS_VECTOR to establish which modules and cores are present
- BIOS writes 1b to the corresponding core that it wishes to **disable**.
- BIOS may disable entire modules by writing 1b to a pair of cores.
- The results of the configuration are maintained in the sustain power well.
- BIOS initiates a cold reset flow at the platform. In a cold reset, the sustain power well maintains power most other rails are power cycled.
- On cold reset exit, launches only the cores requested by BIOS. To software, it will appear as if these cores do not exist.

Software may discover the resolved core exists vector: resolved_core_exists_vector = (!CORE_DISABLE_MASK) and CORE_EXISTS_VECTOR

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 7168h

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD0:** Reserved
15	0x0 RW	**CORE15_DISABLE_MASK:** core15 disable mask **Power Well:** prst

2	0x0 RW	**CORE2_DISABLE_MASK:** core2 disable mask **Power Well:** prst
1	0x0 RW	**CORE1_DISABLE_MASK:** core1 disable mask **Power Well:** prst
0	0x0 RW	**CORE0_DISABLE_MASK:** core0 disable mask **Power Well:** prst

44.3.208 PL3_CONTROL_MCHBAR (P_CR_PL3_CONTROL_0_0_0_MCHBAR)—Offset 71F0h

Control Power Limit 3 (PL3) and Power Limit 4 (PL4) using this register. This limit control is physically different from the same control in the IA core MSR space.

- PL3 is designed to clamp peak sustained power to levels supported by the battery or input power supply and as such manage lifetime degradation of that power delivery element. With PL3, peak power excursions above the limit are allowed so long as they do not exceed the configured duty cycle constraint in this register.
- PL4 is designed to clamp peak instantaneous power to levels below the max supported by the battery or input power supply. These clamps are implemented a priori and the SOC is guaranteed to constrain itself below the PL4 limit always.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [MCHBAR] + 71F0h

Default: 0000000000000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
63	0x0 RW/L	**LOCK:** Write a 1b to lock this register until next reset. Once locked, no further updates may be written to any bits in the register.
62:48	0x0 RO	**RSVD0:** Reserved
47	0x0 RW/L	**PL4_ENABLE:** • 0 = disabled • 1 = enabled
46:32	0x0 RW/L	**PMAX:** Power Limit 'PL4' or Pmax power limit in the units as described PACAKGE_POWER_SKU_UNIT MSR. The SoC guarantees it will never exceed this power limit even for very short time windows.
31	0x0 RO	**RSVD1:** Reserved
30:24	0x0 RW/L	**DUTY_CYCLE:** Power limit excursion duty cycle control for PL3, describing what percentage of time it is allowed for the SOC to exceed the programmed PL3 power limit. 0% implies excursions are not supported ever and 100% implies excursions are always allowed (effectively disabling the feature). Units are in percentage(%). E.g., to allow for 20% excursion time and 80% PL3 power limit clamp time, program a value of 14h. Values greater than 100 (64h) are clipped to 100%.
23:17	0x0 RW/L	**TIME_WINDOW:** Duration over which duty cycle control will be maintained. The bits of this field describe parameters for a mathematical equation for time window configuration. This time window is strictly adhered to, if the window described is 40ms, then silicon guarantees no excursions to the programmed duty cycle within a rolling 40ms window. This field is split into two sub-fields: • x = bits[6:5] • y = bits[4:0] Time window equation: **time_window = PACKAGE_POWER_SKU_UNIT.TIME_UNIT * ((1+x/4)^y)**
16	0x0 RO	**RSVD2:** Reserved
15	0x0 RW/L	**PL3_ENABLE:** • 0 = disabled • 1 = enabled

Bit Range	Default & Access	Field Name (ID): Description
14:0	0x0 RW/L	**POWER_LIMIT:** Power Limit 3 (PL3) or PAppMax power level. Any SoC power measurement observed above this level is considered as an excursion against the PL3 power limit and duty cycle / time window budget. Units of this power limit are defined by PACKAGE_POWER_SKU_UNIT_MSR.PWR_UNIT.

44.3.209 CONFIG_TDP_LEVEL (P_CR_CONFIG_TDP_LEVEL1_0_0_0_MCHBAR)—Offset 7220h

Config TDP level n. There are 3 instances of this register for 3 different levels.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [MCHBAR] + 7220h

Default: 0000000000000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
63	0x0 RO	**RSVD0:** Reserved
62:48	0x0 RW	**PKG_MIN_POWER:** Min Power of SKU (units from PKG_POWER_SKU_UNIT)
47	0x0 RO	**RSVD1:** Reserved
46:32	0x0 RW	**PKG_MAX_POWER:** Max Power of SKU
31:24	0x0 RO	**RSVD2:** Reserved
23:16	0x0 RW	**TDP_RATIO:** TDP ratio for this level
15	0x0 RO	**RSVD3:** Reserved
14:0	0x0 RW	**TDP_POWER_VALUE:** TDP power value (Units from PKG_POWER_SKU_UNIT)

44.3.210 CONFIG_TDP_LEVEL (P_CR_CONFIG_TDP_LEVEL2_0_0_0_MCHBAR)—Offset 7228h

Config TDP level n. There are 3 instances of this register for 3 different levels.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [MCHBAR] + 7228h

Default: 0000000000000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
63	0x0 RO	**RSVD0:** Reserved
62:48	0x0 RW	**PKG_MIN_POWER:** Min Power of SKU (units from PKG_POWER_SKU_UNIT)

31:24	0x0 RO	**RSVD2:** Reserved
23:16	0x0 RW	**TDP_RATIO:** TDP ratio for this level
15	0x0 RO	**RSVD3:** Reserved
14:0	0x0 RW	**TDP_POWER_VALUE:** TDP power value (Units from PKG_POWER_SKU_UNIT)

44.3.212 CONFIG_TDP_CONTROL (P_CR_CONFIG_TDP_CONTROL_0_0_0_MCHBAR)—Offset 7238h

Config TDP control

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MCHBAR] + 7238h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/L	**CONFIG_TDP_LOCK:** Lock this register. BIOS should set this after selecting ConfigTDP level
30:2	0x0 RO	**RSVD0:** Reserved
1:0	0x0 RW/L	**CONFIG_TDP_LEVEL:** Used to select which configTDP level is desired

44.3.213 CONFIG_TDP_NOMINAL (P_CR_CONFIG_TDP_NOMINAL_0_0_0_MCHBAR)—Offset 723Ch

Config TDP nominal

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 723Ch

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD0:** Reserved
7:0	0x0 RW	**TDP_RATIO:** Config TDP ratio

44.3.214 Graphics Superqueue Active Clocks (P_CR_PP1_ANY_THREAD_ACTIVITY_0_0_0_MCHBAR)—Offset 7244h

Graphics Superqueue active residency counter. Counts at ART)) 4.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MCHBAR] + 7244h

Default: 00000000h

MCHBAR Type: PCI Configuration Register (Size: 64 bits)
MCHBAR Reference: [B:0, D:0, F:0] + 48h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**SUPERQUEUE_ACTIVE_RESIDENCY:** Graphics Superqueue active residency counter. Counts in 19.2MHz reference clocks.

44.3.215 B-Unit Copy of Default VTd BAR PMEN (B_CR_PMEN_REG_0_0_0_DEFVTDBAR)—Offset 64h

B-Unit copy of the Default VTd BAR PMEN register. Bit 31 is the only bit used for B-Unit.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [DEFVTDBAR] + 64h

Default: 00000000h

DEFVTDBAR Type: Memory Mapped I/O Register (Size: 64 bits)
DEFVTDBAR Reference: MCHBAR + 6C80)h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/V	**EPM:** This field controls DMA accesses to the protected lowmemory and protected highmemory regions. • 0: Protected memory regions are disabled. • 1: Protected memory regions are enabled.
30:1	0x0 RO	**Reserved (RESERVED_0):** Reserved.
0	0x0 RO	**PRS Unused (PRS):** Unused by the B-Unit. This field indicates the status of protected memory regions: • 0: Protected memory regions are disabled. • 1: Protected memory regions are enabled.

44.3.216 B-Unit Copy of Default VTd BAR PLM Base Register (B_CR_PLMBASE_REG_0_0_0_DEFVTDBAR)—Offset 68h

Register to set up the base address of DMA-protected low-memory region below 4GB. This register must be set up before enabling protected memory through PMEN_REG, and must not be updated when protected memory regions are enabled. This register is always treated as RO for implementations not supporting protected low memory region (PLMR field reported as Clear in the Capability register). The alignment of the protected low memory region base depends on the number of reserved bits (N:0) of this register. Software may determine N by writing all 1s to this register, and finding the most significant bit position with 0 in the value read back from the register. Bits N:0 of this register are decoded by hardware as all 0s. Software must setup the protected low memory region below 4GB. Section 10.4.18 of the Intel Virtualization Technology for Directed I/O: Spec describes the Protected Low-Memory Limit register and hardware decoding of these registers. Software must not modify this register when protected memory regions are enabled (PRS field Set in PMEN_REG).

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [DEFVTDBAR] + 68h

Default: 00000000h

DEFVTDBAR Type: Memory Mapped I/O Register (Size: 64 bits)
DEFVTDBAR Reference: MCHBAR + 6C80)h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW/V	**Protected Low Memory Base (PLMB):** This register specifies the base of the protected low-memory region in system memory.
19:0	0x0 RO	**Reserved (RESERVED_0):** Reserved.

44.3.217 B-Unit Copy of Default VTd BAR PLM Limit Register (B_CR_PLMLIMIT_REG_0_0_0_DEFVTDBAR)—Offset 6Ch

This register sets up the limit address of DMA-protected low-memory region below 4GB. This register must be set up before enabling protected memory through PMEN_REG, and it must not be updated when protected memory regions are enabled. This register is always treated as RO for implementations not supporting protected low memory region (PLMR field reported as Clear in the Capability register). The alignment of the protected low memory region limit depends on the number of reserved bits (N:0) of this register. Software may determine N by writing all 1's to this register, and then finding most significant zero bit position with 0 in the value read back from the register. Bits N:0 of the limit register are decoded by hardware as all 1s.

The Protected low-memory base and limit registers function as follows:

Programming the protected low-memory base and limit registers with the same value in bits 31:(N+1) specifies a protected low-memory region of size 2^(N+1) bytes. Programming the protected low-memory limit register with a value less than the protected low-memory base register disables the protected low-memory region. Software must not modify this register when protected memory regions are enabled (PRS field Set in PMEN_REG).

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [DEFVTDBAR] + 6Ch

DEFVTDBAR Type: Memory Mapped I/O Register (Size: 64 bits)
DEFVTDBAR Reference: MCHBAR + 6C80)h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW/V	**Protected Low Memory Limit (PLML):** This register specifies the last host physical address of the DMAprotected lowmemory region in system memory.
19:0	0x0 RO	**Reserved (RESERVED_0):** Reserved.

44.3.218 B-Unit Copy of Default VTd BAR PHM Base Register (B_CR_PHMBASE_REG_0_0_0_DEFVTDBAR)—Offset 70h

This is the register to set up the base address of the DMA-protected high-memory region. This register must be set up before enabling protected memory through PMEN_REG, and must not be updated when protected memory regions are enabled. This register is always treated as RO for implementations not supporting protected high memory region (PHMR field reported as Clear in the Capability register). The alignment of the protected high memory region base depends on the number of reserved bits (N:0) of this register. Software may determine N by writing all 1's to this register, and finding most significant zero bit position below host address width (HAW) in the value read back from the register. Bits N:0 of this register are decoded by hardware as all 0s. Software may setup the protected high memory region either above or below 4GB. Software must not modify this register when protected memory regions are enabled (PRS field Set in PMEN_REG).

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [DEFVTDBAR] + 70h

Default: 0000000000000000h

DEFVTDBAR Type: Memory Mapped I/O Register (Size: 64 bits)
DEFVTDBAR Reference: MCHBAR + 6C80)h

Bit Range	Default & Access	Field Name (ID): Description
63:39	0x0 RO	**Reserved (RESERVED_1):** Reserved.
38:20	0x0 RW/V	**Protected High Memory Base (PHMB):** This register specifies the base of protected high memory region in system memory. Hardware ignores and does not implement bits 63:HAW, where HAW is the host address width.
19:0	0x0 RO	**Reserved (RESERVED_0):** Reserved.

44.3.219 B-Unit Copy of Default VTd BAR PHM Limit Register (B_CR_PHMLIMIT_REG_0_0_0_DEFVTDBAR)—Offset 78h

Register to set up the limit address of DMA-protected high-memory region. This register must be set up before enabling protected memory through PMEN_REG, and must not be updated when protected memory regions are enabled. This register is always treated as RO for implementations not supporting protected high memory region (PHMR field reported as Clear in the Capability register). The alignment of the protected high memory region limit depends on the number of reserved bits (N:0) of this register. Software may determine the value of N by writing all ones to this register, and finding most significant zero bit position below host address width (HAW) in the value read back from the register. Bits N:0 of the limit register are decoded by hardware as all ones.

The protected high-memory base and limit registers function as follows:

Programming the protected low-memory base and limit registers with the same value in bits HAW:(N+1) specifies a protected low-memory region of size 2^(N+1) bytes. Programming the protected high-memory limit register with a value less than the protected high-memory base register disables the protected high-memory region. Software must not modify this register when protected memory regions are enabled (PRS field Set in PMEN_REG).

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [DEFVTDBAR] + 78h

Default: 0000000000000000h

DEFVTDBAR Type: Memory Mapped I/O Register (Size: 64 bits)
DEFVTDBAR Reference: MCHBAR + 6C80)h

Bit Range	Default & Access	Field Name (ID): Description
63:39	0x0 RO	**Reserved (RESERVED_1):** Reserved.
38:20	0x0 RW/V	**Protected High Memory Limit (PHML):** This register specifies the last host physical address of the DMA protected high memory region in system memory. Hardware ignores and does not implement bits 63:HAW where HAW is the host address width.
19:0	0x0 RO	**Reserved (RESERVED_0):** Reserved.

44.4 Registers in Memory Space—DEFVTDBAR

44.4.1 Version Register (VER_REG_0_0_0_VTDBAR)—Offset 0h

Register to report the architecture version supported. Backward compatibility for the architecture is maintained with new revision numbers, allowing software to load remapping hardware drivers written for prior architecture versions.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [DEFVTDBAR] + 0h

Default: 00000010h

DEFVTDBAR Type: Memory Mapped I/O Register (Size: 64 bits)
DEFVTDBAR Reference: B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD0:** Reserved
7:4	0x1 RO	**Major Version Number (MAJOR):** Indicates supported architecture version.
3:0	0x0 RO	**Minor Version Number (MINOR):** Indicates supported architecture minor version.

44.4.2 Capability Register (CAP_REG_0_0_0_VTDBAR)—Offset 8h

Register to report general remapping hardware capabilities.

Note: These values can change based on defeature bits.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [DEFVTDBAR] + 8h

Default: 00D2008C40660462h

DEFVTDBAR Type: Memory Mapped I/O Register (Size: 64 bits)
DEFVTDBAR Reference: B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

Bit Range	Default & Access	Field Name (ID): Description
63:57	0x0 RO	**Reserved:** Reserved
56	0x0 RO	**First Level 64-KByte Page SupportP (FL1GP):** A value of 1 in this field indicates 1-GByte page size is supported for first-level translation.
55	0x1 RO	**Read Draining (DRD):** • 0 = Hardware does not support draining of DMA read requests. • 1 = Hardware supports draining of DMA read requests.
54	0x1 RO	**Write Draining (DWD):** • 0 = Hardware does not support draining of DMA write requests. • 1 = Hardware supports draining of DMA write requests.

22	0x1 RO	**Reserved:** Reserved
21:16	0x26 RO	**Reserved:** Reserved
15:13	0x0 RO	**Reserved:** Reserved
12:8	0x4 RO	**Reserved:** Reserved
7	0x0 RO	**Caching Mode (CM):** • 0 = Not-present and erroneous entries are not cached in any of the remapping caches. Invalidations are not required for modifications to individual not present or invalid entries. However, any modifications that result in decreasing the effective permissions or partial permission increases require invalidations for them to be effective. • 1 = Not-present and erroneous mappings may be cached in the remapping caches. Any software updates to the remapping structures (including updates to not-present or erroneous entries) require explicit invalidation.
6	0x1 RO	**Protected High-Memory Region (PHMR):** • 0 = Indicates protected high-memory region is not supported. • 1 = Indicates protected high-memory region is supported.
5	0x1 RO	**Protected Low-Memory Region (PLMR):** • 0 = Indicates protected low-memory region is not supported. • 1 = Indicates protected low-memory region is supported.
4	0x0 RO	**Required Write-Buffer Flushing (RWBF):** • 0 = Indicates no write-buffer flushing is needed to ensure changes to memory-resident structures are visible to hardware. • 1 = Indicates software must explicitly flush the write buffers to ensure updates made to memory-resident remapping structures are visible to hardware.
3	0x0 RO	**Advanced Fault Logging (AFL):** • 0 = Indicates advanced fault logging is not supported. Only primary fault logging is supported. • 1 = Indicates advanced fault logging is supported.
2:0	0x2 RO	**Number of Domains Supported (ND):** • 010b = Hardware supports 8-bit domain-ids with support for up to 256 domains.

44.4.3 Extended Capability Register (ECAP_REG_0_0_0_VTDBAR)—Offset 10h

Register to report remapping hardware extended capabilities. Note: These values can change based on defeature bits.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [DEFVTDBAR] + 10h

Default: 0000000000F050DAh

DEFVTDBAR Type: Memory Mapped I/O Register (Size: 64 bits)
DEFVTDBAR Reference: B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

Bit Range	Default & Access	Field Name (ID): Description
63:40	0x0 RO	**RSVD0:** Reserved
39:35	0x0 RO	**PASID Size Supported (PSS):** This field reports the PASID size supported by the remapping hardware for requests-with-PASID. A value of N in this field indicates hardware supports PASID field of N+1 bits (For example, value of 7 in this field, indicates 8-bit PASIDs are supported). Requests-with-PASID with PASID value beyond the limit specified by this field are treated as error by the remapping hardware. This field is valid only when PASID field is reported as Set.
34	0x0 RO	**Extended Accessed Flag Support (EAFS):** • 0 = Hardware does not support the extended-accessed (EA) bit in first-level paging-structure entries. • 1 = Hardware supports the extended accessed (EA) bit in first-level paging-structure entries. This field is valid only when PASID field is reported as Set.
33	0x0 RO	**No Write Flag Support (NWFS):** • 0 = Hardware ignores the No Write (NW) flag in Device-TLB translation requests, and behaves as if NW is always 0. • 1 = Hardware supports the No Write (NW) flag in Device-TLB translation requests. This field is valid only when Device-TLB support (DT) field is reported as Set.
32	0x0 RO	**PASID-Only Translations (POT):** • 0 = Hardware does not support PASID-only Translation Type in extended-context-entries. • 1 = Hardware supports PASID-only Translation Type in extended-context-entries. This field is valid only when PASID field is reported as Set.
31	0x0 RO	**Supervisor Request Support (SRS):** • 0 = H/W does not support requests-with-PASID seeking supervisor privilege. • 1 = H/W supports requests-with-PASID seeking supervisor privilege. The field is valid only when PASID field is reported as Set.
30	0x0 RO	**Execute Request Support (ERS):** • 0 = H/W does not support requests-with-PASID seeking execute permission. • 1 = H/W supports requests-with-PASID seeking execute permission. This field is valid only when PASID field is reported as Set.
29	0x0 RO	**Page Request Support (PRS):** • 0 = Hardware does not support Page Requests. • 1 = Hardware supports Page Requests This field is valid only when Device-TLB (DT) field is reported as Set.

Bit Range	Default & Access	Field Name (ID): Description
28	0x0 RO	**Process Address Space ID Support (PASID):** • 0 = Hardware does not support requests tagged with Process Address Space IDs. • 1 = Hardware supports requests tagged with Process Address Space IDs.
27	0x0 RO	**Deferred Invalidate Support (DIS):** • 0 = Hardware does not support deferred invalidations of IOTLB and Device-TLB. • 1 = Hardware supports deferred invalidations of IOTLB and Device-TLB. This field is valid only when PASID field is reported as Set.
26	0x0 RO	**Nested Translation Support (NEST):** • 0 = Hardware does not support nested translations. • 1 = Hardware supports nested translations. This field is valid only when PASID field is reported as Set.
25	0x0 RO	**Memory Type Support (MTS):** • 0 = Hardware does not support Memory Type in first-level translation and Extended Memory type in second-level translation. • 1 = Hardware supports Memory Type in first-level translation and Extended Memory type in second-level translation. This field is valid only when PASID and ECS fields are reported as Set. Remapping hardware units with, one or more devices that operate in processor coherency domain, under its scope must report this field as Set.
24	0x0 RO	**Extended Context Support (ECS):** • 0 = Hardware does not support extended-root-entries and extended-context-entries. • 1 = Hardware supports extended-root-entries and extended-context-entries. Implementations reporting PASID or PRS fields as Set, must report this field as Set.
23:20	0xf RO	**Maximum Handle Mask Value (MHMV):** The value in this field indicates the maximum supported value for the Handle Mask (HM) field in the interrupt entry cache invalidation descriptor (iec_inv_dsc). This field is valid only when the IR field in Extended Capability register is reported as Set.
19:18	0x0 RO	**RSVD1:** Reserved
17:8	0x50 RO	**IOTLB Register Offset (IRO):** This field specifies the offset to the IOTLB registers relative to the register base address of this remapping hardware unit. If the register base address is X, and the value reported in this field is Y, the address for the first IOTLB invalidation register is calculated as X+(16*Y).
7	0x1 RO	**Snoop Control (SC):** • 0 = Hardware does not support 1-setting of the SNP field in the page-table entries. • 1 = Hardware supports the 1-setting of the SNP field in the page-table entries.
6	0x1 RO	**Pass Through (PT):** • 0 = Hardware does not support pass-through translation type in context entries and extended-context-entries. • 1 = Hardware supports pass-through translation type in context entries and extended-context-entries. Pass-through translation is specified through Translation-Type (T) field value of 10b in context-entries, or T field value of 010b in extended-context-entries. Hardware implementations supporting PASID must report a value of 1b in this field.
5	0x0 RO	**RSVD2:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
4	0x1 RO	**Extended Interrupt Mode (EIM):** • 0 = On Intel64 platforms, hardware supports only 8-bit APIC-IDs (xAPIC mode). • 1 = On Intel64 platforms, hardware supports 32-bit APIC-IDs (x2APIC mode). This field is valid only on Intel64 platforms reporting Interrupt Remapping support (IR field Set).
3	0x1 RO	**Interrupt Remapping Suport (IR):** • 0 = Hardware does not support interrupt remapping. • 1 = Hardware supports interrupt remapping. Implementations reporting this field as Set must also support Queued Invalidation (QI).
2	0x0 RO	**Device-TLB Support (DT):** • 0 = Hardware does not support device-IOTLBs. • 1 = Hardware supports Device-IOTLBs. Implementations reporting this field as Set must also support Queued Invalidation (QI). Hardware implementations supporting I/O Page Requests (PRS field Set in Extended Capability register) must report a value of 1b in this field.
1	0x1 RO	**Queued Invalidation Support (QI):** • 0 = Hardware does not support queued invalidations. • 1 = Hardware supports queued invalidations.
0	0x0 RO	**Page-Walk Coherency (C):** This field indicates if hardware access to the root, context, extended-context and interrupt-remap tables, and second-level paging structures for requests-without-PASID, are coherent (snooped) or not. • 0 = Indicates hardware accesses to remapping structures are non-coherent. • 1 = Indicates hardware accesses to remapping structures are coherent. Hardware access to advanced fault log, invalidation queue, invalidation semaphore, page-request queue, PASID-table, PASID-state table, and first-level page-tables are always coherent.

44.4.4 Global Command Register (GCMD_REG_0_0_0_VTDBAR)—Offset 18h

Register to control remapping hardware. If multiple control fields in this register need to be modified, software must serialize the modifications through multiple writes to this register.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [DEFVTDBAR] + 18h

Default: 00000000h

DEFVTDBAR Type: Memory Mapped I/O Register (Size: 64 bits)
DEFVTDBAR Reference: B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**Translation Enable (TE):** Software writes to this field to request hardware to enable/disable DMA-remapping: • 0 = Disable DMA remapping. • 1 = Enable DMA remapping.
30	0x0 WO	**Set Root Table Pointer (SRTP):** Software sets this field to set/update the root-entry table pointer used by hardware. The root-entry table pointer is specified through the Root-entry Table Address (RTA_REG) register. The Set Root Table Pointer operation must be performed before enabling or re-enabling (after disabling) DMA remapping through the TE field.
29	0x0 RO	**Reserved:** Reserved
28	0x0 RO	**Reserved:** Reserved
27	0x0 RO	**Reserved:** Reserved
26	0x0 RW	**Queued Invalidation Enable (QIE):** This field is valid only for implementations supporting queued invalidations. Software writes to this field to enable or disable queued invalidations. • 0 = Disable queued invalidations. • 1 = Enable use of queued invalidations.
25	0x0 RW	**Interrupt Remapping Enable (IRE):** This field is valid only for implementations supporting interrupt remapping. • 0 = Disable interrupt-remapping hardware. • 1 = Enable interrupt-remapping hardware.
24	0x0 WO	**Set Interrupt Remap Table Pointer (SIRTP):** This field is valid only for implementations supporting interrupt-remapping. Software sets this field to set/update the interrupt remapping table pointer used by hardware. The interrupt remapping table pointer is specified through the Interrupt Remapping Table Address (IRTA_REG) register.
23	0x0 RW	**Compatibility Format Interrupt (CFI):** This field is valid only for Intel64 implementations supporting interrupt-remapping. Software writes to this field to enable or disable Compatibility Format interrupts on Intel64 platforms. The value in this field is effective only when interrupt-remapping is enabled and Extended Interrupt Mode (x2APIC mode) is not enabled. • 0 = Block Compatibility format interrupts. • 1 = Process Compatibility format interrupts as pass-through (bypass interrupt remapping).
22:0	0x0 RO	**RSVD0:** Reserved

44.4.5 Global Status Register (GSTS_REG_0_0_0_VTDBAR)—Offset 1Ch

Register to report general remapping hardware status.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [DEFVTDBAR] + 1Ch

Default: 00000000h

DEFVTDBAR Type: Memory Mapped I/O Register (Size: 64 bits)
DEFVTDBAR Reference: B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO/V	**Reserved:** Reserved
30	0x0 RO/V	**Reserved:** Reserved
29	0x0 RO	**Fault Log Status (FLS):** This field: • Is cleared by hardware when software Sets the SFL field in the Global Command register. • Is Set by hardware when hardware completes the Set Fault Log Pointer operation using the value provided in the Advanced Fault Log register.
28	0x0 RO	**Advanced Fault Logging Status (AFLS):** This field is valid only for implementations supporting advanced fault logging. It indicates the advanced fault logging status: • 0 = Advanced Fault Logging is not enabled. • 1 = Advanced Fault Logging is enabled.
27	0x0 RO	**Write Buffer Flush Status (WBFS):** This field is valid only for implementations requiring write buffer flushing. This field indicates the status of the write buffer flush command.
26	0x0 RO/V	**Queued Invalidation Enable Status (QIES):** This field indicates queued invalidation enable status. • 0 = queued invalidation is not enabled. • 1 = queued invalidation is enabled
25	0x0 RO/V	**Interrupt Remapping Enable Status (IRES):** This field indicates the status of Interrupt-remapping hardware. • 0 = Interrupt-remapping hardware is not enabled. • 1 = Interrupt-remapping hardware is enabled
24	0x0 RO/V	**Interrupt Remapping Pointer Status (IRTPS):** This field indicates the status of the interrupt remapping table pointer in hardware. This field is cleared by hardware when software sets the SIRTP field in the Global Command register.
23	0x0 RO/V	**Compatibility Format Interrupt Status (CFIS):** This field indicates the status of Compatibility format interrupts on Intel64 implementations supporting interrupt-remapping. The value reported in this field is applicable only when interrupt-remapping is enabled and Extended Interrupt Mode (x2APIC mode) is not enabled. • 0 = Compatibility format interrupts are blocked. • 1 = Compatibility format interrupts are processed as pass-through (bypassing interrupt remapping).
22:0	0x0 RO	**RSVD0:** Reserved

44.4.6 Root Table Address Register (RTADDR_REG_0_0_0_VTDBAR)—Offset 20h

Register providing the base address of root-entry table.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [DEFVTDBAR] + 20h

Default: 0000000000000000h

DEFVTDBAR Type: Memory Mapped I/O Register (Size: 64 bits)
DEFVTDBAR Reference: B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

Bit Range	Default & Access	Field Name (ID): Description
63:12	0x0 RW	**Root Table Address (RTA):** This register points to base of page aligned, 4KB-sized root-entry table in system memory.
11	0x0 RW	**Root Table Type (RTT):** This field specifies the type of root-table referenced by the Root Table Address (RTA) field: • 0 = Root Table. • 1 = Extended Root Table
10:0	0x0 RO	**RSVD0:** Reserved

44.4.7 Context Command Register (CCMD_REG_0_0_0_VTDBAR)—Offset 28h

Register to manage context cache. The act of writing the uppermost byte of the CCMD_REG with the ICC field Set causes the hardware to perform the context-cache invalidation.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [DEFVTDBAR] + 28h

Default: 0800000000000000h

DEFVTDBAR Type: Memory Mapped I/O Register (Size: 64 bits)
DEFVTDBAR Reference: B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

Bit Range	Default & Access	Field Name (ID): Description
63	0x0 RW/V	**Invalidate Context Cache (ICC):** Software requests invalidation of context-cache by setting this field. Software must also set the requested invalidation granularity by programming the CIRG field. Software must read back and check the ICC field is Clear to confirm the invalidation is complete. Software must not update this register when this field is set. Hardware clears the ICC field to indicate the invalidation request is complete. Hardware also indicates the granularity at which the invalidation operation was performed through the CAIG field. Software must submit a context-cache invalidation request through this field only when there are no invalidation requests pending at this remapping hardware unit. Since information from the context-cache may be used by hardware to tag IOTLB entries, software must perform domain-selective (or global) invalidation of IOTLB after the context cache invalidation has completed. Hardware implementations reporting write-buffer flushing requirement (RWBF=1 in Capability register) must implicitly perform a write buffer flush before invalidating the context cache.
62:61	0x0 RW	**Context Invalidation Request Granularity (CIRG):** Software provides the requested invalidation granularity through this field when setting the ICC field: • 00: Reserved. • 01: Global Invalidation request. • 10: Domain-selective invalidation request. The target domain-id must be specified in the DID field. • 11: Device-selective invalidation request. The target source-id(s) must be specified through the SID and FM fields, and the domain-id (that was programmed in the context-entry for these device(s)) must be provided in the DID field. Hardware implementations may process an invalidation request by performing invalidation at a coarser granularity than requested. Hardware indicates completion of the invalidation request by clearing the ICC field. At this time, hardware also indicates the granularity at which the actual invalidation was performed through the CAIG field.
60:59	0x1 RO/V	**Context Actual Invalidation Granularity (CAIG):** Hardware reports the granularity at which an invalidation request was processed through the CAIG field at the time of reporting invalidation completion (by clearing the ICC field). The following are the encodings for this field: • 00: Reserved. • 01: Global Invalidation performed. This could be in response to a global, domain-selective or device-selective invalidation request. • 10: Domain-selective invalidation performed using the domain-id specified by software in the DID field. This could be in response to a domain-selective or device-selective invalidation request. • 11: Device-selective invalidation performed using the source-id and domain-id specified by software in the SID and FM fields. This can only be in response to a device-selective invalidation request.
58:34	0x0 RO	**RSVD0:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
33:32	0x0 RW	**Function Mask (FM):** Software may use the Function Mask to perform device-selective invalidations on behalf of devices supporting PCI Express Phantom Functions. This field specifies which bits of the function number portion (least significant three bits) of the SID field to mask when performing device-selective invalidations. The following encodings are defined for this field: • 00: No bits in the SID field masked. • 01: Mask most significant bit of function number in the SID field. • 10: Mask two most significant bit of function number in the SID field. • 11: Mask all three bits of function number in the SID field. The context-entries corresponding to all the source-ids specified through the FM and SID fields must have to the domain-id specified in the DID field.
31:16	0x0 RW	**Source-ID (SID):** Indicates the source-id of the device whose corresponding context-entry needs to be selectively invalidated. This field along with the FM field must be programmed by software for device-selective invalidation requests.
15:0	0x0 RW	**Domain-ID (DID):** Indicates the id of the domain whose context-entries need to be selectively invalidated. This field must be programmed by software for both domain-selective and device-selective invalidation requests. The Capability register reports the domain-id width supported by hardware. Software must ensure that the value written to this field is within this limit. Hardware may ignore and not implement bits15:N, where N is the supported domain-id width reported in the Capability register.

44.4.8 Fault Status Register (FSTS_REG_0_0_0_VTDBAR)—Offset 34h

Register indicating the various error status.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [DEFVTDBAR] + 34h

Default: 00000000h

DEFVTDBAR Type: Memory Mapped I/O Register (Size: 64 bits)
DEFVTDBAR Reference: B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD0:** Reserved
15:8	0x0 RO	**Fault Record Index (FRI):** This field is valid only when the PPF field is Set. The FRI field indicates the index (from base) of the fault recording register to which the first pending fault was recorded when the PPF field was Set by hardware. The value read from this field is undefined when the PPF field is clear.
7	0x0 RW/1C	**Page Request Overflow (PRO):** Hardware detected a Page Request Overflow error. Hardware implementations not supporting the Page Request Queue implement this bit as RsvdZ. **Power Well:** prst
6	0x0 RO	**Invalidation Time-out Error (ITE):** Hardware detected a Device-IOTLB invalidation completion time-out. At this time, a fault event may be generated based on the programming of the Fault Event Control register. Hardware implementations not supporting device Device-IOTLBs implement this bit as RsvdZ.
5	0x0 RO	**Invalidation Completion Error (ICE):** Hardware received an unexpected or invalid Device-IOTLB invalidation completion. This could be due to either an invalid ITag or invalid source-id in an invalidation completion response. At this time, a fault event may be generated based on the programming of hte Fault Event Control register. Hardware implementations not supporting Device-IOTLBs implement this bit as RsvdZ.
4	0x0 RW/1C	**Invalidation Queue Error (IQE):** Hardware detected an error associated with the invalidation queue. This could be due to either a hardware error while fetching a descriptor from the invalidation queue, or hardware detecting an erroneous or invalid descriptor in the invalidation queue. At this time, a fault event may be generated based on the programming of the Fault Event Control register. Hardware implementations not supporting queued invalidations implement this bit as RsvdZ. **Power Well:** prst
3	0x0 RO	**Advanced Pending Fault (APF):** When this field is Clear, hardware sets this field when the first fault record (at index 0) is written to a fault log. At this time, a fault event is generated based on the programming of the Fault Event Control register. Software writing 1 to this field clears it. Hardware implementations not supporting advanced fault logging implement this bit as RsvdZ.
2	0x0 RO	**Advanced Fault Overflow (AFO):** Hardware sets this field to indicate advanced fault log overflow condition. At this time, a fault event is generated based on the programming of the Fault Event Control register. Software writing 1 to this field clears it. Hardware implementations not supporting advanced fault logging implement this bit as RsvdZ.
1	0x0 RO/V	**Primary Pending Fault (PPF):** This field indicates if there are one or more pending faults logged in the fault recording registers. Hardware computes this field as the logical OR of Fault (F) fields across all the fault recording registers of this remapping hardware unit. • 0 = No pending faults in any of the fault recording registers. • 1 = One or more fault recording registers has pending faults. The FRI field is updated by hardware whenever the PPF field is set by hardware. Also, depending on the programming of Fault Event Control register, a fault event is generated when hardware sets this field. **Power Well:** prst

Bit Range	Default & Access	Field Name (ID): Description
0	0x0 RW/1C	**Primary Fault Overflow (PFO):** Hardware sets this field to indicate overflow of fault recording registers. Software writing 1 clears this field. When this field is Set, hardware does not record any new faults until software clears this field. **Power Well:** prst

44.4.9 Fault Event Control Register (FECTL_REG_0_0_0_VTDBAR)—Offset 38h

Register specifying the fault event interrupt message control bits.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [DEFVTDBAR] + 38h

Default: 80000000h

DEFVTDBAR Type: Memory Mapped I/O Register (Size: 64 bits)
DEFVTDBAR Reference: B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

Bit Range	Default & Access	Field Name (ID): Description
31	0x1 RW	**Interrupt Mask (IM):** • 0 = No masking of interrupt. When an interrupt condition is detected, hardware issues an interrupt message (using the Fault Event Data and Fault Event Address register values). • 1 = This is the value on reset. Software may mask interrupt message generation by setting this field. Hardware is prohibited from sending the interrupt message when this field is set.
30	0x0 RO/V	**Interrupt Pending (IP):** Hardware sets the IP field whenever it detects an interrupt condition, which is defined as: • When primary fault logging is active, an interrupt condition occurs when hardware records a fault through one of the Fault Recording registers and sets the PPF field in Fault Status register. • When advanced fault logging is active, an interrupt condition occurs when hardware records a fault in the first fault record (at index 0) of the current fault log and sets the APF field in the Fault Status register. • Hardware detected error associated with the Invalidation Queue, setting the IQE field in the Fault Status register. • Hardware detected invalid Device-IOTLB invalidation completion, setting the ICE field in the Fault Status register. • Hardware detected Device-IOTLB invalidation completion time-out, setting the ITE field in the Fault Status register. If any of the status fields in the Fault Status register was already Set at the time of setting any of these fields, it is not treated as a new interrupt condition. The IP field is kept set by hardware while the interrupt message is held pending. The interrupt message could be held pending due to interrupt mask (IM field) being Set or other transient hardware conditions. The IP field is cleared by hardware as soon as the interrupt message pending condition is serviced. This could be due to either: • Hardware issuing the interrupt message due to either change in the transient hardware condition that caused interrupt message to be held pending, or due to software clearing the IM field. • Software servicing all the pending interrupt status fields in the Fault Status register as follows: • When primary fault logging is active, software clearing the Fault (F) field in all the Fault Recording registers with faults, causing the PPF field in Fault Status register to be evaluated as clear. • Software clearing other status fields in the Fault Status register by writing back the value read from the respective fields.
29:0	0x0 RO	**RSVD0:** Reserved

44.4.10 Fault Event Data Register (FEDATA_REG_0_0_0_VTDBAR)—Offset 3Ch

Register specifying the interrupt message data

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [DEFVTDBAR] + 3Ch

Default: 00000000h

DEFVTDBAR Type: Memory Mapped I/O Register (Size: 64 bits)
DEFVTDBAR Reference: B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**Extended Interrupt Message Data (EIMD):** This field is valid only for implementations supporting 32-bit interrupt data fields. Hardware implementations supporting only 16-bit interrupt data may treat this field as RsvdZ.
15:0	0x0 RW	**Interrupt Message Data (IMD):** Data value in the interrupt request.

44.4.11 Fault Event Address Register (FEADDR_REG_0_0_0_VTDBAR)—Offset 40h

Register specifying the interrupt message address.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [DEFVTDBAR] + 40h

Default: 00000000h

DEFVTDBAR Type: Memory Mapped I/O Register (Size: 64 bits)
DEFVTDBAR Reference: B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**Message Address (MA):** When fault events are enabled, the contents of this register specify the DWORD-aligned address (bits 31:2) for the interrupt request.
1:0	0x0 RO	**RSVD0:** Reserved

44.4.12 Fault Event Upper Address Register (FEUADDR_REG_0_0_0_VTDBAR)—Offset 44h

Register specifying the interrupt message upper address.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [DEFVTDBAR] + 44h

Default: 00000000h

DEFVTDBAR Type: Memory Mapped I/O Register (Size: 64 bits)
DEFVTDBAR Reference: B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Message Upper Address (MUA):** Hardware implementations supporting Extended Interrupt Mode are required to implement this register. Hardware implementations not supporting Extended Interrupt Mode may treat this field as RsvdZ.

44.4.13 Advanced Fault Log Register (AFLOG_REG_0_0_0_VTDBAR)—Offset 58h

Register to specify the base address of the memory-resident fault-log region. This register is treated as RsvdZ for implementations not supporting advanced translation fault logging (AFL field reported as 0 in the Capability register).

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [DEFVTDBAR] + 58h

Default: 0000000000000000h

DEFVTDBAR Type: Memory Mapped I/O Register (Size: 64 bits)
DEFVTDBAR Reference: B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

Bit Range	Default & Access	Field Name (ID): Description
63:12	0x0 RO	**Fault Log Address (FLA):** This field specifies the base of 4KB aligned fault-log region in system memory. Hardware ignores and does not implement bits 63:HAW, where HAW is the host address width. Software specifies the base address and size of the fault log region through this register, and programs it in hardware through the SFL field in the Global Command register. When implemented, reads of this field return the value that was last programmed to it.
11:9	0x0 RO	**Fault Log Size (FLS):** This field specifies the size of the fault log region pointed by the FLA field. The size of the fault log region is 2X * 4KB, where X is the value programmed in this register. When implemented, reads of this field return the value that was last programmed to it.
8:0	0x0 RO	**RSVD0:** Reserved

44.4.14 Protected Memory Enable Register (PMEN_REG_0_0_0_VTDBAR)—Offset 64h

Register to enable the DMA-protected memory regions setup through the PLMBASE,..PLMLIMT, PHMBASE, PHMLIMIT registers. This register is always treated as RO for implementations not supporting protected memory regions (PLMR and PHMR fields reported as Clear in the Capability register). Protected memory regions may be used by software to securely initialize remapping structures in memory. To avoid impact to legacy BIOS usage of memory, software is recommended to not overlap protected memory regions with any reserved memory regions of the platform reported through the Reserved Memory Region Reporting (RMRR) structures.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [DEFVTDBAR] + 64h

Default: 00000000h

DEFVTDBAR Type: Memory Mapped I/O Register (Size: 64 bits)
DEFVTDBAR Reference: B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**Enable Protected Memory (EPM):** This field controls DMA accesses to the protected low-memory and protected high-memory regions. • 0 = Protected memory regions are disabled. • 1 = Protected memory regions are enabled.DMA requests accessing protected memory regions are handled as follows: When DMA remapping is not enabled, all DMA requests accessing protected memory regions are blocked. When DMA remapping is enabled: DMA requests processed as pass-through (Translation Type value of 10b in Context-Entry) and accessing the protected memory regions are blocked. DMA requests with translated address (AT=10b) and accessing the protected memory regions are blocked. DMA requests that are subject to address remapping, and accessing the protected memory regions may or may not be blocked by hardware. For such requests, software must not depend on hardware protection of the protected memory regions, and instead program the DMA-remapping page-tables to not allow DMA to protected memory regions. Remapping hardware access to the remapping structures are not subject to protected memory region checks. DMA requests blocked due to protected memory region violation are not recorded or reported as remapping faults. Hardware reports the status of the protected memory enable/disable operation through the PRS field in this register. Hardware implementations supporting DMA draining must drain any in-flight translated DMA requests queued within the Root-Complex before indicating the protected memory region as enabled through the PRS field.
30:1	0x0 RO	**RSVD0:** Reserved
0	0x0 RO/V	**Protected Region Status (PRS):** This field indicates the status of protected memory region(s): • 0 = Protected memory region(s) disabled. • 1 = Protected memory region(s) enabled.

44.4.15 Protected Low Memory Base Register (PLMBASE_REG_0_0_0_VTDBAR)—Offset 68h

Register to set up the base address of DMA-protected low-memory region below 4GB. This register must be set up before enabling protected memory through PMEN_REG, and must not be updated when protected memory regions are enabled. This register is always treated as RO for implementations not supporting protected low memory region (PLMR field reported as Clear in the Capability register). The alignment of the protected low memory region base depends on the number of reserved bits (N:0) of this register. Software may determine N by writing all 1s to this register, and finding the most significant zero bit position with 0 in the value read back from the register. Bits N:0 of this register is decoded by hardware as all 0s...Software must setup the protected low memory region below 4GB. Software must not modify this register when protected memory regions are enabled (PRS field Set in PMEN_REG).

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [DEFVTDBAR] + 68h

Default: 00000000h

DEFVTDBAR Type: Memory Mapped I/O Register (Size: 64 bits)
DEFVTDBAR Reference: B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**Protected Low-Memory Base (PLMB):** This register specifies the base of protected low-memory region in system memory.
19:0	0x0 RO	**RSVD0:** Reserved

44.4.16 Protected Low-Memory Limit Register (PLMLIMIT_REG_0_0_0_VTDBAR)—Offset 6Ch

Register to set up the limit address of DMA-protected low-memory region below 4GB. This register must be set up before enabling protected memory through PMEN_REG, and must not be updated when protected memory regions are enabled This register is always treated as RO for implementations not supporting protected low memory region (PLMR field reported as Clear in the Capability register) The alignment of the protected low memory region limit depends on the number of reserved bits (N:0) of this register. Software may determine N by writing all 1s to this register, and finding most significant zero bit position with 0 in the value read back from the register. Bits N:0 of the limit register is decoded by hardware as all 1s The Protected low-memory base and limit registers functions as follows:

- Programming the protected low-memory base and limit registers with the same value in bits 31: (N+1) specifies a protected low-memory region of size 2(N+1) bytes
- Programming the protected low-memory limit register with a value less than the protected low-memory base register disables the protected low-memory region

Software must not modify this register when protected memory regions are enabled (PRS field Set in PMEN_REG).

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [DEFVTDBAR] + 6Ch

Default: 00000000h

DEFVTDBAR Type: Memory Mapped I/O Register (Size: 64 bits)
DEFVTDBAR Reference: B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW	**Protected Low-Memory Limit (PLML):** This register specifies the last host physical address of the DMA-protected low-memory region in system memory.
19:0	0x0 RO	**RSVD0:** Reserved

44.4.17 Protected High-Memory Base Register (PHMBASE_REG_0_0_0_VTDBAR)—Offset 70h

Register to set up the base address of DMA-protected high-memory region. This register must be set up before enabling protected memory through PMEN_REG, and must not be updated when protected memory regions are enabled This register is always treated as RO for implementations not supporting protected high memory region (PHMR field reported as Clear in the Capability register) The alignment of the protected high memory region base depends on the number of reserved bits (N:0) of this register. Software may determine N by writing all 1s to this register, and finding most significant zero bit position below host address width (HAW) in the value read back from the register. Bits N:0 of this register are decoded by hardware as all 0s Software may setup the protected high memory region either above or below 4GB Software must not modify this register when protected memory regions are enabled (PRS field Set in PMEN_REG).

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [DEFVTDBAR] + 70h

Default: 0000000000000000h

DEFVTDBAR Type: Memory Mapped I/O Register (Size: 64 bits)
DEFVTDBAR Reference: B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

Bit Range	Default & Access	Field Name (ID): Description
63:39	0x0 RO	**RSVD0:** Reserved
38:20	0x0 RW	**Protected High-Memory Base (PHMB):** This register specifies the base of protected (high) memory region in system memory. Hardware ignores, and does not implement, bits 63:HAW, where HAW is the host address width.
19:0	0x0 RO	**RSVD1:** Reserved

44.4.18 Protected High-Memory Limit Register (PHMLIMIT_REG_0_0_0_VTDBAR)—Offset 78h

Register to set up the limit address of DMA-protected high-memory region. This register must be set up before enabling protected memory through PMEN_REG, and must not be updated when protected memory regions are enabled This register is always treated as RO for implementations not supporting protected high memory region (PHMR field reported as Clear in the Capability register) The alignment of the protected high memory region limit depends on the number of reserved bits (N:0) of this register. Software may determine the value of N by writing all 1s to this register, and finding most significant zero bit position below host address width (HAW) in the value read back from the register. Bits N:0 of the limit register is decoded by hardware as all 1s The protected high-memory base and limit registers functions as follows

- Programming the protected low-memory base and limit registers with the same value in bits HAW:(N+1) specifies a protected low-memory region of size 2(N+1) bytes
- Programming the protected high-memory limit register with a value less than the protected high-memory base register disables the protected high-memory region

Software must not modify this register when protected memory regions are enabled (PRS field Set in PMEN_REG).

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [DEFVTDBAR] + 78h

Default: 0000000000000000h

DEFVTDBAR Type: Memory Mapped I/O Register (Size: 64 bits)
DEFVTDBAR Reference: B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

Bit Range	Default & Access	Field Name (ID): Description
63:39	0x0 RO	**RSVD0:** Reserved
38:20	0x0 RW	**Protected High-Memory Limit (PHML):** This register specifies the last host physical address of the DMA-protected high-memory region in system memory. Hardware ignores and does not implement bits 63:HAW, where HAW is the host address width.
19:0	0x0 RO	**RSVD1:** Reserved

44.4.19 Invalidation Queue Head Register (IQH_REG_0_0_0_VTDBAR)—Offset 80h

Register indicating the invalidation queue head. This register is treated as RsvdZ by implementations reporting Queued Invalidation (QI) as not supported in the Extended Capability register.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [DEFVTDBAR] + 80h

Default: 0000000000000000h

DEFVTDBAR Type: Memory Mapped I/O Register (Size: 64 bits)
DEFVTDBAR Reference: B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

Bit Range	Default & Access	Field Name (ID): Description
63:19	0x0 RO	**RSVD0:** Reserved
18:4	0x0 RO/V	**Queue Head (QH):** Specifies the offset (128-bit aligned) to the invalidation queue for the command that will be fetched next by hardware. Hardware resets this field to 0 whenever the queued invalidation is disabled (QIES field Clear in the Global Status register).
3:0	0x0 RO	**RSVD1:** Reserved

44.4.20 Invalidation Queue Tail Register (IQT_REG_0_0_0_VTDBAR)—Offset 88h

Register indicating the invalidation tail head. This register is treated as RsvdZ by implementations reporting Queued Invalidation (QI) as not supported in the Extended Capability register.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [DEFVTDBAR] + 88h

Default: 0000000000000000h

DEFVTDBAR Type: Memory Mapped I/O Register (Size: 64 bits)
DEFVTDBAR Reference: B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

Bit Range	Default & Access	Field Name (ID): Description
63:19	0x0 RO	**RSVD0:** Reserved
18:4	0x0 RW	**Queue Tail (QT):** Specifies the offset (128-bit aligned) to the invalidation queue for the command that will be written next by software.
3:0	0x0 RO	**RSVD1:** Reserved

44.4.21 Invalidation Queue Address Register (IQA_REG_0_0_0_VTDBAR)—Offset 90h

Register to configure the base address and size of the invalidation queue. This register is treated as RsvdZ by implementations reporting Queued Invalidation (QI) as not supported in the Extended Capability register.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [DEFVTDBAR] + 90h

Default: 0000000000000000h

DEFVTDBAR Type: Memory Mapped I/O Register (Size: 64 bits)
DEFVTDBAR Reference: B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

Bit Range	Default & Access	Field Name (ID): Description
63:39	0x0 RO	**RSVD0:** Reserved
38:12	0x0 RW	**Invalidation Queue Base Address (IQA):** This field points to the base of 4KB aligned invalidation request queue. Hardware ignores and does not implement bits 63:HAW, where HAW is the host address width. Reads of this field return the value that was last programmed to it.
11:3	0x0 RO	**RSVD1:** Reserved
2:0	0x0 RW	**Queue Size (QS):** This field specifies the size of the invalidation request queue. A value of X in this field indicates an invalidation request queue of (2X) 4KB pages. The number of entries in the invalidation queue is 2(X + 8).

44.4.22 Invalidation Completion Status Register (ICS_REG_0_0_0_VTDBAR)—Offset 9Ch

Register to report completion status of invalidation wait descriptor with Interrupt Flag (IF) Set This register is treated as RsvdZ by implementations reporting Queued Invalidation (QI) as not supported in the Extended Capability register.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [DEFVTDBAR] + 9Ch

Default: 00000000h

DEFVTDBAR Type: Memory Mapped I/O Register (Size: 64 bits)
DEFVTDBAR Reference: B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0x0 RO	**RSVD0:** Reserved
0	0x0 RW/1C	**Invalidation Wait Descriptor Complete (IWC):** Indicates completion of Invalidation Wait Descriptor with Interrupt Flag (IF) field Set. Hardware implementations not supporting queued invalidations implement this field as RsvdZ. **Power Well:** prst

44.4.23 Invalidation Event Control Register (IECTL_REG_0_0_0_VTDBAR)—Offset A0h

Register specifying the invalidation event interrupt control bits This register is treated as RsvdZ by implementations reporting Queued Invalidation (QI) as not supported in the Extended Capability register.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [DEFVTDBAR] + A0h

Default: 80000000h

DEFVTDBAR Type: Memory Mapped I/O Register (Size: 64 bits)
DEFVTDBAR Reference: B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

Bit Range	Default & Access	Field Name (ID): Description
31	0x1 RW	**Interrupt Mask (IM):** • 0= No masking of interrupt. When a invalidation event condition is detected, hardware issues an interrupt message (using the Invalidation Event Data and Invalidation Event Address register values) • 1= This is the value on reset. Software may mask interrupt message generation by setting this field. Hardware is prohibited from sending the interrupt message when this field is Set.
30	0x0 RO/V	**Interrupt Pending (IP):** Hardware sets the IP field whenever it detects an interrupt condition. Interrupt condition is defined as: • An Invalidation Wait Descriptor with Interrupt Flag (IF) field Set completed, setting the IWC field in the Invalidation Completion Status register • If the IWC field in the Invalidation Completion Status register was already Set at the time of setting this field, it is not treated as a new interrupt condition The IP field is kept Set by hardware while the interrupt message is held pending. The interrupt message could be held pending due to interrupt mask (IM field) being Set, or due to other transient hardware conditions. The IP field is cleared by hardware as soon as the interrupt message pending condition is serviced. This could be due to either: • 0= Hardware issuing the interrupt message due to either change in the transient hardware condition that caused interrupt message to be held pending or due to software clearing the IM field • 1= Software servicing the IWC field in the Invalidation Completion Status register.
29:0	0x0 RO	**RSVD0:** Reserved

44.4.24 Invalidation Event Data Register (IEDATA_REG_0_0_0_VTDBAR)—Offset A4h

Register specifying the Invalidation Event interrupt message data This register is treated as RsvdZ by implementations reporting Queued Invalidation (QI) as not supported in the Extended Capability register.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [DEFVTDBAR] + A4h

Default: 00000000h

DEFVTDBAR Type: Memory Mapped I/O Register (Size: 64 bits)
DEFVTDBAR Reference: B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**Extended Interrupt Message Data (EIMD):** This field is valid only for implementations supporting 32-bit interrupt data fields. Hardware implementations supporting only 16-bit interrupt data treat this field as Rsvd.
15:0	0x0 RW	**Interrupt Message Data (IMD):** Data value in the interrupt request.

44.4.25 Invalidation Event Address Register (IEADDR_REG_0_0_0_VTDBAR)—Offset A8h

Register specifying the Invalidation Event Interrupt message address This register is treated as RsvdZ by implementations reporting Queued Invalidation (QI) as not supported in the Extended Capability register.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [DEFVTDBAR] + A8h

Default: 00000000h

DEFVTDBAR Type: Memory Mapped I/O Register (Size: 64 bits)
DEFVTDBAR Reference: B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**Message Address (MA):** When fault events are enabled, the contents of this register specify the DWORD-aligned address (bits 31:2) for the interrupt request.
1:0	0x0 RO	**RSVD0:** Reserved

44.4.26 Invalidation Event Upper Address Register (IEUADDR_REG_0_0_0_VTDBAR)—Offset ACh

Register specifying the Invalidation Event interrupt message upper address.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [DEFVTDBAR] + ACh

Default: 00000000h

DEFVTDBAR Type: Memory Mapped I/O Register (Size: 64 bits)
DEFVTDBAR Reference: B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Message Upper Address (MUA):** Hardware implementations supporting Queued Invalidations and Extended Interrupt Mode are required to implement this register. Hardware implementations not supporting Queued Invalidations or Extended Interrupt Mode may treat this field as RsvdZ.

44.4.27 Interrupt Remapping Table Address Register (IRTA_REG_0_0_0_VTDBAR)—Offset B8h

Register providing the base address of Interrupt remapping table.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [DEFVTDBAR] + B8h

Default: 0000000000000000h

DEFVTDBAR Type: Memory Mapped I/O Register (Size: 64 bits)
DEFVTDBAR Reference: B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

Bit Range	Default & Access	Field Name (ID): Description
63:12	0x0 RW	**Interrupt Remapping Table Address (IRTA):** This field points to the base of 4KB aligned interrupt remapping table
11	0x0 RW	**Extended Interrupt Mode Enable (EIME):** This field is used by hardware on Intel64 platforms as follows: • 0=xAPIC mode is active. Hardware interprets only low 8-bits of Destination-ID field in the IRTEs. The high 24-bits of the Destination-ID field are treated as reserved • 1= x2APIC mode is active. Hardware interprets all 32-bits of Destination-ID field in the IRTEs
10:4	0x0 RO	**RSVD0:** Reserved
3:0	0x0 RW	**Size (S):** This field specifies the size of the interrupt remapping table. The number of entries in the interrupt remapping table is 2(X+1), where X is the value programmed in this field.

44.4.28 Page Request Status Register (PRESTS_REG_0_0_0_VTDBAR)—Offset DCh

Register to report pending page request in page request queue. This register is treated as RsvdZ by implementations reporting Page Request Support (PRS) as not supported in the Extended Capability register.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [DEFVTDBAR] + DCh

Default: 00000000h

DEFVTDBAR Type: Memory Mapped I/O Register (Size: 64 bits)
DEFVTDBAR Reference: B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0x0 RO	**RSVD0:** Reserved
0	0x0 RW/1C	**Pending Page Request (PPR):** Pending Page Request: Indicates pending page requests to be serviced by software in the page request queue. This field is Set by hardware when a streaming page request entry (page_stream_reg_dsc) or a page group request (page_grp_req_dsc) with Last Page in Group (LPG) field Set, is added to the page request queue. **Power Well:** prst

44.4.29 Page Request Event Control Register (PRECTL_REG_0_0_0_VTDBAR)—Offset E0h

Register specifying the page request event interrupt control bits.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [DEFVTDBAR] + E0h

Default: 80000000h

DEFVTDBAR Type: Memory Mapped I/O Register (Size: 64 bits)
DEFVTDBAR Reference: B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

Bit Range	Default & Access	Field Name (ID): Description
31	0x1 RW	**Interrupt Mask (IM):** Interrupt Mask • 0=No masking of interrupt. When a page request event condition is detected, hardware issues an interrupt message • 1=This is the value on reset. Software may mask interrupt message generation by setting this field.
30	0x0 RO/V	**Interrupt Pending (IP):** Interrupt Pending: Hardware sets the IP field whenever it detects an interrupt condition. The IP field is kept Set by hardware while the interrupt message is held pending.
29:0	0x0 RO	**RSVD0:** Reserved

44.4.30 Page Request Event Data Register (PREDATA_REG_0_0_0_VTDBAR)—Offset E4h

Register specifying the Page Request Event interrupt message data. This register is treated as RsvdZ by implementations reporting Page Request Support (PRS) as not supported in the Extended Capability register.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [DEFVTDBAR] + E4h

Default: 00000000h

DEFVTDBAR Type: Memory Mapped I/O Register (Size: 64 bits)
DEFVTDBAR Reference: B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**Extended Interrupt Message Data (EIMD):** Extended Interrupt Message Data
15:0	0x0 RW	**Interrupt Message Data (IMD):** Interrupt Message Data: Data value in the interrupt request. Software requirements for programming this register are described in VTd Spec

44.4.31 Page Request Event Address Register (PREADDR_REG_0_0_0_VTDBAR)—Offset E8h

Register specifying the Page Request Event Interrupt message address. This register is treated as RsvdZ by implementations reporting Page Request Support (PRS) as not supported in the Extended Capability register.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [DEFVTDBAR] + E8h

Default: 00000000h

DEFVTDBAR Type: Memory Mapped I/O Register (Size: 64 bits)
DEFVTDBAR Reference: B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**Message Address (MA):** Message Address: When fault events are enabled, the contents of this register specify the DWORD-aligned address (bits 31:2) for the interrupt request.
1:0	0x0 RO	**RSVD0:** Reserved

44.4.32 Page Request Event Upper Address Register (PREUADDR_REG_0_0_0_VTDBAR)—Offset ECh

Register specifying the Page Request Event interrupt message upper address.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [DEFVTDBAR] + ECh

Default: 00000000h

DEFVTDBAR Type: Memory Mapped I/O Register (Size: 64 bits)
DEFVTDBAR Reference: B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Message Upper Address (MUA):** Message Upper Address: This field specifies the upper address (bits.. 63:32) for the page request event interrupt.

44.4.33 Fault Recording Register Low [0] (FRCDL_REG_0_0_0_VTDBAR)—Offset 400h

Register to record fault information when primary fault logging is active. Hardware reports the number and location of fault recording registers through the Capability register. This register is relevant only for primary fault logging This register is sticky and can be cleared only through power good reset or by software clearing the RW1C fields by writing a 1.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [DEFVTDBAR] + 400h

Default: 0000000000000000h

DEFVTDBAR Type: Memory Mapped I/O Register (Size: 64 bits)
DEFVTDBAR Reference: B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

Bit Range	Default & Access	Field Name (ID): Description
63:12	0x0 RO/V	**Fault Info (FI):** When the Fault Reason (FR) field indicates one of the DMA-remapping fault conditions, bits 63:12 of this field contain the page address in the faulted DMA request. Hardware treats bits 63:N as reserved (0), where N is the maximum guest address width (MGAW) supported. When the Fault Reason (FR) field indicates one of the interrupt-remapping fault conditions, bits 63:48 of this field indicate the interrupt_index computed for the faulted interrupt request, and bits 47:12 are cleared. This field is relevant only when the F field is Set. **Power Well:** prst
11:0	0x0 RO	**RSVD0:** Reserved

44.4.34 Fault Recording Register High [0] (FRCDH_REG_0_0_0_VTDBAR)—Offset 408h

Register to record fault information when primary fault logging is active. Hardware reports the number and location of fault recording registers through the Capability register. This register is relevant only for primary fault logging This register is sticky and can be cleared only through power good reset or by software clearing the RW1C fields by writing a 1.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [DEFVTDBAR] + 408h

Default: 0000000000000000h

DEFVTDBAR Type: Memory Mapped I/O Register (Size: 64 bits)
DEFVTDBAR Reference: B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

Bit Range	Default & Access	Field Name (ID): Description
63	0x0 RW/1C	**Fault (F):** Hardware sets this field to indicate a fault is logged in this Fault Recording register. The F field is set by hardware after the details of the fault is recorded in other fields. When this field is Set, hardware may collapse additional faults from the same source-id (SID) **Power Well:** prst
62	0x0 RO/V	**Type (T):** Type of the faulted request: • 0=0: Write request • 1=1: Read request or AtomicOp request This field is relevant only when the F field is Set, and when the fault reason (FR) indicates one of the DMA-remapping fault conditions. **Power Well:** prst
61:60	0x0 RO/V	**Address Type (AT):** This field captures the AT field from the faulted DMA request. Hardware implementations not supporting Device-IOTLBs (DI field Clear in Extended Capability register) treat this field as RsvdZ. When supported, this field is valid only when the F field is Set, and when the fault reason (FR) indicates one of the DMA-remapping fault conditions. **Power Well:** prst
59:40	0x0 RO/V	**PASID Value (PN):** PASID value in the faulted request. This field is relevant only when the PP field is set. Hardware implementations not supporting PASID (PASID field Clear in Extended Capability register) implement this field as RsvdZ. **Power Well:** prst
39:32	0x0 RO/V	**Fault Reason (FR):** Reason for the fault This field is relevant only when the F field is set. **Power Well:** prst
31	0x0 RO/V	**PASID Present (PP):** When set, indicates the faulted request has a PASID tag. The value of the PASID field is reported in the PASID Value (PV) field. This field is relevant only when the F field is Set, and when the fault reason (FR) indicates one of the non-recoverable address translation fault conditions. Hardware implementations not supporting PASID (PASID field Clear in Extended Capability register) implement this field as RsvdZ. **Power Well:** prst
30	0x0 RO/V	**Execute Permission Requested (EXE):** When set, indicates Execute permission was requested by the faulted read request. This field is relevant only when the PP field and T field are both Set. Hardware implementations not supporting PASID (PASID field Clear in Extended Capability register) implement this field as RsvdZ. **Power Well:** prst

Bit Range	Default & Access	Field Name (ID): Description
29	0x0 RO/V	**Privilege Mode Requested (PRIV):** When set, indicates Supervisor privilege was requested by the faulted request. This field is relevant only when the PP field is Set. Hardware implementations not supporting PASID (PASID field Clear in Extended Capability register) implement this field as RsvdZ. **Power Well:** prst
28:16	0x0 RO	**RSVD0:** Reserved
15:0	0x0 RO/V	**Source Identifier (SID):** Requester-id associated with the fault condition. This field is relevant only when the F field is set. **Power Well:** prst

44.4.35 Invalidate Address Register (IVA_REG_0_0_0_VTDBAR)—Offset 500h

Register to provide the DMA address whose corresponding IOTLB entry needs to be invalidated through the corresponding IOTLB Invalidate register. This register is a write-only register.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [DEFVTDBAR] + 500h

Default: 0000000000000000h

DEFVTDBAR Type: Memory Mapped I/O Register (Size: 64 bits)
DEFVTDBAR Reference: B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

Bit Range	Default & Access	Field Name (ID): Description
63:12	0x0 RW	**Address (ADDR):** Software provides the DMA address that needs to be page-selectively invalidated. To make a page-selective invalidation request to hardware, software must first write the appropriate fields in this register, and then issue the appropriate page-selective invalidate command through the IOTLB_REG. Hardware ignores bits 63:N, where N is the maximum guest address width (MGAW) supported. A value returned on a read of this field is undefined.
11:7	0x0 RO	**RSVD0:** Reserved
6	0x0 RW	**Invalidation Hint (IH):** The field provides hint to hardware about preserving or flushing the non-leaf (page-directory) entries that may be cached in hardware: • 0 = Software may have modified both leaf and non-leaf page-table entries corresponding to mappings specified in the ADDR and AM fields. On a page-selective invalidation request, hardware must flush both the cached leaf and non-leaf page-table entries corresponding to the mappings specified by ADDR and AM fields. • 1 = Software has not modified any non-leaf page-table entries corresponding to mappings specified in the ADDR and AM fields. On a page-selective invalidation request, hardware may preserve the cached non-leaf page-table entries corresponding to mappings specified by ADDR and AM fields. A value returned on a read of this field is undefined.
5:0	0x0 RW	**Address Mask (AM):** The value in this field specifies the number of low order bits of the ADDR field that must be masked for the invalidation operation. This field enables software to request invalidation of contiguous mappings for size-aligned regions. For example:..Mask ADDR bits Pages..Value masked invalidated.. 0 None 1.. 1 12 2.. 2 13:12 4.. 3 14:12 8.. 4 15:12 16 When invalidating mappings for super-pages, software must specify the appropriate mask value. For example, when invalidating mapping for a 2MB page, software must specify an address mask value of at least 9...Hardware implementations report the maximum supported mask value through the Capability register.

44.4.36 IOTLB Invalidate Register (IOTLB_REG_0_0_0_VTDBAR)—Offset 508h

Register to invalidate IOTLB. The act of writing the upper byte of the IOTLB_REG with IVT field Set causes the hardware to perform the IOTLB invalidation.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [DEFVTDBAR] + 508h

Default: 0200000000000000h

DEFVTDBAR Type: Memory Mapped I/O Register (Size: 64 bits)
DEFVTDBAR Reference: B_CR_DEFVTDBAR_0_0_0_MCHBAR + 6C80h

Bit Range	Default & Access	Field Name (ID): Description
63	0x0 RW/V	**Invalidate IOTLB (IVT):** Software requests IOTLB invalidation by setting this field. Software must also set the requested invalidation granularity by programming the IIRG field. Hardware clears the IVT field to indicate the invalidation request is complete. Hardware also indicates the granularity at which the invalidation operation was performed through the IAIG field. Software must not submit another invalidation request through this register while the IVT field is Set, nor update the associated Invalidate Address register. Software must not submit IOTLB invalidation requests when there is a context-cache invalidation request pending at this remapping hardware unit. Hardware implementations reporting write-buffer flushing requirement (RWBF=1 in Capability register) must implicitly perform a write buffer flushing before invalidating the IOTLB.
62	0x0 RO	**RSVD0:** Reserved
61:60	0x0 RW	**IOTLB Invalidation Request Granularity (IIRG):** When requesting hardware to invalidate the IOTLB (by setting the IVT field), software writes the requested invalidation granularity through this field. The following are the encodings for the field: • 00 = Reserved • 01 = Global invalidation request • 10 = Domain-selective invalidation request. The target domain-id must be specified in the DID field • 11 = Page-selective invalidation request. The target address, mask and invalidation hint must be specified in the Invalidate Address register, and the domain-id must be provided in the DID field Hardware implementations may process an invalidation request by performing invalidation at a coarser granularity than requested. Hardware indicates completion of the invalidation request by clearing the IVT field. At this time, the granularity at which actual invalidation was performed is reported through the IAIG field.
59	0x0 RO	**RSVD1:** Reserved
58:57	0x1 RO/V	**IOTLB Actual Invalidation Granularity (IAIG):** Hardware reports the granularity at which an invalidation request was processed through this field when reporting invalidation completion (by clearing the IVT field). The following are the encodings for this field • 00 = Reserved. This indicates hardware detected an incorrect invalidation request and ignored the request. Examples of incorrect invalidation requests include detecting an unsupported address mask value in Invalidate Address register for page-selective invalidation requests • 01 = Global Invalidation performed. This could be in response to a global, domain-selective, or page-selective invalidation request • 10 = Domain-selective invalidation performed using the domain-id specified by software in the DID field. This could be in response to a domain-selective or a page-selective invalidation request • 11 = Domain-page-selective invalidation performed using the address, mask and hint specified by software in the Invalidate Address register and domain-id specified in DID field. This can be in response to a page-selective invalidation request.
56:50	0x0 RO	**RSVD2:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
49	0x0 RW	**Drain Reads (DR):** This field is ignored by hardware if the DRD field is reported as clear in the Capability register. When the DRD field is reported as Set in the Capability register, the following encodings are supported for this field: • 0 = Hardware may complete the IOTLB invalidation without draining any translated DMA read requests • 1 = Hardware must drain DMA read requests.
48	0x0 RW	**Drain Writes (DW):** This field is ignored by hardware if the DWD field is reported as Clear in the Capability register. When the DWD field is reported as Set in the Capability register, the following encodings are supported for this field: • 0 = Hardware may complete the IOTLB invalidation without draining DMA write requests • 1 = Hardware must drain relevant translated DMA write requests.
47:32	0x0 RW	**Domain-ID (DID):** Indicates the ID of the domain whose IOTLB entries need to be selectively invalidated. This field must be programmed by software for domain-selective and page-selective invalidation requests. The Capability register reports the domain-id width supported by hardware. Software must ensure that the value written to this field is within this limit. Hardware ignores and not implements bits 47:(32+N), where N is the supported domain-id width reported in the Capability register.
31:0	0x0 RO	**RSVD3:** Reserved

44.5 Sideband Registers

The Sideband registers accessible to the Host are described here. They are accessible in Host Memory Space using the Sideband Base Address Register (BAR) DEFVTDBAR. It is located in Host Root Memory Space MCHBAR +offset 6C80h.

See Section 44.3.123, "Default VTd BAR (B_CR_DEFVTDBAR_0_0_0_MCHBAR)—Offset 6C80h" on page 1316.

44.5.1 UCELOG—Offset 64h

Uncorrectable Error Log This register captures the log information when the corresponding channel DERRSTS.UCE[1:0] is set to 1. This register is cleared and capturing of new errors is re-enabled when the corresponding channel DERRSTS.UCE[1:0] is cleared to 0.

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x10] + 64h
Host Memory Space: SBREG_BAR + 0x100000 + 64h

Default: 00000800h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0x0 RSV	**Rsvd_UCELOG_1:** Reserved
21:20	0x0 RO/V/P	**UCERNK:** Rank Address: This is the rank address that contained the error
19:16	0x0 RO/V/P	**UCEBNK:** Bank Address: This is the bank address that contained the error. DDR3: UCEBNK[3] will always be 0 UCEBNK[2:0] = BA[2:0] DDR4: UCEBNK[3:2] = BG[1:0] UCEBNK[1:0] = BA[1:0]
15	0x0 RO/V/P	**UCEAP:** Auto Pre-charge was issued on the read that contained the error. This will always be 0 since AP is not supported.
14	0x0 RO/V/P	**UCELAST:** Last Burst: If this bit is set, then the error occurred within that last four DQ bus bursts before a DQ bus turn-around cycle.
13	0x0 RO/V/P	**UCEFIRST:** First Burst: If this bit is set, then the error occurred within the first four DQ bus bursts after a DQ bus turn-around cycle.
12	0x0 RO/V/P	**UCEA5:** Address bit 5: This is A[5] from the original request
11	0x1 RO/V/P	**UCEBL8:** Burst Length 8: 0 = Burst Chop 4, 1 = Burst Length 8. This will always be 1 for DNV.
10:8	0x0 RO/V/P	**UCEBOFF:** Burst Offset: This is the burst number that contained the error. Note that all 8 bursts are always numbered starting from 0. Thus, even when the critical chunk causes the bursts to occur in the logical order of 4,5,6,7,0,1,2,3, UCEBOFF will still number these starting from 0. So, for example, if an error is detected on logical byte 0, it is possible that this may be recorded as byte offset 4 with critical chunk reordering.
7:0	0x0 RO/V/P	**UCESYND:** ECC Syndrome: This is the 8-bit syndrome output of the ECC checker logic. For DNV, this field does not provide useful information and is not reliable.

44.5.2 UCEADDR—Offset 68h

Uncorrectable Error Address This register captures the log information when the corresponding channel DERRSTS.UCE[1:0] is set to 1. This register is cleared and capturing of new errors is re-enabled when the corresponding channel DERRSTS.UCE[1:0] is cleared to 0.

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x10] + 68h
Host Memory Space: SBREG_BAR + 0x100000 + 68h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V/P	**UCEADDR:** Address Log: Captures the PMI address A[35:6] of the UCE error location.

44.5.3 SBELOG—Offset 6Ch

Correctable (Single Bit) Error Log This register captures the log information when the corresponding channel DERRSTS.SBE[1:0] is set to 1. This register is cleared and capturing of new errors is re-enabled when the corresponding channel DERRSTS.SBE[1:0] is cleared to 0.

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x10] + 6Ch
Host Memory Space: SBREG_BAR + 0x100000 + 6Ch

Default: 00000800h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0x0 RSV	**Rsvd_SBELOG_1:** Reserved
21:20	0x0 RO/V/P	**SBERNK:** Rank Address: This is the rank address that contained the error
19:16	0x0 RO/V/P	**SBEBNK:** Bank Address: This is the bank address that contained the error. DDR3: UCEBNK[3] will always be 0 UCEBNK[2:0] = BA[2:0] DDR4: UCEBNK[3:2] = BG[1:0] UCEBNK[1:0] = BA[1:0]
15	0x0 RO/V/P	**Reserved:** Reserved
14	0x0 RO/V/P	**SBELAST:** Last Burst: If this bit is set, then the error occurred within that last four DQ bus bursts before a DQ bus turn-around cycle.
13	0x0 RO/V/P	**SBEFIRST:** First Burst: If this bit is set, then the error occurred within the first four DQ bus bursts after a DQ bus turn-around cycle.
12	0x0 RO/V/P	**SBEA5:** Address bit 5: This is A[5] from the original request. In 32 bit mode this field is undefined.
11	0x1 RO/V/P	**Reserved:** Reserved
10:8	0x0 RO/V/P	**SBEBOFF:** Burst Offset: This is the burst number that contained the error. Note that all 8 bursts are always numbered starting from 0.
7:0	0x0 RO/V/P	**SBESYND:** ECC Syndrome: This is the 8-bit syndrome output of the ECC checker logic

44.5.4 SBEADDR—Offset 70h

Correctable Error Address This register captures the log information when the corresponding channel DERRSTS.SBE[1:0] is set to 1. This register is cleared and capturing of new errors is re-enabled when the corresponding channel DERRSTS.SBE[1:0] is cleared.

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x10] + 70h
Host Memory Space: SBREG_BAR + 0x100000 + 70h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V/P	**SBEADDR:** Address Log: Captures the PMI address A[35:6] of the SBE error location.

44.5.5 SBECNT0—Offset 74h

SBE Count for Rank 0

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x10] + 74h
Host Memory Space: SBREG_BAR + 0x100000 + 74h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0x0 RSV	**Rsvd_SBECNT0_0:** Reserved
16	0x0 RW/C/V/P	**CORRERRORSTATUS:** The per rank status bits are set when a rank's error count equals the threshold. The status bits are what tell the BIOS/BMC what caused SMI/ERR[0] to get triggered. Once the status bits are set, they will remain set until cleared by BIOS and will cause the SMI/ERR[0] to get signaled to the cores.
15:0	0x0 RW/C/V/P	**CNT:** Single Bit Error Count for Rank 0. Any write to this register will clear the counter to 0.

44.5.6 SBECNT1—Offset 78h

SBE Count for Rank 1

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x10] + 78h
Host Memory Space: SBREG_BAR + 0x100000 + 78h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0x0 RSV	**Rsvd_SBECNT1_0:** Reserved
16	0x0 RW/C/V/P	**CORRERRORSTATUS:** The per rank status bits are set when a rank's error count equals the threshold. The status bits are what tell the BIOS/BMC what caused SMI/ERR[0] to get triggered. Once the status bits are set, they will remain set until cleared by BIOS and will cause the SMI/ERR[0] to get signaled to the cores.
15:0	0x0 RW/C/V/P	**CNT:** Single Bit Error Count for Rank 1. Any write to this register will clear the counter to 0.

44.5.7 SBECNT2—Offset 7Ch

SBE Count for Rank 2

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x10] + 7Ch
Host Memory Space: SBREG_BAR + 0x100000 + 7Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0x0 RSV	**Rsvd_SBECNT2_0:** Reserved
16	0x0 RW/C/V/P	**CORRERRORSTATUS:** The per rank status bits are set when a rank's error count equals the threshold. The status bits are what tell the BIOS/BMC what caused SMI/ERR[0] to get triggered. Once the status bits are set, they will remain set until cleared by BIOS and will cause the SMI/ERR[0] to get signaled to the cores.
15:0	0x0 RW/C/V/P	**CNT:** Single Bit Error Count for Rank 2. Any write to this register will clear the counter to 0.

44.5.8 SBECNT3—Offset 80h

SBE Count for Rank 3

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x10] + 80h
Host Memory Space: SBREG_BAR + 0x100000 + 80h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0x0 RSV	**Rsvd_SBECNT3_0:** Reserved
16	0x0 RW/C/V/P	**CORRERRORSTATUS:** The per rank status bits are set when a rank's error count equals the threshold. The status bits are what tell the BIOS/BMC what caused SMI/ERR[0] to get triggered. Once the status bits are set, they will remain set until cleared by BIOS and will cause the SMI/ERR[0] to get signaled to the cores.
15:0	0x0 RW/C/V/P	**CNT:** Single Bit Error Count for Rank 3. Any write to this register will clear the counter to 0.

44.5.9 SBEACC0—Offset 84h

SBE Accumulator for Rank0

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x10] + 84h
Host Memory Space: SBREG_BAR + 0x100000 + 84h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0x0 RSV	**Rsvd_SBEACC0_0:** Reserved
17:0	0x0 RW/C/V/P	**LANE:** Single Bit Accumulator per Nibble Lane: This allows for identification of the failing x4 or x8 device. This value is cleared by any write to this register.

44.5.10 SBEACC1—Offset 88h

SBE Accumulator for Rank1

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x10] + 88h
Host Memory Space: SBREG_BAR + 0x100000 + 88h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0x0 RSV	**Rsvd_SBEACC1_0:** Reserved
17:0	0x0 RW/C/V/P	**LANE:** Single Bit Accumulator per Nibble Lane: This allows for identification of the failing x4 or x8 device. This value is cleared by any write to this register.

44.5.11 SBEACC2—Offset 8Ch

SBE Accumulator for Rank2

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x10] + 8Ch
Host Memory Space: SBREG_BAR + 0x100000 + 8Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0x0 RSV	**Rsvd_SBEACC2_0:** Reserved
17:0	0x0 RW/C/V/P	**LANE:** Single Bit Accumulator per Nibble Lane: This allows for identification of the failing x4 or x8 device. This value is cleared by any write to this register.

44.5.12 SBEACC3—Offset 90h

SBE Accumulator for Rank3

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x10] + 90h
Host Memory Space: SBREG_BAR + 0x100000 + 90h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0x0 RSV	**Rsvd_SBEACC3_0:** Reserved
17:0	0x0 RW/C/V/P	**LANE:** Single Bit Accumulator per Nibble Lane: This allows for identification of the failing x4 or x8 device. This value is cleared by any write to this register.

44.5.13 DPATROL_SCRUB_CFG—Offset B0h

Patrol Scrub Config Register

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x10] + B0h
Host Memory Space: SBREG_BAR + 0x100000 + B0h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/P	**PAT_SCRUB_ENABLE:** Bit to enable/disable patrol scrub • 0: Disable patrol scrub • 1: Enable patrol scrub
30	0x0 RW/P	**DIMM1_COL_ADDR_BITS:** Total number of column bits for devices on rank 0 = 10 + DIMM1_COL_ADDR_BITS • 0: DDR4 and DDR3 • 1: Only DDR3
29	0x0 RW/P	**DIMM0_COL_ADDR_BITS:** Total number of column bits for devices on rank 0 = 10 + DIMM0_COL_ADDR_BITS • 0: DDR4 and DDR3 • 1: Only DDR3
28:23	0x0 RW/P	**DIMM1_MAX_ROW_ADDR:** Maximum row address for DIMM1 - bits 17 to 12. Bits 11:0 are assumed to all be 1.
22:17	0x0 RW/P	**DIMM0_MAX_ROW_ADDR:** Maximum row address for DIMM0 - bits 17 to 12. Bits 11:0 are assumed to all be 1.
16	0x0 RW/P	**PATSCRUB_FORCE_WRITEBACK:** When set to 1, force write back of data with no errors. When set to 0, don't write back data that had no errors.
15:0	0x0 RW/P	**MAX_PATSCRUB_DEBIT_CNT:** Maximum number of debit patrol scrub operations. Once the patrol scrub debit counter exceeds this value, patrol scrubs will be issued until the debit counter reaches 0. Set 0 to disable debit mode.

44.5.14 UCELOG1—Offset CCh

This register captures the log information when the corresponding channel DERRSTS.UCE[1:0] is set to 1. This register is cleared and capturing of new errors is re-enabled when the corresponding channel DERRSTS.UCE[1:0] is cleared to 0.

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x10] + CCh
Host Memory Space: SBREG_BAR + 0x100000 + CCh

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0x0 RSV	**RSVD (reg_RSVD):** Reserved
26:18	0x0 RO/V/P	**UCE_COL:** Column address bits above A[5]
17:0	0x0 RO/V/P	**UCE_ROW:** Row bits

44.5.15 SBELOG1—Offset D0h

Single bit error log 1 This register captures the log information when the corresponding channel DERRSTS.SBE[1:0] is set to 1. This register is cleared and capturing of new errors is re-enabled when the corresponding channel DERRSTS.SBE[1:0] is cleared.

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x10] + D0h
Host Memory Space: SBREG_BAR + 0x100000 + D0h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0x0 RSV	**RSVD (reg_RSVD):** Reserved
26:18	0x0 RO/V/P	**SBE_COL:** Column bits [11,9:2], in 32 bit mode SBE_COL[0] will always be 0, SBE_COL[1] contains information for SBEBOFF[2]
17:0	0x0 RO/V/P	**SBE_ROW:** Row bits

44.5.16 CORRERRTHRSHLD0—Offset 100h

Correctable Error Threshold for Rank 0

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x10] + 100h
Host Memory Space: SBREG_BAR + 0x100000 + 100h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RSV	**Rsvd_CORRERRTHRSHLD0_0:** Reserved
15:0	0x0 RW/P	**THRSH_RNK:** Correctable error threshold for rank 0. When the error accumulation in SBECNT0 hits this value, then the CORRERRSTATUS is set and a DO_SMI message is sent if the threshold value is greater than 0.

44.5.17 CORRERRTHRSHLD1—Offset 104h

Correctable Error Threshold for Rank 1

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x10] + 104h
Host Memory Space: SBREG_BAR + 0x100000 + 104h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RSV	**Rsvd_CORRERRTHRSHLD1_0:** Reserved
15:0	0x0 RW/P	**THRSH_RNK:** Correctable error threshold for rank 1. When the error accumulation in SBECNT1 hits this value, then the CORRERRSTATUS is set and a DO_SMI message is sent if the threshold value is greater than 0.

44.5.18 CORRERRTHRSHLD2—Offset 108h

Correctable Error Threshold for Rank 2

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x10] + 108h
Host Memory Space: SBREG_BAR + 0x100000 + 108h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RSV	**Rsvd_CORRERRTHRSHLD2_0:** Reserved
15:0	0x0 RW/P	**THRSH_RNK:** Correctable error threshold for rank 2. When the error accumulation in SBECNT2 hits this value, then the CORRERRSTATUS is set and a DO_SMI message is sent if the threshold value is greater than 0.

44.5.19 CORRERRTHRSHLD3—Offset 10Ch

Correctable Error Threshold for Rank 3

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x10] + 10Ch
Host Memory Space: SBREG_BAR + 0x100000 + 10Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RSV	**Rsvd_CORRERRTHRSHLD3_0:** Reserved
15:0	0x0 RW/P	**THRSH_RNK:** Correctable error threshold for rank 3. When the error accumulation in SBECNT3 hits this value, then the CORRERRSTATUS is set and a DO_SMI message is sent if the threshold value is greater than 0.

44.5.20 LEAKY_BUCKET_CFG0—Offset 110h

Leaky Bucket Configuration Rank 0

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x10] + 110h
Host Memory Space: SBREG_BAR + 0x100000 + 110h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW/P	**CNTR_HI:** Specifies the leaky bucket leak rat in CNTR_LO ticks. When the leaky bucket counter counts through CNTR_HI, the correctable error count for rank 0 is decremented by one.
15:0	0x0 RW/P	**CNTR_LO:** Units for this register are 8192 DRAM clocks. When greater than zero, leaky bucket is enabled. This is the unit for the high order counter for rank 0, CNTR_HI.

44.5.21 LEAKY_BUCKET_CFG1—Offset 114h

Leaky Bucket Configuration Rank 1

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x10] + 114h
Host Memory Space: SBREG_BAR + 0x100000 + 114h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW/P	**CNTR_HI:** Specifies the leaky bucket leak rat in CNTR_LO ticks. When the leaky bucket counter counts through CNTR_HI, the correctable error count for rank 1 is decremented by one.
15:0	0x0 RW/P	**CNTR_LO:** Units for this register are 8192 DRAM clocks. When greater than zero, leaky bucket is enabled. This is the unit for the high order counter for rank 1, CNTR_HI.

44.5.22 LEAKY_BUCKET_CFG2—Offset 118h

Leaky Bucket Configuration Rank 2

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x10] + 118h
Host Memory Space: SBREG_BAR + 0x100000 + 118h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW/P	**CNTR_HI:** Specifies the leaky bucket leak rat in CNTR_LO ticks. When the leaky bucket counter counts through CNTR_HI, the correctable error count for rank 2 is decremented by one.
15:0	0x0 RW/P	**CNTR_LO:** Units for this register are 8192 DRAM clocks. When greater than zero, leaky bucket is enabled. This is the unit for the high order counter for rank 2, CNTR_HI.

44.5.23 LEAKY_BUCKET_CFG3—Offset 11Ch

Leaky Bucket Configuration Rank 3

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x10] + 11Ch
Host Memory Space: SBREG_BAR + 0x100000 + 11Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW/P	**CNTR_HI:** Specifies the leaky bucket leak rat in CNTR_LO ticks. When the leaky bucket counter counts through CNTR_HI, the correctable error count for rank 3 is decremented by one.
15:0	0x0 RW/P	**CNTR_LO:** Units for this register are 8192 DRAM clocks. When greater than zero, leaky bucket is enabled. This is the unit for the high order counter for rank 3, CNTR_HI.

44.5.24 FERRNERR—Offset 120h

First Error and Next Error Register

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x10] + 120h
Host Memory Space: SBREG_BAR + 0x100000 + 120h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0x0 RSV	**Rsvd_FERRNERR_1 (Rsvd_FERRNERR_3):** Reserved
20	0x0 RO/V/P	**FERRUCEPAT:** First Error Uncorrectable Patrol Scrub Read Error Detected: When set, the first error detected was an uncorrectable (multiple bit) error on the patrol scrub read from memory.
19	0x0 RO/V/P	**FERRAPE:** First Error Uncorrectable DDR4 Command Address Parity Error: When set, the first error detected was the assertion of the xxDDR3_0_ALERT_N pin indicating that one or more DRAMs detected a Command/Address parity error.
18	0x0 RO/V/P	**FERRWPE:** First Error Uncorrectable Write Parity Error Detected: When set, the first error detected was an uncorrectable (parity) error on the write data received from the Bunit.
17	0x0 RO/V/P	**FERRUCE:** First Error Uncorrectable Read Error Detected: When set, the first error detected was an uncorrectable (multiple bit) error on the read data from memory.
16	0x0 RO/V/P	**FERRSBE:** First Error Correctable Read Error Detected: When set, the first error detected was a single bit error on the read data from memory and the error was corrected.
15:5	0x0 RSV	**Rsvd_FERRNERR_0 (Rsvd_FERRNERR_1):** Reserved
4	0x0 RO/V/P	**NERRUCEPAT:** Next Error Uncorrectable Patrol Scrub Read Error: When set, the second error detected was an uncorrectable (mutliple bit) error on the patrol scrub read data from memory.
3	0x0 RO/V/P	**NERRAPE:** Next Error Uncorrectable DDR4 Command Address Parity Error: When set, the second error detected was the assertion of the xxDDR3_0_ALERT_N pin indicating that one or more DRAMs detected a Command/Address parity error. Note that this bit can never be set as the same time as FERRAPE
2	0x0 RO/V/P	**NERRWPE:** Next Error Uncorrectable Write Parity Error Detected: When set, the second error detected was an uncorrectable (parity) error on the write data received from the Bunit.
1	0x0 RO/V/P	**NERRUCE:** Next Error Uncorrectable Read Error Detected: When set, the second error detected was an uncorrectable (multiple bit) error on the read data from memory.
0	0x0 RO/V/P	**NERRSBE:** Next Error Correctable Read Error Detected: When set, the second error detected was a single bit error on the read data from memory and the error was corrected.

44.5.25 DERRSTS—Offset 124h

Error Status Register

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x10] + 124h
Host Memory Space: SBREG_BAR + 0x100000 + 124h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0x0 RSV	**Rsvd_DERRSTS_0 (Rsvd_DERRSTS_1):** Reserved
6	0x0 RW/1C/V/P	**CAP_ERR_STATE:** Channel Command Address Parity Error State. 1 = CAP error seen, error state entered. All PMI reads will be returned with bad parity. 0 = No CAP error seen. Normal PMI operation.
5	0x0 RO/V/P	**ALERT:** Current state of the channel ALERT_N pin, captured here as active high: 1 = Error being driven by at least one DRAM device 0 = No error currently detected by any DRAM device
4	0x0 RW/1C/V/P	**UCEPAT:** Uncorrectable (multiple bit) patrol scrub error: When set, an uncorrectable (multiple bit error was detected on the read data from memory.
3	0x0 RW/1C/V/P	**APE:** Uncorrectable DDR4 Command/Address Parity Error: When set, an uncorrectable DDR4 command/address parity error was detected by one or more of the DRAMs on channel 0.
2	0x0 RW/1C/V/P	**WPE:** Uncorrectable (Parity) Write Error: When set, an uncorrectable (parity) error was detected on the write data received from the Bunit.
1	0x0 RW/1C/V/P	**UCE:** Uncorrectable (Double Bit) Read Error: When set, a double bit error was detected on the read data from memory.
0	0x0 RW/1C/V/P	**SBE:** Correctable (Single Bit) Read Error: When set, a single bit error was detected on the read data from memory and the error was corrected.

44.5.26 DERRMSKSEV—Offset 128h

Error Mask and Severity

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x10] + 128h
Host Memory Space: SBREG_BAR + 0x100000 + 128h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0x0 RSV	**Rsvd_DERRMSKSEV_2:** Reserved
20	0x0 RW/P	**MSK_UCEPAT:** Uncorrectable patrol scrub error mask: When set, uncorrectable patrol scrub ECC data errors will not be logged in DERRESTS[0], DO_SERR_SEV messages will not be sent to the IEH, and derrcnt will not count for this error.
19	0x0 RW/P	**MSK_APE:** Uncorrectable command/address parity error mask: When set, uncorrectable DDR4 command/address parity errors will not be logged in DERRESTS[0], DO_SERR_SEV messages will not be sent to the IEH, and derrcnt will not count for this error.
18	0x0 RW/P	**MSK_WDBR:** Uncorrectable (parity) write data buffer read error mask: When set, uncorrectable (pairty) write data buffer read errors will not be logged in DERRESTS[0], DO_SERR_SEV messages will not be sent to the IEH, and derrcnt will not count for this error.
17	0x0 RW/P	**MSK_UCE:** Uncorrectable (multiple bit) error mask: When set, uncorrectable (multiple bit) read and patrol scrub errors will not be logged in DERRESTS[0], DO_SERR_SEV messages will not be sent to the IEH, and derrcnt will not count for this error.
16	0x0 RW/P	**MSK_SBE:** Correctable (single bit) error mask: When set, correctable (single bit) read and patrol scrub errors will not be logged in DERRESTS[0] and DO_SERR_SEV messages will not be sent to the IEH.
15:5	0x0 RSV	**Rsvd_DERRMSKSEV_1:** Reserved
4	0x0 RW/P	**SEV_UCEPAT:** Uncorrectable (Multiple Bit) Patrol Scrub Read Error Severity: When set, UCE errors logged in DERRSTS[5] will be escalated to the global error logic as a fatal error; otherwise it will be escalated as a non-fatal error.
3	0x0 RW/P	**SEV_APE:** Uncorrectable DDR4 Command/Address Parity Error Severity: When set, APE errors logged in DERRSTS[3] will be escalated to the global error logic as a fatal error; otherwise it will be escalated as a non-fatal error.
2	0x0 RW/P	**SEV_WDBR:** Uncorrectable (Parity) Write Error Severity: When set, WPE errors logged in DERRSTS[2] will be escalated to the global error logic as a fatal error; otherwise it will be escalated as a non-fatal error.
1	0x0 RW/P	**SEV_UCE:** Uncorrectable (Multiple Bit) Read Error Severity: When set, UCE errors logged in DERRSTS[1] will be escalated to the global error logic as a fatal error; otherwise it will be escalated as a non-fatal error.
0	0x0 RSV	**Rsvd_DERRMSKSEV_0:** Reserved

44.5.27 DERRCNTSEL—Offset 12Ch

Uncorrectable Error Count Select

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x10] + 12Ch
Host Memory Space: SBREG_BAR + 0x100000 + 12Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0x0 RSV	**Rsvd_DERRCNTSEL_2:** Reserved
4	0x0 RW/P	**SEL_UCEPAT:** Uncorrectable (Multiple Bit) Patrol Scrub Read Error Count Select: When set, UCE errors logged in DERRSTS[1] will be counted in DERRCNT.UNCCNT1.
3	0x0 RW/P	**SEL_APE:** Uncorrectable DDR4 Command/Address Parity Error Count Select: When set, APE0 errors logged in DERRSTS[3] will be counted in DERRCNT.UNCCNT0.
2	0x0 RW/P	**SEL_WPE:** Uncorrectable (Parity) Write Error Count Select: When set, WPE0 errors logged in DERRSTS[2] will be counted in DERRCNT.UNCCNT0.
1	0x0 RW/P	**SEL_UCE:** Uncorrectable (Multiple Bit) Read Error Count Select: When set, UCE0 errors logged in DERRSTS[1] will be counted in DERRCNT.UNCCNT0.
0	0x0 RSV	**Rsvd_DERRCNTSEL_0:** Reserved

44.5.28 DERRCNT—Offset 130h

Uncorrectable Error Count

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x10] + 130h
Host Memory Space: SBREG_BAR + 0x100000 + 130h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RSV	**Rsvd_DERRCNT:** Reserved
7:0	0x0 RW/1C/V/P	**UNCCNT:** Uncorrectable Error Count: The count of uncorrectable errors that have occurred since the last time the count was cleared. The count limit is 128 (80h) and the count is cleared by writing ones to all bits (FFh). The type of uncorrectable errors that are counted is determined by the DERRCNTSEL register. Additionally, if two uncorrectable errors occur in the same clock cycle, only one type will be counted, even if multiple types are selected.

44.5.29 ERRINJCTL—Offset 134h

Error Injection Control

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x10] + 134h
Host Memory Space: SBREG_BAR + 0x100000 + 134h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RW/P	**INJECCPAR:** Error Injection ECC/Parity[7:0]: Error injection ECC/parity. Zero bits indicate no injection; one bits indicate that the corresponding read/write ECC or parity bit should be inverted.
23:20	0x0 RSV	**Rsvd_ERRINJCTL_2:** Reserved
19	0x0 RW/P	**INJAMSK4:** Error Injection Address Mask[4]: This is the mask bit for error injection address bit 4; address mask bits 36:5 are located in the ERRINJAMSK register.
18	0x0 RW/P	**INJADDR4:** Error Injection Address[4]: This is error injection address bit 4; address bits 36:5 are located in the ERRINJADDR register.
17	0x0 RW/P	**INJAMSK3:** Error Injection Address Mask[3]: This is the mask bit for error injection address bit 3; address mask bits 36:5 are located in the ERRINJAMSK register.
16	0x0 RW/P	**INJADDR3:** Error Injection Address[3]: This is error injection address bit 3; address bits 35:4 are located in the ERRINJADDR register.
15:14	0x0 RW/P	**INJTRIGSEL:** Error Injection Trigger Selection: 0x = Disable error injection trigger sources 10 = Enable error injection when trigger source 0 (ddr_fsta_trigev[0]) is asserted 11 = Enable error injection when trigger source 1 (ddr_fsta_trigev[1]) is asserted. When setting this field to 1X, the INJEN field should be set to 0 since it will be set automatically when the trigger asserts.
13:12	0x0 RW/P	**INJCAP:** Command address parity injection per dclk half
11:8	0x0 RW/P	**INJSRC:** Error Injection Source[3:0]: The selected requestor source ID match against when selecting the transaction for error injection.
7	0x0 RW/P	**INJPAT:** Inject on patrol scrub request. Address match/mask logic is not used here. Error injection will occur on the next patrol scrub once INJEN is set.
6	0x0 RW/P	**INJREAD:** Error Injection in the Read Data Path: 0 = Disable 1 = Enabled
5	0x0 RW/P	**INJWRITE:** Error Injection in the Write Data Path: 0 = Disable 1 = Enabled
4	0x0 RW/P	**INJECC:** Error Injection in ECC or Parity Path Selection: 0 = Inject in the Data/Parity Path 1 = Inject in the Data/ECC Path
3	0x0 RW/P	**INJSRCEN:** Error Injection Source Enable: When set, the error injection will be performed only for the specified requestor source.
2	0x0 RW/P	**INJADREN:** Error Injection Address Enable: When set, the error injection will be performed only for addresses that match the address specified in the ERRINJADDR and ERRINJAMSK registers.
1	0x0 RW/P	**INJONCE:** Error Injection Once: When set, a single error will be injected after error injection is enabled. Otherwise, error injection will be continuous until disabled. Note that error injection has a minimum temporal granularity of one dunit clock cycle. Thus, if the address match/match bits allow injections on multiple bursts, it is possible to inject up to 4 errors (across the 4 bursts per dunit cycle) even with this bit set. To ensure predictable single error injection INJAMSK3, INJAMSK4 and ERRINJAMSK.INJAMSK[0] must be set to 0.
0	0x0 RW/V/P	**INJEN:** Error Injection Enable: 0 - Error injection is disabled 1 - Error injection is enabled. This bit is self clearing when inject once is selected and the single error injection has been performed. This bit should be set to 0 when INJTRIGSEL is set to 1X. Upon assertion, the trigger will automatically set the INJEN field.

44.5.30 ERRINJADDR—Offset 138h

Error Injection Address

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x10] + 138h
Host Memory Space: SBREG_BAR + 0x100000 + 138h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/P	**INJADDR:** Error Injection PMI Address[36:5]

44.5.31 ERRINJAMSK—Offset 13Ch

Error Injection Address Mask

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x10] + 13Ch
Host Memory Space: SBREG_BAR + 0x100000 + 13Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/P	**INJAMSK:** Error Injection PMI Address Mask[36:5]: For each bit that is 0 in the address mask, the corresponding PMI address bit will be compared against the same bit in ERRINJADDR.

44.5.32 ERRINJDATA0—Offset 140h

Error Injection Data 0

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x10] + 140h
Host Memory Space: SBREG_BAR + 0x100000 + 140h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/P	**INJDATA0:** Error Injection Data[31:0]: Zero bits indicate no injection; one bits indicate that the corresponding read/write data bit should be inverted.

44.5.33 ERRINJDATA1—Offset 144h

Error Injection Data 1

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x10] + 144h
Host Memory Space: SBREG_BAR + 0x100000 + 144h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/P	**INJDATA1:** Error Injection Data[63:32]: Zero bits indicate no injection; one bits indicate that the corresponding read/write data bit should be inverted.

44.5.34 DCS—Offset 170h

DRAM Control and Status

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x10] + 170h
Host Memory Space: SBREG_BAR + 0x100000 + 170h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RSV	**Rsvd_DCS_5:** Reserved
28	0x0 RW	**Reserved:** Reserved
27:24	0x0 RSV	**Rsvd_DCS_4:** Reserved
23	0x0 RW/V/P	**SCRAMBLE_ENABLE:** Data Scrambler Enable: When set to 1 the data lanes (DDR3_DQ[63:0]) and the ECC lanes (DDR3_DQECC[7:0]) will be scrambled, otherwise no scrambling will occur.
22	0x0 RSV	**Rsvd_DCS_3:** Reserved
21	0x0 RW/P	**MPRMODE:** Mask Chip-Selects for all commands except read commands and MRS commands
20	0x0 RW/P	**Reserved:** Reserved
19:18	0x0 RSV	**Rsvd_DCS_2:** Reserved
17:16	0x0 RW/P	**Reserved:** Reserved
15:13	0x0 RSV	**Rsvd_DCS_1:** Reserved
12	0x0 RW/P	**ODTMODE:** ODT Control Mode: • 0 - Dunit auto controls the ODT pins based on DRAM Write transactions. • 1 - The value of ODTVAL above directly controls the ODT pins.
11:8	0x0 RW/P	**ODTVAL:** ODT Control Value: Each bit of ODTVAL directly controls an ODT pin, when ODTMODE is set to 1. Used only during init flow by BIOS.
7:5	0x0 RSV	**Rsvd_DCS_0:** Reserved
4	0x0 RW/P	**CKEMODE:** CKE Control Mode: • 0 - Dunit auto controls the CKE pins based on Power-Down and Self Refresh entry and exit. • 1 - The value of CKEVAL above directly controls the CKE pins.
3:0	0x0 RW/P	**CKEVAL:** CKE Control Value: Each bit of CKEVAL directly controls a CKE pin, when CKEMODE is set to 1. Used only during init flow by BIOS.

44.5.35 DECCCTRL—Offset 180h

Dunit ECC Control

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x10] + 180h
Host Memory Space: SBREG_BAR + 0x100000 + 180h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0x0 RSV	**Rsvd_DECCCTRL_1:** Reserved
25	0x0 RW/P	**RD2CLRACC:** Read to Clear C[1:0]SBEACC Registers: • 0 = C[1:0]SBEACC Registers are cleared when written • 1 = C[1:0]SBEACC Registers are cleared when written or read
24:18	0x0 RSV	**Rsvd_DECCCTRL_0:** Reserved
17	0x0 RW/P	**ENCBGEN:** Enable Generation of ECC Check Bits: • 0 - Disable generation of ECC Check Bits ECC for Bunit is 0 ECC for CPGC is generated by the CPCC • 1 - Enable generation of ECC Check Bits ECC is generated for both the Bunit and the CPGC
16	0x0 RW/P	**ECCOVREN:** ECC Check Bits Override Enable: • 0 - Normal ECC is generated. • 1 - ECC override enabled, the value in ECCOVR will be used for the ECC code.
15:8	0x0 RW/P	**ECCOVR:** ECC Check Bits Override Value: The ECC override code to be used on writes if enabled by ECCOVREN.
7:5	0x0 RW/P	**UCE_FILTER:** Uncorrectable Error Filter: • 000: Normal mode; All 8 byte ECC checks/corrections are performed independently, no anti-aliasing filters are applied. • 011: An uncorrectable error that is detected in any 8 byte ECC check will cause all four parallel 8 byte ECC checks to be treated as uncorrectable errors.
4	0x0 RW/P	**DPAREN:** Data Parity Enable: When set, data path parity is enabled. The write data parity is checked at the point when ECC is generated and read data parity is generated at the point that ECC is checked.
3	0x0 RW/P	**CAPERREN:** Enable Command Address Parity Error Detection: When set, command address parity errors are detected and signaled to the Bunit.
2	0x0 RW/P	**DERREN:** Enable Uncorrectable Error Notification: When set, uncorrectable ECC errors are signaled to the Bunit and patrol scrub.
1	0x0 RW/P	**SERREN:** Enable Correctable Error Notification: When set, correctable ECC errors are signaled to the Bunit and patrol scrub which indicates that the read data needs to be written back to memory. This causes the DRAM cell with the single bit error to be scrubbed.
0	0x0 RW/V/P	**ECCEN:** ECC Enable: When set, single bit error correction and double bit error detection (SEC/DED ECC) is enabled. The ECC is an 8 bit protection code for every 64 bits of data stored in DRAM. ECC is generated on writes and checked on reads, requiring a 72 bit DDR3 data bus width.

44.5.36 LEAKY_BUCKET_CNTR_UPPER—Offset 18Ch

Leaky Bucket Counter Upper

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x10] + 18Ch
Host Memory Space: SBREG_BAR + 0x100000 + 18Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RW/P	**CNTR_UPPER_RANK3:** Rank 3 CNTR_UPPER configuration. Total Leak Rate = (CNTR_UPPER_RANK3 + 1)* (LEAKY_BUCKET_CFG3.CNTR_HI + 1) * (LEAKY_BUCKET_CFG3.CNTR_LO + 1) * 8192 DRAM clocks. Setting CNTR_LO to zero will disable the leaky bucket.
23:16	0x0 RW/P	**CNTR_UPPER_RANK2:** Rank 2 CNTR_UPPER configuration. Total Leak Rate = (CNTR_UPPER_RANK2 + 1)* (LEAKY_BUCKET_CFG2.CNTR_HI + 1) * (LEAKY_BUCKET_CFG2.CNTR_LO + 1) * 8192 DRAM clocks. Setting CNTR_LO to zero will disable the leaky bucket.
15:8	0x0 RW/P	**CNTR_UPPER_RANK1:** Rank 1 CNTR_UPPER configuration. Total Leak Rate = (CNTR_UPPER_RANK1 + 1)* (LEAKY_BUCKET_CFG1.CNTR_HI + 1) * (LEAKY_BUCKET_CFG1.CNTR_LO + 1) * 8192 DRAM clocks. Setting CNTR_LO to zero will disable the leaky bucket.
7:0	0x0 RW/P	**CNTR_UPPER_RANK0:** Rank 0 CNTR_UPPER configuration. Total Leak Rate = (CNTR_UPPER_RANK0 + 1)* (LEAKY_BUCKET_CFG0.CNTR_HI + 1) * (LEAKY_BUCKET_CFG0.CNTR_LO + 1) * 8192 DRAM clocks. Setting CNTR_LO to zero will disable the leaky bucket.

44.5.37 DPATROL_SCRUB_TMR—Offset 194h

Patrol Scrub Timer Register

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x10] + 194h
Host Memory Space: SBREG_BAR + 0x100000 + 194h

Default: FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	0xffffffff RW/P	**PATSCRTIMER:** Patrol scrub interval timer in DCLKs (DRAM cmd clk divided by 2). A new patrol scrub is scheduled every time the timer ticks to the value in this register. Any non zero value is valid

44.5.38 UCELOG—Offset 64h

Uncorrectable Error Log This register captures the log information when the corresponding channel DERRSTS.UCE[1:0] is set to 1. This register is cleared and capturing of new errors is re-enabled when the corresponding channel DERRSTS.UCE[1:0] is cleared to 0.

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x12] + 64h
Host Memory Space: SBREG_BAR + 0x120000 + 64h

Default: 00000800h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0x0 RSV	**Rsvd_UCELOG_1:** Reserved
21:20	0x0 RO/V/P	**UCERNK:** Rank Address: This is the rank address that contained the error
19:16	0x0 RO/V/P	**UCEBNK:** Bank Address: This is the bank address that contained the error. DDR3: UCEBNK[3] will always be 0 UCEBNK[2:0] = BA[2:0] DDR4: UCEBNK[3:2] = BG[1:0] UCEBNK[1:0] = BA[1:0]
15	0x0 RO/V/P	**Reserved:** Reserved
14	0x0 RO/V/P	**UCELAST:** Last Burst: If this bit is set, then the error occurred within that last four DQ bus bursts before a DQ bus turn-around cycle.
13	0x0 RO/V/P	**UCEFIRST:** First Burst: If this bit is set, then the error occurred within the first four DQ bus bursts after a DQ bus turn-around cycle.
12	0x0 RO/V/P	**UCEA5:** Address bit 5: This is A[5] from the original request
11	0x1 RO/V/P	**Reserved:** Reserved
10:8	0x0 RO/V/P	**UCEBOFF:** Burst Offset: This is the burst number that contained the error. Note that all 8 bursts are always numbered starting from 0.
7:0	0x0 RO/V/P	**UCESYND:** ECC Syndrome: This is the 8-bit syndrome output of the ECC checker logic. For DNV, this field does not provide useful information and is not reliable.

44.5.39 UCEADDR—Offset 68h

Uncorrectable Error Address This register captures the log information when the corresponding channel DERRSTS.UCE[1:0] is set to 1. This register is cleared and capturing of new errors is re-enabled when the corresponding channel DERRSTS.UCE[1:0] is cleared to 0.

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x12] + 68h
Host Memory Space: SBREG_BAR + 0x120000 + 68h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V/P	**UCEADDR:** Address Log: Captures the PMI address A[35:6] of the UCE error location.

44.5.40 SBELOG—Offset 6Ch

Correctable (Single Bit) Error Log This register captures the log information when the corresponding channel DERRSTS.SBE[1:0] is set to 1. This register is cleared and capturing of new errors is re-enabled when the corresponding channel DERRSTS.SBE[1:0] is cleared to 0.

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x12] + 6Ch
Host Memory Space: SBREG_BAR + 0x120000 + 6Ch

Default: 00000800h

Bit Range	Default & Access	Field Name (ID): Description
31:22	0x0 RSV	**Rsvd_SBELOG_1:** Reserved
21:20	0x0 RO/V/P	**SBERNK:** Rank Address: This is the rank address that contained the error
19:16	0x0 RO/V/P	**SBEBNK:** Bank Address: This is the bank address that contained the error. DDR3: UCEBNK[3] will always be 0 UCEBNK[2:0] = BA[2:0] DDR4: UCEBNK[3:2] = BG[1:0] UCEBNK[1:0] = BA[1:0]
15	0x0 RO/V/P	**Reserved:** Reserved
14	0x0 RO/V/P	**SBELAST:** Last Burst: If this bit is set, then the error occurred within that last four DQ bus bursts before a DQ bus turn-around cycle.
13	0x0 RO/V/P	**SBEFIRST:** First Burst: If this bit is set, then the error occurred within the first four DQ bus bursts after a DQ bus turn-around cycle.
12	0x0 RO/V/P	**SBEA5:** Address bit 5: This is A[5] from the original request. In 32 bit mode this field is undefined.
11	0x1 RO/V/P	**Reserved:** Reserved
10:8	0x0 RO/V/P	**SBEBOFF:** Burst Offset: This is the burst number that contained the error. Note that all 8 bursts are always numbered starting from 0.
7:0	0x0 RO/V/P	**SBESYND:** ECC Syndrome: This is the 8-bit syndrome output of the ECC checker logic

44.5.41 SBEADDR—Offset 70h

Correctable Error Address This register captures the log information when the corresponding channel DERRSTS.SBE[1:0] is set to 1. This register is cleared and capturing of new errors is re-enabled when the corresponding channel DERRSTS.SBE[1:0] is cleared.

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x12] + 70h
Host Memory Space: SBREG_BAR + 0x120000 + 70h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V/P	**SBEADDR:** Address Log: Captures the PMI address A[35:6] of the SBE error location.

44.5.42 SBECNT0—Offset 74h

SBE Count for Rank 0

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x12] + 74h
Host Memory Space: SBREG_BAR + 0x120000 + 74h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0x0 RSV	**Rsvd_SBECNT0_0:** Reserved
16	0x0 RW/C/V/P	**CORRERRORSTATUS:** The per rank status bits are set when a rank's error count equals the threshold. The status bits are what tell the BIOS/BMC what caused SMI/ERR[0] to get triggered. Once the status bits are set, they will remain set until cleared by BIOS and will cause the SMI/ERR[0] to get signaled to the cores.
15:0	0x0 RW/C/V/P	**CNT:** Single Bit Error Count for Rank 0. Any write to this register will clear the counter to 0.

44.5.43 SBECNT1—Offset 78h

SBE Count for Rank 1

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x12] + 78h
Host Memory Space: SBREG_BAR + 0x120000 + 78h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0x0 RSV	**Rsvd_SBECNT1_0:** Reserved
16	0x0 RW/C/V/P	**CORRERRORSTATUS:** The per rank status bits are set when a rank's error count equals the threshold. The status bits are what tell the BIOS/BMC what caused SMI/ERR[0] to get triggered. Once the status bits are set, they will remain set until cleared by BIOS and will cause the SMI/ERR[0] to get signaled to the cores.
15:0	0x0 RW/C/V/P	**CNT:** Single Bit Error Count for Rank 1. Any write to this register will clear the counter to 0.

44.5.44 SBECNT2—Offset 7Ch

SBE Count for Rank 2

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x12] + 7Ch
Host Memory Space: SBREG_BAR + 0x120000 + 7Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0x0 RSV	**Rsvd_SBECNT2_0:** Reserved
16	0x0 RW/C/V/P	**CORRERRORSTATUS:** The per rank status bits are set when a rank's error count equals the threshold. The status bits are what tell the BIOS/BMC what caused SMI/ERR[0] to get triggered. Once the status bits are set, they will remain set until cleared by BIOS and will cause the SMI/ERR[0] to get signaled to the cores.
15:0	0x0 RW/C/V/P	**CNT:** Single Bit Error Count for Rank 2. Any write to this register will clear the counter to 0.

44.5.45 SBECNT3—Offset 80h

SBE Count for Rank 3

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x12] + 80h
Host Memory Space: SBREG_BAR + 0x120000 + 80h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0x0 RSV	**Rsvd_SBECNT3_0:** Reserved
16	0x0 RW/C/V/P	**CORRERRORSTATUS:** The per rank status bits are set when a rank's error count equals the threshold. The status bits are what tell the BIOS/BMC what caused SMI/ERR[0] to get triggered. Once the status bits are set, they will remain set until cleared by BIOS and will cause the SMI/ERR[0] to get signaled to the cores.
15:0	0x0 RW/C/V/P	**CNT:** Single Bit Error Count for Rank 3. Any write to this register will clear the counter to 0.

44.5.46 SBEACC0—Offset 84h

SBE Accumulator for Rank0

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x12] + 84h
Host Memory Space: SBREG_BAR + 0x120000 + 84h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0x0 RSV	**Rsvd_SBEACC0_0:** Reserved
17:0	0x0 RW/C/V/P	**LANE:** Single Bit Accumulator per Nibble Lane: This allows for identification of the failing x4 or x8 device. This value is cleared by any write to this register.

44.5.47 SBEACC1—Offset 88h

SBE Accumulator for Rank1

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x12] + 88h
Host Memory Space: SBREG_BAR + 0x120000 + 88h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0x0 RSV	**Rsvd_SBEACC1_0:** Reserved
17:0	0x0 RW/C/V/P	**LANE:** Single Bit Accumulator per Nibble Lane: This allows for identification of the failing x4 or x8 device. This value is cleared by any write to this register.

44.5.48 SBEACC2—Offset 8Ch

SBE Accumulator for Rank2

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x12] + 8Ch
Host Memory Space: SBREG_BAR + 0x120000 + 8Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0x0 RSV	**Rsvd_SBEACC2_0:** Reserved
17:0	0x0 RW/C/V/P	**LANE:** Single Bit Accumulator per Nibble Lane: This allows for identification of the failing x4 or x8 device.

44.5.49 SBEACC3—Offset 90h

SBE Accumulator for Rank3

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x12] + 90h
Host Memory Space: SBREG_BAR + 0x120000 + 90h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0x0 RSV	**Rsvd_SBEACC3_0:** Reserved
17:0	0x0 RW/C/V/P	**LANE:** Single Bit Accumulator per Nibble Lane: This allows for identification of the failing x4 or x8 device.

44.5.50 DPATROL_SCRUB_CFG—Offset B0h

Patrol Scrub Config Register

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x12] + B0h
Host Memory Space: SBREG_BAR + 0x120000 + B0h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/P	**PAT_SCRUB_ENABLE:** Bit to enable/disable patrol scrub 0: Disable patrol scrub 1: Enable patrol scrub
30	0x0 RW/P	**DIMM1_COL_ADDR_BITS:** Total number of column bits for devices on rank 0 = 10 + DIMM1_COL_ADDR_BITS 0: DDR4 and DDR3 1: Only DDR3
29	0x0 RW/P	**DIMM0_COL_ADDR_BITS:** Total number of column bits for devices on rank 0 = 10 + DIMM0_COL_ADDR_BITS 0: DDR4 and DDR3 1: Only DDR3
28:23	0x0 RW/P	**DIMM1_MAX_ROW_ADDR:** Maximum row address for DIMM1 - bits 17 to 12. Bits 11:0 are assumed to all be 1.
22:17	0x0 RW/P	**DIMM0_MAX_ROW_ADDR:** Maximum row address for DIMM0 - bits 17 to 12. Bits 11:0 are assumed to all be 1.
16	0x0 RW/P	**PATSCRUB_FORCE_WRITEBACK:** When set to 1, force write back of data with no errors. When set to 0, don't write back data that had no errors.
15:0	0x0 RW/P	**MAX_PATSCRUB_DEBIT_CNT:** Maximum number of debit patrol scrub operations. Once the patrol scrub debit counter exceeds this value, patrol scrubs will be issued until the debit counter reaches 0. Set 0 to disable debit mode.

44.5.51 UCELOG1—Offset CCh

This register captures the log information when the corresponding channel DERRSTS.UCE[1:0] is set to 1. This register is cleared and capturing of new errors is re-enabled when the corresponding channel DERRSTS.UCE[1:0] is cleared to 0.

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x12] + CCh
Host Memory Space: SBREG_BAR + 0x120000 + CCh

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0x0 RSV	**RSVD (reg_RSVD):** Reserved
26:18	0x0 RO/V/P	**UCE_COL:** Column address bits above A[5]
17:0	0x0 RO/V/P	**UCE_ROW:** Row bits

44.5.52 SBELOG1—Offset D0h

Single bit error log 1 This register captures the log information when the corresponding channel DERRSTS.SBE[1:0] is set to 1. This register is cleared and capturing of new errors is re-enabled when the corresponding channel DERRSTS.SBE[1:0] is cleared.

Type: Sideband Register (Size: 32 bits)

Sideband Port and Offset: [Port: 0x12] + D0h
Host Memory Space: SBREG_BAR + 0x120000 + D0h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0x0 RSV	**RSVD (reg_RSVD):** Reserved
26:18	0x0 RO/V/P	**SBE_COL:** Column bits [11,9:2], in 32 bit mode SBE_COL[0] will always be 0, SBE_COL[1] contains information for SBEBOFF[2]
17:0	0x0 RO/V/P	**SBE_ROW:** Row bits

44.5.53 CORRERRTHRSHLD0—Offset 100h

Correctable Error Threshold for Rank 0

Type: Sideband Register (Size: 32 bits)

Sideband Port and Offset: [Port: 0x12] + 100h
Host Memory Space: SBREG_BAR + 0x120000 + 100h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RSV	**Rsvd_CORRERRTHRSHLD0_0:** Reserved
15:0	0x0 RW/P	**THRSH_RNK:** Correctable error threshold for rank 0. When the error accumulation in SBECNT0 hits this value, then the CORRERRSTATUS is set and a DO_SMI message is sent if the threshold value is greater than 0.

44.5.54 CORRERRTHRSHLD1—Offset 104h

Correctable Error Threshold for Rank 1

Type: Sideband Register (Size: 32 bits)

Sideband Port and Offset: [Port: 0x12] + 104h
Host Memory Space: SBREG_BAR + 0x120000 + 104h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RSV	**Rsvd_CORRERRTHRSHLD1_0:** Reserved
15:0	0x0 RW/P	**THRSH_RNK:** Correctable error threshold for rank 1. When the error accumulation in SBECNT1 hits this value, then the CORRERRSTATUS is set and a DO_SMI message is sent if the threshold value is greater than 0.

44.5.55 CORRERRTHRSHLD2—Offset 108h

Correctable Error Threshold for Rank 2

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x12] + 108h
Host Memory Space: SBREG_BAR + 0x120000 + 108h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RSV	**Rsvd_CORRERRTHRSHLD2_0:** Reserved
15:0	0x0 RW/P	**THRSH_RNK:** Correctable error threshold for rank 2. When the error accumulation in SBECNT2 hits this value, then the CORRERRSTATUS is set and a DO_SMI message is sent if the threshold value is greater than 0.

44.5.56 CORRERRTHRSHLD3—Offset 10Ch

Correctable Error Threshold for Rank 3

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x12] + 10Ch
Host Memory Space: SBREG_BAR + 0x120000 + 10Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RSV	**Rsvd_CORRERRTHRSHLD3_0:** Reserved
15:0	0x0 RW/P	**THRSH_RNK:** Correctable error threshold for rank 3. When the error accumulation in SBECNT3 hits this value, then the CORRERRSTATUS is set and a DO_SMI message is sent if the threshold value is greater than 0.

44.5.57 LEAKY_BUCKET_CFG0—Offset 110h

Leaky Bucket Configuration Rank 0

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x12] + 110h
Host Memory Space: SBREG_BAR + 0x120000 + 110h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW/P	**CNTR_HI:** Specifies the leaky bucket leak rat in CNTR_LO ticks. When the leaky bucket counter counts through CNTR_HI, the correctable error count for rank 0 is decremented by one.
15:0	0x0 RW/P	**CNTR_LO:** Units for this register are 8192 DRAM clocks. When greater than zero, leaky bucket is enabled. This is the unit for the high order counter for rank 0, CNTR_HI.

44.5.58 LEAKY_BUCKET_CFG1—Offset 114h

Leaky Bucket Configuration Rank 1

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x12] + 114h
Host Memory Space: SBREG_BAR + 0x120000 + 114h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW/P	**CNTR_HI:** Specifies the leaky bucket leak rat in CNTR_LO ticks. When the leaky bucket counter counts through CNTR_HI, the correctable error count for rank 1 is decremented by one.
15:0	0x0 RW/P	**CNTR_LO:** Units for this register are 8192 DRAM clocks. When greater than zero, leaky bucket is enabled. This is the unit for the high order counter for rank 1, CNTR_HI.

44.5.59 LEAKY_BUCKET_CFG2—Offset 118h

Leaky Bucket Configuration Rank 2

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x12] + 118h
Host Memory Space: SBREG_BAR + 0x120000 + 118h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW/P	**CNTR_HI:** Specifies the leaky bucket leak rat in CNTR_LO ticks. When the leaky bucket counter counts through CNTR_HI, the correctable error count for rank 2 is decremented by one.
15:0	0x0 RW/P	**CNTR_LO:** Units for this register are 8192 DRAM clocks. When greater than zero, leaky bucket is enabled. This is the unit for the high order counter for rank 2, CNTR_HI.

44.5.60 LEAKY_BUCKET_CFG3—Offset 11Ch

Leaky Bucket Configuration Rank 3

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x12] + 11Ch
Host Memory Space: SBREG_BAR + 0x120000 + 11Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW/P	**CNTR_HI:** Specifies the leaky bucket leak rat in CNTR_LO ticks. When the leaky bucket counter counts through CNTR_HI, the correctable error count for rank 3 is decremented by one.
15:0	0x0 RW/P	**CNTR_LO:** Units for this register are 8192 DRAM clocks. When greater than zero, leaky bucket is enabled. This is the unit for the high order counter for rank 3, CNTR_HI.

44.5.61 FERRNERR—Offset 120h

First Error and Next Error Register

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x12] + 120h
Host Memory Space: SBREG_BAR + 0x120000 + 120h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0x0 RSV	**Rsvd_FERRNERR_1 (Rsvd_FERRNERR_3):** Reserved
20	0x0 RO/V/P	**FERRUCEPAT:** First Error Uncorrectable Patrol Scrub Read Error Detected: When set, the first error detected was an uncorrectable (multiple bit) error on the patrol scrub read from memory.
19	0x0 RO/V/P	**FERRAPE:** First Error Uncorrectable DDR4 Command Address Parity Error: When set, the first error detected was the assertion of the xxDDR3_0_ALERT_N pin indicating that one or more DRAMs detected a Command/Address parity error.
18	0x0 RO/V/P	**FERRWPE:** First Error Uncorrectable Write Parity Error Detected: When set, the first error detected was an uncorrectable (parity) error on the write data received from the Bunit.
17	0x0 RO/V/P	**FERRUCE:** First Error Uncorrectable Read Error Detected: When set, the first error detected was an uncorrectable (multiple bit) error on the read data from memory.
16	0x0 RO/V/P	**FERRSBE:** First Error Correctable Read Error Detected: When set, the first error detected was a single bit error on the read data from memory and the error was corrected.
15:5	0x0 RSV	**Rsvd_FERRNERR_0 (Rsvd_FERRNERR_1):** Reserved
4	0x0 RO/V/P	**NERRUCEPAT:** Next Error Uncorrectable Patrol Scrub Read Error: When set, the second error detected was an uncorrectable (mutliple bit) error on the patrol scrub read data from memory.
3	0x0 RO/V/P	**NERRAPE:** Next Error Uncorrectable DDR4 Command Address Parity Error: When set, the second error detected was the assertion of the xxDDR3_0_ALERT_N pin indicating that one or more DRAMs detected a Command/Address parity error. Note that this bit can never be set as the same time as FERRAPE
2	0x0 RO/V/P	**NERRWPE:** Next Error Uncorrectable Write Parity Error Detected: When set, the second error detected was an uncorrectable (parity) error on the write data received from the Bunit.
1	0x0 RO/V/P	**NERRUCE:** Next Error Uncorrectable Read Error Detected: When set, the second error detected was an uncorrectable (multiple bit) error on the read data from memory.
0	0x0 RO/V/P	**NERRSBE:** Next Error Correctable Read Error Detected: When set, the second error detected was a single bit error on the read data from memory and the error was corrected.

44.5.62 DERRSTS—Offset 124h

Error Status Register

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x12] + 124h
Host Memory Space: SBREG_BAR + 0x120000 + 124h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0x0 RSV	**Reserved:** Reserved
6	0x0 RW/1C/V/P	**CAP_ERR_STATE:** Channel Command Address Parity Error State. 1 = CAP error seen, error state entered. All PMI reads will be returned with bad parity. 0 = No CAP error seen. Normal PMI operation.
5	0x0 RO/V/P	**ALERT:** Current state of the channel ALERT_N pin, captured here as active high: 1 = Error being driven by at least one DRAM device 0 = No error currently detected by any DRAM device
4	0x0 RW/1C/V/P	**UCEPAT:** Uncorrectable (multiple bit) patrol scrub error: When set, an uncorrectable (multiple bit error was detected on the read data from memory.
3	0x0 RW/1C/V/P	**APE:** Uncorrectable DDR4 Command/Address Parity Error: When set, an uncorrectable DDR4 command/address parity error was detected by one or more of the DRAMs on channel 0.
2	0x0 RW/1C/V/P	**WPE:** Uncorrectable (Parity) Write Error: When set, an uncorrectable (parity) error was detected on the write data received from the Bunit.
1	0x0 RW/1C/V/P	**UCE:** Uncorrectable (Double Bit) Read Error: When set, a double bit error was detected on the read data from memory.
0	0x0 RW/1C/V/P	**SBE:** Correctable (Single Bit) Read Error: When set, a single bit error was detected on the read data from memory and the error was corrected.

44.5.63 DERRMSKSEV—Offset 128h

Error Mask and Severity

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x12] + 128h
Host Memory Space: SBREG_BAR + 0x120000 + 128h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0x0 RSV	**Rsvd_DERRMSKSEV_2:** Reserved
20	0x0 RW/P	**MSK_UCEPAT:** Uncorrectable patrol scrub error mask: When set, uncorrectable patrol scrub ECC data errors will not be logged in DERRESTS[0], DO_SERR_SEV messages will not be sent to the IEH, and derrcnt will not count for this error.
19	0x0 RW/P	**MSK_APE:** Uncorrectable command/address parity error mask: When set, uncorrectable DDR4 command/address parity errors will not be logged in DERRESTS[0], DO_SERR_SEV messages will not be sent to the IEH, and derrcnt will not count for this error.
18	0x0 RW/P	**MSK_WDBR:** Uncorrectable (parity) write data buffer read error mask: When set, uncorrectable (pairty) write data buffer read errors will not be logged in DERRESTS[0], DO_SERR_SEV messages will not be sent to the IEH, and derrcnt will not count for this error.
17	0x0 RW/P	**MSK_UCE:** Uncorrectable (multiple bit) error mask: When set, uncorrectable (multiple bit) read and patrol scrub errors will not be logged in DERRESTS[0], DO_SERR_SEV messages will not be sent to the IEH, and derrcnt will not count for this error.
16	0x0 RW/P	**MSK_SBE:** Correctable (single bit) error mask: When set, correctable (single bit) read and patrol scrub errors will not be logged in DERRESTS[0] and DO_SERR_SEV messages will not be sent to the IEH.
15:5	0x0 RSV	**Rsvd_DERRMSKSEV_1:** Reserved
4	0x0 RW/P	**SEV_UCEPAT:** Uncorrectable (Multiple Bit) Patrol Scrub Read Error Severity: When set, UCE errors logged in DERRSTS[5] will be escalated to the global error logic as a fatal error; otherwise it will be escalated as a non-fatal error.
3	0x0 RW/P	**SEV_APE:** Uncorrectable DDR4 Command/Address Parity Error Severity: When set, APE errors logged in DERRSTS[3] will be escalated to the global error logic as a fatal error; otherwise it will be escalated as a non-fatal error.
2	0x0 RW/P	**SEV_WDBR:** Uncorrectable (Parity) Write Error Severity: When set, WPE errors logged in DERRSTS[2] will be escalated to the global error logic as a fatal error; otherwise it will be escalated as a non-fatal error.
1	0x0 RW/P	**SEV_UCE:** Uncorrectable (Multiple Bit) Read Error Severity: When set, UCE errors logged in DERRSTS[1] will be escalated to the global error logic as a fatal error; otherwise it will be escalated as a non-fatal error.
0	0x0 RSV	**Rsvd_DERRMSKSEV_0:** Reserved

44.5.64 DERRCNTSEL—Offset 12Ch

Uncorrectable Error Count Select

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x12] + 12Ch
Host Memory Space: SBREG_BAR + 0x120000 + 12Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0x0 RSV	**Rsvd_DERRCNTSEL_2:** Reserved
4	0x0 RW/P	**SEL_UCEPAT:** Uncorrectable (Multiple Bit) Patrol Scrub Read Error Count Select: When set, UCE errors logged in DERRSTS[1] will be counted in DERRCNT.UNCCNT1.
3	0x0 RW/P	**SEL_APE:** Uncorrectable DDR4 Command/Address Parity Error Count Select: When set, APE0 errors logged in DERRSTS[3] will be counted in DERRCNT.UNCCNT0.
2	0x0 RW/P	**SEL_WPE:** Uncorrectable (Parity) Write Error Count Select: When set, WPE0 errors logged in DERRSTS[2] will be counted in DERRCNT.UNCCNT0.
1	0x0 RW/P	**SEL_UCE:** Uncorrectable (Multiple Bit) Read Error Count Select: When set, UCE0 errors logged in DERRSTS[1] will be counted in DERRCNT.UNCCNT0.
0	0x0 RSV	**Rsvd_DERRCNTSEL_0:** Reserved

44.5.65 DERRCNT—Offset 130h

Uncorrectable Error Count

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x12] + 130h
Host Memory Space: SBREG_BAR + 0x120000 + 130h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RSV	**Rsvd_DERRCNT:** Reserved
7:0	0x0 RW/1C/V/P	**UNCCNT:** Uncorrectable Error Count: The count of uncorrectable errors that have occurred since the last time the count was cleared. The count limit is 128 (80h) and the count is cleared by writing ones to all bits (FFh). The type of uncorrectable errors that are counted is determined by the DERRCNTSEL register. Additionally, if two uncorrectable errors occur in the same clock cycle, only one type will be counted, even if multiple types are selected.

44.5.66 ERRINJCTL—Offset 134h

Error Injection Control

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x12] + 134h
Host Memory Space: SBREG_BAR + 0x120000 + 134h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RW/P	**INJECCPAR:** Error Injection ECC/Parity[7:0]: Error injection ECC/parity. Zero bits indicate no injection; one bits indicate that the corresponding read/write ECC or parity bit should be inverted.
23:20	0x0 RSV	**Rsvd_ERRINJCTL_2:** Reserved
19	0x0 RW/P	**INJAMSK4:** Error Injection Address Mask[4]: This is the mask bit for error injection address bit 4; address mask bits 36:5 are located in the ERRINJAMSK register.
18	0x0 RW/P	**INJADDR4:** Error Injection Address[4]: This is error injection address bit 4; address bits 36:5 are located in the ERRINJADDR register.
17	0x0 RW/P	**INJAMSK3:** Error Injection Address Mask[3]: This is the mask bit for error injection address bit 3; address mask bits 36:5 are located in the ERRINJAMSK register.
16	0x0 RW/P	**INJADDR3:** Error Injection Address[3]: This is error injection address bit 3; address bits 35:4 are located in the ERRINJADDR register.
15:14	0x0 RW/P	**INJTRIGSEL:** Error Injection Trigger Selection: 0x = Disable error injection trigger sources 10 = Enable error injection when trigger source 0 (ddr_fsta_trigev[0]) is asserted 11 = Enable error injection when trigger source 1 (ddr_fsta_trigev[1]) is asserted. When setting this field to 1X, the INJEN field should be set to 0 since it will be set automatically when the trigger asserts.
13:12	0x0 RW/P	**INJCAP:** Command address parity injection per dclk half
11:8	0x0 RW/P	**INJSRC:** Error Injection Source[3:0]: The selected requestor source ID match against when selecting the transaction for error injection.
7	0x0 RW/P	**INJPAT:** Inject on patrol scrub request. Address match/mask logic is not used here. Error injection will occur on the next patrol scrub once INJEN is set.
6	0x0 RW/P	**INJREAD:** Error Injection in the Read Data Path: 0 = Disable 1 = Enabled
5	0x0 RW/P	**INJWRITE:** Error Injection in the Write Data Path: 0 = Disable 1 = Enabled
4	0x0 RW/P	**INJECC:** Error Injection in ECC or Parity Path Selection: 0 = Inject in the Data/Parity Path 1 = Inject in the Data/ECC Path
3	0x0 RW/P	**INJSRCEN:** Error Injection Source Enable: When set, the error injection will be performed only for the specified requestor source.
2	0x0 RW/P	**INJADREN:** Error Injection Address Enable: When set, the error injection will be performed only for addresses that match the address specified in the ERRINJADDR and ERRINJAMSK registers.
1	0x0 RW/P	**INJONCE:** Error Injection Once: When set, a single error will be injected after error injection is enabled. Otherwise, error injection will be continuous until disabled. Note that error injection has a minimum temporal granularity of one dunit clock cycle. Thus, if the address match/match bits allow injections on multiple bursts, it is possible to inject up to 4 errors (across the 4 bursts per dunit cycle) even with this bit set. To ensure predictable single error injection INJAMSK3, INJAMSK4 and ERRINJAMSK.INJAMSK[0] must be set to 0.
0	0x0 RW/V/P	**INJEN:** Error Injection Enable: 0 - Error injection is disabled 1 - Error injection is enabled. This bit is self clearing when inject once is selected and the single error injection has been performed. This bit should be set to 0 when INJTRIGSEL is set to 1X. Upon assertion, the trigger will automatically set the INJEN field.

44.5.67 ERRINJADDR—Offset 138h

Error Injection Address

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x12] + 138h
Host Memory Space: SBREG_BAR + 0x120000 + 138h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/P	**INJADDR:** Error Injection PMI Address[36:5]

44.5.68 ERRINJAMSK—Offset 13Ch

Error Injection Address Mask

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x12] + 13Ch
Host Memory Space: SBREG_BAR + 0x120000 + 13Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/P	**INJAMSK:** Error Injection PMI Address Mask[36:5]: For each bit that is 0 in the address mask, the corresponding PMI address bit will be compared against the same bit in ERRINJADDR.

44.5.69 ERRINJDATA0—Offset 140h

Error Injection Data 0

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x12] + 140h
Host Memory Space: SBREG_BAR + 0x120000 + 140h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/P	**INJDATA0:** Error Injection Data[31:0]: Zero bits indicate no injection; one bits indicate that the corresponding read/write data bit should be inverted.

44.5.70 ERRINJDATA1—Offset 144h

Error Injection Data 1

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x12] + 144h
Host Memory Space: SBREG_BAR + 0x120000 + 144h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/P	**INJDATA1:** Error Injection Data[63:32]: Zero bits indicate no injection; one bits indicate that the corresponding read/write data bit should be inverted.

44.5.71 DCS—Offset 170h

DRAM Control and Status

Type: Sideband Register (Size: 32 bits)

Sideband Port and Offset: [Port: 0x12] + 170h
Host Memory Space: SBREG_BAR + 0x120000 + 170h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RSV	**Rsvd_DCS_5:** Reserved
28	0x0 RW	**PMICTL:** PMI Control: • 0: Connect to the Bunit • 1: Connect to CPGC When this field is changed, the Dunit will only switch after all previous transactions from the previous unit have been completed. Since the Dunit is a slave to the PMI interface and it cannot prevent the Bunit or CPGC from sendign transactions, the initiatior of this request will have to make sure that the Bunit/CPGC are configured appropriately. Status of this operation from the Dunit perspective is provided in the PMI STAT register.
27:24	0x0 RSV	**Rsvd_DCS_4:** Reserved
23	0x0 RW/V/P	**SCRAMBLE_ENABLE:** Data Scrambler Enable: When set to 1 the data lanes (DDR3_DQ[63:0]) and the ECC lanes (DDR3_DQECC[7:0]) will be scrambled, otherwise no scrambling will occur.
22	0x0 RSV	**Rsvd_DCS_3:** Reserved
21	0x0 RW/P	**MPRMODE:** Mask Chip-Selects for all commands except read commands and MRS commands
20	0x0 RW/P	**BLKPHASEB:** Block Phase_B Commands: The Dunit runs at half the frequency of the DRAM clock to save power. In order to issue back-to-back commands on every DRAM clock cycles, the Dunit has to schedule two commands per Dunit clock. Therefore, it processes requests thru two separate arbitration paths labeled as Phase_A and Phase_B. Setting this bit to a 1 will disable Phase_B completely, and all memory requests will be processed thru Phase_A arbitration path. With only Phase_A, the DRAM devices will never see back-to-back commands. The best it will see is a command every other DRAM clock cycle. • 0 - No block • 1 - Block
19:18	0x0 RSV	**Rsvd_DCS_2:** Reserved
17:16	0x0 RW/P	**ECCLANESWAP:** ECC Byte Lane Swap: This feature is not supported in 32 bit mode and this field must be set to 0. • 0h - Normal mode • 1h - Swap ECC and Data Byte 0 • 2h - Reserved • 3h - Reserved
15:13	0x0 RSV	**Rsvd_DCS_1:** Reserved
12	0x0 RW/P	**ODTMODE:** ODT Control Mode: • 0 - Dunit auto controls the ODT pins based on DRAM Write transactions. • 1 - The value of ODTVAL above directly controls the ODT pins.
11:8	0x0 RW/P	**ODTVAL:** ODT Control Value: Each bit of ODTVAL directly controls an ODT pin, when ODTMODE is set to 1. Used only during init flow by BIOS.
7:5	0x0 RSV	**Rsvd_DCS_0:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
4	0x0 RW/P	**CKEMODE:** CKE Control Mode: • 0 - Dunit auto controls the CKE pins based on Power-Down and Self Refresh entry and exit. • 1 - The value of CKEVAL above directly controls the CKE pins.
3:0	0x0 RW/P	**CKEVAL:** CKE Control Value: Each bit of CKEVAL directly controls a CKE pin, when CKEMODE is set to 1. Used only during init flow by BIOS.

44.5.72 DECCCTRL—Offset 180h

Dunit ECC Control

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x12] + 180h
Host Memory Space: SBREG_BAR + 0x120000 + 180h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0x0 RSV	**Rsvd_DECCCTRL_1:** Reserved
25	0x0 RW/P	**RD2CLRACC:** Read to Clear C[1:0]SBEACC Registers: • 0 = C[1:0]SBEACC Registers are cleared when written • 1 = C[1:0]SBEACC Registers are cleared when written or read
24:18	0x0 RSV	**Rsvd_DECCCTRL_0:** Reserved
17	0x0 RW/P	**ENCBGEN:** Enable Generation of ECC Check Bits: • 0 - Disable generation of ECC Check Bits • 1 - Enable generation of ECC Check Bits ECC is generated for both the Bunit and the CPGC
16	0x0 RW/P	**ECCOVREN:** ECC Check Bits Override Enable: • 0 - Normal ECC is generated. • 1 - ECC override enabled, the value in ECCOVR will be used for the ECC code.
15:8	0x0 RW/P	**ECCOVR:** ECC Check Bits Override Value: The ECC override code to be used on writes if enabled by ECCOVREN.
7:5	0x0 RW/P	**UCE_FILTER:** Uncorrectable Error Filter: • 000: Normal mode; All 8 byte ECC checks/corrections are performed independently, no anti-aliasing filters are applied. • 011: An uncorrectable error that is detected in any 8 byte ECC check will cause all four parallel 8 byte ECC checks to be treated as uncorrectable errors.
4	0x0 RW/P	**DPAREN:** Data Parity Enable: When set, data path parity is enabled. The write data parity is checked at the point when ECC is generated and read data parity is generated at the point that ECC is checked.
3	0x0 RW/P	**CAPERREN:** Enable Command Address Parity Error Detection: When set, command address parity errors are detected and signalled to the Bunit.
2	0x0 RW/P	**DERREN:** Enable Uncorrectable Error Notification: When set, uncorrectable ECC errors are signalled to the Bunit and patrol scrub.
1	0x0 RW/P	**SERREN:** Enable Correctable Error Notification: When set, correctable ECC errors are signalled to the Bunit and patrol scrub which indicates that the read data needs to be written back to memory. This causes the DRAM cell with the single bit error to be scrubbed.
0	0x0 RW/V/P	**ECCEN:** ECC Enable: When set, single bit error correction and double bit error detection (SEC/DED ECC) is enabled. The ECC is an 8 bit protection code for every 64 bits of data stored in DRAM. ECC is generated on writes and checked on reads, requiring a 72 bit DDR3 data bus width.

44.5.73 LEAKY_BUCKET_CNTR_UPPER—Offset 18Ch

Leaky Bucket Counter Upper

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x12] + 18Ch
Host Memory Space: SBREG_BAR + 0x120000 + 18Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RW/P	**CNTR_UPPER_RANK3:** Rank 3 CNTR_UPPER configuration. Total Leak Rate = (CNTR_UPPER_RANK3 + 1)* (LEAKY_BUCKET_CFG3.CNTR_HI + 1) * (LEAKY_BUCKET_CFG3.CNTR_LO + 1) * 8192 DRAM clocks. Setting CNTR_LO to zero will disable the leaky bucket.
23:16	0x0 RW/P	**CNTR_UPPER_RANK2:** Rank 2 CNTR_UPPER configuration. Total Leak Rate = (CNTR_UPPER_RANK2 + 1)* (LEAKY_BUCKET_CFG2.CNTR_HI + 1) * (LEAKY_BUCKET_CFG2.CNTR_LO + 1) * 8192 DRAM clocks. Setting CNTR_LO to zero will disable the leaky bucket.
15:8	0x0 RW/P	**CNTR_UPPER_RANK1:** Rank 1 CNTR_UPPER configuration. Total Leak Rate = (CNTR_UPPER_RANK1 + 1)* (LEAKY_BUCKET_CFG1.CNTR_HI + 1) * (LEAKY_BUCKET_CFG1.CNTR_LO + 1) * 8192 DRAM clocks. Setting CNTR_LO to zero will disable the leaky bucket.
7:0	0x0 RW/P	**CNTR_UPPER_RANK0:** Rank 0 CNTR_UPPER configuration. Total Leak Rate = (CNTR_UPPER_RANK0 + 1)* (LEAKY_BUCKET_CFG0.CNTR_HI + 1) * (LEAKY_BUCKET_CFG0.CNTR_LO + 1) * 8192 DRAM clocks. Setting CNTR_LO to zero will disable the leaky bucket.

44.5.74 DPATROL_SCRUB_TMR—Offset 194h

Patrol Scrub Timer Register

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x12] + 194h
Host Memory Space: SBREG_BAR + 0x120000 + 194h

Default: FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	0xffffffff RW/P	**PATSCRTIMER:** Patrol scrub interval timer in DCLKs (DRAM cmd clk divided by 2). A new patrol scrub is scheduled every time the timer ticks to the value in this register. Any non zero value is valid

44.5.75 ICLK_DWORD8—Port 99h, Offset 220h

Flex Clock 0 and Flex Clock 1 Frequency Register

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0x99] + 220h
Host Memory Space: SBREG_BAR + 0x990000 + 220h

Default: 0004_2222h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RSV	**Reserved**
13	0x1 RW/V	**sel_flex_base1:** Selects the frequency of flex_base1: 0=200 MHz for flex1 clock 1=96 MHz for flex1 clock
12	0x0 RSV	**Reserved**
11:8	0x2 RW/V	**flex_ck_div1:** flex clock 1 is flex_base1/flex_ck_div1.
7:6	0x0 RSV	**Reserved**
5	0x1 RW/V	**sel_flex_base0** Selects the frequency of flex_base0: 0=200 MHz for flex1 clock 1=96 MHz for flex1 clock
4	0x0 RSV	**Reserved**
3:0	0x2 RW/V	**flex_ck_div0:** flex clock 0 is flex_base0/flex_ck_div0.

§ §

45 Global and Local Error Registers (GLMREG) - B0, D4, F0

45.1 Introduction and Index

The host-accessible registers for the Global and Local Error Registers (GLMREG) are described here.

To determine the number of devices/functions available refer to the following:

- Table 1-1, "Features by product SKU - Server and Cloud Storage SKUs 0 through 4"
- Table 1-2, "Features by Product SKU - Network and Enterprise Storage SKUs 5 through 10"
- Table 1-3, "Features by Product SKU - Extended Temperature SKUs 11 through 14".

The legend for the register access codes are described in Chapter 43, "Introduction."

45.1.1 Host Configuration Space

These registers are discovered in Host Configuration Space starting at Bus 0, Device 4 (decimal), Function 0. The offset addresses are listed.

Table 45-1. Summary of PCI Configuration Registers—0/4/0

Offset (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
0	2	8086	"GLREG Vendor ID (GLREG_VID)—Offset 0h" on page 1483
4	2	0000	"GLREG PCI Command (GLREG_PCICMD)—Offset 4h" on page 1484
6	2	0010	"GLREG PCI Status (GLREG_PCISTS)—Offset 6h" on page 1485
9	3	00060000	"GLREG Class Code (GLREG_CC)—Offset 9h" on page 1486
C	1	00	"GLREG Cacheline Size (GLREG_CLS)—Offset Ch" on page 1486
2C	2	8086	"GLREG Subsystem Vendor ID (GLREG_SVID)—Offset 2Ch" on page 1487
34	1	40	"GLREG Capabilities Pointer (GLREG_CAPPTR)—Offset 34h" on page 1487
3D	3	00	"GLREG Interrupt Pin (GLREG_INTP)—Offset 3Dh" on page 1488
40	2	0010	"GLREG PCI Express Capability List (GLREG_EXPCAPLST)—Offset 40h" on page 1488
42	2	0092	"GLREG PCI Express Capability List (GLREG_EXPCAPLST)—Offset 40h" on page 1488
48	2	0000	"GLREG Device Control (GLREG_DEVCTL)—Offset 48h" on page 1490
4A	1	00	"GLREG Device Status (GLREG_DEVSTS)—Offset 4Ah" on page 1491
200	4	00000000	"GLREG Global Correctable Error Status (GLREG_GCOERRSTS)—Offset 200h" on page 1492
204	4	00000000	"GLREG Global Non-Fatal Error Status (GLREG_GNFERRSTS)—Offset 204h" on page 1494
208	4	00000000	"GLREG Global Fatal Error Status (GLREG_GFAERRSTS)—Offset 208h" on page 1496
20C	4	00000000	"GLREG Global Error Mask (GLREG_GERRMSK)—Offset 20Ch" on page 1498
228	8	0000000000000000	"GLREG Global Error Timer (GLREG_GTIME)—Offset 228h" on page 1500
230	8	0000000000000000	"GLREG Global Correctable FERR Error Time Stamp (GLREG_GCOFERRTIME)—Offset 230h" on page 1500
238	8	0000000000000000	"GLREG Global Nonfatal FERR Error Time Stamp (GLREG_GNFFERRTIME)—Offset 238h" on page 1501
240	8	0000000000000000	"GLREG Global Fatal FERR Error Time Stamp (GLREG_GFAFERRTIME)—Offset 240h" on page 1501
248	4	00000000	"GLREG Global System Event Status (GLREG_GSYSEVTSTS)—Offset 248h" on page 1502
24C	4	00000000	"GLREG Global System Event Mask (GLREG_GSYSEVTMSK)—Offset 24Ch" on page 1502
250	4	00000025	"GLREG Global System Event Map (GLREG_GSYSEVTMAP)—Offset 250h" on page 1503
254	4	00000025	"GLREG Error Pin Control (GLREG_ERRPINCTRL)—Offset 254h" on page 1504
258	4	00000000	"GLREG Error Pin Status (GLREG_ERRPINSTS)—Offset 258h" on page 1504
25C	4	00000000	"GLREG Error Pin Data (GLREG_ERRPINDATA)—Offset 25Ch" on page 1505
294	1	00	"GLREG Uncorrectable Error Counter (GLREG_LUNCERRCNT)—Offset 294h" on page 1506

45.2 Registers in Configuration Space

45.2.1 GLREG Vendor ID (GLREG_VID)—Offset 0h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:4, F:0] + 0h

Default: 8086h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x8086 RO	**VID:** This field identifies Intel as the manufacturer of the device.

45.2.2 GLREG PCI Command (GLREG_PCICMD)—Offset 4h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:4, F:0] + 4h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0x0 RO	**Reserved:** Reserved.
10	0x0 RO	**INTxD:** This bit controls the ability of the PCI-Express Function to generate INTx interrupt message. When set, functions are prevented from asserting INTx interrupt messages. Any INTx emulation interrupts already asserted by the function must be deserted when this bit is set by generating a Deassert_INTx message(s).
9	0x0 RO	**FBE:** Not applicable to PCI-Express. Hardwired to 0.
8	0x0 RO	**SEE:** When set, this bit enables reporting of Non-Fatal and Fatal Errors detected by the Function to the Root Complex. ERR_COR messages are not affected by this bit. Errors are reported when enabled either through this bit or through the PCI Express-specific bits in the Device Control Register (GLREG_DEVCTL).
7	0x0 RO	**WCC:** Not applicable to PCI-Express. Hardwired to 0.
6	0x0 RO	**PERE:** This bit controls the setting of the master data parity error bit in the Status Register (GLREG_PCISTS) in response to a parity error received on the PCI Express interface (poisoned TLP).
5	0x0 RO	**VGA_PSE:** Not applicable to PCI-Express. Hardwired to 0.
4	0x0 RO	**MWIE:** Not applicable to PCI-Express. Hardwired to 0.
3	0x0 RO	**SCE:** Not applicable to PCI-Express. Hardwired to 0.
2	0x0 RO	**BME:** This bit controls the ability of the Function to issue Memory and I/O read or write requests, and the ability of Root or Switch port to forward memory and I/O read or write requests in the upstream direction.
1	0x0 RO	**MSE:** This bit controls the function's response to Memory Space accesses.
0	0x0 RO	**IOSE:** This bit controls the function's response to IO Space accesses.

45.2.3 GLREG PCI Status (GLREG_PCISTS)—Offset 6h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:4, F:0] + 6h

Default: 0010h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RO	**DPE:** This bit is set when a poisoned TLP is received. This bit is set even when the parity error response enable bit (bit[6] of the PCICMD Register (GLREG_PCICMD) is not set.
14	0x0 RO	**SSE:** This bit is set when ERR_FATAL or ERR_NONFATAL messages are sent to the root complex event collector and the SERR enable bit in the PCICMD Register (GLREG_PCICMD) is set.
13	0x0 RO	**RMA:** This bit is set when the requester receives a completion with an UR completion status.
12	0x0 RO	**RTA:** This bit is set when a requester receives a CA completions status.
11	0x0 RO	**STA:** This bit is set when the switch generates a completion packet with Completer Abort (CA) status is generated by its primary side.
10:9	0x0 RO	**Reserved:** Reserved
8	0x0 RO	**MDPD:** This bit is set by a requester if the parity error response enable bit (PERE) in the Command Register (GLREG_PCICMD) is set and either of the following two conditions occur: • Requester receives a completion marked poisoned. • Requester poisons a write requests. If the parity error bit is 0b, this bit is never set.
7	0x0 RO	**Reserved:** Reserved
6	0x0 RO	**RSVD0:** Reserved
5	0x0 RO	**Reserved:** Reserved
4	0x1 RO	**CAPE:** This bit indicates the presence of an Extended capabilities list items. This bit is hardwired to 1b.
3	0x0 RO	**INTS:** When set, this bit indicates that an INTx emulation interrupt is pending internally in this function.
2:0	0x0 RO	**RSVD1:** Reserved

45.2.4 GLREG Class Code (GLREG_CC)—Offset 9h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:4, F:0] + 9h

Default: 00060000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**RSVD0:** Reserved
23:16	0x6 RO	**BC:** This function is hardwired to 06h indicating a Host bridge.
15:8	0x0 RO	**SC:** This function is hardwired to 00h, indicating a Host Bridge.
7:0	0x0 RO	**RLPI:** Set to 00h for all non-APIC devices.

45.2.5 GLREG Cacheline Size (GLREG_CLS)—Offset Ch

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:4, F:0] + Ch

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**CLS:** These bits specify the system cache-line size in units of DWords. This field is implemented by PCI Express devices but has no effect on device behavior.

45.2.6 GLREG Subsystem Vendor ID (GLREG_SVID)—Offset 2Ch

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:4, F:0] + 2Ch

Default: 8086h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x8086 RW/O	**SVID:** This field identifies Intel as the manufacturer of the device.

45.2.7 GLREG Capabilities Pointer (GLREG_CAPPTR)—Offset 34h

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:4, F:0] + 34h

Default: 40h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x40 RO	**CPTR:** Contains the offset of the first item in the list of capabilities. (GLREG_EXPCAPLST)

45.2.8 GLREG Interrupt Pin (GLREG_INTP)—Offset 3Dh

Type: PCI Configuration Register
(Size: 8 bits)

Offset: [B:0, D:4, F:0] + 3Dh

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO	**INTP:** This register tells which interrupt pin the function uses. • 01h: Generate INTA • 02h: Generate INTB • 03h: Generate INTC • 04h: Generate INTD • Others: Reserved • Devices (or device functions) that do not use an interrupt pin must put a 0 in this register. Not applicable since this device does not generate any interrupts on its own.

45.2.9 GLREG PCI Express Capability List (GLREG_EXPCAPLST)—Offset 40h

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:4, F:0] + 40h

Default: 0010h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x0 RO	**NP:** Contains the offset of the next item in the capabilities list. Indicates that this is the last capability in the list.
7:0	0x10 RO	**CAPID:** Identifies the function as PCI Express capable.

45.2.10 GLREG PCI Express Capabilities (GLREG_EXPCAP)—Offset 42h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:4, F:0] + 42h

Default: 0092h

Bit Range	Default & Access	Field Name (ID): Description
15:14	0x0 RO	**RSVD0:** Reserved
13:9	0x0 RO	**IMN:** This field indicates the interrupt message number that is generated from the PCI Express port.
8	0x0 RO	**SI:** Indicates the PCI Express link associated with this port is connected to a slot.
7:4	0x9 RO	**DT:** 1001b Root Complex Integrated Endpoint (RCEC).
3:0	0x2 RO	**VN:** These bits indicate the version number of the PCI Express capability structure.

45.2.11 GLREG Device Control (GLREG_DEVCTL)—Offset 48h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:4, F:0] + 48h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RO	**RSVD0:** Reserved
14:12	0x0 RO	**MRRS:** This field sets the maximum Read Requests size for the function as a requester. The Function must not generate read requests with size exceeding the set value. • 000b: 128 bytes maximum Read Request size • 001b: 256 bytes maximum Read Request size • 010b: 512 bytes maximum Read Request size • 011b: 1024 bytes maximum Read Request size • 100b: 2048 bytes maximum Read Request size • 101b: 4096 bytes maximum Read Request size • Others: Reserved Functions that do not generate Read Requests larger than 128B and functions that do not generate Read Requests on their own behalf are permitted to implement this field as Read Only (RO) with a value of 000b.
11	0x0 RO	**ENOSNP:** This bit is permitted to be hardwired to 0b if a function would never set the No Snoop attribute in transactions it initiates.
10	0x0 RO	**AUXPME:** Not supported
9	0x0 RO	**PFE:** Functions that do not implement this capability hardware this bit to 0b.
8	0x0 RO	**ETFE:** Functions that do not implement this capability hardwire this bit to 0b.
7:5	0x0 RW	**MPS:** This field sets maximum TLP payload size for the function. As a receiver, the function must handle TLPs as larger as the set value. As a Transmitter, the function must not generate TLPs exceeding the set value. • 000b: 128 bytes maximum payload size • 001b: 256 bytes maximum payload size • 010b: 512 bytes maximum payload size (Unsupported) • 011b: 1024 bytes maximum payload size (Unsupported) • 100b: 2048 bytes maximum payload size (Unsupported) • 101b: 4096 bytes maximum payload size (Unsupported) • Others: Reserved
4	0x0 RO	**ENRO:** A function is permitted to hardwire this bit to 0b if it never sets the Relaxed ordering attribute in transactions it initiates as a requester.
3	0x0 RO	**URRE:** This bit controls the enabling of ERR_CORR, ERR_NONFATAL or ERR_FATAL messages on PCI Express for reporting Unsupported Request (UR) errors.
2	0x0 RO	**FERE:** Generation of the ERR_FATAL message is disabled.
1	0x0 RO	**NFERE:** Generation of the ERR_NONFATAL message is disabled.
0	0x0 RO	**CERE:** Generation of the ERR_CORR message is disabled.

45.2.12 GLREG Device Status (GLREG_DEVSTS)—Offset 4Ah

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:4, F:0] + 4Ah

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0x0 RO	**RSVD0:** Reserved
5	0x0 RO	**Reserved:** Reserved
4	0x0 RO	**APD:** Auxiliary Power is not supported.
3	0x0 RO	**URD:** This bit indicates that the device received an Unsupported Request (UR).
2	0x0 RO	**FED:** This bit indicates status of Fatal Errors detected.
1	0x0 RO	**NFED:** This bit indicates status of Non-Fatal Errors detected.
0	0x0 RO	**CED:** This bit indicates status of Correctable Errors detected.

45.2.13 GLREG Global Correctable Error Status (GLREG_GCOERRSTS)—Offset 200h

This register indicates that a Correctable Error is reported to the global error logic. An individual error status bit that is set indicates that a particular local device or RCEC has detected an error.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:4, F:0] + 200h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RW/1C/V/P	**Reserved:** Reserved.
23	0x0 RW/1C/V/P	**NPK_CO_STS:** NPK Error Status - Not used by the SoC
22	0x0 RW/1C/V/P	**SPIESPI_CO_STS:** SPIESPI Error Status - Not used by the SoC
21	0x0 RW/1C/V/P	**HSUART_CO_STS:** HSUART Error Status - Not used by the SoC
20	0x0 RW/1C/V/P	**SMBUS_CO_STS:** SMBUS Error Status - Not used by the SoC
19	0x0 RW/1C/V/P	**LPC_CO_STS:** LPC Error Status - Not used by the SoC
18	0x0 RW/1C/V/P	**USB_CO_STS:** USB Error Status - Not used by the SoC
17	0x0 RW/1C/V/P	**SATA1_CO_STS:** SATA1 Error Status - Not used by the SoC
16	0x0 RW/1C/V/P	**SATA0_CO_STS:** SATA0 Error Status - Not used by the SoC
15	0x0 RW/1C/V/P	**VRP2_CO_STS:**
14	0x0 RW/1C/V/P	**VRP1_CO_STS:**
13	0x0 RW/1C/V/P	**VRP0_CO_STS:**
12	0x0 RW/1C/V/P	**PCIeRP7_CO_STS:**
11	0x0 RW/1C/V/P	**PCIeRP6_CO_STS:**
10	0x0 RW/1C/V/P	**PCIeRP5_CO_STS:**
9	0x0 RW/1C/V/P	**PCIeRP4_CO_STS:**
8	0x0 RW/1C/V/P	**PCIeRP3_CO_STS:**
7	0x0 RW/1C/V/P	**PCIeRP2_CO_STS:**
6	0x0 RW/1C/V/P	**PCIeRP1_CO_STS:**

Bit Range	Default & Access	Field Name (ID): Description
5	0x0 RW/1C/V/P	**PCIeRP0_CO_STS:**
4	0x0 RW/1C/V/P	**Dunit1_CO_STS:**
3	0x0 RW/1C/V/P	**Dunit0_CO_STS:**
2	0x0 RW/1C/V/P	**Bunit_CO_STS:**
1	0x0 RW/1C/V/P	**Aunit_CO_STS:**
0	0x0 RW/1C/V/P	**RCEC_CO_STS:**

45.2.14 GLREG Global Non-Fatal Error Status (GLREG_GNFERRSTS)—Offset 204h

This register indicates that a Non-Fatal Error is reported to the global error logic. An individual error status bit that is set indicates that a particular local device or RCEC has detected an error.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:4, F:0] + 204h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RW/1C/V/P	**Reserved:** Reserved.
23	0x0 RW/1C/V/P	**NPK_NF_STS:** NPK Error Status - Not used by the SoC
22	0x0 RW/1C/V/P	**SPIESPI_NF_STS:** SPIESPI Error Status - Not used by the SoC
21	0x0 RW/1C/V/P	**HSUART_NF_STS:** Reserved.
20	0x0 RW/1C/V/P	**SMBUS_NF_STS:** SMBUS Error Status - Not used by the SoC
19	0x0 RW/1C/V/P	**LPC_NF_STS:** LPC Error Status - Not used by the SoC
18	0x0 RW/1C/V/P	**USB_NF_STS:** USB Error Status - Not used by the SoC
17	0x0 RW/1C/V/P	**SATA1_NF_STS:** SATA1 Error Status - Not used by the SoC
16	0x0 RW/1C/V/P	**SATA0_NF_STS:** SATA0 Error Status - Not used by the SoC
15	0x0 RW/1C/V/P	**VRP2_NF_STS:**
14	0x0 RW/1C/V/P	**VRP1_NF_STS:**
13	0x0 RW/1C/V/P	**VRP0_NF_STS:**
12	0x0 RW/1C/V/P	**PCIeRP7_NF_STS:**
11	0x0 RW/1C/V/P	**PCIeRP6_NF_STS:**
10	0x0 RW/1C/V/P	**PCIeRP5_NF_STS:**
9	0x0 RW/1C/V/P	**PCIeRP4_NF_STS:**
8	0x0 RW/1C/V/P	**PCIeRP3_NF_STS:**
7	0x0 RW/1C/V/P	**PCIeRP2_NF_STS:**
6	0x0 RW/1C/V/P	**PCIeRP1_NF_STS:**

Bit Range	Default & Access	Field Name (ID): Description
5	0x0 RW/1C/V/P	**PCIeRP0_NF_STS:**
4	0x0 RW/1C/V/P	**Dunit1_NF_STS:**
3	0x0 RW/1C/V/P	**Dunit0_NF_STS:**

0	0x0 RW/1C/V/P	**RCEC_FA_STS:**

45.2.16 GLREG Global Error Mask (GLREG_GERRMSK)—Offset 20Ch

This register masks the reporting of errors detected by local devices. An individual error mask bit that is set masks error reporting of the particular local device, software may set or clear the mask bit. This register is sticky and can only be reset by PWRGOOD. Global Error Mask register masks errors reported from the local devices or RCEC to the global register. If the error reporting is masked in this register, all errors from the corresponding local device or RCEC will not set any of the global error status bits.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:4, F:0] + 20Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RW/P	**Reserved:** Reserved.
23	0x0 RW/P	**NPK_MSK:** • 1=mask • 0=unmask
22	0x0 RW/P	**SPIESPI_MSK:** • 1=mask • 0=unmask
21	0x0 RW/P	**HSUART_MSK:** • 1=mask • 0=unmask
20	0x0 RW/P	**SMBUS_MSK:** • 1=mask • 0=unmask
19	0x0 RW/P	**LPC_MSK:** • 1=mask • 0=unmask
18	0x0 RW/P	**USB_MSK:** • 1=mask • 0=unmask
17	0x0 RW/P	**SATA1_MSK:** • 1=mask • 0=unmask
16	0x0 RW/P	**SATA0_MSK:** • 1=mask • 0=unmask
15	0x0 RW/P	**VRP2_MSK:** • 1=mask • 0=unmask
14	0x0 RW/P	**VRP1_MSK:** • 1=mask • 0=unmask
13	0x0 RW/P	**VRP0_MSK:** • 1=mask • 0=unmask
12	0x0 RW/P	**PCIeRP7_MSK:** • 1=mask • 0=unmask

Bit Range	Default & Access	Field Name (ID): Description
11	0x0 RW/P	**PCIeRP6_MSK:** • 1=mask • 0=unmask
10	0x0 RW/P	**PCIeRP5_MSK:** • 1=mask • 0=unmask
9	0x0 RW/P	**PCIeRP4_MSK:** • 1=mask • 0=unmask
8	0x0 RW/P	**PCIeRP3_MSK:** • 1=mask • 0=unmask
7	0x0 RW/P	**PCIeRP2_MSK:** • 1=mask • 0=unmask
6	0x0 RW/P	**PCIeRP1_MSK:** • 1=mask • 0=unmask
5	0x0 RW/P	**PCIeRP0_MSK:** • 1=mask • 0=unmask
4	0x0 RW/P	**Dunit1_MSK:** • 1=mask • 0=unmask
3	0x0 RW/P	**Dunit0_MSK:** • 1=mask • 0=unmask
2	0x0 RW/P	**Bunit_MSK:** • 1=mask • 0=unmask
1	0x0 RW/P	**Aunit_MSK:** • 1=mask • 0=unmask
0	0x0 RW/P	**RCEC_MSK:** • 1=mask • 0=unmask

45.2.17 GLREG Global Error Timer (GLREG_GTIME)—Offset 228h

Global Error Timer register is a free running 64-bit counter and will indicate the current value of the 64-bit counter. This counter is reset to 0 by PWRGOOD. Once out of PWRGOOD reset, the counter begins to run.

Type: PCI Configuration Register (Size: 64 bits)

Offset: [B:0, D:4, F:0] + 228h

Default: 0000000000000000h

Bit Range	Default & Access	Field Name (ID): Description
63:0	0x0 RO/V/P	**GTIME_Value:** This is the 64-bit free running counter.

45.2.18 GLREG Global Correctable FERR Error Time Stamp (GLREG_GCOFERRTIME)—Offset 230h

The time stamp register logs the 64-bit free running counter when the first Correctable Error was logged.

Type: PCI Configuration Register (Size: 64 bits)

Offset: [B:0, D:4, F:0] + 230h

Default: 0000000000000000h

Bit Range	Default & Access	Field Name (ID): Description
63:0	0x0 RO/V/P	**G_COFERR_TIME:** The time stamp register logs the 64-bit free running counter when the first Correctable Error was logged.

45.2.19 GLREG Global Nonfatal FERR Error Time Stamp (GLREG_GNFFERRTIME)—Offset 238h

The time stamp register logs the 64-bit free running counter when the first Nonfatal Error was logged.

Type: PCI Configuration Register (Size: 64 bits)

Offset: [B:0, D:4, F:0] + 238h

Default: 0000000000000000h

Bit Range	Default & Access	Field Name (ID): Description
63:0	0x0 RO/V/P	**G_NFFERR_TIME:** The time stamp register logs the 64-bit free running counter when the first Non-Fatal Error was logged.

45.2.20 GLREG Global Fatal FERR Error Time Stamp (GLREG_GFAFERRTIME)—Offset 240h

The time stamp register logs the 64-bit free running counter when the first Fatal Error was logged.

Type: PCI Configuration Register (Size: 64 bits)

Offset: [B:0, D:4, F:0] + 240h

Default: 0000000000000000h

Bit Range	Default & Access	Field Name (ID): Description
63:0	0x0 RO/V/P	**G_FAFERR_TIME:** The time stamp register logs the 64-bit free running counter when the first Fatal Error was logged.

45.2.21 GLREG Global System Event Status (GLREG_GSYSEVTSTS)—Offset 248h

This register indicates the error severity signaled by the global error logic. Setting of an individual error status bit indicates that the corresponding error severity has been detected.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:4, F:0] + 248h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0x0 RO	**Reserved:** Reserved.
2	0x0 RO/V/P	**FA_SYSEV_STS:** A Fatal Error was detected when set
1	0x0 RO/V/P	**NF_SYSEV_STS:** A Nonfatal Error was detected when set
0	0x0 RO/V/P	**CO_SYSEV_STS:** A Correctable Error was detected when set

45.2.22 GLREG Global System Event Mask (GLREG_GSYSEVTMSK)—Offset 24Ch

The System Event Mask register masks the reporting the errors indicated by the system event status register. When set, the error severity does not cause the generation of the system event. When cleared, detection of the error severity generates system event(s) according to System Event Map Register (SYSEVMAP)

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:4, F:0] + 24Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0x0 RO	**Reserved:** Reserved.
2	0x0 RW/P	**FA_SYSEV_M:** Fatal Error System Event Mask • 0 - Unmask system event reporting of the Fatal Error • 1 - Mask system event reporting of the Fatal Error
1	0x0 RW/P	**NF_SYSEV_M:** Nonfatal Error System Event Mask • 0 - Unmask system event reporting of the nonfatal error • 1 - Mask system event reporting of the Nonfatal Error
0	0x0 RW/P	**CO_SYSEV_M:** Correctable Error System Event Mask • 0 - Unmask system event reporting of the Correctable Error • 1 - Mask system event reporting of the Correctable Error

45.2.23 GLREG Global System Event Map (GLREG_GSYSEVTMAP)—Offset 250h

This register maps the error severity detected to one of the system events. When an error is detected, its corresponding error severity determines which system event to generate according to this register.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:4, F:0] + 250h

Default: 00000025h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0x0 RO	**Reserved:** Reserved.
5:4	0x2 RW/P	**FA_SYSEV_MAP:** • 11: Reserved • 10: Generate NMI • 01: Generate SMI • 00: No system event generation ***Note:*** NMIE.NMI=1 and NSC.SERR#_NMI_enable=1 to generate an NMI.
3:2	0x1 RW/P	**NF_SYSEV_MAP:** • 11: Reserved • 10: Generate NMI • 01: Generate SMI • 00: No system event generation ***Note:*** NMIE.NMI=1 and NSC.SERR#_NMI_enable=1 to generate an NMI.
1:0	0x1 RW/P	**CO_SYSEV_MAP:** • 11: Reserved • 10: Generate NMI • 01: Generate SMI • 00: No system event generation ***Note:*** NMIE.NMI=1 and NSC.SERR#_NMI_enable=1 to generate an NMI.

45.2.24 GLREG Error Pin Control (GLREG_ERRPINCTRL)—Offset 254h

This register provides the option to configure an error pin to either as a special purpose error pin which is asserted based on the detected error severity, or as a general purpose output which is asserted based on the value in the ERRPINDAT. The assertion of the error pins can also be completely disabled by this register.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:4, F:0] + 254h

Default: 00000025h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0x0 RO	**Reserved:** Reserved.
5:4	0x2 RW/P	**ERR2_ENABLE:** • 11: Reserved. • 10: Assert Error Pin when Fatal Error is set in the system event status reg. • 01: Assert and Deassert Error pin according to Error Pin Data register • 00: Disable Error pin assertion
3:2	0x1 RW/P	**ERR1_ENABLE:** • 11: Reserved. • 10: Assert Error Pin when Non-Fatal Error is set in the system event status reg. • 01: Assert and Deassert Error pin according to Error Pin Data register • 00: Disable Error pin assertion
1:0	0x1 RW/P	**ERR0_ENABLE:** • 11: Reserved. • 10: Assert Error Pin when Correctable Error is set in the system event status reg. • 01: Assert and Deassert Error pin according to Error Pin Data register • 00: Disable Error pin assertion

45.2.25 GLREG Error Pin Status (GLREG_ERRPINSTS)—Offset 258h

This register reflects the state of the error pin assertion. The status bit of the corresponding error pin is set upon the deassertion to assertion transition of the error pin.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:4, F:0] + 258h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0x0 RO	**Reserved:** Reserved.
2	0x0 RW/1C/V/P	**ERR2_STS:** This bit is set upon the transition of deassertion to assertion of the Error pin. Software writes '1' to clear the status.
1	0x0 RW/1C/V/P	**ERR1_STS:** This bit is set upon the transition of deassertion to assertion of the Error pin. Software writes '1' to clear the status.
0	0x0 RW/1C/V/P	**ERR0_STS:** This bit is set upon the transition of deassertion to assertion of the Error pin. Software writes '1' to clear the status.

45.2.26 GLREG Error Pin Data (GLREG_ERRPINDATA)—Offset 25Ch

This register provides the data value when the error pin is configured as a general purpose output.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:4, F:0] + 25Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0x0 RO	**Reserved:** Reserved.
2	0x0 RW	**ERR2_PINDATA:** (applies when ERRPINCTL[5:4]=01, otherwise reserved) This bit acts as the general purpose output for the ERR[2] pin. ERR [2] pin value will follow the value programmed in ERR[2] Pin Data register. • 0 - Deassert ERR[2] pin • 1 - Assert ERR[2] pin
1	0x0 RW	**ERR1_PINDATA:** (applies when ERRPINCTL[3:2]=01, otherwise reserved). This bit acts as the general purpose output for the ERR[1] pin. ERR [1] pin value will follow the value programmed in ERR[1] Pin Data register. • 0 - Deassert ERR[1] pin • 1 - Assert ERR[1] pin
0	0x0 RW	**ERR0_PINDATA:** (applies when ERRPINCNTL[1:0]=01, otherwise reserved). This bit acts as the general purpose output for the ERR[0] pin. Error [0] pin value will follow the value programmed in ERR[0] Pin Data register. • 0 - Deassert ERR[0] pin • 1 - Assert ERR[0] pin

45.2.27 GLREG Uncorrectable Error Counter (GLREG_LUNCERRCNT)—Offset 294h

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:4, F:0] + 294h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RW/1C/V/P	**ERR_OVF:** • 0: No overflow occurred • 1: Error overflow. The error count may not be valid.
6:0	0x0 RW/1C/V/P	**ERRCNT:** This counter accumulates errors that occur when the associated error type is selected in the FNBERRCNTSEL register. This field is cleared by writing 7Fh. Maximum counter available is 127d (7Fh). ***Note:*** Single bit write clears the corresponding bit.

§ §

46 Root Complex Event Collector - B0, D5, F0

46.1 Introduction and Index

The host-accessible registers for the Root Complex Event Collector (RCEC) are described here.

To determine the number of devices/functions available refer to the following:

- Table 1-1, "Features by product SKU - Server and Cloud Storage SKUs 0 through 4"
- Table 1-2, "Features by Product SKU - Network and Enterprise Storage SKUs 5 through 10"
- Table 1-3, "Features by Product SKU - Extended Temperature SKUs 11 through 14".

The legend for the register access codes are described in Chapter 43, "Introduction."

46.1.1 Host Configuration Space

These registers are discovered in Host Configuration Space starting at Bus 0, Device 5 (decimal), Function 0. The offset addresses are listed.

Table 46-1. Summary of PCI Configuration Registers—0/5/0

Offset (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
0	2	8086	"RCEC Vendor ID (RCEC_VID)—Offset 0h" on page 1509
4	2	0000	"RCEC PCI Command (RCEC_PCICMD)—Offset 4h" on page 1510
6	2	0010	"RCEC PCI Status (RCEC_PCISTS)—Offset 6h" on page 1511
9	3	00080700	"RCEC Class Code (RCEC_CC)—Offset 9h" on page 1512
C	2	00	"RCEC Cacheline Size (RCEC_CLS)—Offset Ch" on page 1512
3D	3	01	"RCEC Interrupt Pin (RCEC_INTP)—Offset 3Dh" on page 1513
40	2	8010	"RCEC PCI Express Capability List (RCEC_EXPCAPLST)—Offset 40h" on page 1513
42	2	00A2	"RCEC PCI Express Capability List (RCEC_EXPCAPLST)—Offset 40h" on page 1513
48	2	0000	"RCEC Device Control (RCEC_DEVCTL)—Offset 48h" on page 1515
4A	1	00	"RCEC Device Status (RCEC_DEVSTS)—Offset 4Ah" on page 1516
5C	2	00	"RCEC Root Control (RCEC_ROOTCTL)—Offset 5Ch" on page 1517
82	2	C803	"RCEC Power Management Capabilities (RCEC_PMCAP)—Offset 82h" on page 1518
84	2	0000	"RCEC Power Management Control / Status (RCEC_PMCSR)—Offset 84h" on page 1518
90	2	0005	"RCEC MSI Capability List (RCEC_MSICAPLST)—Offset 90h" on page 1519
92	2	0100	"RCEC MSI Message Control (RCEC_MSICTL)—Offset 92h" on page 1519
94	4	00000000	"RCEC MSI Message Address (RCEC_MSIADDR)—Offset 94h" on page 1520
98	2	0000	"RCEC MSI Message Data (RCEC_MSIDATA)—Offset 98h" on page 1520
9C	4	00000000	"RCEC MSI Mask Bit (RCEC_MSIMSK)—Offset 9Ch" on page 1521
A0	2	0000	"RCEC MSI Pending Bit (RCEC_MSIPENDING)—Offset A0h" on page 1521
100	4	15010001	"RCEC Advanced Error Reporting Extended Capability Header (RCEC_AERCAPHDR)—Offset 100h" on page 1521
104	4	00000000	"RCEC Uncorrectable Error Status (RCEC_ERRUNCSTS)—Offset 104h" on page 1522
110	2	0000	"RCEC Correctable Error Status (RCEC_ERRCORSTS)—Offset 110h" on page 1523
114	2	E000	"RCEC Correctable Error Mask (RCEC_ERRCORMSK)—Offset 114h" on page 1524
118	2	0000	"RCEC Advanced Error Capabilities and Control (RCEC_AERCAPCTL)—Offset 118h" on page 1525
11C	4	00000000	"RCEC Header Log (RCEC_AERHDRLOG1)—Offset 11Ch" on page 1525
120	4	00000000	"RCEC Header Log (RCEC_AERHDRLOG2)—Offset 120h" on page 1526
124	4	00000000	"RCEC Header Log (RCEC_AERHDRLOG3)—Offset 124h" on page 1526
128	4	00000000	"RCEC Header Log (RCEC_AERHDRLOG4)—Offset 128h" on page 1526
12C	1	00	"RCEC Root Error Command (RCEC_ROOTERRCMD)—Offset 12Ch" on page 1527
130	4	00000000	"RCEC Root Error Status (RCEC_ROOTERRSTS)—Offset 130h" on page 1528
134	4	00000000	"RCEC Error Source Identification (RCEC_ERRSRCID)—Offset 134h" on page 1529

46.2 Registers in Configuration Space

46.2.1 RCEC Vendor ID (RCEC_VID)—Offset 0h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:5, F:0] + 0h

Default: 8086h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x8086 RO	**VID:** This field identifies Intel as the manufacturer of the device.

46.2.2 RCEC PCI Command (RCEC_PCICMD)—Offset 4h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:5, F:0] + 4h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0x0 RO	**Reserved:** Reserved.
10	0x0 RW	**INTxD:** This bit controls the ability of the PCI-Express Function to generate INTx interrupt message. When set, functions are prevented from asserting INTx interrupt messages. Any INTx emulation interrupts already asserted by the function must be deserted when this bit is set by generating a Deassert_INTx message(s).
9	0x0 RO	**FBE:** Not applicable to PCI-Express. Hardwired to 0.
8	0x0 RW	**SEE:** (SERR Enable) When set, this bit enables reporting of Non-Fatal and Fatal Errors detected by the Function of the Root Complex. ERR_COR messages are not affected by this bit. Errors are reported when enabled either through this bit or through the PCI Express-specific bits in the Device Control Register (RCEC_DEVCTL).
7	0x0 RO	**WCC:** Not applicable to PCI-Express. Hardwired to 0.
6	0x0 RW	**PERE:** This bit controls the setting of the master data parity error bit in the Status Register (RCEC_PCISTS) in response to a parity error received on the PCI Express interface (poisoned TLP).
5	0x0 RO	**VGA_PSE:** Not applicable to PCI-Express. Hardwired to 0.
4	0x0 RO	**MWIE:** Not applicable to PCI-Express. Hardwired to 0.
3	0x0 RO	**SCE:** Not applicable to PCI-Express. Hardwired to 0.
2	0x0 RW	**BME:** This bit controls the ability of the Function to issue Memory and I/O read or write requests, and the ability of Root or Switch port to forward memory and I/O read or write requests in the upstream direction. MSI interrupts are inband memory writes and are blocked when this bit is 0b.
1	0x0 RO	**MSE:** This bit controls the function's response to Memory Space accesses. When this bit is 0b, the function will handle memory transactions targeting the Function as an Unsupported Request (UR).
0	0x0 RO	**IOSE:** This bit controls the function's response to IO Space accesses. When this bit is 0b, the function will handle memory transactions targeting the Function as an Unsupported Request (UR).

46.2.3 RCEC PCI Status (RCEC_PCISTS)—Offset 6h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:5, F:0] + 6h

Default: 0010h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW/1C/V	**DPE:** This bit is set when a poisoned TLP is received. This bit is set even when the parity error response enable, bit 6 of the PCICMD Register (RCEC_PCICMD) is not set.
14	0x0 RW/1C/V	**SSE:** This bit is set when ERR_FATAL or ERR_NONFATAL messages are sent to the root complex event collector and the SERR enable bit in the PCICMD Register (RCEC_PCICMD) is set.
13	0x0 RO	**RMA:** This bit is set when the requester receives a completion with an UR completion status.
12	0x0 RO	**RTA:** This bit is set when a requester receives a CA completions status.
11	0x0 RO	**STA:** This bit is set when the switch generates a completion packet with Completer Abort (CA) status is generated by its primary side.
10:9	0x0 RO	**DVT:** These bits have no meaning on PCI Express. Fast decode timing is reported.
8	0x0 RO	**MDPD:** This bit is set by a requester (primary side for type1 configuration header functions) if the parity error response enable bit (PERE) in the Command Register (RCEC_PCICMD) is set and either of the following two conditions occur: • Requester receives a completion marked poisoned. • Requester poisons a write requests. If the parity error bit is 0b, this bit is never set.
7	0x0 RO	**FBC:** This bit has no meaning on PCI Express.
6	0x0 RO	**RSVD0:** Reserved
5	0x0 RO	**C66:** This bit has no meaning on PCI Express.
4	0x1 RO	**CAPE:** This bit indicates the presence of an Extended capabilities list items.
3	0x0 RO/V	**INTS:** When set, this bit indicates that an INTx emulation interrupt is pending internally in this function.
2:0	0x0 RO	**RSVD1:** Reserved

46.2.4 RCEC Class Code (RCEC_CC)—Offset 9h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:5, F:0] + 9h

Default: 00080700h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**RSVD0:** Reserved
23:16	0x8 RW/O	**BC:** Root Complex Event Collector
15:8	0x7 RW/O	**SC:** Root Complex Event Collector
7:0	0x0 RW/O	**RLPI:** Reserved.

46.2.5 RCEC Cacheline Size (RCEC_CLS)—Offset Ch

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:5, F:0] + Ch

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**CLS:** These bits specify the system cache-line size in units of DWords. This field is implemented by PCI Express devices but has no effect on device behavior.

46.2.6 RCEC Interrupt Pin (RCEC_INTP)—Offset 3Dh

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:5, F:0] + 3Dh

Default: 01h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x1 RO	**INTP:** This register tells which interrupt pin the function uses. • 01h: Generate INTA • 02h: Generate INTB • 03h: Generate INTC • 04h: Generate INTD • Others: Reserved Devices (or device functions) that do not use an interrupt pin must put a 0 in this register. As a single function device, this device specifies INTA as its interrupt pin.

46.2.7 RCEC PCI Express Capability List (RCEC_EXPCAPLST)—Offset 40h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:5, F:0] + 40h

Default: 8010h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x80 RO	**NP:** Contains the offset of the next item in the capabilities list (RCEC_PMCAPLST).
7:0	0x10 RO	**CAPID:** Identifies the function as PCI Express capable.

46.2.8 RCEC PCI Express Capabilities (RCEC_EXPCAP)—Offset 42h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:5, F:0] + 42h

Default: 00A2h

Bit Range	Default & Access	Field Name (ID): Description
15:14	0x0 RO	**RSVD0:** Reserved
13:9	0x0 RO	**IMN:** This field indicates the interrupt message number that is generated from the PCI Express port.
8	0x0 RO	**SI:** Indicates the PCI Express link associated with this port is connected to a slot.
7:4	0xa RO	**DT:** 1010b Root Complex Event Collector
3:0	0x2 RO	**VN:** These bits indicate the version number of the PCI Express capability structure.

46.2.9 RCEC Device Control (RCEC_DEVCTL)—Offset 48h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:5, F:0] + 48h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RO	**RSVD0:** Reserved
14:12	0x0 RO	**MRRS:** This field sets the maximum Read Requests size for the function as a requester. The Function must not generate read requests with size exceeding the set value. • 000b: 128 bytes maximum Read Request size • 001b: 256 bytes maximum Read Request size • 010b: 512 bytes maximum Read Request size • 011b: 1024 bytes maximum Read Request size • 100b: 2048 bytes maximum Read Request size • 101b: 4096 bytes maximum Read Request size • Others: Reserved Functions that do not generate Read Requests larger than 128B and functions that do not generate Read Requests on their own behalf are permitted to implement this field as Read Only (RO) with a value of 000b.
11	0x0 RO	**Reserved:** Reserved
10	0x0 RO	**AUXPME:** Not supported
9	0x0 RO	**Reserved:** Reserved
8	0x0 RO	**ETFE:** When set, this bit enables a function to use an 8-bit tag field as a Requester.
7:5	0x0 RW	**MPS:** This field sets maximum TLP payload size for the function. As a receiver, the function must handle TLPs as larger as the set value. As a Transmitter, the function must not generate TLPs exceeding the set value. • 000b: 128 bytes maximum payload size • 001b: 256 bytes maximum payload size • 010b: 512 bytes maximum payload size (Unsupported) • 011b: 1024 bytes maximum payload size (Unsupported) • 100b: 2048 bytes maximum payload size (Unsupported) • 101b: 4096 bytes maximum payload size (Unsupported) • Others: Reserved
4	0x0 RO	**ENRO:** When set, the function is permitted to set the relaxed ordering bit in the attribute field of transactions it initiates that do not require strong write ordering.
3	0x0 RW	**URRE:** This bit controls the enabling of ERR_CORR, ERR_NONFATAL or ERR_FATAL messages on PCI Express for reporting Unsupported Request (UR) errors.
2	0x0 RW	**FERE:** When this bit is set, generation of the ERR_FATAL message is enabled.
1	0x0 RW	**NFERE:** When this bit is set, generation of the ERR_NONFATAL message is enabled.
0	0x0 RW	**CERE:** When this bit is set, generation of the ERR_CORR message is enabled.

46.2.10 RCEC Device Status (RCEC_DEVSTS)—Offset 4Ah

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:5, F:0] + 4Ah

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:6	0x0 RO	**RSVD0:** Reserved
5	0x0 RO	**Reserved:** Reserved
4	0x0 RO	**APD:** Auxiliary Power is not supported.
3	0x0 RW/1C/V	**URD:** This bit indicates that the device received an Unsupported Request (UR). Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control Register.
2	0x0 RW/1C/V	**FED:** This bit indicates status of Fatal Errors detected. Errors are logged in this register regardless of the settings of the Correctable Error mask register.
1	0x0 RW/1C/V	**NFED:** This bit indicates status of Non-Fatal Errors detected.
0	0x0 RW/1C/V	**CED:** This bit indicates status of Correctable Errors detected.

46.2.11 RCEC Root Control (RCEC_ROOTCTL)—Offset 5Ch

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:5, F:0] + 5Ch

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:5	0x0 RO	**RSVD0:** Reserved
4	0x0 RO	**CRSSVE:** This bit, when set, enables the Root Port to return Configuration Retry Status (CRS) Completion status to software. • 1: Enable software to received a CRS status. This allows software to make the decision to re-issue the configuration request or move on and re-issue the request at a later time. • 0: Disable software from receiving a CRS response. The PCI-E will wait and re-issue the configuration request until it receives a response other than CRS without notifying software.
3	0x0 RO	**PMEIE:** This field controls the generation of interrupts for PME messages. • 1: Enables interrupt generation upon receipt of a PME message as reflected in the PME Status bit defined in the ROOTSTS register. A PME interrupt is generated if the PMESTATUS register bit is set when this bit is set from a cleared state. • 0: Disables interrupt generation for PME messages.
2	0x0 RW	**SEFEE:** This field controls generation of system errors in the PCI-Express root Complex Event Collector for Fatal Errors. • 1: indicates that a System Error should be generated if a Fatal Error (ERR_FATAL) is reported by any of the devices associated with and including this PCI-Express root complex event collector. • 0: No System Error should be generated on a Fatal Error (ERR_FATAL) reported by any of the devices associated with and including this PCI-Express root complex event collector.
1	0x0 RW	**SENFEE:** This field controls generation of system errors in the PCI-Express root Complex Event Collector for Non-Fatal Errors. • 1: indicates that a System Error should be generated if a Non-Fatal Error (ERR_NONFATAL) is reported by any of the devices associated with and including this PCI-Express root complex event collector. • 0: No System Error should be generated on a Non-Fatal Error (ERR_NONFATAL) reported by any of the devices associated with and including this PCI-Express root complex event collector.
0	0x0 RW	**SECEE:** This field controls generation of system errors in the PCI-Express root Complex Event Collector for Correctable Errors. • 1: indicates that a System Error should be generated if a Correctable Error (ERR_COR) is reported by any of the devices associated with and including this PCI-Express root complex event collector • 0: No System Error should be generated on a Correctable Error (ERR_COR) reported by any of the devices associated with and including this PCI-Express root complex event collector.

46.2.12 RCEC Power Management Capabilities (RCEC_PMCAP)—Offset 82h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:5, F:0] + 82h

Default: C803h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0x19 RO	**PMESUP:** PME assertion is supported when in D3hot. PME assertion from D3cold is not supported.
10	0x0 RO	**D2S:** Not supported
9	0x0 RO	**D1S:** Not supported
8:6	0x0 RO	**AC:** Auxiliary power is not supported.
5	0x0 RO	**DSI:** Device-specific initialization is not required when transitioning to D0 from D3hot state. This bit is zero.
4	0x0 RO	**RSVD0:** Reserved
3	0x0 RO	**PMECLK:** Does not apply to PCI Express. Hard-wired to 0.
2:0	0x3 RO	**VER:** PM implementation is compliant with PCI Bus Power Management Interface Specification, Revision 11 1.2.

46.2.13 RCEC Power Management Control / Status (RCEC_PMCSR)—Offset 84h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:5, F:0] + 84h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW/1C/V/P	**PMESTS:** Reserved.
14:13	0x0 RO	**DC:** Not supported
12:9	0x0 RO	**DS:** Not supported
8	0x0 RW/P	**PMEEN:** Gates assertion of the PME message.
7:2	0x0 RO	**RSVD0:** Reserved
1:0	0x0 RW/V	**PS:** This field is used both to determine the current power state of a function and to set the function into a new power state. The definition of the supported values is given below: • 0h - D0 • 3h - D3hot

46.2.14 RCEC MSI Capability List (RCEC_MSICAPLST)—Offset 90h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:5, F:0] + 90h

Default: 0005h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x0 RO	**NP:** Contains the offset of the next item in the capabilities list. A null value is used to indicate that this is the last capability.
7:0	0x5 RO	**CAPID:** Identifies the function as MSI capable.

46.2.15 RCEC MSI Message Control (RCEC_MSICTL)—Offset 92h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:5, F:0] + 92h

Default: 0100h

Bit Range	Default & Access	Field Name (ID): Description
15:9	0x0 RO	**RSVD0:** Reserved
8	0x1 RO	**PVM:** This bit indicates that this device supports MSI per-vector masking.
7	0x0 RO	**AD64C:** When set, this bit indicates that the function is capable of generating a 64-bit message address.
6:4	0x0 RW	**MMEN:** Only one message is supported. These bits are R/W for software compatibility.
3:1	0x0 RO	**MMC:** Only one message is supported.
0	0x0 RW	**MSIE:** When set, MSI is enabled and traditional interrupt pins are not used to generate interrupts.

46.2.16 RCEC MSI Message Address (RCEC_MSIADDR)—Offset 94h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:5, F:0] + 94h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**Address:** Message address specified by the system, always DWORD aligned
1:0	0x0 RO	**Reserved:** Reserved.

46.2.17 RCEC MSI Message Data (RCEC_MSIDATA)—Offset 98h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:5, F:0] + 98h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW	**TM:** • 0: Edge Triggered • 1: Level Triggered
14	0x0 RW	**LVL:** if TM is 0h, then this field is a don't care. Edge triggered messages are always treated as assert messages. For level triggered interrupts, this bit reflects the state of the interrupt input if TM is 1h, then: • 0: Deassert Messages • 1: Assert Messages
13:12	0x0 RW	**Reserved:** Reserved
11:8	0x0 RW	**DM:** • 0000: Fixed: Trigger Mode can be edge or level. • 0001: Lowest Priority: Trigger Mode can be edge or level. • 0010: SMI/PMI/MCA - Not supported via MSI of root port • 0011: Reserved - Not supported via MSI of root port • 0100: NMI - Not supported via MSI of root port • 0101: INIT - Not supported via MSI of root port • 0110: Reserved • 0111: ExtINT - Not supported via MSI of primary port • 1000 -1111: Reserved
7:0	0x0 RW	**Reserved:** Reserved

46.2.18 RCEC MSI Mask Bit (RCEC_MSIMSK)—Offset 9Ch

The MSI Mask Bit register enables software to disable message sending on a per-vector basis.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:5, F:0] + 9Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0x0 RO	**RSVD0:** Reserved
0	0x0 RW	**MSKB:** For each Mask bit that is set, the device is prohibited from sending the associated message. Corresponding bits are masked if set to '1'

46.2.19 RCEC MSI Pending Bit (RCEC_MSIPENDING)—Offset A0h

The Mask Pending register enables software to defer message sending on a per-vector basis.

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:5, F:0] + A0h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:1	0x0 RO	**RSVD0:** Reserved
0	0x0 RO/V	**PB:** For each Pending bit that is set, the device has a pending associated message. Corresponding bits are pending if set to '1'

46.2.20 RCEC Advanced Error Reporting Extended Capability Header (RCEC_AERCAPHDR)—Offset 100h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:5, F:0] + 100h

Default: 15010001h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0x150 RO	**NCO:** Contains the offset of the next structure in the Extended Capabilities list (RCEC_RCECEPACAPHDR).
19:16	0x1 RO	**CV:** Indicates the version of the Capability structure present.
15:0	0x1 RO	**EXCAPID:** Identifies the function as Advanced Error Reporting (AER) capable.

46.2.21 RCEC Uncorrectable Error Status (RCEC_ERRUNCSTS)—Offset 104h

This register reports the error status of individual Uncorrectable Error sources. An individual error status bit that is set to 1 indicates that a particular error occurred. Software can clear an error status by writing a 1 to the respective bit.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:5, F:0] + 104h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0x0 RO	**RSVD0:** Reserved
22	0x0 RW/1C/V/P	**UIE:** This bit is set whenever an IEH Uncorrectable Internal Error as defined in IEH_UNCERRSTS is detected.
21	0x0 RO	**RSVD1:** Reserved
20	0x0 RW/1C/V/P	**URE:** As a receiver, Set whenever an Unsupported Request (negatively-decoded transaction) is detected. The Header is logged.
19	0x0 RO	**RSVD2:** Reserved
18	0x0 RW/1C/V/P	**MalformedTLP:** As a receiver, set whenever a malformed TLP (Length not equal to 000000001b for config requests) is detected. The Header is logged.
17	0x0 RO	**RSVD3:** Reserved
16	0x0 RW/1C/V/P	**UnexpectedCompletion:** As a receiver, set whenever a completion is received that does not match the requestor ID or outstanding Tag. The Header is logged.
15:0	0x0 RO	**RSVD4:** Reserved

46.2.22 RCEC Correctable Error Status (RCEC_ERRCORSTS)—Offset 110h

This register reports the error status of individual Correctable Error sources on a PCI Express device. An individual error status bit set to 1 indicates that a particular error has occurred. Software can clear the error status by writing a 1 to the respective bit.

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:5, F:0] + 110h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RO	**HLOE:** Reserved.
14	0x0 RO	**CIE:** Reserved.
13	0x0 RW/1C/V/P	**ANFE:** Reserved.
12	0x0 RO	**RTTE:** The PCI-E sets this bit when replay timer time-out occurs.
11:9	0x0 RO	**RSVD0:** Reserved
8	0x0 RO	**RNRE:** The PCI-E sets this bit when the replay number rolls over from 11 to 00.
7	0x0 RO	**BDLLPE:** The switch sets this bit on CRC errors on DLLP.
6	0x0 RO	**BTLPE:** The switch sets this bit on CRC errors on TLP.
5:1	0x0 RO	**RSVD1:** Reserved
0	0x0 RO	**RE:** The PCI-E sets this bit when the physical layer detects a receiver error.

46.2.23 RCEC Correctable Error Mask (RCEC_ERRCORMSK)—Offset 114h

This register controls the reporting of individual Correctable Errors via ERR_COR message. A masked error (respective bit set in mask register) is not reported to the host bridge by the switch. There is a mask bit corresponding to every bit in the Correctable Error Status Register.

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:5, F:0] + 114h

Default: E000h

Bit Range	Default & Access	Field Name (ID): Description
15	0x1 RO	**HLOEM:** Reserved.
14	0x1 RO	**CIEM:** Reserved.
13	0x1 RW/P	**ANFEM:** This bit is set by default to enable compatibility with software that does not comprehend Role-Based Error Reporting.
12	0x0 RO	**RTTEM:** Reserved.
11:9	0x0 RO	**RSVD0:** Reserved
8	0x0 RO	**RNREM:** Reserved.
7	0x0 RO	**BDLLPEM:** Reserved.
6	0x0 RO	**BTLPEM:** Reserved.
5:1	0x0 RO	**RSVD1:** Reserved
0	0x0 RO	**REM:** Reserved.

46.2.24 RCEC Advanced Error Capabilities and Control (RCEC_AERCAPCTL)—Offset 118h

This register gives the status and control for ECRC checks and also the pointer to the first Uncorrectable Error that happened.

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:5, F:0] + 118h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0x0 RO	**RSVD0:** Reserved
10	0x0 RO	**MHRE:** When set, this bit enables the function to record more than one error header.
9	0x0 RO	**MHRC:** Supports more than one error header.
8	0x0 RO	**ECE:** Not supported. Hard-wired to 0
7	0x0 RO	**ECC:** Not supported. Hard-wired to 0
6	0x0 RO	**EGE:** Not supported. Hard-wired to 0
5	0x0 RO	**EGC:** Not supported. Hard-wired to 0
4:0	0x0 RO/V/P	**FEP:** This field identifies the bit position of the first error reported in the Uncorrectable Error Status Register. This register re-arms itself (which does not change its current value) as soon as the error status bit indicated by the pointer is cleared by the software by writing a 1 to that status bit.

46.2.25 RCEC Header Log (RCEC_AERHDRLOG1)—Offset 11Ch

This register logs the 4 Dwords of the transaction header for PCI Express errors.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:5, F:0] + 11Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V/P	**TLPHDRLOG:** As soon as an error is logged in this register, it remains locked for further error-logging until the software clears the status bit that caused the header log (in other words, until the error pointer is re-armed for logging again).

46.2.26 RCEC Header Log (RCEC_AERHDRLOG2)—Offset 120h

This register logs the 4 Dwords of the transaction header for PCI Express errors.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:5, F:0] + 120h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V/P	**TLPHDRLOG:** As soon as an error is logged in this register, it remains locked for further error-logging until the software clears the status bit that caused the header log (in other words, until the error pointer is re-armed for logging again).

46.2.27 RCEC Header Log (RCEC_AERHDRLOG3)—Offset 124h

This register logs the 4 Dwords of the transaction header for PCI Express errors.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:5, F:0] + 124h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V/P	**TLPHDRLOG:** As soon as an error is logged in this register, it remains locked for further error-logging until the software clears the status bit that caused the header log (in other words, until the error pointer is re-armed for logging again).

46.2.28 RCEC Header Log (RCEC_AERHDRLOG4)—Offset 128h

This register logs the 4 Dwords of the transaction header for PCI Express errors.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:5, F:0] + 128h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V/P	**TLPHDRLOG:** As soon as an error is logged in this register, it remains locked for further error-logging until the software clears the status bit that caused the header log (in other words, until the error pointer is re-armed for logging again).

46.2.29 RCEC Root Error Command (RCEC_ROOTERRCMD)—Offset 12Ch

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:5, F:0] + 12Ch

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0x0 RO	**RSVD0:** Reserved
2	0x0 RW	**FERE:** When set, this bit enables the generation of an interrupt when a Fatal Error is reported by any of the functions in the hierarchy associated with this Root Port.
1	0x0 RW	**NFERE:** When set, this bit enables the generation of an interrupt when a Non-Fatal Error is reported by any of the functions in the hierarchy associated with this Root Port.
0	0x0 RW	**CERE:** When set, this bit enables the generation of an interrupt when a Correctable Error is reported by any of the functions in the hierarchy associated with this Root Port.

46.2.30 RCEC Root Error Status (RCEC_ROOTERRSTS)—Offset 130h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:5, F:0] + 130h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0x0 RO	**AEMN:** This register indicates which MSI/MSI-X vector is used for the interrupt message generated in association with any of the status bits of this Capability. For MSI, the value in this register indicates the offset between the base Message Data and the interrupt message that is generated. Hardware is required to update this field so that it is correct if the number of MSI Messages assigned to the Function changes when software writes to the Multiple Message Enable field in the MSI Message Control register. For MSI-X, the value in this register indicates which MSI-X Table entry is used to generate the interrupt message. The entry must be one of the first 32 entries even if the Function implements more than 32 entries. For a given MSI-X implementation, the entry must remain constant. • If both MSI and MSI-X are implemented, they are permitted to use different vectors, though software is permitted to enable only one mechanism at a time. If software enables both MSI and MSI-X at the same time, the value in this register is undefined. • If MSI-X is enabled, the value in this register must indicate the vector for MSI-X. • If MSI is enabled or neither is enabled, the value in this register must indicate the vector for MSI.
26:7	0x0 RO	**RSVD0:** Reserved
6	0x0 RW/1C/V/P	**FEMR:** Set when one or more Fatal Uncorrectable Error Messages have been received.
5	0x0 RW/1C/V/P	**NFEMR:** Set when one or more Non-Fatal Uncorrectable Error Messages have been received.
4	0x0 RW/1C/V/P	**FUF:** Set when the first Uncorrectable Error Message or PCI_error Message received is for a Fatal Error.
3	0x0 RW/1C/V/P	**MEFR:** Set when either a Fatal or a Non-Fatal Error is received and ERR_FATAL/NONFATAL Received is already Set.
2	0x0 RW/1C/V/P	**EFR:** Set when a Fatal or a Non-Fatal Error Message is received and this bit is not already Set.
1	0x0 RW/1C/V/P	**MCER:** Set when a Correctable Error Message is received and ERR_COR Received is already Set.
0	0x0 RW/1C/V/P	**CER:** Set when a Correctable Error Message is received and this bit is not already Set.

46.2.31 RCEC Error Source Identification (RCEC_ERRSRCID)—Offset 134h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:5, F:0] + 134h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO/V/P	**EFSID:** Requester ID of the source when a Fatal or Non-Fatal Error is received and the Fatal Error Message Received (FEMR) or Non-Fatal Error Message Received (NFEMR) bit is not already set.
15:0	0x0 RO/V/P	**ECSID:** Requester ID of the source when a Correctable Error is received and the Correctable Error Received (CER) bit is not already set.

§ §

47 RP - Intel® QuickAssist Technology - B0, D6/D22/D23, F0

47.1 Introduction and Index

The host-accessible registers for the "Virtual Root Port" (vRP) dedicated to the Intel® QuickAssist Technology Controller are described here.

To determine the number of devices/functions available refer to the following:

- Table 1-1, "Features by product SKU - Server and Cloud Storage SKUs 0 through 4"
- Table 1-2, "Features by Product SKU - Network and Enterprise Storage SKUs 5 through 10"
- Table 1-3, "Features by Product SKU - Extended Temperature SKUs 11 through 14".

The SoC also contains a vRP (Device 22) dedicated to LAN Controller 0 and another vRP (Device 23) dedicated to LAN Controller 1.

The registers shown in this chapter apply to vRP Device 6 as well as vRP Devices 22 and 23. Register information unique to a device is explained in the register and bit field descriptions.

The legend for the register access codes are described in Chapter 43, "Introduction."

47.1.1 Host Configuration Space

These Virtual Root Port (vRP) registers are discovered in Host Configuration Space starting at:

- Bus 0, Device 6, Function 0 for the vRP of the Intel® QuickAssist Technology Controller
- Bus 0, Device 22 (decimal), Function 0 for the vRP of LAN Controller 0
- Bus 0, Device 23 (decimal), Function 0 for the vRP of LAN Controller 1

Table 47-1. Summary of PCI Configuration Registers—0/6/0, 0/22/0, and 0/23/0 (Sheet 1 of 3)

47.2 Registers in Configuration Space

47.2.1 VID—Offset 0h

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:6, F:0] + 0h
Offset: [B:0, D:22, F:0] + 0h
Offset: [B:0, D:23, F:0] + 0h

Default: 8086h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x8086 RO	**Vendor ID (VID):** This field identifies Intel as the manufacturer of the device.

47.2.2 DID—Offset 2h

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:6, F:0] + 2h
Offset: [B:0, D:22, F:0] + 2h
Offset: [B:0, D:23, F:0] + 2h

Default: 19A3h for D6
Default: 19D1h for D22
Default: 19D2h for D23

Bit Range	Default & Access	Field Name (ID): Description
15:0	D6: 0x19A3 D22: 0x19D1 D23: 0x19D2 RO/V	**Device ID (DID):** This field identifies the particular function as allocated by Intel.

47.2.3 PCICMD—Offset 4h

This register controls how the device behaves on the primary interface (PCI Express).

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:6, F:0] + 4h
Offset: [B:0, D:22, F:0] + 4h
Offset: [B:0, D:23, F:0] + 4h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0x0 RO	**RSVD0:** Reserved
10	0x0 RW	**Interrupt Disable (INTxD):** This bit controls the ability of the PCI-Express Function to generate legacy INTx interrupt message. When set, functions are prevented from asserting INTx interrupt messages. Any INTx emulation interrupts already asserted by the function must be deasserted when this bit is set by generating a Deassert_INTx message(s).
9	0x0 RO	**Fast Back-to-back enable (FBE):** Not applicable to PCI-Express. Hardwired to 0.
8	0x0 RW	**SERR# Enable (SEE):** When set, this bit enables reporting of Non-Fatal and Fatal errors detected by the Function of the Root Complex.
7	0x0 RO	**Wait Cycle Control (WCC):** Not applicable to PCI-Express. Hardwired to 0.
6	0x0 RW	**Parity Error Response Enable (PERE):** This bit controls the setting of the master data parity error bit in the Status Register PCI Status Register (PCISTS) in response to a parity error received on the PCI Express interface (either internal queue errors or a poisoned TLP).
5	0x0 RO	**VGA Palette Snoop Enable (VGA_PSE):** Not applicable to PCI-Express. Hardwired to 0.
4	0x0 RO	**Memory Write and Invalidate Enable (MWIE):** Not applicable to PCI-Express. Hardwired to 0.
3	0x0 RO	**Special Cycle Enable (SCE):** Not applicable to PCI-Express. Hardwired to 0.
2	0x0 RW	**Bus Master Enable (BME):** This bit controls the ability of the Function to issue Memory and I/O read or write requests, and the ability of Root or Switch port to forward memory and I/O read or write requests in the upstream direction. When this bit is 0b, memory and I/O requests received at the root port or downstream side of a switch port (secondary side) must be handled as an Unsupported Request (UR). MSI interrupts are inband memory writes and are blocked when this bit is 0b.
1	0x0 RW	**Memory Space Enable (MSE):** • 0 - Respond to all Memory Requests on the primary interface as Unsupported Request Received. Forward all memory requests from the secondary interface to the primary interface. • 1- Enable forwarding of memory transactions to the secondary interface and any internal function.
0	0x0 RW	**I/O Space Enable (IOSE):** • 0 - Respond to all I/O Requests on the primary interface with an Unsupported Request Completion. Forward all I/O transactions from the secondary interface to the primary interface (if supported). • 1 - Enable forwarding of I/O Requests to the secondary interface.

47.2.4 PCISTS—Offset 6h

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:6, F:0] + 6h
Offset: [B:0, D:22, F:0] + 6h
Offset: [B:0, D:23, F:0] + 6h

Default: 0010h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW/1C/V	**Detected Parity Error (DPE):** This bit is set when a poisoned TLP is received from PCIe or IOSF. This bit is set even when the parity error response enable bit (bit[6] of the PCI Command Register (PCICMD) is not set.
14	0x0 RW/1C/V	**Signaled System Error (SSE):** This bit is set when ERR_FATAL or ERR_NONFATAL messages are sent to the root complex and the SERR enable bit in the PCICMD Register PCI Command Register (PCICMD) is set.
13	0x0 RW/1C/V	**Received Master Abort (RMA):** This bit is set when the requester receives a completion with an UR completion status.
12	0x0 RW/1C/V	**Received Target Abort (RTA):** This bit is set when a requester receives a CA completions status.
11	0x0 RW/1C/V	**Signaled Target Abort (STA):** This bit is Set when the port completes a Posted or Non-Posted Request as a Completer Abort error.
10:9	0x0 RO	**DEVSEL# Timing (DVT):** These bits have no meaning on PCI Express.
8	0x0 RW/1C/V	**Master Data Parity Error Detected (MDPD):** This bit is set if the parity error response enable bit (PERE) in the Command Register PCI Command Register (PCICMD) is set and either of the following two conditions occur: • Requester receives a completion marked poisoned. • Requester sends a poisoned request (includes writes and messages). If the parity error bit is 0b, this bit is never set.
7	0x0 RO	**Fast Back-to-Back Capable (FBC):** This bit has no meaning on PCI Express.
6	0x0 RO	**RSVD0:** Reserved
5	0x0 RO	**Reserved:** Reserved
4	0x1 RO	**Capabilities List Enable (CAPE):** This bit indicates the presence of an Extended capabilities list items.
3	0x0 RO/V	**Interrupt Status (INTS):** When set, this bit indicates that an INTx emulation interrupt is pending internally in this function.
2:0	0x0 RO	**RSVD1:** Reserved

47.2.5 CCR—Offset 9h

The CCR register has an attribute of RW-L PRST to allow configuration software to modify and lock the register from further update. Lock Key bit is located in the Personality Lock Key Control Register ('PLKCTL').

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:6, F:0] + 9h
Offset: [B:0, D:22, F:0] + 9h
Offset: [B:0, D:23, F:0] + 9h

Default: 00060400h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**RSVD0:** Reserved
23:16	0x6 RW/L	**Base Class (BC):** The value of 06h indicates that this is a bridge device. **Power Well:** PRST
15:8	0x4 RW/L	**Sub-Class (SC):** This 8-bit value indicates that this device is a PCI-to-PCI Bridge. **Power Well:** PRST
7:0	0x0 RW/L	**Register-Level Programming Interface (RLPI):** This bit indicates that this device is standard (non-subtractive) PCI-to-PCI Bridge. **Power Well:** PRST

47.2.6 CLS—Offset Ch

Type: PCI Configuration Register
(Size: 8 bits)

Offset: [B:0, D:6, F:0] + Ch
Offset: [B:0, D:22, F:0] + Ch
Offset: [B:0, D:23, F:0] + Ch

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Cache Line Size (CLS):** These bits specify the system cache-line size in units of DWords. This field is implemented by PCI Express devices but has no effect on device behavior.

47.2.7 IOBASE—Offset 1Ch

The I/O Base and I/O Limit registers define an address range that is used by the PCI-Express port to determine when to forward I/O transactions from one interface to the other using the following formula: IO_BASE (= A[15:12](=IO_LIMIT Only the upper 4 bits are programmable. For the purpose of address decode, address bits A[11:0] are treated as 0. The bottom of the defined I/O address range will be aligned to a 4KB boundary while the top of the region specified by IO_LIMIT will be one less than a 4 KB multiple.

Type: PCI Configuration Register
(Size: 8 bits)

Offset: [B:0, D:6, F:0] + 1Ch
Offset: [B:0, D:22, F:0] + 1Ch
Offset: [B:0, D:23, F:0] + 1Ch

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:4	0x0 RW	**I/O Base Address Bits (IOBA):** These bits define the bottom address of an address range to determine when to forward I/O transactions from one interface to another. These bits correspond to address lines[15:12] for 4 KB alignment. Bits[11:0] are assumed to be 000h.
3:0	0x0 RO	**I/O Base Addressing Capability (IOBC):** Each of these bits is hard-wired to 0, indicating support for 16-bit I/O addressing only.

47.2.8 IOLIMIT—Offset 1Dh

The I/O Base and I/O Limit registers define an address range that is used by the PCI-Express bridge to determine when to forward I/O transactions from one interface to the other using the following formula: IO_BASE (= A[15:12] (=IO_LIMIT Only the upper 4 bits are programmable. For the purpose of address decode, address bits A[11:0] of the IO limit register is treated as FFFh.

Type: PCI Configuration Register
(Size: 8 bits)

Offset: [B:0, D:6, F:0] + 1Dh
Offset: [B:0, D:22, F:0] + 1Dh
Offset: [B:0, D:23, F:0] + 1Dh

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:4	0x0 RW	**I/O Limit Address Bits (IOLA):** These bits define the top address of an address range to determine when to forward I/O transactions from PCI Express to PCI. These bits correspond to address lines[15:12] for 4 KB aligned window. Bits[11:0] are assumed to be FFFh.
3:0	0x0 RO	**I/O Limit Addressing Capability (IOLC):** Each of these bits is hard-wired to 0, indicating support for 16-bit I/O addressing only.

47.2.9 MEMBASE—Offset 20h

The Memory Base and Memory Limit registers define a memory mapped I/O non-prefetchable address range (32-bit addresses) and direct the accesses in this range to the PCI-Express port based on the following formula: MEMORY_BASE (= A[31:20] (= MEMORY_LIMIT The upper 12 bits of both the Memory Base and Memory Limit registers are read/write and corresponds to the upper 12 address bits, AD[31:20], of 32-bit addresses. For the purpose of address decoding, the bridge assumes that the lower 20 address bits, AD[19:0], of the memory base address are zero. Similarly, the bridge assumes that the lower 20 address bits, AD[19:0], of the memory limit address (not implemented in the Memory Limit register) are FFFFFh. Thus, the bottom of the defined memory address range will be aligned to a 1 MB boundary and the top of the defined memory address range will be one less than a 1 MB boundary

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:6, F:0] + 20h
Offset: [B:0, D:22, F:0] + 20h
Offset: [B:0, D:23, F:0] + 20h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:4	0x0 RW	**Memory Base (MB):** These bits are compared with bits[31:20] of the incoming address to determine the lower 1 MB-aligned value (inclusive) of the range. The incoming address must be greater than or equal to this value.
3:0	0x0 RO	**RSVD0:** Reserved

47.2.10 MEMLIMIT—Offset 22h

This register controls the processor to PCI-Express non-prefetchable memory access routing based on the following formula as described above: MEMORY_BASE (= A[31:20] The upper 12 bits of the register are read/write and correspond to the upper 12 address bits A[31:20] of the 32 bit address. The bottom 4 bits of this register are read-only and return zeroes when read. This register must be initialized by the configuration software. For the purpose of address decode address bits A[19:0] are assumed to be FFFFFh. Memory range covered by MEMBASE and MEMLIM registers, are used to map non-prefetchable PCIExpress address ranges (typically where control/ status memory-mapped I/O data structures reside) and PFBASE and PFLIMIT are used to map prefetchable address ranges.

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:6, F:0] + 22h
Offset: [B:0, D:22, F:0] + 22h
Offset: [B:0, D:23, F:0] + 22h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:4	0x0 RW	**Memory Limit (ML):** These bits are compared with bits[31:20] of the incoming address to determine the upper limit of the range of memory accesses that will be passed by the port. The incoming address must be less than or equal to this value as described in the formula in 'Memory Base Register' (MEMBASE).
3:0	0x0 RO	**RSVD0:** Reserved

47.2.11 PFBASE—Offset 24h

The Prefetchable Memory Base and Memory Limit registers define a memory mapped I/O prefetchable address range (32-bit addresses) which is used by the PCI-Express bridge to determine when to forward memory transactions based on the following formula: PREFETCH_MEMORY_BASE (= A[31:20] The upper 12 bits of both the Prefetchable Memory Base and Memory Limit registers are read/ write and corresponds to the upper 12 address bits, A[31:20], of 32-bit addresses. For the purpose of address decoding, the bridge assumes that the lower 20 address bits, A[19:0], of the memory base address are zero. Similarly, the bridge assumes that the lower 20 address bits, A[19:0], of the memory limit address (not implemented in the Memory Limit register) are FFFFFh. Thus, the bottom of the defined memory address range will be aligned to a 1 MB boundary and the top of the defined memory address range will be one less than a 1 MB boundary.

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:6, F:0] + 24h
Offset: [B:0, D:22, F:0] + 24h
Offset: [B:0, D:23, F:0] + 24h

Default: 0001h

Bit Range	Default & Access	Field Name (ID): Description
15:4	0x0 RW	**Prefetchable Memory Base (PMB):** These bits are compared with bits[31:20] of the incoming address to determine the lower 1 MB-aligned value (inclusive) of the range. The incoming address must be greater than or equal to this value.
3:0	0x1 RO	**Prefetchable Memory Base Address Capability (PFMCAP):** • 0: 32-bit Prefetchable Memory addressing • 1: 64-bit Prefetchable Memory addressing This field indicates that 64-bit addressing is supported for the limit.

47.2.12 PFLIMIT—Offset 26h

This register controls the processor to PCI-Express prefetchable memory access routing based on the following formula as described above: PREFETCH_MEMORY_BASE (= A[31:20] The upper 12 bits of the register are read/write and correspond to the upper 12 address bits A[31:20] of the 32 bit address. This register must be initialized by the configuration software. For the purpose of address decode address bits A[19:0] are assumed to be FFFFFh.

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:6, F:0] + 26h
Offset: [B:0, D:22, F:0] + 26h
Offset: [B:0, D:23, F:0] + 26h

Default: 0001h

Bit Range	Default & Access	Field Name (ID): Description
15:4	0x0 RW	**Prefetchable Memory Limit (PML):** These bits are compared with bits[31:20] of the incoming address to determine the upper limit of the prefetchable memory range. The incoming address must be less than or equal to this value as described in the formula in 'Prefetchable Memory Limit Register (PFLIMIT).
3:0	0x1 RO	**Prefetchable Memory Limit Address Capability (PMLC):** This field indicates that 64-bit addressing is supported for the limit.

47.2.13 PFBASEU—Offset 28h

The Prefetchable Base Upper 32 Bits and Prefetchable Limit Upper 32 Bits registers are extensions to the Prefetchable Memory Base and Prefetchable Memory Limit registers. If a 64-bit prefetchable memory address range is supported, the Prefetchable Base Upper 32 Bits and Prefetchable Limit Upper 32 Bits registers specify the upper 32-bits, corresponding to A[63:32], of the 64-bit base and limit addresses which specify the prefetchable memory address range. PREFETCH_MEMORY_BASE_UPPER (= A[63:32] PREFETCH_MEMORY_BASE_LIMIT_UPPER

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:6, F:0] + 28h
Offset: [B:0, D:22, F:0] + 28h
Offset: [B:0, D:23, F:0] + 28h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Prefetchable Memory Base Upper Portion (PMBU):** Corresponds to A[63:32] of the memory address that maps to the upper base of the prefetchable range of memory accesses that will be passed by the PCI-Express bridge.

47.2.14 PFLIMITU—Offset 2Ch

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:6, F:0] + 2Ch
Offset: [B:0, D:22, F:0] + 2Ch
Offset: [B:0, D:23, F:0] + 2Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Prefetchable Memory Limit Upper Portion (PMLU):** Corresponds to A[63:32] of the memory address that maps to the upper limit of the prefetchable range of memory accesses that will be passed by the PCI-Express bridge. The incoming address must be less than or equal to this value as described in the formula in 'Prefetchable Memory Base Upper 32 Bits Register' (PFBASEU).

47.2.15 CAPPTR—Offset 34h

Type: PCI Configuration Register
(Size: 8 bits)

Offset: [B:0, D:6, F:0] + 34h
Offset: [B:0, D:22, F:0] + 34h
Offset: [B:0, D:23, F:0] + 34h

Default: 40h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x40 RO	**Capabilities Pointer (CPTR):** Contains the offset of the first item in the list of capabilities. (EXPCAPLST)

47.2.16 INTL—Offset 3Ch

Type: PCI Configuration Register
(Size: 8 bits)

Offset: [B:0, D:6, F:0] + 3Ch
Offset: [B:0, D:22, F:0] + 3Ch
Offset: [B:0, D:23, F:0] + 3Ch

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Interrupt Line (INTL):** This register is used to communicate interrupt line routing information.

47.2.17 INTP—Offset 3Dh

Type: PCI Configuration Register
(Size: 8 bits)

Offset: [B:0, D:6, F:0] + 3Dh
Offset: [B:0, D:22, F:0] + 3Dh
Offset: [B:0, D:23, F:0] + 3Dh

Default: 01h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x1 RW/L	**Interrupt Pin (INTP):** This register tells which interrupt pin the function uses. • 01h: Generate INTA • 02h: Generate INTB • 03h: Generate INTC • 04h: Generate INTD • Others: Reserved **Power Well:** PRST

47.2.18 BCTL—Offset 3Eh

This register provides extensions to the PCI Command Register (PCICMD) that are specific to a bridge. The Bridge Control Register provides many of the same controls for the secondary interface that are provided by the Command Register for the primary interface. Some bits affect operation of both interfaces of the bridge.

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:6, F:0] + 3Eh
Offset: [B:0, D:22, F:0] + 3Eh
Offset: [B:0, D:23, F:0] + 3Eh

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:12	0x0 RO	**RSVD0:** Reserved
11	0x0 RO	**Discard Timer SERR# Enable (DTSE):** Not applicable to PCI Express. Hardwired to 0.
10	0x0 RO	**Discard Timer Status (DTS):** Not applicable to PCI Express. Hardwired to 0.
9	0x0 RO	**Secondary Discard Timer (SDT):** Not applicable to PCI Express. Hardwired to 0.

Bit Range	Default & Access	Field Name (ID): Description
8	0x0 RO	**Primary Discard Timer (PDT):** Not applicable to PCI Express. Hardwired to 0.
7	0x0 RO	**Fast Back-to-Back Enable (FBE):** Not applicable to PCI Express. Hardwired to 0.
6	0x0 RW	**Secondary Bus Reset (SBR):** Setting this bit triggers a hot reset on the downstream link for the corresponding PCIe Express port and the PCI Express hierarchy domain subordinate to the port. Software must ensure a minimum reset duration of 1us as defined in the PCI Local Bus Specification, Revision 3.0. Hardware will continue to maintain the hot reset state as long as the SBR bit is set. For Root Ports, it is recommended that software assert this field for a minimum of 2 ms to ensure that all downstream links enters hot reset state. A secondary bus reset will not reset any register of a Type 1 configuration space header function.
5	0x0 RO	**Master Abort Mode (MAM):** Not applicable to PCI Express. Hardwired to 0.
4	0x0 RW	**VGA 16-bit Decode (VGA16BD):** This bit enables the bridge to provide 16-bit decoding of VGA I/O address precluding the decoding of VGA alias addresses every 1 KB. This bit requires the VGA enable bit (bit 3 of this register) to be set to 1. • 0: execute 10-bit address decode on VGA I/O accesses • 1: execute 16-bit address decode on VGA I/O accesses
3	0x0 RW	**VGA Enable (VGAE):** This bit modifies the response to VGA-compatible addresses. When set to 1b, the bridge positively decodes and forwards the following transactions from primary side to secondary side regardless of the value of the I/O base and limit registers. The transactions are qualified by the memory enable and I/O enable in the command register. Memory addresses: • 000A 0000h-000B FFFFh I/O addresses: • 3B0h-3BBh and 3C0h-3DFh in first 64 KB of I/O address space (Inclusive of ISA address aliases when IO address bits[15:10] are not decoded)
2	0x0 RW	**ISA Enable (IE):** This bit modifies the response by the bridge to ISA I/O addresses. This field applies only to I/O addresses that are enabled by the I/O base and I/O limit registers and are in the first 64 KB of PCI I/O space. When this bit is set, the bridge blocks all forwarding from primary to secondary of I/O transactions addressing the last 768 bytes in each 1 KB block (offsets 100h to 3FFh). In the opposite direction (secondary to primary), I/O transactions will be forwarded if they address the last 768B in each 1 KB block. • 1: Forward upstream ISA I/O addresses in the address range defined by the I/O Base and I/O Limit registers that are in the firsts 64KB of PCI I/O address space (Top 768B of each 1K block). • 0: Forward downstream all I/O addresses in the address range defined by the I/O Base and I/O Limit registers.
1	0x0 RW	**SERR# Enable (SE):** This bit controls the forwarding of PCI Express ERR_COR, ERR_NONFATAL and ERR_FATAL messages to the primary side. • 1: Enables forwarding of ERR_COR, ERR_NONFATAL, ERR_FATAL messages. • 0: Disables forwarding of ERR_COR, ERR_NONFATAL, ERR_FATAL messages.
0	0x0 RW	**Parity Error Response Enable (PERE):** This bit controls the response to poisoned TLPs in the PCI Express port. • 1: Enables reporting of poisoned TLP errors. • 0: Disables reporting of poisoned TLP errors.

47.2.19 EXPCAPLST—Offset 40h

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:6, F:0] +40h
Offset: [B:0, D:22, F:0] +40h
Offset: [B:0, D:23, F:0] +40h

Default: 8010h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x80 RO	**Next Pointer (NP):** Contains the offset of the next item in the capabilities list. (PMCAPLST)
7:0	0x10 RO	**Capability ID (CAPID):** Identifies the function as PCI Express capable.

47.2.20 EXPCAP—Offset 42h

This register stores the version number of the capability item and other base information contained in the capability structure.

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:6, F:0] +42h
Offset: [B:0, D:22, F:0] +42h
Offset: [B:0, D:23, F:0] +42h

Default: 0042h

Bit Range	Default & Access	Field Name (ID): Description
15:14	0x0 RO	**RSVD0:** Reserved
13:9	0x0 RO	**Interrupt Message Number (IMN):** This field indicates the interrupt message number that is generated from the PCI Express port.
8	0x0 RO	**Slot Implemented (SI):** Hardwired to 0 for non root ports and non DP.
7:4	0x4 RO	**Device/Port Type (DT):** 4h: Virtual Root Port
3:0	0x2 RO	**Version Number (VN):** These bits indicate the version number of the PCI Express capability structure.

47.2.21 DEVCAP—Offset 44h

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:6, F:0] +44h
Offset: [B:0, D:22, F:0] +44h
Offset: [B:0, D:23, F:0] +44h

Default: 00008001h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RO	**RSVD0:** Reserved
27:26	0x0 RO	**Captured Slot Power Limit Scale (CSPLS):** In combination with the Slot Power Limit value (bits[25:18], this field specifies the upper limit of the power supplied by slot. The power limit (in Watts) is calculated by multiplying the value in this field by the value in the Slot Power Limit Value field. This value is set by the Set_Slot_Power_Limit message. Does not apply to root ports or integrated devices or end points or downstream ports or Virtual Root Port/switch port
25:18	0x0 RO	**Captured Slot Power Limit Value (CSPLV):** In combination with the Slot Power Limit Scale value (bits[27:26]), this field specifies the upper limit of the power supplied by slot. The power limit (in Watts) is calculated by multiplying the value in this field by the value in the Slot Power Limit Scale field. This value is set by the Set_Slot_Power_Limit message. Does not apply to root ports or integrated devices or end points or downstream ports or Virtual Root Port/switch ports
17:16	0x0 RO	**RSVD1:** Reserved
15	0x1 RO	**Role-Based Error Reporting (RBER):** The PCIe cluster supports Role-based Error Reporting.
14:12	0x0 RO	**Undefined:** Reserved.
11:9	0x0 RO	**Endpoint L1 Acceptable Latency (EPL1AL):** This field only applies to Endpoint and is hardwired to 0 for other types such as root ports, upstream/downstream ports
8:6	0x0 RO	**Endpoint L0s Acceptable Latency (EPL0AL):** This field only applies to Endpoint and is hardwired to 0 for other types such as root ports, upstream/downstream ports
5	0x0 RO	**Extended Tag Field Supported (ETFG):** • 0: The PCIe supports 5-bit extended tag • 1: The PCIe supports 8-bit extended tag
4:3	0x0 RO	**Phantom Functions Supported (PFS):** This field indicates the number of most significant bits of the function number portion of Requester ID in a TLP that are logically combined with the Tag identifier. The PCIe cluster does not support phantom functions
2:0	0x1 RO/V	**Max Payload size Supported (MPSS):** The PCIe SIP can tolerate upto 512-byte packets as maximum payload for project specific.

47.2.22 DEVCTL—Offset 48h

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:6, F:0] +48h
Offset: [B:0, D:22, F:0] +48h
Offset: [B:0, D:23, F:0] +48h

Default: 2000h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RO	**RSVD0:** Reserved
14:12	0x2 RW	**Max_Read_Request_Size (MRRS):** This field sets the maximum Read Requests size of the function as a requester. • 000b: 128 bytes maximum Read Request size • 001b: 256 bytes maximum Read Request size • 010b: 512 bytes maximum Read Request size • 011b: 1024 bytes maximum Read Request size • 100b: 2048 bytes maximum Read Request size • 101b: 4096 bytes maximum Read Request size • Others: Reserved
11	0x0 RO	**Enable No Snoop (ENOSNP):** If this bit this is set, the function is permitted to set the No Snoop bit in the Requester attributes of transactions it initiates that do not require hardware enforced cache coherency.

9	0x0 RO	**Reserved:** Reserved
8	0x0 RO	**Reserved:** Reserved
7:5	0x0 RW	**Maximum Payload Size (MPS):** This field sets maximum TLP payload size for the function. As a receiver, the function must handle TLPs as large as the set value. As a Transmitter, the function must not generate TLPs exceeding the set value. • 000b: 128 bytes maximum payload size (default) • 001b: 256 bytes maximum payload size • 010b: 512 bytes maximum payload size • 011b: 1024 bytes maximum payload size • 100b: 2048 bytes maximum payload size • 101b: 4096 bytes maximum payload size • Others: Reserved
4	0x0 RO	**Reserved:** Reserved
3	0x0 RW	**Unsupported Request Reporting Enable (URRE):** This bit controls the enabling of ERR_CORR, ERR_NONFATAL or ERR_FATAL messages on PCI Express for reporting 'Unsupported Request' errors.
2	0x0 RW	**Fatal Error Reporting Enable (FERE):** When this bit is set, generation of the ERR_FATAL message is enabled.
1	0x0 RW	**NonFatal Error Reporting Enable (NFERE):** When this bit is set, generation of the ERR_NONFATAL message is enabled.
0	0x0 RW	**Correctable Error Reporting Enable (CERE):** When this bit is set, generation of the ERR_CORR message is enabled.

47.2.23 DEVSTS—Offset 4Ah

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:6, F:0] +4Ah
Offset: [B:0, D:22, F:0] +4Ah
Offset: [B:0, D:23, F:0] +4Ah

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:6	0x0 RO	**RSVD0:** Reserved
5	0x0 RO/V	**Transactions Pending (TP):** When set, this bit indicates that the function has issued Non-Posted Requests that have not been completed.
4	0x0 RO	**Auxiliary Power Detected (APD):** Auxiliary Power is not supported.
3	0x0 RW/1C/V	**Unsupported Request Detected (URD):** This bit indicates that this function received an unsupported request from PCI Express link. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register.
2	0x0 RW/1C/V	**Fatal Error Detected (FED):** This bit indicates that this function has detected a Fatal error. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register.
1	0x0 RW/1C/V	**Non-Fatal Error Detected (NFED):** This bit indicates that this function has detected a Non-Fatal error. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register.
0	0x0 RW/1C/V	**Correctable Error Detected (CED):** This bit indicates that this function has detected a Correctable error. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register.

47.2.24 LINKCAP—Offset 4Ch

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:6, F:0] +4Ch
Offset: [B:0, D:22, F:0] +4Ch
Offset: [B:0, D:23, F:0] +4Ch

Default: 06000C11h for D6
Default: 16000C11h for D22
Default: 17000C11h for D23

Bit Range	Default & Access	Field Name (ID): Description
31:24	D6: 0x6 D22: 0x16 D23: 0x17 RW/L	**Port Number (PN):** This field indicates the PCI Express port number assigned to this link for Virtual Root Port/Switch Port. **Power Well:** PRST
23:22	0x0 RO	**RSVD0:** Reserved
21	0x0 RO	**Link Bandwidth Notification Capability (LBNC):** A value of 1b indicates support for the Link Bandwidth Notification status and interrupt mechanisms.
20	0x0 RO	**Data Link Layer Active Error Reporting Capable (DLLERC):** For Upstream Ports and components that do not support this optional capability, this bit must be hardwired to 0b Used device number to distinguish the vRP and vSP for default values
19	0x0 RO	**Surprise Down Error Reporting Capable (SLDERC):** For Upstream Ports and components that do not support this optional capability, this bit must be hardwired to 0b.
18	0x0 RO	**Clock Power Management Capable (CPMC):** For Downstream Ports, this bit must be hardwired to 0b.
17:15	0x0 RO	**L1 Exit Latency (L1EL):** This field indicates the L1 exit latency for the given PCI-Express Link. It indicates the length of time this port requires to complete transition from L1 to L0. • 000: Less than 1us • 001: 1us to less than 2us • 010: 2us to less than 4us • 011: 4us to less than 8us • 100: 8us to less than 16us • 101: 16us to less than 32us • 110: 32us to less than 64us • 111: More than 64us If L1 is not supported, the value is undefined
14:12	0x0 RO	**L0s Exit Latency (L0sEL):** This field indicates the L0s exit latency for the given PCI-Express Link. It indicates the length of time this port requires to complete transition from L0s to L0. • 000b: Less than 64ns • 001b: 64ns to less than 128ns • 010b: 128ns to less than 256ns • 011b: 256ns to less than 512ns • 100b 512 ns to less than 1us • 101b: 1us to less than 2us • 110b: 2us to less than 4us • 111b: More than 4us If L0s is not supported, the value is undefined

Bit Range	Default & Access	Field Name (ID): Description
11:10	0x3 RO	**ASPM Support (ASPMSUP):** This field indicates the level of ASPM supported on the given PCI Express Link. • 00b: No ASPM Support • 01b: L0s Supported • 10b: L1 Supported • 11b: L0s and L1 Supported
9:4	0x1 RO	**Maximum Link Width (MLW):** This field indicates the maximum link width implemented by the given PCI Express Link. • 00h: Reserved • 01h: x1 • 02h: x2 • 04h: x4 • 08h: x8 • 10h: x16 • 20h: x32 (Unsupported) • Others Reserved
3:0	0x1 RO	**Maximum Link Speed (MLS):** This field indicates the maximum supported link speed(s) of the associated port. • 0001b: 2.5 Gb/s link speed is supported • 0010b: 5.0 Gb/s and 2.5 Gb/s link speed supported • 0011b: 8.0 Gb/s and 5.0 and 2.5 Gb/s link speed supported • Others: Reserved.

47.2.25 LINKCTL—Offset 50h

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:6, F:0] +50h
Offset: [B:0, D:22, F:0] +50h
Offset: [B:0, D:23, F:0] +50h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:12	0x0 RO	**RSVD0:** Reserved
11	0x0 RO	**Reserved:** Reserved
10	0x0 RO	**Link Bandwidth Management Interrupt Enable (LBMIE):** When set, this bit enables the generation of an interrupt to indicate that the Link Bandwidth Management Status bit has been set.
9	0x0 RO	**Reserved:** Reserved
8	0x0 RW/L	**Enable Clock Power Management (ECPM):** Applicable only for Upstream Ports and with form factors that support a 'Clock Request' (CLKREQ#) mechanism, this bit operates as follows: • 0b Clock power management is disabled and device must hold CLKREQ# signal low. • 1b When this bit is Set, the device is permitted to use CLKREQ# signal to power manage Link clock according to protocol defined. **Power Well:** PRST
7	0x0 RW	**Extended Synch (ES):** When set, this bit forces extended transmission of 4096 FTS ordered sets in FTS and an extra 1024 TS1 at exit from L1 prior to entering L0.
6	0x0 RW	**Common Clock Configuration (CCCFG):** When set, this bit indicates that this component and the component at the opposite end of this link are operating with distributed common reference clocks. A value of 0b indicates that this component and the component at the opposite end of this link are operating with asynchronous reference clock.
5	0x0 RO	**Retrain Link (RL):** When set, this bit initiates link retraining by directing the physical layer LTSSM to recovery state. For the upstream port or virtual switch port, it is Read-only.
4	0x0 RW	**Link Disable (LD):** This bit is reserved on Endpoints, PCI Express to PCI/PCI-X bridges, and Upstream Ports of Switches.
3	0x0 RO	**Read Completion Boundary (RCB):** This bit indicates the RCB value for Root Port, Endpoints and Bridges. • 0b: 64 byte • 1b: 128 byte
2	0x0 RO	**RSVD1:** Reserved
1:0	0x0 RW	**ASPM Control (ASPMCTL):** This field controls the level of ASPM enabled on a given PCI Express Link. • 00b: Disabled • 01b: L0s Entry Enabled • 10b: L1 Entry Enabled • 11b: L0s and L1 Entry Enabled ''L0s Entry Enabled' enables the Transmitter to enter L0s.

47.2.26 LINKSTS—Offset 52h

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:6, F:0] +52h
Offset: [B:0, D:22, F:0] +52h
Offset: [B:0, D:23, F:0] +52h

Default: 1011h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RO	**Link Autonomous Bandwidth Status (LABS):** This bit is set by hardware.
14	0x0 RO	**Link Bandwidth Management Status (LBMS):** This bit is set by hardware. This bit must be set if the Physical Layer reports a non-autonomous speed or width change initiated by the Upstream Port.
13	0x0 RO	**Data Link Layer Link Active (DLLLA):** This bit indicates the status of the Data Link Control and Management Status Machine. It returns a 1b to indicate the DL_Active state, 0b otherwise.
12	0x1 RW/L	**Slot Clock Configuration (SCC):** When to 1b, this bit indicates that the component uses the same physical reference clock that he platform provides on the connector. If the device uses an independent clock irrespective of the presence of a reference on the connector, this bit must be clear. • 1: Indicates same reference clock. • 0: Indicates independent reference clock **Power Well:** PRST
11	0x0 RO	**Link Training (LT):** This bit indicates that the Physical Layer LTSSM is in the Configuration or Recovery state, or a 1b was written to the Retrain Link bit but the Link training has not yet begun. Hardware clears this bit when the LTSSM exits the Configuration/Recovery state.
10	0x0 RO	**Undefined:** Not applicable
9:4	0x1 RO	**Negotiated Link Width (NLW):** This field indicates the negotiated width of the PCI Express link. • 00 0001b: x1 • 00 0010b: X2 • 00 0100b: x4 • 00 1000b: X8 • 00 1100b: X12 not supported • 01 0000b: X16 • 10 0000b: X32 not supported • All other values are reserved. The value in this field is undefined when the link is not up.
3:0	0x1 RO	**Current Link Speed (CLS):** This field indicates the negotiated link speed of the given PCI Express link. • 0001b: 2.5 Gb/s PCI Express Link • 0010b: 5.0 Gb/s PCI Express Link • 0011b: 8.0 Gb/s PCI Express Link • Others: Reserved

47.2.27 SLOTSTS—Offset 5Ah

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:6, F:0] +5Ah
Offset: [B:0, D:22, F:0] +5Ah
Offset: [B:0, D:23, F:0] +5Ah

Default: 0040h

Bit Range	Default & Access	Field Name (ID): Description
15:7	0x0 RO	**RSVD0:** Reserved
6	0x1 RO/V	**Presence Detect State (PDS):** This field conveys the Presence Detect status of an adapter in the slot. • 0: Card/Module/Cable slot empty or Cable Slot occupied but not powered • 1: Card/module Present in slot (powered or unpowered) or cable present and powered on the other end.
5:0	0x0 RO	**RSVD1:** Reserved

47.2.28 ROOTCTL—Offset 5Ch

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:6, F:0] +5Ch
Offset: [B:0, D:22, F:0] +5Ch
Offset: [B:0, D:23, F:0] +5Ch

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:5	0x0 RO	**RSVD0:** Reserved
4	0x0 RO	**CRS Software Visibility Enable (CRSSVE):** This bit, when set, enables the Root Port to return Configuration Retry Status (CRS) Completion status to software. • 1: Enable software to received a CRS status. This allows software to make the decision to re-issue the configuration request or move on and re-issue the request at a later time. • 0: Disable software from receiving a CRS response. The PCIe will wait and re-issue the configuration request until it receives a response other than CRS without notifying software.
3	0x0 RW	**PME Interrupt Enable (PMEIE):** This field controls the generation of interrupts for PME messages. • 1: Enables interrupt generation upon receipt of a PME message as reflected in the PME Status bit defined in the ROOTSTS register. A PME interrupt is generated if the PMESTATUS register bit defined in Root Status Register (ROOTSTS), is set when this bit is set from a cleared state. 0: Disables interrupt generation for PME messages.
2	0x0 RW	**System Error on Fatal Error Enable (SEFEE):** This field controls generation of system errors in the PCI-Express port hierarchy for fatal errors. • 1: indicates that a System Error should be generated if a fatal error (ERR_FATAL) is reported by any of the devices in the hierarchy associated with and including this PCI-Express port. • 0: No System Error should be generated on a fatal error (ERR_FATAL) reported by any of the devices in the hierarchy.
1	0x0 RW	**System Error on Non-Fatal Error Enable (SENFEE):** This field controls generation of system errors in the PCI-Express port hierarchy for non-fatal errors. • 1: indicates that a System Error should be generated if a non-fatal error (ERR_NONFATAL) is reported by any of the devices in the hierarchy associated with and including this PCI-Express port. • 0: No System Error should be generated on a non-fatal error (ERR_NONFATAL) reported by any of the devices in the hierarchy.
0	0x0 RW	**System Error on Correctable Error Enable (SECEE):** This field controls generation of system errors in the PCI-Express port hierarchy for correctable errors. • 1: indicates that a System Error should be generated if a correctable error (ERR_COR) is reported by any of the devices in the hierarchy associated with and including this PCI-Express port • 0: No System Error should be generated on a correctable error (ERR_COR) reported by any of the devices in the hierarchy associated with and including this PCI-Express port.

47.2.29 ROOTCAP—Offset 5Eh

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:6, F:0] +5Eh
Offset: [B:0, D:22, F:0] +5Eh
Offset: [B:0, D:23, F:0] +5Eh

Default: 0001h

Bit Range	Default & Access	Field Name (ID): Description
15:1	0x0 RO	**RSVD0:** Reserved
0	0x1 RW/L	**CRS Software Visibility (CRSSV):** This bit, when set, indicates that the Root Port is capable of returning Configuration Retry Status (CRS) on completions to software. Based on Design input, the CRS notification will be implemented in the EIP PCIe macro and hence the default is set to 1. The field attribute is made as RW-O for any specific changes to be installed by BIOS **Power Well:** PRST

47.2.30 ROOTSTS—Offset 60h

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:6, F:0] +60h
Offset: [B:0, D:22, F:0] +60h
Offset: [B:0, D:23, F:0] +60h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0x0 RO	**RSVD0:** Reserved
17	0x0 RO/V	**PME Pending (PMEPEND):** This field indicates that another PME is pending when the PME Status bit is set. When the PME Status bit is cleared by software, the pending PME is delivered by hardware by setting the PME Status bit again and updating the Requestor ID appropriately. The PME pending bit is cleared by hardware if no more PMEs are pending. ***Note:*** The root port can handle two outstanding PM_PME messages in its internal queues of the Power Management controller per port. If the downstream device issues more than 2 PM_PME messages successively, it will be dropped.
16	0x0 RW/1C/V	**PME Status (PMESTS):** This field indicates status of a PME that is underway in the PCI-Express port. 1: PME was asserted by a requester as indicated by the PMEREQID field This bit is cleared by software by writing a '1'. Subsequent PMEs are kept pending until the PME Status is cleared.
15:0	0x0 RO/V	**PME Requester ID (PMERID):** This field indicates the PCI requester ID of the last PME requestor.

47.2.31 DEVCAP2—Offset 64h

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:6, F:0] +64h
Offset: [B:0, D:22, F:0] +64h
Offset: [B:0, D:23, F:0] +64h

Default: 00000020h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RO	**RSVD0:** Reserved
19:18	0x0 RO	**OBFF Supported (OBFFS):** • 00b: OBFF Not Supported • 01b: OBFF supported using Message signaling only • 10b: OBFF supported using WAKE# signaling only • 11b: OBFF supported using WAKE# and Message signaling Applicable only to Root Ports, Switch Ports, and Endpoints that support this capability. Must be 00b for other function types.
17:14	0x0 RO	**RSVD1:** Reserved
13:12	0x0 RO	**TPH Completer Supported (TPHCS):** Value indicates Completer support for TPH or Extended TPH. • 00b:TPH and Extended TPH Completer not supported • 01b: TPH Completer supported, Extended TPH completer not supported • 10b: Reserved • 11b: Both TPH and Extended TPH Completer supported Applicable only to Root Ports and Endpoints. Must be 00b for other function types.
11	0x0 RW/L	**LTR Mechanism Supported (LTRMS):** This bit when set indicates support for the Latency Tolerance Reporting (LTR) mechanism. **Power Well:** PRST
10	0x0 RO	**No RO-enabled PR-PR Passing (NROEPRPASS):** This bit if set to 1b disables passing permitted by row entry A2b in PCIe ordering table that is associated with the Relaxed Ordering Attribute field being set. This bit applies only for Switches and RCs that support peer-to-peer traffic between ports. The bit only applies to posted requests being forwarded through the switch or RC. It does not apply to traffic originating or terminating with in the switch or RC itself.
9	0x0 RO	**AD128 CAS Completer Supported (AD128ACS):** This bit must be set to 1b if the function supports this optional capability. Applicable to functions with memory space BARs as well as Root Ports. This is not implemented in Virtual Root port
8	0x0 RO	**AD64-bit AtomicOp Completer Supported (AD64ACS):** This bit must be set to 1b if the function supports this optional capability. Applicable to Functions with Memory Space BARs as well as all Root Ports, must be 0b otherwise. Includes FetchAdd, Swap, and CAS AtomicOps. This is not implemented in Virtual Root port
7	0x0 RO	**AD32 bit AtomicOp Completer Supported (AD32ACS):** Applicable to Functions with Memory Space BARs as well as all Root Ports, must be 0b otherwise. Includes FetchAdd, Swap, and CAS AtomicOps. This bit must be set to 1b if the Function supports this optional capability. This is not implemented in Virtual Root port
6	0x0 RW/L	**AtomicOp Routing Supported (ARS):** This bit must be set to 1b if the port supports this optional capability. Applicable only to switch upstream ports, Switch downstream ports, and root ports,. This is not implemented in Virtual Root port. **Power Well:** PRST
5	0x1 RW/L	**ARI Forwarding Supported (ARI):** This bit is set to 1b indicating that the downstream port supports this capability. Applicable only to Switch Downstream Ports and Root Ports, must be 0b for other Function types. This bit must be set to 1b if a Switch Downstream Port or Root Port supports this optional capability. **Power Well:** PRST

Bit Range	Default & Access	Field Name (ID): Description
4	0x0 RO	**Completion Timeout Disable Support (CTDS):** A value of 1b indicates support for the completion Timeout Disable Mechanism. Support of completion timeout disable is optional for Root Ports. The Completion timeout is not supported for vRP/vSP
3:0	0x0 RO	**Completion Timeout Range Supported (CTRS):** This field indicates device support for the optional Completion Timeout programmability mechanism. This mechanism allows system software to modify the Completion Timeout value. This field is applicable only to Root Ports, Endpoints that issue requests on their own behalf, and PCI Express to PCI/PCI-X Bridges that take ownership of request issues on PCI Express. Four time values ranges are defined: • Range A: 50us to 10ms • Range B: 10ms to 250ms • Range C: 250ms to 4s • Range D: 4s to 64s Bits ares set according to table below to show timeout value ranges supported. • 0000b: Completions Timeout programming not supported -- values is fixed by implementation in the range 50us to 50ms. • 0001b: Range A • 0010b: Range B • 0011b: Range A and B • 0110b: Range B and C • 0111b: Range A, B, and C • 1110b: Range B, C, and D • 1111b: Range A, B, C, and D • All other values are reserved. For all other devices this field is reserved and maybe be hardwired to 0000b. Lock Key bit is located in the Personality Lock Key Control Register ('PLKCTL'). CT Ranges are defined for Virtual Root Port / Virtual Switch Port is 0 (unsupported)

47.2.32 DEVCTL2—Offset 68h

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:6, F:0] +68h
Offset: [B:0, D:22, F:0] +68h
Offset: [B:0, D:23, F:0] +68h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RO	**RSVD0:** Reserved
14:13	0x0 RO	**OBFF Enable (OBFFE):** Reserved.
12:11	0x0 RO	**RSVD1:** Reserved
10	0x0 RW/V	**LTR Mechanism Enable (LTRME):** When set to 1b, this bit enables Upstream Ports to send LTR messages and Downstream Ports to process LTR Messages. Applicable to Root Ports, Switches, and Endpoints that implement the LTR capability must implement this bit. For Downstream Ports, this bit must be reset to the default value if the Port goes to DL_Down status.
9	0x0 RO	**IDO Completion Enable (IDOCE):** This bit when set to 1b allows the function to set the ID-Based Ordering (IDO) bit of completions it returns. Applicable only to Endpoints including RC integrated Endpoints and Root Ports.
8	0x0 RO	**IDO Request Enable (IDORE):** This bit when set to 1b allows the function to set the ID-Based Ordering (IDO) bit on requests it initiates. Applicable only to Endpoints including RC integrated Endpoints and Root Ports.
7	0x0 RO	**AtomicOp Egress Blocking (AEB):** When this bit is set, AtomicOp requests that target this out going Egress port must be blocked. Applicable and mandatory for switch Upstream Ports, Switch Downstream Ports, and Root Ports that implement AtomicOp routing capability. Otherwise, must be hardwired to 0b. AEB is not supported for Virtual Root port but applicable for Virtual Switch Port if supported.
6	0x0 RO	**AtomicOp Requester Enable (ARE):** Applicable only to Endpoints and Root Ports, must be hardwired to 0b for other Function types.
5	0x0 RW	**ARI Forwarding Enable (ARIE):** When set to 1b, ARI is enabled for the downstream port or root ports. The Downstream Port disables its traditional Device Number field being 0 enforcement when turning a Type 1 Configuration Request into a Type 0 Configuration Request, permitting access to Extended Functions in an ARI Device immediately below the Port. Default value of this bit is 0b.
4	0x0 RO	**Completion Timeout Disable (CTD):** • 1: Disable the completions timeout mechanism for all NP transactions. • 0: Completion timeout is enabled for all NP transactions.
3:0	0x0 RO	**Completion Timeout Value (CTV):** In devices that support completion timeout programmability, this field allows system software to modify the completion timeout range. The following encodings and corresponding timeout ranges are defined based on implementation choice. This field provides finer control based over the ranges chosen by DEVAP2.CTRS. The implementation specific range is shown in brackets • 0000b: 50us to 50ms (16.8ms - 25.2ms based on core clk period) • 0001b: 50us to 100us (65.5us - 99.3us based on core clk period) • 0010b: 1ms to 10ms (4.2ms - 6.3ms based on core clk period) • 0101b: 16ms to 55ms (33.6ms - 50.3ms based on core clk period) • 0110b: 65ms to 210ms (134.2ms - 201.3ms based on core clk period) • 1001b: 260ms to 900ms (536.9ms - 805.3ms based on core clk period) • 1010b: 1s to 3.5s (2.1s - 3.2s based on core clk period) • 1101b: 4s to 13s (8.6s - 12.9s based on core clk period) • 1110b: 17s to 64s (34.4s - 51.5s based on core clk period) • All others are reserved. CTV is not supported in UP, DP and vRP/vSP It is highly recommended that the completion timeout value not be less then 10ms. A small completion timeout value may result in premature completion timeout for slower responding devices.

47.2.33 LINKCAP2—Offset 6Ch

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:6, F:0] +6Ch
Offset: [B:0, D:22, F:0] +6Ch
Offset: [B:0, D:23, F:0] +6Ch

Default: 00000002h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0x0 RO	**RSVD0:** Reserved
22:16	0x0 RW/L	**Lower SKP OS Reception Supported Speeds Vector (LSKPOSRSSV):** If this field is non-zero, it indicates that the Port, when operating at the indicated speed(s) supports SRIS and also supports receiving SKP OS at the rate defined for SRNS while running in SRIS. Bit definitions within this field are: • Bit 0 2.5 GT/s • Bit 1 5.0 GT/s • Bit 2 8.0 GT/s • Bits 6:3 RsvdP Multi-Function devices associated with an Upstream Port must report the same value in this field for all Functions. Behavior is undefined if a bit is Set in this field and the corresponding bit is not Set in the Supported Link Speeds Vector. Currently, design does not support reception of low frequency SOS in L0. **Power Well:** PRST
15:9	0x0 RW/L	**Lower SKP OS Generation Supported Speeds Vector (LSKPOSGSSV):** If this field is non-zero, it indicates that the Port, when operating at the indicated speed(s) supports SRIS and also supports software control of the SKP Ordered Set transmission scheduling rate. Bit definitions within this field are: • Bit 0 2.5 GT/s • Bit 1 5.0 GT/s • Bit 2 8.0 GT/s • Bits 6:3 RsvdP Multi-Function devices associated with an Upstream Port must report the same value in this field for all Functions. Behavior is undefined if a bit is Set in this field and the corresponding bit is not Set in the Supported Link Speeds Vector. **Power Well:** PRST
8	0x0 RW/L	**Crosslink Supported (CLS):** When set to 1b, this bit indicates that the associated Port supports crosslinks When set to 0b on a Port that supports Link speeds of 8.0 GT/s or higher, this bit indicates that the associated Port does not support crosslinks. When set to 0b on a Port that only supports Link speeds of 2.5 GT/s or 5.0 GT/s, this bit provides no information regarding the Port's level of crosslink support. It is recommended that this bit be Set in any Port that supports crosslinks even though doing so is only required for Ports that also support operating at 8.0 GT/s or higher Link speeds. ***Note:*** Software should use this bit when referencing fields whose definition depends on whether or not the Port supports crosslinks. **Power Well:** PRST
7:1	0x1 RO	**Supported Link Speeds Vector (SLNKSPV):** This field indicates the supported Link speed(s) of the associated Port. For each bit, a value of 1b indicates that the corresponding Link speed is supported, otherwise, the Link speed is not supported. Bit definitions are: • bit 1 2.5 GT/s • bit 2 5.0 GT/s • bit 3 8.0 GT/s • Others: Reserved
0	0x0 RO	**RSVD1:** Reserved

47.2.34 LINKCTL2—Offset 70h

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:6, F:0] +70h
Offset: [B:0, D:22, F:0] +70h
Offset: [B:0, D:23, F:0] +70h

Default: 0001h

Bit Range	Default & Access	Field Name (ID): Description
15:12	0x0 RO	**Compliance Preset/De-emphasis (CD):** For 8 GT/s and 5 GT/s: This bit sets the transmitter preset level forPolling.Compliance state if the entry occurred due to the Enter Compliance bit being 1b. The Encoding are defined as follows: 8 GT/s Rate: • 0000b: -6 dB for de-emphasis, 0 dB for preshoot • 0001b: -3.5 dB for de-emphasis, 0 dB for preshoot • 0010b: -4.5 dB for de-emphasis, 0 dB for preshoot • 0011b: -2.5 dB for de-emphasis, 0 dB for preshoot • 0100b: 0 dB for de-emphasis, 0 dB for preshoot • 0101b: 0 dB for de-emphasis, 2 dB for preshoot • 0110b: 0 dB for de-emphasis, 2.5 dB for preshoot • 0111b: -6 dB for de-emphasis, 3.5 dB for preshoot • 1000b: -3.5 dB for de-emphasis, 3.5 dB for preshoot • 1001b: 0 dB for de-emphasis, 3.5 dB for preshoot • 1010b: The Transmitter Preset encoding of 1010b corresponds to the maximum Vtx-boost that the Transmitter advertises with FS and LF in both full swing and reduced swing modes with C-1 = 0 and C+1 = FS - (2*LF). • All other encodings are reserved. 5 GT/s Rate: • 001b: -3.5dB • 000b: -6 dB • All other are reserved. When the link is operating at 2.5 Gb/s, the setting of this bit has no effect. Components that support only 2.5 GT/s speed are permitted to hardwire this bit to 0b.
11	0x0 RO	**Compliance SOS (CSOS):** When set to 1b, the LTSSM is required to send Skip Ordered Sets periodically in between the (modified) compliance patterns.
10	0x0 RO	**Enter Modified Compliance (EMC):** When set to 1b, the device transmits Modified Compliance Pattern if the LTSSM enters Polling.Compliance substate. This register is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this register only during debug or compliance testing. In all other cases, the system must ensure that this register is set to the default value.
9:7	0x0 RO	**Transmit Margin (TM):** This field controls the value of the non-de-emphasized voltage level at the transmitter pins. This field is reset to 000b on entry to the LTSSM Polling.Configuration substate. • 000b: Normal operating range • 001b: 800-1200mV for full swing and 400-700mV for half-swing • 010b-110b: TBD • Others: Reserved This register is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this register only during debug or compliance testing. In all other cases, the system must ensure that this register is set to the default value.
6	0x0 RO	**Selectable De-emphasis (SD):** This bit is not applicable and reserved for Endpoints, PCI Express to PCI/PCI-X bridges, and upstream ports of switches.

Bit Range	Default & Access	Field Name (ID): Description
5	0x0 RO	**Hardware Autonomous Speed Disable (HASD):** When set, this bit disables hardware from changing the link speed for device specific reasons other than attempting to correct unreliable link operation by reducing link speed for device-specific reasons other than attempting to correct unreliable link operations by reducing link speed. Initial transition to the highest supported common link speed is not blocked by this bit.
4	0x0 RO	**Enter Compliance (EC):** Software is permitted to force a link to enter compliance mode at the speed indicated in the Target Link Speed field by setting this bit to 1b in both components on a link and then initiating a hot reset on the link.
3:0	0x1 RO	**Target Link Speed (TLS):** For downstream ports and root ports, this field sets an upper limit on link operational speed by restricting the values advertised by the Downstream Port in its training sequences. • 0001b: 2.5 Gb/s Target Link Speed • 0010b: 5.0 Gb/s Target Link Speed • 0011b: 8.0 Gb/s Target Link Speed • Others: Reserved The encoding is the binary value of the bit in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the desired target Link speed. All other encodings are reserved If a value is written to this field that does not correspond to a speed included in the Supported Link Speeds field, the result is undefined. The default value of this field is the highest Link speed supported by the component (as reported in the Max Link Speed field of the Link Capabilities register) unless the corresponding platform/form factor requires a different default value. For both Upstream and Downstream Ports, this field is used to set the target compliance mode speed when software is using the Enter Compliance bit to force a Link into compliance mode.

47.2.35 LINKSTS2—Offset 72h

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:6, F:0] +72h
Offset: [B:0, D:22, F:0] +72h
Offset: [B:0, D:23, F:0] +72h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:6	0x0 RO	**RSVD0:** Reserved
5	0x0 RO	**Link Equalization Request (LNKEQREQ):** This bit is set by hardware to request the Link equalization process to be performed on the Link.
4	0x0 RO	**Equalization Phase 3 Successful (EQPH3SUCC):** When set to 1b, this bit indicates that Phase 3 of the Transmitter Equalization procedure has successfully completed.
3	0x0 RO	**Equalization Phase 2 Successful (EQPH2SUCC):** When set to 1b, this bit indicates that Phase 2 of the Transmitter Equalization procedure has successfully completed.
2	0x0 RO	**Equalization Phase 1 Successful (EQPH1SUCC):** When set to 1b, this bit indicates that Phase 1 of the Transmitter Equalization procedure has successfully completed.
1	0x0 RO	**Equalization Complete (EQCMPLT):** When set to 1b, this bit indicates that the Transmitter Equalization procedure has successfully completed.
0	0x0 RO	**Current De-emphasis Level (CDL):** When the link is operating at 5 Gb/s speed, this bit reflects the level of de-emphasis. • 1b: -3.5 dB • 0b: -6dB The value in this bit is undefined when the Link is not operating at 25.0 GT/s speed. Components that support only the 2.5 GT/s speed are permitted to hardwire this bit to 0b.

47.2.36 PMCAPLST—Offset 80h

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:6, F:0] +80h
Offset: [B:0, D:22, F:0] +80h
Offset: [B:0, D:23, F:0] +80h

Default: 8801h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x88 RO	**Next Pointer (NextPointer):** Contains the offset of the next item in the capabilities list. (SSCAPLST)
7:0	0x1 RO	**Capability ID (CapabilityID):** Identifies the function as PCI Power Management capable.

47.2.37 PMCAP—Offset 82h

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:6, F:0] +82h
Offset: [B:0, D:22, F:0] +82h
Offset: [B:0, D:23, F:0] +82h

Default: C803h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0x19 RO	**PME_Support (PMES):** PME assertion is supported when in D3hot/D3cold. Identifies power states in which the PCIe can send an 'Assert_PMEGPE/ Deassert PMEGPE' message. Bits 15, 14 and 11 must be set to '1' for PCIPCI bridge structures representing ports on root complexes. The definition of these bits is taken from the PCI Bus Power Management Interface Specification Revision 1.1. • XXXX1b - Assert_PMEGPE/Deassert PMEGPE can be sent from D0 • XXX1Xb - Assert_PMEGPE/Deassert PMEGPE can be sent from D1 (Not supported by PCI-E) • XX1XXb - Assert_PMEGPE/Deassert PMEGPE can be sent from D2 (Not supported by PCI-E) • X1XXXb - Assert_PMEGPE/Deassert PMEGPE can be sent from D3 hot (Supported by PCI-E) • 1XXXXb - Assert_PMEGPE/Deassert PMEGPE can be sent from D3 cold (Supported by PCI-E) In the EIP PCIe implementation, there is no PME support for D3 cold as the part does not have the capability. For PCIe compliance purposes, bit 15 is set to 1.
10	0x0 RO	**D2 Support (D2S):** Not supported
9	0x0 RO	**D1 Support (D1S):** Not supported
8:6	0x0 RO	**Auxiliary Current (AC):** Auxiliary power is not supported.
5	0x0 RO	**Device Specific Initialization (DSI):** Device-specific initialization is not required when transitioning to D0 from D3hot state. This bit is zero.
4	0x0 RO	**RSVD0:** Reserved
3	0x0 RO	**PME Clock (PMECLK):** Does not apply to PCI Express. Hard-wired to 0.
2:0	0x3 RO	**Version (VER):** The PM implementation in the PCIe cluster is compliant with PCI Bus Power Management Interface Specification, Revision 1.2.

47.2.38 PMCSR—Offset 84h

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:6, F:0] +84h
Offset: [B:0, D:22, F:0] +84h
Offset: [B:0, D:23, F:0] +84h

Default: 0008h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW/1C/V/P	**PME Status (PMESTS):** Reserved.
14:13	0x0 RO	**Data Scale (DC):** Not supported
12:9	0x0 RO	**Data Select (DS):** Not supported
8	0x0 RW/P	**PME Enable (PMEEN):** Gates assertion of the PME message.
7:4	0x0 RO	**RSVD0:** Reserved
3	0x1 RW/L	**No Soft Reset (NSR):** This bit when 1b indicates that a device transitioning from D3hot to D0 does not perform an internal reset. The configuration context is preserved. **Power Well:** PRST
2	0x0 RO	**RSVD1:** Reserved
1:0	0x0 RW/V	**Power State (PS):** This field is used both to determine the current power state of a function and to set the function into a new power state. The definition of the supported values is given below: • 0h - D0 • 3h - D3hot If software attempts to write an unsupported, optional state to this field, the write operation must complete normally, however, the data is discarded and no state change occurs.

47.2.39 PMBSE—Offset 86h

Type: PCI Configuration Register
(Size: 8 bits)

Offset: [B:0, D:6, F:0] +86h
Offset: [B:0, D:22, F:0] +86h
Offset: [B:0, D:23, F:0] +86h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RO	**Bus Power/Clock Control Enable (BPCC_EN):** Neither bus or clock control of PCI is supported when in D3hot state. This bit is hard-wired to 0.
6	0x0 RO	**B2/B3# (B23EN):** Not supported. This bit has no meaning since the BPCC_En bit is hard-wired to 0.
5:0	0x0 RO	**RSVD0:** Reserved

47.2.40 SSCAPLST—Offset 88h

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:6, F:0] +88h
Offset: [B:0, D:22, F:0] +88h
Offset: [B:0, D:23, F:0] +88h

Default: 900Dh

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x90 RO	**Next Pointer (NP):** Contains the offset of the next item in the capabilities list. (MSICAPLST)
7:0	0xd RO	**Capability ID (CAPID):** Identifies the function as Subsystem Identification capable.

47.2.41 SSVID—Offset 8Ch

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:6, F:0] +8Ch
Offset: [B:0, D:22, F:0] +8Ch
Offset: [B:0, D:23, F:0] +8Ch

Default: 8086h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x8086 RW/L	**Subsystem Vendor Identifier (SSVID):** Assigned by PCI-SIG for vendor ID. **Power Well:** PRST

47.2.42 SSID—Offset 8Eh

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:6, F:0] +8Eh
Offset: [B:0, D:22, F:0] +8Eh
Offset: [B:0, D:23, F:0] +8Eh

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x0 RW/L	**Subsystem Identifier (SSID):** Assigned to uniquely identify the subsystem vendor. **Power Well:** PRST

47.2.43 MSICAPLST—Offset 90h

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:6, F:0] +90h
Offset: [B:0, D:22, F:0] +90h
Offset: [B:0, D:23, F:0] +90h

Default: 0005h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x0 RO	**Next Pointer (NP):** Contains the offset of the next item in the capabilities list (MSIXCAPLST). A null value is used to indicate that this is the last capability. The Next Pointer is terminated for DP, vRP/vSP, RP and DMI EP in RC.
7:0	0x5 RO	**Capability ID (CAPID):** Identifies the function as MSI capable.

47.2.44 MSICTL—Offset 92h

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:6, F:0] +92h
Offset: [B:0, D:22, F:0] +92h
Offset: [B:0, D:23, F:0] +92h

Default: 0100h

Bit Range	Default & Access	Field Name (ID): Description
15:9	0x0 RO	**RSVD0:** Reserved
8	0x1 RW/L	**Per-vector masking capable (PVM):** This bit indicates that PCI Express ports support MSI per-vector masking. **Power Well:** PRST
7	0x0 RO	**Address 64-Bit Capable (AD64C):** When set, this bit indicates that the function is capable of generating a 64-bit message address.
6:4	0x0 RW	**Multiple Message Enable (MMEN):** Only one message is supported. These bits are R/W for software compatibility.
3:1	0x0 RO	**Multiple Message Capable (MMC):** Only one message is supported.
0	0x0 RW	**MSI Enable (MSIE):** When set, MSI is enabled and traditional interrupt pins are not used to generate interrupts.

47.2.45 MSIADDR—Offset 94h

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:6, F:0] +94h
Offset: [B:0, D:22, F:0] +94h
Offset: [B:0, D:23, F:0] +94h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**Address:** Message address specified by the system, always DWORD aligned
1:0	0x0 RO	**RSVD0:** Reserved

47.2.46 MSIDATA—Offset 98h

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:6, F:0] +98h
Offset: [B:0, D:22, F:0] +98h
Offset: [B:0, D:23, F:0] +98h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD0:** Reserved
15	0x0 RW	**Trigger Mode (TM):** • 0: Edge Triggered • 1: Level Triggered
14	0x0 RW	**Level (LVL):** if TM is 0h, then this field is a don't care. Edge triggered messages are always treated as assert messages. For level triggered interrupts, this bit reflects the state of the interrupt input if TM is 1h, then • 0: Deassert Messages • 1: Assert Messages
13:12	0x0 RW	**Future:** These bits are don't care for an IOxAPIC interrupt message data field specification.
11:8	0x0 RW	**Delivery Mode (DM):** • 0000: Fixed: Trigger Mode can be edge or level. • 0001: Lowest Priority: Trigger Mode can be edge or level. • 0010: SMI/PMI/MCA - Not supported via MSI of root port • 0011: Reserved - Not supported via MSI of root port • 0100: NMI - Not supported via MSI of root port • 0101: INIT - Not supported via MSI of root port • 0110: Reserved • 0111: ExtINT - Not supported via MSI of primary port • 1000 -1111 - Reserved
7:0	0x0 RW	**Interrupt Vector (IV):** The interrupt vector will be modified by the EIP PCIe Gen3 to provide context sensitive interrupt information for different events that require attention from the processor.

47.2.47 MSIMSK—Offset 9Ch

The MSI Mask Bit register enables software to disable message sending on a per-vector basis.

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:6, F:0] +9Ch
Offset: [B:0, D:22, F:0] +9Ch
Offset: [B:0, D:23, F:0] +9Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0x0 RO	**RSVD0:** Reserved
0	0x0 RW	**Mask Bits (MSKB):** For each Mask bit that is set, the PCI Express port is prohibited from sending the associated message. Corresponding bits are masked if set to '1'

47.2.48 MSIPENDING—Offset A0h

The Mask Pending register enables software to defer message sending on a per-vector basis.

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:6, F:0] +A0h
Offset: [B:0, D:22, F:0] +A0h
Offset: [B:0, D:23, F:0] +A0h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0x0 RO	**RSVD0:** Reserved
0	0x0 RO/V	**Pending Bits (PB):** For each Pending bit that is set, the PCI Express port has a pending associated message. Corresponding bits are pending if set to '1'

47.2.49 RPPMCSR—Offset A8h

47.2.50 PMCSRS—Offset B0h

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:6, F:0] +B0h
Offset: [B:0, D:22, F:0] +B0h
Offset: [B:0, D:23, F:0] +B0h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW/P	**PME Status (PMESTS):** This field is utilized for Software to restore the PME Status once exit Sx State. Hardware will reflect the value to the associated PMCSR.PMESTS if this bit was written by Software.
14:0	0x0 RO	**RSVD0:** Reserved

47.2.51 SMICSR—Offset C8h

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:6, F:0] +C8h
Offset: [B:0, D:22, F:0] +C8h
Offset: [B:0, D:23, F:0] +C8h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0x0 RO	**RSVD0:** Reserved
18	0x0 RW/1C/V	**Hot Plug DLLSC SMI Status (HPLSCSMISTS):** This bit is set when rising edge detected as result of both SLOTSTS.DLLSCS and SMICSR.HPSMIE being set. This field will be treated as reserved for vRP.
17	0x0 RW/1C/V	**Hot Plug SMI Status (HPSMISTS):** This bit is set when rising edge detected as result of both SLOTSTS.PDCS and SMICSR.HPSMIE being set. This field will be treated as reserved for vRP.
16	0x0 RW/1C/V	**Power Management SMI Status (PMSMISTS):** This bit is set when rising edge detected as result of both ROOTSTS.PMESTS and SMICSR.PMSMIE being set.
15:2	0x0 RO	**RSVD1:** Reserved
1	0x0 RW	**Hot Plug SMI Enable (HPSMIE):** Enables the Root Port/DSP to generate SMI whenever a Hot Plug event is detected. This field will be treated as reserved for vRP.
0	0x0 RW	**Power Management SMI Enable (PMSMIE):** Enables the Root Port to generate SMI whenever a power management event is detected.

47.2.52 SCICSR—Offset CCh

The Tag field is being used to differentiate between PMSCI (Tag = '001') and HPSCI (Tag = '000') for PMC whenever a single set of Assert/Deassert SCI is sent.

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:6, F:0] +CCh
Offset: [B:0, D:22, F:0] +CCh
Offset: [B:0, D:23, F:0] +CCh

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0x0 RO	**RSVD0:** Reserved
18	0x0 RW/1C/V	**Hot Plug DLLSC SCI Status (HPLSCSCISTS):** This bit is set when rising edge detected as result of both SLOTSTS.DLLSCS and SCICSR.HPSCIE being set. This field will be treated as reserved for vRP.
17	0x0 RW/1C/V	**Hot Plug SCI Status (HPSCISTS):** This bit is set when rising edge detected as result of both SLOTSTS.PDCS and SCICSR.HPSCIE being set. This field will be treated as reserved for vRP.
16	0x0 RW/1C/V	**Power Management SCI Status (PMSCISTS):** This bit is set when rising edge detected as result of both ROOTSTS.PMESTS and SCICSR.PMSCIE being set.
15:2	0x0 RO	**RSVD1:** Reserved
1	0x0 RW	**Hot Plug SCI Enable (HPSCIE):** Enables the Root Port/DSP to generate SCI whenever a Hot Plug event is detected. This field will be treated as reserved for vRP.
0	0x0 RW	**Power Management SCI Enable (PMSCIE):** Enables the Root Port to generate SCI whenever a power management event is detected.

47.2.53 PBTXNCTL—Offset D8h

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:6, F:0] +D8h
Offset: [B:0, D:22, F:0] +D8h
Offset: [B:0, D:23, F:0] +D8h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0x0 RW/P	**ECO31:** These register fields are of type 'RWS' and have no associated functionality currently. They are allocated for future use to add defeature capability as the need arise during tapeout/ECO netlist fixes.
17:0	0x0 RW/P	**ECO17:** These register fields are of type 'RWS' and have no associated functionality currently. They are allocated for future use to add defeature capability as the need arise during tapeout/ECO netlist fixes.

47.2.54 PLKCTL—Offset EAh

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:6, F:0] +EAh
Offset: [B:0, D:22, F:0] +EAh
Offset: [B:0, D:23, F:0] +EAh

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:3	0x0 RO	**RSVD0:** Reserved
2	0x0 RW/L	**Lnk Layer Capability Lock (LLCL):** Lock key bit for all RWS-L bits located in the following CSRs. VCxRCTL XPLDEF XPLDEF2 LLRBERRINJCTL RXPERRINJCTL CRCERRINJCTL CRCERRINJMSK RTRYCTL PACKTHRESH • 1b: Lock • 0b: Unlocked This bit is self-locking. Once this bit is set to a 1b, this key bit can not be unlocked. Writing a 0b has no affect on this bit. **Power Well:** PRST
1	0x0 RW/L	**Txn Layer Capability Lock (TLCL):** Lock key bit for all RWS-L bits located in XPEINJ[1:0], XPCDTHROTTLEP,N,C, XPTDEF*, MBAR01CTL EXPPTMBARCTL. • 1b: Lock • 0b: Unlocked This bit is self-locking. Once this bit is set to a 1b, this key bit can not be unlocked. Writing a 0b has no affect on this bit. **Power Well:** PRST
0	0x0 RW/L	**Capability Lock (CL):** Lock key bit for all RWS-L bits (capabilities, next capability pointer, SSID/SVID, slot register, etc) bits for the function. • 1b: Lock • 0b: Unlocked This bit is self-locking. Once this bit is set to a 1b, this key bit can not be unlocked. Writing a 0b has no affect on this bit. **Power Well:** PRST

47.2.55 LTRCSR—Offset ECh

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:6, F:0] +ECh
Offset: [B:0, D:22, F:0] +ECh
Offset: [B:0, D:23, F:0] +ECh

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/L	**Capability Lock (CL):** Lock key bit for all RW-L bits of LTRCSR and LTROVR register only. • 1b: Lock • 0b: Unlocked This bit is self-locking. Once this bit is set to a 1b, this key bit can not be unlocked. Writing a 0b has no affect on this bit. **Power Well:** PRST
30:18	0x0 RO	**RSVD0:** Reserved
17	0x0 RW/1C/V	**Invalid LTR Latency Scale Value Received (IVLSVR):** Set to '1' by hardware when an LTR message is received with Not Permitted Latency Scale Value and both the LTR Mechanism Supported bit and the LTR Mechanism Enable bit are set. Cleared to '0' by software writing 1 to this register.
16	0x0 RW/1C/V	**LTR Received (LTRR):** Set to '1' by hardware when an LTR message is received and both the LTR Mechanism Supported bit and LTR Mechanism Enable bit are set. It can be set/cleared by hardware internally, or software by writing 1 to clear it.
15:4	0x0 RO	**RSVD1:** Reserved
3	0x0 RW/P	**LTR Aggregation Mode Disable (LTRAMD):** • Default is 0 to enable LTR aggregation mode. • Set 1 to disable LTR Aggregation Mode.
2	0x0 RW/L	**LTR Override Policy (LTROVRPLCY):** This register bit defines the LTR override behavior when the respective LTR Override Enable bits are set. 0: The LTR Override values will be in effect when the link is up and in D0, until a valid new LTR message is received from the device. 1: The LTR Override values will be in effect when the link is up and in D0. LTR values from the valid new LTR message received from device will be ignored. Note: This register should be programmed prior to enabling LTR override and should not be modified after LTR override has been enabled. **Power Well:** PRST
1	0x0 RW/L	**LTR No-Snoop Override Enable (LTRNSOVREN):** When this bit is set, the latency tolerance values for this port will be overridden to the values programmed in the LTRNSLOVRV, LTRNSLSOVRV and LTRNSROVR fields. The latency values from the LTR messages received from the devices will be ignored. Hardware should treat this bit as dynamic and the transition of this bit from '0' to '1' will cause a new IOSF sideband LTR message to be sent to update PMC if the new aggregated latency values change as a result of this. **Power Well:** PRST
0	0x0 RW/L	**LTR Snoop Override Enable (LTRSOVREN):** When this bit is set, the latency tolerance values for this port will be overridden to the values programmed in the LTRSLOVRV, LTRSLSOVRV and LTRSROVR fields. The latency values from the LTR messages received from the devices will be ignored. Hardware should treat this bit as dynamic and the transition of this bit from '0' to '1' will cause a new IOSF sideband LTR message to be sent to update PMC if the new aggregated latency values change as a result of this. **Power Well:** PRST

47.2.56 LTRL—Offset F0h

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:6, F:0] +F0h
Offset: [B:0, D:22, F:0] +F0h
Offset: [B:0, D:23, F:0] +F0h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO/V	**LTR No-Snoop Latency Field (LTRNSLF):** This field contains the No-Snoop Latency field of the latest received LTR Message. When an LTR message is received and both the LTR Mechanism Supported bit and LTR Mechanism Enable field are set, bytes 12:13 of the PCIe header are stored in this register. This includes the case where the Latency Scale Value contains 'Not Permitted' encoding.
15:0	0x0 RO/V	**LTR Snoop Latency Field (LTRSLF):** This field contains the Snoop Latency field of the latest received LTR Message. When an LTR message is received and both the LTR Mechanism Supported bit and LTR Mechanism Enable field are set, bytes 14:15 of the PCIe header are stored in this register. This includes the case where the Latency Scale Value contains 'Not Permitted' encoding.

47.2.57 LTROVR—Offset F4h

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:6, F:0] +F4h
Offset: [B:0, D:22, F:0] +F4h
Offset: [B:0, D:23, F:0] +F4h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/L	**LTR No-Snoop Requirement Bit Override (LTRNSROVR):** This field contains the No-Snoop Requirement bit override value for this particular PCIe root port. This field is Read-Only when LTRCSR.CL is set. **Power Well:** PRST
30:29	0x0 RO	**RSVD0:** Reserved
28:26	0x0 RW/L	**LTR No-Snoop Latency Scale Override Value (LTRNSLSOVRV):** This field contains the Snoop latency scale override value for this particular PCIe root port. 000: LTRNSLOVRV times 1 ns 001: LTRNSLOVRV times 32 ns 010: LTRNSLOVRV times 1,024 ns 011: LTRNSLOVRV times 32,768 ns 100: LTRNSLOVRV times 1,048,576 ns 101: LTRNSLOVRV times 33,554,432 ns Others: Not Permitted. This field is Read-Only when LTRCSR.CL is set. **Power Well:** PRST
25:16	0x0 RW/L	**LTR No-Snoop Latency Override Value (LTRNSLOVRV):** This field contains the No-Snoop latency override value for this particular PCIe root port. This field is Read-Only when LTRCSR.CL is set. **Power Well:** PRST
15	0x0 RW/L	**LTR Snoop Requirement Bit Override (LTRSROVR):** This field contains the No-Snoop Requirement bit override value for this particular PCIe root port. This field is Read-Only when LTRCSR.CL is set. **Power Well:** PRST
14:13	0x0 RO	**RSVD1:** Reserved
12:10	0x0 RW/L	**LTR Snoop Latency Scale Override Value (LTRSLSOVRV):** This field contains the Snoop latency scale override value for this particular PCIe root port. • 000: LTRSLOVRV times 1 ns • 001: LTRSLOVRV times 32 ns • 010: LTRSLOVRV times 1,024 ns • 011: LTRSLOVRV times 32,768 ns • 100: LTRSLOVRV times 1,048,576 ns • 101: LTRSLOVRV times 33,554,432 ns • Others: Not Permitted. This field is Read-Only when LTRCSR.CL is set. **Power Well:** PRST
9:0	0x0 RW/L	**LTR Snoop Latency Override Value (LTRSLOVRV):** This field contains the Snoop latency override value for this particular PCIe root port. This field is Read-Only when LTRCSR.CL is set. **Power Well:** PRST

47.2.58 INTXSWZCTL—Offset F8h

This register provides software the ability to swizzle the legacy interrupts (INTx) from each port and remap them to a different interrupt type for purposes of interrupt rebalancing. This swizzling only applies to inbound INTx messages that arrive on the secondary side of the switch or root port. This register does not affect PCI-Express defined INTx re-map based on device # that is required by the PCI-Express base specification. This register should be treated as reserved if not applicable to device/ project specific.

Type: PCI Configuration Register
(Size: 8 bits)

Offset: [B:0, D:6, F:0] +F8h
Offset: [B:0, D:22, F:0] +F8h
Offset: [B:0, D:23, F:0] +F8h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0x0 RO	**RSVD0:** Reserved
2:0	0x0 RW/L	**INTx Swizzle (INTXSWZ):** The encoding below defines the target INTx type to which the incoming INTx message is mapped to for that port. • 000b:INTA=)INTA, INTB=)INTB, INTC=)INTC, INTD=)INTD • 001b:INTA=)INTB, INTB=)INTC, INTC=)INTD, INTD=)INTA • 010b:INTA=)INTC, INTB=)INTD, INTC=)INTA, INTD=)INTB • 011b:INTA=)INTD, INTB=)INTA, INTC=)INTB, INTD=)INTC • 100b:INTA=)INTA, INTB=)INTA, INTC=)INTA, INTD=)INTA **Power Well:** PRST

47.2.59 AERCAPCTL—Offset 118h

This register gives the status and control for ECRC checks and also the pointer to the first uncorrectable error that happened.

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:6, F:0] +118h
Offset: [B:0, D:22, F:0] +118h
Offset: [B:0, D:23, F:0] +118h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:13	0x0 RO	**RSVD0:** Reserved
12	0x0 RO	**Completion Timeout Prefix/Header Log Capable (CTPHLC):** If Set, this bit indicates that the Function records the prefix/header of Request TLPs that experience a Completion Timeout error.
11	0x0 RO/V/P	**TLP Prefix Log Present (TLPPLP):** If Set and the First Error Pointer is valid, indicates that the TLP Prefix Log register contains valid information. If Clear or if First Error Pointer is invalid, the TLP Prefix Log register is undefined.
10	0x0 RO	**Multiple Header Recording Enable (MHRE):** When set, this bit enables the function to record more than one error header.
9	0x0 RO	**Multiple Header Recording Capable (MHRC):** Supports more than one error header.
8	0x0 RW/P	**ECRC Check Enable (ECE):** When Set, ECRC checking is enabled. Functions that do not implement the associated mechanism are permitted to hardwire this bit to 0b.
7	0x0 RW/L	**ECRC Check Capable (ECC):** If Set, this bit indicates that the Function is capable of checking ECRC. **Power Well:** PRST
6	0x0 RW/P	**ECRC Generation Enable (EGE):** When Set, ECRC generation is enabled. Functions that do not implement the associated mechanism are permitted to hardwire this bit to 0b. Default value of this bit is 0b.
5	0x0 RW/L	**ECRC Generation Capable (EGC):** If Set, this bit indicates that the Function is capable of generating ECRC. **Power Well:** PRST
4:0	0x0 RO/V/P	**First Error Pointer (FEP):** This field identifies the bit position of the first error reported in the Uncorrectable Error Status Register (xref). This register re-arms itself (which does not change its current value) as soon as the error status bit indicated by the pointer is cleared by the software by writing a 1 to that status bit.

47.2.60 AERHDRLOG1—Offset 11Ch

This register logs the 4 Dwords of the transaction header for PCI Express errors.

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:6, F:0] +11Ch
Offset: [B:0, D:22, F:0] +11Ch
Offset: [B:0, D:23, F:0] +11Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V/P	**TLP Header Log (TLPHDRLOG):** As soon as an error is logged in this register, it remains locked for further error-logging until the software clears the status bit that caused the header log (in other words, until the error pointer is re-armed for logging again).

47.2.61 AERHDRLOG2—Offset 120h

This register logs the 4 Dwords of the transaction header for PCI Express errors.

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:6, F:0] +120h
Offset: [B:0, D:22, F:0] +120h
Offset: [B:0, D:23, F:0] +120h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V/P	**TLP Header Log (TLPHDRLOG):** As soon as an error is logged in this register, it remains locked for further error-logging until the software clears the status bit that caused the header log (in other words, until the error pointer is re-armed for logging again).

47.2.62 AERHDRLOG3—Offset 124h

This register logs the 4 Dwords of the transaction header for PCI Express errors.

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:6, F:0] +124h
Offset: [B:0, D:22, F:0] +124h
Offset: [B:0, D:23, F:0] +124h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V/P	**TLP Header Log (TLPHDRLOG):** As soon as an error is logged in this register, it remains locked for further error-logging until the software clears the status bit that caused the header log (in other words, until the error pointer is re-armed for logging again).

47.2.63 AERHDRLOG4—Offset 128h

This register logs the 4 Dwords of the transaction header for PCI Express errors.

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:6, F:0] +128h
Offset: [B:0, D:22, F:0] +128h
Offset: [B:0, D:23, F:0] +128h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V/P	**TLP Header Log (TLPHDRLOG):** As soon as an error is logged in this register, it remains locked for further error-logging until the software clears the status bit that caused the header log (in other words, until the error pointer is re-armed for logging again).

47.2.64 ROOTERRCMD—Offset 12Ch

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:6, F:0] +12Ch
Offset: [B:0, D:22, F:0] +12Ch
Offset: [B:0, D:23, F:0] +12Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0x0 RO	**RSVD0:** Reserved
2	0x0 RW	**Fatal Error Reporting Enable (FERE):** When set, this bit enables the generation of an interrupt when a Fatal error is reported by any of the functions in the hierarchy associated with this Root Port.
1	0x0 RW	**Non-Fatal Error Reporting Enable (NFERE):** When set, this bit enables the generation of an interrupt when a Non-Fatal error is reported by any of the functions in the hierarchy associated with this Root Port.
0	0x0 RW	**Correctable Error Reporting Enable (CERE):** When set, this bit enables the generation of an interrupt when a Correctable error is reported by any of the functions in the hierarchy associated with this Root Port.

47.2.65 ROOTERRSTS—Offset 130h

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:6, F:0] +130h
Offset: [B:0, D:22, F:0] +130h
Offset: [B:0, D:23, F:0] +130h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0x0 RO/V	**Advanced Error Interrupt Message Number (AEMN):** This register indicates which MSI/MSI-X vector is used for the interrupt message generated in association with any of the status bits of this Capability. For MSI, the value in this register indicates the offset between the base Message Data and the interrupt message that is generated. Hardware is required to update this field so that it is correct if the number of MSI Messages assigned to the Function changes when software writes to the Multiple Message Enable field in the MSI Message Control register. For MSI-X, the value in this register indicates which MSI-X Table entry is used to generate the interrupt message. The entry must be one of the first 32 entries even if the Function implements more than 32 entries. For a given MSI-X implementation, the entry must remain constant. For remaining fields info, please refer to PCIe Spec. for more details.
26:7	0x0 RO	**RSVD0:** Reserved
6	0x0 RW/1C/V/P	**Fatal Error Message Received (FEMR):** Reserved.
5	0x0 RW/1C/V/P	**Non-Fatal Error message Received (NFEMR):** Reserved.
4	0x0 RW/1C/V/P	**First Uncorrectable Fatal (FUF):** Reserved.
3	0x0 RW/1C/V/P	**Multiple Error Fatal/Non-Fatal Received (MEFR):** Reserved.
2	0x0 RW/1C/V/P	**Error Fatal/Non-Fatal Received (EFR):** Reserved.
1	0x0 RW/1C/V/P	**Multiple Error Correctable Error Received (MCER):** Reserved.
0	0x0 RW/1C/V/P	**Correctable Error Received (CER):** Reserved.

47.2.66 ERRSRCID—Offset 134h

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:6, F:0] +134h
Offset: [B:0, D:22, F:0] +134h
Offset: [B:0, D:23, F:0] +134h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO/V/P	**Fatal/Non-Fatal Error Source ID (EFSID):** Requester ID of the source when an Fatal or No Fatal Error is received and the Fatal Error Message Received (FEMR) or Non-Fatal Error message Received (NFEMR) bit is not already set.
15:0	0x0 RO/V/P	**Correctable Error Source ID (ECSID):** Requester ID of the source when a correctable error is received and the Correctable Error Received (CER) bit is not already set.

47.2.67 ACSCAPHDR—Offset 138h

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:6, F:0] +138h
Offset: [B:0, D:22, F:0] +138h
Offset: [B:0, D:23, F:0] +138h

Default: 0001000Dh

Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW/L	**Next Capability Offset (NCO):** Contains the offset of the next structure in the Extended Capabilities. Software will need to program this field appropriately for linked capabilities list if default is not supported. **Power Well:** PRST
19:16	0x1 RO	**Capability Version (CV):** Indicates the version of the Capability structure present.
15:0	0xd RO	**Extended Capability ID (ECID):** Identifies the function as Access Control Services capable.

47.2.68 ACSCAP—Offset 13Ch

This register identifies the Access Control Services (ACS) capabilities.

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:6, F:0] +13Ch
Offset: [B:0, D:22, F:0] +13Ch
Offset: [B:0, D:23, F:0] +13Ch

Default: 005Fh

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x0 RO	**Egress Control Vector Size (ECVS):** Indicates the number of bits in the Egress Control Vector. This is set to 00h as ACS P2P Egress Control (ACSP2PEC) bit 5 in this register is 0b.
7	0x0 RO	**RSVD0:** Reserved
6	0x1 RO	**ACS Direct Translated P2P (TACSDTP2P):** Indicates that the component does implement ACS Direct Translated P2P. Required for Root Ports that support Address Translation Services (ATS) and also support peer-to-peer traffic with other Root Ports, required for Switch Downstream Ports,
5	0x0 RO	**ACS P2P Egress Control (EACSP2PEC):** Hardwired to 0. Indicates that the component does not implement ACS P2P Egress Control.
4	0x1 RO	**ACS Upstream Forwarding (UACSUF):** Indicates that the component implements ACS Upstream Forwarding.
3	0x1 RO	**ACS P2P Completion Redirect (CACSP2PRR):** Indicates that the component implements ACS P2P Completion Redirect. This includes Read Completions, AtomicOp Completions, and other Completions, either with or without data.
2	0x1 RO	**ACS P2P Request Redirect (RACSP2PRR):** Indicates that the component implements ACS P2P Request Redirect.
1	0x1 RO	**ACS Translation Blocking (BACSTB):** Indicates that the component implements ACS Translation Blocking.
0	0x1 RO	**ACS Source Validation (VACSSV):** Indicates that the component implements ACS Source Validation.

47.2.69 ACSCTL—Offset 13Eh

This register identifies the Access Control Services (ACS) control bits.

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:6, F:0] +13Eh
Offset: [B:0, D:22, F:0] +13Eh
Offset: [B:0, D:23, F:0] +13Eh

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:7	0x0 RO	**RSVD0:** Reserved
6	0x0 RW	**ACS Direct Translated P2P Enable (TACSP2PECE):** When Set, overrides the ACS P2P Request Redirect and ACS P2P Egress Control mechanisms with peer-to-peer Memory Requests whose Address Translation (AT) field indicates a Translated address This bit is ignored if ACS Translation Blocking (B) is enabled.
5	0x0 RO	**ACS P2P Egress Control Enable (EACSP2PECE):** This is hardwired to 0b as the component does not implement ACS P2P Egress Control.
4	0x0 RW	**ACS Upstream Forwarding Enable (UACSUFE):** When set, the component forwards upstream any Request or Completion TLPs it receives that were redirected upstream by a component lower in the hierarchy. Note that the U bit only applies to upstream TLPs arriving at a Downstream Port, and whose normal routing targets the same Downstream Port.
3	0x0 RW	**ACS P2P Completion Redirect Enable (CACSP2PCRE):** Determines when the component redirects peer-to-peer Completions upstream, applicable only to Read Completions whose Relaxed Ordering Attribute is clear.
2	0x0 RW	**ACS P2P Request Redirect Enable (RACSP2PRRE):** This bit determines when the component redirects peer-to-peer Requests upstream.
1	0x0 RW	**ACS Translation Blocking Enable (BACSTBE):** When set, the component blocks all upstream Memory Requests whose Address Translation (AT) field is not set to the default value.
0	0x0 RW	**ACS Source Validation Enable (VACSSVE):** When set, the component validates the Bus Number from the Requester ID of upstream Requests against the secondary / subordinate Bus Numbers.

47.2.70 XPTDEF—Offset 2DCh

Lock Key bit is located in the Personality Lock Key Control Register (PLKCTL.TLCL).

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:6, F:0] +2DCh
Offset: [B:0, D:22, F:0] +2DCh
Offset: [B:0, D:23, F:0] +2DCh

Default: 00008000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RO	**RSVD0:** Reserved
29	0x0 RW/P/L	**Internal Sideband Error Message Disable (SBEMSGD):** This bit when set to 1b will disable the generation of the internal sideband message, thus losing some of the error logging capability. It is used to avoid deadlocks on internal sideband bus (if one is discovered).
28:27	0x0 RO	**RSVD1:** Reserved
26	0x0 RW/P/L	**Tx Quick Data Credit Return Override (TXQDCRO):** On the IOSF interface, the data for a TLP is required to be sent in back to back clocks after the request is granted. The design is parameterized to either return data credits on each data queue read for the amount of data read, or return all data credits for a TLP when it is granted, assuming that the returned credits cannot be reused before all the data is read out. This bit switches the mode that the data credits are returned. If the design is compiled with the parameter set to return all credits at once, setting this bit will cause each data queue read to return the credits for the amount of data read from the queue (Tx).
25	0x0 RW/P/L	**Rx Quick Data Credit Return Override (RXQDCRO):** On the IOSF interface, the data for a TLP is required to be sent in back to back clocks after the request is granted. The design is parameterized to either return data credits on each data queue read for the amount of data read, or return all data credits for a TLP when it is granted, assuming that the returned credits cannot be reused before all the data is read out. This bit switches the mode that the data credits are returned. If the design is compiled with the parameter set to return all credits at once, setting this bit will cause each data queue read to return the credits for the amount of data read from the queue (Rx).
24	0x0 RO	**RSVD2:** Reserved
23:21	0x0 RW/P/L	**IDF Master Request Throttle Flow (IDFMRTFCCSEL):** This field selects which traffic (flow) class to throttle. Setting this bit causes the IDF Master to only issue a single request at a time (non-pipeline mode) regardless of the fabric advertised credits. These bits are independent of each other. • xx1: Posted • x1x: Non-Posted • 1xx: Completion • 111: Any traffic class. ***Note:*** '111' would limit all traffic (flow) classes to a single credit, i.e. each flow class would have a single request credit without sharing a single credit across all flow classes.
20	0x0 RO	**RSVD3:** Reserved
19:17	0x0 RW/P/L	**IOSF Master Request Throttle Flow Control Class Select (IMRTFCCSEL):** This field selects which flow control class to throttle. Setting this bit causes the IOSF(CPT/PPF/SWF) Master to only issue a single request at a time (non-pipeline mode) regardless advertised credits by fabric. • These bits are independent of each other. • xx1: Posted • x1x: Non-Posted • 1xx: Completion • 111: Any flow control class ***Note:*** '111' would limit all flow classes to a single credit, i.e. each flow class would have a single request credit without sharing a single credit across all flow classes.
16	0x0 RO	**RSVD4:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
15	0x1 RW/P/L	**Disable Inbound Peer to Peer Configuration (DIS_INB_P2PCFG):** This bit is actually a disable of type1 configuration upstream. This bit is used for controlling configuration request accesses through the PCI-Express port (security feature) for Type1 Configuration access upstream direction, Type0 will still get UR'd. • 1: Upstream type1 configuration accesses will be Master Aborted by IP. • 0: Allows Upstream type1 configuration access. This register bit is of type 'write once' and is controlled by BIOS/special initialization firmware and applies only to upstream type1 configuration. The default value is to disable upstream type1 configuration access.
14	0x0 RW/P/L	**Config Type 1 Check Disable (CFGT1CD):** This bit controls the Express Port's type1 configuration check in both direction. This bit applies only if DIS_INB_P2PCFG is clear. Setting this bit bypasses all type1 configuration checks and forwards the type1 configuration instead of UR. This bit does not apply type1 configuration targeting the IP, which follows the proper check. This is not applicable to NTB.
13	0x0 RW/P/L	**MSG Route by ID Disable (MSGRIDCD):** This bit controls the Express Port's message Route by ID check in both direction. Setting this bit bypasses messages route by ID checks and forwards the message instead of UR/Drop. This bit does not apply messages targeting the IP, which follows the proper check. This is not applicable to NTB.
12	0x0 RW/P/L	**Completion Check Disable (CCD):** This bit controls the Express Port's completion check (Requester ID/Transaction ID) in both direction. Setting this bit bypasses all completion checks based and forwards the completion instead of unexpected completion check. This bit does not apply completion targeting the IP, which follows the proper check. This is not applicable to NTB and Root Ports.
11	0x0 RW/P/L	**ISA Check Disable (ISACD):** This bit controls the Express Port's ISA IO region check in both direction. Setting this bit bypasses ISA IO decode checks and forwards access instead of UR. ISA region check (ISACD) is don't care when bit 9 (IOCD) is set. This is not applicable to NTB.
10	0x0 RW/P/L	**VGA Check Disable (VGACD):** This bit controls the Express Port's VGA Memory and IO check in upstream direction only. Setting this bit bypasses upstream VGA Memory and IO decode checks and forwards the VGA access upstream instead of UR. VGA Memory checks are don't care when bit 8 (MCD) is set, while VGA IO check is a don't care when bit 9 (IOCD) is set. This is not applicable to NTB.
9	0x0 RW/P/L	**IO Check Disable (IOCD):** This bit controls the Express Port's IO check in both direction. Setting this bit bypasses all IO decode checks based on base/limit or BAR registers and forwards the IO access. This bit does not apply for any IO region decoded for IP's internal resources. IO txn) 64K will be UR'd when this bit is set. This is not applicable to NTB.
8	0x0 RW/P/L	**Memory Check Disable (MCD):** This bit controls the Express Port's Memory check in both direction. Setting this bit bypasses all memory decode checks based on base/limit or BAR registers and forwards the memory access. This bit does not apply for any memory region decoded for IP's internal resources. This is not applicable to NTB.
7	0x0 RW/P/L	**Reserved ECO 7 (RECO7):** This field is reserved for ECO purpose.
6:5	0x0 RW/P/L	**Store Forward Override (SFO):** These bits are used to override the store forward of TLPs through the transmit queue. One bit enables the override and the other bit selects whether to force store-forwarding on or off. Note that store-forward on is safer in all cases, but impacts latency. If they clock frequencies are known such that store forwarding is not needed, it can be overridden here. • 0x - No override. • 10 - Force store forward disable. • 11 - Force store forward enable.
4:0	0x0 RW/P/L	**Reserved ECO 0 (RECO0):** This field is reserved for ECO purpose.

47.2.71 XPTDEF2—Offset 2E0h

Lock Key bit is located in the Personality Lock Key Control Register (PLKCTL.TLCL).

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:6, F:0] +2E0h
Offset: [B:0, D:22, F:0] +2E0h
Offset: [B:0, D:23, F:0] +2E0h

Default: 00001D00h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/1C/V/P	**MSI Address Violation Status (MSIAVS):** MSI address violation check status that does not target 0xFEEx_xxxx while MSIAVCD is not being set. This is only valid for RPs usage.
30:19	0x0 RW/P/L	**Reserved ECO (RECO):** This field is reserved for ECO purpose.
18	0x0 RW/P/L	**Hold Retrain during Surprise Removal Disable (HRSRD):** For Surprise Removal, EIP RPs will not allow retrain to occur until the SLOTSTS.PDCS bit has been cleared by software for the removal event. This bit is to disable the above behavior and allow the retrain to occur. This field is only applicable to RPs and should be treated as reserved for other devices.
17	0x0 RW/P/L	**ECRC Malformed Error Precedence Disable (ECRCMFEPD):** This bit changes the error precedence if a TLP has both a ECRC error and is malform. • When this bit is set to 1, the packet will be logged as an ECRC error. • When set to 0, the packet will be logged as a malform TLP, which is compliant to the PCIe spec errata. Only the type of error logged is affected. If the TLP is malform, it will be dropped with no credit return. If there is only an ECRC error detected on a packet, it will be dropped and credits will be returned per PCI-SIG Errata.
16	0x0 RW/P/L	**MSI Address Violation Check Disable (MSIAVCD):** Disable MSI address violation check that does not target 0xFEEx_xxxx. This is only valid for RPs usage.
15	0x0 RW/P/L	**Force Downstream Relaxed Order (FORCERODN):** Forces all downstream completions to follow relaxed ordering rules. This allows downstream completions to pass downstream posted requests. Note that setting this bit breaks the producer consumer model when the data is in the address space below the port and the flag is in the address space outside the port, because the read of the flag will not push the data writes down the port. The belief is that usage model is not used.
14	0x0 RW/P/L	**Downstream Relaxed Order Disable (DNRODIS):** Disables the ability of downstream relaxed ordered completions from passing posted requests in the same direction.
13	0x0 RW/P/L	**Upstream Relaxed Order Disable (UPRODIS):** Disables the ability of upstream relaxed ordered completions from passing posted requests in the same direction.
12	0x1 RW/P/L	**IOSF tdparity check disable (TDPAR_CHK_DIS):** When set this bit disables the data parity check for incoming data into the IOSF Target block. The logic will ignore the data parity bit and will operate as though the parity bit did not exist. No errors will be logged and good DW based parity will be written into the data queue.
11	0x1 RW/P/L	**IOSF tcparity check disable (TCPAR_CHK_DIS):** When set this bit disables the command parity check for incoming commands into the IOSF Target block. The logic will ignore the command parity bit and will operate as though the parity bit did not exist. No errors will be logged and good DW based parity will be written into the header queue.
10	0x1 RW/P/L	**MCTP Message Bus Number Check Enable (MMBNCE):** When set, if the Requester ID bus number of an MCTP message request received on the PCIe link does not fall within the range between SCBN and SBBN, the MCTP message will be silently discarded.
9	0x0 RW/P/L	**Completion credit advertisement enable (CPLCDT_EN):** Endpoints are required to advertise infinite completion credits. Setting this defeature bit breaks that rule and enables the advertisement of non-infinite completion credits and flow control updates for completion credits. This is only valid for project specific

Bit Range	Default & Access	Field Name (ID): Description
8	0x1 RW/P/L	**Enable Virtual Port IDs (EVPID):** • 1: Enables SB Virtual Port ID mode with allocated VPIDs which is associated with ports for all the egress INTx and LTR messages based on project specific. We will assign (N-1) virtual sideband PortID's to associate with the physical PortID which is port 0. The physical one is the same one as being assigned by the router as we have now, and would be used for all non-INTx messages and INTx messages from port 0. However, the VPIDs would be used for INTx messages routing from port(N-1:1), respectively. This allows all INTx from N ports to be forwarded to the ILB accordingly, so ILB can differentiate the source of the INTx message. • 0: Normal operation with single SB Port ID per cluster for INTx delivery. This is only valid for project specific with multi root ports.
7	0x0 RW/P/L	**Enable Receive Completion Ordering (ERCO):** The default ordering is to allow received completions to pass received posted requests to avoid receiver overflow conditions if posted requests cannot be processed. Setting this bit will enable PCI Express ordering for completions, preventing completions from passing posted requests. This is only valid for project specific
6	0x0 RW/P/L	**Enable MSI Generation Override (MSIGENOV):** • 1: Enables Root Port MSI generation override even if PCICMD.BME = 0 for the root port device as required by PCI Express specification. • 0: Normal operation for Root Port behavior. If PCICMD.BME = 0, the root port will not generate a MSI. This is only valid for project specific .
5	0x0 RW/P/L	**Completion Combining Disable (CPLCOMBINE_D):** When a larger read request is split into smaller read requests, the completions for the small requests may be opportunistically combined into larger completions to enable higher bandwidth and link utilization, as long as packet formation rules are not violated. This bit disables the port from combining completions. This is only valid for project specific .
4	0x0 RW/P/L	**Config Retry Disable (CRD):** Setting this bit disables the re-issuing of a configuration request if the request is completed with a configuration retry status (CRS). The completion with CRS will be returned to the requestor.
3	0x0 RW/P/L	**Optional Unexpected Completion Check Disable (UCCHKD):** Setting this bit disables some optional unexpected checks on completions. Specifically, it disables the checking on the byte count and lower address fields.
2	0x0 RW/P/L	**MCTP Disable Bus Check (MCTPDBC):** Setting this bit will disable the Bus 0 check for all MCTP VDM Type1 messages. The check is enabled by default as following: • Upstream - ReqBus =/= 0 • Downstream - TgtBus =/= 0
1	0x0 RW/P/L	**Reserved ECO 1 (RECO1):** This field is reserved for ECO purpose.
0	0x0 RW/P/L	**Global Stop Disable (GBLSTOPD):** When the design detects an uncorrectable internal error, a stop signal in the design asserts, blocking the processing of transactions in both directions in the transaction layer. Setting this bit, disables the stop mechanism, allowing the transactions to proceed as if no error occurred.

47.2.72 IOSFDEVCLKGCTL—Offset 2E4h

It is included for DMI in RC as an extension of Rootport definition.

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:6, F:0] +2E4h
Offset: [B:0, D:22, F:0] +2E4h
Offset: [B:0, D:23, F:0] +2E4h

Default: 0010h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW	**Idle Clock Gating Enable (ICGE):** This bit when set enables clock gating to occur. **Power Well:** PRST
14:8	0x0 RO	**RSVD0:** Reserved
7:0	0x10 RW	**Idle Clock Timer (ICT):** This field indicates the number of clocks that the IP block controls the delay before going into IDLE. 16 (default value) is the minimum number of clocks recommended. **Power Well:** PRST

47.2.73 SBDEVCLKGCTL—Offset 2E6h

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:6, F:0] +2E6h
Offset: [B:0, D:22, F:0] +2E6h
Offset: [B:0, D:23, F:0] +2E6h

Default: 8010h

Bit Range	Default & Access	Field Name (ID): Description
15	0x1 RW	**Idle Clock Gating Enable (ICGE):** This bit when set enables clock gating to occur when the IP block is idle longer then the Idle Clock Timer. **Power Well:** PRST
14:8	0x0 RO	**RSVD0:** Reserved
7:0	0x10 RW	**Idle Clock Timer (ICT):** This field indicates the number of clocks that the IP block must be idle before the clock disable process begins. 16 (default value) is the minimum number of clocks recommended. **Power Well:** PRST

47.2.74 IDFDEVCLKGCTL—Offset 2E8h

The IDF Device Clock Gate control register is defined only for the Virtual Root port/ Switch Port.

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:6, F:0] +2E8h
Offset: [B:0, D:22, F:0] +2E8h
Offset: [B:0, D:23, F:0] +2E8h

Default: 0010h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW	**Idle Clock Gating Enable (ICGE):** This bit when set enables clock gating to occur when the IP block is idle longer then the Idle Clock Timer. **Power Well:** PRST
14:8	0x0 RO	**RSVD0:** Reserved
7:0	0x10 RW	**Idle Clock Timer (ICT):** This field indicates the number of clocks that the IP block must be idle before the clock disable process begins. 16 (default value) is the minimum number of clocks recommended. **Power Well:** PRST

§ §

48 PCI Express Root Ports - B0, D(9-12, 14-17), F0

48.1 Introduction and Index

The host-accessible registers for the PCI Express Root Ports are described here.

To determine the number of devices/functions available refer to the following:

- Table 1-1, "Features by product SKU - Server and Cloud Storage SKUs 0 through 4"
- Table 1-2, "Features by Product SKU - Network and Enterprise Storage SKUs 5 through 10"
- Table 1-3, "Features by Product SKU - Extended Temperature SKUs 11 through 14".

The legend for the register access codes are described in Chapter 43, "Introduction."

48.1.1 Host Configuration Space

These registers are discovered in Host Configuration Space starting at Bus 0, Device (9-12, 14-17) (decimal), Function 0. The offset addresses are listed.

Table 48-1. Summary of PCI Configuration Registers—0/9-12, 14-17/0 (Sheet 1 of 7)

Offset (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
0	2	8086	"VID—Offset 0h" on page 1600
2	2	19A4	"DID—Offset 2h" on page 1600
4	2	0000	"PCICMD—Offset 4h" on page 1601
6	2	0010	"PCISTS—Offset 6h" on page 1602
8	1	00	"RID—Offset 8h" on page 1603
9	3	060400	"CCR—Offset 9h" on page 1603
C	1	00	"CLS—Offset Ch" on page 1604
D	1	00	"PLAT—Offset Dh" on page 1604
E	1	01	"HDR—Offset Eh" on page 1604

48.1.2 Sideband Registers

An index of the Sideband registers that are accessible to the Host are listed here. Each is accessible in Host Memory Space using the Sideband Base Address Register (SBREG_BAR). See Section 3.4.1, "Using SBREG_BAR Method" on page 187.

Table 48-2. Summary of Sideband Registers—0xB4 (Devices 9-12)

Offset (hex)	Default Value (hex)	Register Name (Register Symbol)
10	00000000	"PPBIFCTL_PRIV—Offset 10h" on page 1815

Table 48-3. Summary of Sideband Registers—0xB3 (Devices 14-17)

Offset (hex)	Default Value (hex)	Register Name (Register Symbol)
10	00000000	"PPBIFCTL_PRIV—Offset 10h" on page 1816

48.2 Registers in Configuration Space

48.2.1 VID—Offset 0h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 0h

Default: 8086h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x8086 RO	**Vendor ID (VID):** This field identifies Intel as the manufacturer of the device.

48.2.2 DID—Offset 2h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 2h

Default: 19A4h

Bit Range	Default & Access	Field Name (ID): Description
15:0	*See the Field Description for the default value for each Root Port* RO/V	**Device ID (DID):** This field identifies the particular function as allocated by Intel. The default ID values assigned to each Host Root Port: • RP0 = 0x19A4 (PCI Device 9) • RP1 = 0x19A5 (PCI Device 10) • RP2 = 0x19A6 (PCI Device 11) • RP3 = 0x19A7 (PCI Device 12) • RP4 = 0x19A8 (PCI Device 14) • RP5 = 0x19A9 (PCI Device 15) • RP6 = 0x19AA (PCI Device 16) • RP7 = 0x19AB (PCI Device 17)

48.2.3 PCICMD—Offset 4h

This register controls how the device behaves on the primary interface (PCI Express).

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 4h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0x0 RO	**RSVD0:** Reserved
10	0x0 RW	**Interrupt Disable (INTxD):** This bit controls the ability of the PCI-Express Function to generate legacy INTx interrupt message. When set, functions are prevented from asserting INTx interrupt messages. Any INTx emulation interrupts already asserted by the function must be deasserted when this bit is set by generating a Deassert_INTx message(s).
9	0x0 RO	**Fast Back-to-back enable (FBE):** Not applicable to PCI-Express. Hardwired to 0.
8	0x0 RW	**SERR# Enable (SEE):** When set, this bit enables reporting of Non-Fatal and Fatal errors detected by the Function of the Root Complex.
7	0x0 RO	**Wait Cycle Control (WCC):** Not applicable to PCI-Express. Hardwired to 0.
6	0x0 RW	**Parity Error Response Enable (PERE):** This bit controls the setting of the master data parity error bit in the Status Register ('PCI Status Register "PCISTS—Offset 6h" on page 1602) in response to a parity error received on the PCI Express interface (either internal queue errors or a poisoned TLP).
5	0x0 RO	**VGA Palette Snoop Enable (VGA_PSE):** Not applicable to PCI-Express. Hardwired to 0.
4	0x0 RO	**Memory Write and Invalidate Enable (MWIE):** Not applicable to PCI-Express. Hardwired to 0.
3	0x0 RO	**Special Cycle Enable (SCE):** Not applicable to PCI-Express. Hardwired to 0.
2	0x0 RW	**Bus Master Enable (BME):** This bit controls the ability of the Function to issue Memory and I/O read or write requests, and the ability of Root or Switch port to forward memory and I/O read or write requests in the upstream direction. When this bit is 0b, memory and I/O requests received at the root port or downstream side of a switch port (secondary side) must be handled as an Unsupported Request (UR).
1	0x0 RW	**Memory Space Enable (MSE):** • 0 - Respond to all Memory Requests on the primary interface as Unsupported Request Received. • 1 - Enable forwarding of memory transactions to the secondary interface and any internal function.
0	0x0 RW	**I/O Space Enable (IOSE):** • 0 - Respond to all I/O Requests on the primary interface with an Unsupported Request Completion. • 1 - Enable forwarding of I/O Requests to the secondary interface.

48.2.4 PCISTS—Offset 6h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 6h

Default: 0010h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW/1C/V	**Detected Parity Error (DPE):** This bit is set when a poisoned TLP is received from PCIe or IOSF. This bit is set even when the parity error response enable bit (bit[6] of the PCICMD Register 'PCI Command Register "PCICMD—Offset 4h" on page 1601) is not set.
14	0x0 RW/1C/V	**Signaled System Error (SSE):** This bit is set when ERR_FATAL or ERR_NONFATAL messages are sent to the root complex and the SERR enable bit in the PCICMD Register ('PCI Command Register "PCICMD—Offset 4h" on page 1601) is set.
13	0x0 RW/1C/V	**Received Master Abort (RMA):** This bit is set when the requester receives a completion with an UR completion status. On Type 1 configuration header functions, the bit is set when a UR completions status is received on the primary side.
12	0x0 RW/1C/V	**Received Target Abort (RTA):** This bit is set when a requester receives a CA completions status. On Type 1 configuration header functions, the bit is set when a 'Completer Abort' is received on the primary side.
11	0x0 RW/1C/V	**Signaled Target Abort (STA):** This bit is Set when the port completes a Posted or Non-Posted Request as a Completer Abort error. This applies to a Function with a Type 1 Configuration header when the Completer Abort was generated by its Primary Side.
10:9	0x0 RO	**DEVSEL# Timing (DVT):** These bits have no meaning on PCI Express.
8	0x0 RW/1C/V	**Master Data Parity Error Detected (MDPD):** This bit is set by a requester (primary side for type1 configuration header functions) if the parity error response enable bit (PERE) in the Command Register ('PCI Command Register "PCICMD—Offset 4h" on page 1601) is set and either of the following two conditions occur:
7	0x0 RO	**Fast Back-to-Back Capable (FBC):** This bit has no meaning on PCI Express.
6	0x0 RO	**RSVD0:** Reserved
5	0x0 RO	**66 MHz Capable (C66):** This bit has no meaning on PCI Express.
4	0x1 RO	**Capabilities List Enable (CAPE):** This bit indicates the presence of an Extended capabilities list items. Offset 34H indicates the offset for the first entry in the linked list of capabilities.
3	0x0 RO/V	**Interrupt Status (INTS):** When set, this bit indicates that an INTx emulation interrupt is pending internally in this function.
2:0	0x0 RO	**RSVD1:** Reserved

48.2.5 RID—Offset 8h

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 8h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO/V/P	**Revision ID (RID):** This field specifies the specific revision of this function and should be viewed as a extension to the Device ID.

48.2.6 CCR—Offset 9h

The CCR register has an attribute of RW-L PRST to allow configuration software to modify and lock the register from further update. Lock Key bit is located in the Personality Lock Key Control Register ('PLKCTL').

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 9h

Default: 060400h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**RSVD0:** Reserved
23:16	0x6 RW/L	**Base Class (BC):** The value of 06h indicates that this is a bridge device. **Power Well:** PRST
15:8	0x4 RW/L	**Sub-Class (SC):** This 8-bit value indicates that this device is a PCI-to-PCI Bridge. **Power Well:** PRST
7:0	0x0 RW/L	**Register-Level Programming Interface (RLPI):** This bit indicates that this device is standard (non-subtractive) PCI-to-PCI Bridge. **Power Well:** PRST

48.2.7 CLS—Offset Ch

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + Ch

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Cache Line Size (CLS):** These bits specify the system cache-line size in units of DWords.

48.2.8 PLAT—Offset Dh

This register denotes the maximum time slice for a burst transaction in legacy PCI 2.3 on the primary interface. It does not affect/influence PCI-Express functionality.

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + Dh

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO	**Primary Latency Timer (Prim_Lat_timer):** Not applicable to PCI-Express. Hardwired to 00h. This register is typically called as 'latency Timer' for Endpoints in PCI 3.0 specification

48.2.9 HDR—Offset Eh

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + Eh

Default: 01h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RW/L	**Multi-function device (MFD):** The root port, DMI in RC, Virtual Root port/switch port and downstream ports are single function only. **Power Well:** PRST
6:0	0x1 RW/L	**Header Type (HTYPE):** These bits define the layout of addresses 10h through 3Fh in the configuration space. These bits read as 01h to indicate that the register layout conforms to the standard PCI-to-PCI Bridge layout. **Power Well:** PRST

48.2.10 BIST—Offset Fh

This register is used for reporting control and status information of BIST checks within a PCIExpress port. It is not supported in this implementation.

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + Fh

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO	**BIST Tests (BIST_TST):** Not supported. Hardwired to 0h

48.2.11 PRIBUS—Offset 18h

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 18h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Primary Bus Number (PBN):** These bits indicate the PCI Express bus number.

48.2.12 SECBUS—Offset 19h

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 19h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Secondary Bus Number (SCBN):** These bits indicate the bus number of the PCI device to which the secondary interface is connected.

48.2.13 SUBBUS—Offset 1Ah

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 1Ah

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Subordinate Bus Number (SBBN):** These bits indicate the highest PCI bus number downstream of this bridge.

48.2.14 IOBASE—Offset 1Ch

The I/O Base and I/O Limit registers define an address range that is used by the PCI-Express port to determine when to forward I/O transactions from one interface to the other using the following formula:

IO_BASE (= A[15:12](=IO_LIMIT Only the upper 4 bits are programmable. For the purpose of address decode, address bits A[11:0] are treated as 0.

The bottom of the defined I/O address range will be aligned to a 4KB boundary while the top of the region specified by IO_LIMIT will be one less than a 4 KB multiple.

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 1Ch

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:4	0x0 RW	**I/O Base Address Bits (IOBA):** These bits define the bottom address of an address range to determine when to forward I/O transactions from one interface to another. These bits correspond to address lines[15:12] for 4 KB alignment. Bits[11:0] are assumed to be 000h.
3:0	0x0 RO	**I/O Base Addressing Capability (IOBC):** Each of these bits is hard-wired to 0, indicating support for 16-bit I/O addressing only.

48.2.15 IOLIMIT—Offset 1Dh

The I/O Base and I/O Limit registers define an address range that is used by the PCI-Express bridge to determine when to forward I/O transactions from one interface to the other using the following formula:

IO_BASE (= A[15:12] (=IO_LIMIT Only the upper 4 bits are programmable. For the purpose of address decode, address bits A[11:0] of the IO limit register is treated as FFFh.

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 1Dh

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:4	0x0 RW	**I/O Limit Address Bits (IOLA):** These bits define the top address of an address range to determine when to forward I/O transactions from PCI Express to PCI. These bits correspond to address lines[15:12] for 4 KB aligned window.
3:0	0x0 RO	**I/O Limit Addressing Capability (IOLC):** Each of these bits is hard-wired to 0, indicating support for 16-bit I/O addressing only.

48.2.16 SECSTS—Offset 1Eh

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 1Eh

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW/1C/V	**Detected Parity Error (DPE):** This bit is set by the secondary side for a Type 1 Configuration Space header function whenever it receives a Poisoned TLP, regardless of the state in the Parity Error Response Enable (PERE) field of the Bridge Control Register (BCTL).
14	0x0 RW/1C/V	**Received System Error (RSE):** This bit is set by the secondary side for a Type 1 Configuration Space header function whenever it receives an ERR_FATAL or ERR_NONFATAL message.
13	0x0 RW/1C/V	**Received Master Abort (RMA):** This bit is set when the secondary side for Type 1 configuration space header function (for requests initiated by the Type 1 header function itself) receives a completion with Unsupported Requests Completion Status.
12	0x0 RW/1C/V	**Received Target Abort (RTA):** This bit is set when the secondary side for Type 1 Configuration Space Header Function (for Requests initiated by the Type 1 header Function itself) receives a completion with Completer About Completion Status.
11	0x0 RW/1C/V	**Signaled Target Abort (STA):** This bit is set when the secondary side for Type 1 configuration space header function (for requests completed by type 1 header functions itself) completes a Posted or Non-posted request as a Completer Abort error.
10:9	0x0 RO	**DEVSEL# Timing (DVT):** Not applicable to PCI Express. Hardwired to 0.
8	0x0 RW/1C/V	**Master Data Parity Error Detected (MDPD):** This bit is set by the secondary side requester if the Parity Error Response Enable (PERE) bit in the Bridge Control Register (BCTL) is set and either of the following conditions occurs: Requester receives completion marked poisoned Requester sends a poisoned request (includes writes and messages) If the PERE bit in the Bridge Control Register (BCTL) is clear, this bit is never set.
7	0x0 RO	**Fast Back-to-Back Capable (FBC):** Not applicable to PCI Express. Hardwired to 0.
6	0x0 RO	**RSVD0:** Reserved
5	0x0 RO	**66 MHz Capable (C66):** Not applicable to PCI Express. Hardwired to 0.
4:0	0x0 RO	**RSVD1:** Reserved

48.2.17 MEMBASE—Offset 20h

The Memory Base and Memory Limit registers define a memory mapped I/O non-prefetchable address range (32-bit addresses) and direct the accesses in this range to the PCI-Express port based on the following formula:

MEMORY_BASE (= A[31:20] (= MEMORY_LIMIT The upper 12 bits of both the Memory Base and Memory Limit registers are read/write and corresponds to the upper 12 address bits, AD[31:20], of 32-bit addresses.

For the purpose of address decoding, the bridge assumes that the lower 20 address bits, AD[19:0], of the memory base address are zero. Similarly, the bridge assumes that the lower 20 address bits, AD[19:0], of the memory limit address (not implemented in the Memory Limit register) are FFFFFh. Thus, the bottom of the defined memory address range will be aligned to a 1 MB boundary and the top of the defined memory address range will be one less than a 1 MB boundary

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 20h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:4	0x0 RW	**Memory Base (MB):** These bits are compared with bits[31:20] of the incoming address to determine the lower 1 MB-aligned value (inclusive) of the range.
3:0	0x0 RO	**RSVD0:** Reserved

48.2.18 MEMLIMIT—Offset 22h

This register controls the processor to PCI-Express non-prefetchable memory access routing based on the following formula as described above:

MEMORY_BASE (= A[31:20] (= MEMORY_LIMIT The upper 12 bits of the register are read/write and correspond to the upper 12 address bits A[31:20] of the 32 bit address. The bottom 4 bits of this register are read-only and return zeros when read. This register must be initialized by the configuration software. For the purpose of address decode address bits A[19:0] are assumed to be FFFFFh.

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 22h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:4	0x0 RW	**Memory Limit (ML):** These bits are compared with bits[31:20] of the incoming address to determine the upper limit of the range of memory accesses that will be passed by the port.
3:0	0x0 RO	**RSVD0:** Reserved

48.2.19 PFBASE—Offset 24h

The Prefetchable Memory Base and Memory Limit registers define a memory mapped I/O prefetchable address range (32-bit addresses) which is used by the PCI-Express bridge to determine when to forward memory transactions based on the following formula:

PREFETCH_MEMORY_BASE (= A[31:20] (= PREFETCH_MEMORY_LIMIT The upper 12 bits of both the Prefetchable Memory Base and Memory Limit registers are read/ write and corresponds to the upper 12 address bits, A[31:20], of 32-bit addresses. For the purpose of address decoding, the bridge assumes that the lower 20 address bits, A[19:0], of the memory base address are zero. Similarly, the bridge assumes that the lower 20 address bits, A[19:0], of the memory limit address (not implemented in the Memory Limit register) are FFFFFh.

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 24h

Default: 0001h

Bit Range	Default & Access	Field Name (ID): Description
15:4	0x0 RW	**Prefetchable Memory Base (PMB):** These bits are compared with bits[31:20] of the incoming address to determine the lower 1 MB-aligned value (inclusive) of the range. The incoming address must be greater than or equal to this value.
3:0	0x1 RO	**Prefetchable Memory Base Address Capability (PFMCAP):** • 0: 32-bit Prefetchable Memory addressing. • 1: 64-bit Prefetchable Memory addressing. This field indicates that 64-bit addressing is supported for the limit.

48.2.20 PFLIMIT—Offset 26h

This register controls the processor to PCI-Express prefetchable memory access routing based on the following formula as described above:

PREFETCH_MEMORY_BASE (= A[31:20] (= PREFTCH_MEMORY_LIMIT The upper 12 bits of the register are read/write and correspond to the upper 12 address bits A[31:20] of the 32 bit address. This register must be initialized by the configuration software. For the purpose of address decode address bits A[19:0] are assumed to be FFFFFh.

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 26h

Default: 0001h

Bit Range	Default & Access	Field Name (ID): Description
15:4	0x0 RW	**Prefetchable Memory Limit (PML):** These bits are compared with bits[31:20] of the incoming address to determine the upper limit of the prefetchable memory range.
3:0	0x1 RO	**Prefetchable Memory Limit Address Capability (PMLC):** This field indicates that 64-bit addressing is supported for the limit.

48.2.21 PFBASEU—Offset 28h

The Prefetchable Base Upper 32 Bits and Prefetchable Limit Upper 32 Bits registers are extensions to the Prefetchable Memory Base and Prefetchable Memory Limit registers. If a 64-bit prefetchable memory address range is supported, the Prefetchable Base Upper 32 Bits and Prefetchable Limit Upper 32 Bits registers specify the upper 32-bits, corresponding to A[63:32], of the 64-bit base and limit addresses which specify the prefetchable memory address range. PREFETCH_MEMORY_BASE_UPPER (= A[63:32] (= PREFETCH_MEMORY_BASE_LIMIT_UPPER

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 28h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Prefetchable Memory Base Upper Portion (PMBU):** Corresponds to A[63:32] of the memory address that maps to the upper base of the prefetchable range of memory accesses that will be passed by the PCI-Express bridge.

48.2.22 PFLIMITU—Offset 2Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 2Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Prefetchable Memory Limit Upper Portion (PMLU):** Corresponds to A[63:32] of the memory address that maps to the upper limit of the prefetchable range of memory accesses that will be passed by the PCI-Express bridge.

48.2.23 CAPPTR—Offset 34h

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 34h

Default: 40h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x40 RO	**Capabilities Pointer (CPTR):** Contains the offset of the first item in the list of capabilities. (EXPCAPLST)

48.2.24 INTL—Offset 3Ch

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 3Ch

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Interrupt Line (INTL):** This register is used to communicate interrupt line routing information. The device itself does not use this value, rather it is used by device drivers and operating systems. (compatibility)

48.2.25 INTP—Offset 3Dh

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 3Dh

Default: 01h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x1 RW/L	**Interrupt Pin (INTP):** This register tells which interrupt pin the function uses. • 01h: Generate INTA • 02h: Generate INTB • 03h: Generate INTC • 04h: Generate INTD • Others: Reserved BIOS has the ability to write this register once during boot to setup the correct interrupt for the Function. **Power Well:** PRST

48.2.26 BCTL—Offset 3Eh

This register provides extensions to the Command Register ('PCI Command Register "PCICMD—Offset 4h" on page 1601) that are specific to a bridge. The Bridge Control Register provides many of the same controls for the secondary interface that are provided by the Command Register for the primary interface. Some bits affect operation of both interfaces of the bridge.

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 3Eh

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:12	0x0 RO	**RSVD0:** Reserved
11	0x0 RO	**Discard Timer SERR# Enable (DTSE):** Not applicable to PCI Express. Hardwired to 0.
10	0x0 RO	**Discard Timer Status (DTS):** Not applicable to PCI Express. Hardwired to 0.
9	0x0 RO	**Secondary Discard Timer (SDT):** Not applicable to PCI Express. Hardwired to 0.
8	0x0 RO	**Primary Discard Timer (PDT):** Not applicable to PCI Express. Hardwired to 0.
7	0x0 RO	**Fast Back-to-Back Enable (FBE):** Not applicable to PCI Express. Hardwired to 0.
6	0x0 RW	**Secondary Bus Reset (SBR):** Setting this bit triggers a hot reset on the downstream link for the corresponding PCIe Express port and the PCI Express hierarchy domain subordinate to the port. Software must ensure a minimum reset duration of 1us as defined in the PCI Local Bus Specification, Revision 3.0. Hardware will continue to maintain the hot reset state as long as the SBR bit is set. For Root Ports, it is recommended that software assert this field for a minimum of 2 ms to ensure that all downstream links enters hot reset state. A secondary bus reset will not reset any register of a Type 1 configuration space header function.
5	0x0 RO	**Master Abort Mode (MAM):** Not applicable to PCI Express. Hardwired to 0.
4	0x0 RW	**VGA 16-bit Decode (VGA16BD):** This bit enables the bridge to provide 16-bit decoding of VGA I/O address precluding the decoding of VGA alias addresses every 1 KB. This bit requires the VGA enable bit (bit 3 of this register) to be set to 1. • 0: execute 10-bit address decode on VGA I/O accesses • 1: execute 16-bit address decode on VGA I/O accesses
3	0x0 RW	**VGA Enable (VGAE):** This bit modifies the response to VGA-compatible addresses. When set to 1b, the bridge positively decodes and forwards the following transactions from primary side to secondary side regardless of the value of the I/O base and limit registers. The transactions are qualified by the memory enable and I/O enable in the command register. Memory addresses: 000A 0000h-000B FFFFh I/O addresses: 3B0h-3BBh and 3C0h-3DFh in first 64 KB of I/O address space (Inclusive of ISA address aliases when IO address bits[15:10] are not decoded)

Bit Range	Default & Access	Field Name (ID): Description
2	0x0 RW	**ISA Enable (IE):** This bit modifies the response by the bridge to ISA I/O addresses. This field applies only to I/O addresses that are enabled by the I/O base and I/O limit registers and are in the first 64 KB of PCI I/O space. When this bit is set, the bridge blocks all forwarding from primary to secondary of I/O transactions addressing the last 768 bytes in each 1 KB block (offsets 100h to 3FFh). In the opposite direction (secondary to primary), I/O transactions will be forwarded if they address the last 768B in each 1 KB block. • 1: Forward upstream ISA I/O addresses in the address range defined by the I/O Base and I/O Limit registers that are in the firsts 64KB of PCI I/O address space (Top 768B of each 1K block). • 0: Forward downstream all I/O addresses in the address range defined by the I/O Base and I/O Limit registers.
1	0x0 RW	**SERR# Enable (SE):** This bit controls the forwarding of PCI Express ERR_COR, ERR_NONFATAL and ERR_FATAL messages to the primary side. • 1: Enables forwarding of ERR_COR, ERR_NONFATAL, ERR_FATAL messages. • 0: Disables forwarding of ERR_COR, ERR_NONFATAL, ERR_FATAL messages.
0	0x0 RW	**Parity Error Response Enable (PERE):** This bit controls the response to poisoned TLPs in the PCI Express port. • 1: Enables reporting of poisoned TLP errors. • 0: Disables reporting of poisoned TLP errors.

48.2.27 EXPCAPLST—Offset 40h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 40h

Default: 8010h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x80 RO	**Next Pointer (NP):** Contains the offset of the next item in the capabilities list. (PMCAPLST)
7:0	0x10 RO	**Capability ID (CAPID):** Identifies the function as PCI Express capable.

48.2.28 EXPCAP—Offset 42h

This register stores the version number of the capability item and other base information contained in the capability structure.

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 42h

Default: 0042h

Bit Range	Default & Access	Field Name (ID): Description
15:14	0x0 RO	**RSVD0:** Reserved
13:9	0x0 RO/V	**Interrupt Message Number (IMN):** This field indicates the interrupt message number that is generated from the PCI Express port. When there is more than one MSI interrupt number, this register is required to contain the offset between the base Message Data and the MSI Message that is generated when the status bits in the slot status register or root port status registers are set. The chipset is required to update this field if the number of MSI messages change. Applies only to Root ports. The PCIe macro assigns the first vector for PM/HP events and so this field is set to 0.
8	0x0 RW/L	**Slot Implemented (SI):** • 1: Indicates the PCI Express link associated with this port is connected to a slot. • 0: Indicates no slot is connected to this port. Applies only to root and downstream ports. ***Note:*** For any devices with hot plug enabled, this bit will be forced to 1 (slot) in BIOS. **Power Well:** PRST
7:4	0x4 RO	**Device/Port Type (DT):** 4h: Root Port of a PCIe Root Complex
3:0	0x2 RO	**Version Number (VN):** These bits indicate the version number of the PCI Express capability structure.

48.2.29 DEVCAP—Offset 44h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 44h

Default: 00008021h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RO	**RSVD0:** Reserved
27:26	0x0 RO	**Captured Slot Power Limit Scale (CSPLS):** In combination with the Slot Power Limit value (bits[25:18], this field specifies the upper limit of the power supplied by slot. The power limit (in Watts) is calculated by multiplying the value in this field by the value in the Slot Power Limit Value field. This value is set by the Set_Slot_Power_Limit message. Does not apply to root ports or integrated devices or end points or downstream ports or Virtual Root Port/switch port
25:18	0x0 RO	**Captured Slot Power Limit Value (CSPLV):** In combination with the Slot Power Limit Scale value (bits[27:26]), this field specifies the upper limit of the power supplied by slot. The power limit (in Watts) is calculated by multiplying the value in this field by the value in the Slot Power Limit Scale field. This value is set by the Set_Slot_Power_Limit message. Does not apply to root ports or integrated devices or end points or downstream ports or Virtual Root Port/switch ports
17:16	0x0 RO	**RSVD1:** Reserved
15	0x1 RO	**Role-Based Error Reporting (RBER):** The PCIe cluster supports Role-based Error Reporting.
14:12	0x0 RO	**Undefined:** Reserved.
11:9	0x0 RO	**Endpoint L1 Acceptable Latency (EPL1AL):** This field only applies to Endpoint and is hardwired to 0 for other types such as root ports, upstream/downstream ports
8:6	0x0 RO	**Endpoint L0s Acceptable Latency (EPL0AL):** This field only applies to Endpoint and is hardwired to 0 for other types such as root ports, upstream/downstream ports
5	0x1 RW/L	**Extended Tag Field Supported (ETFG):** • 0: The PCIe supports 5-bit extended tag • 1: The PCIe supports 8-bit extended tag **Power Well:** PRST
4:3	0x0 RO	**Phantom Functions Supported (PFS):** This field indicates the number of most significant bits of the function number portion of Requester ID in a TLP that are logically combined with the Tag identifier. The PCIe cluster does not support phantom functions
2:0	0x1 RW/L	**Max Payload size Supported (MPSS):** The PCIe SIP can tolerate up to 512-byte packets as maximum payload for project specific. Defined encodings are: • 000b 128 bytes max payload size • 001b 256 bytes max payload size • 010b 512 bytes max payload size • 011b 1024 bytes max payload size • 100b 2048 bytes max payload size • 101b 4096 bytes max payload size • 110b Reserved • 111b Reserved **Power Well:** PRST

48.2.30 DEVCTL—Offset 48h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 48h

Default: 2000h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RO	**RSVD0:** Reserved
14:12	0x2 RW	**Max_Read_Request_Size (MRRS):** This field sets the maximum Read Requests size of the function as a requester. The Function must not generate read requests with size exceeding the set value. • 000b: 128 bytes maximum Read Request size • 001b: 256 bytes maximum Read Request size • 010b: 512 bytes maximum Read Request size • 011b: 1024 bytes maximum Read Request size • 100b: 2048 bytes maximum Read Request size • 101b: 4096 bytes maximum Read Request size • Others: Reserved Functions that do not generate Read Requests larger than 128B and functions that do not generate Read Requests on their own behalf are permitted to implement this field as Read Only (RO) with a value of 000b.
11	0x0 RO	**Enable No Snoop (ENOSNP):** If this bit this is set, the function is permitted to set the No Snoop bit in the Requester attributes of transactions it initiates that do not require hardware enforced cache coherency.
10	0x0 RO	**RSVD:** Reserved
9	0x0 RO	**RSVD:** Reserved
8	0x0 RW	**Extended Tag Field Enable (ETFE):** When set, this bit enables a function to use an 8-bit tag field as a Requester. Functions that do not implement this capability hardwire this bit to 0b.
7:5	0x0 RW	**Maximum Payload Size (MPS):** This field sets maximum TLP payload size for the function. As a receiver, the function must handle TLPs as large as the set value. As a Transmitter, the function must not generate TLPs exceeding the set value. • 000b: 128 bytes maximum payload size (default) • 001b: 256 bytes maximum payload size • 010b: 512 bytes maximum payload size • 011b: 1024 bytes maximum payload size • 100b: 2048 bytes maximum payload size • 101b: 4096 bytes maximum payload size • Others: Reserved
4	0x0 RO	**Enable Relaxed Ordering (ENRO):** When set, the function is permitted to set the relaxed ordering bit in the attribute field of transactions it initiates that do not require strong write ordering.
3	0x0 RW	**Unsupported Request Reporting Enable (URRE):** This bit controls the enabling of ERR_CORR, ERR_NONFATAL or ERR_FATAL messages on PCI Express for reporting 'Unsupported Request' errors.
2	0x0 RW	**Fatal Error Reporting Enable (FERE):** When this bit is set, generation of the ERR_FATAL message is enabled.
1	0x0 RW	**NonFatal Error Reporting Enable (NFERE):** When this bit is set, generation of the ERR_NONFATAL message is enabled.
0	0x0 RW	**Correctable Error Reporting Enable (CERE):** When this bit is set, generation of the ERR_CORR message is enabled.

48.2.31 DEVSTS—Offset 4Ah

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 4Ah

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:6	0x0 RO	**RSVD0:** Reserved
5	0x0 RO/V	**Transactions Pending (TP):** When set, this bit indicates that the function has issued Non-Posted Requests that have not been completed. For Root or Switch port, it applies to Non-Posted Requests the port has issued on its own behalf (Port's Request ID).
4	0x0 RO	**RSVD:** Reserved
3	0x0 RW/1C/V	**Unsupported Request Detected (URD):** This bit indicates that this function received an unsupported request from PCI Express link. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register.
2	0x0 RW/1C/V	**Fatal Error Detected (FED):** This bit indicates that this function has detected a Fatal error. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register.
1	0x0 RW/1C/V	**Non-Fatal Error Detected (NFED):** This bit indicates that this function has detected a Non-Fatal error. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register.
0	0x0 RW/1C/V	**Correctable Error Detected (CED):** This bit indicates that this function has detected a Correctable error. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register.

48.2.32 LINKCAP—Offset 4Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 4Ch

Default: 09794883h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x9 RW/V/L	**Port Number (PN):** This field indicates the PCI Express port number assigned to this link. **Power Well:** PRST
23	0x0 RO	**RSVD0:** Reserved
22	0x1 RW/L	**ASPM Optionality Compliance (ASPMOPCMP):** The ASPM Optionality Compliance bit was created as a tool to set clear expectations for hardware and software interaction. This bit is Set to indicate hardware that conforms to the current specification. **Power Well:** PRST
21	0x1 RW/L	**Link Bandwidth Notification Capability (LBNC):** A value of 1b indicates support for the Link Bandwidth Notification status and interrupt mechanisms. **Power Well:** PRST
20	0x1 RW/L	**Data Link Layer Active Error Reporting Capable (DLLERC):** For a Downstream Port, this bit must be hardwired to 1b if the component supports the optional capability of reporting the DL_Active state of the Data Link Control and Management State Machine. **Power Well:** PRST
19	0x1 RW/L	**Surprise Down Error Reporting Capable (SLDERC):** For a Downstream Port, this bit must be Set if the component supports the optional capability of detecting and reporting a Surprise Down error condition. **Power Well:** PRST
18	0x0 RO	**Clock Power Management Capable (CPMC):** A value of 0b indicates the component does not have this capability and that reference clock(s) must not be removed in these Link states.
17:15	0x2 RW/L	**L1 Exit Latency (L1EL):** This field indicates the L1 exit latency for the given PCI-Express Link. It indicates the length of time this port requires to complete transition from L1 to L0. • 000: Less than 1us • 001: 1us to less than 2us • 010: 2us to less than 4us • 011: 4us to less than 8us • 100: 8us to less than 16us • 101: 16us to less than 32us • 110: 32us to less than 64us • 111: More than 64us If L1 is not supported, the value is undefined. **Power Well:** PRST

Bit Range	Default & Access	Field Name (ID): Description
14:12	0x4 RW/L	**L0s Exit Latency (L0sEL):** This field indicates the L0s exit latency for the given PCI-Express Link. It indicates the length of time this port requires to complete transition from L0s to L0. • 000b: Less than 64ns • 001b: 64ns to less than 128ns • 010b: 128ns to less than 256ns • 011b: 256ns to less than 512ns • 100b 512 ns to less than 1 us • 101b: 1us to less than 2us • 110b: 2us to less than 4us • 111b: More than 4us If L0s is not supported, the value is undefined. **Power Well:** PRST
11:10	0x2 RW/L	**ASPM Support (ASPMSUP):** This field indicates the level of ASPM supported on the given PCI Express Link. • 00b: No ASPM Support • 01b: L0s Supported • 10b: L1 Supported • 11b: L0s and L1 Supported **Power Well:** PRST
9:4	0x8 RO/V	**Maximum Link Width (MLW):** This field indicates the maximum link width implemented by the given PCI Express Link. • 00h: Reserved • 01h: x1 • 02h: x2 • 04h: x4 • 08h: x8 • 10h: x16 • 20h: x32 (Unsupported) • Others: Reserved
3:0	0x3 RO/V	**Maximum Link Speed (MLS):** This field indicates the supported link speed(s) of the associated port. • 0001b: 2.5 Gb/s link speed is supported • 0010b: 5.0 Gb/s and 2.5 Gb/s link speed supported • 0011b: 8.0 Gb/s and 5.0 and 2.5 Gb/s link speed supported • Others: Reserved.

48.2.33 LINKCTL—Offset 50h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 50h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:12	0x0 RO	**RSVD0:** Reserved
11	0x0 RW	**Link Autonomous Bandwidth Interrupt Enable (LABIE):** When Set, this bit enables the generation of an interrupt to indicate that the Link Autonomous Bandwidth Status bit has been set. Functions that do not implement the Link Bandwidth Notification Capability must hardwire this bit to 0b.
10	0x0 RW	**Link Bandwidth Management Interrupt Enable (LBMIE):** When set, this bit enables the generation of an interrupt to indicate that the Link Bandwidth Management Status bit has been set. This bit is not applicable and is reserved for Endpoints, PCI Express-to-PCI/PCI-X bridges, and Upstream Ports of Switches.
9	0x0 RW	**Hardware Autonomous Width Disable (HAWD):** Set, this bit disables hardware from changing the Link width for reasons other than attempting to correct unreliable Link operation by reducing Link width. For a Multi-Function device associated with an Upstream Port, the bit in Function 0 is of type RW, and only Function 0 controls the components Link behavior. In all other Functions of that device, this bit is of type RsvdP. Components that do not implement the ability autonomously to change Link width are permitted to hardwire this bit to 0b. Default value of this bit is 0b.
8	0x0 RW/L	**Enable Clock Power Management (ECPM):** Applicable only for Upstream Ports and with form factors that support a 'Clock Request' (CLKREQ#) mechanism, this bit operates as follows: • 0b Clock power management is disabled and device must hold CLKREQ# signal low. • 1b When this bit is Set, the device is permitted to use CLKREQ# signal to power manage Link clock according to protocol defined in appropriate form factor specification. For a non-ARI multi-Function device, power-management-configuration software must only Set this bit if all Functions of the multi-Function device indicate a 1b in the Clock Power Management bit of the Link Capabilities register. The component is permitted to use the CLKREQ# signal to power manage Link clock only if this bit is Set for all Functions. For ARI Devices, Clock Power Management is enabled solely by the setting in Function 0. The settings in the other Functions always return whatever value software programmed for each, but otherwise are ignored by the component. The CLKREQ# signal may also be controlled via the L1 PM Substates mechanism. Such control is not affected by the setting of this bit. Downstream Ports and components that do not support Clock Power Management (as indicated by a 0b value in the Clock Power Management bit of the Link Capabilities register) must hardwire this bit to 0b. Default value of this bit is 0b, unless specified otherwise by the form factor specification. **Power Well:** PRST
7	0x0 RW	**Extended Synch (ES):** When set, this bit forces extended transmission of 4096 FTS ordered sets in FTS and an extra 1024 TS1 at exit from L1 prior to entering L0. This mode provides external devices monitoring the link time to achieve bit and symbol lock before the link enters L0 state and resumes communication. Default value for this bit is 0.
6	0x0 RW	**Common Clock Configuration (CCCFG):** When set, this bit indicates that this component and the component at the opposite end of this link are operating with distributed common reference clocks. A value of 0b indicates that this component and the component at the opposite end of this link are operating with asynchronous reference clock. After changing the value in this bit in both components on a link, software must trigger the link to retrain by writing a 1b to the Retrain Link bit of the Downstream Port.

Bit Range	Default & Access	Field Name (ID): Description
5	0x0 RW/V	**Retrain Link (RL):** When set, this bit initiates link retraining by directing the physical layer LTSSM to recovery state. If the LTSSM is already in recovery or configuration, re-entering Recovery is permitted but not required. Reads of this bit always return 0b. This is used by the downstream ports, Root ports or DMI EP in RC only. For the upstream port or virtual switch port, it is Read-only.
4	0x0 RW	**Link Disable (LD):** This bit disables the Link by directing the LTSSM to the Disabled state when Set, This is used by the downstream ports, Root ports or DMI EP in RC only. For the upstream port or virtual switch port, it is Read-only.
3	0x0 RO	**Read Completion Boundary (RCB):** This bit indicates the RCB value for Root Port, Endpoints and Bridges. • 0b: 64 byte • 1b: 128 byte Configuration software must only set this bit if the Root Port Upstream from the Endpoint or Bridge reports an RCB value of 128 bytes (Root Port only)
2	0x0 RO	**RSVD1:** Reserved
1:0	0x0 RW	**ASPM Control (ASPMCTL):** This field controls the level of ASPM enabled on a given PCI Express Link. • 00b: Disabled • 01b: L0s Entry Enabled • 10b: L1 Entry Enabled • 11b: L0s and L1 Entry Enabled ''L0s Entry Enabled' enables the Transmitter to enter L0s. If L0s is supported, the Receiver must be capable of entering L0s even when the Transmitter is disabled from entering L0s (00b or 10b).

48.2.34 LINKSTS—Offset 52h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 52h

Default: 1001h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW/1C/V	**Link Autonomous Bandwidth Status (LABS):** This bit is set by hardware to indicate that the PCIe cluster has autonomously changed link or width, without the port transitioning through DL_Down status, for reason other than to attempt to correct unreliable link operation. This bit must be set if the Physical Layer reports an autonomous speed or width change initiated by the Upstream Port.
14	0x0 RW/1C/V	**Link Bandwidth Management Status (LBMS):** This bit is set by hardware to indicate that either of the following has occurred without the port transitioning through DL_Down status:
13	0x0 RO/V	**Data Link Layer Link Active (DLLLA):** This bit indicates the status of the Data Link Control and Management Status Machine.
12	0x1 RW/L	**Slot Clock Configuration (SCC):** When to 1b, this bit indicates that the component uses the same physical reference clock that he platform provides on the connector. If the device uses an independent clock irrespective of the presence of a reference on the connector, this bit must be clear. • 1: Indicates same reference clock. • 0: Indicates independent reference clock **Power Well:** PRST
11	0x0 RO/V	**Link Training (LT):** This bit indicates that the Physical Layer LTSSM is in the Configuration or Recovery state
10	0x0 RO	**Undefined:** Not applicable
9:4	0x0 RO/V	**Negotiated Link Width (NLW):** This field indicates the negotiated width of the PCI Express link. • 00 0001b: x1 • 00 0010b: x2 • 00 0100b: x4 • 00 1000b: X8 • 00 1100b: x12 not supported • 01 0000b: x16 • 10 0000b: x32 not supported • All other values are reserved. The value in this field is undefined when the link is not up.
3:0	0x1 RO/V	**Current Link Speed (CLS):** This field indicates the negotiated link speed of the given PCI Express link. • 0001b: 2.5 Gb/s PCI Express Link • 0010b: 5.0 Gb/s PCI Express Link • 0011b: 8.0 Gb/s PCI Express Link • Others: Reserved

48.2.35 SLOTCAP—Offset 54h

Lock Key bit is located in the Personality Lock Key Control Register ('PLKCTL').

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 54h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0x0 RW/L	**Physical Slot Number (PSN):** This field indicates the physical slot number connected to the PCI-Express port. It should be initialized to 0 for ports connected to devices that are either integrated on the system board or integrated within the same silicon such as the switch device or the Root port. **Power Well:** PRST
18	0x0 RW/L	**No Command Completed Support (NCCS):** When Set, this bit indicates that this slot does not generate software notification when an issued command is completed by the Hot-Plug Controller. This bit is only permitted to be Set if the hot-plug capable Port is able to accept writes to all fields of the Slot Control register without delay between successive writes. **Power Well:** PRST
17	0x0 RW/L	**Electromechanical Interlock Present (EMIP):** This bit when set indicates that an Electromechanical Interlock is implemented on the chassis for this slot and that lock is controlled by bit 11 in Slot Control Register. **Power Well:** PRST
16:15	0x0 RW/L	**Slot Power Limit Scale (SPLS):** This field specifies the scale used for the Slot Power Limit Value. Range of Values: • 00: 1.0x • 01: 0.1x • 10: 0.01x • 11: 0.001x This register must be implemented if the Slot Implemented bit is set in EXPCAP. Writes to this register (SLOTCAP) when the Data Link Layer reports DL_Up status, or the link transitions from a non-DL_Up to a DL_Up would cause the Port to send the Set_Slot_Power_Limit Message. **Power Well:** PRST
14:7	0x0 RW/L	**Slot Power Limit Value (SPLV):** This field specifies the upper limit on power supplied by slot in conjunction with the Slot Power Limit Scale value defined previously Power limit (in Watts). i.e Power limit = SPLS x SPLV. This register must be implemented if the Slot Implemented bit is set in EXPCAP. Writes to this register (SLOTCAP) when the Data Link Layer reports DL_Up status, or the link transitions from a non-DL_Up to a DL_Up would cause the Port to send the Set_Slot_Power_Limit Message. **Power Well:** PRST
6	0x0 RW/L	**Hot-plug Capable (HPC):** This field defines hot-plug support capabilities for the PCI-Express port. • 0: indicates that this slot is not capable of supporting Hot-plug operations. • 1: indicates that this slot is capable of supporting Hot-plug operations **Power Well:** PRST
5	0x0 RW/L	**Hot-plug Surprise (HPS):** This field indicates that a device in this slot may be removed from the system without prior notification. • 0: indicates that hot-plug surprise is not supported • 1: indicates that hot-plug surprise is supported **Power Well:** PRST

Bit Range	Default & Access	Field Name (ID): Description
4	0x0 RW/L	**Power Indicator Present (PIP):** This bit indicates that a Power Indicator is implemented on the chassis for this slot. • 0: indicates that Power Indicator is not present • 1: indicates that Power Indicator is present **Power Well:** PRST
3	0x0 RW/L	**Attention Indicator Present (AIP):** This bit indicates that an Attention Indicator is implemented on the chassis for this slot. • 0: indicates that an Attention Indicator is not present • 1: indicates that an Attention Indicator is present **Power Well:** PRST
2	0x0 RW/L	**MRL Sensor Present (MRLSP):** This bit indicates that an MRL Sensor is implemented on the chassis for this slot. • 0: indicates that an MRL Sensor is not present • 1: indicates that an MRL Sensor is present **Power Well:** PRST
1	0x0 RW/L	**Power Controller Present (PCP):** This bit indicates that a Power Controller is implemented on the chassis for this slot. • 0: indicates that a Power Controller is not present • 1: indicates that a Power Controller is present **Power Well:** PRST
0	0x0 RW/L	**Attention Button Present (ABP):** This bit indicates that an Attention Button is implemented on the chassis for this slot. • 0: indicates that an Attention Button is not present • 1: indicates that an Attention Button is present **Power Well:** PRST

48.2.36 SLOTCTL—Offset 58h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 58h

Default: 03C0h

Bit Range	Default & Access	Field Name (ID): Description
15:14	0x0 RO	**RSVD0:** Reserved
13	0x0 RW	**Auto Slot Power Limit Disable (ASPLD):** When Set, this disables the automatic sending of a Set_Slot_Power_Limit Message when a Link transitions from a non-DL_Up status to a DL_Up status.
12	0x0 RW	**Data Link Layer State Changed Enable (DLLSCE):** When set to 1, this field enables software notification when Data Link Layer Link Active reporting field is changed.
11	0x0 RW/V	**Electromechanical Interlock Control (EIC):** When software writes either a 1 to this bit, The PCIe port pulses the EMIL pin per PCIExpress Server/Workstation Module Electromechanical Spec Rev 1.0. Write of 0 has no effect. This bit always returns a 0 when read. If electromechanical lock is not implemented, then either a write of 1 or 0 to this register has no effect.
10	0x0 RW	**Power Controller Control (PCC):** This bit indicates the current state of the Power applied to the slot of the PCIExpress port. Reads of this field must reflect the value from the latest write, even if the corresponding hot-plug command is not executed yet at the VPP, unless software issues a write without waiting for the previous command to complete in which case the read value is undefined. • 0: Power On • 1: Power Off
9:8	0x3 RW	**Power Indicator Control (PIC):** If a Power Indicator is implemented, writes to this register set the Power Indicator to the written state. Reads of this field must reflect the value from the latest write, even if the corresponding hot-plug command is not executed yet at the VPP, unless software issues a write without waiting for the previous command to complete in which case the read value is undefined. • 00: Reserved. • 01: On • 10: Blink (The PCIe cluster drives 1.5 Hz square wave for Chassis mounted LEDs in the case of legacy card form factor for PCI-Express devices) • 11: Off When this register is written, the event is signaled via the virtual pins of the switch over a dedicated SMBus port. The switch does not generated the Power_Indicator_On/Off/Blink messages on PCI Express when this field is written to by software.
7:6	0x3 RW	**Attention Indicator Control (AIC):** If an Attention Indicator is implemented, writes to this register sets the Attention Indicator to the written state. Reads of this field reflect the value from the latest write, even if the corresponding hot-plug command is not executed yet at the VPP, unless software issues a write without waiting for the previous command to complete in which case the read value is undefined. • 00: Reserved. • 01: On • 10: Blink (The switch drives 1.5 Hz square wave) • 11: Off When this register is written, the event is signaled via the virtual pins of the switch over a dedicated SMBus port.
5	0x0 RW	**Hot-plug Interrupt Enable (HPIE):** This field enables the generation of Hot-plug interrupts and events in the PCIExpress port. • 0: Disables Hot-plug events and interrupts • 1: Enables Hot-plug events and interrupts
4	0x0 RW	**Command Completed Interrupt Enable (CCIE):** This field enables the generation of Hot-plug interrupts when a command is completed by the Hot-plug controller connected to the PCI-Express port. • 0: Disables hot-plug interrupts on a command completion by a hot-plug Controller • 1: Enables hot-plug interrupts on a command completion by a hot-plug Controller

Bit Range	Default & Access	Field Name (ID): Description
3	0x0 RW	**Presence Detect Changed Enable (PDCIE):** This bit enables the generation of hot-plug interrupts or wake messages via a presence detect changed event. • 0: Disables generation of hot-plug interrupts or wake messages when a presence detect changed event happens. • 1- Enables generation of hot-plug interrupts or wake messages when a presence detect changed event happens.
2	0x0 RW	**MRL Sensor Changed Enable (MSCIE):** This bit enables the generation of hot-plug interrupts or wake messages via a MRL Sensor changed event. • 0: Disables generation of hot-plug interrupts or wake messages when an MRL Sensor changed event happens. • 1: Enables generation of hot-plug interrupts or wake messages when an MRL Sensor changed event happens.
1	0x0 RW	**Power Fault Detected Enable (PFDIE):** This bit enables the generation of hot-plug interrupts or wake messages via a power fault event. • 0: Disables generation of hot-plug interrupts or wake messages when a power fault event happens. • 1: Enables generation of hot-plug interrupts or wake messages when a power fault event happens.
0	0x0 RW	**Attention Button Pressed Enable (ABPE):** This bit enables the generation of hot-plug interrupts or wake messages via an attention button pressed event. • 0: Disables generation of hot-plug interrupts or wake messages when the attention button is pressed. • 1: Enables generation of hot-plug interrupts or wake messages when the attention button is pressed

48.2.37 SLOTSTS—Offset 5Ah

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 5Ah

Default: 0040h

Bit Range	Default & Access	Field Name (ID): Description
15:9	0x0 RO	**RSVD0:** Reserved
8	0x0 RW/1C/V	**Data Link Layer State Changed (DLLSCS):** This bit is set (if it is not already set) when the state of the Data Link Layer Link Active bit in the Link Status register has changed. Software must read Data Link Layer Active field to determine the link state before initiating configuration cycles to the hot plugged device.
7	0x0 RO/V	**Electromechanical Interlock Status (ELS):** A read to this register returns the current state of the Electromechanical Interlock (the EMILS pin) which has the defined encodings as: • 0: Electromechanical Interlock Disengaged • 1: Electromechanical Interlock Engaged

6	0x1
	RO/V
		Presence Detect State (PDS): This field conveys the Presence Detect status of an adapter in the slot.
		It reflects the Logical 'OR' of the Physical Layer in-band presence detect mechanism and any out-of-band presence detect mechanism defined for the slot's corresponding form factor.
		• 0: Card/Module/Cable slot empty or Cable Slot occupied but not powered
		• 1: Card/module Present in slot (powered or unpowered) or cable present and powered on the other end.
		This field is set to 1 by the switch following reset for all the ports since it is related to the complement of the EXPCAP.SI bit whose default is 0 implying that the card is connected to the switch on the motherboard.
		Software should ensure that for those standard PCI-Express ports which are hot-plug capable, it sets the EXPCAP.SI field to '1' such that PDS becomes 0.
		Then any subsequent hotplug action will ensure that this field is set. Refer to the algorithm given below:
		if (EXPCAP.SI == FALSE) // always set to 1b and ignore the input from inband/OOB presence detect SLOTSTS.PDS = 1b else //
		if (EXPCAP.SI == TRUE) // Slot Empty = 0, Card Present = 1 SLOTSTS.PDS reflects slot status of side-band SMBUS Presence Detect signal OR Inband Presence Detect Mechanism.

5	0x0 RO/V	**MRL Sensor State (MRLSS):** This bit reports the status of an MRL sensor if it is implemented. • 0: MRL Closed • 1: MRL Open If Hotplug is implemented through VPP, the correct polarity of the external MRL sensor in the motherboard should be translated to map to the encodings as defined in this register field. (Tylersburg issue)
4	0x0 RW/1C/V	**Command Completed (CCS):** This bit is set when the hot-plug controller completes an issued command and is ready to accept a new command. It is subsequently cleared by software after the field has been read and processed. If Command Completed notification is supported, then the No Command Completed Support bit in the Slot Capabilities register should be 0.
3	0x0 RW/1C/V	**Presence Detect Changed (PDCS):** This bit is set when a Presence Detect Changed event is detected. It is subsequently cleared by software after the field has been read and processed. On-board logic per slot must set the VPP signal corresponding to this bit inactive if the FF/system does not support out-of-band presence detect. RPs may hold the re-training to occur until the SLOTSTS.PDCS bit has been cleared by software for the removal event. If the device is configured as a slot in the EXPCAP_.SI bit, this bit will need to be cleared before re-training will occur.
2	0x0 RW/1C/V	**MRL Sensor Changed (MRLSC):** This bit is set when an MRL Sensor Changed event is detected. It is subsequently cleared by software after the field has been read and processed. On-board logic per slot must set the VPP signal corresponding to this bit inactive if the FF/system does not support out-of-band presence detect.

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RW/1C/V	**Power Fault Detected (PFD):** This bit is set when a power fault event is detected by the power controller. It is subsequently cleared by software after the field has been read and processed. On-board logic per slot must set the VPP signal corresponding to this bit inactive if the FF/system does not support out-of-band presence detect.
0	0x0 RW/1C/V	**Attention Button Pressed (ABP):** This bit is set when the attention button is pressed. It is subsequently cleared by software after the field has been read and processed. On-board logic per slot must set the VPP signal corresponding to this bit inactive if the FF/system does not support out-of-band presence detect. Design should implement this as an edge detection logic in the chipset/platform to recognize a 0 -) 1 transition as a ABP event. Due to the long time frames for human interaction, software could potentially have serviced and cleared this event while the operator is pressing the attention button. For instance, if the user presses the Attention button that lasts for 2ms and the VPP sampling rate is, say 100us and if the Interrupt Service routine (ISR) processes and clears the ABP in 100us, there could be up to 10 (i.e 2000/(100+100)) different interrupts for the same event.Hardware must only generate 1 interrupt for every ABP event by treating it as edge based rather than level based event.

48.2.38 ROOTCTL—Offset 5Ch

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 5Ch

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:5	0x0 RO	**RSVD0:** Reserved
4	0x0 RW	**CRS Software Visibility Enable (CRSSVE):** This bit, when set, enables the Root Port to return Configuration Retry Status (CRS) Completion status to software. • 1: Enable software to received a CRS status. This allows software to make the decision to re-issue the configuration request or move on and re-issue the request at a later time. • 0: Disable software from receiving a CRS response. The PCIe will wait and re-issue the configuration request until it receives a response other than CRS without notifying software. CRS is implemented for general Root ports. (See 'ROOTCAP').
3	0x0 RW	**PME Interrupt Enable (PMEIE):** This field controls the generation of interrupts for PME messages. • 1: Enables interrupt generation upon receipt of a PME message as reflected in the PME Status bit defined in the ROOTSTS register. A PME interrupt is generated if the PMESTATUS register bit defined i 'Root Status Register "ROOTSTS—Offset 60h" on page 1466, is set when this bit is set from a cleared state. • 0: Disables interrupt generation for PME messages.
2	0x0 RW	**System Error on Fatal Error Enable (SEFEE):** This field controls generation of system errors in the PCI-Express port hierarchy for fatal errors. • 1: indicates that a System Error should be generated if a fatal error (ERR_FATAL) is reported by any of the devices in the hierarchy associated with and including this PCI-Express port. • 0: No System Error should be generated on a fatal error (ERR_FATAL) reported by any of the devices in the hierarchy.
1	0x0 RW	**System Error on Non-Fatal Error Enable (SENFEE):** This field controls generation of system errors in the PCI-Express port hierarchy for non-fatal errors. • 1: indicates that a System Error should be generated if a non-fatal error (ERR_NONFATAL) is reported by any of the devices in the hierarchy associated with and including this PCI-Express port. • 0: No System Error should be generated on a non-fatal error (ERR_NONFATAL) reported by any of the devices in the hierarchy.
0	0x0 RW	**System Error on Correctable Error Enable (SECEE):** This field controls generation of system errors in the PCI-Express port hierarchy for correctable errors. • 1: indicates that a System Error should be generated if a correctable error (ERR_COR) is reported by any of the devices in the hierarchy associated with and including this PCI-Express port. • 0: No System Error should be generated on a correctable error (ERR_COR) reported by any of the devices in the hierarchy associated with and including this PCI-Express port.

48.2.39 ROOTCAP—Offset 5Eh

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 5Eh

Default: 0001h

Bit Range	Default & Access	Field Name (ID): Description
15:1	0x0 RO	**RSVD0:** Reserved
0	0x1 RW/L	**CRS Software Visibility (CRSSV):** This bit, when set, indicates that the Root Port is capable of returning Configuration Retry Status (CRS) on completions to software. Based on Design input, the CRS notification will be implemented in the EIP PCIe macro and hence the default is set to 1. The field attribute is made as RW-O for any specific changes to be installed by BIOS **Power Well:** PRST

48.2.40 ROOTSTS—Offset 60h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 60h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0x0 RO	**RSVD0:** Reserved
17	0x0 RO/V	**PME Pending (PMEPEND):** This field indicates that another PME is pending when the PME Status bit is set. When the PME Status bit is cleared by software, the pending PME is delivered by hardware by setting the PME Status bit again and updating the Requestor ID appropriately. The PME pending bit is cleared by hardware if no more PMEs are pending. ***Note:*** The root port can handle two outstanding PM_PME messages in its internal queues of the Power Management controller per port. If the downstream device issues more than 2 PM_PME messages successively, it will be dropped.
16	0x0 RW/1C/V	**PME Status (PMESTS):** This field indicates status of a PME that is underway in the PCI-Express port. 1: PME was asserted by a requester as indicated by the PMEREQID field. This bit is cleared by software by writing a '1'. Subsequent PMEs are kept pending until the PME Status is cleared.
15:0	0x0 RO/V	**PME Requester ID (PMERID):** This field indicates the PCI requester ID of the last PME requestor.

48.2.41 DEVCAP2—Offset 64h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 64h

Default: 00000437h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**RSVD0:** Reserved
23:22	0x0 RW/L	**Max End-End TLP Prefixes (MAXE2ETLP):** Indicates the maximum number of End-End TLP Prefixes supported by this Function. TLPs received by this Function that contain more End-End TLP Prefixes than are supported must be handled as Malformed TLPs. • 01: 1 End-End TLP Prefix • 10: 2 End-End TLP Prefixes • 11: 3 End-End TLP Prefixes • 00: 4 End-End TLP Prefixes • If End-End TLP Prefix Supported is Clear, this field is Reserved. **Power Well:** PRST
21	0x0 RW/L	**End-End TLP Prefix Supported (E2ETLPS):** Indicates whether End-End TLP Prefix support is offered by a Function. • 0: No Support • 1: Support is provided to receive TLPs containing End-End TLP Prefixes. The EIP does not support E2E TLP prefix and is hardwired to 0. **Power Well:** PRST
20	0x0 RW/L	**Extended Fmt Field Supported (EXFMTFS):** • 0: The Function supports a 2-bit definition of the Fmt field (default) • 1: The Function supports the 3-bit definition of the Fmt field. Must be Set for Functions that support End-End TLP Prefixes. **Power Well:** PRST
19:18	0x0 RW/L	**OBFF Supported (OBFFS):** • 00b: OBFF Not Supported • 01b: OBFF supported using Message signaling only • 10b: OBFF supported using WAKE# signaling only • 11b: OBFF supported using WAKE# and Message signaling Applicable only to Root Ports, Switch Ports, and Endpoints that support this capability. Must be 00b for other function types. **Power Well:** PRST
17:14	0x0 RO	**RSVD1:** Reserved
13:12	0x0 RW/L	**TPH Completer Supported (TPHCS):** Value indicates Completer support for TPH or Extended TPH. • 00b:TPH and Extended TPH Completer not supported • 01b: TPH Completer supported, Extended TPH completer not supported • 10b: Reserved • 11b: Both TPH and Extended TPH Completer supported Applicable only to Root Ports and Endpoints. Must be 00b for other function types. **Power Well:** PRST
11	0x0 RW/L	**LTR Mechanism Supported (LTRMS):** This bit when set indicates support for the Latency Tolerance Reporting (LTR) mechanism. **Power Well:** PRST

Bit Range	Default & Access	Field Name (ID): Description
10	0x1 RW/L	**No RO-enabled PR-PR Passing (NROEPRPASS):** This bit if set to 1b disables passing permitted by row entry A2b in PCIe ordering table that is associated with the Relaxed Ordering Attribute field being set. This bit applies only for Switches and RCs that support peer-to-peer traffic between ports. The bit only applies to posted requests being forwarded through the switch or RC. It does not apply to traffic originating or terminating with in the switch or RC itself. **Power Well:** PRST
9	0x0 RW/L	**AD128 CAS Completer Supported (AD128ACS):** This bit must be set to 1b if the function supports this optional capability. Applicable to functions with memory space BARs as well as Root Ports. **Power Well:** PRST
8	0x0 RW/L	**AD64-bit AtomicOp Completer Supported (AD64ACS):** This bit must be set to 1b if the function supports this optional capability. Applicable to Functions with Memory Space BARs as well as all Root Ports, must be 0b otherwise. Includes FetchAdd, Swap, and CAS AtomicOps. **Power Well:** PRST
7	0x0 RW/L	**AD32 bit AtomicOp Completer Supported (AD32ACS):** Applicable to Functions with Memory Space BARs as well as all Root Ports, must be 0b otherwise. Includes FetchAdd, Swap, and CAS AtomicOps. This bit must be set to 1b if the Function supports this optional capability. This is set to 1 for Rootport implementations in the PCIe EIP. **Power Well:** PRST
6	0x0 RW/L	**AtomicOp Routing Supported (ARS):** This bit must be set to 1b if the port supports this optional capability. Applicable only to switch upstream ports, Switch downstream ports, and root ports. Must be 00b for other function types. **Power Well:** PRST
5	0x1 RW/L	**ARI Forwarding Supported (ARI):** This bit is set to 1b indicating that the downstream port supports this capability. Applicable only to Switch Downstream Ports and Root Ports, must be 0b for other Function types. This bit must be set to 1b if a Switch Downstream Port or Root Port supports this optional capability. **Power Well:** PRST
4	0x1 RW/L	**Completion Timeout Disable Support (CTDS):** A value of 1b indicates support for the completion Timeout Disable Mechanism. Support of completion timeout disable is optional for Root Ports. The PCIe port supports completions timeout disable. **Power Well:** PRST

Bit Range	Default & Access	Field Name (ID): Description
3:0	0x7 RW/L	**Completion Timeout Range Supported (CTRS):** This field indicates device support for the optional Completion Timeout programmability mechanism. This mechanism allows system software to modify the Completion Timeout value. This field is applicable only to Root Ports, Endpoints that issue requests on their own behalf, and PCI Express to PCI/PCI-X Bridges that take ownership of request issues on PCI Express. Four time values ranges are defined: • Range A: 50us to 10ms • Range B: 10ms to 250ms • Range C: 250ms to 4s • Range D: 4s to 64s Bits ares set according to table below to show timeout value ranges supported. • 0000b: Completions Timeout programming not supported -- values are fixed by implementation in the range 50us to 50ms. • 0001b: Range A • 0010b: Range B • 0011b: Range A and B • 0110b: Range B and C • 0111b: Range A, B, and C • 1111b: Range A, B, C and D All other values are reserved. • For all other devices this field is reserved and maybe be hardwired to 0000b. **Power Well:** PRST

48.2.42 DEVCTL2—Offset 68h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 68h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RO	**End-End TLP Prefix Blocking (E2ETLPBLK):** Controls whether the routing function is permitted to forward TLPs containing an End-End TLP Prefix. • 0: Forwarding Enabled - Function is permitted to send TLPs with End-End TLP Prefixes. • 1: Forwarding Blocked - Function is not permitted to send TLPs with End-End TLP Prefixes.
14:13	0x0 RW	**OBFF Enable (OBFFE):** • 00b: OBFF Disabled • 01b: OBFF Enabled using Message signaling [Variation A] • 10b: OBFF Enabled using Message signaling [Variation B] • 11b: OBFF Enabled using WAKE# signaling This field is required for all Ports that support the OBFF Capability. For a Multi-Function Device associated with an Upstream Port of a Device that implements OBFF, the field in Function 0 is of type RW, and only Function 0 controls the Component's behavior. In all other Functions of that Device, this field is of type RsvdP.
12:11	0x0 RO	**RSVD0:** Reserved
10	0x0 RW/V	**LTR Mechanism Enable (LTRME):** When set to 1b, this bit enables Upstream Ports to send LTR messages and Downstream Ports to process LTR Messages. Applicable to Root Ports, Switches, and Endpoints that implement the LTR capability must implement this bit. For Downstream Ports, this bit must be reset to the default value if the Port goes to DL_Down status.
9	0x0 RO	**IDO Completion Enable (IDOCE):** This bit when set to 1b allows the function to set the ID-Based Ordering (IDO) bit of completions it returns. Applicable only to Endpoints including RC integrated Endpoints and Root Ports.
8	0x0 RO	**IDO Request Enable (IDORE):** This bit when set to 1b allows the function to set the ID-Based Ordering (IDO) bit on requests it initiates. Applicable only to Endpoints including RC integrated Endpoints and Root Ports.
7	0x0 RW	**AtomicOp Egress Blocking (AEB):** When this bit is set, AtomicOp requests that target this out going Egress port must be blocked. Applicable and mandatory for switch Upstream Ports, Switch Downstream Ports, and Root Ports that implement AtomicOp routing capability. Otherwise, must be hardwired to 0b.
6	0x0 RW	**AtomicOp Requester Enable (ARE):** Applicable only to Endpoints and Root Ports, must be hardwired to 0b for other Function types. The Function is allowed to initiate AtomicOp Requests only if this bit and the Bus Master Enable bit in the Command register are both Set.
5	0x0 RW	**ARI Forwarding Enable (ARIE):** When set to 1b, ARI is enabled for the downstream port or root ports. The Downstream Port disables its traditional Device Number field being 0 enforcement when turning a Type 1 Configuration Request into a Type 0 Configuration Request, permitting access to Extended Functions in an ARI Device immediately below the Port. Default value of this bit is 0b.
4	0x0 RW	**Completion Timeout Disable (CTD):** • 1: Disable the completions timeout mechanism for all NP transactions. • 0: Completion timeout is enabled for all NP transactions.

Bit Range	Default & Access	Field Name (ID): Description
3:0	0x0 RW	**Completion Timeout Value (CTV):** In devices that support completion timeout programmability, this field allows system software to modify the completion timeout range. The following encodings and corresponding timeout ranges are defined based on implementation choice. This field provides finer control based over the ranges chosen by DEVAP2.CTRS. The implementation specific range is shown in brackets • 0000b: 50us to 50ms (16.8ms - 25.2ms based on core clk period) • 0001b: 50us to 100us (65.5us - 99.3us based on core clk period) • 0010b: 1ms to 10ms (4.2ms - 6.3ms based on core clk period) • 0101b: 16ms to 55ms (33.6ms - 50.3ms based on core clk period) • 0110b: 65ms to 210ms (134.2ms - 201.3ms based on core clk period) • 1001b: 260ms to 900ms (536.9ms - 805.3ms based on core clk period) • 1010b: 1s to 3.5s (2.1s - 3.2s based on core clk period) • 1101b: 4s to 13s (8.6s - 12.9s based on core clk period) • 1110b: 17s to 64s (34.4s - 51.5s based on core clk period) • All others are reserved. It is highly recommended that the completion timeout value not be less then 10ms. A small completion timeout value may result in premature completion timeout for slower responding devices.

48.2.43 LINKCAP2—Offset 6Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 6Ch

Default: 0000000Eh

Bit Range	Default & Access	Field Name (ID): Description
31:23	0x0 RO	**RSVD0:** Reserved
22:16	0x0 RW/L	**Lower SKP OS Reception Supported Speeds Vector (LSKPOSRSSV):** If this field is non-zero, it indicates that the Port, when operating at the indicated speed(s) supports SRIS and also supports receiving SKP OS at the rate defined for SRNS while running in SRIS. Bit definitions within this field are: • Bit 0 2.5 GT/s • Bit 1 5.0 GT/s • Bit 2 8.0 GT/s • Bits 6:3 RsvdP Multi-Function devices associated with an Upstream Port must report the same value in this field for all Functions. Behavior is undefined if a bit is Set in this field and the corresponding bit is not Set in the Supported Link Speeds Vector. Currently, design does not support reception of low frequency SOS in L0. **Power Well:** PRST
15:9	0x0 RW/L	**Lower SKP OS Generation Supported Speeds Vector (LSKPOSGSSV):** If this field is non-zero, it indicates that the Port, when operating at the indicated speed(s) supports SRIS and also supports software control of the SKP Ordered Set transmission scheduling rate. Bit definitions within this field are: • Bit 0 2.5 GT/s • Bit 1 5.0 GT/s • Bit 2 8.0 GT/s • Bits 6:3 RsvdP Multi-Function devices associated with an Upstream Port must report the same value in this field for all Functions. Behavior is undefined if a bit is Set in this field and the corresponding bit is not Set in the Supported Link Speeds Vector. **Power Well:** PRST
8	0x0 RW/L	**Crosslink Supported (CLS):** When set to 1b, this bit indicates that the associated Port supports crosslinks When set to 0b on a Port that supports Link speeds of 8.0 GT/s or higher, this bit indicates that the associated Port does not support crosslinks. When set to 0b on a Port that only supports Link speeds of 2.5 GT/s or 5.0 GT/s, this bit provides no information regarding the Port's level of crosslink support. It is recommended that this bit be Set in any Port that supports crosslinks even though doing so is only required for Ports that also support operating at 8.0 GT/s or higher Link speeds. ***Note:*** Software should use this bit when referencing fields whose definition depends on whether or not the Port supports crosslinks. **Power Well:** PRST
7:1	0x7 RO/V	**Supported Link Speeds Vector (SLNKSPV):** This field indicates the supported Link speed(s) of the associated Port. For each bit, a value of 1b indicates that the corresponding Link speed is supported, otherwise, the Link speed is not supported. Bit definitions are: • Bit 1 2.5 GT/s • Bit 2 5.0 GT/s • Bit 3 8.0 GT/s • Others: Reserved
0	0x0 RO	**RSVD1:** Reserved

48.2.44 LINKCTL2—Offset 70h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 70h

Default: 0003h

Bit Range	Default & Access	Field Name (ID): Description
15:12	0x0 RW/P	**Compliance Preset/De-emphasis (CD):** For 8 GT/s and 5 GT/s: This bit sets the transmitter preset level for Polling. Compliance state if the entry occurred due to the Enter Compliance bit being 1b. The Encoding are defined as follows: 8 GT/s Rate: • 0000b: -6 dB for de-emphasis, 0 dB for preshoot • 0001b: -3.5 dB for de-emphasis, 0 dB for preshoot • 0010b: -4.5 dB for de-emphasis, 0 dB for preshoot • 0011b: -2.5 dB for de-emphasis, 0 dB for preshoot • 0100b: 0 dB for de-emphasis, 0 dB for preshoot • 0101b: 0 dB for de-emphasis, 2 dB for preshoot • 0110b: 0 dB for de-emphasis, 2.5 dB for preshoot • 0111b: -6 dB for de-emphasis, 3.5 dB for preshoot • 1000b: -3.5 dB for de-emphasis, 3.5 dB for preshoot • 1001b: 0 dB for de-emphasis, 3.5 dB for preshoot • 1010b: The Transmitter Preset encoding of 1010b corresponds to the maximum Vtx-boost that the Transmitter advertises with FS and LF in both full swing and reduced swing modes with C-1 = 0 and C+1 = FS - (2*LF). • All other encodings are reserved. 5 GT/s Rate: • 001b: -3.5dB • 000b: -6 dB • All other are reserved. When the link is operating at 2.5 Gb/s, the setting of this bit has no effect. Components that support only 2.5 GT/s speed are permitted to hardwire this bit to 0b.
11	0x0 RW/P	**Compliance SOS (CSOS):** When set to 1b, the LTSSM is required to send Skip Ordered Sets periodically in between the (modified) compliance patterns.
10	0x0 RW/P	**Enter Modified Compliance (EMC):** When set to 1b, the device transmits Modified Compliance Pattern if the LTSSM enters Polling. Compliance substate. This register is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this register only during debug or compliance testing. In all other cases, the system must ensure that this register is set to the default value.
9:7	0x0 RW/V/P	**Transmit Margin (TM):** This field controls the value of the non-de-emphasized voltage level at the transmitter pins. This field is reset to 000b on entry to the LTSSM Polling. Configuration substate. • 000b: Normal operating range • 001b: 800-1200mV for full swing and 400-700mV for half-swing • 010b-110b: TBD • Others: Reserved This register is intended for debug, compliance testing purposes only. System firmware and software is allowed to modify this register only during debug or compliance testing. In all other cases, the system must ensure that this register is set to the default value.
6	0x0 RW/L	**Selectable De-emphasis (SD):** Applicable to RootPorts and downstream ports of PCI Express to PCIe bridges. When the link is operating at 5 Gb/s speed, this bit selects the level of de-emphasis for an Downstream Port. Encodings: 1b -3.5 dB 0b -6 dB When the Link is operating at 2.5 GT/s speed, the setting of this bit has no effect. **Power Well:** PRST

Bit Range	Default & Access	Field Name (ID): Description
5	0x0 RW/P	**Hardware Autonomous Speed Disable (HASD):** When set, this bit disables hardware from changing the link speed for device specific reasons other than attempting to correct unreliable link operation by reducing link speed for device-specific reasons other than attempting to correct unreliable link operations by reducing link speed. Initial transition to the highest supported common link speed is not blocked by this bit.
4	0x0 RW/V/P	**Enter Compliance (EC):** Software is permitted to force a link to enter compliance mode at the speed indicated in the Target Link Speed field by setting this bit to 1b in both components on a link and then initiating a hot reset on the link.
3:0	0x3 RW/V/P	**Target Link Speed (TLS):** For downstream ports and root ports, this field sets an upper limit on link operational speed by restricting the values advertised by the Downstream Port in its training sequences. • 0001b: 2.5 Gb/s Target Link Speed • 0010b: 5.0 Gb/s Target Link Speed • 0011b: 8.0 Gb/s Target Link Speed • Others: Reserved. The encoding is the binary value of the bit in the Supported Link Speeds Vector (in the Link Capabilities 2 register) that corresponds to the desired target Link speed. • All other encodings are reserved If a value is written to this field that does not correspond to a speed included in the Supported Link Speeds field, the result is undefined. The default value of this field is the highest Link speed supported by the component (as reported in the Max Link Speed field of the Link Capabilities register) unless the corresponding platform/form factor requires a different default value. For both Upstream and Downstream Ports, this field is used to set the target compliance mode speed when software is using the Enter Compliance bit to force a Link into compliance mode.

48.2.45 LINKSTS2—Offset 72h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 72h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:6	0x0 RO	**RSVD0:** Reserved
5	0x0 RW/1C/V/P	**Link Equalization Request (LNKEQREQ):** This bit is set by hardware to request the Link equalization process to be performed on the Link.
4	0x0 RO/V/P	**Equalization Phase 3 Successful (EQPH3SUCC):** When set to 1b, this bit indicates that Phase 3 of the Transmitter Equalization procedure has successfully completed.
3	0x0 RO/V/P	**Equalization Phase 2 Successful (EQPH2SUCC):** When set to 1b, this bit indicates that Phase 2 of the Transmitter Equalization procedure has successfully completed.
2	0x0 RO/V/P	**Equalization Phase 1 Successful (EQPH1SUCC):** When set to 1b, this bit indicates that Phase 1 of the Transmitter Equalization procedure has successfully completed.
1	0x0 RO/V/P	**Equalization Complete (EQCMPLT):** When set to 1b, this bit indicates that the Transmitter Equalization procedure has successfully completed.
0	0x0 RO/V	**Current De-emphasis Level (CDL):** When the link is operating at 5 Gb/s speed, this bit reflects the level of de-emphasis. • 1b: -3.5 dB • 0b: -6dB The value in this bit is undefined when the Link is not operating at 5.0 GT/s speed. Components that support only the 2.5 GT/s speed are permitted to hardwire this bit to 0b.

48.2.46 PMCAPLST—Offset 80h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 80h

Default: 8801h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x88 RO	**Next Pointer (NextPointer):** Contains the offset of the next item in the capabilities list. (SSCAPLST)
7:0	0x1 RO	**Capability ID (CapabilityID):** Identifies the function as PCI Power Management capable.

48.2.47 PMCAP—Offset 82h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 82h

Default: C803h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0x19 RO	**PME_Support (PMES):** PME assertion is supported when in D3hot/D3cold. Identifies power states in which the PCIe can send an 'Assert_PMEGPE/Deassert PMEGPE' message. Bits 15, 14 and 11 must be set to '1' for PCIPCI bridge structures representing ports on root complexes. The definition of these bits is taken from the PCI Bus Power Management Interface Specification Revision 1.1. • XXXX1b - Assert_PMEGPE/Deassert PMEGPE can be sent from D0 • XXX1Xb - Assert_PMEGPE/Deassert PMEGPE can be sent from D1 (Not supported by PCI-E) • XX1XXb - Assert_PMEGPE/Deassert PMEGPE can be sent from D2 (Not supported by PCI-E) • X1XXXb - Assert_PMEGPE/Deassert PMEGPE can be sent from D3 hot (Supported by PCI-E) • 1XXXXb - Assert_PMEGPE/Deassert PMEGPE can be sent from D3 cold (Supported by PCI-E) In the EIP PCIe implementation, there is no PME support for D3 cold as the part does not have the capability. For PCIe compliance purposes, bit 15 is set to 1.
10	0x0 RO	**D2 Support (D2S):** Not supported
9	0x0 RO	**D1 Support (D1S):** Not supported
8:6	0x0 RO	**Auxiliary Current (AC):** Auxiliary power is not supported.
5	0x0 RO	**Device Specific Initialization (DSI):** Device-specific initialization is not required when transitioning to D0 from D3hot state. This bit is zero.
4	0x0 RO	**RSVD0:** Reserved
3	0x0 RO	**PME Clock (PMECLK):** Does not apply to PCI Express. Hard-wired to 0.
2:0	0x3 RO	**Version (VER):** The PM implementation in the PCIe cluster is compliant with PCI Bus Power Management Interface Specification, Revision 1.2.

48.2.48 PMCSR—Offset 84h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 84h

Default: 0008h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW/1C/V/P	**PME Status (PMESTS):** Reserved.
14:13	0x0 RO	**Data Scale (DC):** Not supported
12:9	0x0 RO	**Data Select (DS):** Not supported
8	0x0 RW/P	**PME Enable (PMEEN):** Gates assertion of the PME message.
7:4	0x0 RO	**RSVD0:** Reserved
3	0x1 RW/L	**No Soft Reset (NSR):** This bit when 1b indicates that a device transitioning from D3hot to D0 does not perform an internal reset. The configuration context is preserved. **Power Well:** PRST
2	0x0 RO	**RSVD1:** Reserved
1:0	0x0 RW/V	**Power State (PS):** This field is used both to determine the current power state of a function and to set the function into a new power state. The definition of the supported values is given below: • 0h - D0 • 3h - D3hot If software attempts to write an unsupported, optional state to this field, the write operation must complete normally, however, the data is discarded and no state change occurs.

48.2.49 PMBSE—Offset 86h

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 86h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RO	**Bus Power/Clock Control Enable (BPCC_EN):** Neither bus or clock control of PCI is supported when in D3hot state. This bit is hard-wired to 0.
6	0x0 RO	**B2/B3# (B23EN):** Not supported. This bit has no meaning since the BPCC_En bit is hard-wired to 0.
5:0	0x0 RO	**RSVD0:** Reserved

48.2.50 SSCAPLST—Offset 88h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 88h

Default: 900Dh

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x90 RO	**Next Pointer (NP):** Contains the offset of the next item in the capabilities list. (MSICAPLST)
7:0	0xd RO	**Capability ID (CAPID):** Identifies the function as Subsystem Identification capable.

48.2.51 SSVID—Offset 8Ch

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 8Ch

Default: 8086h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x8086 RW/L	**Subsystem Vendor Identifier (SSVID):** Assigned by PCI-SIG for vendor ID. **Power Well:** PRST

48.2.52 SSID—Offset 8Eh

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 8Eh

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x0 RW/L	**Subsystem Identifier (SSID):** Assigned to uniquely identify the subsystem vendor. **Power Well:** PRST

48.2.53 MSICAPLST—Offset 90h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 90h

Default: 0005h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x0 RO	**Next Pointer (NP):** Contains the offset of the next item in the capabilities list (MSIXCAPLST). A null value is used to indicate that this is the last capability. The Next Pointer is terminated for DP, vRP/vSP, RP and DMI EP in RC.
7:0	0x5 RO	**Capability ID (CAPID):** Identifies the function as MSI capable.

48.2.54 MSICTL—Offset 92h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 92h

Default: 0100h

Bit Range	Default & Access	Field Name (ID): Description
15:9	0x0 RO	**RSVD0:** Reserved
8	0x1 RW/L	**Per-vector masking capable (PVM):** This bit indicates that PCI Express ports support MSI per-vector masking. **Power Well:** PRST
7	0x0 RO	**Address 64-Bit Capable (AD64C):** When set, this bit indicates that the function is capable of generating a 64-bit message address.
6:4	0x0 RW	**Multiple Message Enable (MMEN):** Only one message is supported. These bits are R/W for software compatibility.
3:1	0x0 RO	**Multiple Message Capable (MMC):** Only one message is supported.
0	0x0 RW	**MSI Enable (MSIE):** When set, MSI is enabled and traditional interrupt pins are not used to generate interrupts.

48.2.55 MSIADDR—Offset 94h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 94h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**Address:** Message address specified by the system, always DWORD aligned
1:0	0x0 RO	**RSVD0:** Reserved

48.2.56 MSIDATA—Offset 98h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 98h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD0:** Reserved
15	0x0 RW	**Trigger Mode (TM):** • 0: Edge Triggered • 1: Level Triggered
14	0x0 RW	**Level (LVL):** if TM is 0h, then this field is a don't care. Edge triggered messages are always treated as assert messages. For level triggered interrupts, this bit reflects the state of the interrupt input if TM is 1h, then • 0: Deassert Messages • 1: Assert Messages
13:12	0x0 RW	**Future:** These bits are don't care for an IOxAPIC interrupt message data field specification.
11:8	0x0 RW	**Delivery Mode (DM):** • 0000: Fixed: Trigger Mode can be edge or level. • 0001: Lowest Priority: Trigger Mode can be edge or level. • 0010: SMI/PMI/MCA - Not supported via MSI of root port • 0011: Reserved - Not supported via MSI of root port • 0100: NMI - Not supported via MSI of root port • 0101: INIT - Not supported via MSI of root port • 0110: Reserved • 0111: ExtINT - Not supported via MSI of primary port • 1000 -1111 - Reserved
7:0	0x0 RW	**Interrupt Vector (IV):** The interrupt vector will be modified by the EIP PCIe Gen3 to provide context sensitive interrupt information for different events that require attention from the processor. e.g Hot plug, Power Management and RAS error events.

48.2.57 MSIMSK—Offset 9Ch

The MSI Mask Bit register enables software to disable message sending on a per-vector basis.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 9Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0x0 RO	**RSVD0:** Reserved
0	0x0 RW	**Mask Bits (MSKB):** For each Mask bit that is set, the PCI Express port is prohibited from sending the associated message. Corresponding bits are masked if set to '1'

48.2.58 MSIPENDING—Offset A0h

The Mask Pending register enables software to defer message sending on a per-vector basis.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + A0h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0x0 RO	**RSVD0:** Reserved
0	0x0 RO/V	**Pending Bits (PB):** For each Pending bit that is set, the PCI Express port has a pending associated message. Corresponding bits are pending if set to '1'

48.2.59 RPPMCSR—Offset A8h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + A8h

Default: 00000020h

Bit Range	Default & Access	Field Name (ID): Description
31:9	0x0 RO	**RSVD0:** Reserved
8	0x0 RO/V	**Mod-PHY Core Well Power Gating Status (MCWPGS):** This field reflects the effective 'Logical OR' state of the mod-PHY data lane 'Core Power Request' from controller to PHY and 'Core Power Ack' from PHY to controller for all the data lanes owned by the port. Software can read this bit to know that the mod-PHY Core Well power gating handshake is completed, before it proceeds to power down the mod-PHY Suspend Well using the RPPGEN.MDLSWPR and RPPGEN.MDLSWPA bits. This bit is intended to be used for RTD3, as part of the flow to power gate the mod-PHY Core Well.
7	0x0 RO/V	**Mod-PHY Data Lane Suspend Well Power Gating Exit Ack (MDLSWPGXA):** This fields reflects the effective 'Logical AND' of mod-PHY Data Lane Suspend Well Power Gating Exit Ack for all the data lanes owned by this port. • A '1b' indicates that at all the Data Lane Suspend Well Power Gating Exit Ack is asserted. • A '0b' indicates that at least one of the Data Lane Suspend Well Power Gating Exit Ack has been de-asserted. This bit is intended to be used for RTD3, as part of the flow to power gate the mod-PHY data lane Suspend Well.
6	0x0 RO/V	**Mod-PHY Data Lane Suspend Well Power Gating Entry Ack (MDLSWPGEA):** This fields reflects the effective 'Logical OR' of mod-PHY Data Lane Suspend Well Power Gating Entry Ack for all the data lanes owned by this port. • A '1b' indicates that at least one of the Data Lane Suspend Well Power Gating Entry Ack is still asserted. • A '0b' indicates that all the Data Lane Suspend Well Power Ack has been de-asserted. This bit is intended to be used for RTD3, as part of the flow to power gate the mod-PHY data lane Suspend Well.
5	0x1 RW	**Mod-PHY Data Lane Suspend Well Power Request (MDLSWPR):** Software can write a '0b' to this field to de-assert 'Suspend Well Power Request' to all the data lanes owned by this port only when MDLSWPGXA is '1b'. Software can write a '1b' to this field to assert Suspend Well Power Request to all the data lanes owned by this port only when MDLSWPGEA is '0b'. This bit is intended to be used for RTD3, as part of the flow to power gate the mod-PHY data lane Suspend Well.
4	0x0 RW	**PME_TO_ACK Timeout Policy (PME_TO_ACK_TOP):** When set, Root Port will trigger an exit if the link is in TXL0s or L1 and PME_TO_ACK timer times out.
3:2	0x0 RW	**PME_TO_ACK Timeout (PME_TO_ACK_TO):** This timer is activated from the time the PME_Turn_Off message is sent to the link. It will be reset once the timer expires or when PME_TO_ACK has been received from the downstream device and link has been put into L2/L3 Ready state. Once the timer expires, the Sx sequence will continue to take the link down. • 00: 1 ms (default) • 01: 10 ms • 10: 1 us (Pre-Si) • 11: Disable

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RW/V/P	**L23Rdy to Detect Transition (L23RDY2DT):** When set by software, the LTSSM moves from L2/L3 Ready to Detect state. This bit is cleared by hardware once the LTSSM is in Detect state. The PHY power and clocks needed to enable this transition is brought up in response to this bit being set by software. If the link is not in L2/L3 Ready when this bit is set, the bit is cleared immediately by hardware.
0	0x0 RW/V/P	**L23Rdy Entry Request (L23RDYER):** When set by software, the corresponding Root Port will initiate the sequence to put the link into L2/L3 Ready state. PME_Turn_Off message will be sent and the corresponding PME_TO_Ack response will be returned by the device. Once the link enters L2/L3 Ready, this bit will be cleared by hardware. Alternatively, this bit will be cleared by hardware when PME_Turn_Off timer time-out.

48.2.60 PMCSRS—Offset B0h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + B0h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW/P	**PME Status (PMESTS):** This field is utilized for Software to restore the PME Status once exit Sx State. Hardware will reflect the value to the associated PMCSR.PMESTS if this bit was written by Software.
14:0	0x0 RO	**RSVD0:** Reserved

48.2.61 PPBIFCTL—Offset C0h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + C0h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO/V/P	**Capability Lock (CL):** Lock key bit for all RW-L bits of PPBIFCTL register only. • 1b: Lock • 0b: Unlocked This bit is self-locking. Once this bit is set to a 1b from IOSF-SB, this key bit can not be unlocked. Writing a 0b has no affect on this bit.
30:3	0x0 RO	**RSVD0:** Reserved
2:0	0x0 RO/V/P	**Bifurcation Control 0 (BIFCTL0):** • 111-101: Reserved • 100: x8 • 011: x4x4 • 010: x4x2x2 • 001: x2x2x4 • 000: x2x2x2x2 A write of '1' on the CL will lock this register field down as bifurcation control status information.

48.2.62 SMICSR—Offset C8h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + C8h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0x0 RO	**RSVD0:** Reserved
18	0x0 RW/1C/V	**Hot Plug DLLSC SMI Status (HPLSCSMISTS):** This bit is set when rising edge detected as result of both SLOTSTS.DLLSCS and SMICSR.HPSMIE being set.
17	0x0 RW/1C/V	**Hot Plug SMI Status (HPSMISTS):** This bit is set when rising edge detected as result of both SLOTSTS.PDCS and SMICSR.HPSMIE being set.
16	0x0 RW/1C/V	**Power Management SMI Status (PMSMISTS):** This bit is set when rising edge detected as result of both ROOTSTS.PMESTS and SMICSR.PMSMIE being set.
15:2	0x0 RO	**RSVD1:** Reserved
1	0x0 RW	**Hot Plug SMI Enable (HPSMIE):** Enables the Root Port/DSP to generate SMI whenever a Hot Plug event is detected.
0	0x0 RW	**Power Management SMI Enable (PMSMIE):** Enables the Root Port to generate SMI whenever a power management event is detected.

48.2.63 SCICSR—Offset CCh

The Tag field is being used to differentiate between PMSCI (Tag = '001') and HPSCI (Tag = '000') for PMC whenever a single set of Assert/Deassert SCI is sent.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + CCh

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0x0 RO	**RSVD0:** Reserved
18	0x0 RW/1C/V	**Hot Plug DLLSC SCI Status (HPLSCSCISTS):** This bit is set when rising edge detected as result of both SLOTSTS.DLLSCS and SCICSR.HPSCIE being set.
17	0x0 RW/1C/V	**Hot Plug SCI Status (HPSCISTS):** This bit is set when rising edge detected as result of both SLOTSTS.PDCS and SCICSR.HPSCIE being set.
16	0x0 RW/1C/V	**Power Management SCI Status (PMSCISTS):** This bit is set when rising edge detected as result of both ROOTSTS.PMESTS and SCICSR.PMSCIE being set.
15:2	0x0 RO	**RSVD1:** Reserved
1	0x0 RW	**Hot Plug SCI Enable (HPSCIE):** Enables the Root Port/DSP to generate SCI whenever a Hot Plug event is detected.
0	0x0 RW	**Power Management SCI Enable (PMSCIE):** Enables the Root Port to generate SCI whenever a power management event is detected.

48.2.64 SSCTL—Offset D0h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + D0h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:9	0x0 RO	**RSVD0:** Reserved
8	0x0 RW/1C/V/P	**Stop and Scream Event Status (SSES):** This bit indicates that a stop and scream event has occurred on the Tx side of the PCI Express port due to a header or data parity error.
7:2	0x0 RO	**RSVD1:** Reserved
1	0x0 RW	**Stop and Scream LTSSM Operation (SSLTOP):** • 0: PCIe will set the affected link to 'link.disabled' state when the stop and scream condition is signaled by the Transaction Layer due to poisoned data. • 1: PCIe will set the affected link to 'link.disabled' state and then provide feedback to the Transaction Layer. The transaction layer will then initiate a link retraining sequence via the LTSSM to bring it back alive. Sometime the PCI Express port will be unable to return to normal operation due to the nature of the error that initiated the stop and scream mechanism. If Software desires to retrain the link when this field is set to 0, it can perform either of the following tasks: Change the LINKCTL.RL register field or Change mode field (SSLTOP) in this register to 1b or Initialize the BCTL.SBR to clear the sub-hierarchy of the PCI-Express port and reset. This SBR method is only applicable to standard PCI-Express ports and not the DMI This field will only return the PCI Express link back to normal operation after a logged Stop and Scream event. Errors such as header/control parity error which utilize the Stop and Scream mechanism will not be controlled by this register field. A platform reset will be required to re-enable the link. **Power Well:** PRST
0	0x0 RW	**Stop and Scream Enable (SSEN):** • 0: Disable Stop and Scream (normal/default operation) • 1: Enables the link to perform Stop and Scream functionality. When this bit is set, if PCIe root port or downstream port encounters a poisoned data traversing the outbound path, the cluster stops the data, sets the link_down condition internally and places the link in disable. Inbound/outbound paths are blocked and all outstanding requests will be master aborted including Memory, I/O and configuration requests. **Power Well:** PRST

48.2.65 EXPPTMBARCTL—Offset D2h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + D2h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:9	0x0 RO	**RSVD0:** Reserved
8	0x0 RW/L	**Disable MBAR mPhy (DMBARMPHY):** When set to a 1b, memory transaction targeting the 64K-128K space of the EXPPTMBAR dedicated for mPhy will be prevented from accessing control registers. Memory read transactions will return 0's. Memory writes will have no effect. **Power Well:** PRST
7:4	0x0 RO	**RSVD1:** Reserved
3	0x0 RW/L	**Disable Forth 4K Page (D4THPAGE):** When set to a 1b, memory transaction targeting the forth 4K page of the EXPPTMBAR will be prevented from accessing control registers. Memory read transactions will return 0's. Memory writes will have no effect. **Power Well:** PRST
2	0x0 RW/L	**Disable Third 4K Page (D3RDPAGE):** When set to a 1b, memory transaction targeting the third 4K page of the EXPPTMBAR will be prevented from accessing control registers. Memory read transactions return 0's. Memory writes will have no effect. **Power Well:** PRST
1	0x0 RW/L	**Disable Second 4K Page (D2NDPAGE):** When set to a 1b, memory transaction targeting the Second 4K page of the EXPPTMBAR will be prevented from accessing control registers. Memory read transactions will return 0's. Memory writes will have no effect. **Power Well:** PRST
0	0x0 RW/L	**Disable First 4K Page (D1STPAGE):** When set to a 1b, memory transaction targeting the first 4K page of the EXPPTMBAR will be prevented from accessing control registers. Memory read transactions will return 0's. Memory writes will have no effect. **Power Well:** PRST

48.2.66 PPD0—Offset D4h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + D4h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/L	**Capability Lock (CL):** Lock key bit for all RW-L bits of PPD0 register only. • 1b: Lock • 0b: Unlocked This bit is self-locking. Once this bit is set to a 1b, this key bit can not be unlocked. Writing a 0b has no affect on this bit. **Power Well:** PRST
30:14	0x0 RO	**RSVD0:** Reserved
13	0x0 RW/V/L	**Configuration Retry Enable (CRE):** This bit controls the ability of the external side of the NTB to respond to transactions (normal, UR, CRS). The PCIe link is expected to be active after training in about 10-100ms from platform reset deassertion. However, the internal controller may take longer to boot, and to initialize its registers. To allow longer boot time, the CRE bit is used to ensure that the Internal side and related functionality is up and operational before allowing transactions from the external side to be processed even though link training could have been completed prior. • 0: External Link handles PCIe transactions (configuration, memory, messages) in the normal fashion during linkup state. • 1: External Link presents Configuration Retry Status (CRS) to the incoming configuration cycle on the external cycle in the linkup state. • All other requests will be URed. The NTB will respond with Configuration Retry Status (CRS) on the PCIe link for configuration cycles until such time when the internal firmware completes initialization of all internal resources. If the external side sends any other request (memory, messages) before this initialization is done, it will be master aborted (UR) on the external side. It is the responsibility of software to adhere to this flow. This bit is reserved in Root Ports, Downstream Port and DMI EP in RC. This bit is not functional.
12:10	0x0 RO	**RSVD1:** Reserved
9:8	0x0 RO	**NTB Port Definition (NPD):** Value indicating the value to be loaded into the DID register (offset 02h). • 00b - RP0 • 01b - 2 NTBs connected back to back • 10b - Reserved • 11b - Reserved (NTB connected to a RP) The default value is determined by soft straps/fuse proxy. (DSP and NTB only)
7:4	0x0 RO	**RSVD2:** Reserved
3	0x0 RW/V	**Initiate Link Training 0 (ILINKTRN0):** This bit controls PCI Express port link training for associated ports. A value of '1' initiates link training on ports 0, 1, 2, and 3. After writing this bit to a a '1', software can poll the Data Link Layer link active bit in the LNKSTS register to determine if a port is up and running. The associated ports will not automatically initiate link training after reset unless soft strap default values have already set this bit to '1'. A write of '0' has no effect. A write of '1' will lock this register bit down and initiate link training. • 0: The associated PCI Express ports have not initiated link training. • 1: The associated PCI Express ports are initiating link training or have trained. The default value is determined by soft straps This will reset on DL_Down events when in NTB mode **Power Well:** PRST

Bit Range	Default & Access	Field Name (ID): Description
2:1	0x0 RO	**RSVD3:** Reserved
0	0x0 RW/P	**Clear ILINKTRN0 on Link down (ClrTrnEnOnLnkDn):** when set to 1, a link down event will cause the link train enable field of this register to be cleared and block subsequent training until that train enable is set again. If 0, a link down will not clear the train enable unless a link down causes a reset.

48.2.67 PBTXNCTL—Offset D8h

This register is reserved for the design team. These bits will control implementation specific features in the transaction layer.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + D8h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/P	**Disable APIC EOI Message (DEOIM):** This bit when set to 1b will disable downstream forwarding of the End of Interrupt (EOI) message by the Root Ports or DSP. The EOI message is silently dropped.
30	0x0 RW/P	**GPE Enable (GPEE):** • 1b: Enables 'Assert GPE' (Deassert_GPE) messages to be sent from Root Port. • 0b: Disables 'Assert GPE' (Deassert_GPE) messages. This bit has an overriding effect to generate an ACPI HP event over traditional interrupts. This bit only control the ports internally generated Assert, Deassert_GPE messages
29:26	0x0 RW/P	**Virtual Pin Port Number (VPPN):** This field is used to identify the SMBus device and port number of the 9555 SMBus components. [29:27] = SMBus Address [26] = IO Port
25	0x0 RW/P	**Enable Virtual Pin Port (DVPP):** This bit when set to 1b will enable the VPP pins for the given PCI Express port. • 1b: VPP is enable for this PCI Express port. • 0b: VPP is disable for this PCI Express port.
24	0x0 RW/P	**Hot Plug Form Factor (HPFF):** This bit determines the what hot plug form-factor a particular port. • 0: CEM/Cable • 1: SIOM This bit is used to interpret bit 6 in the VPP serial stream for the port as either MRL# (CEM/Cable) or EMILS (SIOM) input.
23:18	0x0 RW/P	**Undefined:** Design Specific Control bits
17	0x0 RW/P	**Select Override Enable (SOE):** This bit when 1b enables the VPP Select Override field to program the 9555 IO pin direction.
16	0x0 RW/P	**Inversion Override Enable (IOE):** This bit when 1b enables the VPP Inversion Override field to program the 9555 IO pin polarity.
15:8	0x0 RW/P	**VPP Select Override (VPPSELOV):** This field is used by the HP SMBus controller to program the 9555 IO pin direction. Each bit corresponds to a pin for the VPP. • 0b: indicates input • 1b: indicates output pin
7:0	0x0 RW/P	**VPP Inversion Override (VPPIOV):** This field is used by the HP SMBus controller to program the 9555 IO pin polarity. Each bit corresponds to a pin for the VPP. • 1b: Invert Polarity. • 0b: Polarity not inverted.

48.2.68 PBPHYCTL—Offset E0h

This register is reserved for the design team. These bits will control implementation specific features in the physical layer.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + E0h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/P	**Undefined:** Design Specific Control bits

48.2.69 PLKCTL—Offset EAh

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + EAh

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:3	0x0 RO	**RSVD0:** Reserved
2	0x0 RW/L	**Lnk Layer Capability Lock (LLCL):** Lock key bit for all RWS-L bits located in the following CSRs. XPLDEF XPLDEF2 LLRBERRINJCTL RXPERRINJCTL CRCERRINJCTL CRCERRINJMSK RTRYCTL PACKTHRESH • 1b: Lock • 0b: Unlocked This bit is self-locking. Once this bit is set to a 1b, this key bit can not be unlocked. Writing a 0b has no affect on this bit. **Power Well:** PRST
1	0x0 RW/L	**Txn Layer Capability Lock (TLCL):** Lock key bit for all RWS-L bits located in XPEINJ[1:0], XPCDTHROTTLEP,N,C, XPTDEF*, MBAR01CTL EXPPTMBARCTL. • 1b: Lock • 0b: Unlocked This bit is self-locking. Once this bit is set to a 1b, this key bit can not be unlocked. Writing a 0b has no affect on this bit. **Power Well:** PRST
0	0x0 RW/L	**Capability Lock (CL):** Lock key bit for all RWS-L bits (capabilities, next capability pointer, SSID/SVID, slot register, etc) bits for the function. • 1b: Lock • 0b: Unlocked This bit is self-locking. Once this bit is set to a 1b, this key bit can not be unlocked. Writing a 0b has no affect on this bit. **Power Well:** PRST

48.2.70 LTRCSR—Offset ECh

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + ECh

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/L	**Capability Lock (CL):** Lock key bit for all RW-L bits of LTRCSR and LTROVR register only. • 1b: Lock • 0b: Unlocked This bit is self-locking. Once this bit is set to a 1b, this key bit can not be unlocked. Writing a 0b has no affect on this bit. **Power Well:** PRST
30:18	0x0 RO	**RSVD0:** Reserved
17	0x0 RW/1C/V	**Invalid LTR Latency Scale Value Received (IVLSVR):** Set to '1' by hardware when an LTR message is received with Not Permitted Latency Scale Value and both the LTR Mechanism Supported bit and the LTR Mechanism Enable bit are set. Cleared to '0' by software writing 1 to this register.
16	0x0 RW/1C/V	**LTR Received (LTRR):** Set to '1' by hardware when an LTR message is received and both the LTR Mechanism Supported bit and LTR Mechanism Enable bit are set. It can be set/cleared by hardware internally, or software by writing 1 to clear it.
15:4	0x0 RO	**RSVD1:** Reserved
3	0x0 RW/P	**LTR Aggregation Mode Disable (LTRAMD):** Default is 0 to enable LTR aggregation mode. Set 1 to disable LTR Aggregation Mode.
2	0x0 RW/L	**LTR Override Policy (LTROVRPLCY):** This register bit defines the LTR override behavior when the respective LTR Override Enable bits are set. • 0: The LTR Override values will be in effect when the link is up and in D0, until a valid new LTR message is received from the device. • 1: The LTR Override values will be in effect when the link is up and in D0. LTR values from the valid new LTR message received from device will be ignored. ***Note:*** This register should be programmed prior to enabling LTR override and should not be modified after LTR override has been enabled. **Power Well:** PRST
1	0x0 RW/L	**LTR No-Snoop Override Enable (LTRNSOVREN):** When this bit is set, the latency tolerance values for this port will be overridden to the values programmed in the LTRNSLOVRV, LTRNSLSOVRV and LTRNSROVR fields. The latency values from the LTR messages received from the devices will be ignored. Hardware should treat this bit as dynamic and the transition of this bit from '0' to '1' will cause a new IOSF sideband LTR message to be sent to update PMC if the new aggregated latency values change as a result of this. **Power Well:** PRST
0	0x0 RW/L	**LTR Snoop Override Enable (LTRSOVREN):** When this bit is set, the latency tolerance values for this port will be overridden to the values programmed in the LTRSLOVRV, LTRSLSOVRV and LTRSROVR fields. The latency values from the LTR messages received from the devices will be ignored. Hardware should treat this bit as dynamic and the transition of this bit from '0' to '1' will cause a new IOSF sideband LTR message to be sent to update PMC if the new aggregated latency values change as a result of this. **Power Well:** PRST

48.2.71 LTRL—Offset F0h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + F0h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO/V	**LTR No-Snoop Latency Field (LTRNSLF):** This field contains the No-Snoop Latency field of the latest received LTR Message. When an LTR message is received and both the LTR Mechanism Supported bit and LTR Mechanism Enable field are set, bytes 12:13 of the PCIe header are stored in this register. This includes the case where the Latency Scale Value contains 'Not Permitted' encoding.
15:0	0x0 RO/V	**LTR Snoop Latency Field (LTRSLF):** This field contains the Snoop Latency field of the latest received LTR Message. When an LTR message is received and both the LTR Mechanism Supported bit and LTR Mechanism Enable field are set, bytes 14:15 of the PCIe header are stored in this register. This includes the case where the Latency Scale Value contains 'Not Permitted' encoding.

48.2.72 LTROVR—Offset F4h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + F4h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/L	**LTR No-Snoop Requirement Bit Override (LTRNSROVR):** This field contains the No-Snoop Requirement bit override value for this particular PCIe root port. This field is Read-Only when LTRCSR.CL is set. **Power Well:** PRST
30:29	0x0 RO	**RSVD0:** Reserved
28:26	0x0 RW/L	**LTR No-Snoop Latency Scale Override Value (LTRNSLSOVRV):** This field contains the Snoop latency scale override value for this particular PCIe root port. • 000: LTRNSLOVRV times 1 ns • 001: LTRNSLOVRV times 32 ns • 010: LTRNSLOVRV times 1,024 ns • 011: LTRNSLOVRV times 32,768 ns • 100: LTRNSLOVRV times 1,048,576 ns • 101: LTRNSLOVRV times 33,554,432 ns • Others: Not Permitted. This field is Read-Only when LTRCSR.CL is set. **Power Well:** PRST
25:16	0x0 RW/L	**LTR No-Snoop Latency Override Value (LTRNSLOVRV):** This field contains the No-Snoop latency override value for this particular PCIe root port. This field is Read-Only when LTRCSR.CL is set. **Power Well:** PRST
15	0x0 RW/L	**LTR Snoop Requirement Bit Override (LTRSROVR):** This field contains the No-Snoop Requirement bit override value for this particular PCIe root port. This field is Read-Only when LTRCSR.CL is set. **Power Well:** PRST
14:13	0x0 RO	**RSVD1:** Reserved
12:10	0x0 RW/L	**LTR Snoop Latency Scale Override Value (LTRSLSOVRV):** This field contains the Snoop latency scale override value for this particular PCIe root port. • 000: LTRSLOVRV times 1 ns • 001: LTRSLOVRV times 32 ns • 010: LTRSLOVRV times 1,024 ns • 011: LTRSLOVRV times 32,768 ns • 100: LTRSLOVRV times 1,048,576 ns • 101: LTRSLOVRV times 33,554,432 ns • Others: Not Permitted. This field is Read-Only when LTRCSR.CL is set. **Power Well:** PRST
9:0	0x0 RW/L	**LTR Snoop Latency Override Value (LTRSLOVRV):** This field contains the Snoop latency override value for this particular PCIe root port. This field is Read-Only when LTRCSR.CL is set. **Power Well:** PRST

48.2.73 INTXSWZCTL—Offset F8h

This register provides software the ability to swizzle the legacy interrupts (INTx) from each port and remap them to a different interrupt type for purposes of interrupt rebalancing. This swizzling only applies to inbound INTx messages that arrive on the secondary side of the switch or root port. This register does not affect PCI-Express defined INTx re-map based on device # that is required by the PCI-Express base specification.

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + F8h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0x0 RO	**RSVD0:** Reserved
2:0	0x0 RW/L	**INTx Swizzle (INTXSWZ):** The encoding below defines the target INTx type to which the incoming INTx message is mapped to for that port. • 000b:INTA=)INTA, INTB=)INTB, INTC=)INTC, INTD=)INTD, • 001b:INTA=)INTB, INTB=)INTC, INTC=)INTD, INTD=)INTA, • 010b:INTA=)INTC, INTB=)INTD, INTC=)INTA, INTD=)INTB, • 011b:INTA=)INTD, INTB=)INTA, INTC=)INTB, INTD=)INTC, • 100b:INTA=)INTA, INTB=)INTA, INTC=)INTA, INTD=)INTA, **Power Well:** PRST

48.2.74 CFGAGTERR—Offset FCh

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + FCh

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:11	0x0 RO	**RSVD0:** Reserved
10	0x0 RW/1C/V/P	**Data Parity Error Status (DPES):** Reserved.
9	0x0 RO	**RSVD1:** Reserved
8	0x0 RW/1C/V/P	**Transaction Layer Internal Parity Error Status (TLIPES):** Reserved.
7	0x0 RW/1C/V/P	**Link Layer Internal Parity Error Status (LLIPES):** Reserved.
6	0x0 RW/1C/V/P	**Physical Layer Internal Parity Error Status (PLIPES):** Reserved.
5	0x0 RO	**RSVD2:** Reserved
4	0x0 RW/P	**Data Parity Error Mask (DPEM):** Reserved.
3	0x0 RO	**RSVD3:** Reserved
2	0x0 RW/P	**Transaction Layer Internal Parity Error Mask (TLIPEM):** Reserved.
1	0x0 RW/P	**Link Layer Internal Parity Error Mask (LLIPEM):** Reserved.
0	0x0 RW/P	**Physical Layer Internal Parity Error Mask (PLIPEM):** Reserved.

48.2.75 AERCAPHDR—Offset 100h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 100h

Default: 13810001h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0x138 RW/L	**Next Capability Offset (NCO):** Contains the offset of the next structure in the Extended Capabilities list. (ACSCAPHDR). Software will need to program this field appropriately for linked capabilities list if default is not supported. **Power Well:** PRST
19:16	0x1 RO	**Capability Version (CV):** Indicates the version of the Capability structure present.
15:0	0x1 RO	**Extended Capability ID (EXCAPID):** Identifies the function as Advanced Error Reporting capable.

48.2.76 ERRUNCSTS—Offset 104h

This register reports the error status of individual uncorrectable error sources. An individual error status bit that is set to 1 indicates that a particular error occurred. Software can clear an error status by writing a 1 to the respective bit.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 104h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0x0 RO	**RSVD0:** Reserved
26	0x0 RW/1C/V/P	**Poisoned TLP Egress Blocked Status (PTLPEBS):** Reserved.
25	0x0 RO	**TLP Prefix Blocked Error Status (TPBES):** Reserved.
24	0x0 RW/1C/V/P	**Atomic Egress Blocked Status (AEBE):** This bit is set whenever an Atomic OP TLP is blocked on any egress port
23	0x0 RW/1C/V/P	**MC Blocked TLP Status (MCE):** This bit is set whenever a Multicast TLP is blocked.
22	0x0 RW/1C/V/P	**Uncorrectable Internal Error Status (UIE):** This bit is set whenever an uncorrectable internal error is detected.
21	0x0 RW/1C/V/P	**ACS Violation Status (ACSE):** This bit is set whenever an ACS violation is detected by the PCI Express port.
20	0x0 RW/1C/V/P	**Unsupported Request Error Status (URE):** This bit is set whenever an unsupported request is detected on PCI Express port
19	0x0 RW/1C/V/P	**ECRC Error Status (ECRCE):** ECRC checking is optional for project specific.
18	0x0 RW/1C/V/P	**Malformed TLP Status (MTLPE):** This bit is set when it receives a malformed TLP. Header logging is performed.
17	0x0 RW/1C/V/P	**Receiver Overflow Status (ROE):** This bit is set when the PCI Express interface unit receive buffers overflow.
16	0x0 RW/1C/V/P	**Unexpected Completion Status (UCE):** This bit is set whenever a completion is received with a requestor ID that does not match side A or side B, or when a completion is received with a matching requestor ID but an unexpected tag field. Header logging is performed.
15	0x0 RW/1C/V/P	**Completer Abort Status (CAE):** The bridge sets this bit and logs the header associated with the request when the configuration unit signals a completer abort.
14	0x0 RW/1C/V/P	**Completion Timeout Status (CTE):** For Switch Ports, this bit is set if the Switch Port issues Non-Posted Requests on its own behalf (vs. only forwarding such as Requests generated by other devices).
13	0x0 RW/1C/V/P	**Flow Control Protocol Error Status (FCE):** This bit is set when a flow control protocol error is detected.
12	0x0 RW/1C/V/P	**Poisoned TLP Received Status (PTLPE):** This bit is set and the bridge logs the header when a poisoned TLP is received from PCI Express.
11:6	0x0 RO	**RSVD1:** Reserved
5	0x0 RW/1C/V/P	**Surprise Down Error Status (SLDE):** This bit is set when a surprise down error is detected. This bit does not apply to the upstream port.
4	0x0 RW/1C/V/P	**Data Link Protocol Error Status (DLPE):** This bit is set when a data link protocol error is detected.

Bit Range	Default & Access	Field Name (ID): Description
3:0	0x0 RO	**RSVD2:** Reserved

48.2.77 ERRUNCMSK—Offset 108h

This register controls the reporting of individual uncorrectable errors by device to the host bridge via a PCI Express error message. This register also controls the logging of the header. Refer to the PCI Express specifications for details of how the mask bits function. A masked error (respective bit set in the mask register) is not reported to the host bridge by the switch, nor is the header logged (status bits unaffected by the mask bit). There is a mask bit per bit of the Uncorrectable Error Status Register. The attr. of AER Error Mask bits in VRSP will be changed to be compliant with PCIe Spec.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 108h

Default: 04400000h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0x0 RO	**RSVD0:** Reserved
26	0x1 RW/P	**Poisoned TLP Egress Blocked Mask (PTLPEBM):** Reserved.
25	0x0 RO	**TLP Prefix Blocked Error Mask (TPBES):** Reserved.
24	0x0 RW/P	**AtomicOp Egress Blocked Mask (AEBEM):** Reserved.
23	0x0 RW/P	**MC Blocked TLP Mask (MCEM):** Reserved.
22	0x1 RW/P	**Uncorrectable Internal Error Mask (UIEM):** Reserved.
21	0x0 RW/P	**ACS Violation Mask (ACSEM):** Reserved.
20	0x0 RW/P	**Unsupported Request Error Mask (UREM):** Reserved.
19	0x0 RW/P	**ECRC Error Mask (ECRCEM):** Reserved.
18	0x0 RW/P	**Malformed TLP Mask (MTLPEM):** Reserved.
17	0x0 RW/P	**Receiver Overflow Mask (ROEM):** Reserved.

12	0x0 RW/P	**Poisoned TLP Received Mask (PTLPEM):** Reserved.
11:6	0x0 RO	**RSVD1:** Reserved
5	0x0 RW/P	**Surprise Down Error Mask (SLDEM):** This bit does not apply to the upstream port or End point

Bit Range	Default & Access	Field Name (ID): Description
4	0x0 RW/P	**Data Link Protocol Error Mask (DLPEM):** Reserved.
3:0	0x0 RO	**RSVD2:** Reserved

48.2.78 ERRUNCSEV—Offset 10Ch

This register controls whether an individual uncorrectable error is reported as a fatal error. An uncorrectable error is reported as fatal when the corresponding error bit in this register is set. When the bit is cleared, the corresponding error is considered non-fatal. The attr. of AER Error Severity bits in VRSP will be changed to be compliant with PCIe Spec.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 10Ch

Default: 00462030h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0x0 RO	**RSVD0:** Reserved
26	0x0 RW/P	**Poisoned TLP Egress Blocked Severity (PTLPEBS):** Reserved.
25	0x0 RO	**TLP Prefix Blocked Error Severity (TPBES):** Reserved.
24	0x0 RW/P	**AtomicOp Egress Blocked Severity (AEBES):** Reserved.
23	0x0 RW/P	**MC Blocked TLP Severity (MCES):** Reserved.
22	0x1 RW/P	**Uncorrectable Internal Error Severity (UIES):** Reserved.
21	0x0 RW/P	**ACS Violation Severity (ACSES):** Reserved.
20	0x0 RW/P	**Unsupported Request Error Severity (URES):** Reserved.
19	0x0 RW/P	**ECRC Error Severity (ECRCES):** Reserved.
18	0x1 RW/P	**Malformed TLP Severity (MTLPES):** Reserved.
17	0x1 RW/P	**Receiver Overflow Error Severity (ROES):** Reserved.
16	0x0 RW/P	**Unexpected Completion Error Severity (UCES):** Reserved.
15	0x0 RW/P	**Completer Abort Error Severity (CAES):** Reserved.
14	0x0 RW/P	**Completion Timeout Error Severity (CTES):** Reserved.
13	0x1 RW/P	**Flow Control Protocol Error Severity (FCES):** Reserved.
12	0x0 RW/P	**Poisoned TLP Received Severity (PTLPES):** Reserved.
11:6	0x0 RO	**RSVD1:** Reserved
5	0x1 RW/P	**Surprise Down Error Severity (SLDES):** This bit does not apply to the upstream port or end point
4	0x1 RW/P	**Data Link Protocol Error Severity (DLPES):** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
3:0	0x0 RO	**RSVD2:** Reserved

48.2.79 ERRCORSTS—Offset 110h

This register reports the error status of individual correctable error sources on a PCI Express device. An individual error status bit set to 1 indicates that a particular error has occurred. Software can clear the error status by writing a 1 to the respective bit.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 110h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD0:** Reserved
15	0x0 RW/1C/V/P	**Header Log Overflow Error (HLOE):** Reserved.
14	0x0 RW/1C/V/P	**Correctable Internal Error (CIE):** Reserved.
13	0x0 RW/1C/V/P	**Advisory Non-Fatal Error (ANFE):** Reserved.
12	0x0 RW/1C/V/P	**Replay Timer Timeout Error (RTTE):** The PCIe sets this bit when replay timer time-out occurs.
11:9	0x0 RO	**RSVD1:** Reserved
8	0x0 RW/1C/V/P	**Replay Number Rollover Error (RNRE):** The PCIe sets this bit when the replay number rolls over from 11 to 00.
7	0x0 RW/1C/V/P	**Bad DLLP Error (BDLLPE):** The switch sets this bit on CRC errors on DLLP.
6	0x0 RW/1C/V/P	**Bad TLP Error (BTLPE):** The switch sets this bit on CRC errors on TLP.
5:1	0x0 RO	**RSVD2:** Reserved
0	0x0 RW/1C/V/P	**Receiver Error (RE):** The PCIe sets this bit when the physical layer detects a receiver error.

48.2.80 ERRCORMSK—Offset 114h

This register controls the reporting of individual correctable errors via ERR_COR message. A masked error (respective bit set in mask register) is not reported to the host bridge by the switch. There is a mask bit corresponding to every bit in the Correctable Error Status Register.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 114h

Default: 0000E000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD0:** Reserved
15	0x1 RW/P	**Header Log Overflow Error Mask (HLOEM):** Reserved.
14	0x1 RW/P	**Correctable Internal Error Mask (CIEM):** Reserved.
13	0x1 RW/P	**Advisory Non-Fatal Error Mask (ANFEM):** Reserved.
12	0x0 RW/P	**Replay Timer Timeout Error Mask (RTTEM):** Reserved.
11:9	0x0 RO	**RSVD1:** Reserved
8	0x0 RW/P	**Replay Number Rollover Error Mask (RNREM):** Reserved.
7	0x0 RW/P	**Bad DLLP Error Mask (BDLLPEM):** Reserved.
6	0x0 RW/P	**Bad TLP Error Mask (BTLPEM):** Reserved.
5:1	0x0 RO	**RSVD2:** Reserved
0	0x0 RW/P	**Receiver Error Mask (REM):** Reserved.

48.2.81 AERCAPCTL—Offset 118h

This register gives the status and control for ECRC checks and also the pointer to the first uncorrectable error that happened.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 118h

Default: 00001000h

Bit Range	Default & Access	Field Name (ID): Description
31:13	0x0 RO	**RSVD0:** Reserved
12	0x1 RW/L	**Completion Timeout Prefix/Header Log Capable (CTPHLC):** If Set, this bit indicates that the Function records the prefix/header of Request TLPs that experience a Completion Timeout error. **Power Well:** PRST
11	0x0 RO/V/P	**TLP Prefix Log Present (TLPPLP):** If Set and the First Error Pointer is valid, indicates that the TLP Prefix Log register contains valid information. If Clear or if First Error Pointer is invalid, the TLP Prefix Log register is undefined.
10	0x0 RO	**Multiple Header Recording Enable (MHRE):** When set, this bit enables the function to record more than one error header.
9	0x0 RO	**Multiple Header Recording Capable (MHRC):** Supports more than one error header.
8	0x0 RW/P	**ECRC Check Enable (ECE):** When Set, ECRC checking is enabled. Functions that do not implement the associated mechanism are permitted to hardwire this bit to 0b.
7	0x0 RW/L	**ECRC Check Capable (ECC):** If Set, this bit indicates that the Function is capable of checking ECRC. **Power Well:** PRST
6	0x0 RW/P	**ECRC Generation Enable (EGE):** When Set, ECRC generation is enabled. Functions that do not implement the associated mechanism are permitted to hardwire this bit to 0b. Default value of this bit is 0b.
5	0x0 RW/L	**ECRC Generation Capable (EGC):** If Set, this bit indicates that the Function is capable of generating ECRC. **Power Well:** PRST
4:0	0x0 RO/V/P	**First Error Pointer (FEP):** This field identifies the bit position of the first error reported in the Uncorrectable Error Status Register (xref). This register re-arms itself (which does not change its current value) as soon as the error status bit indicated by the pointer is cleared by the software by writing a 1 to that status bit.

48.2.82 AERHDRLOG1—Offset 11Ch

This register logs the 4 Dwords of the transaction header for PCI Express errors.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 11Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V/P	**TLP Header Log (TLPHDRLOG):** As soon as an error is logged in this register, it remains locked for further error-logging until the software clears the status bit that caused the header log (in other words, until the error pointer is re-armed for logging again).

48.2.83 AERHDRLOG2—Offset 120h

This register logs the 4 Dwords of the transaction header for PCI Express errors.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 120h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V/P	**TLP Header Log (TLPHDRLOG):** As soon as an error is logged in this register, it remains locked for further error-logging until the software clears the status bit that caused the header log (in other words, until the error pointer is re-armed for logging again).

48.2.84 AERHDRLOG3—Offset 124h

This register logs the 4 Dwords of the transaction header for PCI Express errors.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 124h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V/P	**TLP Header Log (TLPHDRLOG):** As soon as an error is logged in this register, it remains locked for further error-logging until the software clears the status bit that caused the header log (in other words, until the error pointer is re-armed for logging again).

48.2.85 AERHDRLOG4—Offset 128h

This register logs the 4 Dwords of the transaction header for PCI Express errors.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 128h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V/P	**TLP Header Log (TLPHDRLOG):** As soon as an error is logged in this register, it remains locked for further error-logging until the software clears the status bit that caused the header log (in other words, until the error pointer is re-armed for logging again).

48.2.86 ROOTERRCMD—Offset 12Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 12Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0x0 RO	**RSVD0:** Reserved
2	0x0 RW	**Fatal Error Reporting Enable (FERE):** When set, this bit enables the generation of an interrupt when a Fatal error is reported by any of the functions in the hierarchy associated with this Root Port.
1	0x0 RW	**Non-Fatal Error Reporting Enable (NFERE):** When set, this bit enables the generation of an interrupt when a Non-Fatal error is reported by any of the functions in the hierarchy associated with this Root Port.
0	0x0 RW	**Correctable Error Reporting Enable (CERE):** When set, this bit enables the generation of an interrupt when a Correctable error is reported by any of the functions in the hierarchy associated with this Root Port.

48.2.87 ROOTERRSTS—Offset 130h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 130h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0x0 RO/V	**Advanced Error Interrupt Message Number (AEMN):** This register indicates which MSI/MSI-X vector is used for the interrupt message generated in association with any of the status bits of this Capability. For MSI, the value in this register indicates the offset between the base Message Data and the interrupt message that is generated. Hardware is required to update this field so that it is correct if the number of MSI Messages assigned to the Function changes when software writes to the Multiple Message Enable field in the MSI Message Control register. For MSI-X, the value in this register indicates which MSI-X Table entry is used to generate the interrupt message. The entry must be one of the first 32 entries even if the Function implements more than 32 entries. For a given MSI-X implementation, the entry must remain constant. For remaining fields info, please refer to PCIe Spec. for more details.
26:7	0x0 RO	**RSVD0:** Reserved
6	0x0 RW/1C/V/P	**Fatal Error Message Received (FEMR):** Reserved.
5	0x0 RW/1C/V/P	**Non-Fatal Error message Received (NFEMR):** Reserved.
4	0x0 RW/1C/V/P	**First Uncorrectable Fatal (FUF):** Reserved.
3	0x0 RW/1C/V/P	**Multiple Error Fatal/Non-Fatal Received (MEFR):** Reserved.
2	0x0 RW/1C/V/P	**Error Fatal/Non-Fatal Received (EFR):** Reserved.
1	0x0 RW/1C/V/P	**Multiple Error Correctable Error Received (MCER):** Reserved.
0	0x0 RW/1C/V/P	**Correctable Error Received (CER):** Reserved.

48.2.88 ERRSRCID—Offset 134h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 134h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO/V/P	**Fatal/Non-Fatal Error Source ID (EFSID):** Requester ID of the source when an Fatal or No Fatal Error is received and the Fatal Error Message Received (FEMR) or Non-Fatal Error message Received (NFEMR) bit is not already set.
15:0	0x0 RO/V/P	**Correctable Error Source ID (ECSID):** Requester ID of the source when a correctable error is received and the Correctable Error Received (CER) bit is not already set.

48.2.89 ACSCAPHDR—Offset 138h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 138h

Default: 1501000Dh

Bit Range	Default & Access	Field Name (ID): Description
31:20	0x150 RW/L	**Next Capability Offset (NCO):** Contains the offset of the next structure in the Extended Capabilities. Software will need to program this field appropriately for linked capabilities list if default is not supported. **Power Well:** PRST
19:16	0x1 RO	**Capability Version (CV):** Indicates the version of the Capability structure present.
15:0	0xd RO	**Extended Capability ID (ECID):** Identifies the function as Access Control Services capable.

48.2.90 ACSCAP—Offset 13Ch

This register identifies the Access Control Services (ACS) capabilities.

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 13Ch

Default: 005Fh

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x0 RO	**Egress Control Vector Size (ECVS):** Indicates the number of bits in the Egress Control Vector. This is set to 00h as ACS P2P Egress Control (ACSP2PEC) bit 5 in this register is 0b.
7	0x0 RO	**RSVD0:** Reserved
6	0x1 RO	**ACS Direct Translated P2P (TACSDTP2P):** Indicates that the component does implement ACS Direct Translated P2P. Required for Root Ports that support Address Translation Services (ATS) and also support peer-to-peer traffic with other Root Ports, required for Switch Downstream Ports,
5	0x0 RO	**ACS P2P Egress Control (EACSP2PEC):** Hardwired to 0. Indicates that the component does not implement ACS P2P Egress Control.
4	0x1 RO	**ACS Upstream Forwarding (UACSUF):** Indicates that the component implements ACS Upstream Forwarding.
3	0x1 RO	**ACS P2P Completion Redirect (CACSP2PRR):** Indicates that the component implements ACS P2P Completion Redirect. This includes Read Completions, AtomicOp Completions, and other Completions, either with or without data.
2	0x1 RO	**ACS P2P Request Redirect (RACSP2PRR):** Indicates that the component implements ACS P2P Request Redirect.
1	0x1 RO	**ACS Translation Blocking (BACSTB):** Indicates that the component implements ACS Translation Blocking.
0	0x1 RO	**ACS Source Validation (VACSSV):** Indicates that the component implements ACS Source Validation.

48.2.91 ACSCTL—Offset 13Eh

This register identifies the Access Control Services (ACS) control bits.

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 13Eh

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:7	0x0 RO	**RSVD0:** Reserved
6	0x0 RW	**ACS Direct Translated P2P Enable (TACSP2PECE):** When Set, overrides the ACS P2P Request Redirect and ACS P2P Egress Control mechanisms with peer-to-peer Memory Requests whose Address Translation (AT) field indicates a Translated address. This bit is ignored if ACS Translation Blocking (B) is enabled.
5	0x0 RO	**ACS P2P Egress Control Enable (EACSP2PECE):** This is hardwired to 0b as the component does not implement ACS P2P Egress Control.
4	0x0 RW	**ACS Upstream Forwarding Enable (UACSUFE):** When set, the component forwards upstream any Request or Completion TLPs it receives that were redirected upstream by a component lower in the hierarchy. Note that the U bit only applies to upstream TLPs arriving at a Downstream Port, and whose normal routing targets the same Downstream Port.
3	0x0 RW	**ACS P2P Completion Redirect Enable (CACSP2PCRE):** Determines when the component redirects peer-to-peer Completions upstream, applicable only to Read Completions whose Relaxed Ordering Attribute is clear.
2	0x0 RW	**ACS P2P Request Redirect Enable (RACSP2PRRE):** This bit determines when the component redirects peer-to-peer Requests upstream.
1	0x0 RW	**ACS Translation Blocking Enable (BACSTBE):** When set, the component blocks all upstream Memory Requests whose Address Translation (AT) field is not set to the default value.
0	0x0 RW	**ACS Source Validation Enable (VACSSVE):** When set, the component validates the Bus Number from the Requester ID of upstream Requests against the secondary / subordinate Bus Numbers.

48.2.92 ERRUNCDETMSK—Offset 140h

A value of 1 masks the field and prevents detection as well as logging.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 140h

Default: 04000000h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0x0 RO	**RSVD0:** Reserved
26	0x1 RW/P	**Poisoned TLP Egress Blocked Detect Mask (PTLPEBDM):** Reserved.
25	0x0 RO	**TLP Prefix Blocked Error Detect Mask (TPBEDM):** Reserved.
24	0x0 RW/P	**AtomicOp Egress Blocked Error Detect Mask (AEBEDM):** Reserved.
23	0x0 RW/P	**MC Blocked TLP Error Detect Mask (MCEDM):** Reserved.
22	0x0 RW/P	**Uncorrectable Internal Error Detect Mask (UIEDM):** Reserved.
21	0x0 RW/P	**ACS Violation Error Detect Mask (ACSEDM):** Reserved.
20	0x0 RW/P	**Unsupported Request Error Detect Mask (UREDM):** Reserved.
19	0x0 RW/P	**ECRC Check Error Mask (ECRCEDM):** Supported
18	0x0 RW/P	**Malformed TLP Error Detect Mask (MTLPEDM):** Reserved.
17	0x0 RW/P	**Receiver Overflow Error Detect Mask (ROEDM):** Reserved.
16	0x0 RW/P	**Unexpected Completion Error Detect Mask (UCEDM):** Reserved.
15	0x0 RW/P	**Completer Abort Error Detect Mask (CAEDM):** Reserved.
14	0x0 RW/P	**Completion Timeout Error Detect Mask (CTEDM):** Reserved.
13	0x0 RW/P	**Flow Control Error Detect Mask (FCEDM):** Reserved.
12	0x0 RW/P	**Poisoned TLP Error Detect Mask (PTLPEDM):** Reserved.
11:6	0x0 RO	**RSVD1:** Reserved
5	0x0 RW/P	**Surprise Down Error Detect Mask (SLDEDM):** Reserved.
4	0x0 RW/P	**Data Link Protocol Error Detect Mask (DLPEDM):** Reserved.
3:0	0x0 RO	**RSVD2:** Reserved

48.2.93 ERRCORDETMSK—Offset 144h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 144h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD0:** Reserved
15	0x0 RW/P	**Header Log Overflow Error Detect Mask (HLOEDM):** Reserved.
14	0x0 RW/P	**Correctable Internal Error Detect Mask (CIEDM):** Reserved.
13	0x0 RW/P	**Advisory Non-Fatal Error Detect Mask (ANFEDM):** Reserved.
12	0x0 RW/P	**Replay Timer Timeout Error Detect Mask (RTTEDM):** Reserved.
11:9	0x0 RO	**RSVD1:** Reserved
8	0x0 RW/P	**Replay Number Rollover Error Detect Mask (RNREDM):** Reserved.
7	0x0 RW/P	**Bad DLLP Error Detect Mask (BDLLPEDM):** Reserved.
6	0x0 RW/P	**Bad TLP Error Detect Mask (BTLPEDM):** Reserved.
5:1	0x0 RO	**RSVD2:** Reserved
0	0x0 RW/P	**Receiver Error Detect Mask (REDM):** Reserved.

48.2.94 ROOTERRDETMSK—Offset 148h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 148h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0x0 RO	**RSVD0:** Reserved
2	0x0 RW/P	**Received Fatal Message Detect Mask (RFMDM):** Reserved.
1	0x0 RW/P	**Received Non-Fatal Message Detect Mask (RNFMDM):** Reserved.
0	0x0 RW/P	**Received Correctable Message Detect Mask (RCEMDM):** Reserved.

48.2.95 MCSTCAPHDR—Offset 150h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 150h

Default: 18010012h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0x180 RW/L	**Next Capability Offset (NCO):** Contains the offset of the next structure in the Extended Capabilities. Software will need to program this field appropriately for linked capabilities list if default is not supported. **Power Well:** PRST
19:16	0x1 RO	**Capability Version (CV):** Indicates the version of the Capability structure present.
15:0	0x12 RO	**Extended Capability ID (ECID):** Identifies the function as Multicast Capability.

48.2.96 MCSTCAP—Offset 154h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 154h

Default: 000Fh

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RO	**MC ECRC Regeneration supported (MCERS):** 1: When set, this bit indicates that ECRC regeneration is supported.
14:6	0x0 RO	**RSVD0:** Reserved
5:0	0xf RO	**MC Max Group (MCMG):** This field indicates the maximum number of Multicast Groups that the component supports, encoded as M-1. A value of 00h indicates that one multicast Group is supported.

48.2.97 MCSTCTL—Offset 156h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 156h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW	**MC Enable (MCEN):** When set, this bit indicates the Multicast Capability is enabled for the component. This is a global field that controls MC for the specific function.
14:6	0x0 RO	**RSVD0:** Reserved
5:0	0x0 RW	**MC Number Group (MCNG):** This field indicates the number of Multicast Groups configured for use, encoded as N-1. A value of 00h indicates that one Multicast Group is configured for use. Behavior is undefined if value exceeds MC Max Group. This parameter indirectly defines the upper limit of the Multicast address range. This field is ignored if MC Enable is Clear.

48.2.98 MCSTBAR—Offset 158h

The MC_Base_Address register contains the MC_Base_Address and the MC_Index_Position for calculating whether a MC hit occurred or not. Refer to the PCI Local Bus Specification, Revision 3.0 for details on how the MC hit/miss and the MC group number is calculated. This register is 4K aligned and hence only the top 20 bits are useable for the base address.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 158h

Default: 0000000Ch

Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RW	**Lower Address 32-bit (L32ADR):** Reserved.
11:6	0x0 RO	**RSVD0:** Reserved
5:0	0xc RW	**MC Index Position (MCIP):** This field indicates the location of the LSB of the Multicast Group number within the address. Behavior is undefined if this field is less than 12 when MC Enable is set.

48.2.99 MCSTUBAR—Offset 15Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 15Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Upper Address 32-bit (U32ADR):** Reserved.

48.2.100 MCSTRCV—Offset 160h

The MC_Receive register provides a bit vector denoting which Multicast groups the Function should accept

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 160h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD0:** Reserved
15:0	0x0 RW	**MC Receive (MCR):** For each bit that is set, this function gets a copy of any Multicast TLPs for the associated Multicast Group. Bits above MC Number Groups are ignored by hardware.

48.2.101 MCSTBLKALL—Offset 168h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 168h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD0:** Reserved
15:0	0x0 RW	**MC Block All (MCBA):** For each bit that is set, this function is blocked from sending TLPs to the associated Multicast Group. Bits above MC Number Groups are ignored by hardware.

48.2.102 MCSTOLBAR—Offset 178h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 178h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RW	**MC Overlay BAR (MCOVRBAR):** Specifies the base address of the window onto which MC TLPs passing through this function will be overlaid. The overlay BAR is 4K aligned. Default is 0.
11:6	0x0 RO	**RSVD0:** Reserved
5:0	0x0 RW	**MC Overlay Size (MCOVRSZ):** If 6 or greater, specifies the size in bytes of the overlay aperture as a power of 2. If less than 6, disables the overlay mechanism. Default is 0.

48.2.103 MCSTUOLBAR—Offset 17Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 17Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**MC Overlay BAR Upper 32 (MCOVRBARU32):** Specifies the base address of the window onto which MC TLPs passing through this function will be overlaid.

48.2.104 EINJCAPHDR—Offset 180h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 180h

Default: 1901000Bh

Bit Range	Default & Access	Field Name (ID): Description
31:20	0x190 RW/L	**Next Capability Offset (NCO):** Contains the offset of the next structure in the Extended Capabilities. Software will need to program this field appropriately for linked capabilities list if default is not supported. **Power Well:** PRST
19:16	0x1 RO	**Capability Version (CV):** Indicates the version of the Capability structure present.
15:0	0xb RO	**Extended Capability ID (ECID):** Vendor Defined Capability

48.2.105 EINJHDR—Offset 184h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 184h

Default: 00A00003h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0xa RO	**VSEC Length (VSECLEN):** This field indicates the number of bytes in the entire VSEC structure, including the PCI Express Extended Capability header, the Vendor-Specific header, and the Vendor-Specific registers.
19:16	0x0 RO	**VSEC Rev (VSECREV):** This field is a vendor-defined version number that indicates the version of the VSEC structure. Software must qualify the Vendor ID and VSEC ID before interpreting this field.
15:0	0x3 RO	**VSEC ID (VSECID):** This field is a vendor-defined ID number that indicates the nature and format of the VSEC structure. Software must qualify the Vendor ID before interpreting this field. 3h is assigned to WHEA Error Injection.

48.2.106 EINJCTL—Offset 188h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 188h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:3	0x0 RO	**RSVD0:** Reserved
2	0x0 RW	**Inject Completion Timeout Error (INJCTOERR):** When this bit is written from 0 to 1, one and only one error assertion pulse is produced on the error source signal for the given port. This error will appear equivalent to an actual error assertion because this event is OR'd into the existing error reporting structure. To log another error, this bit must be cleared first, before setting again. Leaving this bit in a 1 state does not produce a persistent error condition.
1	0x0 RW	**Inject Receiver Error (INJRCVERR):** When this bit is written from 0 to 1, one and only one error assertion pulse is produced on the error source signal for the given port. This error will appear equivalent to an actual error assertion because this event is OR'd into the existing error reporting structure. To log another error, this bit must be cleared first, before setting again. Leaving this bit in a 1 state does not produce a persistent error condition.
0	0x0 RW/L	**Error Injection Disable (EINJDIS):** This bit disables the usage of the PCIe Error Injection bits for EINJCTL.INJRCVERR, INJCTOERR This bit is self-locking. Once this bit is set to a 1b, this key bit can not be unlocked. Writing a 0b has no affect on this bit. **Power Well:** PRST

48.2.107 SECEXPCAP—Offset 200h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 200h

Default: 00010019h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW/L	**Next Capability Offset (NCO):** Contains the offset of the next structure in the Extended Capabilities list. Set to Null. Software will need to program this field appropriately for linked capabilities list if default is not supported. **Power Well:** PRST
19:16	0x1 RO	**Capability Version (CV):** Indicates the version of the Capability structure present.
15:0	0x19 RO	**Extended Capability ID (ECID):** PCI Express Extended Capability ID for the Secondary PCI Express Extended Capability is 0019h

48.2.108 LINKCTL3—Offset 204h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 204h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD0:** Reserved
15:9	0x0 RW	**Enable Lower SKP OS Generation Vector (ELSKPOSGV):** When the Link is in L0 and the bit in this field corresponding to the current Link speed is Set, SKP Ordered Sets are scheduled at the rate defined for SRNS, overriding the rate required based on the clock tolerance architecture. See section 4.2.7 for additional requirements. Bit definitions within this field are: Bit 0 2.5 GT/s Bit 1 5.0 GT/s Bit 2 8.0 GT/s Bits 6:3 RsvdP Bits in this field are RW if the corresponding bit in the Lower SKP OS Generation Supported Speeds Vector is Set, otherwise they are permitted to be hardwired to 0. Behavior is undefined if a bit is Set in this field and the corresponding bit in the Lower SKP OS Generation Supported Speeds Vector is not Set. The default value of this field is 000 0000b.
8:2	0x0 RO	**RSVD1:** Reserved
1	0x0 RW	**Link Equalization Request Interrupt Enable (LNKEQREQINTEN):** When Set, this bit enables the generation of interrupt to indicate that the Link Equalization Request bit has been set. This bit is not applicable and is reserved for Endpoints, PCI Express to PCI/PCIX bridges, and Upstream Ports of Switches.
0	0x0 RW/V	**Perform Equalization (PE):** When this register is 1b and a 1b is written to the 'Link Retrain' register with 'Target Link Speed' set to 8 GT/s, the Downstream Port must perform Transmitter Equalization. Software must guarantee that no transactions are pending in the link while the link is in Recovery when this bit is set to 1b. This bit is not applicable and is reserved for Endpoints, PCI Express to PCI/PCIX bridges, and Upstream Ports of Switches.

48.2.109 LANEERRSTS—Offset 208h

The Equalization Control Register consist of control fields required for per lane equalization and the number of entries in this register are sized by Max Link Width

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 208h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD0:** Reserved
7	0x0 RW/1C/V/P	**Lane 7 Error (L7ERR):** A value of 1b indicates that a lane based error was detected on the corresponding PCI Express Lane Number.
6	0x0 RW/1C/V/P	**Lane 6 Error (L6ERR):** A value of 1b indicates that a lane based error was detected on the corresponding PCI Express Lane Number.
5	0x0 RW/1C/V/P	**Lane 5 Error (L5ERR):** A value of 1b indicates that a lane based error was detected on the corresponding PCI Express Lane Number.
4	0x0 RW/1C/V/P	**Lane 4 Error (L4ERR):** A value of 1b indicates that a lane based error was detected on the corresponding PCI Express Lane Number.
3	0x0 RW/1C/V/P	**Lane 3 Error (L3ERR):** A value of 1b indicates that a lane based error was detected on the corresponding PCI Express Lane Number.
2	0x0 RW/1C/V/P	**Lane 2 Error (L2ERR):** A value of 1b indicates that a lane based error was detected on the corresponding PCI Express Lane Number.
1	0x0 RW/1C/V/P	**Lane 1 Error (L1ERR):** A value of 1b indicates that a lane based error was detected on the corresponding PCI Express Lane Number.
0	0x0 RW/1C/V/P	**Lane 0 Error (L0ERR):** A value of 1b indicates that a lane based error was detected on the corresponding PCI Express Lane Number.

48.2.110 LANEEQCTL0—Offset 20Ch

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 20Ch

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RO	**RSVD0:** Reserved
14:12	0x0 RW/L	**Upstream Port Receiver Preset Hint (UPRPH):** Preset Hint for Upstream Port with the following encoding. The Downstream Port must pass on this value in the EQ TS2's. • 000b: -6 dB 001b: -7 dB • 010b: -8 dB 011b: -9 dB • 100b: -10 dB 101b: -11 dB • 110b: -12 dB 111b: Reserved For a Upstream Port, this field reflects the latest Receiver Preset value requested from the Downstream Port for corresponding Lane. **Power Well:** PRST
11:8	0x0 RW/L	**Upstream Port Transmitter Preset (UPTP):** Transmitter Preset for Upstream Port with the following encoding. The Downstream Port must pass on this value in the EQ TS2's. • 0000b: -6 dB for de-emphasis, 0 dB for preshoot • 0001b: -3.5 dB for de-emphasis, 0 dB for preshoot • 0010b: -4.5 dB for de-emphasis, 0 dB for preshoot • 0011b: -2.5 dB for de-emphasis, 0 dB for preshoot • 0100b: 0 dB for de-emphasis, 0 dB for preshoot • 0101b: 0 dB for de-emphasis, 2 dB for preshoot • 0110b: 0 dB for de-emphasis, 2.5 dB for preshoot • 0111b: -6 dB for de-emphasis, 3.5 dB for preshoot • 1000b: -3.5 dB for de-emphasis, 3.5 dB for preshoot • 1001b: 0 dB for de-emphasis, 3.5 dB for preshoot • 1010b: The Transmitter Preset encoding of 1010b corresponds to the maximum Vtx-boost that the Transmitter advertises with FS and LF in both full swing and reduced swing modes with C-1 = 0 and C+1 = FS - (2*LF). • All other encodings are reserved. For a Upstream Port, this field reflects the latest Receiver Preset value requested from the Downstream Port for corresponding Lane. **Power Well:** PRST
7	0x0 RO	**RSVD1:** Reserved
6:4	0x0 RW/L	**Downstream Port Receiver Preset Hint (DPRPH):** Receiver Preset Hint for Downstream Port. The Downstream Port may use this hint for receiver equalization. • 000b: -6 dB • 001b: -7 dB • 010b: -8 dB • 011b: -9 dB • 100b: -10 dB • 101b: -11 dB • 110b: -12 dB • 111b: Reserved This field is not applicable and reserved for Endpoints, PCI Express to PCI/PCI-X bridges, and Upstream Ports of Switches. **Power Well:** PRST

Bit Range	Default & Access	Field Name (ID): Description
3:0	0x0 RW/L	**Downstream Port Transmitter Preset (DPTP):** Transmitter Preset for an Downstream Port, with the following encoding. • 0000b: -6 dB for de-emphasis, 0 dB for preshoot • 0001b: -3.5 dB for de-emphasis, 0 dB for preshoot • 0010b: -4.5 dB for de-emphasis, 0 dB for preshoot • 0011b: -2.5 dB for de-emphasis, 0 dB for preshoot • 0100b: 0 dB for de-emphasis, 0 dB for preshoot • 0101b: 0 dB for de-emphasis, 2 dB for preshoot • 0110b: 0 dB for de-emphasis, 2.5 dB for preshoot • 0111b: -6 dB for de-emphasis, 3.5 dB for preshoot • 1000b: -3.5 db for de-emphasis, 3.5 dB for preshoot • 1001b:0 dB for de-emphasis, 3.5 dB for preshoot • 1010b: The Transmitter Preset encoding of • 1010b corresponds to the maximum Vtx-boost that the Transmitter advertises with FS and LF in both full swing and reduced swing modes with C-1 = 0 and C+1 = FS - (2*LF). • All other encodings are reserved. This field is not applicable and reserved for Endpoints, PCI Express to PCI/PCI-X bridges, and Upstream Ports of Switches. **Power Well:** PRST

48.2.111 LANEEQCTL1—Offset 20Eh

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 20Eh

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RO	**RSVD0:** Reserved
14:12	0x0 RW/L	**Upstream Port Receiver Preset Hint (UPRPH):** Preset Hint for Upstream Port with the following encoding. The Downstream Port must pass on this value in the EQ TS2's. • 000b: -6 dB • 001b: -7 dB • 010b: -8 dB • 011b: -9 dB • 100b: -10 dB • 101b: -11 dB • 110b: -12 dB • 111b: Reserved For a Upstream Port, this field reflects the latest Receiver Preset value requested from the Downstream Port for corresponding Lane. **Power Well:** PRST

Offset: [B:0, D:9-12, 14-17, F:0] + 294h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**Local/Global Event Select (LOCGLOBEVSEL):** This register bit allows for standalone cluster simulation. Normally the global events are used as control signals for the performance monitors. When this bit is set to1, the internal IPTRIG[0-3] signals are selected respectively in place of the external GE[0-3] signals. ***Note:*** It is possible to have one PERFMON use the internal events, while the other PERFMON uses the external events. • 0:Global events are selected • 1:Local events are selected
30	0x0 RW	**Not greater than comparison (NOTGRTCMP):** • 0: PMC will compare a greater than function. When clear the perfmon status will assert when the PMD is greater than the PMC. • 1: PMC will compare with NOT (greater than) function. When set the perfmon status will assert when the PMD is less than or equal to the PMC. CSPEC NOTE: This bit was not in Seaburg.
29	0x0 RW	**Force PMD counter to add zero to input (FRCPMDADDZ):** This feature is used with the queue measurement bus. When this bit is set the value on the queue measurement bus is added to zero so the result in PMD will always reflect the value from the queue measurement bus. • 0: Do not add zero. Normal PerfMon operation. • 1: Add zero with input queue bus.
28	0x0 RW	**Latched Count Enable Select (LATCNTENSEL):** • 0: Normal PM operation. Use CENS as count enable. • 1: Use Latched count enable from queue empty events
27	0x0 RW	**Reset Pulse Enable (RSTPULSEN):** Setting this bit will select a pulsed version of the reset signal source in the reset block. • 0: Normal reset signaling • 1: Select a pulsed reset from the reset signal sources.
26:24	0x0 RO	**RSVD0:** Reserved
23:22	0x0 RW	**DFX Byte Lane Selection for PerfMon (DFXLNSEL):** This bit field is only active when LDES is asserted. These bits select which set of 3 byte lanes from the 72 bit (9 byte lane) local debug bus is active for DFx event counting with the PerfMons. • 00: Local Debug Byte Lanes 0-2 • 01: Local Debug Byte Lanes 3-5 • 10: Local Debug Byte Lanes 6-8 • 11: Reserved
21	0x0 RW	**Local DFT Event Select (LDES):** This selection enables the local debug bus to be selected for event counting. Enabling this selection changes the PMEVL,H register into 24bits of DFx masking and matching. • 0: Disable DFx event monitoring • 1: Enable DFx event monitoring.
20:19	0x0 RW	**Event Group Selection (EGS):** Selects which event register to use for performance monitoring. • 00: Bus events (XPPMEVL,H register) • 01: Resource utilizations (in the XPPMER register) • 10: Queue measurement (in the XPPMER register) • 11: FIFO queue measurements (selects 1h on the queue measurement bus).

Bit Range	Default & Access	Field Name (ID): Description
18:17	0x0 RW	**Count Event Select (CNTEVSEL):** Selects the condition for incrementing the performance monitor counter. • 00: Event source selected by PMEVL,H • 01: Partner event status (max compare or overflow) • 10: All clocks when enabled • 11: Reserved
16	0x0 RW	**Event Polarity Invert (EVPOLINV):** This bit inverts the polarity of the conditioned event signal. • 0: No inversion • 1: Invert the polarity of the conditioned event signal
15:14	0x0 RW	**Count Mode (CNTMD):** This field sets how the events will be counted. • 00: Count clocks for the duration of event signal is active. • 01: Count rising edge events (for active low signals EVPOLINV must be set for correct measurements). • 10: Count clocks continuously after the event was asserted. The latched state of this condition is cleared by PerfMon reset block, PMR.CNTRST bit, or XPPERFCON.GRST. • 11: Enable queue threshold measuring. This mode will reassign the event selection registers from both PerfMons, selects a modified count enable, and enables add/sub operation. Selecting this mode will not allow normal PerfMon operations to occur. To simplify the logic a strict assignment of functions is applied. PM0's event selection registers are assigned to the add (increment) function and PM1's event selection registers are assigned to the subtract (decrement) function. When both PM0 and PM1 events are asserted or when both are not asserted do not add or subtract values from the queue. PM0Ev.....PM1Ev.....PM condition ....0.....0.....Do not add/sub ....1.....0.....Add queue value ....0.....1.....Sub queue value ....1.....1.....Do not add/sub Setting this mode enables the PM event registers as described but it also enables the selection of a empty signal to be used a count enable signal. The count enable is latched high continuously and only cleared with PM global reset or local counter reset. The THRQMSRSTR bit field selects which bit[3] of each nibble in each byte lane that acts as a count enable. Once this event occurs it is latched and queue counting begins. Because this signal is latched a counter reset or PERCON global reset is required to start another measurement. This latched condition is cleared by the PMR.CNTRST bit, or XPPERFCON.GRST.
13:11	0x0 RW	**Counter enable source (CENS):** These bits identify which input enables the counter. Default value disables counting. • 000: Disabled • 001: Local Count Enabled (LCEN). This bit is always a logic 1. • 010: Partner counter's event status (max compare or overflow) • 011: Header MatchOut signal • 100: GE[0], from the Global Debug Event Block • 101: GE[1], from the Global Debug Event Block • 110: GE[2], from the Global Debug Event Block • 111: GE[3], from the Global Debug Event Block ***Note:*** Address/Header MatchOut signal must align with PMEVL,H events for this to be effective. ***Note:*** The GEs used are dependent on bit 31 (LOCGLOBEVSEL). If bit 31 is used, local events will be used instead of global events.

Bit Range	Default & Access	Field Name (ID): Description
10:8	0x0 RW	**Reset Event Select (RSTEVSEL):** This bit field will reset the PMD counter. For details regarding usage and pair mode operation see Chapter 21. • 000: No reset condition • 001: Partner's event status: When the partner counter causes an event status condition to be activated, either by a counter overflow or max comparison, then this counter will reset and continue counting. • 010: Partners PME register event: When the partner counter detects a match condition which meets its selected PME register qualifications, then this counter will reset and continue counting. • 011: This PM counter's status output. • 100: GE[0], from the Global Debug Event Block. • 101: GE[1], from the Global Debug Event Block. • 110: GE[2], from the Global Debug Event Block. • 111: GE[3], from the Global Debug Event Block. ***Note:*** The GEs used are dependent on bit 31 (LOCGLOBEVSEL). If bit 31 is used, local events will be used instead of global events.
7:6	0x0 RW	**Compare Mode (CMPMD):** This field defines how the PMC (compare) register is to be used. • 00: compare mode disabled (PMC register not used) sig p = sig s • 01: max compare only: The PMC register value is compared with the counter value. If the counter value is greater then the Compare Status (CMPSTAT) will be set. sig p = sig n • 10: max compare with update of PMC at end of sample: The PMC register value is compared with the counter value, and if the counter value is greater, the PMC register is updated with the counter value. Note: The Compare Status field is not affected in this mode. sig p = sig n • 11: Reserved
5	0x0 RW	**PM Status Signal Output (PMSSIG):** • 0: Level output from status/overflow signals. • 1: Pulsed output from status/overflow signals.
4:3	0x0 RW	**PerfMon Trigger Output (PTO):** This field selects what the signal is communicated to the chip's event logic structure. • 00: No cluster trigger output from PerfMons or header match. • 01: PM Status. • 10: PM Event Detection. • 11: Address Header Match
2	0x0 RW/1C/V	**Compare Status (CMPSTAT):** This status bit captures a count compare event. • 0: no event • 1: count compare - PMD counter greater than PMC register when in compare mode. This bit remains set once an event is reported even though the original condition is no longer valid. Writing a logic '1' clears the bit.
1	0x0 RW/1C/V	**Overflow Status Bit (OVS):** This status bit captures the overflow event from the PMD counter. This bit remains set once an event is reported even though the original condition is no longer valid. Writing a logic '1' clears the bit.
0	0x0 RW	**Counter Reset (CNTRST):** Setting this bit resets the following bit fields. This only applies to the set of registers for this PM block. Setting this bit resets the PMD counter, the associated adder storage register and the count mode state latch (see bits CNTMD) to the default state. It does not change the state of this PMR register, the event selections, or the value in the compare register. Note: This bit must be cleared by software, otherwise the counters remain in reset. There is also a reset bit in the XPPERFCON register which clears all PM registers including the PMR.

48.2.125 XPPMR1—Offset 298h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 298h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**Local/Global Event Select (LOCGLOBEVSEL):** This register bit allows for standalone cluster simulation. 5	0x0 RW	**PM Status Signal Output (PMSSIG):** • 0: Level output from status/overflow signals. • 1: Pulsed output from status/overflow signals.
4:3	0x0 RW	**PerfMon Trigger Output (PTO):** This field selects what the signal is communicated to the chip's event logic structure. • 00: No cluster trigger output from PerfMons or header match. • 01: PM Status. • 10: PM Event Detection. • 11: Address Header Match
2	0x0 RW/1C/V	**Compare Status (CMPSTAT):** This status bit captures a count compare event. • 0: no event • 1: count compare - PMD counter greater than PMC register when in compare mode. This bit remains set once an event is reported even though the original condition is no longer valid. Writing a logic '1' clears the bit.
1	0x0 RW/1C/V	**Overflow Status Bit (OVS):** This status bit captures the overflow event from the PMD counter. This bit remains set once an event is reported even though the original condition is no longer valid. Writing a logic '1' clears the bit.
0	0x0 RW	**Counter Reset (CNTRST):** Setting this bit resets the following bit fields. This only applies to the set of registers for this PM block. Setting this bit resets the PMD counter, the associated adder storage register and the count mode state latch (see bits CNTMD) to the default state. It does not change the state of this PMR register, the event selections, or the value in the compare register. ***Note:*** This bit must be cleared by software, otherwise the counters remain in reset. There is also a reset bit in the XPPERFCON register which clears all PM registers including the PMR.

48.2.126 XPPMEVL0—Offset 29Ch

Selections in this register correspond to fields within the PEX packet header. Each field selection is ANDed with all other fields in this register including the XPPMEVH except where noted.

The qualifications for fields in this register are as follows: PMEV Match = ((IO_Cfg_Write_event + IO_Cfg_Read_event _+ Mem_Write_event + Mem_Read_event + Trusted_write_event + Trusted_read_event + General_event) and INOUTBND) + GESEL IO_Cfg_Write_event = (REQCMP[0] and CMPR[1] and RDWR[1] and DATALEN and (TTYP[2] + (TTYP[1] and CFGTYP))) IO_Cfg_Read_event = (REQCMP[0] and CMPR[1] and RDWR[0] and DATALEN and (TTYP[2] + (FMTTYP[1] and CFGTYP))) Mem_Write_event = (REQCMP[0] and CMPR[0] and RDWR[1] and DATALEN and TTYP[3] and LOCK and EXTADDR and SNATTR)

Note: An outbound memory write does not have a snoop attribute as an inbound memory write has. So the user should set SNATTR='11' for outbound memory write transaction event counting. Mem_Read_event = (REQCMP[0] and CMPR[1] and RDWR[0] and DATALEN and ((TTYP[3] and LOCK and EXTADDR and SNATTR) + TTYP[2] + (TTYP[1] and CFGTYP)))

Note: For outbound memory reads there is no concept of issuing a snoop cycle. The user should select SNATTR='11' for either snoop attribute. Msg_event = (TTYP[0] and DND) (INOUTBND[0] and (MatchEq) + (IOBND[1] and (MatchEq)

Note: Setting both bits in INOUTBND is acceptable however the performance data gathered will not be accurate since once one header can be counted at a time.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 29Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RW	**Data or No Data Attribute (DND):** • x1: Request/completion/message packet with data • 1x: Request/completion/message packet without data

Selections in this register correspond to fields within the PEX packet header. Each field selection is ANDed with all other fields in this register including the XPPMEVH except where noted. The qualifications for fields in this register are as follows: PMEV Match = ((IO_Cfg_Write_event + IO_Cfg_Read_event _+ Mem_Write_event + Mem_Read_event + Trusted_write_event + Trusted_read_event + General_event) and INOUTBND) + GESEL IO_Cfg_Write_event = (REQCMP[0] and CMPR[1] and RDWR[1] and DATALEN and (TTYP[2] + (TTYP[1] and CFGTYP))) IO_Cfg_Read_event = (REQCMP[0] and CMPR[1] and RDWR[0] and DATALEN and (TTYP[2] + (FMTTYP[1] and CFGTYP))) Mem_Write_event = (REQCMP[0] and CMPR[0] and RDWR[1] and DATALEN and TTYP[3] and LOCK and EXTADDR and SNATTR)

Note: An outbound memory write does not have a snoop attribute as an inbound memory write has. So the user should set SNATTR='11' for outbound memory write transaction event counting. Mem_Read_event = (REQCMP[0] and CMPR[1] and RDWR[0] and DATALEN and ((TTYP[3] and LOCK and EXTADDR and SNATTR) + TTYP[2] + (TTYP[1] and CFGTYP)))

Note: For outbound memory reads there is no concept of issuing a snoop cycle. The user should select SNATTR='11' for either snoop attribute. Msg_event = (TTYP[0] and DND) (INOUTBND[0] and (MatchEq) + (IOBND[1] and (MatchEq)

Note: Setting both bits in INOUTBND is acceptable however the performance data gathered will not be accurate since once one header can be counted at a time.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 2A0h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RW	**Data or No Data Attribute (DND):** • x1: Request/completion/message packet with data • 1x: Request/completion/message packet without data
29:28	0x0 RW	**Snoop Attribute (SNATTR):** • x1: Snoop required • 1x: No snoop required • 11: Either
27:26	0x0 RW	**Request or Completion Packet Selection (REQCMP):** • x1: Request packet • 1x: Completion packet • 11: Either
25:24	0x0 RW	**Read or Write Selection (RDWR):** • x1: Read • 1x: Write • 11: Either
23:22	0x0 RW	**Completion Required (CMPR):** (Request packet only) • x1: No completion required • 1x: Completion required • 11: Either
21:20	0x0 RW	**Lock Attribute Selection (LOCK):** • x1: No lock • 1x: Lock • 11: Either

Bit Range	Default & Access	Field Name (ID): Description
19:18	0x0 RW	**Extended Addressing Header (EXTADDR):** • x1: 32b addressing • 1x: 64b addressing • 11: Either
17:16	0x0 RW	**Configuration Type (CFGTYP):** (If Config cycle Space selected) • x1: Type 0 • 1x: Type 1 • 11: Either
15:11	0x0 RW	**Transaction Type Encoding (TTYP):** (ORed group) • 1xxxx: Trusted • x1xxx: Memory • xx1xx: IO • xxx1x: Configuration • xxxx1: Messages • 11111: Any transaction type
10:4	0x0 RW	**Data Length (DATLEN):** • 1xxxxxx: (129 to 256 bytes) • x1xxxxx: (65 to 128 bytes) • xx1xxxx: (33 to 64 bytes) • xxx1xxx: (17 to 32 bytes) • xxxx1xx: (9 to 16 bytes) • xxxxx1x: (0 to 8 bytes) • xxxxxx1: 0 bytes, used for a special zero length encoded packets • 1111111: Any Data length
3:0	0x0 RW	**Completion Status (CMPSTAT):** (for Completion Packet) or message encoding (for Request Packet). • 1xxx: Completer abort • x1xx: Configuration request retry status (only used for receive completions) • xx1x: Unsupported request • xxx1: Successful completion • 1111: Any status

48.2.128 XPPMEVH0—Offset 2A4h

Selections in this register correspond to fields within the PEX packet header. Each field selection is ANDed with all other fields in this register including the XPPMEVL except for the Global Event signals. These signals are OR'ed with any event in the XPPMEVL and enables for debug operations requiring the accumulation of specific debug signals.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 2A4h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0x0 RO	**RSVD0:** Reserved
5:2	0x0 RW	**Global Event Selection (GESEL):** Selects which GE[3:0] is used for event counting. This field is OR'd with other fields in this register. The GEs cannot be qualified with other PerfMon signals. If more than 1 GE is selected then the resultant event is the OR between each GE. However, properly counting Global Event based on design, XP PM Response Control Register bit [13:11] CENS must be set to choose GE[3:0] and also bit[18:17] CNTEVSEL must be set to 2'b10. • 1xxx: GE[3] • x1xx: GE[2] • xx1x: GE[1] • xxx1: GE[0]
1:0	0x0 RW	**Receive or Transmit Selection (RXTXSEL):** Selects which path to count transactions. • 1x: Transmit • x1: Receive (from PCI bus) • 11: Either

48.2.129 XPPMEVH1—Offset 2A8h

Selections in this register correspond to fields within the PEX packet header. Each field selection is ANDed with all other fields in this register including the XPPMEVL except for the Global Event signals. These signals are OR'ed with any event in the XPPMEVL and enables for debug operations requiring the accumulation of specific debug signals.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 2A8h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0x0 RO	**RSVD0:** Reserved
5:2	0x0 RW	**Global Event Selection (GESEL):** Selects which GE[3:0] is used for event counting. This field is OR'd with other fields in this register. The GEs cannot be qualified with other PerfMon signals. If more than 1 GE is selected then the resultant event is the OR between each GE. However, properly counting Global Event based on design, XP PM Response Control Register bit [13:11] CENS must be set to choose GE[3:0] and also bit[18:17] CNTEVSEL must be set to 2'b10. • 1xxx: GE[3] • x1xx: GE[2] • xx1x: GE[1] • xxx1: GE[0]
1:0	0x0 RW	**Receive or Transmit Selection (RXTXSEL):** Selects which path to count transactions. • 1x: Transmit • x1: Receive (from PCI bus) • 11: Either

48.2.130 XPPMER0—Offset 2ACh

This register is used to select queuing structures for measurement. Use of this event register is mutually exclusive with the XPPMEVL,H registers. The Event Register Select field in the PMR register must select this register for to enable monitoring operations of the queues.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 2ACh

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0x0 RO	**RSVD0:** Reserved
24	0x0 RW	**Count Uncorrectable Errors (CNTUCERR):** Setting this bit enables the counting of uncorrectable errors by the perfmon counter. Only uncorrectable errors that are not masked by the ERRUNCDETMSK register are counted. Errors are counted on the ports enabled by the XPRSCA field in this register.
23	0x0 RW	**Count Correctable Errors (CNTCERR):** Setting this bit enables the counting of correctable errors by the perfmon counter. Only correctable errors that are not masked by the ERRCORDETMSK register are counted. Errors are counted on the ports enabled by the XPRSCA field in this register.
22	0x0 RW	**Tx L0s state utilization event (TXL0SU):** • 0: No tx_l0s utilization selected • 1: Enable tx_l0s utilization counting
21	0x0 RW	**Rx L0s state utilization event (RXL0SU):** • 0: No rx_l0s utilization selected • 1: Enable rx_l0s utilization counting
20:17	0x0 RW	**XP Resource Assignment (XPRSCA):** This selects which PCI-Express links are being monitored and against with XPPMEVL and XPPMEFH match registers and the queue measure select modes. A logic 1 selects that PCIe link for monitoring. • 1000: Select port 3 for monitoring. • 0100: Select port 2 for monitoring. • 0010: Select port 1 for monitoring. • 0001: Select port 0 for monitoring. If multiple bits are set, each port with a set bit will be counted (ie. you can count the total traffic on all ports).
16:13	0x0 RW	**Link Utilization (LNKUTIL):** Link Utilization field counts clocks that a port is receiving data and checking for receiver errors. It is used to calculate link reliability. If one counter counts receiver errors and another counter counts the cycles the port was checking for receiver error, a bit error rate can be calculated. • 0000: No event selected • 1000: Port 3 of 4, where applicable (DSPs only) • 0100: Port 2 of 4, where applicable (DSPs only) • 0010: Port 1 of 4, where applicable (DSPs only) • 0001: Port 0 of 4 (USP, DSPs, vSP/vRP) If multiple bits are set, each port with a set bit will be counted (ie. you can count the total traffic on all ports) For configs with less then 4 ports, the upper bits corresponding to non-existent ports have no effect
12	0x0 RO	**RSVD1:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
11:10	0x0 RW	**Queue Measure Select (QMSEL):** • 00: Transaction Bandwidth Measurement. Counts data payload in dwords going in the direction programmed (RxTx, FC, VC, Port) • 01: FIFO Queue Histogram Measurement. Uses the queue depth. 48.2.136 XPPERFCON—Offset 2C4h

The XPPERFCON register is a local performance monitor control register used to clear all of the counters or to assign which XP (PCIe) device participates in the performance monitoring event. All perfmon blocks will needs this register. We will perform ORing this register and global PERFCON from full chip for backup usage and self contained purpose.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 2C4h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RO	**RSVD0:** Reserved
1	0x0 RW	**Global Count Enable (GCE):** This bit is AND'ed with the PMR.CENS mux enable selection. • 0: Disable all counters. • 1: Enable local selection of CENS.
0	0x0 RW	**Global Reset (GRST):** Setting this bit to a logic 1 will reset the following bit fields in all PerfMon blocks throughout the component. xxxPMDx.CNT xxxPMR.OVS xxxPMR.CMPSTAT xxxPMCx.PMCx registers, and count mode state latch selected by xxxPMR.CNTMD = '01'. Where xxx is the cluster prefix name. ***Note:*** Software must clear this bit after setting it, otherwise the PerfMons remain in a reset state.

48.2.137 XPPERFSTAT—Offset 2C8h

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 2C8h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:2	0x0 RO	**RSVD0:** Reserved
1	0x0 RW/1C/V	**XP cluster PM1 Status (XPPM1STAT):** This bit indicates the status of PM0 from either the compare or overflow status. This is bit is cleared by writing a '1'.
0	0x0 RW/1C/V	**XP cluster PM0 Status (XPPM0STAT):** This bit indicates the status of PM0 from either the compare or overflow status. This is bit is cleared by writing a '1'.

48.2.138 XPCDTHROTTLEP—Offset 2D0h

This register controls the withholding of posted credits for throttling and survivability. For PCIe ports, the receive direction applies to PCIe credits and the transmit direction applies to IOSF credits. For the vSP/RP where both sides are IOSF credits, the receive credits apply to the IDF credits. Lock Key bit is located in the Personality Lock Key Control Register ('PLKCTL.TLCL').

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 2D0h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0x0 RW/P/L	**Tx Posted Request Data Throttling (TXPRD):** Remove this many credits from the available pool of credits for this type of transaction.
22:16	0x0 RW/P/L	**Tx Posted Request Header Throttling (TXPRH):** Remove this many credits from the available pool of credits for this type of transaction.
15:7	0x0 RW/P/L	**Rx Posted Request Data Throttling (RXPRD):** Remove this many credits from the available pool of credits for this type of transaction.
6:0	0x0 RW/P/L	**Rx Posted Request Header Throttling (RXPRH):** Remove this many credits from the available pool of credits for this type of transaction.

48.2.139 XPCDTHROTTLEN—Offset 2D4h

This register controls the withholding of non-posted credits for throttling and survivability. For PCIe ports, the receive direction applies to PCIe credits and the transmit direction applies to IOSF credits. For the vSP/RP where both sides are IOSF credits, the receive credits apply to the IDF credits. Lock Key bit is located in the Personality Lock Key Control Register ('PLKCTL.TLCL').

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 2D4h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0x0 RW/P/L	**Tx Non-Posted Request Data Throttling (TXNPRD):** Remove this many credits from the available pool of credits for this type of transaction.
22:16	0x0 RW/P/L	**Tx Non-Posted Request Header Throttling (TXNPRH):** Remove this many credits from the available pool of credits for this type of transaction.
15:7	0x0 RW/P/L	**Rx Non-Posted Request Data Throttling (RXNPRD):** Remove this many credits from the available pool of credits for this type of transaction.
6:0	0x0 RW/P/L	**Rx Non-Posted Request Header Throttling (RXNPRH):** Remove this many credits from the available pool of credits for this type of transaction.

48.2.140 XPCDTHROTTLEC—Offset 2D8h

This register controls the withholding of completion credits for throttling and survivability. For PCIe ports, the receive direction applies to PCIe credits and the transmit direction applies to IOSF credits. For the vSP/RP where both sides are IOSF credits, the receive credits apply to the IDF credits. Lock Key bit is located in the Personality Lock Key Control Register ('PLKCTL.TLCL').

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 2D8h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0x0 RW/P/L	**Tx Completion Data Throttling (TXCPLD):** Remove this many credits from the available pool of credits for this type of transaction.
22:16	0x0 RW/P/L	**Tx Completion Header Throttling (TXCPLH):** Remove this many credits from the available pool of credits for this type of transaction.
15:7	0x0 RW/P/L	**Rx Completion Data Throttling (RXCPLD):** Remove this many credits from the available pool of credits for this type of transaction.
6:0	0x0 RW/P/L	**Rx Completion Header Throttling (RXCPLH):** Remove this many credits from the available pool of credits for this type of transaction.

48.2.141 IOSFDEVCLKGCTL—Offset 2E4h

It is included for DMI EP in RC as an extension of Rootport definition.

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 2E4h

Default: 0010h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW	**Idle Clock Gating Enable (ICGE):** This bit when set enables clock gating to occur. **Power Well:** PRST
14:8	0x0 RO	**RSVD0:** Reserved
7:0	0x10 RW	**Idle Clock Timer (ICT):** This field indicates the number of clocks that the IP block controls the delay before going into IDLE. 16 (default value) is the minimum number of clocks recommended. **Power Well:** PRST

48.2.142 SBDEVCLKGCTL—Offset 2E6h

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 2E6h

Default: 8010h

Bit Range	Default & Access	Field Name (ID): Description
15	0x1 RW	**Idle Clock Gating Enable (ICGE):** This bit when set enables clock gating to occur when the IP block is idle longer then the Idle Clock Timer. **Power Well:** PRST
14:8	0x0 RO	**RSVD0:** Reserved
7:0	0x10 RW	**Idle Clock Timer (ICT):** This field indicates the number of clocks that the IP block must be idle before the clock disable process begins. 16 (default value) is the minimum number of clocks recommended. **Power Well:** PRST

48.2.143 VDHDRCAP—Offset 300h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 300h

Default: 0001000Bh

Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RW/L	**Next Capability Offset (PCIeNextPtr):** Contains the offset of the next item in the capabilities list. **Power Well:** PRST
19:16	0x1 RO	**Capability Version (PCIeCapVersion):** These bits indicate the version number of the PCI Express capability structure.
15:0	0xb RO	**Extended Capability ID (PCIeCapID):** Identifies the function as a Vendor Specific capability.

48.2.144 IBSTHDRCAP—Offset 304h

This register stores the version number of the capability item and other base information contained in the capability structure.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 304h

Default: 2A800001h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0x2a8 RO	**Vendor Specific Extended Capability Length (VSECLength):** These bits indicate the length of the PCI Express extended capability structure.
19:16	0x0 RO	**Revision Number (VSECIDRev):** These bits indicate the Revision number of the PCI Express capability structure.
15:0	0x1 RO	**Vendor Specific Extended Capability ID (VSECID):** Reserved.

48.2.145 IBSTENGLKSPDCAP—Offset 310h

REUT-ENG-LSCAPDevice: 7

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 310h

Default: 00000007h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RO	**RSVD0:** Reserved
29	0x0 RO	**Unique Speed (UniqSpd):** Reserved.
28	0x0 RO	**LSCTR is Passive (SpdCtlPassive):** Link speed is set by Link Speed Control (IBISTENGLKSPDCTL) register or it is passive where REUT-ENG-LSCTR (IBISTENGLKSPDCTL) does not control link speed.
27:26	0x0 RO	**RSVD1:** Reserved
25:24	0x0 RO/V	**Number of Test Controllers (NumTestContr):** Need to update with respect to port type.
23:16	0x0 RO	**RSVD2:** Reserved
15:8	0x0 RO	**Link Speed Capability1 (LinkSpeedCap1):** This field indicates the link speed. Valid only if Unique Speed is 1b and # of Test Controllers is) 0. • 00000001b: Gen 1 Speed (2.5 GT/s) • 00000010b: Gen 2 Speed (5 GT/s) • 00000100b: Gen 3 Speed (8 GT/s) • Others: Reserved.
7:0	0x7 RO/V	**Link Speed Capability (LinkSpeedCap):** This field indicates the link speed capabilities of test controller 0 (if Unique Speed = 1b) or all Test Controllers (if Unique Speed = 0). • 00000001b: Gen 1 Speed (2.5 GT/s) • 00000010b: Gen 2 Speed (5 GT/s - Never used) • 00000011b: Gen 1 and Gen 2 Speeds • 00000100b: Gen 3 Speed Only (Unique Speed = 1) • 00000111b: Gen 1, Gen2, and Gen3 Speed • Others: Reserved.

48.2.146 IBSTENGLKSPDCTL—Offset 314h

REUT-ENG-LSCTR

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 314h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RW/L	**Link 3 Speed Select (Link3SpeedSel):** This field controls the link speed of Link 3 if defined. This field overrides target link speed field defined in PCI Express spec and forces the link to operate at specified speed when programmed to a non-zero value. • 00000000b: Force link speed control off • 00000001b: Gen 1 Speed (2.5 GT/s) • 00000010b: Gen 2 Speed (5 GT/s) • 00000100b: Gen 3 Speed (8 GT/s) • Others: Reserved.
23:16	0x0 RW/L	**Link 2 Speed Select (Link2SpeedSel):** This field controls the link speed of Link 2 if defined. This field overrides target link speed field defined in PCI Express spec and forces the link to operate at specified speed when programmed to a non-zero value. • 00000000b: Force link speed control off • 00000001b: Gen 1 Speed (2.5 GT/s) • 00000010b: Gen 2 Speed (5 GT/s) • 00000100b: Gen 3 Speed (8 GT/s) • Others: Reserved.
15:8	0x0 RW/L	**Link 1 Speed Select (Link1SpeedSel):** This field controls the link speed of Link 1 if defined. This field overrides target link speed field defined in PCI Express spec and forces the link to operate at specified speed when programmed to a non-zero value. • 00000000b: Force link speed control off • 00000001b: Gen 1 Speed (2.5 GT/s) • 00000010b: Gen 2 Speed (5 GT/s) • 00000100b: Gen 3 Speed (8 GT/s) • Others: Reserved.
7:0	0x0 RW/L	**Link 0 Speed Select (Link0SpeedSel):** This field controls the link speed of Link 0. This field overrides target link speed field defined in PCI Express spec and forces the link to operate at specified speed when programmed to a non-zero value. • 00000000b: Force link speed control off • 00000001b: Gen 1 Speed (2.5 GT/s) • 00000010b: Gen 2 Speed (5 GT/s) • 00000100b: Gen 3 Speed (8 GT/s) • Others: Reserved.

48.2.147 IBSTENGLKTXRXCFG—Offset 31Ch

REUT-ENG-LTRCON

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 31Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:26	0x0 RO	**RSVD0:** Reserved
25	0x0 RO	**Link Automatic Configuration (LinkAutoConfiguration):** Link automatic configuration is not supported by this IBIST engine.
24	0x0 RW/P/L	**IBIST Write Disable (ReutDisable):** When set, this bit will prevent software writes to the IBIST engine's PCI Express Extended Capability Register Structure to prevent unwanted usage of the IBIST engine. Once set, the registers are unwritable until next Powergood reset. ***Note:*** At a Minimum, REUT-ENG-LSCTR.LinkSpeedSel, REUT-ENG-LTRCON.LinkControl, REUT-PAT-TEC.StartTest, and REUT-PH-CTR.Initialization Mode are cleared and locked.
23:15	0x0 RO	**RSVD1:** Reserved
14:8	0x0 RO	**Link Control 1 (LinkControl1):** This field is only valid if Unique Speed is a 1b and Number tof test controllers is) 0.
7	0x0 RO	**RSVD2:** Reserved
6:0	0x0 RW/P/L	**Link Control (LinkControl):** This field indicates the number of links under the control of the IBIST Engine. This control bit or field requires a link re-initialization though the LTSSM Detect state before any action is taken by hardware. All the odd bits can not be set by SW. Need to become RO-V to reflect LWCTRL register for downstream or Root ports.

48.2.148 IBSTERRCRCSTS0—Offset 320h

REUT-ERR-CED0-3

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 320h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD0:** Reserved
15	0x0 RW/1C/V/P	**CRC Error Overflow (CrcECC2Ovrflow):** Reserved.
14:0	0x0 RW/1C/V/P	**CRC Error Counter (CrcECC2ErrCnt):** Reserved.

48.2.149 IBSTERRRCRVSTS0—Offset 324h

REUT-ERR-ECCRCV0-3 IBSTERRRCRVSTS[1-3] are valid only for multi-port configuration.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 324h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/1C/V/P	**Recovery Overflow (LinkRecovOverflow):** This bit when 1b, indicates the recovery counter has overflowed.
30:16	0x0 RW/1C/V/P	**Recovery Counter (RecovCnt):** This field indicates the number of times the link(s) LTSSM state machine has entered the recovery state.
15	0x0 RW/1C/V/P	**Receiver Error Overflow (RxErrCntOvrflow):** This bit when 1b, indicates the receive error counter has overflowed.
14:0	0x0 RW/1C/V/P	**Receiver Error Counter (RxErrCnt):** This field indicates the number of times the link(s) has detected an 8b/10b receiver error.

48.2.150 IBSTERRCRCSTS1—Offset 328h

REUT-ERR-CED0-3

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 328h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD0:** Reserved
15	0x0 RW/1C/V/P	**CRC Error Overflow (CrcECC2Ovrflow):** Reserved.
14:0	0x0 RW/1C/V/P	**CRC Error Counter (CrcECC2ErrCnt):** Reserved.

48.2.151 IBSTERRRCRVSTS1—Offset 32Ch

REUT-ERR-ECCRCV0-3 IBSTERRRCRVSTS[1-3] are valid only for multi-port configuration.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 32Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/1C/V/P	**Recovery Overflow (LinkRecovOverflow):** This bit when 1b, indicates the recovery counter has overflowed.
30:16	0x0 RW/1C/V/P	**Recovery Counter (RecovCnt):** This field indicates the number of times the link(s) LTSSM state machine has entered the recovery state.
15	0x0 RW/1C/V/P	**Receiver Error Overflow (RxErrCntOvrflow):** This bit when 1b, indicates the receive error counter has overflowed.
14:0	0x0 RW/1C/V/P	**Receiver Error Counter (RxErrCnt):** This field indicates the number of times the link(s) has detected an 8b/10b receiver error.

48.2.152 IBSTERRCRCSTS2—Offset 330h

REUT-ERR-CED0-3

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 330h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD0:** Reserved
15	0x0 RW/1C/V/P	**CRC Error Overflow (CrcECC2Ovrflow):** Reserved.
14:0	0x0 RW/1C/V/P	**CRC Error Counter (CrcECC2ErrCnt):** Reserved.

48.2.153 IBSTERRRCRVSTS2—Offset 334h

REUT-ERR-ECCRCV0-3 IBSTERRRCRVSTS[1-3] are valid only for multi-port configuration.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 334h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/1C/V/P	**Recovery Overflow (LinkRecovOverflow):** This bit when 1b, indicates the recovery counter has overflowed.
30:16	0x0 RW/1C/V/P	**Recovery Counter (RecovCnt):** This field indicates the number of times the link(s) LTSSM state machine has entered the recovery state.
15	0x0 RW/1C/V/P	**Receiver Error Overflow (RxErrCntOvrflow):** This bit when 1b, indicates the receive error counter has overflowed.
14:0	0x0 RW/1C/V/P	**Receiver Error Counter (RxErrCnt):** This field indicates the number of times the link(s) has detected an 8b/10b receiver error.

48.2.154 IBSTERRCRCSTS3—Offset 338h

REUT-ERR-CED0-3

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 338h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD0:** Reserved
15	0x0 RW/1C/V/P	**CRC Error Overflow (CrcECC2Ovrflow):** Reserved.
14:0	0x0 RW/1C/V/P	**CRC Error Counter (CrcECC2ErrCnt):** Reserved.

48.2.155 IBSTERRRCRVSTS3—Offset 33Ch

REUT-ERR-ECCRCV0-3 IBSTERRRCRVSTS[1-3] are valid only for multi-port configuration.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 33Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/1C/V/P	**Recovery Overflow (LinkRecovOverflow):** This bit when 1b, indicates the recovery counter has overflowed.
30:16	0x0 RW/1C/V/P	**Recovery Counter (RecovCnt):** This field indicates the number of times the link(s) LTSSM state machine has entered the recovery state.
15	0x0 RW/1C/V/P	**Receiver Error Overflow (RxErrCntOvrflow):** This bit when 1b, indicates the receive error counter has overflowed.
14:0	0x0 RW/1C/V/P	**Receiver Error Counter (RxErrCnt):** This field indicates the number of times the link(s) has detected an 8b/10b receiver error.

48.2.156 IBSTPHYLCTL0—Offset 344h

REUT-PH-CTR0-3 IBSTPHYLCTL[1-3] are valid only for multi-port configuration.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 344h

Default: 00400000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0x0 RO	**RSVD0:** Reserved
22	0x1 RW/P	**Enable Scramble with LFSR (EnableScrambleLFSR):** When set to 1b, this bit enables scrambling by setting the disable scrambling bit in TS1 to 0b. This control bit or field requires a link re-initialization though the LTSSM Detect state before any action is taken by hardware.
21:14	0x0 RO	**RSVD1:** Reserved
13	0x0 RW/P	**Disable Auto-Compliance (DisableAutocompliance):** This bit when set to 1b does not allow the LTSSM state machine to transition from polling to compliance because squelch is enabled. This control bit or field requires a link re-initialization though the LTSSM Detect state before any action is taken by hardware.
12	0x0 RW/P	**Initialization Abort Freeze (InitAbortFreeze):** This bit when set to 1b freezes the LTSSM state machine at whenever a timeout occurs that would have caused the LTSSM state machine to exit to detect state. This control bit or field requires a link re-initialization though the LTSSM Detect state before any action is taken by hardware.
11	0x0 RO	**RSVD2:** Reserved
10:8	0x0 RW/P/L	**Initialization Mode (InitializationMode):** This field indicated the initialization mode of the link. • 000b: Normal Initialization • 001b: Initialization towards Loopback state • 010b: Tester Mode • 011b: Initialization towards Loopback.Compliance Master • 100b: Forced Entry to Compliance Master • 101b: Forced Entry to Compliance Slave • 110b: Initialization towards Compliance Receive • 111b: Reserved. This control bit or field requires a link re-initialization though the LTSSM Detect state before any action is taken by hardware. Note: Based on LKCON registers
7:3	0x0 RO	**RSVD3:** Reserved
2	0x0 RO	**Bypass Calibration (BypassCalib):** ***Note:*** This can change based on IO design.
1	0x0 RO	**RSVD4:** Reserved
0	0x0 RW/P	**Physical Layer Reset (PhyLayerReset):** This bit controls the reset assertion to the physical layer. Software is required to both set and clear this bit. ***Note:*** This bit is equivalent to the link disable bit in the link control register. PCIe logic should 'OR' this bit and the link disable bit.

48.2.157 IBSTPHYLCTL1—Offset 348h

REUT-PH-CTR0-3 IBSTPHYLCTL[1-3] are valid only for multi-port configuration.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 348h

Default: 00400000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0x0 RO	**RSVD0:** Reserved
22	0x1 RW/P	**Enable Scramble with LFSR (EnableScrambleLFSR):** When set to 1b, this bit enables scrambling by setting the disable scrambling bit in TS1 to 0b. This control bit or field requires a link re-initialization though the LTSSM Detect state before any action is taken by hardware.
21:14	0x0 RO	**RSVD1:** Reserved

3:0	0xf RO/V	**Post Configuration Lane 0 ID (PostConfigLane0ID):** This field identifies the Post-configuration Link ID for lane 0 (or lane 8 for IBSTPOSTCFG1).

48.2.168 TLPCIECLKGCTL—Offset 8E0h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 8E0h

Default: 001Fh

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW	**DIDT Mode (DIDT):** This bit when set to 1b will ensure that all clock gating is staggered by the amount of time determined by the Stagger Timer field in this register. **Power Well:** PRST
14:9	0x0 RO	**RSVD0:** Reserved
8:0	0x1f RW	**Stagger Timer (ST):** This field indicates the number of clocks that the IP block must be wait before the clock can be disable process begins. **Power Well:** PRST

48.2.169 TLPCIECLKGCCTL—Offset 8E2h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 8E2h

Default: 0055h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x0 RO	**RSVD0:** Reserved
7:6	0x1 RW	**Port Grant Count 3 (PGC3):** Reserved. **Power Well:** PRST
5:4	0x1 RW	**Port Grant Count 2 (PGC2):** Reserved. **Power Well:** PRST
3:2	0x1 RW	**Port Grant Count 1 (PGC1):** Reserved. **Power Well:** PRST
1:0	0x1 RW	**Port Grant Count 0 (PGC0):** Reserved. **Power Well:** PRST

48.2.170 PT0TXNCLKGCTL—Offset 8E4h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 8E4h

Default: 0010h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW	**Idle Clock Gating Enable (ICGE):** This bit when set enables clock gating to occur when the IP block is idle longer then the Idle Clock Timer. **Power Well:** PRST
14:8	0x0 RO	**RSVD0:** Reserved
7:0	0x10 RW	**Idle Clock Timer (ICT):** This field indicates the number of clocks that the IP block must be idle before the clock disable process begins. 16 (default value) is the minimum number of clocks recommended. **Power Well:** PRST

48.2.171 PT1TXNCLKGCTL—Offset 8E6h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 8E6h

Default: 0010h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW	**Idle Clock Gating Enable (ICGE):** This bit when set enables clock gating to occur when the IP block is idle longer then the Idle Clock Timer. **Power Well:** PRST
14:8	0x0 RO	**RSVD0:** Reserved
7:0	0x10 RW	**Idle Clock Timer (ICT):** This field indicates the number of clocks that the IP block must be idle before the clock disable process begins. 16 (default value) is the minimum number of clocks recommended. **Power Well:** PRST

48.2.172 PT2TXNCLKGCTL—Offset 8E8h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 8E8h

Default: 0010h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW	**Idle Clock Gating Enable (ICGE):** This bit when set enables clock gating to occur when the IP block is idle longer then the Idle Clock Timer. **Power Well:** PRST
14:8	0x0 RO	**RSVD0:** Reserved
7:0	0x10 RW	**Idle Clock Timer (ICT):** This field indicates the number of clocks that the IP block must be idle before the clock disable process begins. 16 (default value) is the minimum number of clocks recommended. **Power Well:** PRST

48.2.173 PT3TXNCLKGCTL—Offset 8EAh

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 8EAh

Default: 0010h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW	**Idle Clock Gating Enable (ICGE):** This bit when set enables clock gating to occur when the IP block is idle longer then the Idle Clock Timer. **Power Well:** PRST
14:8	0x0 RO	**RSVD0:** Reserved
7:0	0x10 RW	**Idle Clock Timer (ICT):** This field indicates the number of clocks that the IP block must be idle before the clock disable process begins. 16 (default value) is the minimum number of clocks recommended. **Power Well:** PRST

48.2.174 XPTDEF2—Offset 8F8h

Lock Key bit is located in the Personality Lock Key Control Register ('PLKCTL.TLCL').

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 8F8h

Default: 00001D00h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/1C/V/P	**MSI Address Violation Status (MSIAVS):** MSI address violation check status that does not target 0xFEEx_xxxx while MSIAVCD is not being set. This is only valid for RPs usage.
30:19	0x0 RW/P/L	**Reserved ECO (RECO):** This field is reserved for ECO purpose.
18	0x0 RW/P/L	**Hold Retrain during Surprise Removal Disable (HRSRD):** For Surprise Removal, EIP RPs will not allow retrain to occur until the SLOTSTS.PDCS bit has been cleared by software for the removal event. This bit is to disable the above behavior and allow the retrain to occur. This field is only applicable to RPs and should be treated as reserved for other devices.
17	0x0 RW/P/L	**ECRC Malformed Error Precedence Disable (ECRCMFEPD):** This bit changes the error precedence if a TLP has both a ECRC error and is malform. • When this bit is set to 1, the packet will be logged as an ECRC error. • When set to 0, the packet will be logged as a malform TLP, which is compliant to the PCIe spec errata. Only the type of error logged is affected. If the TLP is malform, it will be dropped with no credit return. If there is only an ECRC error detected on a packet, it will be dropped and credits will be returned per PCI-SIG Errata.
16	0x0 RW/P/L	**MSI Address Violation Check Disable (MSIAVCD):** Disable MSI address violation check that does not target 0xFEEx_xxxx. This is only valid for RPs usage.
15	0x0 RW/P/L	**Force Downstream Relaxed Order (FORCERODN):** Forces all downstream completions to follow relaxed ordering rules. This allows downstream completions to pass downstream posted requests. Note that setting this bit breaks the producer consumer model when the data is in the address space below the port and the flag is in the address space outside the port, because the read of the flag will not push the data writes down the port. The belief is that usage model is not used.
14	0x0 RW/P/L	**Downstream Relaxed Order Disable (DNRODIS):** Disables the ability of downstream relaxed ordered completions from passing posted requests in the same direction.
13	0x0 RW/P/L	**Upstream Relaxed Order Disable (UPRODIS):** Disables the ability of upstream relaxed ordered completions from passing posted requests in the same direction.
12	0x1 RW/P/L	**IOSF tdparity check disable (TDPAR_CHK_DIS):** When set this bit disables the data parity check for incoming data into the IOSF Target block. The logic will ignore the data parity bit and will operate as though the parity bit did not exist. No errors will be logged and good DW based parity will be written into the data queue.
11	0x1 RW/P/L	**IOSF tcparity check disable (TCPAR_CHK_DIS):** When set this bit disables the command parity check for incoming commands into the IOSF Target block. The logic will ignore the command parity bit and will operate as though the parity bit did not exist. No errors will be logged and good DW based parity will be written into the header queue.
10	0x1 RW/P/L	**MCTP Message Bus Number Check Enable (MMBNCE):** When set, if the Requester ID bus number of an MCTP message request received on the PCIe link does not fall within the range between SCBN and SBBN, the MCTP message will be silently discarded.
9	0x0 RW/P/L	**Completion credit advertisement enable (CPLCDT_EN):** Endpoints are required to advertise infinite completion credits. Setting this defeature bit breaks that rule and enables the advertisement of non-infinite completion credits and flow control updates for completion credits. This is only valid for project specific

Bit Range	Default & Access	Field Name (ID): Description
8	0x1 RW/P/L	**Enable Virtual Port IDs (EVPID):** • 1: Enables SB Virtual Port ID mode with allocated VPIDs which is associated with ports for all the egress INTx and LTR messages based on project specific. We will assign (N-1) virtual sideband PortID's to associate with the physical PortID which is port 0. The physical one is the same one as being assigned by the router as we have now, and would be used for all non-INTx messages and INTx messages from port 0. However, the VPIDs would be used for INTx messages routing from port(N-1:1), respectively. This allows all INTx from N ports to be forwarded to the ILB accordingly, so ILB can differentiate the source of the INTx message. • 0: Normal operation with single SB Port ID per cluster for INTx delivery. This is only valid for project specific with multi root ports.
7	0x0 RW/P/L	**Enable Receive Completion Ordering (ERCO):** The default ordering is to allow received completions to pass received posted requests to avoid receiver overflow conditions if posted requests cannot be processed. Setting this bit will enable PCI Express ordering for completions, preventing completions from passing posted requests. This is only valid for project specific
6	0x0 RW/P/L	**Enable MSI Generation Override (MSIGENOV):** • 1: Enables Root Port MSI generation override even if PCICMD.BME = 0 for the root port device as required by PCI Express specification. • 0: Normal operation for Root Port behavior. If PCICMD.BME = 0, the root port will not generate a MSI. This is only valid for project specific.
5	0x0 RW/P/L	**Completion Combining Disable (CPLCOMBINE_D):** When a larger read request is split into smaller read requests, the completions for the small requests may be opportunistically combined into larger completions to enable higher bandwidth and link utilization, as long as packet formation rules are not violated. This bit disables the port from combining completions. This is only valid for project specific .
4	0x0 RW/P/L	**Config Retry Disable (CRD):** Setting this bit disables the re-issuing of a configuration request if the request is completed with a configuration retry status (CRS). The completion with CRS will be returned to the requestor.
3	0x0 RW/P/L	**Optional Unexpected Completion Check Disable (UCCHKD):** Setting this bit disables some optional unexpected checks on completions. Specifically, it disables the checking on the byte count and lower address fields.
2	0x0 RW/P/L	**MCTP Disable Bus Check (MCTPDBC):** Setting this bit will disable the Bus 0 check for all MCTP VDM Type1 messages. The check is enabled by default as following: • Upstream - ReqBus =/= 0 • Downstream - TgtBus =/= 0
1	0x0 RW/P/L	**MSI-X Single Message Vector (MSIXSMSGV):** This bit when set, causes only a single MSI-X vector to be generated if MSI-X is enabled. This bit affects the default value of the MSI-X Table Size field
0	0x0 RW/P/L	**Global Stop Disable (GBLSTOPD):** When the design detects an uncorrectable internal error, a stop signal in the design asserts, blocking the processing of transactions in both directions in the transaction layer. Setting this bit, disables the stop mechanism, allowing the transactions to proceed as if no error occurred.

48.2.175 PMIDLTMR—Offset 948h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 948h

Default: 00000306h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/P	**ENPMTIMEOUT:** A number of pci-e cards have a particular erratum which causes them to send spurious PM requests. When such spurious behavior happens, the northbridge starts the pm negotiation from its side and results in a system failure. This bit when set enables an exit to recovery if the power management request did not terminate within 64-96us.
30:28	0x0 RW/P	**PMDLLPCNT:** Only useful for upstream devices. Do not take action based on seeing ASPM/PM DLLPs until 'PMDLLPCNT' DLLPs have been observed. When set to 0, a single ASPM/PM DLLP will cause a response. Used to work around broken devices that fail to flush all ASPM/PM DLLPs before entering the low power state and send spurious DLLPs upon return to L0 state.
27:12	0x0 RO	**RSVD0:** Reserved
11:8	0x3 RW/P	**L0s_IDLE_TIMER:** Indicates the amount of idle time in [us], as defined in the PCI-E spec, after which a tx-L0s transition will be initiated. Timers have an accuracy of -1/+0us. A setting of 0 will disable tx-L0s transitions.
7:5	0x0 RO	**RSVD1:** Reserved
4:0	0x6 RW/P	**L1_IDLE_TIMER:** Only used for Downstream devices. Not useful for an RC. Downstream device will initiate ASPM L1 request after the specified number of us of idle time. For RH can be used as a scratch register. A setting of 0 can be used as a non-specd way of disabling ASPM L1.

48.2.176 LLRBSIZE—Offset 98Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 98Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0x0 RO	**RSVD0:** Reserved
26:16	0x0 RO/V	**LUT_SIZE:** Number of physical entries in LUT (does not account for RTRYCTL.UNUSABLE_MAP_ENTRIES). Units are 'TLPs'.
15:11	0x0 RO	**RSVD1:** Reserved
10:0	0x0 RO/V	**LLRB_SIZE:** Number of symbol times of data in the LLRB (does not account for RTRYCTL.UNUSABLE_LLRB_ENTRIES). Units are symbol times.

48.2.177 FRMERRMSK—Offset 99Ch

These errors in FRMERRMSK, STS only apply to Gen1/Gen2.

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 99Ch

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:10	0x0 RO	**RSVD0:** Reserved
9	0x0 RW/P	**DUMP_IN_DLLP_MSK:** This bit masks reporting of the corresponding errors in the FRMERRSTS register.
8	0x0 RW/P	**DUMP_IN_TLP_MSK:** This bit masks reporting of the corresponding errors in the FRMERRSTS register.
7	0x0 RW/P	**ILL_STP_END_ERR_MSK:** This bit masks reporting of the corresponding errors in the FRMERRSTS register.
6	0x0 RW/P	**SDP_FRQ_ERR_MSK:** This bit masks reporting of the corresponding errors in the FRMERRSTS register.
5	0x0 RW/P	**STP_FRQ_ERR_MSK:** This bit masks reporting of the corresponding errors in the FRMERRSTS register.
4	0x0 RW/P	**GAP_SDP_ERR_MSK:** This bit masks reporting of the corresponding errors in the FRMERRSTS register.
3	0x0 RW/P	**GAP_STP_ERR_MSK:** This bit masks reporting of the corresponding errors in the FRMERRSTS register.
2	0x0 RW/P	**IDL_ERR_MSK:** This bit masks reporting of the corresponding errors in the FRMERRSTS register.
1	0x0 RW/P	**PAD_ERR_MSK:** This bit masks reporting of the corresponding errors in the FRMERRSTS register.
0	0x0 RW/P	**DW1_ERR_MSK:** This bit masks reporting of the corresponding errors in the FRMERRSTS register.

48.2.178 FRMERRSTS—Offset 99Eh

These errors in FRMERRMSK, STS only apply to Gen1/Gen2.

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 99Eh

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:10	0x0 RO	**RSVD0:** Reserved
9	0x0 RW/1C/V/P	**DUMP_IN_DLLP_ERR:** Preprocessor block detected error in DLLP framing.
8	0x0 RW/1C/V/P	**DUMP_IN_TLP_ERR:** Preprocessor block detected error in TLP framing.
7	0x0 RW/1C/V/P	**ILL_STP_END_ERR:** STP/SDP/END/EDB seen in illegal lanes.
6	0x0 RW/1C/V/P	**SDP_FRQ_ERR:** SDP seen too frequently in otherwise legal lanes.
5	0x0 RW/1C/V/P	**STP_FRQ_ERR:** STP seen too frequently in otherwise legal lanes.
4	0x0 RW/1C/V/P	**GAP_SDP_ERR:** Framing error: Gap seen between first packet and DLLP.
3	0x0 RW/1C/V/P	**GAP_STP_ERR:** Framing error: Gap seen between first packet and TLP.
2	0x0 RW/1C/V/P	**IDL_ERR:** Framing error: Logic idles not seen where expected.
1	0x0 RW/1C/V/P	**PAD_ERR:** Framing error: PADs not seen where expected.
0	0x0 RW/1C/V/P	**DW1_ERR:** Framing error in 1st DW of a TLP/DLLP.

48.2.179 LLPCIECLKGCTL—Offset 9E0h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 9E0h

Default: 001Fh

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW	**DIDT Mode (DIDT):** This bit when set to 1b will ensure that all clock gating is staggered by the amount of time determined by the Stagger Timer field in this register. **Power Well:** PRST
14:9	0x0 RO	**RSVD0:** Reserved
8:0	0x1f RW	**Stagger Timer (ST):** This field indicates the number of clocks that the IP block must be wait before the clock can be disable process begins. **Power Well:** PRST

48.2.180 LLPCIECLKGCCTL—Offset 9E2h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 9E2h

Default: 0055h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x0 RO	**RSVD0:** Reserved
7:6	0x1 RW	**Port Grant Count 3 (PGC3):** Reserved. **Power Well:** PRST
5:4	0x1 RW	**Port Grant Count 2 (PGC2):** Reserved. **Power Well:** PRST
3:2	0x1 RW	**Port Grant Count 1 (PGC1):** Reserved. **Power Well:** PRST
1:0	0x1 RW	**Port Grant Count 0 (PGC0):** Reserved. **Power Well:** PRST

48.2.181 PT0LNKCLKGCTL—Offset 9E4h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 9E4h

Default: 0010h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW	**Idle Clock Gating Enable (ICGE):** This bit when set enables clock gating to occur when the IP block is idle longer then the Idle Clock Timer. **Power Well:** PRST
14:8	0x0 RO	**RSVD0:** Reserved
7:0	0x10 RW	**Idle Clock Timer (ICT):** This field indicates the number of clocks that the IP block must be idle before the clock disable process begins. 16 (default value) is the minimum number of clocks recommended. **Power Well:** PRST

48.2.182 PT1LNKCLKGCTL—Offset 9E6h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 9E6h

Default: 0010h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW	**Idle Clock Gating Enable (ICGE):** This bit when set enables clock gating to occur when the IP block is idle longer then the Idle Clock Timer. **Power Well:** PRST
14:8	0x0 RO	**RSVD0:** Reserved
7:0	0x10 RW	**Idle Clock Timer (ICT):** This field indicates the number of clocks that the IP block must be idle before the clock disable process begins. 16 (default value) is the minimum number of clocks recommended. **Power Well:** PRST

48.2.183 PT2LNKCLKGCTL—Offset 9E8h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 9E8h

Default: 0010h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW	**Idle Clock Gating Enable (ICGE):** This bit when set enables clock gating to occur when the IP block is idle longer then the Idle Clock Timer. **Power Well:** PRST
14:8	0x0 RO	**RSVD0:** Reserved
7:0	0x10 RW	**Idle Clock Timer (ICT):** This field indicates the number of clocks that the IP block must be idle before the clock disable process begins. 16 (default value) is the minimum number of clocks recommended. **Power Well:** PRST

48.2.184 PT3LNKCLKGCTL—Offset 9EAh

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 9EAh

Default: 0010h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW	**Idle Clock Gating Enable (ICGE):** This bit when set enables clock gating to occur when the IP block is idle longer then the Idle Clock Timer. **Power Well:** PRST
14:8	0x0 RO	**RSVD0:** Reserved
7:0	0x10 RW	**Idle Clock Timer (ICT):** This field indicates the number of clocks that the IP block must be idle before the clock disable process begins. 16 (default value) is the minimum number of clocks recommended. **Power Well:** PRST

48.2.185 CFGPCIECLKGCTL—Offset 9ECh

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + 9ECh

Default: 0010h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW	**Idle Clock Gating Enable (ICGE):** This bit when set enables clock gating to occur when the IP block is idle longer then the Idle Clock Timer. **Power Well:** PRST
14:8	0x0 RO	**RSVD0:** Reserved

48.2.196 UPCFGCSR—Offset AB8h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + AB8h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0x0 RO	**RSVD0:** Reserved
22	0x0 RO/V	**RCVDUPCFGCAP:** Received up configure support by link partner.
21:16	0x0 RO/V	**ILW:** Initial Link Width (maximum width to up configure to). ILW format is the same as MLW.
15:8	0x0 RO	**RSVD1:** Reserved
7	0x0 RW/P	**UPCFGCAPEN:** This bit when set to 1 enables advertising dynamic width support in the training sequences. When this bit is set 1 from 0, the link will move through Recovery to Config advertising upconfigure capability. It will also ignore the settings in fields TLW and UPCFGEN at the time the bit is set.
6:1	0x0 RW/P	**TLW:** This is the target link width used when mastering a dynamic width change. If TLW is greater than the initial trained link width when LinkUp goes to 0--)1, then the initial link width is chosen as a cap.
0	0x0 RW/V	**UPCFGEN:** When UPCFGCAPEN is set to 1 and this bit is set to 1, a dynamic width change is initiated if the TLW field is not equal to the current link width (if other end advertises support for it), this bit is cleared by hardware after making one attempt to change width. On error, this bit will be cleared and TLW != NLW. If TLW==NLW and this bit is set, hardware will clear it without entering Recovery/Config.

48.2.197 SOSCTL—Offset AC8h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + AC8h

Default: 00025A4Eh

Bit Range	Default & Access	Field Name (ID): Description
31:23	0x0 RO	**RSVD0:** Reserved
22	0x0 RW/V/P	**SRISEN:** This field should be set prior to link training and may be loaded via fuse or strap. When enabled, the high frequency SOS interval is defined in SRISSOSINT and the low frequency SOS interval is defined in SOSINTERVAL.
21:11	0x4b RW/P	**SRISSOSINT:** SOS interval used in SRIS mode (high frequency interval). Same interval definition as the SOSINTERVAL field.
10:0	0x24e RW/P	**SOSINTERVAL:** Symbol between SOS insertions For 2.5GTs/ and 5GT/s modes = val * 2 For 8GT/s mode = val * 8

48.2.198 G3SOSERRSTS—Offset ACCh

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + ACCh

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW/1C/V/P	**LFSRERR:** 8GT/s SOS block LFSR state mis-compare.
15:0	0x0 RW/1C/V/P	**PARERR:** 8GT/s SOS block parity error.

48.2.199 PLPCIECLKGCTL—Offset AE0h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + AE0h

Default: 001Fh

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW	**DIDT Mode (DIDT):** This bit when set to 1b will ensure that all clock gating is staggered by the amount of time determined by the Stagger Timer field in this register. **Power Well:** PRST
14:9	0x0 RO	**RSVD0:** Reserved
8:0	0x1f RW	**Stagger Timer (ST):** This field indicates the number of clocks that the IP block must be wait before the clock can be disable process begins. **Power Well:** PRST

48.2.200 PLPCIECLKGCCTL—Offset AE2h

The grant count needs to be greater than 0 for the arbitration to function. A grant count of 0 means no resources available and the requester will never be serviced.

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + AE2h

Default: 0055h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x0 RO	**RSVD0:** Reserved
7:6	0x1 RW	**Port Grant Count 3 (PGC3):** This field is valid only for multi-port configuration. **Power Well:** PRST
5:4	0x1 RW	**Port Grant Count 2 (PGC2):** This field is valid only for multi-port configuration. **Power Well:** PRST
3:2	0x1 RW	**Port Grant Count 1 (PGC1):** This field is valid only for multi-port configuration. **Power Well:** PRST
1:0	0x1 RW	**Port Grant Count 0 (PGC0):** Reserved. **Power Well:** PRST

48.2.201 PT0PHYCLKGCTL—Offset AE4h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + AE4h

Default: 0010h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW	**Idle Clock Gating Enable (ICGE):** This bit when set enables clock gating to occur when the IP block is idle longer then the Idle Clock Timer. **Power Well:** PRST
14:8	0x0 RO	**RSVD0:** Reserved
7:0	0x10 RW	**Idle Clock Timer (ICT):** This field indicates the number of clocks that the IP block must be idle before the clock disable process begins. 16 (default value) is the minimum number of clocks recommended. **Power Well:** PRST

48.2.202 PT1PHYCLKGCTL—Offset AE6h

This register is valid only for multi-port configuration.

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + AE6h

Default: 0010h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW	**Idle Clock Gating Enable (ICGE):** This bit when set enables clock gating to occur when the IP block is idle longer then the Idle Clock Timer. **Power Well:** PRST
14:8	0x0 RO	**RSVD0:** Reserved
7:0	0x10 RW	**Idle Clock Timer (ICT):** This field indicates the number of clocks that the IP block must be idle before the clock disable process begins. 16 (default value) is the minimum number of clocks recommended. **Power Well:** PRST

48.2.203 PT2PHYCLKGCTL—Offset AE8h

This register is valid only for multi-port configuration.

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + AE8h

Default: 0010h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW	**Idle Clock Gating Enable (ICGE):** This bit when set enables clock gating to occur when the IP block is idle longer then the Idle Clock Timer. **Power Well:** PRST
14:8	0x0 RO	**RSVD0:** Reserved
7:0	0x10 RW	**Idle Clock Timer (ICT):** This field indicates the number of clocks that the IP block must be idle before the clock disable process begins. 16 (default value) is the minimum number of clocks recommended. **Power Well:** PRST

48.2.204 PT3PHYCLKGCTL—Offset AEAh

This register is valid only for multi-port configuration.

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + AEAh

Default: 0010h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW	**Idle Clock Gating Enable (ICGE):** This bit when set enables clock gating to occur when the IP block is idle longer then the Idle Clock Timer. **Power Well:** PRST
14:8	0x0 RO	**RSVD0:** Reserved
7:0	0x10 RW	**Idle Clock Timer (ICT):** This field indicates the number of clocks that the IP block must be idle before the clock disable process begins. 16 (default value) is the minimum number of clocks recommended. **Power Well:** PRST

48.2.205 LTLGCAP—Offset B00h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + B00h

Default: 36000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x3600 RO	**BAROFFSET:** Memory bar offset for ram entry 0
15:4	0x0 RO/V	**RAMSIZE:** Number of total ram entries.
3	0x0 RO	**RSVD0:** Reserved
2:0	0x0 RO/V	**NUMSUBLOG:** Number of sub-loggers supported.

48.2.206 LTLGCTRL—Offset B04h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + B04h

Default: 00321000h

Bit Range	Default & Access	Field Name (ID): Description
31:23	0x0 RO	**RSVD0:** Reserved
22:20	0x3 RW/P	**SUBLOG3PT:** Port to assign to sub-logger 3.
19	0x0 RO	**RSVD1:** Reserved
18:16	0x2 RW/P	**SUBLOG2PT:** Port to assign to sub-logger 2.
15	0x0 RO	**RSVD2:** Reserved
14:12	0x1 RW/P	**SUBLOG1PT:** Port to assign to sub-logger 1.
11	0x0 RO	**RSVD3:** Reserved
10:8	0x0 RW/P	**SUBLOG0PT:** Port to assign to sub-logger 0.
7:5	0x0 RO	**RSVD4:** Reserved
4	0x0 RW/V/P	**CLEARALL:** Clear and restart all sub-loggers.
3	0x0 RO	**RSVD5:** Reserved
2:0	0x0 RW/P	**SPLITCTL:** Control of splitting logger if 1 sub log, ignored if 2 sub logs, only bit 0 used [0] = 1, sublog0 owns full ram [0] = 0, sublog0/1 split ram if 4 sub-logs • 1-- = sublog0 owns full ram • 011 = sublog0/2 split ram in half • 001 = sublog0 gets half, sublog2/3 get a quarter each • 010 = sublog0/1 get a quarter each, sublog2 gets half • 000 = sublog0/1/2/3 get a quarter each

48.2.207 LTLGSTART0—Offset B08h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + B08h

Default: 00000001h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0x0 RW/P	**STARTTRGMSK:** If XSTOPTRGEN = 0, and any bit is set to 1, it will make that corresponding start trigger bit a don't care (always match). If XSTOPTRGEN = 1, bits [19:18] are used and [31:20] reserved. Here is the definition for a and b which is the OR mask to dmona/b. a = bit[18] | dmona b = bit[19] | dmonb
17:4	0x0 RW/P	**STARTTRG:** If XSTOPTRGEN = 0, start trigger value, used in conjunction with the start trigger mask [13:10] State exit arc [9:8] RxL0s state [7:4] LTSSM main state [3:0] LTSSM sub state. If XSTOPTRGEN = 1, bits [6:4] are used, [17:7] reserved. Here is the definition of the external trigger event using the mask and dmona/b values • 000 - trigger (= (!a and !b) • 001 - trigger (= (a and !b) • 010 - trigger (= (!a and b) • 011 - trigger (= (a and b) • 100 - trigger (= (!a | !b) • 101 - trigger (= (a | !b) • 110 - trigger (= (!a | b) • 111 - trigger (= (a | b) a = bit[18] | dmona b = bit[19] | dmonb
3	0x0 RW/P	**STARTTRGEN:** If set, logging starts when the start trigger field and mask match the current LTSSM state/arc
2	0x0 RW/1C/V/P	**STARTTRIGGERED:** If 1, the start trigger event was hit.
1	0x0 RO	**RSVD0:** Reserved
0	0x1 RW/V/P	**START:** Enable logging. 0--)1 transition will clear log data If using the stop trigger, this bit will clear if the stop trigger event occurs. LTLGSTART[3:0] is based on one per sub-logger.

48.2.208 LTLGSTART1—Offset B0Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + B0Ch

Default: 00000001h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0x0 RW/P	**STARTTRGMSK:** • If XSTOPTRGEN = 0, and any bit is set to 1, it will make that corresponding start trigger bit a don't care (always match). • If XSTOPTRGEN = 1, bits [19:18] are used and [31:20] reserved. Here is the definition for a and b which is the OR mask to dmona/b. a = bit[18] | dmona b = bit[19] | dmonb
17:4	0x0 RW/P	**STARTTRG:** If XSTOPTRGEN = 0, start trigger value, used in conjunction with the start trigger mask [13:10] State exit arc [9:8] RxL0s state [7:4] LTSSM main state [3:0] LTSSM sub state If XSTOPTRGEN = 1, bits [6:4] are used, [17:7] reserved. 48.2.211 LTLGSTP0—Offset B18h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + B18h

Default: 1E000009h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/1C/V/P	**TRIGGERED:** If 1, the trigger event was hit.
30	0x0 RW/1C/V/P	**XTRIGGERED:** If 1, external stop trigger event occurred.
29	0x0 RW/P	**XSTOPTRGEN:** Use external trigger event to stop logging, see LTLGCTL.STARTTRG and STARTTRGMSK for configuration details. Enabling this does not disable the state match stop event and it does disable the state match start event (acts as if STARTTRGEN=0).
28:15	0x3c00 RW/P	**STOPTRGMSK:** if any bit is set to 1, it will make that corresponding stopt trigger bit a don't care (always match)
14:1	0x4 RW/P	**STOPTRG:** Stop trigger value, used in conjunction with the stop trigger mask [13:10] State exit arc [9:8] RxL0s state [7:4] LTSSM main state [3:0] LTSSM sub state
0	0x1 RW/P	**STOPTRGEN:** If set, logging stops when the stop trigger field and mask match the current LTSSM state/arc. LTLGSTP[3:0] is based on one per sub-logger.

48.2.212 LTLGSTP1—Offset B1Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + B1Ch

Default: 1E000009h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/1C/V/P	**TRIGGERED:** If 1, the trigger event was hit.
30	0x0 RW/1C/V/P	**XTRIGGERED:** If 1, external stop trigger event occurred.
29	0x0 RW/P	**XSTOPTRGEN:** Use external trigger event to stop logging, see LTLGCTL.STARTTRG and STARTTRGMSK for configuration details. Enabling this does not disable the state match stop event and it does disable the state match start event (acts as if STARTTRGEN=0).
28:15	0x3c00 RW/P	**STOPTRGMSK:** if any bit is set to 1, it will make that corresponding stop trigger bit a don't care (always match)
14:1	0x4 RW/P	**STOPTRG:** Stop trigger value, used in conjunction with the stop trigger mask [13:10] State exit arc [9:8] RxL0s state [7:4] LTSSM main state [3:0] LTSSM sub state
0	0x1 RW/P	**STOPTRGEN:** If set, logging stops when the stop trigger field and mask match the current LTSSM state/arc. LTLGSTP[3:0] is based on one per sub-logger.

48.2.213 LTLGSTP2—Offset B20h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + B20h

Default: 1E000009h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/1C/V/P	**TRIGGERED:** If 1, the trigger event was hit.
30	0x0 RW/1C/V/P	**XTRIGGERED:** If 1, external stop trigger event occurred.
29	0x0 RW/P	**XSTOPTRGEN:** Use external trigger event to stop logging, see LTLGCTL.STARTTRG and STARTTRGMSK for configuration details. Enabling this does not disable the state match stop event and it does disable the state match start event (acts as if STARTTRGEN=0).
28:15	0x3c00 RW/P	**STOPTRGMSK:** if any bit is set to 1, it will make that corresponding stopt trigger bit a don't care (always match)
14:1	0x4 RW/P	**STOPTRG:** Stop trigger value, used in conjunction with the stop trigger mask [13:10] State exit arc [9:8] RxL0s state [7:4] LTSSM main state [3:0] LTSSM sub state
0	0x1 RW/P	**STOPTRGEN:** If set, logging stops when the stop trigger field and mask match the current LTSSM state/arc. LTLGSTP[3:0] is based on one per sub-logger.

48.2.214 LTLGSTP3—Offset B24h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + B24h

Default: 1E000009h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/1C/V/P	**TRIGGERED:** If 1, the trigger event was hit.
30	0x0 RW/1C/V/P	**XTRIGGERED:** If 1, external stop trigger event occurred.
29	0x0 RW/P	**XSTOPTRGEN:** Use external trigger event to stop logging, see LTLGCTL.STARTTRG and STARTTRGMSK for configuration details. Enabling this does not disable the state match stop event and it does disable the state match start event (acts as if STARTTRGEN=0).
28:15	0x3c00 RW/P	**STOPTRGMSK:** if any bit is set to 1, it will make that corresponding stop trigger bit a don't care (always match)
14:1	0x4 RW/P	**STOPTRG:** Stop trigger value, used in conjunction with the stop trigger mask [13:10] State exit arc [9:8] RxL0s state [7:4] LTSSM main state [3:0] LTSSM sub state
0	0x1 RW/P	**STOPTRGEN:** If set, logging stops when the stop trigger field and mask match the current LTSSM state/arc. LTLGSTP[3:0] is based on one per sub-logger.

48.2.215 LTLGTMEV0—Offset B28h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + B28h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/1C/V/P	**TRIGGERED:** If 1, the trigger event was hit.
30:24	0x0 RO	**RSVD0:** Reserved
23	0x0 RW/P	**EVLVL:** • 1: Event should be a level signal (high as long as compare condition is true) • 0: Event should be a pulse
22:6	0x0 RW/P	**COUNT:** The time value to compare with. The value is in units defined by the UNIT field.
5:3	0x0 RW/P	**CMP:** • 00 = compare to equal the time value • 01 = compare to greater than the time value • 10 = compare to less than the time value • 11 = reserved
2	0x0 RW/P	**UNIT:** • 1 = 256cc • 0 = 1cc Where cc is 1 pclk period and the user needs to be cognizant of designs that utilize variable (rate based) pclk.
1	0x0 RW/P	**SMEGC:** Select which state matching register to use for the state matching portion. The register must belong to the port set in the start register.
0	0x0 RW/P	**ENABLE:** Enable timer event using port defined in the start register. LTLGMEV[3:0] is based on one per sub-logger.

48.2.216 LTLGTMEV1—Offset B2Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + B2Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/1C/V/P	**TRIGGERED:** If 1, the trigger event was hit.
30:24	0x0 RO	**RSVD0:** Reserved
23	0x0 RW/P	**EVLVL:** • 1: Event should be a level signal (high as long as compare condition is true) • 0: Event should be a pulse
22:6	0x0 RW/P	**COUNT:** The time value to compare with. The value is in units defined by the UNIT field.
5:3	0x0 RW/P	**CMP:** • 00 = compare to equal the time value • 01 = compare to greater than the time value • 10 = compare to less than the time value • 11 = reserved
2	0x0 RW/P	**UNIT:** • 1 = 256cc • 0 = 1cc Where cc is 1 pclk period and the user needs to be cognizant of designs that utilize variable (rate based) pclk.
1	0x0 RW/P	**SMEGC:** Select which state matching register to use for the state matching portion. The register must belong to the port set in the start register.
0	0x0 RW/P	**ENABLE:** Enable timer event using port defined in the start register. LTLGMEV[3:0] is based on one per sub-logger.

48.2.217 LTLGTMEV2—Offset B30h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + B30h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/1C/V/P	**TRIGGERED:** If 1, the trigger event was hit.
30:24	0x0 RO	**RSVD0:** Reserved
23	0x0 RW/P	**EVLVL:** • 1: Event should be a level signal (high as long as compare condition is true) • 0: Event should be a pulse
22:6	0x0 RW/P	**COUNT:** The time value to compare with. The value is in units defined by the UNIT field.
5:3	0x0 RW/P	**CMP:** • 00 = compare to equal the time value • 01 = compare to greater than the time value • 10 = compare to less than the time value • 11 = reserved
2	0x0 RW/P	**UNIT:** • 1 = 256cc • 0 = 1cc Where cc is 1 pclk period and the user needs to be cognizant of designs that utilize variable (rate based) pclk.
1	0x0 RW/P	**SMEGC:** Select which state matching register to use for the state matching portion. The register must belong to the port set in the start register.
0	0x0 RW/P	**ENABLE:** Enable timer event using port defined in the start register. LTLGMEV[3:0] is based on one per sub-logger.

48.2.218 LTLGTMEV3—Offset B34h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + B34h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/1C/V/P	**TRIGGERED:** If 1, the trigger event was hit.
30:24	0x0 RO	**RSVD0:** Reserved
23	0x0 RW/P	**EVLVL:** • 1: Event should be a level signal (high as long as compare condition is true) • 0: Event should be a pulse
22:6	0x0 RW/P	**COUNT:** The time value to compare with. The value is in units defined by the UNIT field.
5:3	0x0 RW/P	**CMP:** • 00 = compare to equal the time value • 01 = compare to greater than the time value • 10 = compare to less than the time value • 11 = reserved
2	0x0 RW/P	**UNIT:** 1 = 256cc 0 = 1cc Where cc is 1 pclk period and the user needs to be cognizant of designs that utilize variable (rate based) pclk.
1	0x0 RW/P	**SMEGC:** Select which state matching register to use for the state matching portion. The register must belong to the port set in the start register.
0	0x0 RW/P	**ENABLE:** Enable timer event using port defined in the start register. LTLGMEV[3:0] is based on one per sub-logger.

48.2.219 LTLGRDCT—Offset B40h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + B40h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0x0 RO	**RSVD0:** Reserved
17:16	0x0 RW/P	**LOGSEL:** Select which sub-logger to read.
15	0x0 RW/P	**AUTOINC:** • 1: Every time a read to LTLGRES happens, the read index increment automatically • 0: manual movement of the read index is required
14:6	0x0 RO	**RSVD1:** Reserved
5:0	0x0 RW/V/P	**RDINDEX:** The value in this field will point the LTLGRES register to a particular log entry. 0 is the latest entry 63 is oldest entry

48.2.220 LTLGRES—Offset B44h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + B44h

Default: FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	0xffffffff RO/V/P	**ENTRY:** [31] Time granularity bit • 1=512ns • 0=2ns Switch between modes is done when [30:14] increments past 1FFFFh [30:14] time unit count see bit 31 for unit definition [13:10] State exit arc • 0=state not exited • 1..15=see state specific map [9:8] RxL0s State [7:4] LTSSM Main state [3:0] LTSSM Sub state

48.2.221 LTLGSMEV0—Offset B48h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + B48h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/1C/V/P	**TRIGGERED:** If 1, the trigger event was hit.
30:29	0x0 RO	**RSVD0:** Reserved
28:15	0x0 RW/P	**MASK:** if any bit is set to 1, it will make that corresponding trigger bit a don't care (always match)
14:1	0x0 RW/P	**VALUE:** trigger value, used in conjunction with the mask [13:10] State exit arc [9:8] RxL0s state [7:4] LTSSM main state [3:0] LTSSM sub state
0	0x0 RW/P	**ENABLE:** Enable the trigger on match

48.2.222 LTLGSMEV1—Offset B4Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + B4Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/1C/V/P	**TRIGGERED:** If 1, the trigger event was hit.
30:29	0x0 RO	**RSVD0:** Reserved
28:15	0x0 RW/P	**MASK:** if any bit is set to 1, it will make that corresponding trigger bit a don't care (always match)
14:1	0x0 RW/P	**VALUE:** trigger value, used in conjunction with the mask [13:10] State exit arc [9:8] RxL0s state [7:4] LTSSM main state [3:0] LTSSM sub state
0	0x0 RW/P	**ENABLE:** Enable the trigger on match

48.2.223 NFTSCOMCLK—Offset B50h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + B50h

Default: 00FFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**RSVD0:** Reserved
23:16	0xff RW/P	**GEN3NFTS:** Number of FTS blocks required for RxL0s in common clock mode
15:8	0xff RW/P	**GEN2NFTS:** Number of FTS ordered sets required for RxL0s in common clock mode
7:0	0xff RW/P	**GEN1NFTS:** Number of FTS ordered sets required for RxL0s in common clock mode

48.2.224 NFTSDSCCLK—Offset B54h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + B54h

Default: 00FFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**RSVD0:** Reserved
23:16	0xff RW/P	**GEN3NFTS:** Number of FTS blocks required for RxL0s in non-common clock mode
15:8	0xff RW/P	**GEN2NFTS:** Number of FTS ordered sets required for RxL0s in non-common clock mode
7:0	0xff RW/P	**GEN1NFTS:** Number of FTS ordered sets required for RxL0s in non-common clock mode

48.2.225 LEKBERR—Offset B58h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + B58h

Default: 2000FFFFh

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/P	**Enable Leaky Bucket Error Counter (G3LBEEN):** Enable Leaky Bucket Error Counters for gen3, this allows H/W to request re-equalization based on error rate.
30	0x0 RO	**RSVD0:** Reserved
29:25	0x10 RW/P	**Gen3 Leaky Bucket Error Threshold (G3ERRTHRESH):** Leaky Bucket error threshold used for 8GT/s and above. When the error count for a lane passes this threshold, that lane will be flagged as faulty.
24:20	0x0 RW/P	**Leaky Bucket Error Threshold (ERRTHRESH):** Sets the threshold for leaky bucket error handling. When the error count for a lane passes this threshold, that lane will be flagged as faulty.
19:0	0xffff RW/P	**Aggregate error for leaky bucket error handling (AGGRERR):** The error count for the leaky bucket algorithm increments by one when AGGRERR number of errors have been encountered during the specified time period.

48.2.226 EXPBERR0—Offset B5Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + B5Ch

Default: FFFFFFFFh

Bit Range	Default & Access	Field Name (ID): Description
31:0	0xffffffff RW/P	**EXP_BER:** [31:0] Expected BER for leaky bucket error handling [31:0]. Selects the time window that is sampled for aggregate errors.

48.2.227 EXPBERR1—Offset B60h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + B60h

Default: 02000007h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x2 RW/P	**G3AGGRERR:** Aggregate error for gen3. The error count for the leaky bucket algorithm increments by one when AGGRERR number of errors have been encountered during the specified time period.
23:18	0x0 RO	**RSVD0:** Reserved
17:0	0x7 RW/P	**EXP_BER:** [49:32] Expected BER for leaky bucket error handling [49:32]. Selects the time window that is sampled for aggregate errors.

48.2.228 LEKBPROERR—Offset B64h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + B64h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**RSVD0:** Reserved
23:16	0x0 RW/1C/V/P	**G3ERRLNSTS:** Feature to check status of lane for Gen3. Bit is set when the current error rate exceeds the set error threshold.
15:8	0x0 RO	**RSVD1:** Reserved
7:0	0x0 RW/1C/V/P	**Lane Error Limit Status (ERRLNSTS):** Feature to check status of lane. Bit is set when the current error rate exceeds the set error threshold.

48.2.229 SPEEDCTL—Offset B68h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + B68h

Default: 02001821h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RO	**RSVD0:** Reserved
29	0x0 RW/V	**LBEG3DIS:** When set to 1, 8GT/s and higher rates are disabled. Hardware or software may set this bit. Hardware will set it when the LBE is enabled to degrade link speed and the LBE threshold is tripped. Software may set or clear at its will. The register is sticky through in-band resets.
28	0x0 RW/V	**LBEG2DIS:** When set to 1, 5GT/s and higher rates are disabled. Hardware or software may set this bit. Hardware will set it when the LBE is enabled to degrade link speed and the LBE threshold is tripped. Software may set or clear at its will. The register is sticky through in-band resets.
27:26	0x0 RO	**RSVD1:** Reserved
25	0x1 RW/P	**LBEG3DEGRADEEN:** Enable LBE to trigger a speed degrade from 8GT/s operation. The 8GT/s mode and higher is disabled until LBEG3DIS is cleared.
24	0x0 RW/P	**LBEG2DEGRADEEN:** Enable LBE to trigger a speed degrade from 5GT/s operation. The 5GT/s mode and higher is disabled until LBEG2DIS is cleared.
23:21	0x0 RO	**RSVD2:** Reserved
20	0x0 RW/V	**RL:** Retrain Link. This bit has the same functionality as the LinkCtrl.Retrain does for downstream ports. It is intended to be used when initiating a software based speed change.
19:16	0x0 RO	**UPTLS:** unused in downstream ports
15:13	0x0 RW/P	**SPDCHGFAILLIM:** Number of failures to train to a particular speed before that speed (and above) is removed from operation. Used in conjunction with LTSSMERRSTS1. A value of 0 disables this feature.
12	0x1 RW/P	**RPTSPDCHANGE:** • 1: Allow speed changes to be logged as a bandwidth change in the LinkStatus register. • 0: Don't report speed changes as a bandwidth change
11	0x1 RW/P	**RPTCFGCHANGE:** • 1: Allow width changes to be logged as a bandwidth change in the LinkStatus register. • 0: Don't report width changes as a bandwidth change
10	0x0 RW/V/P	**DISINITSPDCHNG:** • 1: blocks initial speed change from Gen1-)Gen2/3 after DL_Active asserts • 0: allows an automatic speed change attempt after reaching DL_Active to the highest common speed supported
9	0x0 RW/P	**FORCEGEN3:** • 1: Forces LTSSM to Detect and then trains link at 8GT/s mode • 0: Releases forced speed
8	0x0 RW/P	**FORCEGEN2:** • 1: Forces LTSSM to Detect and then trains link at 5GT/s mode • 0: Releases forced speed
7	0x0 RW/P	**OVRDISGEN3:** Override of disabling gen3

Bit Range	Default & Access	Field Name (ID): Description
6	0x0 RW/P	**OVRDISGEN2:** Override of disabling gen2
5	0x1 RW/P	**MAINTAINTLS:** Aggressively attempt to keep link at LinkCtl2.TLS speed setting. (DSP only)
4	0x0 RW/P	**DISG3POLCFG:** Don't support advertising Gen3 speed in polling.
3	0x0 RW/P	**DISG2POLCFG:** Don't support upper speed G2 in polling
2	0x0 RW/P	**DISG3UNLESSRCVDTS:** Don't support speeds 8GT/s and higher until other device advertises it after a speed change failure or the 200ms timer expires.
1	0x0 RW/P	**DISG2UNLESSRCVDTS:** Don't support speeds 5GT/s and higher until other device advertises it after a speed change failure or 200ms timer expires.
0	0x1 RW/P	**DIRECTEDSPEEDCHNG:** Controls if the highest ever recorded speed supported is used to set the directed speed change internal variable for downstream operation. • 0: two retrain cycles • 1: one retrain cycle (DSP only)

48.2.230 RCVRDETSTS—Offset B6Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + B6Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD0:** Reserved
7:0	0x0 RO/V/P	**RCVRDETSTS:** The present receiver detect state of each lane in the cluster.

48.2.231 RCVRERR—Offset B70h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + B70h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**RSVD0:** Reserved
23:16	0x0 RW/P	**MASK:** prevent 8b/10b error from given cluster lane from being promoted to PCIE receiver error. Has no effect on RCVRERR.LANE
15:8	0x0 RO	**RSVD1:** Reserved
7:0	0x0 RW/1C/V/P	**LANE:** Indication that a loggable receiver error occurred on a particular lane of the cluster.

48.2.232 EBERR—Offset B74h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + B74h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**RSVD0:** Reserved
23:16	0x0 RW/1C/V/P	**EB Full per lane (EBFULLERR):** Indication that a loggable receiver error occurred on a particular lane of the cluster.
15:8	0x0 RO	**RSVD1:** Reserved
7:0	0x0 RW/1C/V/P	**EB Empty per lane (EBEMPTYERR):** Indication that a loggable receiver error occurred on a particular lane of the cluster.

48.2.233 EBERRMSK—Offset B78h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + B78h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD0:** Reserved
7:0	0x0 RW/P	**MASK:** Prevent EB error from given cluster lane from being promoted to PCIE receiver error. Has no effect on EBERR.

48.2.234 OBEINJCTL—Offset B7Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + B7Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/P	**Response function Done Signal Disable (RESPDONEDIS):** This bit will disable the done signal returned from the response logic. • 0: Use the Done return signal to remove the assertion. • 1: Disable the Done signal from altering the response function assertion.
30:27	0x0 RW/P	**Lane select to inject error on (LNSLCT):** • 0: Lane 0 • 1: Lane1 • ... • 15: Lane 15 Assume N = max number of lanes for the port, then values greater than (N-1) are reserved.
26:25	0x0 RO	**RSVD0:** Reserved
24	0x0 RW/P	**Inject Error in Symbols other than STP, END, SDP (OTHRINJ):** • 0: Do not inject error on type Others. • 1: Inject error on type Others when EINJEN is set.
23	0x0 RW/P	**Inject Error in a SDP Symbol (SDPINJ):** • 0: Do not inject error on SDP. • 1: Inject error on SDP when EINJEN is set.
22	0x0 RW/P	**Inject Error in a END Symbol (ENDINJ):** • 0: Do not inject error on END. • 1: Inject error on END when EINJEN is set.
21	0x0 RW/P	**Inject Error in a STP Symbol (STPINJ):** • 0: Do not inject error on STP. • 1: Inject error on STP when EINJEN is set.
20:12	0x0 RO	**RSVD1:** Reserved
11:10	0x0 RW/P	**INJERRTYPE:** This field defines the type of error that is created. In Gen2 • 00: 10b error, invert bit[0] of designated byte after 8b10b encoding • 01: Disparity error on designated byte • 10: 8b error, invert bit[0] of designated byte before 810b encoding • 11: Reserved - no error injected In Gen3 • 00: Invert bit[0] of designated Tx data byte • 01: Invert syncheader[1:0] bits 01(=)10, changes a data block to a control block or vice versa • 10: force syncheader[1:0]=2'b00 (invalid header) • 11: force syncheader[1:0]=2'b11 (invalid header)
9:6	0x0 RW/P	**BLKBYTEOFF:** In gen3, when OTHRINJ is set and the block type matches BLKTYPE, this field defines the Nth byte of block to place error (0 is 1st byte of block).
5	0x0 RW/P	**HDRINJ:** In GEN3, inject an error on the block header that matched block type. The error will be specified by encodings 01-11 of INJERRTYPE.
4	0x0 RW/P	**BLKTYPE:** In GEN3, what block type to either inject a header error on to or qualify the block start with for offset error injection.
3:2	0x0 RO	**RSVD2:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RW/P	**Error Injection Function Select (EINJFUNCTSEL):** • 0: Select EINJ0 response function. • 1: Select EINJ1 response function.
0	0x0 RW/P	**Error Injection Enable (EINJEN):** • 0: Disable error injection. • 1: Enable error injection.

48.2.235 LTSSMERRSTS0—Offset B80h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + B80h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RW/1C/V/P	**Reserved**
29	0x0 RW/1C/V/P	**EQMEVAL_TO:** Timeout in Phase2 (DSC) or Phase3 (USC) resulting in Rec.Speed
28	0x0 RW/1C/V/P	**EQMEVALCK_TO:** Timeout in Phase2 (DSC) or Phase3 (USC) while locking on to next set of TS, may not result in Rec.Speed
27	0x0 RW/1C/V/P	**EQSEVA_TO:** Timeout in Equalization Phase3 (DSC) or Phase2 (USC) resulting in Rec.Speed
26	0x0 RW/1C/V/P	**EQSEVASYNC_TO:** Timeout in Equalization Phase3 (DSC) or Phase2 (USC) while locking on to next set of TS resulting in Rec.Speed
25	0x0 RW/1C/V/P	**EQPH1_TO:** Timeout in Equalization Phase1
24	0x0 RW/1C/V/P	**EQPH0_TO:** Timeout in Equalization Phase0
23	0x0 RW/1C/V/P	**RECRCVRLCKWIDTH:** Recovery.RcvrLock Timeout Some TS to Config
22	0x0 RW/1C/V/P	**RECRCVRLCKNOTALLTS:** Recovery.RcvrLock Timeout Some TS to Rec.RcvrCfg
21	0x0 RW/1C/V/P	**RXL0SFTS_TO:** RxL0sFTS Timeout
20	0x0 RW/1C/V/P	**UNEXPECTEDEI:** unexpected electrical idle event in L0
19	0x0 RW/1C/V/P	**LBMSTENTRY_TO:** Loopback.Master Entry timeout
18	0x0 RW/1C/V/P	**DISWTEIOS_TO:** Disable.WaitForEIOS timeout
17	0x0 RW/1C/V/P	**RECIDLEDOWN_TO:** Recovery.Idle Timeout link down
16	0x0 RW/1C/V/P	**RECRCVRCFGSPDOWN_TO:** Recovery.RcvrConfigSpeed Timeout link down
15	0x0 RW/1C/V/P	**RECRCVRCFGDOWN_TO:** Recovery.RcvrConfig Timeout link down
14	0x0 RW/1C/V/P	**RECSPDEXITEIEX_TO:** Recovery.SpeedIdleExit Timeout waiting on EI exit
13	0x0 RW/1C/V/P	**RECSPDIDLWTEI_TO:** Recovery.SpeedIdle Timeout waiting on EI
12	0x0 RW/1C/V/P	**RECRCVRLCKBW_TO:** Recovery.RcvrLock Timeout to Recovery.Speed
11	0x0 RW/1C/V/P	**RECRCVRLCKDOWN_TO:** Recovery.RcvrLock Timeout Link Down
10	0x0 RW/1C/V/P	**UPL12RCVEIOS_TO:** Timed out in L12 Entry waiting on received EIOS

Bit Range	Default & Access	Field Name (ID): Description
9	0x0 RW/1C/V/P	**CFGIDLE_TO:** Timed out in Config.Idle
8	0x0 RW/1C/V/P	**CFGCMPLT_TO:** Timed out in Config.Complete
7	0x0 RW/1C/V/P	**CFGLNNUMAC_TO:** Timed out in Config.LaneNumAccept
6	0x0 RW/1C/V/P	**CFGLNNUMWT_TO:** Timed out in Config.LaneNumWait
5	0x0 RW/1C/V/P	**CFGLNKWDAC_TO:** Timed out in Config.LinkWidthAccept
4	0x0 RW/1C/V/P	**CFGLNKWDST_TO:** Timed out in Config.LinkWidthStart
3	0x0 RW/1C/V/P	**POLCFG_NOTS:** Timed out in Polling.Config w/out any TS seen
2	0x0 RW/1C/V/P	**POLACT_NOTS:** Timed out in Polling.Active w/out any TS seen
1	0x0 RW/1C/V/P	**PARTIAL_RCVRDET:** LTSSM detected something, but on 2nd look, no rcvr detected
0	0x0 RW/1C/V/P	**SPEEDCHANGEFAIL:** A speed change attempt failed.

48.2.236 LTSSMERRSTS1—Offset B84h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + B84h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0x0 RO/V/P	**LTERR0FERR:** Pointer to the first error logged in LTSSMERRSTS0, value is only valid if a bit is set in LTSSMERRSTS0
26:8	0x0 RW/1C/V/P	**Reserved**
7	0x0 RW/1C/V/P	**G3FAILLIMERR:** Speed changes to 8GT/s have reached the maximum allowed failures, 8GT/s mode is now disabled. See SPEEDCTL.SPDCHGFAILLIM register for more details.
6:4	0x0 RO/V	**G3FAILCTR:** The number of failed attempts to train to 8GT/s without successfully reaching L0 at 8GT/s. This count resets to zero when G3FAILLIMERR is cleared or when L0 is reached at 8GT/s data rate without error.
3	0x0 RW/1C/V/P	**G2FAILLIMERR:** Speed changes to 5GT/s have reached the maximum allowed failures, 5GT/s mode is now disabled. See SPEEDCTL.SPDCHGFAILLIM register for more details.
2:0	0x0 RO/V	**G2FAILCTR:** The number of failed attempts to train to 5GT/s without successfully reaching L0 at 5GT/s. This count resets to zero when G2FAILLIMERR is cleared or when L0 is reached at 5GT/s data rate without error.

48.2.237 EQEVALCTL6—Offset B8Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + B8Ch

Default: 04904623h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RO	**RSVD0:** Reserved
28	0x0 RW/P	**REQLBMSTRCOEFF:** When intending to master loopback at Gen3 speeds, and entry is from the Config state, this bit can be used to enable the dictation of what far end Tx EQ settings to use. The per lane settings are defined in the GEN3FARTXCOEFF#.D1/2/FTYPE fields. The LNOVRD field is not required to be set. Valid values must also be captured or programmed into the EQFARFSLF register. This mode will not be enabled if loopback is entered from Recovery as it is assumed the values used to reach L0 in that scenario should be used.
27:22	0x12 RW/P	**EIEREENERRCTRMSK:** Number of EIES cycles to wait before counting additional errors after EB/SOS error
21:16	0x10 RW/P	**EIEREENTIME:** Number of EIES cycles to keep EIE reset bit de-asserted after EB/SOS error
15	0x0 RW/V	**LOCBUSFETCHINIT:** Initiate a manual fetch self clears when complete.
14	0x1 RW/P	**LOCBUSFETCHEN:** Enable Local bus fetch of coeff table.
13	0x0 RW/P	**SPDCHGCTLEADPTEN:** Backup to the IOs doing CTLE for speed change to G3. Control will initiate a CTLE adapt after speed changed and Rx EI Exit.
12:10	0x1 RW/P	**LBCTLEADPTWT:** Time before starting CTLE after EI exit detect. • 000 = 512ns • 001 = 1us • 010 = 1.5us • 011 = 2us • 100 = 4us • 101 = 8us • 110 = 12us • 111 = 16us
9	0x1 RW/P	**LBCTLEADPTEN:** Enable CTLE Adaption on entry to Loopback.Master @Gen3.
8:6	0x0 RW/P	**REEQCTLEADPTWT:** Time before starting CTLE after entry to DP.PH1/UP.PH0. • 000 = 512ns • 001 = 1us • 010 = 1.5us • 011 = 2us • 100 = 4us • 101 = 8us • 110 = 12us • 111 = 16us
5	0x1 RW/P	**REEQCTLEADPTEN:** Enable CTLE Adaption on entry to phase1/0 not from speed change w/EQTS2
4:0	0x3 RW/P	**BACKOFFTIME:** Time in EQ before starting CTLE Adapt and then TS lock val(16 =) val[3:0],6'h0, CXLT_TOU_4NS 0-3.84us +0/-4ns val*256ns val)=16 =) val[4:0],5'h0, CXLT_TOU_128NS 0-126.98us +0/-128ns val*4us

48.2.238 EQEVALCTL7—Offset B90h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + B90h

Default: 000000FFh

Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD0:** Reserved
7:0	0xff RW/P	**FOMSTPLIM:** Max FOM value, if FOM)=FOMSTPLIM, exit evaluation.

48.2.239 EQFARFSLF—Offset B9Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + B9Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0x0 RO	**RSVD0:** Reserved
17	0x0 RO/V	**LFSAME:** All lanes of the port have equal LF
16	0x0 RO/V	**FSSAME:** All lanes of the port have equal FS
15:14	0x0 RO	**RSVD1:** Reserved
13:8	0x0 RW/V/P	**FARLF:** This field shows the current EQ phase1 status of the link partners LF parameter. The value is also used during entry to loopback master from config when requesting the use of coefficients. If the link has not gone through phase1 of EQ, then software will need to manually write a value. Anytime the link goes through phase1, this field is updated with the value advertised by the link partner (discarding any software written value).
7:6	0x0 RO	**RSVD2:** Reserved
5:0	0x0 RW/V/P	**FARFS:** This field shows the current EQ phase1 status of the link partners FS parameter. The value is also used during entry to loopback master from config when requesting the use of coefficients. If the link has not gone through phase1 of EQ, then software will need to manually write a value. Anytime the link goes through phase1, this field is updated with the value advertised by the link partner (discarding any software written value).

48.2.240 FOMINCCTL—Offset BA4h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + BA4h

Default: 03046820h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x3 RW/P	**SlowTimerThresh:** FOM feedback value threshold to switch to Slow timer from fast
23	0x0 RW/P	**ErrMaskEn:** Enable Error Mask window
22	0x0 RW/P	**Tem_Unit:** Error mask window time unit • 0: 28ns + val* 32ns upto 2044ns (+0/-4ns) • 1: 896ns + val* 1024ns upto 65408ns (+0/-128ns)
21:16	0x4 RW/P	**Tem_Val:** Error mask window time count
15:14	0x1 RW/P	**Tsi_Unit:** Slow Time Unit
13:8	0x28 RW/P	**Tsi_Val:** Slow Time Count Value
7:6	0x0 RW/P	**Tfi_Unit:** Fast Time Unit • 00: 28ns + val* 32ns upto 2044ns (+0/-4ns) • 01: 896ns + val* 1024ns upto 65408ns (+0/-128ns) • 10: 7us + val* 8us upto 504us (+0/-1us) • 11: 48us + val* 64us upto 4.08ms (+0/-16us)
5:0	0x20 RW/P	**Tfi_Val:** Fast Time Count Value

48.2.241 PHYRECAL—Offset BA8h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + BA8h

Default: 0000000Ch

Bit Range	Default & Access	Field Name (ID): Description
31:4	0x0 RO	**RSVD0:** Reserved
3	0x1 RW/P	**G3RecOnErrEn:** Request recal on Gen3 Recovery due to Error
2	0x1 RW/P	**G2RecOnErrEn:** Request recal on Gen2 Recovery due to Error
1	0x0 RW/P	**G3L1ExitEn:** Request recal on Gen3 L1 exit
0	0x0 RW/P	**G2L1ExitEn:** Request recal on Gen2 L1 exit

48.2.242 PLLSTBYCTL—Offset BACh

This register is only valid for project specific w/ PLLSTBY feature.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + BACh

Default: 00000100h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RW	**PLL Standby In Progress Assertion (PSIP):** When PLL standby is enable gives a range of time to all idle to L1 entry. This indicates to the PCI PLL Control block to assert PSIP. Also known as t200. Range : 0 = 70ns 1 = 150ns 2 = 230ns ... 15= 1270ns **Power Well:** PRST
27:24	0x0 RW	**PLL Standby Assertion (PSTBYA):** Time window to allow for synchronization between idle indications and PLL control logic. This window starts after L1 entry and PLL standby Enabled. Also known as t200. Range: 0 = 40ns 1 = 50ns 2 = 60ns ... 15= 190ns **Power Well:** PRST
23:20	0x0 RW	**PLL Standby Min Assertion time (PSMAT):** Minimum time that the PLL Control block can put the PLL in standby. Anytime shorter than the min time can cause indeterminate PLL behavior. Also known as t202. Range: 0 = 150ns 1 = 310ns 2 = 470ns ... 15= 2550ns **Power Well:** PRST
19:9	0x0 RO	**RSVD0:** Reserved
8	0x1 RW	**P2 vs P1/2 for PLL Idle (P2VSP1):** 0 = lane in P1 equal to idle for PLL standby (see PIPECTL for P2 disable) 1 = lane in P2 equal to idle for PLL standby **Power Well:** PRST
7:4	0x0 RO	**RSVD1:** Reserved
3:0	0x0 RW	**PLL Standby Enable (PSE):** A one enables the PLL control block to put PLL1-4 in standby when the port is in L1 and all idle conditions are met. **Power Well:** PRST

48.2.243 PLUTXEQCTL—Offset BB0h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + BB0h

Default: 078A0000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RO	**RSVD0:** Reserved
27:22	0x1e RW/V/P	**8GT/s Full Swing (FS):** This field is used for setting 8GT/s full swing coefficient parameter.
21:16	0xa RW/V/P	**8GT/s Low Frequency (LF):** This field is used for setting 8GT/s low frequency coefficient parameter.
15:0	0x0 RO	**RSVD1:** Reserved

48.2.244 PHYCGIDLEMSK—Offset BB4h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + BB4h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0x0 RO	**RSVD0:** Reserved
5	0x0 RW/P	**PLL_L1IDLE:** Disables placing the PLL in standby during L1.Idle state This field is only valid for project specific w/ PLLSTBY feature.
4	0x0 RW/P	**PLL_L2IDLE:** Disables placing the PLL in standby during L2.Idle state This field is only valid for project specific w/ PLLSTBY feature.
3	0x0 RW/P	**PLL_DISSUCC:** Disables placing the PLL in standby during Disable.Success state This field is only valid for project specific w/ PLLSTBY feature.
2	0x0 RW/P	**Disable L1 Clock Gating (L1IDLE):** Disables clock gating in L1.Idle state
1	0x0 RW/P	**Disable L2 Clock Gating (L2IDLE):** Disables clock gating in L2.Idle state
0	0x0 RW/P	**Disable LTSSM Disable State Clock Gating (DISSUCC):** Disables clock gating in Disable.Success state

48.2.245 EQEVALCTL4—Offset BB8h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + BB8h

Default: 64320000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/P	**REVERSEEQTS2:** Allows EQTS2s to be sent by upstream port or decoded by downstream port to override the LinkEqCtl.DownStreamPortTxPreset value. For an upstream port, the PREFPRESET1 value will be sent in the EQTS2s it sends to the upstream component. For a downstream port, this will enable it to accept EQTS2s from the upstream port and override the LinkEqCtl.DownstreamTxPreset value.
30:24	0x64 RW/P	**QCHKTMVAL:** Final evaluation loop time. This loop will not ask the IOs to enabled any adaptive eq logic and is used as a quick sanity check of link errors.
23	0x0 RW/P	**QCHKTMUNIT:** 0 = time limit is QCHKTMVAL * 1us, 1 = time limit is QCHKTMVAL * 128us
22:20	0x3 RW/P	**HINTIDXMODE:** Hint mode index lookup FarTxWeight (FTW) = Using TxPreset captured in Phase1, apply mapping from UPHINTMAP0/1 register LocTxWeight (LTW) = Using TxPreset captured in EQTS2s (LaneEqCtl.UPTP), apply mapping from UPHINTMAP0/1 register RxHintWeight (RHW) = Using Rx Hint captured in EQTS2s (LaneEqCtl.UPRPH), apply mapping from UPHINTMAP2 register Register Value: Hint Index Result • 000: (LTW+FTW)/2 • 001: FTW • 010: LTW • 100: RHW • 011: (LTW+FTW)/2 • 101: (RHW+FTW)/2 • 110: (RHW+LTW)/2 • 111: (RHW+LTW+FTW)/3 The resultant index is used in the comparison of UPHISELFOMTBL. UPHISELFOMTBL.MST If the value calculated according to EQEVALCTL4.HINTIDXMODE is less than the programmed value, treat channel as short and use FOM stage1 entries from the FOM Hint Table. UPHISELFOMTBL.MLT If the value calculated according to EQEVALCTL4.HINTIDXMODE is less than the programmed value and greater or equal to MST, treat the channel as medium-short and use UPHIFOMTBLM0-7.MSD1,D2,FT for FOM Stage1 entries. UPHISELFOMTBL.MLT If the value calculated according to EQEVALCTL4.HINTIDXMODE is less than the programmed value and greater or equal to MST, treat the channel as medium-short and use UPHIFOMTBLM0-7.MSD1,D2,FT for FOM Stage1 entries. UPHISELFOMTBL.LT If the value calculated according to EQEVALCTL4.HINTIDXMODE is less than the programmed value and greater or equal to MLT, treat the channel as medium-long and use UPHIFOMTBLM0-7.MLD1,D2,FT for FOM Stage1 entries. If the value calculated according to EQEVALCTL4.HINTIDXMODE is greater or equal to the programmed value, treat the channel as long and use UPHIFOMTBLL0-7.LD1,D2,FT for FOM Stage1 entries.
19	0x0 RW/V/P	**RXHINT7OVR_EN:** When set to 1, the starting coeff to evaluate (phase2 upstream, phase3 downstream) will be derived from Rx Hint Table entry DBXX (7). This overrides the preferred preset mode and the normal Rx Hint table mode.
18	0x0 RW/P	**RXHINTCOEFF_EN:** If this field is set and FOMSEARH_EN=1 and port is an Upstream port, use HINTIDXMODE and UPHISELFOMTBL to select FOM Stage1 points -OR- FOMSEARCH_EN=1 and port is a Downstream port, field is unused (except if EQEVALCTL2.EVALATT==1). -OR- FOMSEARCH_EN=0, use HINTIDXMODE result to index into FOMHINTTBL for single coefficient evaluation.
17	0x1 RW/V/P	**FOMSEARCH_EN:** Figure of Merit search enable.
16:10	0x0 RO	**RSVD0:** Reserved
9:0	0x0 RW/P	**FOMERRTHRESH:** Figure of Merit error threshold

48.2.246 EQEVALCTL5—Offset BBCh

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + BBCh

Default: 3A87F003h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**RSVD0:** Reserved
30:27	0x7 RW/P	**PhSTimerVal:** Slave phase (UP=Phase3, DP=Phase2) timeout. time limit is (val+1)*4ms.
26:23	0x5 RW/P	**PhMTimerVal:** Master phase (UP=Phase2, DP=Phase3) timeout. time limit is (val+1)*4ms.
22:20	0x0 RW/P	**PhaseTODis:** Disable phase 1/2/3 timeouts bit 0 - phase 1 bit 1 - phase 2 bit 3 - phase 3
19:12	0x7f RW/P	**USEPREEVALWAIT:** Time to wait after lock (or lock timeout) before enabling the IOs to evaluate the new tx preset settings. This allows the circuits some extra time to setup their evaluation logic. Time is value*4us.
11:4	0x0 RW/P	**COEFFEVALWAIT:** Time to wait after lock (or lock timeout) before enabling the IOs to evaluate the new coeff settings. This allows the circuits some extra time to setup their evaluation logic. Time is value*4us.
3:0	0x3 RW/P	**LOCKTIME:** Max time to allow block lock on new coeff request. Time is value*4us. When this field is set to 0, it will remain in Lock state until lock is achieved or the primary timer for Phase2/3 expires (thus an EQ failure).

48.2.247 LEKBLNERRCNT0—Offset BC0h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + BC0h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RO	**RSVD0:** Reserved
29:25	0x0 RO/V	**Lane 5 Error Count (ERRCNT5):** Error count seen on a lane for the current time window. Decrements progressively to 0 if no errors seen over a prolonged time period.
24:20	0x0 RO/V	**Lane 4 Error Count (ERRCNT4):** Error count seen on a lane for the current time window. Decrements progressively to 0 if no errors seen over a prolonged time period.
19:15	0x0 RO/V	**Lane 3 Error Count (ERRCNT3):** Error count seen on a lane for the current time window. Decrements progressively to 0 if no errors seen over a prolonged time period.
14:10	0x0 RO/V	**Lane 2 Error Count (ERRCNT2):** Error count seen on a lane for the current time window. Decrements progressively to 0 if no errors seen over a prolonged time period.
9:5	0x0 RO/V	**Lane 1 Error Count (ERRCNT1):** Error count seen on a lane for the current time window. Decrements progressively to 0 if no errors seen over a prolonged time period.
4:0	0x0 RO/V	**Lane 0 Error Count (ERRCNT0):** Error count seen on a lane for the current time window. Decrements progressively to 0 if no errors seen over a prolonged time period.

48.2.248 LEKBLNERRCNT1—Offset BC4h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + BC4h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0x0 RO	**RSVD0:** Reserved
9:5	0x0 RO/V	**Lane 7 Error Count (ERRCNT7):** Error count seen on a lane for the current time window. Decrements progressively to 0 if no errors seen over a prolonged time period.
4:0	0x0 RO/V	**Lane 6 Error Count (ERRCNT6):** Error count seen on a lane for the current time window. Decrements progressively to 0 if no errors seen over a prolonged time period.

48.2.249 EQEVALCTL—Offset BD0h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + BD0h

Default: 00080808h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**RSVD0:** Reserved
30	0x0 RW/P	**BYPASSEQ:** Bypass all aspects of Adaptive EQ.
29	0x0 RW/P	**NODLINITBLK:** Don't block the DL state machine from starting DL Init once initial L0 reached.
28	0x0 RW/P	**BYPASSEQTS2:** For a downstream link, this allows entry to Gen3 w/out sending EQTS2 in 8b/10b mode prior to transmitting at 8GT/s.
27:24	0x0 RW/P	**DEFPRESET:** Preset that will be used if 8GT/s entered w/out receiving EQTS2s. preset 0000 is -6dB de-emphasis and 0dB preshoot.
23	0x0 RW/P	**FLIPCOEFFUPDPOL:** Chicken bit to flip what coeff up/down means to core.
22:16	0x8 RW/P	**PREACCTHR:** Pre cursor eval threshold. The threshold used is value*8 for calculation.
15	0x0 RO	**RSVD1:** Reserved
14:8	0x8 RW/P	**MAINACCTHR:** Main cursor eval threshold. The threshold used is value*8 for calculation.
7	0x0 RO	**RSVD2:** Reserved
6:0	0x8 RW/P	**POSTACCTHR:** Post cursor eval threshold. The threshold used is value*8 for calculation.

48.2.250 EQEVALCTL2—Offset BD4h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + BD4h

Default: 0000FF55h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/P	**BLKUPEQREQ:** When this bit is set to 1, the following two events will NOT set the request eq bit in TS2s during Rec.RcvrCfg following Rec.Equalization. • Equalization engine deems link usable but not optimal (this would normally trigger an immediate eq request in TS2s) • Coeff received in Rec.RcvrLck follow Rec.Eq don't match negotiated coeff during Eq.
30	0x0 RW/P	**BLKUPSPEED:** H/W will not initiate an up step in speed to 8GT/s in order to advertise or re-do equalization
29	0x0 RW/P	**IGNOREQUIESCE:** H/W will ignore quiesce bit received from downstream component
28	0x0 RW/P	**HWQUIESCE:** H/W will require quiescing of the link prior to re-equalization
27	0x0 RW/P	**HWREEQEN:** Allow HW to initiate re-equalization.
26	0x0 RW/P	**EXTEIEOS:** Enable extended EIEOS request during master eval stage (up component phase 3, down component phase 2).
25	0x0 RW/P	**IGNOREMD:** Echo coeff back but don't change them to the IO.
24	0x0 RW/P	**SKIPEVALPH:** Skip execution of the master eval coeff phase (up component phase 3, down component phase 2). For downstream it skips phase2/3 completely per PCIe Spec. For upstream it passes quickly through phase2 doing no real eval.
23	0x0 RW/P	**REEQSPDDEGRADE:** When set, a self detected need to re-equalize will result in a down shift in speed and a disabling of the current rate (8GT/s or higher) and all rates above it.
22:16	0x0 RO	**RSVD0:** Reserved
15:8	0xff RW/V/P	**EVALATT:** Max number of coeff for a lane to eval before quitting eval phase. Value of 0 means no limit. The value is scaled by the link partners advertised FS value (adj_val = roundup(val*(FS+1)/64)). If FS is 63, the spec max, the value would be unaltered, whereas for a FS of 31, the value written to the config register would be halved. One attempt will be made if the programmed value is greater than 0 and the adjusted value would have resulted in a value of 0. Any evaluation attempt following an InvalidRequest indication on the PIPE interface is not counted as an attempt.
7:0	0x55 RW/P	**EVALTIME:** Field defined to do each coeff eval as following. Evaltime[7:6] = unit Evaltime[5:0] = value Unit: • 11=)1ms • 10=)128us • 01=)16u • 00=)1us This field should not be programmed in value of 0 (unit=any, value=0) for devices connected to WM design.

48.2.251 EQEVALCTL3—Offset BD8h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + BD8h

Default: 33F30802h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0x3 RW/P	**REPEATLIM:** Maximum number of times a previously tried coeff can be attempted. A value of 0 means disable the repeat check. Repeats are defined as coeff already seen in the history matrix. Each time a coeff lookup in the history matrix returns a hit and the limit not reached, the history matrix is reset and the repeat counter incremented.
27:24	0x3 RW/P	**INVREQATTLIM:** Maximum number of repeated times the MAC will allow the PIPE-Phy to request an out-of-bounds coeff (MAC responds to each by asserting InvalidRequest) before aborting the equalization evaluation process. The PIPE3 spec gives no bounds, but if after some number of attempts, the PIPE-Phy keeps requesting the same invalid update, it makes no sense to continue. A value of 0 disables this check.
23	0x1 RW/P	**AllowFromMainOnly:** When set to 1, the main cursor is the only cursor pre or post can get a unit from. So if main is at its minimum value, then an addition to post (or pre) can only occur if a subtraction from pre (or post) is also requested. This prevents adjusting the cursor ratio of pre or post in the opposite direction than is desired. When set to 0, a pre/post edit will take a unit from post/pre if the main cursor does not have a unit to give.
22	0x1 RW/P	**OptCursorEdit:** If pre and post cursor movement requests are in opposite directions, service both at once if legally possible. If not set, it will only edit 1 cursor using the priority defined by PreVsPostRR and PreOverPost
21	0x1 RW/P	**PreVsPostRR:** Edits to pre vs post cursor will be done in a fair round robin manner. The PreOverPost field will dictate the first cursor to be modified. If not set, it will follow a strict priority to pre or post based on PreOverPost field.
20	0x1 RW/P	**PreOverPost:** Pre-cursor adjustments will be taken over post-cursor adjustments when set to 1, else post has priority.
19:18	0x0 RO	**RSVD0:** Reserved
17	0x1 RW/P	**UNDERT2REDO:** If block error count under Threshold 2 but equal to or over Threshold 1, request a redo of equalization
16	0x1 RW/P	**OVERT2SPDFAIL:** If block error count measured over Threshold 2, force link to fail down to lower speed
15:8	0x8 RW/P	**ERRTHRESH2:** Block error count limit considered usable, but may spawn a redo of Equalization if enabled. Setting of 0 causes all checks to at least pass the Threshold 2 check.
7:0	0x2 RW/P	**ERRTHRESH1:** Block error count limit considered optimal. Setting of 0 disables block error check.

48.2.252 EQEVALSTS—Offset BDCh

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:9-12, 14-17, F:0] + BDCh

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**RSVD0:** Reserved
23	0x0 RO/V/P	**Lane 7 at EVAL Loop (LNLOOP7):** FBDIR = Lane hit Loop Limit: Lane evaluation stopped due to repeated coeff (IO tap update resulted in a loop) FOM = Lane in Paused state: PAUSE gets set when lane SM goes to PAUSE

7	0x0 RW/1C/V/P	**ITKNTL:** Invalid token post TLP (may include misplaced legal token) [as x1/x2, includes bad EDB token]
6	0x0 RW/1C/V/P	**SDSFE:** bad/unexpected data following SDS block
5	0x0 RW/1C/V/P	**BKFE:** block framing error (header mismatch, bad header, etc.)
4	0x0 RW/1C/V/P	**BK1FE:** unexpected type 1 (OS) header
3	0x0 RW/1C/V/P	**EDS:** bad data following EDS (includes EDS not at end of block)
2	0x0 RW/1C/V/P	**STP2:** two TLP start tokens in same symbol time
1	0x0 RW/1C/V/P	**SDP2:** two DLLP start tokens in same symbol time
0	0x0 RW/1C/V/P	**RDOK:** rcvd data ok removed unexpectedly (rcvr. imp. specific)

48.3 Sideband Registers - Devices 9-12

The Sideband registers accessible to the Host are described here. They are accessible in Host Memory Space starting at the Sideband Base Address Register (SBREG_BAR). See Section 3.4.1, "Using SBREG_BAR Method" on page 187.

48.3.1 PPBIFCTL_PRIV—Offset 10h

Port Configuration Bifurcation Control for MLW (x8) vs Port number

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xB4] + 10h
Host Memory Space: SBREG_BAR + 0xB40000 + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/L	**Capability Lock (CL):** Lock key bit for all RW-L bits of PPBIFCTL register only. • 1b: Lock • 0b: Unlocked This bit is self-locking. Once this bit is set to a 1b, this key bit can not be unlocked. Writing a 0b has no affect on this bit.
30:3	0x0 RO	**RSVD0:** Reserved
2:0	0x0 RW/V/L	**Bifurcation Control 0 (BIFCTL0):** • 111-101: Reserved • 100: x8 • 011: x4x4 • 010: x4x2x2 • 001: x2x2x4 • 000: x2x2x2x2 A write of '1' on the CL will lock this register field down as bifurcation control status information.

48.4 Sideband Registers - Devices 14-17

The Sideband registers accessible to the Host are described here. They are accessible in Host Memory Space starting at the Sideband Base Address Register (SBREG_BAR). See Section 3.4.1, "Using SBREG_BAR Method" on page 187.

48.4.1 PPBIFCTL_PRIV—Offset 10h

Port Configuration Bifurcation Control for MLW (x8) vs Port number

Type: Sideband Register
(Size: 32 bits)

Sideband Port and Offset: [Port: 0xB3] + 0h
Host Memory Space: SBREG_BAR + 0xB30000 + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/L	**Capability Lock (CL):** Lock key bit for all RW-L bits of PPBIFCTL register only. • 1b: Lock • 0b: Unlocked This bit is self-locking. Once this bit is set to a 1b, this key bit can not be unlocked. Writing a 0b has no affect on this bit.
30:3	0x0 RO	**RSVD0:** Reserved
2:0	0x0 RW/V/L	**Bifurcation Control 0 (BIFCTL0):** • 111-101: Reserved • 100: x8 • 011: x4x4 • 010: x4x2x2 • 001: x2x2x4 • 000: x2x2x2x2 A write of '1' on the CL will lock this register field down as bifurcation control status information.

§ §

49 SMBus - Host - B0, D18, F0

49.1 Introduction and Index

The host-accessible registers for the SMBus - Host are described here.

To determine the number of devices/functions available refer to the following:

- Table 1-1, "Features by product SKU - Server and Cloud Storage SKUs 0 through 4"
- Table 1-2, "Features by Product SKU - Network and Enterprise Storage SKUs 5 through 10"
- Table 1-3, "Features by Product SKU - Extended Temperature SKUs 11 through 14".

The legend for the register access codes are described in Chapter 43, "Introduction."

49.1.1 Host Configuration Space

These registers are discovered in Host Configuration Space starting at Bus 0, Device 18 (decimal), Function 0. The offset addresses are listed.

Table 49-1. Summary of PCI Configuration Registers—0/18/0

Offset (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
0	2	8086	"VID—Offset 0h" on page 1820
2	2	19AC	"DID—Offset 2h" on page 1820
4	2	0000	"PCICMD—Offset 4h" on page 1821
6	2	0010	"PCISTS—Offset 6h" on page 1822
8	1	00	"RID—Offset 8h" on page 1823
9	3	00088000	"CCR—Offset 9h" on page 1823
10	8	0000000000000004	"SMTBAR—Offset 10h" on page 1824
2C	2	8086	"SVID—Offset 2Ch" on page 1824
2E	2	0000	"SID—Offset 2Eh" on page 1825
3C	1	00	"INTL—Offset 3Ch" on page 1825
3D	3	01	"INTP—Offset 3Dh" on page 1826
40	2	8010	"EXPCAPLST—Offset 40h" on page 1826
44	4	10008001	"DEVCAP—Offset 44h" on page 1827
48	2	0000	"DEVCTL—Offset 48h" on page 1829
4A	2	0000	"DEVSTS—Offset 4Ah" on page 1830
80	2	8C01	"PMCAPLST—Offset 80h" on page 1831
8C	2	0005	"MSICAPLST—Offset 8Ch" on page 1831
8E	2	0180	"MSICTL—Offset 8Eh" on page 1832
90	8	0000000000000000	"MSIADDR—Offset 90h" on page 1832
98	4	00000000	"MSIDATA—Offset 98h" on page 1833
9C	4	00000000	"MSIMSK—Offset 9Ch" on page 1834
EA	2	0000	"PLKCTL—Offset EAh" on page 1834

49.1.2 Host Memory Space—SMTBAR

An index of the registers that are accessible in Host Memory Space is shown here.

Table 49-2. Summary of Memory Mapped I/O Registers—SMTBAR

Offset (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
0	4	00000000	"GCTRL—Offset 0h" on page 1835
8	8	0000000000000000	"SMTICL—Offset 8h" on page 1836
10	4	00000000	"ERRINTMSK—Offset 10h" on page 1837
14	4	00000000	"ERRAERMSK—Offset 14h" on page 1838
18	4	00000000	"ERRSTS—Offset 18h" on page 1839
1C	4	00000000	"ERRINFO—Offset 1Ch" on page 1840
100	8	0000000000000000	"MDBA—Offset 100h" on page 1840
108	4	00000000	"MCTRL—Offset 108h" on page 1841
10C	4	00000000	"MSTS—Offset 10Ch" on page 1842
110	4	00000000	"MDS—Offset 110h" on page 1843
114	4	00061020	"RPOLICY—Offset 114h" on page 1844
200	8	0000000000000000	"TBBA—Offset 200h" on page 1846
208	4	00000010	"TCTRL—Offset 208h" on page 1847
20C	4	00000000	"TSTS—Offset 20Ch" on page 1848
210	4	00000000	"TBS—Offset 210h" on page 1849
218	4	00000000	"HTHP—Offset 218h" on page 1849
21C	4	00000000	"FTTP—Offset 21Ch" on page 1850
220	4	00000058	"TRxCTRL—Offset 220h" on page 1850
224	4	00000000	"TRxSTS—Offset 224h" on page 1851
228	4	00000000	"TACTRL—Offset 228h" on page 1852
22C	4	00000000	"TPOLICY—Offset 22Ch" on page 1853
240	4	00000000	"GPBRCTRL—Offset 240h" on page 1855
244	4	00000000	"GPBRDBUF—Offset 244h" on page 1856
280	4	00000000	"SMTARPCTRL—Offset 280h" on page 1857
290	8	8086000000000000	"UDID0—Offset 290h" on page 1858
298	8	8108808600000024	"UUDID0—Offset 298h" on page 1859
2A0	8	8086000000000000	"UDID1—Offset 2A0h" on page 1860
2A8	8	8108808600000024	"UUDID1—Offset 2A8h" on page 1861
300	4	00000005	"SPGT—Offset 300h" on page 1862
304	4	08080000	"SPMT—Offset 304h" on page 1863
308	4	00000000	"SPST—Offset 308h" on page 1864
30C	4	00002024	"SMBFT—Offset 30Ch" on page 1865
310	4	000015E1	"CLTC—Offset 310h" on page 1866
380	4	80000000	"DCLKGT—Offset 380h" on page 1866
384	4	00000011	"SUSCHKB—Offset 384h" on page 1867
388	4	00000003	"DBCTRL—Offset 388h" on page 1868
38C	4	00000300	"DBSTS—Offset 38Ch" on page 1869

49.2 Registers in Configuration Space

49.2.1 VID—Offset 0h

The Vendor ID Register identifies this device as an Intel device and adheres to the definitions in the PCI Local Bus Specification, Revision 3.0.

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:18, F:0] + 0h

Default: 8086h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x8086 RO	**Vendor ID (VID):** This is the standard 16-bit value assigned to Intel by PCI-SIG.

49.2.2 DID—Offset 2h

The Device ID Register identifies this device and adheres to the PCI Local Bus Specification, Revision 3.0.

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:18, F:0] + 2h

Default: 19ACh

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x19ac RO/V	**Device ID (DID):** This is the SMT Device identification Number.

49.2.3 PCICMD—Offset 4h

The PCI Command Register follows a subset of the PCI Local Bus Specification, Revision 3.0. This register provides the basic control of the ability of the device to initiate and respond to transactions sent to it and maintains compatibility with PCI configuration space.

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:18, F:0] + 4h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0x0 RO	**RSVD0:** Reserved
10	0x0 RW	**Interrupt Disable (INTxD):** Controls the ability to generate legacy INTx interrupt messages. When set, functions are prevented from asserting INTx interrupt messages.
9	0x0 RO	**Fast Back to Back Enable (FBE):** Hard-wired to 0.
8	0x0 RW	**SERR# Enable (SEE):** This bit indicates whether the device is allowed to signal a PCIe SERR condition. • 0: The device is disabled from generating fatal/non-fatal errors. • 1: The device is enabled to send fatal/non-fatal errors.
7	0x0 RO	**RSVD:** Reserved
6	0x0 RW	**Parity Error Response (PERE):** This bit controls the setting of the master data parity error bit in the Status Register in response to a parity error received on the PCI Express interface (either internal queue errors or a poisoned TLP). • 0: Parity errors are ignored by the device. • 1: The device reports parity errors.
5	0x0 RO	**RSVD:** Reserved
4	0x0 RO	**RSVD:** Reserved
3	0x0 RO	**RSVD:** Reserved
2	0x0 RW	**Bus Master Enable (BME):** Controls the ability of this device to initiate transactions to memory including MMIO. • 0: The function is not allowed to issue any memory requests. • 1: The function is allowed to issue memory requests.
1	0x0 RW	**Memory Space Enable (MSE):** Controls whether the device responds to memory space transactions as located by its memory space BAR. • 0: Disables device's memory BAR to be decoded as a valid target address. • 1: Enables device's memory BAR to be decoded as a valid target address.
0	0x0 RO	**RSVD:** Reserved

49.2.4 PCISTS—Offset 6h

The PCI Status Register follows a subset of the PCI Local Bus Specification, Revision 3.0. This register maintains compatibility with PCI configuration space. Since this register is part of the standard PCI header, there is a PCISTS register per PCI function.

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:18, F:0] + 6h

Default: 0010h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW/1C/V	**Detected Parity Error (DPE):** This bit is set when the device receives an uncorrectable data error or Address/Control parity error regardless of the Parity Error Response bit in the "PCICMD—Offset 4h" on page 1821.
14	0x0 RW/1C/V	**SERR# Asserted (SSE):** • 0: No internal device port errors are signaled. • 1: The device reported internal fatal/non-fatal errors.
13	0x0 RW/1C/V	**Received Master Abort (RMA):** This bit is set when device experiences a master abort on a transaction it has mastered on IOSF.
12	0x0 RW/1C/V	**Received Target Abort (RTA):** This bit is set when device accesses to IOSF return a failed completion status.
11	0x0 RW/1C/V	**Signaled Target Abort (STA):** The IPI interface of the SMT will flag a completer abort for requests to its MMIO space that are greater than 8B in length.
10:9	0x0 RO	**RSVD:** Reserved
8	0x0 RW/1C/V	**Master Data Parity Error (MDPD):** This bit is set if the Parity Error Response bit in the PCI Command register set is set and it receives a completion with poisoned data from IOSF.
7	0x0 RO	**RSVD:** Reserved
6	0x0 RO	**RSVD0:** Reserved
5	0x0 RO	**RSVD:** Reserved
4	0x1 RO	**Capabilities List (CAPE):** This bit indicates that this device implements a PCI Capability list.
3	0x0 RO/V	**Interrupt Status (INTS):** When set, this bit indicates that an INTx emulation interrupt is pending internally in this function, it is reset when the internal signal is de-asserted. This bit has meaning only in the legacy interrupt mode. This bit is always 0 when MSI-X has been selected for DMA interrupts.
2:0	0x0 RO	**RSVD1:** Reserved

49.2.5 RID—Offset 8h

Revision ID Register bit definitions adhere to PCI Local Bus Specification, Revision 3.0.

Type: PCI Configuration Register
(Size: 8 bits)

Offset: [B:0, D:18, F:0] + 8h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO/V/P	**Revision ID (RID):** This value is initially 0 for the first release and is incremented for subsequent releases in order to identify any changes.

49.2.6 CCR—Offset 9h

Class Code Register bit definitions adhere to PCI Local Bus Specification, Revision 3.0. Auto configuration software reads this register to determine the PCI device function.

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:18, F:0] + 9h

Default: 00088000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**RSVD0:** Reserved
23:16	0x8 RW/O	**Base Class (BASE):** Indicates it is a 'Generic System Peripheral'. **Power Well:** PRST
15:8	0x80 RW/O	**Sub Class (SUB):** Indicates 'Other System Peripheral'. **Power Well:** PRST
7:0	0x0 RO	**RSVD:** Reserved **Power Well:** PRST

49.2.7 SMTBAR—Offset 10h

This base address register marks the memory-mapped registers used for SMBus Management Transport functionality. These registers are listed subsequently.

Type: PCI Configuration Register (Size: 64 bits)

Offset: [B:0, D:18, F:0] + 10h

Default: 0000000000000004h

Bit Range	Default & Access	Field Name (ID): Description
63:10	0x0 RW	**Base Address (MBA):** Base address of SMT control registers.
9:4	0x0 RO	**Memory Size (MS):** Reserved.
3	0x0 RO	**Prefetchable (PFMEM):** This bit is hardwired to 0b to indicate non-prefetchable.
2:1	0x2 RO	**Type (MTYPE):** The SMT MMIO registers should have the ability to be relocated anywhere within 64-bit address space.
0	0x0 RO	**Memory space indicator (MSI):** Hardwired to 0 to indicate that this is a memory space BAR.

49.2.8 SVID—Offset 2Ch

The Subsystem Vendor ID Register bit definitions adhere to PCI Local Bus Specification, Revision 3.0.

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:18, F:0] + 2Ch

Default: 8086h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x8086 RW/O	**Subsystem Vendor ID (SVID):** This register uniquely identifies the add-in board or subsystem vendor. **Power Well:** PRST

49.2.9 SID—Offset 2Eh

The Subsystem ID Register bit definitions adhere to PCI Local Bus Specification, Revision 3.0.

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:18, F:0] + 2Eh

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x0 RW/O	**Subsystem ID (SID):** uniquely identifies the add-in board or subsystem. **Power Well:** PRST

49.2.10 INTL—Offset 3Ch

Interrupt Line Register bit definitions adhere to PCI Local Bus Specification, Revision 3.0.

This register identifies interrupt line routing information.

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:18, F:0] + 3Ch

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Interrupt Assigned (INTL):** system-assigned value identifies which system interrupt controller's interrupt request has the device's PCI interrupt request routed to it (as specified in the interrupt pin register). A value of FFH signifies 'no connection' or 'unknown'.

49.2.11 INTP—Offset 3Dh

Interrupt Pin Register bit definitions adhere to PCI Local Bus Specification, Revision 3.0. This register must be programmed before legacy interrupts are enabled.

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:18, F:0] + 3Dh

Default: 01h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x1 RW/L	**Interrupt Pin (INTP):** Indicates which INTx assert/deassert legacy interrupt messages are used. • 01h: Generate INTA. • 02h: Generate INTB. • 03h: Generate INTC. • 04h: Generate INTD. • Others: Reserved. **Power Well:** PRST

49.2.12 EXPCAPLST—Offset 40h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:18, F:0] + 40h

Default: 8010h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x80 RO	**Next Pointer (NP):** Contains the offset of the next item in the capabilities list ("PMCAPLST—Offset 80h").
7:0	0x10 RO	**Capability ID (CAPID):** Identifies the function as PCI Express capable.

49.2.13 DEVCAP—Offset 44h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:18, F:0] + 44h

Default: 10008001h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RO	**RSVD0:** Reserved.
28	0x1 RW/O	**Function Level Reset Capability (FLR):** This field when set indicates this function supports function Level Reset mechanism. Lock key bit for DEVCTL.IFLR. • 0b: Lock. • 1b: Unlocked. **Power Well:** PRST
27:26	0x0 RO	**RSVD:** Reserved
25:18	0x0 RO	**RSVD:** Reserved
17:16	0x0 RO	**RSVD1:** Reserved.
15	0x1 RO	**Role-Based Error Reporting (RBER):** The PCIe cluster supports Role-based Error Reporting.
14:12	0x0 RO	**RSVD:** Reserved.
11:9	0x0 RO	**Endpoint L1 Acceptable Latency (EPL1AL):** • 000b Maximum of 1 us • 001b Maximum of 2 us • 010b Maximum of 4 us • 011b Maximum of 8 us • 100b Maximum of 16 us • 101b Maximum of 32 us • 110b Maximum of 64 us • 111b No limit This field does not apply to SMT device. The minimal latency is shown here as default
8:6	0x0 RO	**Endpoint L0s Acceptable Latency (EPL0AL):** • 000b Maximum of 64 ns • 001b Maximum of 128 ns • 010b Maximum of 256 ns • 011b Maximum of 512 ns • 100b Maximum of 1 us • 101b Maximum of 2 us • 110b Maximum of 4 us • 111b No limit This field does not apply to SMT device. The minimal latency is shown here as default
5	0x0 RO	**Extended Tag Field Supported (ETFG):** • 0: The device supports 5-bit extended tag • 1: The device supports 8-bit extended tag Currently, only 5-bit tag is supported and validated for the EP
4:3	0x0 RO	**RSVD:** Reserved

Bit Range	Default & Access	Field Name (ID): Description
2:0	0x1 RO	**Max Payload size Supported (MPSS):** This is an internal device and can send/receive up to 256B packets internally from/to the IOSF fabric.

49.2.14 DEVCTL—Offset 48h

The MPS register field is coded with NFLRST attribute to indicate it is not reset by FLR.

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:18, F:0] + 48h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW/V/L	**Initiate Function Level Reset (IFLR):** A write of 1 initiates Function Level Reset. The value read by software from this bit is always 0b. Only applies to end point. This field is locked by the complement of the DEVCAP.FLR LockKey: ~DEVCAP.FLR **Power Well:** NFLRST
14:12	0x0 RO	**Max_Read_Request_Size (MRRS):** This field sets the maximum Read Requests size of the function as a requester on PCIe.
11	0x0 RW	**Enable No Snoop (ENOSNP):** If this bit this is set, the function is permitted to set the No Snoop bit in the Requester attributes of transactions.
10	0x0 RO	**RSVD:** Reserved
9	0x0 RO	**RSVD:** Reserved
8	0x0 RO	**RSVD:** Reserved
7:5	0x0 RW	**Maximum Payload Size (MPS):** This field sets maximum TLP payload size for the function. • 000b: 128 bytes maximum payload size (default) • 001b: 256 bytes maximum payload size • Others: Reserved **Power Well:** NFLRST
4	0x0 RO	**RSVD:** Reserved
3	0x0 RW	**Unsupported Request Reporting Enable (URRE):** This bit controls the enabling of ERR_CORR, ERR_NONFATAL, or ERR_FATAL messages for reporting 'Unsupported Request' errors.
2	0x0 RW	**Fatal Error Reporting Enable (FERE):** When this bit is set, generation of the ERR_FATAL message is enabled.
1	0x0 RW	**NonFatal Error Reporting Enable (NFERE):** When this bit is set, generation of the ERR_NONFATAL message is enabled.
0	0x0 RW	**Correctable Error Reporting Enable (CERE):** When this bit is set, generation of the ERR_CORR message is enabled.

49.2.15 DEVSTS—Offset 4Ah

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:18, F:0] + 4Ah

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:6	0x0 RO	**RSVD0:** Reserved
5	0x0 RO/V	**Transactions Pending (TP):** When set, this bit indicates that the device has issued non-posted PCI Express transactions which have not yet completed.
4	0x0 RO	**RSVD:** Reserved
3	0x0 RW/1C/V	**Unsupported Request Detected (URD):** This bit indicates that this function received an unsupported request from PCI Express link. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register.
2	0x0 RW/1C/V	**Fatal Error Detected (FED):** This bit indicates that the function has detected a Fatal error. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register.
1	0x0 RW/1C/V	**Non-Fatal Error Detected (NFED):** This bit indicates that the function has detected a Non-Fatal error. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register.
0	0x0 RW/1C/V	**Correctable Error Detected (CED):** This bit indicates that the function has detected a Correctable error. Errors are logged in this register regardless of whether error reporting is enabled or not in the Device Control register.

49.2.16 PMCAPLST—Offset 80h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:18, F:0] + 80h

Default: 8C01h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x8c RO	**Next Pointer (NP):** Contains the offset of the next item in the capabilities list ("MSICAPLST—Offset 8Ch").
7:0	0x1 RO	**Capability ID (CAPID):** Identifies the function as PCI Power Management capable.

49.2.17 MSICAPLST—Offset 8Ch

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:18, F:0] + 8Ch

Default: 0005h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x0 RO	**Next Pointer (NP):** Contains the offset of the next item in the capabilities list.
7:0	0x5 RO	**Capability ID (CAPID):** Identifies the function as MSI capable.

49.2.18 MSICTL—Offset 8Eh

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:18, F:0] + 8Eh

Default: 0180h

Bit Range	Default & Access	Field Name (ID): Description
15:9	0x0 RO	**RSVD0:** Reserved.
8	0x1 RO	**Per-vector masking capable (PVM):** This bit indicates that this device supports MSI per-vector masking.
7	0x1 RO	**Address 64-Bit Capable (AD64C):** When set, this bit indicates that this function is capable of generating a 64-bit message address. • 1: Function is capable of sending 64-bit message address. • 0: Function is not capable of sending 64-bit message address.
6:4	0x0 RW	**Multiple Message Enable (MMEN):** These bits are R/W for software compatibility. SMT supports only one message. • 000b = 1 Message. • Others = Reserved.
3:1	0x0 RO	**Multiple Message Capable (MMC):** SMT supports only one MSI message (power of 2). There is no option of supporting multiple messages.
0	0x0 RW	**MSI Enable (MSIE):** When set, MSI is enabled and traditional interrupt pins are not used to generate interrupts. Software must disable INTx and MSI-X for this device when using MSI.

49.2.19 MSIADDR—Offset 90h

Type: PCI Configuration Register
(Size: 64 bits)

Offset: [B:0, D:18, F:0] + 90h

Default: 0000000000000000h

Bit Range	Default & Access	Field Name (ID): Description
63:2	0x0 RW	**Address (ADDR):** Message address specified by the system, always Dword aligned.
1:0	0x0 RO	**RSVD0:** Reserved.

49.2.20 MSIDATA—Offset 98h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:18, F:0] + 98h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD0:** Reserved.
15	0x0 RW	**Trigger Mode (TM):** • 0: Edge Triggered. • 1: Level Triggered.
14	0x0 RW	**Level (LVL):** If TM is 0h, then this field is a don't care. Edge-triggered messages are always treated as assert messages. If TM is 1h, then: • 0: Deassert Messages • 1: Assert Messages. For level-triggered interrupts, this bit reflects the state of the interrupt input.
13:12	0x0 RW	**Future:** These bits are don't care for an IOxAPIC interrupt message data field specification.
11:8	0x0 RW	**Delivery Mode (DM):** • 0000: Fixed: Trigger Mode can be edge or level. • 0001: Lowest Priority: Trigger Mode can be edge or level. • 0010: SMI/PMI/MCA - Not supported via MSI of root port • 0011: Reserved - Not supported via MSI of root port. • 0100: NMI - Not supported via MSI of root port. • 0101: INIT - Not supported via MSI of root port. • 0110: Reserved. • 0111: ExtINT - Not supported via MSI of primary port. • 1000 -1111 - Reserved.
7:0	0x0 RW	**Interrupt Vector (IV):** The interrupt vector (LSB) will be modified by the IIO to provide context-sensitive interrupt information for different events that require attention from the processor. e.g Hot plug, Power Management and RAS error events.

49.2.21 MSIMSK—Offset 9Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:18, F:0] + 9Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0x0 RO	**RSVD0:** Reserved.
0	0x0 RW	**Mask Bits (MSKB):** For each Mask bit that is set, the PCI Express port is prohibited from sending the associated message. The SMT supports 1 MSI message. Corresponding bits are masked if set to '1'.

49.2.22 PLKCTL—Offset EAh

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:18, F:0] + EAh

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:1	0x0 RO	**RSVD0:** Reserved.
0	0x0 RW/L	**Capability Lock (CL):** Lock key bit for all RW-L bits (capabilities, next capability pointer, SSID/SVID, slot register, etc) bits for the function. • 1b: Lock. • 0b: Unlocked. This bit is self-locking. Once this bit is set to a 1b, this key bit can not be unlocked. Writing a 0b has no effect on this bit. **Power Well:** PRST

49.3 Registers in Memory Space—SMTBAR

These registers are accessed in Host Memory Space starting at the relocatable memory address defined by the Base Address Register (BAR) SMTBAR described in Section 49.2.7, "SMTBAR—Offset 10h" on page 1824.

49.3.1 GCTRL—Offset 0h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [SMTBAR] + 0h

SMTBAR Type: PCI Configuration Register (Size: 64 bits)
SMTBAR Reference: [B:0, D:18, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0x0 RO	**RSVD0:** Reserved.
6	0x0 RW/V/P	**SRST (SoftReset):** Set by the FW to asynchronously Reset the SMT Master and Target logic, Clear all the MMIO registers, and Release the SMBus Clock and Data lines.
5:4	0x0 RO	**RSVD1:** Reserved.
3	0x0 RW/V/P	**KILL:** FW sets the bit to cause HW to cause clock low timeout on the SMBus and generate stop after the timeout.
2	0x0 RW/V/P	**Target Reset (TRST):** Set by FW to force HW to idle its internal SMBus clock and data.
1:0	0x0 RO	**RSVD2:** Reserved.

49.3.2 SMTICL—Offset 8h

This address register marks the location of where SMT interrupt cause information is written before an MSI is sent. The two least-significant bits are fixed at 00b so that the memory address is Dword-aligned.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [SMTBAR] + 8h

Default: 0000000000000000h

SMTBAR Type: PCI Configuration Register (Size: 64 bits)
SMTBAR Reference: [B:0, D:18, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
63:2	0x0 RW	**Base Address (BA):** Base address of SMT interrupt cause.
1:0	0x0 RO	**Memory Size (MS):** Reserved.

49.3.3 ERRINTMSK—Offset 10h

Interrupt masking applies to both MSI and INTx.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [SMTBAR] + 10h

Default: 00000000h

SMTBAR Type: PCI Configuration Register (Size: 64 bits)
SMTBAR Reference: [B:0, D:18, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0x0 RO	**RSVD0:** Reserved.
24	0x0 RW/P	**SMBus Clock Low Timeout Error Interrupt Mask (CKLTO):** FW sets this bit to mask HW from generating an interrupt due to ERRSTS.CKLTO being set.
23:18	0x0 RO	**RSVD1:** Reserved.
17	0x0 RW/P	**Target Ring Buffer Full Error Interrupt Mask (TRBF):** FW sets this bit to mask HW from generating an interrupt due to ERRSTS.TRBF being set.
16	0x0 RW/P	**Target Ring Buffer Almost Full Error Interrupt Mask (TRBAF):** FW sets this bit to mask HW from generating an interrupt due to ERRSTS.TRBAF being set.
15:13	0x0 RO	**RSVD2:** Reserved.
12	0x0 RW/P	**IPI Host Interface Error (IHIE):** FW sets this bit to mask HW from generating an interrupt due to ERRSTS.IHIE being set.
11	0x0 RW/P	**IPI Master Abort Error (IMAE):** FW sets this bit to mask HW from generating an interrupt due to ERRSTS.IMAE being set. ERRINTMSK.IMAE: this bit is assumed to be '1' when MSICTL.MSIE is set. IMAE will occur only if PCICMD.BME is clear and MSI requires BME to be set.
10	0x0 RO	**IPI Transmit Error Interrupt Mask (ITE):** FW sets this bit to mask HW from generating an interrupt due to ERRSTS.ITE being set. This error condition is deprecated.
9	0x0 RW/P	**IPI Receive Data Parity Error Interrupt Mask (IRDPE):** FW sets this bit to mask HW from generating an interrupt due to ERRSTS.IRDPE being set.
8	0x0 RO	**IPI Receive Error Interrupt Mask (IRE):** FW sets this bit to mask HW from generating an interrupt due to ERRSTS.IRE being set. This error condition is deprecated.
7:2	0x0 RO	**RSVD3:** Reserved.
1	0x0 RW/P	**SPD Write Error Mask (SPDWE):** FW sets this bit to mask HW from generating an interrupt due to ERRSTS.SPDWE being set.
0	0x0 RW/P	**CSR Parity Error Interrupt Mask (CPE):** FW sets this bit to mask HW from generating an interrupt due to ERRSTS.CPE being set.

49.3.4 ERRAERMSK—Offset 14h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [SMTBAR] + 14h

SMTBAR Type: PCI Configuration Register (Size: 64 bits)
SMTBAR Reference: [B:0, D:18, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0x0 RO	**RSVD0:** Reserved.
24	0x0 RW/P	**SMBus Clock Low Timeout Error AER Mask (CKLTO):** FW sets this bit to mask HW from escalating through AER Uncorrectable Internal Error due to ERRSTS.CKLTO being set.
23:18	0x0 RO	**RSVD1:** Reserved.
17	0x0 RW/P	**Target Ring Buffer Full Error AER Mask (TRBF):** FW sets this bit to mask HW from escalating through AER Uncorrectable Internal Error due to ERRSTS.TRBF being set.
16	0x0 RW/P	**Target Ring Buffer Almost Full Error AER Mask (TRBAF):** FW sets this bit to mask HW from escalating through AER Uncorrectable Internal Error due to ERRSTS.TRBAF being set.
15:13	0x0 RO	**RSVD2:** Reserved.
12	0x0 RW/P	**IPI Host Interface Error (IHIE):** FW sets this bit to mask HW from escalating through AER Uncorrectable Internal Error due to ERRSTS.IHIE being set.
11	0x0 RW/P	**IPI Master Abort Error (IMAE):** FW sets this bit to mask HW from escalating through AER Correctable Internal Error due to ERRSTS.IMAE being set. This error is escalated as Correctable.
10	0x0 RO	**IPI Transmit Error AER Mask (ITE):** FW sets this bit to mask HW from escalating through AER Uncorrectable Internal Error due to ERRSTS.ITE being set. This error condition is deprecated.
9	0x0 RW/P	**IPI Receive Data Parity Error AER Mask (IRDPE):** FW sets this bit to mask HW from escalating through AER Uncorrectable Internal Error due to ERRSTS.IRDPE being set.
8	0x0 RO	**IPI Receive Error AER Mask (IRE):** FW sets this bit to mask HW from escalating through AER Uncorrectable Internal Error due to ERRSTS.IRE being set. This error condition is deprecated.
7:2	0x0 RO	**RSVD3:** Reserved.
1	0x0 RW/P	**SPD Write Error AER Mask (SPDWE):** FW sets this bit to mask HW from escalating through AER Correctable Internal Error due to ERRSTS.SPDWE being set.
0	0x0 RW/P	**CSR Parity Error AER Mask (CPE):** FW sets this bit to mask HW from escalating through AER Uncorrectable Internal Error due to ERRSTS.CPE being set.

49.3.5 ERRSTS—Offset 18h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [SMTBAR] + 18h

SMTBAR Type: PCI Configuration Register (Size: 64 bits)
SMTBAR Reference: [B:0, D:18, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0x0 RO	**RSVD0:** Reserved.
24	0x0 RW/1C/V/P	**SMBus Clock Low Timeout Error Status (CKLTO):** This bit is set by HW when SMBus clock is seen low for the time programmed in CLTC.CNT. FW clears this register by writing '1'.
23:18	0x0 RO	**RSVD1:** Reserved.
17	0x0 RW/1C/V/P	**Target Ring Buffer Full Error Status (TRBF):** HW sets this bit when it needs to write data and/or header to memory and does not have enough free space in the ring buffer in memory. Once the ring buffer full status bit is set, HW will silently NACK all incoming target transactions on the command phase to indicate that it is busy. FW clears this register by writing '1'.
16	0x0 RW/1C/V/P	**Target Ring Buffer Almost Full Error Status (TRBAF):** HW sets this bit after it has completed writing data and/or header to memory and checks if there is less than 85B of free space in the ring buffer. FW clears this register by writing '1'.
15:13	0x0 RO	**RSVD2:** Reserved.
12	0x0 RW/1C/V/P	**IPI Host Interface Error (IHIE):** HW sets this bit when a read completion returns with non-successful status. FW clears this register by writing '1'.
11	0x0 RW/1C/V/P	**IPI Master Abort Error (IMAE):** HW sets this bit if a request is made when PCICMD.BME is clear. FW clears this register by writing '1'.
10	0x0 RO	**IPI Transmit Error Status (ITE):** HW sets this bit if an error is detected in any IPI transmit transaction. This error condition is deprecated.
9	0x0 RW/1C/V/P	**IPI Receive Data Parity Error Status (IRDPE):** HW sets this bit if a data parity error is detected in any IPI receive transaction. FW clears this register by writing '1'.
8	0x0 RO	**IPI Receive Error Status (IRE):** HW sets this bit if an error is detected in any IPI receive transaction. This error condition is deprecated.
7:2	0x0 RO	**RSVD3:** Reserved.
1	0x0 RW/1C/V/P	**SPD Write Error Status (SPDWE):** HW sets this bit if a write is attempted to SPD address range (A0h-AEh) and write disable (MCTRL.SPDDIS) has been set. FW clears this register by writing '1'.
0	0x0 RW/1C/V/P	**CSR Parity Error Status (CPE):** HW sets this bit if a parity error is detected in any CSR. FW clears this register by writing '1'.

49.3.6 ERRINFO—Offset 1Ch

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [SMTBAR] + 1Ch

SMTBAR Type: PCI Configuration Register (Size: 64 bits)
SMTBAR Reference: [B:0, D:18, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD0:** Reserved.
15:13	0x0 RO/V/P	**Second Error Info (SERRINFO):** Scratchpad.
12:8	0x0 RO/V/P	**Second Error Pointer (SERRPTR):** Upon the second occurrence of any error, as included in ERRSTS, HW sets this register to point to the specific bit which was set.
7:5	0x0 RO/V/P	**First Error Info (FERRINFO):** Scratchpad.
4:0	0x0 RO/V/P	**First Error Pointer (FERRPTR):** Upon the first occurrence of any error, as included in ERRSTS, HW sets this register to point to the specific bit which was set.

49.3.7 MDBA—Offset 100h

Type: Memory Mapped I/O Register (Size: 64 bits)

Default: 0000000000000000h

BAR and Offset: [SMTBAR] + 100h

SMTBAR Type: PCI Configuration Register (Size: 64 bits)
SMTBAR Reference: [B:0, D:18, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
63:6	0x0 RW	**Master Descriptor Base Address (MDBA):** 64Byte aligned base address of the master descriptor ring buffer in FW memory. HW uses this base to add to MSTS.HMTP to calculate the physical address of the memory location it wants to access. FW must update this register only when MCTRL.SS and MSTS.IP bits are cleared.
5:0	0x0 RO	**RSVD0:** Reserved.

49.3.8 MCTRL—Offset 108h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [SMTBAR] + 108h

SMTBAR Type: PCI Configuration Register (Size: 64 bits)
SMTBAR Reference: [B:0, D:18, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**RSVD0:** Reserved.
23:16	0x0 RW	**Firmware Master Head Pointer (FMHP):** Address offset of the number of descriptors available in the descriptor ring. Updated by FW when it has programmed one or more new descriptors in the master descriptor ring buffer. Always points to the descriptor offset that FW will next write to. FW can increment this register at most to be 'MSTS.HMTP - 1' thus implying that Master Descriptor Ring Buffer can only hold 'MDS - 1' valid descriptors. FW must roll this register to 0 after MDS is reached.
15:5	0x0 RO	**RSVD1:** Reserved.
4	0x0 RW	**Master Error Interrupt Enable (MEIE):** Set by FW to enable HW to generate MSI (if MSICTL.MSIE set) if MSTS.MEIS bit is set.
3	0x0 RW/O/P	**SPD Write Disable (SPDDIS):** This bit must be set to '1' to disable writes to DIMM SPD, which are located in address range A0h-AEh. If set, this address range is unwritable until the next platform reset. Reads are unaffected. This bit is reset only upon platform reset. It should be set by BIOS MRC (Memory Reference Code).
2:1	0x0 RO	**RSVD2:** Reserved.
0	0x0 RW/V	**Start/Stop (SS):** Set by the FW when it has programmed at least one descriptor in the descriptor ring. Cleared by FW when it wants HW to stop processing more descriptors. FW must monitor the MSTS.IP bit which indicates that HW is truly stopped. HW clears this register for the following fatal error scenario, regardless of Stop-on-Error (SOE) bit in the master descriptor: • HW receives unsuccessful completion on internal IOSF. HW clears this register for the following non-fatal scenario: • Master descriptor SOE bit was set and the transaction was unsuccessful for any condition as reported in the Status WB Dword.

49.3.9 MSTS—Offset 10Ch

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [SMTBAR] + 10Ch

SMTBAR Type: PCI Configuration Register (Size: 64 bits)
SMTBAR Reference: [B:0, D:18, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**RSVD0:** Reserved.
23:16	0x0 RW/V	**Hardware Master Tail Pointer (HMTP):** Descriptor offset in the descriptor ring. Incremented by HW and points to the descriptor that HW is currently processing or will process next. Initialized by FW with the descriptor location where it wants the master to start transaction from (typically 0). This register must only be written by FW when the MCTRL.SS bit is '0' and the MSTS.IP bit is '0'. HW must not increment this pointer in the case that due to the failure of a descriptor-initiated cycle, HW clears the MCTRL.SS bit. HW uses MSTS.HMTP and MCTRL.FMHP to calculate Full and Empty conditions. FW must never initialize this buffer to a value greater than MDS.
15:6	0x0 RO	**RSVD1:** Reserved.
5	0x0 RW/1C/V	**Master Interrupt Status (MIS):** Set by HW to indicate that the descriptor that was being processed was successfully done over SMBus. HW proceeds normally to process the next descriptor if the MCTRL.SS bit is set. HW auto-clears this register if INT bit in the descriptor which it finished processing is set and the associated MSI is sent. If INT bit in descriptor is cleared, FW clears this bit by writing '1'.
4	0x0 RW/1C/V	**Master Error Interrupt Status (MEIS):** Set by HW to indicate that the descriptor that was being processed was not successfully done on SMBus. HW halts the descriptor engine by clearing the MCTRL.SS bit if this bit is set and the SOE bit in the descriptor which was processed was set. HW auto-clears this register if MCTRL.MEIE register is set and the associated Master Error MSI is sent. If MCTRL.MEIE is cleared, FW clears this bit by writing '1'.
3:1	0x0 RO	**RSVD2:** Reserved.
0	0x0 RO/V	**In Progress (IP):** Set by the HW to indicate that its DMA processor is active meaning that it is processing a descriptor. HW will clear this bit after it has finished processing the current descriptor (which is the completion of the descriptor's status write back into memory and Interrupt if enabled is sent). This is to aid the stopping of HW even if there are multiple descriptors to be processed.

49.3.10 MDS—Offset 110h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [SMTBAR] + 110h

SMTBAR Type: PCI Configuration Register (Size: 64 bits)
SMTBAR Reference: [B:0, D:18, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD0:** Reserved.
7:0	0x0 RW	**Master Descriptor Size (MDS):** Defines the size of the master descriptor ring buffer that is pointed to by MDBA. 0-based number of 16B descriptors. The top of the ring buffer is MDBA+MDS including the last location. A value of '1' represents a total possible capacity of 2 descriptors in the ring, and a value of '255' represents capacity of 256 descriptors in the ring. Used by HW to calculate if it has reached the top of the buffer and must wrap back to 0.

49.3.11 RPOLICY—Offset 114h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00061020h

BAR and Offset: [SMTBAR] + 114h

SMTBAR Type: PCI Configuration Register (Size: 64 bits)
SMTBAR Reference: [B:0, D:18, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**RSVD0:** Reserved.
23:16	0x6 RW	**Time Between Retry Clock Count (TBRCLKCNT):** This register is programmed by the FW to set the retry timer clock count. The reference clock used for this timer count is specified by FW in RPOLICY.TBRBCLK. The combination of the setting in this register and the reference tick used in RPOLICY.TBRBCLK determines how long the HW waits before issuing an automatic retry for master transactions. A value of '0' indicates HW should retry the transaction without any additional delay. ***Note:*** Retry count is not applicable for retries due to collision on SMBus. Those must be retried as soon as SMBus is free. This timer must be reloaded every time HW attempts a retry or a completely new cycle is initiated by FW. ***Note:*** (FW) Since the timer ticks in register RPOLICY.TBRBCLK are free running and not independently generated by HW, there is a possibility of inaccuracy in delay time. This inaccuracy is at most 1 complete duration of the timer tick, e.g. if 1ms tick is chosen the inaccuracy is never greater than 1ms. Hence FW should use its judgment in which timer tick is selected. Recommendation would be to use a faster tick so that the inaccuracy is smaller.
15:14	0x0 RO	**RSVD1:** Reserved.
13:11	0x2 RW	**Collision Retry (COLRTRY):** This field allows the FW to set the number of times master transactions are retried before HW gives up. HW decrements this count after it attempts a master transaction and loses arbitration on SMBus. This timer must be reloaded by HW whenever the RPOLICY.RETRY count is changed (i.e. decremented due to retry or reloaded due to new master cycle initiated). • 000: Reserved. • 001: Retry once (total attempts = 2). • 010: Retry 2 times (total attempts = 3). • 011: Retry 3 times (total attempts = 4). • 100: Retry 4 times (total attempts = 5). • 101: Retry 5 times (total attempts = 6). • 110: Retry 6 times (total attempts = 7). • 111: Retry 7 times (total attempts = 8).
10:8	0x0 RW	**Time Between Retry Base Clock (TBRBCLK):** This register allows the FW to choose the granularity of the timer tick. • 000: 10us. • 001: 100us. • 010: 1ms. • 011: 10ms. • 100: 100ms. • 101: Reserved. • 110: Reserved. • 111: Reserved. The combination of this register and the RPOLICY.TBRCLKCNT register allows the FW to set mean time between retries on SMBus.

Bit Range	Default & Access	Field Name (ID): Description
7:4	0x2 RW	**RETRY:** HW will decode this field to determine the number of times to retry before HW gives up. HW must not decrement this count for cycles that are retried because of collision. HW must reload this count every time it starts a new master cycle. HW must not retry cycles if the cycle was unsuccessful due to a clock-low timeout on the SMBus. • 0000: No retries. • 0001: Retry once (total attempts = 2). • 0010: Retry 2 times (total attempts = 3). • 0011: Retry 3 times (Default: total attempts = 4). • 0100: Retry 4 times (total attempts = 5). • 0110: Retry 5 times (total attempts = 6). • 0111: Retry 6 times (total attempts = 7). • ... • 1111: Retry 15 times (Total attempts = 16).
3:0	0x0 RO	**RSVD2:** Reserved.

49.3.12 TBBA—Offset 200h

Type: Memory Mapped I/O Register (Size: 64 bits)

Default: 0000000000000000h

BAR and Offset: [SMTBAR] + 200h

SMTBAR Type: PCI Configuration Register (Size: 64 bits)
SMTBAR Reference: [B:0, D:18, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
63:6	0x0 RW	**Target Buffer Base Address (TBBA):** 64B aligned base address of the target ring buffer. HW uses this base to add to the HTHP to calculate the physical address of the memory location it wants to access. FW must update this register only when target is disabled and TSTS.IP bit is cleared.
5:0	0x0 RO	**RSVD0:** Reserved.

49.3.13 TCTRL—Offset 208h

For definitions and usage of fields PBC (Payload Byte Count), RBC (Read Byte Count), MTYPE (Message Type), TSTS (Transaction Status), and TTYPE (Transaction Type) in the target header, refer to Figure 20-7, 'Target Header Format' on page 863, Table 20-11, 'Target Header Descriptor' on page 864, Table 20-12, 'Valid Target Descriptor MTYPE and TTYPE Combinations' on page 867, and Table 20-13, 'Target Header Encodings (TSTS) Per Transaction Type (TTYPE)' on page 868.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [SMTBAR] + 208h

Default: 00000010h

SMTBAR Type: PCI Configuration Register (Size: 64 bits)
SMTBAR Reference: [B:0, D:18, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0x0 RO	**RSVD0:** Reserved.
6	0x0 RW	**Un-Successful Received Target Writes Policy (URxTWP):** FW sets this bit to enable the HW to send data and header for unsuccessful write cycles received by the HW as a target. Since HW is responsible only for writing the payload to memory and sending a descriptor to FW, it is FW responsibility to inspect the transaction data to determine protocol type, payload, etc. The following cycles fall under this policy umbrella: • SMBus Host Notify. • ARP Notify. • ARP Master. • ARP Prepare to ARP. • ARP Assign Address. • ARP General Reset Device command. • ARP Directed Reset Device command to TACTRL.ADDR0 or TACTRL.ADDR1. • SMBus Send Byte command to TACTRL.ADDR0 or TACTRL.ADDR1. • SMBus Write Byte/Word command to TACTRL.ADDR0 or TACTRL.ADDR1. • SMBus Block Write command to TACTRL.ADDR0 or TACTRL.ADDR1 I2C. • Master-TX writes Slave-RX to TACTRL.ADDR0 or TACTRL.ADDR1. The header bits will define the transaction size (PBC and RBC), cycle type (MTYPE and TTYPE), and why the cycle was unsuccessful (TSTS!=0000b). When this bit is cleared, HW only sends data and header to FW of cycles which were successful.
5	0x0 RW	**Un-Successful Completion Header WB Policy (UCHWBP):** FW sets this bit to enable the HW to send a header for programmed FW cycles that were unsuccessfully completed as a target. The following cycles fall under this policy umbrella: • SMBus Block Reads to GPBR Address (GPBRCTRL.GPTRADR). • SMBus Quick Command to TACTRL.ADDR0 or TACTRL.ADDR1. • ARP Directed Get UDID command to TACTRL.ADDR0 or TACTRL.ADDR1. • ARP General Get UDID command. The header bits will define the transaction size (PBC and RBC), cycle type (MTYPE and TTYPE), and why the cycle was unsuccessful (TSTS!=0000b). When this bit is cleared, no header writeback is done by HW. If General Get UDID command is received and that UDID Address Resolved (AR) flag is set, HW will NACK the ARP 'command' byte to indicate it has a valid assigned slave address (its ARP is complete), and it should not send any unsuccessful completion header to FW.
4	0x1 RW	**Successful Completion Header WB Policy (SCHWBP):** FW sets this bit to enable the HW to send a header for programmed FW cycles that were successfully completed as target on SMBus. The following cycles fall under this policy umbrella: • SMBus Block Reads to GPBR Address (GPBRCTRL.GPTRADR). • Cycles to ADDR0 or ADDR1 (TACTRL.ADDR0 or TACTRL.ADDR1). • Cycles to Default Address (C2h). • Cycles to SMBus or ARP Host (10h). The header bits will define the transaction size (PBC and RBC), cycle type (MTYPE and TTYPE), and successful completion status (TSTS=0000b). When this bit is cleared, no header writeback is done by HW.

Bit Range	Default & Access	Field Name (ID): Description
3:1	0x0 RO	**RSVD1:** Reserved.
0	0x0 RW	**Target Interrupt Enable (TIE):** FW sets this bit to enable HW to send MSI when it writes header to memory, i.e. when TSTS.TIS is set.

49.3.14 TSTS—Offset 20Ch

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [SMTBAR] + 20Ch

SMTBAR Type: PCI Configuration Register (Size: 64 bits)
SMTBAR Reference: [B:0, D:18, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RO	**RSVD0:** Reserved.
11:8	0x0 RO/V	**Target Cycle In Progress (TCIP):** This field allows FW to check which logical target address HW is currently servicing as a target. This field is set by HW at the same time as TSTS.IP transitions from 0 to 1. • 0000: Default SMBus transaction to C2h. • 0001: Transaction targeting address (TACTRL.ADDR0) of UDID0. • 0010: Transaction targeting address (TACTRL.ADDR1) of UDID1. • 0100: Host Notify transaction targeting 10h. • 0101: Generic Programmable Block Read to programmed address in GPBRCTRL.GPTRADR. • Others: Reserved. This field is valid only when the TSTS.IP bit is set. This field is consistent with Target Header Descriptor TTYPE field.
7:2	0x0 RO	**RSVD1:** Reserved.
1	0x0 RO/V	**In Progress (IP):** This bit is set by HW when it is processing a target cycle received on SMBus. This is the phase after the HW has ACKed a matching address until Stop is asserted by the external initiator, target buffer is emptied, and interrupt if enabled is sent to FW. This bit is cleared otherwise.
0	0x0 RW/1C/V	**Target Interrupt Status (TIS):** This bit is set by HW after it has written status header in target ring buffer as an indication of interrupt generation. • The conditions which result in a status header being written are governed by these policies: TCTRL.SCHWBP: upon successful completion. • TCTRL.UCHWBP: upon unsuccessful completion. • TCTRL.URxTWP: upon unsuccessful completion of writes to target. If TCTRL.TIE is cleared, FW must write '1' to clear this bit. It TCTRL.TIE register is set and global MSICTL.MSIE is set, HW sends the MSI and auto-clears this bit.

49.3.15 TBS—Offset 210h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [SMTBAR] + 210h

SMTBAR Type: PCI Configuration Register (Size: 64 bits)
SMTBAR Reference: [B:0, D:18, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD0:** Reserved.
15:2	0x0 RW	**Target Buffer Size (TBS):** Defines the size in bytes of the target ring buffer in memory which must be Dword aligned. Bits[1:0] are reserved such that FW always provides HW a buffer in granularity of 4Bytes. • 0x0000: 4B. • 0x0004: 8B. • ... • 0xFFFC: 65536B (~64KB).
1:0	0x0 RO	**RSVD1:** Reserved.

49.3.16 HTHP—Offset 218h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [SMTBAR] + 218h

SMTBAR Type: PCI Configuration Register (Size: 64 bits)
SMTBAR Reference: [B:0, D:18, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD0:** Reserved.
15:2	0x0 RW/V	**Hardware Target Buffer Head Pointer (HTBHP):** Dword offset from the base address within the target ring buffer. Updated by HW to indicate the offset within the ring buffer where the HW is writing payload data/ header or will be writing to next. HW uses HTHP and FTTP and TBS to calculate buffer full, empty, and wrap conditions. FW must never initialize this to a value greater than TBS.TBS or undefined HW behavior may occur.
1:0	0x0 RO	**RSVD1:** Reserved.

49.3.17 FTTP—Offset 21Ch

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [SMTBAR] + 21Ch

SMTBAR Type: PCI Configuration Register (Size: 64 bits)
SMTBAR Reference: [B:0, D:18, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD0:** Reserved.
15:2	0x0 RW	**Firmware Target Buffer Tail Pointer (FTBTP):** Dword offset from the base address within the target ring buffer. Updated by FW and points to the offset FW is reading from or will read from next. FW must never increment this register beyond the value of the HTHP.HTBHP register.
1:0	0x0 RO	**RSVD1:** Reserved.

49.3.18 TRxCTRL—Offset 220h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000058h

BAR and Offset: [SMTBAR] + 220h

SMTBAR Type: PCI Configuration Register (Size: 64 bits)
SMTBAR Reference: [B:0, D:18, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Descriptio
31:8	0x0 RO	**RSVD0:** Reserved.
7:0	0x58 RW	**Max Receive Bytes (MRxB):** This register sets the limit for the maximum number of bytes (address included) that SMT can receive as a target of write transactions. Once this limit is reached, HW must NACK the following received bytes. The encoding is 0's based, i.e. '0' means 1 byte (address only) and '255' means 256 bytes. • 00h: Reserved. • 01h: 2 bytes (address + 1 additional byte). • ... • EFh: 240 bytes (address + 239 additional bytes). • F0h: Reserved. • ... • FFh: Reserved. HW must always track the received number of bytes for I2C transactions to ensure that it never overflows the count programmed in this register. When this count is met, HW must NACK any following received bytes. (It is expected that bounded protocols, like SMBus which announces a byte count, provide protocol-level control to ensure write count is not exceeded. Should HW NACK such an overflowing transaction it is the responsibility of the bus master to recover and retry.) Default is defined for MCTP with 80B MCTP packet payload: (8B) MCTP SMBus Packet Header (includes 4B SMBus medium-specific header and 4B MCTP transport header) (80B) MCTP Packet Payload (1B) SMBus PEC = 89B --) 88d (0's-based encoding).

49.3.19 TRxSTS—Offset 224h

This register is updated by HW for cycles received as a target. HW updates this register with every new target cycle received even during EP well power available. The contents are similar to the target header updates by HW, so refer to the header fields for explanation, unless noted below.

This register is primarily a debug feature. This register is updated based on HW responding to transactions on SMBus. There is no ordering maintained w.r.t. updating this register and header/data write back to memory.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [SMTBAR] + 224h

Default: 00000000h

SMTBAR Type: PCI Configuration Register (Size: 64 bits)
SMTBAR Reference: [B:0, D:18, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO/V	**Payload Byte Count (PBC):** HW updates this field to indicate how many bytes were ACKed on SMBus sent by the external master and stored within the target buffer locally. For writes coming in, this data will include the sum total of all bytes ACKed from 'start' to 'stop'. For error scenarios where the master drives more data than expected or command code does not match, HW will update the count with all bytes ACKed on SMBus from 'Start' until the first byte NACKed by HW (this byte is not added to the count).
23:22	0x0 RO	**RSVD0:** Reserved.
21:16	0x0 RO/V	**Read Byte Count (RBC):** This byte count is for externally generated read transactions only. HW updates this field to indicate the sum total of data bytes it successfully provided over SMBus to the external master.
15:12	0x0 RO	**RSVD1:** Reserved.
11:8	0x0 RO/V	**MTYPE:** Check the Target header description.
7:4	0x0 RO/V	**TSTS:** Check the Target header description.
3:0	0x0 RO/V	**TTYPE:** Check the Target header description.

49.3.20 TACTRL—Offset 228h

Each address supported by SMT device must be unique since they all logically reside on the same SMBus segment.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [SMTBAR] + 228h

Default: 00000000h

SMTBAR Type: PCI Configuration Register (Size: 64 bits)
SMTBAR Reference: [B:0, D:18, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD0:** Reserved.
15:9	0x0 RW	**Address1 (ADDR1):** FW programs this field with an address of the SMT logic.
8	0x0 RO	**RSVD1:** Reserved.
7:1	0x0 RW	**Address0 (ADDR0):** FW programs this field with an address of the SMT logic.
0	0x0 RO	**RSVD2:** Reserved.

49.3.21 TPOLICY—Offset 22Ch

The target addresses referenced above are located in the following registers:

- TACTRL.ADDR0
- TACTRL.ADDR1
- GPBRCTRL.GPTRADR

FW can write to this register to enable/disable functionality pertaining to a target address. FW requests HW to update the new policy by setting TPOLICY.PTUREQ register.

HW waits until all the pending target cycles are over, and copies the contents of this register into internal non-FW-visible register bits. Once it is done, HW clears the TPOLICY.PTUREQ register as confirmation to FW that the new policy is in effect. FW can always read this register and see the current policy that HW is using if the PTUREQ bit is cleared. Any setting or clearing of the policies in this register without setting the PTUREQ bit first must not cause HW to change policies.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [SMTBAR] + 22Ch

Default: 00000000h

SMTBAR Type: PCI Configuration Register (Size: 64 bits)
SMTBAR Reference: [B:0, D:18, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/V/P	**Target Policy Update Request (PTUREQ):** FW sets this bit to indicate to the HW that it wants to update registers/policies in the target interface. The new policy that the FW needs is programmed in the lower word of this register. HW clears this bit when it has updated the new policy. When this bit is cleared the other registers indicate the current policy in effect in HW.
30:11	0x0 RO	**RSVD0:** Reserved.
10	0x0 RW	**C2_BSY:** When set forces HW to ACK only matching C2h address byte and NACK in any subsequent bytes to indicate device is busy.
9	0x0 RW	**Host Busy (HOSTBSY):** When set forces HW to ACK only matching 10h address byte and NACK in any subsequent bytes to indicate device is busy.
8	0x0 RW	**ADDR1 Busy (ADDR1BSY):** When set forces HW to ACK only matching ADDR1 address byte and NACK in any subsequent bytes to indicate device is busy.
7	0x0 RO	**RSVD1:** Reserved.
6	0x0 RW	**ADDR0 Busy (ADDR0BSY):** When set forces HW to ACK only matching ADDR0 address byte and NACK in any subsequent bytes to indicate device is busy.
5	0x0 RO	**RSVD2:** Reserved.
4	0x0 RW/V/P	**Device Address0 Enable (ADDR0_EN):** When set, enables target logic to ACK ADDR0 address on the SMBus. Fuse load.
3	0x0 RW/V/P	**Host SMBus Address Enable (Host_SMBADDR_EN):** When set, enables HW to accept write cycles targeting address 10h. This bit must be set to '1' when SoC is the SMBus Segment Owner. Fuse load.
2	0x0 RW	**Default SMBus Address Enable (DEF_SMBADDR_EN):** When set, enables HW to ACK cycles targeting address C2h, which is the SMBus default address.
1	0x0 RW/V/P	**Device Address1 Enable (ADDR1_EN):** When set, enables target logic to ACK ADDR1 address on the SMBus. Fuse load.

Bit Range	Default & Access	Field Name (ID): Description
0	0x0 RW	**Target Enable (TGTEN):** Set to '1' by the FW after it has programmed the base address in the Target Data Ring Buffer and updated target policies. While in default state '0' all bytes will be NACKed on SMBus including the address byte of the enabled addresses. TGTEN applies to all target addresses: ADDR0_EN, ADDR1_EN, Host_SMBADDR_EN, DEF_SMBADDR_EN, and GPBRCTRL.EN.

49.3.22 GPBRCTRL—Offset 240h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [SMTBAR] + 240h

SMTBAR Type: PCI Configuration Register (Size: 64 bits)
SMTBAR Reference: [B:0, D:18, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/V/P	**Enable (EN):** This bit is set by FW to enable HW to respond to a block read command to address GPBRCTRL.GPTRADR and command GPBRCTRL.CMD. HW clears this bit after HW ACKs the command code (CMD) on the Block Read command if GPBRCTRL.HWCLRDIS is cleared.
30	0x0 RW	**PEC Enable (PECEN):** This bit is set by FW to indicate that HW must provide PEC at the end of the transaction to the external master.
29	0x0 RW	**HW Clear Disable (HWCLRDIS):** This bit is set by FW to disable the HW from clearing of the GPBRCTRL.EN bit. This functionality allows HW to continuously provide current data in the GPRDx registers to the external master without FW involvement. When this bit is set, HW must start sending data from byte 0 (of the buffer behind GPBRDBUF) when responding to a new Block Read cycle.
28	0x0 RW/V	**GPBR Buffer Contents Reset (BUFRST):** This bit is set by FW to reset (zero) the contents of the GPBR buffer ("GPBRDBUF—Offset 244h"). HW clears this bit after it has reset the GPBR buffer contents.
27	0x0 RW/V	**GPBR Buffer Pointer Reset (PTRRST):** This bit is set by FW to reset the pointer into the GPBR buffer ("GPBRDBUF—Offset 244h"). HW clears this bit after it has reset the GPBR buffer pointer.
26:24	0x0 RO	**RSVD0:** Reserved.
23:16	0x0 RW	**Byte Count (BC):** Byte count indicating how many bytes are programmed in the Generic Read Data buffer ("GPBRDBUF—Offset 244h") by FW. The maximum count is 32B, which is the maximum number of bytes that the buffer can hold. On the block read, after HW matches the address and command, HW sends the contents of this byte on the SMBus and then sends out those many bytes from the Generic Read Data Buffer starting from the LSB of GPBRDBUF0 register, i.e. the byte 0 of GPBRDBUF0.
15:8	0x0 RW	**Command (CMD):** Command byte of the block read command.
7:0	0x0 RW/V/P	**General Purpose Target Read Address (GPTRADR):** Target address of the externally initiated Block Read command cycle. Bit [0] of this register is the 'Enable' for this address. HW does not take any action based on the value of bit [0]. It is simply provided to FW for reading. Fuse load.

49.3.23 GPBRDBUF—Offset 244h

This register is used to load data into the generic programmable read data buffer. The buffer is used to provide a mechanism of supporting generic programmable reads (GPBR) by an external SMBus master under FW initiated flow. The data buffer is filled by FW initiating DW writes to this register. A hidden pointer always points to the next available buffer location reading and writing to GPBRDBUF cause the pointer to increment automatically.

Because the pointer auto-increments after each write, a read of GPBRDBUF will NOT return the most recently written data. Normal usage requires the buffer contents to be cleared prior to filling it with a new data payload, therefore a read (of the next 'empty' location) will return 0s (See also GPBRCTRL.BUFRST and GPBRCTRL.PTRRST).

HW provides read data payload starting from bit [7:0] of Dword0 of the buffer, then bit [15:8] of Dword0, and so on. All bytes must be programmed in the sequence to be sent out without gaps. HW will simply count the number of bytes indicated in the GPBRCTRL.BC register and start sending them out sequentially starting at byte 0 of Dword 0 until the byte count is decremented to 0.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [SMTBAR] + 244h

SMTBAR Type: PCI Configuration Register (Size: 64 bits)
SMTBAR Reference: [B:0, D:18, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/V	**Data DWORD (GPBRD):** Reserved.

49.3.24 SMTARPCTRL—Offset 280h

The flags AV0 and AR0 refer to UDID0 and its corresponding target address TACTRL.ADDR0. The flags AV1 and AR1 refer to UDID1 and its corresponding target address TACTRL.ADDR1.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [SMTBAR] + 280h

Default: 00000000h

SMTBAR Type: PCI Configuration Register (Size: 64 bits)
SMTBAR Reference: [B:0, D:18, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**Disable 'Notify ARP Master' (NOTIFYD):** If asserted, the SMT will not issue a 'Notify ARP Master' command. Otherwise, if SMT is not the ARP Host, it is permitted to issue a 'Notify ARP Master' command.
30:7	0x0 RO	**RSVD0:** Reserved.
6	0x0 RW	**Address Resolved (AR1):** If asserted, the device's slave address has been resolved by the ARP Master.
5	0x0 RW	**Address Valid (AV1):** If asserted, the device's slave address is valid.
4	0x0 RW	**UDID1 Enable (UDID1E):** If cleared the SMT will not ACK or respond to ARP transactions directed to UDID1.
3	0x0 RO	**RSVD1:** Reserved
2	0x0 RW	**Address Resolved (AR0):** If asserted, the device's slave address has been resolved by the ARP Master.
1	0x0 RW	**Address Valid (AV0):** If asserted, the device's slave address is valid.
0	0x0 RW	**UDID0 Enable (UDID0E):** If cleared the SMT will not ACK or respond to ARP transactions directed to UDID0.

49.3.25 UDID0—Offset 290h

These bits are programmed by FW and are provided by the HW to external master when it initiates a Directed Get UDID Block Read command (with PEC) to UDID0's SMBus target address.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [SMTBAR] + 290h

Default: 8086000000000000h

SMTBAR Type: PCI Configuration Register (Size: 64 bits)
SMTBAR Reference: [B:0, D:18, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
63:48	0x8086 RO	**Subsystem Vendor ID (SVID):** Subsystem Vendor ID Indicates that the device subsystem vendor is Intel.
47:32	0x0 RO	**Subsystem Device ID (SDID):** Subsystem Device ID.
31:0	0x0 RW/V/P	**Vendor Specific ID (VSID):** Vendor Specific ID must uniquely identify this device when dynamic, volatile addressing is enabled. At least 24 bits should be provided from fuses to uniquely identify over 16 million the SoC devices (without resorting to other revision fields). Fuse load

49.3.26 UUDID0—Offset 298h

These bits are programmed by FW and are provided by the HW to external master when it initiates a Directed Get UDID Block Read command (with PEC) to UDID0 SMBus target address.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [SMTBAR] + 298h

Default: 8108808600000024h

SMTBAR Type: PCI Configuration Register (Size: 64 bits)
SMTBAR Reference: [B:0, D:18, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
63:56	0x81 RW	**Device Capabilities (DEVCAP):** Device Capabilities by default indicate that the device is a dynamic and volatile address device which supports PEC. FW may modify the capability, for instance to behave as a fixed-address device.
55:48	0x8 RO	**Version/Revision (RID):** Version/ Revision indicating UDID version 1 and Revision 0 of the silicon.
47:32	0x8086 RO	**Vendor ID (VID):** Vendor ID indicates that the device vendor is Intel.
31:16	0x0 RO	**Device ID (DID):** Device ID.
15:0	0x24 RW	**Interface (INTF):** Interface field indicates that the device supports SMBus 2.0 and its ASF capabilities bit set.

49.3.27 UDID1—Offset 2A0h

These bits are programmed by FW and are provided by the HW to external master when it initiates a Directed Get UDID Block Read command (with PEC) to UDID1 SMBus target address.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [SMTBAR] + 2A0h

Default: 8086000000000000h

SMTBAR Type: PCI Configuration Register (Size: 64 bits)
SMTBAR Reference: [B:0, D:18, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
63:48	0x8086 RO	**Subsystem Vendor ID (SVID):** Subsystem Vendor ID Indicates that the device subsystem vendor is Intel.
47:32	0x0 RO	**Subsystem Device ID (SDID):** Subsystem Device ID.
31:0	0x0 RW/V/P	**Vendor Specific ID (VSID):** Vendor Specific ID must uniquely identify this device when dynamic, volatile addressing is enabled. At least 24 bits should be provided from fuses to uniquely identify over 16 million the SoC devices (without resorting to other revision fields). Fuse load

49.3.28 UUDID1—Offset 2A8h

These bits are programmed by FW and are provided by the HW to external master when it initiates a Directed Get UDID Block Read command (with PEC) to UDID1's SMBus target address.

Type: Memory Mapped I/O Register (Size: 64 bits)

BAR and Offset: [SMTBAR] + 2A8h

Default: 8108808600000024h

SMTBAR Type: PCI Configuration Register (Size: 64 bits)
SMTBAR Reference: [B:0, D:18, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
63:56	0x81 RW	**Device Capabilities (DEVCAP):** Device Capabilities by default indicate that the device is a dynamic and volatile address device which supports PEC. FW may modify the capability, for instance to behave as a fixed-address device.
55:48	0x8 RO	**Version/Revision (RID):** Version/ Revision indicating UDID version 1 and Revision 0 of the silicon.
47:32	0x8086 RO	**Vendor ID (VID):** Vendor ID indicates that the device vendor is Intel.
31:16	0x0 RO	**Device ID (DID):** Device ID.
15:0	0x24 RW	**Interface (INTF):** Interface field indicates that the device supports SMBus 2.0 and its ASF capabilities bit set.

49.3.29 SPGT—Offset 300h

Setting of these timing parameters by FW, will affect both master and target timing on the physical.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [SMTBAR] + 300h

Default: 00000005h

SMTBAR Type: PCI Configuration Register (Size: 64 bits)
SMTBAR Reference: [B:0, D:18, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RW/V/P	**SMBus Speed (SPD):** Value to indicate what speed physical bus must operate. It is up to the system designer to ensure that all devices on the same SMBus segment are capable of operating at the programmed speed. • 00: Standard (80 kHz). • 01: Standard (100 kHz). • 10: Fast Mode (400 kHz). • 11: Fast Mode Plus (1 MHz).
29	0x0 RW	**Speed Lock (SPDLK):** FW sets this register if it overrides the settings of SPGT.SPD register. If this bit is set, HW must not load the SPGT.SPD from the soft strap.
28:20	0x0 RO	**RSVD0:** Reserved.
19:16	0x0 RW	**T-Hold Data (THDDAT):** The value in this field will be added to the Thddat timing parameter as defined in the SMBus 2.0 spec. • 0000: 0 Clocks (0ns). • 0001: 1 Clocks (10ns). • 0010: 2 Clocks (20ns). • ... • 1111: 15 Clocks (150ns).
15:12	0x0 RO	**RSVD1:** Reserved.
11:8	0x0 RW	**T-Setup Data (TSUDAT):** The value in this field will be added to the Tsudat timing parameter as defined in the SMBus 2.0 spec. • 0000: 0 Clocks (0ns). • 0001: 1 Clocks (10ns). • 0010: 2 Clocks (20ns). • ... • 1111: 15 Clocks (150ns).
7:0	0x5 RW	**De-Glitch (DG):** The value in this field defines the minimum de-glitch pulse that the de-glitch logic will reject from the SMBus clock and data lines. • 000000xx: No de-glitch. • 00000100: 4 Clocks (40ns glitch pulse). • 00000101: 5 Clocks (50ns glitch pulse). • ... • 11111111: 255 Clocks (2550ns glitch pulse).

49.3.30 SPMT—Offset 304h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 08080000h

BAR and Offset: [SMTBAR] + 304h

SMTBAR Type: PCI Configuration Register (Size: 64 bits)
SMTBAR Reference: [B:0, D:18, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x8 RW	**Time high (Thigh):** The value in this field will be added/subtracted to the Thigh timing parameter as defined in the SMBus 2.0 spec. • 00000000: 0 Clock (0ns). • 00000001: -1 Clock (-10ns). • ... • 00000111: -7 Clocks (-70ns). • 00001000: 0 Clock (0ns). • 00001001: +1 Clock (+10ns). • ... • 11111111: +247 Clocks (+2,470ns). These are offsets that control the range of the nominal Thigh value in the PHY layers.
23:16	0x8 RW	**Time low (Tlow):** The value in this field will be added/subtracted to the Tlow timing parameter as defined in SMBus 2.0 spec. See Thigh field above for encoding.
15:12	0x0 RW	**Thdsta:** The time value in this field will be added/subtracted to the Thdsta timing parameter as defined in SMBus 2.0 spec. • 1111: -7 Clocks (-70ns). • 1110: -6 Clocks (-60ns). • ... • x000: 0 Clock (0ns). • 0001: +1 Clock (+10ns). • ... • 0111: +7 Clocks (+70ns).
11:8	0x0 RW	**Tsusta:** The time value in this field will be added/subtracted to the Tsusta timing parameter as defined in SMBus 2.0 spec. See Thdsta field above.
7:4	0x0 RW	**Tbuf:** The time value in this field will be added/subtracted to the Tbuf timing parameter as defined in SMBus 2.0 spec. See Thdsta field above.
3:0	0x0 RW	**Tsusto:** The time value in this field will be added/subtracted to the Tsusto timing parameter as defined in SMBus 2.0 spec. See Thdsta field above.

49.3.31 SPST—Offset 308h

These values should only be changed when the physical is idle. These timings are based off the 100-MHz PHY clock. A higher-frequency PHY clock will scale the timings accordingly.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [SMTBAR] + 308h

Default: 00000000h

SMTBAR Type: PCI Configuration Register (Size: 64 bits)
SMTBAR Reference: [B:0, D:18, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RW	**Slave Tlow Extension (Slave_Tlow_Ext):** The time value in this field will be added to the SMBCLK Tlow extension timing parameter on a per bit basis. • 00000000: 0 Clock (0ns). • 00000001: 1 Clock (10ns). • ---- • 11111111: 255 Clocks (2,550ns). These Tlow extensions are only visible when set) Tlow:min as defined in the SMBus 2.0 spec. The slave will attempt to stretch the CLK on every bit, thus slowing down the entire bus segment, regardless of whether it is currently the target addressed by an external master.
23:12	0x0 RO	**RSVD0:** Reserved.
11:8	0x0 RW	**Slave Tsusta (Slave_Tsusta):** The time value in this field will be added/subtracted to the detection of Tsusta timing parameter as defined in SMBus 2.0 spec. • 1111: -7 Clocks (-70ns). • 1110: -6 Clocks (-60ns). • ---- • x000: 0 Clock (0ns). • 0001: +1 Clock (+10ns). • ---- • 0111: +7 Clocks (+70ns). These are offsets that control the range of the nominal Tsusta value detected as a slave the PHY layers.
7:4	0x0 RW	**Slave Tthdsta (Slave_Tthdsta):** The time value in this field will be added/subtracted to the detection of Thdsta timing parameter as defined in SMBus 2.0 spec. See Slave_Tsusta field above.
3:0	0x0 RW	**Slave Ttsusto (Slave_Ttsusto):** The time value in this field will be added/subtracted to the detection of Tsusto timing parameter as defined in SMBus 2.0 spec. See Slave_Tsusta field above.

49.3.32 SMBFT—Offset 30Ch

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00002024h

BAR and Offset: [SMTBAR] + 30Ch

SMTBAR Type: PCI Configuration Register (Size: 64 bits)
SMTBAR Reference: [B:0, D:18, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO/V	**Fair Flag (FF):** HW sets this bit when it has mastered a cycle by processing a descriptor in which 'FAIR' control bit was set. This flag when set is an internal state for the HW to wait longer before it attempts to master the next cycle on SMBus. The next cycle does not necessarily have to be descriptor-based or have the 'FAIR' bit set in the descriptor if it is descriptor-based. Mastering a cycle is defined as when HW attempts to do a SMBus block write and in the data phase following byte count it sees its own SMBus address (with RW bit = 1) on the SMBus. This is per MCTP spec. HW clears this flag after the expiry of SMBFT.SFIC.
30:16	0x0 RO	**RSVD0:** Reserved.
15:8	0x20 RW	**SMBus Start Delay (SSD):** This count is the number of ticks (in increments of 1us) that HW must count after SMBFT.FF is cleared before it can attempt to master another SMBus cycle. HW must look for transition of SMBFT.FF bit to transition from 1-)0 before it starts counting off this delay time. • 0h: Reserved (see note). • 1h: Reserved (see note). • 2h: 2us. • ... • FFh: 255us. ***Note:*** The base delay for this in each timing mode is defined as T_IDLE_DELAY in MCTP spec. For Standard Mode (100kHz) or lower SMBus operation the minimum is 31us. For Fast Mode (400kHz) the minimum is 16us. For Fast Mode Plus (1MHz) the minimum is 10us (MCTP over SMBus/I2C spec has no definition of timings for Fast Mode Plus). The 1us tick used by the HW to count off this delay is not internally generated in SMBus controller, hence the count could be off by a 1us tick therefore 1us guard band should be added to compensate for this.
7:0	0x24 RW	**SMBus Fair Idle Count (SFIC):** This count represents the minimum SMBus Idle Time (in increments of 1us) that the HW must detect after SMBus Stop is seen before clearing the SMBFT.FF register. • 0h: reserved (see note). • 1h: reserved (see note). • 2h: 2us. • ... • FFh: 255us. ***Note:*** The base delay for Fair Idle Count timings is designed to match the T_IDLE_WINDOW minimum plus T_BUF. For Standard Mode (100kHz) or lower SMBus operation the window is 30-60us to which must be added 4.7us (T_BUF). For Fast Mode (400kHz) the window is 5-20us to which must be added 1.3us (T_BUF). For Fast Mode Plus (1MHz) the window is 3us to which must be added 0.5us (T_BUF) (MCTP over SMBus/I2C spec has no definition of timings for Fast Mode Plus.). The 1us tick used by the HW to count off this delay is not internally generated in SMBus controller, hence the count could be off by a 1us tick therefore 1us guard band should be added to compensate for this.

49.3.33 CLTC—Offset 310h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 000015E1h

BAR and Offset: [SMTBAR] + 310h

SMTBAR Type: PCI Configuration Register (Size: 64 bits)
SMTBAR Reference: [B:0, D:18, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD0:** Reserved.
15:4	0x15e RW	**Count (CNT):** FW sets this to the desired count that the HW must count while SMBus clock is low before flagging SMBus Clock Low Timeout. • 0h: Reserved (see note for BCLK). • 1h: Reserved (see note for BCLK). • Others: Count per BCLK. Default value is set to provide 35ms clock low timeout detection (for default 100us BCLK).
3	0x0 RO	**RSVD1:** Reserved.
2:0	0x1 RW	**Base Clock (BCLK):** FW programs this register to set the granularity of the count. The value in this register selects which timer ticks are used to count off the value programmed in CLTC.CNT register. • 000: 10us. • 001: 100us (default). • 010: 1ms. • 011: 10ms. • 100: 100ms. • Others: Reserved. The timer ticks are not internally generated by HW hence the count could be off by 1 timer tick.

49.3.34 DCLKGT—Offset 380h

By default, clock gating is enabled in HW. However in case clock gating has to be disabled in HW, FW can set these register bits to disable clock gating at the individual levels defined below.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 80000000h

BAR and Offset: [SMTBAR] + 380h

SMTBAR Type: PCI Configuration Register (Size: 64 bits)
SMTBAR Reference: [B:0, D:18, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x1 RW	**Global Clock Gating Enable (GCGE):** This bit when set enables dynamic clock gating of the transaction, link, and PHY layers. When set, HW enables global clock gating and the other register policies are followed (DCLKGT bits [6:0]). When cleared, HW disables all clock gating and overrides the policies set by DCLKGT bits [6:0].
30:0	0x0 RO	**RSVD0:** Reserved.

49.3.35 SUSCHKB—Offset 384h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000011h

BAR and Offset: [SMTBAR] + 384h

SMTBAR Type: PCI Configuration Register (Size: 64 bits)
SMTBAR Reference: [B:0, D:18, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0x0 RO	**RSVD0:** Reserved.
5	0x0 RW	**NOA Select (NOASEL):** When set allows NOA signals of instance #2 of SMT to be viewed on NOA for debug purposes.
4	0x1 RW	**Auto Slave Clock Low Disable (ASCKLDIS):** When set disables the auto-clock low stretching by the slave.
3	0x0 RW	**25ms Timeout Detection Enable (TODE25):** When set bypasses the FW controlled Clock low timeout detection and reverts back to fixed 25ms Clock low timeout detection.
2	0x0 RO	**RSVD1:** Reserved.
1	0x0 RW	**Ignore R/W bit on Start Address (IRWST):** When set, HW ignores the value of R/W bit on the start address for all of its SMBus target addresses. HW just matches bits [7:1] to ACK the address. If this bit is clear and R/W bit does not match, HW will ACK the address on SMBus, but will NACK all further bytes until stop is seen. There is no FW notification for this transaction. Cycles targeting address C2h and 10h are also applicable to this policy.
0	0x1 RW	**Ignore R/W bit on Repeated Start Address (IRWRST):** When set, HW ignores the value of R/W bit on the repeated start address for an SMBus transaction. HW just matches bits [7:1] on repeated start address. Cycles targeting address C2h are also applicable to this policy.

49.3.36 DBCTRL—Offset 388h

Note: For FW: HW provides the FW a generic ability to bit bang on the SMBUs. It is however the responsibility of the FW that: HW DMA engine is completely stopped and no transactions are pending within HW, HW target interface is disabled, and SMBus is idle prior to bit banging. FW must guarantee all SMBus protocol and timing.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [SMTBAR] + 388h

Default: 00000003h

SMTBAR Type: PCI Configuration Register (Size: 64 bits)
SMTBAR Reference: [B:0, D:18, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**Enable (EN):** This register is set by FW when it is bit banging on SMBus. This bit must always be set when FW is bit banging on SMBus. FW must clear this bit when it is done bit banging. It is recommended that FW first set the enable bit before it starts bit banging on the clock and data line.
30:2	0x0 RO	**RSVD0:** Reserved.
1	0x1 RW	**SMBus Clock (SMBCK):** This register provides ability for the FW to bit bang directly on the SMBus Clock pin. When FW writes a '0' to this register, HW will drive the SMBus Clock low.
0	0x1 RW	**SMBus Data (SMBDT):** This register provides ability for the FW to bit bang directly on the SMBus Data pin. When FW writes a '0' to this register, HW will drive the SMBus Data low.

49.3.37 DBSTS—Offset 38Ch

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000300h

BAR and Offset: [SMTBAR] + 38Ch

SMTBAR Type: PCI Configuration Register (Size: 64 bits)
SMTBAR Reference: [B:0, D:18, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0x0 RO	**RSVD0:** Reserved.
9	0x1 RO/V	**SMBus Clock (SMBCK):** This register shows the live state of SMBus clock signal as seen by HW from the buffer after HW deglitch and synchronization.
8	0x1 RO/V	**SMBus Data (SMBDT):** This register shows the live state of SMBus data signal as seen by HW from the buffer after HW deglitch and synchronization.
7	0x0 RO/C	**SMBus Clock Change (SMBCKC):** This register when set indicates that there was a 1-)0 or 0-)1 transition on SMBus clock line. This register is cleared by HW on reads by FW.
6	0x0 RO/C	**SMBus Data Change (SMBDC):** This register when set indicates that there was a 1-)0 or 0-)1 transition on SMBus data line. This register is cleared by HW on reads by FW.
5:3	0x0 RO	**RSVD1:** Reserved.
2:0	0x0 RO/V	**Last SMBus State (LSMBS):** This register reflects the last seen state of the SMBus. Since the SMBus state is dynamic, it is advised that FW use its judgment when interpreting this data. • 000: SMBus Idle. • 001: Start Seen. • 010: ACK Seen. • 011: Repeated Start Seen. • 100: Stop Seen. • 101: Reserved. • 110: Reserved. • 111: Reserved

§ §

50 SATA Controllers - B0, D(19, 20), F0

50.1 Introduction and Index

The host-accessible registers for the SATA Controllers are described here.

To determine the number of devices/functions available refer to the following:

- Intel Atom® Processor C3000 Product Family
- Table 1-2, "Features by Product SKU - Network and Enterprise Storage SKUs 5 through 10"
- Table 1-3, "Features by Product SKU - Extended Temperature SKUs 11 through 14".

The legend for the register access codes are described in Chapter 43, "Introduction."

50.1.1 Host Configuration Space

These registers are discovered in Host Configuration Space starting at Bus 0, Device 19 (decimal), Function 0. Another set of configuration registers start at Bus 0, Device 20 (decimal), Function 0. The offset addresses are listed.

Table 50-1. Summary of PCI Configuration Registers—0/19 (or 20)/0

Offset (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
0	4	1C028086	"Identifiers (ID)—Offset 0h" on page 1879
4	2	0000	"Command (CMD)—Offset 4h" on page 1880
6	2	02B0	"Device Status (STS)—Offset 6h" on page 1881
8	1	00	"Revision ID (RID)—Offset 8h" on page 1882

50.2 Registers in Configuration Space

50.2.1 Identifiers (ID)—Offset 0h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:19 or 20, F:0] + 0h

Default: 1C028086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x1c02 RO	**Device ID (DID):** The specific value is dependent on config bits and fuses.
15:0	0x8086 RO	**Vendor ID (VID):** 16-bit field which indicates the company vendor as Intel.

50.2.2 Command (CMD)—Offset 4h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:19 or 20, F:0] + 4h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0x0 RO	**RSVD0:** Reserved.
10	0x0 RW	**Interrupt Disable (ID):** This disables pin-based INTx# interrupts. This bit has no effect on MSI operation. When set, internal INTx# will not be generated. When cleared, internal INTx# are generated if there is an interrupt and MSI is not enabled.
9	0x0 RO	**Fast Back-to-Back Enable (FBE):** Reserved.
8	0x0 RW	**SERR# Enable (SEE):** When set to 1, the HBA is allowed to generate SERR# on DPD or SATAGC.URD event that is enabled for SERR# generation. When cleared to 0, it is not.
7	0x0 RO	**Wait Cycle Enable (WCC):** Reserved.
6	0x0 RW	**Parity Error Response Enable (PEE):** When set, the SATA Controller will corrupt the outbound DATA FIS CRC if a forwarded data parity error is indicated.
5	0x0 RO	**VGA Palette Snooping Enable (VGA):** Reserved.
4	0x0 RO	**Memory Write and Invalidate Enable (MWIE):** Reserved.
3	0x0 RO	**Special Cycle Enable (SCE):** Reserved.
2	0x0 RW	**Bus Master Enable (BME):** Controls the SATA Controller's ability to act as a master for data transfers. This bit does not impact the generation of completions for split transaction commands.
1	0x0 RW	**Memory Space Enable (MSE):** Controls access to the SATA Controller's target memory space (for AHCI).
0	0x0 RW	**I/O Space Enable (IOSE):** Controls access to the SATA Controller's target I/O space.

50.2.3 Device Status (STS)—Offset 6h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:19 or 20, F:0] + 6h

Default: 02B0h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW/1C	**Detected Parity Error (DPE):** Set when the SATA Controller detects a parity error on its interface.
14	0x0 RW/1C	**Signaled System Error (SSE):** Set when SATA Controller generates an SERR#.
13	0x0 RW/1C	**Received Master-Abort Status (RMA):** Set when the SATA Controller receives a master abort to a cycle it generated.
12	0x0 RW/1C	**Received Target-Abort Status (RTA):** Set when the SATA Controller receives a target abort to a cycle it generated.
11	0x0 RW/1C	**Signaled Target-Abort Status (STA):** This bit must be set by a target device whenever it terminates a transaction with Target-Abort. Devices that will never signal Target-Abort do not need to implement this bit.
10:9	0x1 RO	**DEVSEL# Timing Status (DEVT):** Controls the device select time for the SATA Controller's PCI interface.
8	0x0 RW/1C	**Master Data Parity Error Detected (DPD):** Set when the SATA Controller, as a master, either detects a parity error or sees the parity error line asserted, and the parity error response bit (bit 6 of the command register) is set. This bit can only be set on read completions received from the backbone where there is a parity error.
7	0x1 RO	**Fast Back-to-Back Capable (FBC):** Reserved.
6	0x0 RO	**RSVD0:** Reserved.
5	0x1 RO	**66 MHz Capable (RSV):** Reserved.
4	0x1 RO	**Capabilities List (CL):** Indicates the presence of a capabilities list.
3	0x0 RO	**Interrupt Status (IS):** Reflects the state of INTx# messages, IRQ14 or IRQ15. This bit is set when the interrupt is to be asserted. This bit is a 0 after the interrupt is cleared.
2:0	0x0 RO	**RSVD1:** Reserved.

50.2.4 Revision ID (RID)—Offset 8h

Type: PCI Configuration Register
(Size: 8 bits)

Offset: [B:0, D:19 or 20, F:0] + 8h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO	**Revision ID (RID):** Indicates stepping of the host controller hardware.

50.2.5 Programming Interface (PI)—Offset 9h

Type: PCI Configuration Register
(Size: 8 bits)

Offset: [B:0, D:19 or 20, F:0] + 9h

Default: 01h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x1 RO	**Interface (IF):** If CC.SCC=06h(AHCI mode), it indicates that this is an AHCI HBA that has a major revision of 1 (as specified in the AHCI Version register). If CC.SCC=04h(RAID mode), it indicates that there is no programming interface(IF=00h). Internally, under this condition, the SATA controller is in native mode and its I/O spaces are only accessible through the I/O BARs.

50.2.6 Class Code (CC)—Offset Ah

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:19 or 20, F:0] + Ah

Default: 0106h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x1 RO	**Base Class Code (BCC):** Indicates that this is a mass storage device.
7:0	0x6 RO	**Sub Class Code (SCC):** The value reported in this field is dependent on SATAGC.SMS and various fuses and configuration bits.

50.2.7 MSI-X Table Base Address (MXTBA)—Offset 10h

This BAR is used to allocate 32K, 16K or 8K Memory space for the MSI-X Table. The Memory space size is determined by BIOS by making bit-14 and bit-13 Read-Only '1' or Read-Write '0' based on SATAGC.MSS[1:0].

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:19 or 20, F:0] + 10h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:15	0x0 RW	**Base Address (BA):** Base address of memory space.
14	0x0 RW	**Base Address Bit 14 (BAB14):** When SATAGC.MSS [1:0]=00, this bit is Read Only '0' else it's Read Write '0'.
13	0x0 RW	**Base Address Bit 13 (BAB13):** When SATAGC.MSS [1:0]=00 or 01, this bit is Read Only '0' else it's Read Write '0'.
12:4	0x0 RO	**RSVD0:** Reserved.
3	0x0 RO	**Prefetchable (PF):** Indicates that this range is not prefetchable.
2:1	0x0 RO	**Type (TP):** Indicates that this range can be mapped anywhere in 32-bit address space.
0	0x0 RO	**Resource Type Indicator (RTE):** Indicates a request for Memory space.

50.2.8 SCMDBA—Offset 18h

BAR2 register define a 8-byte I/O space but this space is not implemented. Accesses to this space will get master abort.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:19 or 20, F:0] + 18h

Default: 00000001h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD0:** Reserved.
15:3	0x0 RW	**Base Address (BAR):** Base address of the I/O space.
2:1	0x0 RO	**RSVD1:** Reserved.
0	0x1 RO	**Resource Type Indicator (RTE):** Indicates a request for IO space.

50.2.9 SCTLBA—Offset 1Ch

BAR3 register define a 4-byte I/O space but this space is not implemented. Accesses to this space will get master abort.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:19 or 20, F:0] + 1Ch

Default: 00000001h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD0:** Reserved.
15:2	0x0 RW	**Base Address (BAR):** Base address of the I/O space.
1	0x0 RO	**RSVD1:** Reserved.
0	0x1 RO	**Resource Type Indicator (RTE):** Indicates a request for IO space.

50.2.10 AHCI Index Data Pair Base Address (AIDPBA)—Offset 20h

This BAR is used to allocate I/O space for the AHCI index/data pair mechanism.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:19 or 20, F:0] + 20h

Default: 00000001h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD0:** Reserved.
15:5	0x0 RW	**Base Address (BA):** Base address of the I/O space.
4:1	0x0 RO	**RSVD1:** Reserved.
0	0x1 RO	**Resource Type Indicator (RTE):** Indicates a request for IO space.

50.2.11 AHCI Base Address (ABAR)—Offset 24h

This register represents a memory BAR allocating space for the AHCI memory registers.

Note: Bit [31:16] of this register must be programmed to a value greater than 0 to ensure the memory is mapped to an address of 1 Mbyte and greater (i.e. ABAR must be 00010000h or greater). Otherwise, memory cycle targeting the ABAR range may not be accepted.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:19 or 20, F:0] + 24h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0x0 RW	**Base Address (BA):** Base address of register memory space.
18	0x0 RW	**Base Address Bit 18 (BAB18):** When SATAGC.ASSEL[2:0] selects an ABAR size bigger than 256K, this bit is Read Only '0' else it's Read Write '0'.
17	0x0 RW	**Base Address Bit 17 (BAB17):** When SATAGC.ASSEL[2:0] selects an ABAR size bigger than 128K, this bit is Read Only '0' else it's Read Write '0'.
16	0x0 RW	**Base Address Bit 16 (BAB16):** When SATAGC.ASSEL[2:0] selects an ABAR size bigger than 64K, this bit is Read Only '0' else it's Read Write '0'.
15	0x0 RW	**Base Address Bit 15 (BAB15):** When SATAGC.ASSEL[2:0] selects an ABAR size bigger than 32K, this bit is Read Only '0' else it's Read Write '0'.
14	0x0 RW	**Base Address Bit 14 (BAB14):** When SATAGC.ASSEL[2:0] selects an ABAR size bigger than 16K, this bit is Read Only '0' else it's Read Write '0'.
13:11	0x0 RW	**Base Address Bit 13-11 (BAB1311):** When SATAGC.ASSEL[2:0] selects an ABAR size bigger than 2K, this bit is Read Only '0' else it's Read Write '0'.
10:4	0x0 RO	**RSVD0:** Reserved.
3	0x0 RO	**Prefetchable (PF):** Indicates that this range is not prefetchable
2:1	0x0 RO	**Type (TP):** Indicates that this range can be mapped anywhere in 32-bit address space.
0	0x0 RO	**Resource Type Indicator (RTE):** Indicates a request for register memory space.

50.2.12 Capabilities Pointer (CAP)—Offset 34h

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:19 or 20, F:0] + 34h

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x80 RW/L	**Capability Pointer (CP):** Indicates that the first capability pointer offset is offset 80h (the Message Signaled Interrupt capability). The following capability structures are linked by default: • (CAP.CP -) 80h • (MSI) -) D0h • (MSI-X)-) 70h • (PCI Power) -) A8h • (SATA) -) 00h end.

50.2.13 Interrupt Information (INTR)—Offset 3Ch

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:19 or 20, F:0] + 3Ch

Default: 0100h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x1 RW/O	**Interrupt Pin (IPIN):** This register tells which interrupt pin the device function uses. • A value of 1 corresponds to INTA#. • A value of 2 corresponds to INTB#. • A value of 3 corresponds to INTC#. • A value of 4 corresponds to INTD#. This register is not reset by FLR.
7:0	0x0 RW	**Interrupt Line (ILINE):** Software written value to indicate which interrupt line (vector) the interrupt is connected to. No hardware action is taken on this register. Interrupt Line register is not reset by FLR.

50.2.14 PCI Power Management Capability ID (PID)—Offset 70h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:19 or 20, F:0] + 70h

Default: A801h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0xa8 RW/L	**Next Capability (NEXT):** A8h is location of the Serial ATA Capability structure. The RW/L register attribute allows for flexibility in determining the capability structure available in this PCI function. Refer to SATAGC.REGLOCK description in order to lock the register to become RO. This register is not reset by FLR.
7:0	0x1 RO	**Cap ID (CID):** Indicates that this pointer is a PCI power management capability.

50.2.15 PCI Power Management Capabilities (PC)—Offset 72h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:19 or 20, F:0] + 72h

Default: 4003h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0x8 RO	**PME_Support:** The default value is 01000 which indicates PME# can be generated from the D3HOT state in the SATA controller.
10	0x0 RO	**D2_Support:** The D2 state is not supported.
9	0x0 RO	**D1_Support:** The D1 state is not supported.
8:6	0x0 RO	**Aux_Current:** PME# from D3COLD state is not supported, therefore this field is 000b.
5	0x0 RO	**Device Specific Initialization (DSI):** Indicates that no device-specific initialization is required.
4	0x0 RO	**RSVD0:** Reserved
3	0x0 RO	**PME Clock (PMEC):** Indicates that PCI clock is not required to generate PME#.
2:0	0x3 RO	**Version (VS):** Indicates support for Revision 1.2 of the PCI Power Management Specification.

50.2.16 PCI Power Management Control and Status (PMCS)—Offset 74h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:19 or 20, F:0] + 74h

Default: 0008h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW/1C	**PME Status (PMES):** This bit is set when a PME event is to be requested, and if this bit is set and PMEE is set, a PME# will be generated. This register field is not reset by FLR.
14:9	0x0 RO	**RSVD0:** Reserved.
8	0x0 RW	**PME Enable (PMEE):** When set, the SATA controller generates PME# from D3HOT on a wake event. Note: Software is advised to clear PMEE together with PMES prior to changing CC.SCC thru SATAGC.SMS. This register field is not reset by FLR.
7:4	0x0 RO	**RSVD1:** Reserved.
3	0x1 RO	**No Soft Reset (NSFRST):** A 1 indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration context is preserved.
2	0x0 RO	**RSVD2:** Reserved.
1:0	0x0 RW	**Power State (PS):** This field is used both to determine the current power state of the SATA Controller and to set a new power state. The values are: • 00 = D0 state. • 11 = D3HOT state.

50.2.17 Message Signaled Interrupt Identifier (MID)—Offset 80h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:19 or 20, F:0] + 80h

Default: 7005h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x70 RW/L	**Next Pointer (NEXT):** Indicates the next item in the list is the PCI power management pointer.
7:0	0x5 RO	**Capability ID (CID):** Capabilities ID indicates MSI.

50.2.18 Message Signaled Interrupt Message Control (MC)—Offset 82h

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:19 or 20, F:0] + 82h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x0 RO	**RSVD0:** Reserved.
7	0x0 RO	**64 Bit Address Capable (C64):** Capable of generating a 32-bit message only.
6:4	0x0 RO	**Multiple Message Enable (MME):** When this field is cleared to 000 (and MSIE is set), only a single MSI message will be generated for all SATA ports, and bits [15:0] of the message vector will be driven from MD[15:0].
3:1	0x0 RO	**Multiple Message Capable (MMC):** Not supported.
0	0x0 RW	**MSI Enable (MSIE):** If set, MSI is enabled and traditional interrupt pins are not used to generate interrupts.

50.2.19 Message Signaled Interrupt Message Address (MA)—Offset 84h

Type: PCI Configuration Register
(Size: 32 bits)

Offset: [B:0, D:19 or 20, F:0] + 84h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**Address (ADDR):** Lower 32 bits of the system specified message address, always DWORD aligned.
1:0	0x0 RO	**RSVD0:** Reserved.

50.2.20 Message Signaled Interrupt Message Data (MD)—Offset 88h

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:19 or 20, F:0] + 88h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x0 RW	**Data (DATA):** This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the lower word of the data bus of the MSI memory write transaction.

50.2.21 Port Mapping Register (MAP)—Offset 90h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:19 or 20, F:0] + 90h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**RSVD0:** Reserved.
23	0x0 RW/O	**SATA Port 7 Disable (SPD7):** Similar to SPD0 but for port 7. This bit is RO-one if ANY of the fuse/strap/GPIO condition below is true else this bit is RW-zero. PCIe/SATA muxing for port 7 based on fuses, soft straps and GPIO does not select SATA. This bit is only applicable to project(s): that has port 7 physically.
22	0x0 RW/O	**SATA Port 6 Disable (SPD6):** Similar to SPD0 but for port 6. This bit is RO-one if ANY of the fuse/strap/GPIO condition below is true else this bit is RW-zero. PCIe/SATA muxing for port 6 based on fuses, soft straps and GPIO does not select SATA. This bit is only applicable to project(s): that has port 6 physically.
21	0x0 RW/O	**SATA Port 5 Disable (SPD5):** Similar to SPD0 but for port 5. This bit is RO-one if ANY of the fuse/strap/GPIO condition below is true else this bit is RW-zero. PCIe/SATA muxing for port 5 based on fuses, soft straps and GPIO does not select SATA. This bit is only applicable to project(s): that has port 5 physically.
20	0x0 RW/O	**SATA Port 4 Disable (SPD4):** Similar to SPD0 but for port 4. This bit is RO-one if ANY of the fuse/strap/GPIO condition below is true else this bit is RW-zero. PCIe/SATA muxing for port 4 based on fuses, soft straps and GPIO does not select SATA. This bit is only applicable to project(s): that has port 4 physically.
19	0x0 RW/O	**SATA Port 3 Disable (SPD3):** Similar to SPD0 but for port 3. This bit is RO-one if ANY of the fuse/strap/GPIO condition below is true else this bit is RW-zero. • 1. Fuse FFSATA7 (disable port 2 and 3). • 2. Fuse FFSATA8 (disable port 1 and 3). • 3. PCIe/SATA muxing for port 3 based on fuses, soft straps and GPIO does not select SATA. This bit is only applicable to project(s): that has port 3 physically.
18	0x0 RW/O	**SATA Port 2 Disable (SPD2):** Similar to SPD0 but for port 2. This bit is RO-one if ANY of the fuse/strap/GPIO condition below is true else this bit is RW-zero. • 1. Fuse FFSATA7 (disable port 2 and 3). • 2. PCIe/SATA muxing for port 3 based on fuses, soft straps and GPIO does not select SATA. This bit is only applicable to project(s): that has port 3 physically.
17	0x0 RW/O	**SATA Port 1 Disable (SPD1):** Similar to SPD0 but for port 1. This bit is RO-one if ANY of the fuse/strap/GPIO condition below is true else this bit is RW-zero. • 1. Fuse FFSATA8 (disable port 1 and 3). • 2. PCIe/SATA muxing for port 3 based on fuses, soft straps and GPIO does not select SATA. This bit is only applicable to project(s): that has port 1 physically.
16	0x0 RW/O	**SATA Port 0 Disable (SPD0):** A 1 prevents the SATA port from being enabled via config PCS.PxE. Write of 1 to PCS.PxE has no effect when the corresponding SPD[x] bit is 1. In preventing a port(s) from being enabled, BIOS shall first configure MAP.SPDx. And only then BIOS configures the PCS.PxE. This field is not reset by FLR. This bit is only applicable to project(s): that has port 0 physically.
15:8	0x0 RO	**RSVD1:** Reserved.

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Port Clock Disable (PCD):** When any of these bits is set to 1, the backbone clock driven to the associated port logic is gated and will not toggle. When this bit is cleared to 0, all clocks to the associated port logic will operate normally. Assignment of the bits is: • Bit 7: Port 7, this bit is applicable to projects: that has port 7 physically • Bit 6: Port 6, this bit is only applicable to project(s): that has port 6 physically • Bit 5: Port 5, this bit is only applicable to project(s): that has port 5 physically • Bit 4: Port 4, this bit is only applicable to project(s): that has port 4 physically • Bit 3: Port 3, this bit is only applicable to project(s): that has port 3 physically • Bit 2: Port 2, this bit is only applicable to project(s): that has port 2 physically • Bit 1: Port 1, this bit is only applicable to project(s): that has port 1 physically • Bit 0: Port 0, this bit is only applicable to project(s): That has port 0 physically. If a particular port is not available, software shall set the corresponding bit to 1. Software can also set the corresponding bit(s) to 1 after disabling particular port(s). Software cannot set the PCD[port x]=1 if the corresponding config PCS.PxE=1 or AHCI MMIO GHC.PI[x]=1.

50.2.22 Port Control and Status (PCS)—Offset 94h

By default, the SATA ports are set (by hardware) to the disabled state (e.g. bits[5:0] == '0') as a result of an initial power on reset. When enabled by software, the ports can transition between the on, partial, and slumber states and can detect devices. When disabled, the port is in the off state and cannot detect any devices. This register is not reset by FLR.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:19 or 20, F:0] + 94h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**RSVD0:** Reserved.
23	0x0 RO	**Port 7 Present (P7P):** Same as P0P, except for port 7. This bit is only applicable to project(s): That has port 7 physically.
22	0x0 RO	**Port 6 Present (P6P):** Same as P0P, except for port 6. This bit is only applicable to project(s): That has port 6 physically.
21	0x0 RO	**Port 5 Present (P5P):** Same as P0P, except for port 5. This bit is only applicable to project(s): That has port 5 physically.
20	0x0 RO	**Port 4 Present (P4P):** Same as P0P, except for port 4. This bit is only applicable to project(s): That has port 4 physically.
19	0x0 RO	**Port 3 Present (P3P):** Same as P0P, except for port 3. This bit is only applicable to project(s): That has port 3 physically.
18	0x0 RO	**Port 2 Present (P2P):** Same as P0P, except for port 2. This bit is only applicable to project(s): That has port 2 physically.
17	0x0 RO	**Port 1 Present (P1P):** Same as P0P, except for port 1. This bit is only applicable to project(s): That has port 1 physically.
16	0x0 RO	**Port 0 Present (P0P):** When set, the SATA controller has detected the presence of a device on port 0. It may change at any time. Clearing P0E bit leads to clearing of this bit after implementation delay. ***Note:*** For system software that intends to clear all PCS.PxE bits that are previously 1 to 0 and then to 1 again in two consecutive write cycles, software shall poll on this bit being 0 before setting P0E bit to 1. This bit is only applicable to project(s): That has port 0 physically.
15:8	0x0 RO	**RSVD1:** Reserved.
7	0x0 RW	**Port 7 Enabled (P7E):** When MAP.SPD[7] is 1, this bit is reserved and is read-only 0. Otherwise if none of the above is true, this field is RW and the definition of this bit is the same as P0E, except for port 7. This bit takes precedence over P7CMD.SUD. This bit is only applicable to project(s): That has port 7 physically.
6	0x0 RW	**Port 6 Enabled (P6E):** When MAP.SPD[6] is 1, this bit is reserved and is read-only 0. Otherwise if none of the above is true, this field is RW and the definition of this bit is the same as P0E, except for port 6. This bit takes precedence over P6CMD.SUD. This bit is only applicable to project(s): That has port 6 physically.
5	0x0 RW	**Port 5 Enabled (P5E):** When MAP.SPD[5] is 1, this bit is reserved and is read-only 0. Otherwise if none of the above is true, this field is RW and the definition of this bit is the same as P0E, except for port 5. This bit takes precedence over P5CMD.SUD. This bit is only applicable to project(s): That has port 5 physically.
4	0x0 RW	**Port 4 Enabled (P4E):** When MAP.SPD[4] is 1, this bit is reserved and is read-only 0. Otherwise if none of the above is true, this bit is RW and same as P0E but for port 4 and takes precedence over P4CMD.SUD. This bit is only applicable to project(s): That has port 4 physically.

Bit Range	Default & Access	Field Name (ID): Description
3	0x0 RW	**Port 3 Enabled (P3E):** When MAP.SPD[3] is 1, this bit is reserved and is read-only 0. Otherwise if none of the above is true, this bit is RW and same as P0E but for port 3 and takes precedence over P3CMD.SUD. This bit is only applicable to project(s): That has port 3 physically.
2	0x0 RW	**Port 2 Enabled (P2E):** When MAP.SPD[2] is 1, this bit is reserved and is read-only 0. Otherwise if none of the above is true, this bit is RW and same as P0E but for port 2 and takes precedence over P2CMD.SUD. This bit is only applicable to project(s): That has port 2 physically.
1	0x0 RW	**Port 1 Enabled (P1E):** When MAP.SPD[1] is 1, this bit is reserved and read-only 0. Otherwise if none of the above is true, this bit is RW and same as P0E but for port 1 and takes precedence over P1CMD.SUD. This bit is only applicable to project(s): That has port 1 physically.
0	0x0 RW	**Port 0 Enabled (P0E):** When MAP.SPD[0] is 1, this bit is reserved and read-only 0. When set, the port is enabled. When cleared, the port is disabled. When enabled, the port can transition between the on, partial, and slumber states and can detect devices. When disabled, the port is in the off state and cannot detect any devices. This bit takes precedence over P0CMD.SUD.

50.2.23 SATA General Configuration (SATAGC)—Offset 9Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:19 or 20, F:0] + 9Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/O	**Register Lock (REGLOCK):** BIOS can set this bit to 1 to lock the following registers with RW/L attribute: • CAP • CP • MID.NEXT • PIE.NEXT • SATACR0.NEXT. Once locked the register attribute of above list changes from RW/L to RO holding the existing value. This field is not reset by FLR.
30:17	0x0 RO	**RSVD0:** Reserved.
16	0x0 RW	**SATA Mode Select (SMS):** Software (SW) programs these bits to control the mode in which the SATA HBA should operate: • 0b = AHCI mode. • 1b = RAID mode. This register field is not reset by FLR.
15	0x0 RW	**Data Phase Parity Error Enable (DPPEE):** When 1, IOSF data phase parity error handling is enabled. When 0, the data phase parity error handling is disabled.
14:12	0x0 RW	**Write Request_Size Select/Max_Payload_Size (WRRSELMPS):** These two bits select the max write request size that SATA host controller will initiate for DMA write to memory. SATA host controller will internally break up larger write request based on these bits. The request is address-aligned to the selected size. Defined encodings for this field are: • 000b = 128 address aligned bytes max payload size. • 111b = 64 address aligned bytes max payload size. • All other values are reserved for SATA host controller. This field is not reset by FLR.
11	0x0 RW	**Command Parity Error Enable (CPEE):** When 1, command parity error handing is enable. When 0 the command parity error handling is disable
10	0x0 RW	**SATA Controller Function Disable (SCFD):** BIOS program this bit to 1 to disable the SATA Controller function. When 0, SATA Controller function is enabled.
9	0x0 RW	**Unsupported Request Reporting Enable (URRE):** If set to 1 by software, it allows reporting of an Unsupported Request as a system error. If both URRE and PCI configuration SERR# Enable registers are set to a 1, then the agent must set the Signaled System Error bit in the PCI Status register and send a DO_SERR message in IOSF-SB interface.
8	0x0 RW/1C	**Unsupported Request Detected (URD):** Set to 1 by hardware upon detecting an Unsupported Request on IOSF Primary interface that is not considered Advisory Non-Fatal. Cleared to 0 by SW.
7	0x0 RW/O	**Alternate ID Enable (AIE):** When programmed to 0, HW will report the following device id's: 2822h for desktop or 282Ah for mobile. When programmed to a 1, HW will not report these device id's. This field is not reset by FLR.
6	0x0 RW/O	**AIE0 DevID Selection (DEVIDSEL):** This register allows BIOS to select Device ID when AIE=0 and Server Feature (SATA AIE DEVIDSEL) Disable Fuse =0. This field is not reset by FLR.

Bit Range	Default & Access	Field Name (ID): Description
5	0x0 RW/O	**FLR Capability Selection (FLRCSSEL):** This allows the FLR Capability to be bypassed.
4:3	0x0 RW/O	**MXTBA Size Select (MSS):** These 2 bits select the size of the Memory space for the MSI-X Table defined in BAR 0 (Configuration space offset 10h). MSI-X Table Memory space size is: • 32k when MSS[1:0]=00. • 16k when MSS[1:0]=01. • 8k when MSS[1:0]=10. This field is not reset by FLR.
2:0	0x0 RW/O	**ABAR Size Select (ASSEL):** These 3 bits select the size of the Memory space for the ABAR in BAR 5 (Configuration space offset 24h). ABAR Memory space size is: • 2k when ASSEL[2:0]=000. • 16k when ASSEL[2:0]=001. • 32k when ASSEL[2:0]=010. • 64k when ASSEL[2:0]=011. • 128k when ASSEL[2:0]=100. • 256k when ASSEL[2:0]=101. • 512k when ASSEL[2:0]=110. This field is not reset by FLR.

50.2.24 SATA Initialization Register Index (SIRI)—Offset A0h

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:19 or 20, F:0] + A0h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:2	0x0 RW	**Index (IDX):** 6-bit index pointer into the 256-byte space. Data is written into the SIRD register and read from the SIRD register. This points to a DWord register. The byte enables on the SIRD register affect what will be written.
1:0	0x0 RO	**RSVD0:** Reserved.

50.2.25 SATA Initialization Register Data (SIRD)—Offset A4h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:19 or 20, F:0] + A4h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Data (DTA):** 32-bit data value that is written to the register pointed to by SIRI, or read from the register pointed to by SIRI.

50.2.26 Serial ATA Capability Register 0 (SATACR0)—Offset A8h

Note that the SATACR0.NEXT is not changed from RO to become RWO because there is an existing method (SATAGC.FLRCSSEL bit) to bypass the FLR Capability structure.

FLR Capability ID.NEXT is already indicating end of capability structure, it does not need to change to be RWO.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:19 or 20, F:0] + A8h

Default: 00100012h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**RSVD0:** Reserved.
23:20	0x1 RO	**Major Revision (MAJREV):** Major revision number of the SATA Capability Pointer implemented.
19:16	0x0 RO	**Minor Revision (MINREV):** Minor revision number of the SATA Capability Pointer implemented.
15:8	0x0 RW/L	**Next Capability Pointer (NEXT):** 00h indicating the final item in the Capability List. The RW/L register attribute allows for flexibility in determining the capability structure available in this PCI function.
7:0	0x12 RO	**Capability ID (CAP):** The value of 12h has been assigned by the PCI SIG to designate the SATA Capability pointer.

50.2.27 Serial ATA Capability Register 1 (SATACR1)—Offset ACh

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:19 or 20, F:0] + ACh

Default: 00000048h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD0:** Reserved.
15:4	0x4 RO	**BAR Offset (BAROFST):** Indicates the offset into the BAR where the AHCI Index/Data pair are located (in Dword granularity). The Index and Data I/O registers are located at offset 10h within the I/O space defined by LBAR (BAR4). A value of 004h indicates offset 10h. • 000h = 0h offset. • 001h = 4h offset. • 002h = 8h offset. • 003h = Ch offset. • 004h = 10h offset. • ... • FFFh = 3FFFh offset (max 16 KB).
3:0	0x8 RO	**BAR Location (BARLOC):** Indicates the absolute PCI Configuration Register address of the BAR containing the Index/Data pair (in Dword granularity). The Index and Data I/O registers reside within the space defined by LBAR (BAR4) in the SATA controller. A value of 8h indicates offset 20h, which is LBAR (BAR4). • 0000 - 0011b = Reserved • 0100b = 10h =) BAR0 • 0101b = 14h =) BAR1 • 0110b = 18h =) BAR2 • 0111b = 1Ch =) BAR3 • 1000b = 20h =) AIDPBA • 1001b = 24h =) BAR5 • 1010 - 1110b = Reserved • 1111b = Index/Data pair in PCI Configuration space which is not supported.

50.2.28 FLR Capability ID (FLRCID)—Offset B0h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:19 or 20, F:0] + B0h

Default: 0013h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x0 RO	**Next Capability (NEXT):** 00h indicating the final item in the Capability List.
7:0	0x13 RO	**Capability ID (CID):** The value of this field depends on the FLRCSSEL bit: • SATAGC.FLRCSSEL = 0, Capability ID = 13h. • SATAGC.FLRCSSEL = 1, Capability ID = 00h (capability is bypassed).

50.2.29 FLR Control (FLRCTL)—Offset B4h

This register shall be read-only 0 when SATAGC.FLRCSSEL=1.

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:19 or 20, F:0] + B4h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:9	0x0 RO	**RSVD0:** Reserved.
8	0x0 RO	**Transactions Pending (TXP):** A 1 indicates that the controller has issued Non-Posted request which has not been completed. A 0 indicates that Completions for all non-posted requests have been received by the controller.
7:1	0x0 RO	**RSVD1:** Reserved.
0	0x0 RW	**Initiate FLR (Initiate_FLR):** Used to initiated FLR transition. A write of 1 indicates FLR transition. Since hardware must not respond to any cycles till FLR completion, the value read by software from this bit is 0. Refer to Function Level Reset (FLR) on specifics to SATA.

50.2.30 MSI-X Message Control (MXC)—Offset D2h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:19 or 20, F:0] + D2h

Default: 0007h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW	**MSI-X Enable (MXE):** If set to '1' and the MSI Enable bit in the MSI Message Control register is cleared to '0', the function is permitted to use MSI-X to request service and is prohibited from using its INTx# pin (if implemented). If cleared to '0', the function is prohibited from using MSI-X to request service.
14	0x0 RW	**Function Mask (FM):** If set to '1', all of the vectors associated with the function are masked, regardless of their per vector Mask bit states. If cleared to '0', each vector's Mask bit determines whether the vector is masked or not. Setting or clearing the MSI-X Function Mask bit has no effect on the state of the per vector Mask bits.
13:11	0x0 RO	**RSVD0:** Reserved.
10:0	0x7 RO	**Table Size (TS):** This value indicates the size of the MSI-X Table as the value n, which is encoded as n - 1.

50.2.31 MSI-X Table Offset / Table BIR (MXT)—Offset D4h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:19 or 20, F:0] + D4h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0x0 RO	**Table Offset (TO):** Used as an offset from the address contained by one of the function's Base Address registers to point to the base of the MSI-X Table. The lower three Table BIR bits are masked off (cleared to 000b) by system software to form a 32-bit Qword-aligned offset.
2:0	0x0 RO	**Table BIR (TBIR):** This field indicates which one of a function's Base Address registers, located beginning at 10h in Configuration Space, is used to map the function's MSI-X Table into system memory. A read-only value of '0' means 10h.

50.2.32 MSI-X PBA Offset / PBA BIR (MXP)—Offset D8h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:19 or 20, F:0] + D8h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0x0 RO	**PBA Offset (PBAO):** Used as an offset from the address contained by one of the function's Base Address registers to point to the base of the MSI-X PBA. The lower three PBA BIR bits are masked off (cleared to 000b) by software to form a 32-bit Qword-aligned offset.
2:0	0x0 RO	**PBA BIR (PBIR):** This field indicates which one of a function's Base Address registers, located beginning at 10h in Configuration Space, is used to map the function's MSI-X PBA into system memory. A read-only value of '1' means 14h.

50.2.33 BIST FIS Control/Status (BFCS)—Offset E0h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:19 or 20, F:0] + E0h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:18	0x0 RO	**RSVD0:** Reserved
17	0x0 RW	**Port 7 BIST FIS Initiate (P7BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 7, using the parameters specified in this register and BFTD1 and BFTD2. This bit is only applicable to project(s): That has port 7 physically.
16	0x0 RW	**Port 6 BIST FIS Initiate (P6BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 6, using the parameters specified in this register and BFTD1 and BFTD2. This bit is only applicable to project(s): That has port 6 physically.
15	0x0 RW	**Port 5 BIST FIS Initiate (P5BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 5, using the parameters specified in this register and BFTD1 and BFTD2. This bit is only applicable to project(s): That has port 5 physically.
14	0x0 RW	**Port 4 BIST FIS Initiate (P4BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 4, using the parameters specified in this register and BFTD1 and BFTD2. This bit is only applicable to project(s): That has port 4 physically.
13	0x0 RW	**Port 3 BIST FIS Initiate (P3BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 3, using the parameters specified in this register and BFTD1 and BFTD2. This bit is only applicable to project(s): That has port 3 physically.
12	0x0 RW	**Port 2 BIST FIS Initiate (P2BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 2, using the parameters specified in this register and BFTD1 and BFTD2. This bit is only applicable to project(s): That has port 2 physically.
11	0x0 RW/1C/V	**BIST FIS Successful (BFS):** This bit is set any time a BIST FIS transmitted by the SATA controller receives an R_OK completion status from the device.
10	0x0 RW/1C/V	**BIST FIS Failed (BFF):** This bit is set any time that a BIST FIS transmitted by the SATA controller receives an R_ERR completion status from the device.
9	0x0 RW	**Port 1 BIST FIS Initiate (P1BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 1, using the parameters specified in this register and BFTD1 and BFTD2. This bit is only applicable to project(s): That has port 1 physically.
8	0x0 RW	**Port 0 BIST FIS Initiate (P0BFI):** When a rising edge is detected on this bit, the SATA controller will initiate a BIST FIS to the device on port 0, using the parameters specified in this register and BFTD1 and BFTD2. This bit is only applicable to project(s): That has port 0 physically.
7:2	0x0 RW	**BIST FIS Parameters (BFP):** These bits form the contents of the upper 6 bits of the BIST FIS Pattern Definition in the BIST FIS transmitted by the SATA controller. This field is not port specific - its contents will be used for any BIST FIS initiated on the SATA controller. The specific bit definitions are: • Bit 7 (T) Far End Transmit mode. • Bit 6 (A) Align Bypass mode. • Bit 5 (S) Bypass Scrambling. • Bit 4 (L) Far End Retimed Loopback. • Bit 3 (F) Far End Analog Loopback. • Bit 2 (P) Primitive bit for use with Transmit mode.

Bit Range	Default & Access	Field Name (ID): Description
1:0	0x0 RO	**RSVD1:** Reserved.

50.2.34 BIST FIS Transmit Data 1 (BFTD1)—Offset E4h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:19 or 20, F:0] + E4h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Data (DATA):** The data programmed into this register will form the contents of the second DW of any BIST FIS initiated by the SATA controller. This register is not port specific - its contents will be used for BIST FIS initiated on any port. Although the 2nd and 3rd DWs of the BIST FIS are only meaningful when the T bit of the BIST FIS is set to indicate Far-End Transmit mode, this register's contents will be transmitted as the BIST FIS 2nd DW regardless of whether or not the T bit is indicated in the BFCS register.

50.2.35 BIST FIS Transmit Data 2 (BFTD2)—Offset E8h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:19 or 20, F:0] + E8h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Data (DATA):** The data programmed into this register will form the contents of the third DW of any BIST FIS initiated by the SATA controller. This register is not port specific - its contents will be used for BIST FIS initiated on any port. Although the 2nd and 3rd DWs of the BIST FIS are only meaningful when the T bit of the BIST FIS is set to indicate Far-End Transmit mode, this register's contents will be transmitted as the BIST FIS 3rd DW regardless of whether or not the T bit is set in the BFCS register.

50.2.36 Manufacturing ID (MFID)—Offset F8h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:19 or 20, F:0] + F8h

Default: 08000FB1h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RO	**RSVD0:** Reserved.
27:24	0x8 RO/V	**Dot portion of Process ID (DPID):** Indicates the dot. Process is reflected in bits [7:0]. This 8-bit value is received via the IOSF Sideband SetID message.
23:16	0x0 RO/V	**Stepping Identifier (SID):** This field is incremented for each stepping of the part. ***Note:*** This field can be used by software to differentiate steppings when the Revision ID may not change. This is SIP customer implementation specific and SIP customer provides this 8-bit value via the Sideband SetID message.
15:8	0xf RO/V	**Manufacturer Identifier (MID):** This is SIP customer implementation specific and SIP customer provides this 8-bit value via the Sideband SetID message.
7:0	0xb1 RO/V	**Process/Dot Identifier (PID):** Indicates the Process. Dot is reflected in bits [27:24]. This is SIP customer implementation specific and SIP customer provides this 8-bit value via the Sideband SetID message.

50.3 Registers in Memory Space—MXTBA

These registers are accessed in Host Memory Space starting at the relocatable memory address defined by the Base Address Register (BAR) MXTBA described in Section 50.2.7, "MSI-X Table Base Address (MXTBA)—Offset 10h" on page 1883.

50.3.1 MSI-X Table Entries n Message Lower Address (MXTEnMLA)

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MXTBA] + 0h + n*10h (where n<=7)

MXTBA Type: PCI Configuration Register (Size: 32 bits)
MXTBA Reference: [B:0, D:(19,20), F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**MSI-X message lower address (MXMLA):** Specifies the lower 32-bit of the DWORD-aligned address (Addr[31:02]) of the MSI-X Message.
1:0	0x0 RO	**RSVD0:** Reserved.

50.3.2 MSI-X Table Entries n Message Upper Address (MXTEnMUA)

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MXTBA] + 4h + n*10h (where n<=7)

MXTBA Type: PCI Configuration Register (Size: 32 bits)
MXTBA Reference: [B:0, D:(19,20), F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**MSI-X message upper 32-bit address (MXMUA):** Specifies the lower 32-bit of the DWORD-aligned address (Addr[31:02]) of the MSI-X Message.

50.3.3 MSI-X Table Entries n Message Data (MXTEnMD)

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MXTBA] + 8h + n*10h (where n<=7)

MXTBA Type: PCI Configuration Register (Size: 32 bits)
MXTBA Reference: [B:0, D:(19,20), F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**MSI-X message Data (MXMD):** Specifies the 32-bit Data of the MSI-X Message.

50.4 Registers in Memory Space—ABAR

These registers are accessed in Host Memory Space starting at the relocatable memory address defined by the Base Address Register (BAR) ABAR described in Section 50.2.11, "AHCI Base Address (ABAR)—Offset 24h" on page 1886.

50.4.1 HBA Capabilities (GHC_CAP)—Offset 0h

This register indicates basic capabilities of the HBA to driver software. The RWO bits in this register are only cleared upon PLTRST#. This register is not reset by FLR.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: FF36FF07h

BAR and Offset: [ABAR] + 0h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31	0x1 RW/O	**Supports 64-bit Addressing (S64A):** Indicates the S-ATA controller can access 64-bit data structures. The 32-bit upper bits of the port DMA Descriptor, the PRD Base, and each PRD entry are read/write.
30	0x1 RW/O	**Supports Native Command Queuing Acceleration (SCQA):** Indicates the SATA controller supports Serial-ATA Native Command Queuing. The HBA will handle DMA Setup FISes in hardware, including support for auto-activate optimization through the FIS.
29	0x1 RW/O	**Supports SNotification Register (SSNTF):** When set to 1, indicates that the HBA supports the PxSNTF (SNotification) register and its associated functionality. When cleared to 0., the HBA does not support the PxSNTF (SNotification) register and its associated functionality.
28	0x1 RW/O	**Supports Mechanical Presence Switch (SMPS):** When set to 1, the HBA supports mechanical presence switches on its ports for use in hot plug operations. When cleared to 0, this function is not supported. This value is loaded by the BIOS prior to OS initialization.
27	0x1 RW/O	**Supports Staggered Spin-up (SSS):** Indicates whether the S-ATA controller supports staggered spin-up on its ports, for use in balancing power spikes. This value is loaded by platform BIOS prior to OS initialization.
26	0x1 RW/O	**Supports Aggressive Link Power Management (SALP):** Indicates the S-ATA controller supports auto-generating link requests to the partial or slumber states when there are no commands to process. When cleared to 0, software shall treat the PxCMD.ALPE and PxCMD.ASP bits as reserved.
25	0x1 RW/O	**Supports Activity LED (SAL):** Indicates the S-ATA controller supports a single output pin (SATALED#) which indicates activity.
24	0x1 RW/O	**Supports Command List Override (SCLO):** When set to 1, indicates that the HBA supports the PxCMD.CLO bit and it's associated function. When cleared to 0., The HBA is not capable of clearing the BSY and DRQ bits in the Status register in order to issue a software reset if these bits are still set from a previous operation.
23:20	0x3 RW/O	**Interface Speed Support (ISS):** Indicates the maximum speed the S-ATA controller can support on its ports. These encodings match the system software programmable PxSCTL.DET.SPD field. • 0000 = Reserved • 0001 = Gen 1 (1.5 Gbps) • 0010 = Gen 2 (3 Gbps) • 0011 = Gen 3 (6 Gbps) • 0100 - 1111 = Reserved. ***Note:*** If (FFSATA0p0, FFSATA0p1, FFSATA0p2, FFSATA0p3, FFSATA0p4 and FFSATA0p5) is 1, this field is RWO defaulting to 0010 and ignores software write value of 0011. If either FFSATA0p0, FFSATA0p1, FFSATA0p2, FFSATA0p3, FFSATA0p4 or FFSATA0p5 is 0, this field is RWO defaulting to 0011.
19	0x0 RO	**Supports Non-Zero DMA Offsets (SNZO):** Reserved as per AHCI 1.3.

Bit Range	Default & Access	Field Name (ID): Description
18	0x1 RO	**Supports AHCI mode only (SAM):** The SATA controller may optionally support AHCI access mechanism only. A value of 1 indicates that the SATA controller does not implement a legacy, task-file based register interface.
17	0x1 RO	**Supports Port Multiplier (SPM):** The SATA controller may optionally support command-based switching Port Multipliers.
16	0x0 RO	**FIS-based Switching Supported (FBSS):** Not supported.
15	0x1 RO	**PIO Multiple DRQ Block (PMD):** If set to 1, the HBA supports multiple DRQ block data transfers for the PIO command protocol.
14	0x1 RW/O	**Slumber State Capable (SSC):** The SATA controller supports the slumber state.
13	0x1 RW/O	**Partial State Capable (PSC):** The SATA controller supports the partial state.
12:8	0x1f RO	**Number of Command Slots (NCS):** 1Fh indicating support for 32 slots.
7	0x0 RO	**Command Completion Coalescing Supported (CCCS):** When set to 1, indicates that the HBA supports command completion coalescing.
6	0x0 RW/O/V	**Enclosure Management Supported (EMS):** When set to 1, indicates that the HBA supports enclosure management.
5	0x0 RW/O	**Supports External SATA (SXS):** When set to 1, indicates that the HBA has one or more Serial ATA ports that has a signal only connector that is externally accessible.
4:0	0x7 RO/V	**Number of Ports (NP):** 0's based value indicating the maximum number of ports supported.

50.4.2 Global HBA Control (GHC)—Offset 4h

This register controls various global actions of the HBA.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [ABAR] + 4h

Default: 80000000h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31	0x1 RO	**AHCI Enable (AE):** When set, indicates that an AHCI driver is loaded and communication to the HBA shall be via AHCI mechanisms.
30:3	0x0 RO	**RSVD0:** Reserved
2	0x0 RO	**Reserved:** Reserved
1	0x0 RW	**Interrupt Enable (IE):** This global bit enables interrupts from the HBA. When cleared (reset default), all interrupt sources from all ports are disabled. When set, interrupts are enabled.
0	0x0 RW/1S	**HBA Reset (HR):** When set by SW, this bit causes an internal reset of the HBA. All state machines that relate to data transfers and native command queuing will return to an idle condition, and all ports will be re-initialized via COMRESET.

50.4.3 Interrupt Status Register (IS)—Offset 8h

This register indicates which of the ports within the controller have an interrupt pending and require service.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [ABAR] + 8h

Default: 00000000h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD0:** Reserved
7	0x0 RW/1C/V	**Interrupt Pending Status Port 7 (IPS7):** If set, indicates that port 7 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt. This bit is only applicable to project(s): That has port 7 physically.
6	0x0 RW/1C/V	**Interrupt Pending Status Port 6 (IPS6):** If set, indicates that port 6 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt. This bit is only applicable to project(s): That has port 6 physically.
5	0x0 RW/1C/V	**Interrupt Pending Status Port 5 (IPS5):** If set, indicates that port 5 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt. This bit is only applicable to project(s): That has port 5 physically.
4	0x0 RW/1C/V	**Interrupt Pending Status Port 4 (IPS4):** If set, indicates that port 4 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt. This bit is only applicable to project(s): That has port 4 physically.
3	0x0 RW/1C/V	**Interrupt Pending Status Port 3 (IPS3):** If set, indicates that port 3 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt. This bit is only applicable to project(s): That has port 3 physically.
2	0x0 RW/1C/V	**Interrupt Pending Status Port 2 (IPS2):** If set, indicates that port 2 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt. This bit is only applicable to project(s): That has port 2 physically.
1	0x0 RW/1C/V	**Interrupt Pending Status Port 1 (IPS1):** If set, indicates that port 1 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt. This bit is only applicable to project(s): That has port 1 physically.
0	0x0 RW/1C/V	**Interrupt Pending Status Port 0 (IPS0):** If set, indicates that port 0 has an interrupt pending. Software can use this information to determine which ports require service after an interrupt. This bit is only applicable to project(s): That has port 0 physically.

50.4.4 Ports Implemented (GHC_PI)—Offset Ch

This register indicates which ports are exposed to the HBA. It indicates which ports that the device supports are available for software to use. Any available port may not be implemented. This register is not reset by FLR. There is BIOS programming requirement on the PI register. Please refer to section 7.9.13.1.1 for details.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [ABAR] + Ch

Default: 00000000h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**RSVD0:** Reserved
7	0x0 RW/O/V	**Port 7 Implemented (PI7):** If set, then port 7 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 7 is not available.
6	0x0 RW/O/V	**Port 6 Implemented (PI6):** If set, then port 6 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 6 is not available.
5	0x0 RW/O/V	**Port 5 Implemented (PI5):** If set, then port 5 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 5 is not available.
4	0x0 RW/O/V	**Port 4 Implemented (PI4):** If set, then port 4 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 4 is not available.
3	0x0 RW/O/V	**Port 3 Implemented (PI3):** If set, then port 3 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 3 is not available.
2	0x0 RW/O/V	**Port 2 Implemented (PI2):** If set, then port 2 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 2 is not available.
1	0x0 RW/O/V	**Port 1 Implemented (PI1):** If set, then port 1 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 1 is not available.
0	0x0 RW/O/V	**Port 0 Implemented (PI0):** If set, then port 0 is available for use. If cleared, the port is not available for use. This bit is reserved and is read-only 0 if below condition is true else it's RWO-zero: Refer to CAP.NP where port 0 is not available.

50.4.5 AHCI Version (VS)—Offset 10h

This register indicates the major and minor version of the AHCI specification. It is BCD encoded. The upper two bytes represent the major version number, and the lower two bytes represent the minor version number. Example: Version 3.12 would be represented as 00030102h.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [ABAR] + 10h

Default: 00010300h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x1 RO	**Major Version Number (MJR):** Indicates the major version is 1
15:0	0x300 RO	**Minor Version Number (MNR):** Indicates the minor version is 30

50.4.6 Enclosure Management Control (EM_CTL)—Offset 20h

This register is used to control and obtain status for the enclosure management interface. The register includes information on the attributes of the implementation, enclosure management messages supported, the status of the interface, whether any messages are pending, and is used to initiate sending messages. This register is not implemented if enclosure management is not supported (i.e. CAP.EMS = 0).

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [ABAR] + 20h

Default: 07010000h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RO	**RSVD0:** Reserved
27	0x0 RO	**Port Multiplier Support (ATTR_PM):** The HBA does not support enclosure management messages for devices attached via a Port Multiplier. Software should use the Serial ATA enclosure management bridge that is built into many Port Multipliers for enclosure services with these devices. For more information on Serial ATA enclosure management bridges, refer to the Serial ATA II: Extensions to Serial ATA 1.0a revision 1.2 specification.
26	0x1 RW/O	**Activity LED Hardware Driven (ATTR_ALHD):** If set to 1, the HBA drives the activity LED for the LED message type in hardware and does not utilize software settings for this LED. The HBA does not begin transmitting the hardware based activity signal until after software has written CTL.TM=1 after a reset condition.
25	0x1 RO	**Transmit Only (ATTR_XMT):** If set to 1, the HBA only supports transmitting messages and does not support receiving messages. If cleared to 0, the HBA supports transmitting and receiving messages.
24	0x1 RO	**Single Message Buffer (ATTR_SMB):** If set to 1, the HBA has one message buffer that is shared for messages to transmit and messages received. In this case, unsolicited receive messages are not supported and it is software's responsibility to manage access to this buffer. If cleared to 0, there are separate receive and transmit buffers such that unsolicited messages could be supported.
23:20	0x0 RO	**RSVD1:** Reserved
19	0x0 RO	**SGPIO Enclosure Management Messages (SUPP_SGPIO):** If set to 1, the HBA supports the SGPIO register interface message type.
18	0x0 RO	**SES-2 Enclosure Management Messages (SUPP_SES2):** If set to 1, the HBA supports the SES-2 message type.
17	0x0 RO	**SAF-TE Enclosure Management Messages (SUPP_SAFTE):** If set to 1, the HBA supports the SAF-TE message type.
16	0x1 RO	**LED Message Types (SUPP_LED):** If set to 1, the HBA supports the LED message type defined in LED Message Type.
15:10	0x0 RO	**RSVD2:** Reserved
9	0x0 RW/1S	**Reset (RST):** When set to 1 by software, the HBA shall reset all enclosure management message logic and take all appropriate reset actions to ensure messages can be transmitted/received after the reset. After the HBA completes the reset operation, the HBA shall set the value to 0. A write of 0 by software to this field shall have no effect.
8	0x0 RW/1S	**Transmit Message (CTL_TM):** When set to 1 by software, the HBA shall transmit the message contained in the message buffer. When the message is completely sent, the HBA shall clear this bit to 0. A write of 0 to this bit by software shall have no effect. Software shall not change the contents of the message buffer while CTL.TM is set to 1.

Bit Range	Default & Access	Field Name (ID): Description
7:1	0x0 RO	**RSVD3:** Reserved
0	0x0 RO	**Message Received (STS_MR):** Message received is not supported.

50.4.7 HBA Capabilities Extended (GHC_CAP2)—Offset 24h

This register indicates basic capabilities of the HBA to driver software. The RWO bits in this register are only cleared upon PLTRST#. This register is not reset by FLR.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [ABAR] + 24h

Default: 0000003Ch

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0x0 RO	**RSVD0:** Reserved
5	0x1 RW/O	**DEVSLP Entrance from Slumber Only (DESO):** This field specifies that the HBA shall only assert DEVSLP if the interface is in Slumber. When this bit is set to 1, the HBA shall ignore software directed entrance to DEVSLP via PxCMD.ICC unless PxSSTS.IPM = 6h.
4	0x1 RW/O/V	**Supports Aggressive DEVSLP Management (SADM):** When set to 1, the HBA supports hardware assertion of the DEVSLP signal after the idle timeout expires.
3	0x1 RW/O/V	**Supports DEVSLP (SDS):** When set to 1, the HBA supports the DEVSLP feature. When cleared to 0, DEVSLP is not supported.
2	0x1 RW/O/V	**Automatic Partial to Slumber Transitions (APST):** When set to 1, the HBA supports Automatic Partial to Slumber Transitions.
1	0x0 RO	**RSVD1:** Reserved
0	0x0 RO	**Reserved:** Reserved

50.4.8 Vendor Specific (VSP)—Offset A0h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000048h

BAR and Offset: [ABAR] + A0h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:7	0x0 RO	**RSVD0:** Reserved
6	0x1 RO	**Software Feature Mask Supported (SFMS):** Set to 1 if the platform is enabled for premium storage features mask (SFM) as described in VS MMIO space at offset ABAR[RPID.(OFST*4)+4].
5	0x0 RO/V	**Premium Features Supported (PFS):** Set to 1 if the platform is enabled for premium storage features (PFB) as described in VS MMIO space at offset ABAR[RPID.OFST*4]. Set to 0 if the platform is not enabled for premium storage features.
4	0x0 RO/V	**Platform Type (PT):** Set to 1 if mobile platform. Clear (0) if desktop.
3	0x1 RO	**Supports RAID Platform ID Reporting (SRPIR):** If set to 1, then indicates that the RAID Platform ID is reported via ABAR + C0h. Set to 0 if this ID is not reported via MMIO space.
2:0	0x0 RO	**RSVD1:** Reserved

50.4.9 Vendor Specific Capabilities Register (VS_CAP)—Offset A4h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 001002DEh

BAR and Offset: [ABAR] + A4h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RO	**RSVD0:** Reserved
27:16	0x10 RW/O	**NVM Remapped Register Offset (NRMO):** Specifies the offset (in 128B unit) within ABAR as to where the PCIe NAND memory BAR register space is remapped. For example, NRMO=1 means ABAR + 128B. This allows the remapped offset to shift between ABAR + 0B, and ABAR + 512KK - 128B, with 128B step. The remapped offset into the AHCI memory space must not overlap with the memory space used for SATA. The remapped offset into the AHCI memory space and the remapped size must not exceed the allocated AHCI memory space of the integrated AHCI controller. Only valid when NRMBE = 1. The reset default of this field is 10h, this places the start of the PCIe NAND memory BAR register space at ABAR + 2K. This field is not reset by FLR.
15:13	0x0 RO	**RSVD1:** Reserved
12:1	0x16f RW/O	**Memory Space Limit. (MSL):** This field specifies the size (in 128B unit) of the remapped memory space for the PCIe NAND device. It is a 0-based field. For example, MSL=1 means 256B. This allows the remapped size to shift between 128B and 512K with the step of 128B.Memory BAR offset from 0 to MSL of the PCIe NAND device are remapped under the integrated AHCI controller memory space. The remapped offset into the AHCI memory space and the value programmed in this field must not exceed the allocated AHCI memory space of the integrated AHCI controller. Only valid when NRMBE = 1. The reset default of this field is 16Fh which specifies the size of the remapped memory space as 34k. This field is not reset by FLR.
0	0x0 RW/O	**PCIe NAND Memory BAR Remapped Enable (NRMBE):** Set to 1 if a PCIe NAND device is present and remapping of its memory BAR register space is enabled. Cleared to 0 if there is no PCIe NAND device present or the remapping of its memory BAR register space is disabled. This bit is not reset by FLR.

50.4.10 RAID Platform ID (RPID)—Offset C0h

This register is used by the Intel Matrix Storage Manager OROM to match the features supported by the OROM with the platform on which the OROM is executing. This prevents the use of an OROM designed for newer chipsets from being use on older chipsets as this could reduce up-sell potential.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [ABAR] + C0h

Default: 00311C02h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x31 RO	**Offset (OFST):** The offset of the Premium Feature Block (PFB) in DWords from the beginning of the ABAR. SFM follows directly after PFB.
15:0	0x1c02 RO/V	**RAID Platform ID (RPID):** Specifies the DID value that has been assigned to the platform. This is the same DID that is reported by the SATA controller when SATAGC.AIE is set to 1 except that the DID is always reported through this register, regardless if the programming of SATAGC.AIE.

50.4.11 SW Feature Mask (SFM)—Offset C8h

The following will be programmed by the BIOS when VS_CAP.SFMS == 1. The feature mask is used by SW to determine which non-premium features shall be supported by SW. These register bits are not reset by FLR since they are programmed by BIOS.

Type: Memory Mapped I/O Register (Size: 16 bits)

BAR and Offset: [ABAR] + C8h

Default: 003Fh

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
15:12	0x0 RO	**RSVD0:** Reserved
11:10	0x0 RW/O	**OROM UI Normal Delay. (OROM_UI_Normal_Delay):** Values of these bits specify the delay of the OROM UI Splash Screen in a normal status. • 00 = 2 secs (default and previous value) • 01 = 4 secs • 10 = 6 secs • 11 = 8 secs. If bit 5 == 0, then these values are disregarded.
9	0x0 RW/O	**Smart Response Technology. (Smart_Response_Technology):** If set to '1', then Smart Response Technology is enabled. If cleared to '0', the feature is disabled.
8	0x0 RW/O	**RRT Only on ESATA (IRRT_Only_on_ESATA):** If set to 1, then only RRT volumes can span internal and external SATA ports (e.g. eSATA). If cleared to 0, then any RAID volume can span internal and external SATA ports (e.g. eSATA).
7	0x0 RW/O	**LED Locate (LED_Locate):** If set to 1, then LED/SGPIO hardware is attached and the ping to locate feature is enabled in the OS.
6	0x0 RW/O	**HDDUNLOCK:** If set to 1, then HDD password unlock is enabled in the OS.
5	0x1 RW/O	**OROM UI and BANNER (OROM_UI_and_BANNER):** If set to 1, then the OROM UI is displayed. When cleared to 0, the OROM UI and BANNER are not displayed if all disks and volumes have a normal status.
4	0x1 RW/O	**RRT (IRRT):** If set to 1, then Rapid Recovery Technology is enabled.
3	0x1 RW/O	**R5:** If set to 1, then RAID5 is enabled
2	0x1 RW/O	**R10:** If set to 1, then RAID10 is enabled
1	0x1 RW/O	**R1:** If set to 1, then RAID1 is enabled
0	0x1 RW/O	**R0:** If set to 1, then RAID0 is enabled

50.4.12 Port [0-7] Command List Base Address (PxCLB0)—Offset 100h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 100h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0x0 RW	**Command List Base Address (CLB):** Indicates the 32-bit base for the command list for this port. This base is used when fetching commands to execute. This address must be 1K aligned as indicated by bits 31:10 being read/write. ***Note:*** These bits are not reset on a HBA reset.
9:0	0x0 RO	**RSVD0:** Reserved

50.4.13 Port [0-7] Command List Base Address Upper 32-bits (PxCLBU0)—Offset 104h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 104h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Command List Base Address Upper (CLBU):** indicates the upper 32-bits for the command list base address for this port. This base is used when fetching commands to execute. ***Note:*** These bits are not reset on a HBA reset.

50.4.14 Port [0-7] FIS Base Address (PxFB0)—Offset 108h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 108h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RW	**FIS Base Address (FB):** Indicates the 32-bit base for received FISes. This address must be 256-byte aligned as indicated by bits 31:08 being read/write. When FIS-based switching is in use, this structure is 4KB in length and the address shall be 4KB aligned. ***Note:*** These bits are not reset on a HBA reset.
7:0	0x0 RO	**RSVD0:** Reserved

50.4.15 Port [0-7] FIS Base Address Upper 32-bits (PxFBU0)—Offset 10Ch

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 10Ch

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**FIS Base Address Upper (FBU):** Indicates the upper 32-bits for the received FIS base for this port. ***Note:*** These bits are not reset on a HBA reset.

50.4.16 Port [0-7] Interrupt Status (PxIS0)—Offset 110h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 110h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**Cold Presence Detect Status (CPDS):** The SATA controller does not support cold presence detect.
30	0x0 RW/1C/V	**Task File Error Status (TFES):** This bit is set whenever the status register is updated by the device and the error bit (bit 0 of the Status field in the received FIS) is set.
29	0x0 RW/1C/V	**Host Bus Fatal Error Status (HBFS):** Indicates that the HBA encountered a host bus error that it cannot recover from, such as a bad software pointer. In PCI, such an indication would be a target or master abort.
28	0x0 RW/1C/V	**Host Bus Data Error Status (HBDS):** Indicates that the HBA encountered a data error (uncorrectable ECC / parity) when reading from or writing to system memory.
27	0x0 RW/1C/V	**Interface Fatal Error Status (IFS):** Indicates that the HBA encountered an error on the SATA interface which caused the transfer to stop.
26	0x0 RW/1C/V	**Interface Non-fatal Error Status (INFS):** Indicates that the HBA encountered an error on the SATA interface but was able to continue operation.
25	0x0 RO	**RSVD0:** Reserved
24	0x0 RW/1C/V	**Overflow Status (OFS):** Indicates that the HBA received more bytes from a device than was specified in the PRD table for the command.
23	0x0 RW/1C/V	**Incorrect Port Multiplier Status (IPMS):** Indicates that the HBA received a FIS from a device whose port multiplier field did not match what was expected. The IPMS bit may be set during enumeration process. It is recommended that IPMS only be used after enumeration is complete on the Port Multiplier.
22	0x0 RO/V	**PhyRdy Change Status (PRCS):** When set to one indicates the internal PhyRdy signal changed state. This bit reflects the state of PxSERR.DIAG.N. This bit is RO and is only cleared when PxSERR.DIAG.N is cleared.
21:8	0x0 RO	**RSVD1:** Reserved
7	0x0 RW/1C/V	**Device Mechanical Presence Status (DMPS):** When set, indicates that a platform mechanical presence switch has been opened or closed, which may lead to a change in the connection state of the device. This bit is only valid in systems that support mechanical presence switch (CAP.SMPS and PxCMD.MPSP are set).
6	0x0 RO/V	**Port Connect Change Status (PCS):** • 1=Change in Current Connect Status. • 0=No change in Current Connect Status. This bit reflects the state of PxSERR.DIAG.X. This bit is only cleared when PxSERR.DIAG.X is cleared.
5	0x0 RW/1C/V	**Descriptor Processed (DPS):** A PRD with the I. bit set has transferred all of its data.
4	0x0 RO/V	**Unknown FIS Interrupt (UFS):** When set to 1 indicates that an unknown FIS was received and has been copied into system memory. This bit is cleared to 0 by software clearing the PxSERR.DIAG.F bit to 0. Note that this bit does not directly reflect the PxSERR.DIAG.F bit. PxSERR.DIAG.F is set immediately when an unknown FIS is detected, whereas this bit is set when the FIS is posted to memory. Software should wait to act on an unknown FIS until this bit is set to 1 or the two bits may become out of sync.
3	0x0 RW/1C/V	**Set Device Bits Interrupt (SDBS):** A Set Device Bits FIS has been received with the I. bit set and has been copied into system memory.

Bit Range	Default & Access	Field Name (ID): Description
2	0x0 RW/1C/V	**DMA Setup FIS Interrupt (DSS):** A DMA Setup FIS has been received with the I. bit set and has been copied into system memory.
1	0x0 RW/1C/V	**PIO Setup FIS Interrupt (PSS):** A PIO Setup FIS has been received with the I. bit set, it has been copied into system memory, and the data related to that FIS has been transferred. This bit shall be set even if the data transfer resulted in an error.
0	0x0 RW/1C/V	**Device to Host Register FIS Interrupt (DHRS):** A D2H register FIS has been received with the I. bit set, and has been copied into system memory.

50.4.17 Port [0-7] Interrupt Enable (PxIE0)—Offset 114h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 114h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**Cold Presence Detect Enable (CPDS):** The SATA controller does not support cold presence detect.
30	0x0 RW	**Task File Error Enable (TFEE):** When set, GHC.IE is set, and P0S.TFES is set, the HBA shall generate an interrupt.
29	0x0 RW	**Host Bus Fatal Error Enable (HBFE):** When set, GHC.IE is set, and P0IS.HBFS is set, the HBA shall generate an interrupt.
28	0x0 RW	**Host Bus Data Error Enable (HBDE):** when set, GHC.IE is set, and P0IS.HBDS is set, the HBA shall generate an interrupt.
27	0x0 RW	**Interface Fatal Error Enable (IFE):** When set, GHC.IE is set, and P0IS.IFS is set, the HBA shall generate an interrupt.
26	0x0 RW	**Interface Non-fatal Error Enable (INFE):** When set, GHC.IE is set, and P0IS.INFS is set, the HBA shall generate an interrupt.
25	0x0 RO	**RSVD0:** Reserved
24	0x0 RW	**Overflow Enable (OFE):** When set, and GHC.IE and P0IS.OFS are set, the HBA shall generate an interrupt.
23	0x0 RW	**Incorrect Port Multiplier Enable (IPME):** When set, and GHC.IE and P0IS.IPMS are set, the HBA shall generate an interrupt. BIOS is required to program this field to '0'. The same applies to AHCI driver.
22	0x0 RW	**PhyRdy Change Interrupt Enable (PRCE):** When set, and GHC.IE is set, and PxIS.PRCS is set, the HBA shall generate an interrupt.
21:8	0x0 RO	**RSVD1:** Reserved
7	0x0 RW/V	**Device Mechanical Enable (DMPE):** When set, and P0IS.DMPS is set, the HBA shall generate an interrupt.
6	0x0 RW	**Port Change Interrupt Enable (PCE):** When set, GHC.IE is set, and P0IS.PCS is set, the HBA shall generate an interrupt.
5	0x0 RW	**Descriptor Processed Interrupt Enable (DPE):** When set, GHC.IE is set, and P0IS.DPS is set, the HBA shall generate an interrupt.
4	0x0 RW	**Unknown FIS Interrupt Enable (UFE):** When set, GHC.IE is set, and PxIS.UFS is set to 1, the HBA shall generate an interrupt.
3	0x0 RW	**Set Device Bits FIS Interrupt Enable (SDBE):** When set, GHC.IE is set, and P0IS.SDBS is set, the HBA shall generate an interrupt.
2	0x0 RW	**DMA Setup FIS Interrupt Enable (DSE):** When set, GHC.IE is set, and P0IS.DSS is set, the HBA shall generate an interrupt.
1	0x0 RW	**PIO Setup FIS Interrupt Enable (PSE):** When set, GHC.IE is set, and P0IS.PSS is set, the HBA shall generate an interrupt.
0	0x0 RW	**Device to Host Register FIS Interrupt Enable (DHRE):** When set, GHC.IE is set, and P0IS.DHRS is set, the HBA shall generate an interrupt.

50.4.18 Port [0-7] Command (PxCMD0)—Offset 118h

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [ABAR] + 118h

Default: 00000004h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RW	**Interface Communication Control (ICC):** This is a four bit field which can be used to control reset and power states of the interface. If the Link layer is currently in the L_IDLE state, writes to this field shall cause the HBA to initiate a transition to the interface power management state requested. If the Link layer is not currently in the L_IDLE state, writes to this field shall have no effect.
27	0x0 RW	**Aggressive Slumber Partial (ASP):** When set to 1, and the ALPE bit is set, the HBA shall aggressively enter the Slumber state when it clears a bit in the PxCI or PxSACT register and the register values are then PxCI = 0h and PxSACT = 0h. When cleared, and the ALPE bit is set, the HBA will aggressively enter the Partial state when it clears a bit in the PxCI or PxSACT register and the register values are then PxCI = 0h and PxSACT = 0h. If CAP.SALP is cleared to 0., software shall treat this bit as reserved.
26	0x0 RW	**Aggressive Link Power Management Enable (ALPE):** When set, the HBA will aggressively enter a lower link power state (Partial or Slumber) based upon the setting of the ASP bit. Software shall only set this bit to 1 if CAP.SALP is set to 1. If CAP.SALP is cleared to 0, software shall treat this bit as reserved. BIOS is recommended to program this field to 1.
25	0x0 RW	**Drive LED on ATAPI Enable (DLAE):** When set, the HBA will drive the LED pin active for commands regardless of the state of PxCMD.ATAPI. When cleared, the HBA will only drive the LED pin active for commands if PxCMD.ATAPI is set to 0. This bit is set by software.
24	0x0 RW	**Device is ATAPI (ATAPI):** When set, the connected device is an ATAPI device. This bit is used by the HBA to control whether or not to generate the desktop LED when commands are active.
23	0x0 RW	**Automatic Partial to Slumber Transitions Enabled (APSTE):** When set to 1., the HBA may perform Automatic Partial to Slumber Transitions. When cleared to 0. the port shall not perform Automatic Partial to Slumber Transitions. Software shall only set this bit to 1. if CAP2.APST is set to 1.; if CAP2.APST is cleared to 0. software shall treat this bit as reserved.
22	0x0 RO	**FIS-based Switching Capable Port (FBSCP):** The SATA controller does not support FIS-Based Switching.
21	0x0 RW/O	**External SATA Port (ESP):** When set to 1, indicates that this port is routed externally and will be used with an external SATA device. When set to 1, CAP.SXS must also be set to 1. When cleared (0), indicates that this port is not routed externally and supports internal SATA devices only. If ESP is set to '1', then the port may experience hot plug events.
20	0x0 RO	**Cold Presence Detection (CPD):** The SATA controller does not support cold presence detect.
19	0x0 RW/O	**Mechanical Presence Switch Attached to Port (MPSP):** If set to 1, the platform supports a mechanical presence switch attached to this port. If cleared to 0, the platform does not support a mechanical presence switch attached to this port.
18	0x0 RW/O	**Hot Plug Capable Port (HPCP):** This indicates whether the this port is connected to a device which can be hot plugged. SATA by definition is hot-pluggable, but not all platforms are constructed to allow the device to be removed (it may be screwed into the chassis, for example). This bit can be used by system software to indicate a feature such as eject device to the end-user.
17	0x0 RW/V	**Port Multiplier Attached (PMA):** When set, a Port Multiplier is attached to the HBA for this port. When cleared, a Port Multiplier is not attached to the HBA for this port. This bit is a read only 0. when CAP.PMS = 0., and read/write when CAP.PMS = 1. Note that this bit is set by software; hardware does not auto-detect that a Port Multiplier is attached.

Bit Range	Default & Access	Field Name (ID): Description
16	0x0 RO	**RSVD0:** Reserved
15	0x0 RO/V	**Command List Running (CR):** When this bit is set it indicates that the command list DMA engine for the port is running.
14	0x0 RO/V	**FIS Receive Running (FR):** When this bit is set it indicates that the FIS Receive DMA engine for the port is running. Note to software: When FR bit stays set, please read the PxIS.PCS and PxSERR.DET.X to service the PCS interrupt accordingly if any
13	0x0 RO/V	**Mechanical Presence Switch State (MPSS):** The MPSS bit reports the state of a mechanical presence switch attached to this port. If CAP.SMPS is set to 1 and the mechanical presence switch is closed then this bit is cleared to 0. If CAP.SMPS is set to 1 and the mechanical presence switch is open then this bit is set to 1. If CAP.SMPS is set to 0 then this bit is cleared to 0. Software should only use this bit if both CAP.SMPS and PxCMD.MPSP are set to 1.
12:8	0x0 RO	**Current Command Slot (CCS):** Indicates the current command slot the HBA is processing. This field is valid when the PxCMD.ST bit is set, and is constantly updated by the HBA. This field can be updated as soon as the HBA recognizes an active command slot, or at some point soon after when it begins processing the command. When PxCMD.ST transitions from a 1 to a 0, the HBA will reset this field to 0. After PxCMD.ST transitions from 0 to 1, the highest priority slot to issue from next is command slot 0. After the first command has been issued, the highest priority slot to issue from next is PxCMD.CCS + 1. For example, after the HBA has issued its first command, if PxCMD.CCS = 0h and PxCI is set to 3h, the next command that will be issued is from command slot 1.
7:5	0x0 RO	**RSVD1:** Reserved
4	0x0 RW	**FIS Receive Enable (FRE):** When set, the HBA may post received FISes into the FIS receive area pointed to by PxFB and PxFBU. When cleared, received FISes are not accepted by the HBA, except for the first D2H register FIS after the initialization sequence.
3	0x0 RW/1S	**Command List Override (CLO):** Setting this bit to 1 causes PxTFD.STS.BSY and PxTFD.STS.DRQ to be cleared to 0. This allows a software reset to be transmitted to the device regardless of whether the BSY and DRQ bits are still set in the PxTFD.STS register. The HBA sets this bit to 0 when PxTFD.STS.BSY and PxTFD.STS.DRQ have been cleared to 0. A write to this register with a value of 0 shall have no effect.
2	0x1 RO	**Power On Device (POD):** The SATA controller does not support cold presence detect.
1	0x0 RW/V	**Spin-Up Device (SUD):** This bit is read/write for HBAs that support staggered spin-up via CAP.SSS. This bit is read only 1. for HBAs that do not support staggered spin-up. On an edge detect from 0. to 1, the HBA shall start a COMRESET initialization sequence to the device. Clearing this bit causes no action on the interface. Clearing this bit to0 does not cause any OOB signal to be sent on the interface. When this bit is cleared to 0. and PxSCTL.DET = 0h, the HBA will enter listen mode.
0	0x0 RW	**Start (ST):** When set, the HBA may process the command list. When cleared, the HBA may not process the command list. Whenever this bit is changed from a 0 to a 1, the HBA starts processing the command list at entry 0. Whenever this bit is changed from a 1 to a 0, the PxCI and PxSACT register is cleared by the HBA upon the HBA putting the controller into an idle state. PxTFD shall be updated also.

50.4.19 Port [0-7] Serial ATA Status (PxSSTS0)—Offset 128h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 128h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RO	**RSVD0:** Reserved
11:8	0x0 RO/V	**Interface Power Management (IPM):** Indicates the current interface state
7:4	0x0 RO/V	**Current Interface Speed (SPD):** Indicates the negotiated interface communication speed.
3:0	0x0 RO/V	**Device Detection (DET):** Indicates the interface device detection and Phy state.

50.4.20 Port [0-7] Serial ATA Control (PxSCTL0)—Offset 12Ch

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 12Ch

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RO	**RSVD0:** Reserved
19:16	0x0 RW	**Port Multiplier Port (PMP):** This field is not used by AHCI.
15:12	0x0 RW	**Select Power Management (SPM):** This field is not used by AHCI.
11:8	0x0 RW	**Interface Power Management Transitions Allowed (IPM):** Indicates which power states the HBA is allowed to transition to. If an interface power management state is not allowed via this register field, the HBA will not initiate that state and the HBA will PMNAKP any request from the device to enter that state.
7:4	0x0 RW	**Speed Allowed (SPD):** Indicates the highest allowable speed of the interface.
3:0	0x0 RW	**Device Detection Initialization (DET):** Controls the HBA.s device detection and interface initialization.

50.4.21 Port [0-7] Serial ATA Error (PxSERR0)—Offset 130h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 130h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW/1C/V	**Diagnostics (DIAG):** Contains diagnostic error information for use by diagnostic software in validating correct operation or isolating failure modes.
15:0	0x0 RW/1C/V	**Error (ERR):** The ERR field contains error information for use by host software in determining the appropriate response to the error condition. If one or more of bits 11:8 of this register are set, the controller will stop the current transfer.

50.4.22 Port [0-7] Serial ATA Active (PxSACT0)—Offset 134h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 134h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/1S/V	**Device Status (DS):** System software sets this bit for native command queuing commands prior to setting the PxCI.CI bit in the same command slot entry. This field is cleared via the Set Device Bits FIS.

50.4.23 Port [0-7] Commands Issued (PxCI0)—Offset 138h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 138h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Commands Issued (CI):** This field is set by software to indicate to the HBA that a command has been built in system memory for a command slot and may be sent to the device. When the HBA receives a FIS which clears the BSY, ERR, and DRQ bits for the command, it clears the corresponding bit in this register for that command slot. Bits in this field shall only be set to 1 by software when PxCMD.ST is set to 1.

50.4.24 Port [0-7] SNotification (PxSNTF0)—Offset 13Ch

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 13Ch

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD0:** Reserved
15:0	0x0 RW/1C/V	**PM Notify (PMN):** This field indicates whether a particular device with the corresponding PM Port number issued a Set Device Bits FIS to the host with the Notification bit set. PM Port 0h sets bit 0. PM Port Fh sets bit 15. Individual bits are cleared by software writing 1's to the corresponding bit positions. Note that, while this field is reset to default on a HBA Reset, it is not reset by COMRESET or SRST

50.4.25 Port [0-7] Command List Base Address (PxCLB1)—Offset 180h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 180h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0x0 RW	**Command List Base Address (CLB):** Indicates the 32-bit base for the command list for this port. This base is used when fetching commands to execute. This address must be 1K aligned as indicated by bits 31:10 being read/write. ***Note:*** These bits are not reset on a HBA reset.
9:0	0x0 RO	**RSVD0:** Reserved

50.4.26 Port [0-7] Command List Base Address Upper 32-bits (PxCLBU1)—Offset 184h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 184h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Command List Base Address Upper (CLBU):** Indicates the upper 32-bits for the command list base address for this port. This base is used when fetching commands to execute. ***Note:*** These bits are not reset on a HBA reset.

50.4.27 Port [0-7] FIS Base Address (PxFB1)—Offset 188h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 188h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RW	**FIS Base Address (FB):** Indicates the 32-bit base for received FISes. This address must be 256-byte aligned as indicated by bits 31:08 being read/write. When FIS-based switching is in use, this structure is 4KB in length and the address shall be 4KB aligned. ***Note:*** These bits are not reset on a HBA reset.
7:0	0x0 RO	**RSVD0:** Reserved

50.4.28 Port [0-7] FIS Base Address Upper 32-bits (PxFBU1)—Offset 18Ch

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 18Ch

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**FIS Base Address Upper (FBU):** Indicates the upper 32-bits for the received FIS base for this port. ***Note:*** These bits are not reset on a HBA reset.

50.4.29 Port [0-7] Interrupt Status (PxIS1)—Offset 190h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 190h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**Cold Presence Detect Status (CPDS):** The SATA controller does not support cold presence detect.
30	0x0 RW/1C/V	**Task File Error Status (TFES):** This bit is set whenever the status register is updated by the device and the error bit (bit 0 of the Status field in the received FIS) is set.
29	0x0 RW/1C/V	**Host Bus Fatal Error Status (HBFS):** Indicates that the HBA encountered a host bus error that it cannot recover from, such as a bad software pointer. In PCI, such an indication would be a target or master abort.
28	0x0 RW/1C/V	**Host Bus Data Error Status (HBDS):** Indicates that the HBA encountered a data error (uncorrectable ECC / parity) when reading from or writing to system memory.
27	0x0 RW/1C/V	**Interface Fatal Error Status (IFS):** Indicates that the HBA encountered an error on the SATA interface which caused the transfer to stop.
26	0x0 RW/1C/V	**Interface Non-fatal Error Status (INFS):** Indicates that the HBA encountered an error on the SATA interface but was able to continue operation.
25	0x0 RO	**RSVD0:** Reserved
24	0x0 RW/1C/V	**Overflow Status (OFS):** Indicates that the HBA received more bytes from a device than was specified in the PRD table for the command.
23	0x0 RW/1C/V	**Incorrect Port Multiplier Status (IPMS):** Indicates that the HBA received a FIS from a device whose port multiplier field did not match what was expected. The IPMS bit may be set during enumeration process. It is recommended that IPMS only be used after enumeration is complete on the Port Multiplier.
22	0x0 RO/V	**PhyRdy Change Status (PRCS):** When set to one indicates the internal PhyRdy signal changed state. This bit reflects the state of PxSERR.DIAG.N. This bit is RO and is only cleared when PxSERR.DIAG.N is cleared.
21:8	0x0 RO	**RSVD1:** Reserved
7	0x0 RW/1C/V	**Device Mechanical Presence Status (DMPS):** When set, indicates that a platform mechanical presence switch has been opened or closed, which may lead to a change in the connection state of the device. This bit is only valid in systems that support mechanical presence switch (CAP.SMPS and PxCMD.MPSP are set).
6	0x0 RO/V	**Port Connect Change Status (PCS):** • 1=Change in Current Connect Status. • 0=No change in Current Connect Status. This bit reflects the state of PxSERR.DIAG.X. This bit is only cleared when PxSERR.DIAG.X is cleared.
5	0x0 RW/1C/V	**Descriptor Processed (DPS):** A PRD with the I. bit set has transferred all of its data.
4	0x0 RO/V	**Unknown FIS Interrupt (UFS):** When set to 1 indicates that an unknown FIS was received and has been copied into system memory. This bit is cleared to 0 by software clearing the PxSERR.DIAG.F bit to 0. Note that this bit does not directly reflect the PxSERR.DIAG.F bit. PxSERR.DIAG.F is set immediately when an unknown FIS is detected, whereas this bit is set when the FIS is posted to memory. Software should wait to act on an unknown FIS until this bit is set to 1 or the two bits may become out of sync.

Bit Range	Default & Access	Field Name (ID): Description
3	0x0 RW/1C/V	**Set Device Bits Interrupt (SDBS):** A Set Device Bits FIS has been received with the I. bit set and has been copied into system memory.
2	0x0 RW/1C/V	**DMA Setup FIS Interrupt (DSS):** A DMA Setup FIS has been received with the I. bit set and has been copied into system memory.
1	0x0 RW/1C/V	**PIO Setup FIS Interrupt (PSS):** A PIO Setup FIS has been received with the I. bit set, it has been copied into system memory, and the data related to that FIS has been transferred. This bit shall be set even if the data transfer resulted in an error.
0	0x0 RW/1C/V	**Device to Host Register FIS Interrupt (DHRS):** A D2H register FIS has been received with the I. bit set, and has been copied into system memory.

50.4.30 Port [0-7] Interrupt Enable (PxIE1)—Offset 194h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 194h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**Cold Presence Detect Enable (CPDS):** The SATA controller does not support cold presence detect.
30	0x0 RW	**Task File Error Enable (TFEE):** When set, GHC.IE is set, and P0S.TFES is set, the HBA shall generate an interrupt.
29	0x0 RW	**Host Bus Fatal Error Enable (HBFE):** When set, GHC.IE is set, and P0IS.HBFS is set, the HBA shall generate an interrupt.
28	0x0 RW	**Host Bus Data Error Enable (HBDE):** when set, GHC.IE is set, and P0IS.HBDS is set, the HBA shall generate an interrupt.
27	0x0 RW	**Interface Fatal Error Enable (IFE):** When set, GHC.IE is set, and P0IS.IFS is set, the HBA shall generate an interrupt.
26	0x0 RW	**Interface Non-fatal Error Enable (INFE):** When set, GHC.IE is set, and P0IS.INFS is set, the HBA shall generate an interrupt.
25	0x0 RO	**RSVD0:** Reserved
24	0x0 RW	**Overflow Enable (OFE):** When set, and GHC.IE and P0IS.OFS are set, the HBA shall generate an interrupt.
23	0x0 RW	**Incorrect Port Multiplier Enable (IPME):** When set, and GHC.IE and P0IS.IPMS are set, the HBA shall generate an interrupt. BIOS is required to program this field to '0'. The same applies to AHCI driver.
22	0x0 RW	**PhyRdy Change Interrupt Enable (PRCE):** When set, and GHC.IE is set, and PxIS.PRCS is set, the HBA shall generate an interrupt.
21:8	0x0 RO	**RSVD1:** Reserved
7	0x0 RW/V	**Device Mechanical Enable (DMPE):** When set, and P0IS.DMPS is set, the HBA shall generate an interrupt.
6	0x0 RW	**Port Change Interrupt Enable (PCE):** When set, GHC.IE is set, and P0IS.PCS is set, the HBA shall generate an interrupt.
5	0x0 RW	**Descriptor Processed Interrupt Enable (DPE):** When set, GHC.IE is set, and P0IS.DPS is set, the HBA shall generate an interrupt.
4	0x0 RW	**Unknown FIS Interrupt Enable (UFE):** When set, GHC.IE is set, and PxIS.UFS is set to 1, the HBA shall generate an interrupt.
3	0x0 RW	**Set Device Bits FIS Interrupt Enable (SDBE):** When set, GHC.IE is set, and P0IS.SDBS is set, the HBA shall generate an interrupt.
2	0x0 RW	**DMA Setup FIS Interrupt Enable (DSE):** When set, GHC.IE is set, and P0IS.DSS is set, the HBA shall generate an interrupt.
1	0x0 RW	**PIO Setup FIS Interrupt Enable (PSE):** When set, GHC.IE is set, and P0IS.PSS is set, the HBA shall generate an interrupt.
0	0x0 RW	**Device to Host Register FIS Interrupt Enable (DHRE):** When set, GHC.IE is set, and P0IS.DHRS is set, the HBA shall generate an interrupt.

50.4.31 Port [0-7] Command (PxCMD1)—Offset 198h

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [ABAR] + 198h

Default: 00000004h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RW	**Interface Communication Control (ICC):** This is a four bit field which can be used to control reset and power states of the interface. If the Link layer is currently in the L_IDLE state, writes to this field shall cause the HBA to initiate a transition to the interface power management state requested. If the Link layer is not currently in the L_IDLE state, writes to this field shall have no effect.
27	0x0 RW	**Aggressive Slumber Partial (ASP):** When set to 1, and the ALPE bit is set, the HBA shall aggressively enter the Slumber state when it clears a bit in the PxCI or PxSACT register and the register values are then PxCI = 0h and PxSACT = 0h. When cleared, and the ALPE bit is set, the HBA will aggressively enter the Partial state when it clears a bit in the PxCI or PxSACT register and the register values are then PxCI = 0h and PxSACT = 0h. If CAP.SALP is cleared to 0., software shall treat this bit as reserved.
26	0x0 RW	**Aggressive Link Power Management Enable (ALPE):** When set, the HBA will aggressively enter a lower link power state (Partial or Slumber) based upon the setting of the ASP bit. Software shall only set this bit to 1 if CAP.SALP is set to 1. If CAP.SALP is cleared to 0, software shall treat this bit as reserved. BIOS is recommended to program this field to 1.
25	0x0 RW	**Drive LED on ATAPI Enable (DLAE):** When set, the HBA will drive the LED pin active for commands regardless of the state of PxCMD.ATAPI. When cleared, the HBA will only drive the LED pin active for commands if PxCMD.ATAPI is set to 0. This bit is set by software.
24	0x0 RW	**Device is ATAPI (ATAPI):** When set, the connected device is an ATAPI device. This bit is used by the HBA to control whether or not to generate the desktop LED when commands are active.
23	0x0 RW	**Automatic Partial to Slumber Transitions Enabled (APSTE):** When set to 1., the HBA may perform Automatic Partial to Slumber Transitions. When cleared to 0. the port shall not perform Automatic Partial to Slumber Transitions. Software shall only set this bit to 1. if CAP2.APST is set to 1.; if CAP2.APST is cleared to 0. software shall treat this bit as reserved.
22	0x0 RO	**FIS-based Switching Capable Port (FBSCP):** The SATA controller does not support FIS-Based Switching.
21	0x0 RW/O	**External SATA Port (ESP):** When set to 1, indicates that this port is routed externally and will be used with an external SATA device. When set to 1, CAP.SXS must also be set to 1. When cleared (0), indicates that this port is not routed externally and supports internal SATA devices only. If ESP is set to '1', then the port may experience hot plug events.
20	0x0 RO	**Cold Presence Detection (CPD):** The SATA controller does not support cold presence detect.
19	0x0 RW/O	**Mechanical Presence Switch Attached to Port (MPSP):** If set to 1, the platform supports a mechanical presence switch attached to this port. If cleared to 0, the platform does not support a mechanical presence switch attached to this port.
18	0x0 RW/O	**Hot Plug Capable Port (HPCP):** This indicates whether the this port is connected to a device which can be hot plugged. SATA by definition is hot-pluggable, but not all platforms are constructed to allow the device to be removed (it may be screwed into the chassis, for example). This bit can be used by system software to indicate a feature such as eject device to the end-user.
17	0x0 RW/V	**Port Multiplier Attached (PMA):** When set, a Port Multiplier is attached to the HBA for this port. When cleared, a Port Multiplier is not attached to the HBA for this port. This bit is a read only 0. when CAP.PMS = 0., and read/write when CAP.PMS = 1. Note that this bit is set by software; hardware does not auto-detect that a Port Multiplier is attached.

Bit Range	Default & Access	Field Name (ID): Description
16	0x0 RO	**RSVD0:** Reserved
15	0x0 RW/V	**Command List Running (CR):** When this bit is set it indicates that the command list DMA engine for the port is running.
14	0x0 RW/V	**FIS Receive Running (FR):** When this bit is set it indicates that the FIS Receive DMA engine for the port is running. Note to software: When FR bit stays set, please read the PxIS.PCS and PxSERR.DET.X to service the PCS interrupt accordingly if any
13	0x0 RO	**Mechanical Presence Switch State (MPSS):** The MPSS bit reports the state of a mechanical presence switch attached to this port. If CAP.SMPS is set to 1 and the mechanical presence switch is closed then this bit is cleared to 0. If CAP.SMPS is set to 1 and the mechanical presence switch is open then this bit is set to 1. If CAP.SMPS is set to 0 then this bit is cleared to 0. Software should only use this bit if both CAP.SMPS and PxCMD.MPSP are set to 1.
12:8	0x0 RO	**Current Command Slot (CCS):** Indicates the current command slot the HBA is processing. This field is valid when the PxCMD.ST bit is set, and is constantly updated by the HBA. This field can be updated as soon as the HBA recognizes an active command slot, or at some point soon after when it begins processing the command. When PxCMD.ST transitions from a 1 to a 0, the HBA will reset this field to 0. After PxCMD.ST transitions from 0 to 1, the highest priority slot to issue from next is command slot 0. After the first command has been issued, the highest priority slot to issue from next is PxCMD.CCS + 1. For example, after the HBA has issued its first command, if PxCMD.CCS = 0h and PxCI is set to 3h, the next command that will be issued is from command slot 1.
7:5	0x0 RO	**RSVD1:** Reserved
4	0x0 RW	**FIS Receive Enable (FRE):** When set, the HBA may post received FISes into the FIS receive area pointed to by PxFB and PxFBU. When cleared, received FISes are not accepted by the HBA, except for the first D2H register FIS after the initialization sequence.
3	0x0 RW/1S	**Command List Override (CLO):** Setting this bit to 1 causes PxTFD.STS.BSY and PxTFD.STS.DRQ to be cleared to 0. This allows a software reset to be transmitted to the device regardless of whether the BSY and DRQ bits are still set in the PxTFD.STS register. The HBA sets this bit to 0 when PxTFD.STS.BSY and PxTFD.STS.DRQ have been cleared to 0. A write to this register with a value of 0 shall have no effect.
2	0x1 RO	**Power On Device (POD):** The SATA controller does not support cold presence detect.
1	0x0 RW/V	**Spin-Up Device (SUD):** This bit is read/write for HBAs that support staggered spin-up via CAP.SSS. This bit is read only 1. for HBAs that do not support staggered spin-up. On an edge detect from 0. to 1, the HBA shall start a COMRESET initialization sequence to the device. Clearing this bit causes no action on the interface. Clearing this bit to0 does not cause any OOB signal to be sent on the interface. When this bit is cleared to 0. and PxSCTL.DET = 0h, the HBA will enter listen mode.
0	0x0 RW	**Start (ST):** When set, the HBA may process the command list. When cleared, the HBA may not process the command list. Whenever this bit is changed from a 0 to a 1, the HBA starts processing the command list at entry 0. Whenever this bit is changed from a 1 to a 0, the PxCI and PxSACT register is cleared by the HBA upon the HBA putting the controller into an idle state. PxTFD shall be updated also.

50.4.32 Port [0-7] Serial ATA Status (PxSSTS1)—Offset 1A8h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 1A8h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RO	**RSVD0:** Reserved
11:8	0x0 RO/V	**Interface Power Management (IPM):** Indicates the current interface state
7:4	0x0 RO/V	**Current Interface Speed (SPD):** Indicates the negotiated interface communication speed.
3:0	0x0 RO/V	**Device Detection (DET):** Indicates the interface device detection and Phy state.

50.4.33 Port [0-7] Serial ATA Control (PxSCTL1)—Offset 1ACh

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 1ACh

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RO	**RSVD0:** Reserved
19:16	0x0 RW	**Port Multiplier Port (PMP):** This field is not used by AHCI.
15:12	0x0 RW	**Select Power Management (SPM):** This field is not used by AHCI.
11:8	0x0 RW	**Interface Power Management Transitions Allowed (IPM):** Indicates which power states the HBA is allowed to transition to. If an interface power management state is not allowed via this register field, the HBA will not initiate that state and the HBA will PMNAKP any request from the device to enter that state.
7:4	0x0 RW	**Speed Allowed (SPD):** Indicates the highest allowable speed of the interface.
3:0	0x0 RW	**Device Detection Initialization (DET):** Controls the HBA.s device detection and interface initialization.

50.4.34 Port [0-7] Serial ATA Error (PxSERR1)—Offset 1B0h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 1B0h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW/1C/V	**Diagnostics (DIAG):** Contains diagnostic error information for use by diagnostic software in validating correct operation or isolating failure modes.
15:0	0x0 RW/1C/V	**Error (ERR):** The ERR field contains error information for use by host software in determining the appropriate response to the error condition. If one or more of bits 11:8 of this register are set, the controller will stop the current transfer.

50.4.35 Port [0-7] Serial ATA Active (PxSACT1)—Offset 1B4h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 1B4h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/1S/V	**Device Status (DS):** System software sets this bit for native command queuing commands prior to setting the PxCI.CI bit in the same command slot entry. This field is cleared via the Set Device Bits FIS.

50.4.36 Port [0-7] Commands Issued (PxCI1)—Offset 1B8h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 1B8h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/1S/V	**Commands Issued (CI):** This field is set by software to indicate to the HBA that a command has been built in system memory for a command slot and may be sent to the device. When the HBA receives a FIS which clears the BSY, ERR, and DRQ bits for the command, it clears the corresponding bit in this register for that command slot. Bits in this field shall only be set to 1 by software when PxCMD.ST is set to 1.

50.4.37 Port [0-7] SNotification (PxSNTF1)—Offset 1BCh

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 1BCh

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD0:** Reserved
15:0	0x0 RW/1C/V	**PM Notify (PMN):** This field indicates whether a particular device with the corresponding PM Port number issued a Set Device Bits FIS to the host with the Notification bit set. PM Port 0h sets bit 0. PM Port Fh sets bit 15. Individual bits are cleared by software writing 1's to the corresponding bit positions. Note that, while this field is reset to default on a HBA Reset, it is not reset by COMRESET or SRST.

50.4.38 Port [0-7] Command List Base Address (PxCLB2)—Offset 200h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 200h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0x0 RW	**Command List Base Address (CLB):** Indicates the 32-bit base for the command list for this port. This base is used when fetching commands to execute. This address must be 1K aligned as indicated by bits 31:10 being read/write. ***Note:*** These bits are not reset on a HBA reset.
9:0	0x0 RO	**RSVD0:** Reserved

50.4.39 Port [0-7] Command List Base Address Upper 32-bits (PxCLBU2)—Offset 204h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 204h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Command List Base Address Upper (CLBU):** Indicates the upper 32-bits for the command list base address for this port. This base is used when fetching commands to execute. ***Note:*** These bits are not reset on a HBA reset.

50.4.40 Port [0-7] FIS Base Address (PxFB2)—Offset 208h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 208h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RW	**FIS Base Address (FB):** Indicates the 32-bit base for received FISes. This address must be 256-byte aligned as indicated by bits 31:08 being read/write. When FIS-based switching is in use, this structure is 4KB in length and the address shall be 4KB aligned. ***Note:*** These bits are not reset on a HBA reset.
7:0	0x0 RO	**RSVD0:** Reserved

50.4.41 Port [0-7] FIS Base Address Upper 32-bits (PxFBU2)—Offset 20Ch

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 20Ch

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**FIS Base Address Upper (FBU):** Indicates the upper 32-bits for the received FIS base for this port. ***Note:*** These bits are not reset on a HBA reset.

50.4.42 Port [0-7] Interrupt Status (PxIS2)—Offset 210h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 210h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**Cold Presence Detect Status (CPDS):** The SATA controller does not support cold presence detect.
30	0x0 RW/1C/V	**Task File Error Status (TFES):** This bit is set whenever the status register is updated by the device and the error bit (bit 0 of the Status field in the received FIS) is set.
29	0x0 RW/1C/V	**Host Bus Fatal Error Status (HBFS):** Indicates that the HBA encountered a host bus error that it cannot recover from, such as a bad software pointer. In PCI, such an indication would be a target or master abort.
28	0x0 RW/1C/V	**Host Bus Data Error Status (HBDS):** Indicates that the HBA encountered a data error (uncorrectable ECC / parity) when reading from or writing to system memory.
27	0x0 RW/1C/V	**Interface Fatal Error Status (IFS):** Indicates that the HBA encountered an error on the SATA interface which caused the transfer to stop.
26	0x0 RW/1C/V	**Interface Non-fatal Error Status (INFS):** Indicates that the HBA encountered an error on the SATA interface but was able to continue operation.
25	0x0 RO	**RSVD0:** Reserved
24	0x0 RW/1C/V	**Overflow Status (OFS):** Indicates that the HBA received more bytes from a device than was specified in the PRD table for the command.
23	0x0 RW/1C/V	**Incorrect Port Multiplier Status (IPMS):** Indicates that the HBA received a FIS from a device whose port multiplier field did not match what was expected. The IPMS bit may be set during enumeration process. It is recommended that IPMS only be used after enumeration is complete on the Port Multiplier.
22	0x0 RO/V	**PhyRdy Change Status (PRCS):** When set to one indicates the internal PhyRdy signal changed state. This bit reflects the state of PxSERR.DIAG.N. This bit is RO and is only cleared when PxSERR.DIAG.N is cleared.
21:8	0x0 RO	**RSVD1:** Reserved
7	0x0 RW/1C/V	**Device Mechanical Presence Status (DMPS):** When set, indicates that a platform mechanical presence switch has been opened or closed, which may lead to a change in the connection state of the device. This bit is only valid in systems that support mechanical presence switch (CAP.SMPS and PxCMD.MPSP are set).
6	0x0 RO/V	**Port Connect Change Status (PCS):** • 1=Change in Current Connect Status. • 0=No change in Current Connect Status. This bit reflects the state of PxSERR.DIAG.X. This bit is only cleared when PxSERR.DIAG.X is cleared.
5	0x0 RW/1C/V	**Descriptor Processed (DPS):** A PRD with the I. bit set has transferred all of its data.
4	0x0 RO/V	**Unknown FIS Interrupt (UFS):** When set to 1 indicates that an unknown FIS was received and has been copied into system memory. This bit is cleared to 0 by software clearing the PxSERR.DIAG.F bit to 0. Note that this bit does not directly reflect the PxSERR.DIAG.F bit. PxSERR.DIAG.F is set immediately when an unknown FIS is detected, whereas this bit is set when the FIS is posted to memory. Software should wait to act on an unknown FIS until this bit is set to 1 or the two bits may become out of sync.

Bit Range	Default & Access	Field Name (ID): Description
3	0x0 RW/1C/V	**Set Device Bits Interrupt (SDBS):** A Set Device Bits FIS has been received with the I. bit set and has been copied into system memory.
2	0x0 RW/1C/V	**DMA Setup FIS Interrupt (DSS):** A DMA Setup FIS has been received with the I. bit set and has been copied into system memory.
1	0x0 RW/1C/V	**PIO Setup FIS Interrupt (PSS):** A PIO Setup FIS has been received with the I. bit set, it has been copied into system memory, and the data related to that FIS has been transferred. This bit shall be set even if the data transfer resulted in an error.
0	0x0 RW/1C/V	**Device to Host Register FIS Interrupt (DHRS):** A D2H register FIS has been received with the I. bit set, and has been copied into system memory.

50.4.43 Port [0-7] Interrupt Enable (PxIE2)—Offset 214h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 214h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**Cold Presence Detect Enable (CPDS):** The SATA controller does not support cold presence detect.
30	0x0 RW	**Task File Error Enable (TFEE):** When set, GHC.IE is set, and P0S.TFES is set, the HBA shall generate an interrupt.
29	0x0 RW	**Host Bus Fatal Error Enable (HBFE):** When set, GHC.IE is set, and P0IS.HBFS is set, the HBA shall generate an interrupt.
28	0x0 RW	**Host Bus Data Error Enable (HBDE):** when set, GHC.IE is set, and P0IS.HBDS is set, the HBA shall generate an interrupt.
27	0x0 RW	**Interface Fatal Error Enable (IFE):** When set, GHC.IE is set, and P0IS.IFS is set, the HBA shall generate an interrupt.
26	0x0 RW	**Interface Non-fatal Error Enable (INFE):** When set, GHC.IE is set, and P0IS.INFS is set, the HBA shall generate an interrupt.
25	0x0 RO	**RSVD0:** Reserved
24	0x0 RW	**Overflow Enable (OFE):** When set, and GHC.IE and P0IS.OFS are set, the HBA shall generate an interrupt.
23	0x0 RW	**Incorrect Port Multiplier Enable (IPME):** When set, and GHC.IE and P0IS.IPMS are set, the HBA shall generate an interrupt. BIOS is required to program this field to '0'. The same applies to AHCI driver.
22	0x0 RW	**PhyRdy Change Interrupt Enable (PRCE):** When set, and GHC.IE is set, and PxIS.PRCS is set, the HBA shall generate an interrupt.
21:8	0x0 RO	**RSVD1:** Reserved
7	0x0 RW/V	**Device Mechanical Enable (DMPE):** When set, and P0IS.DMPS is set, the HBA shall generate an interrupt.
6	0x0 RW	**Port Change Interrupt Enable (PCE):** When set, GHC.IE is set, and P0IS.PCS is set, the HBA shall generate an interrupt.
5	0x0 RW	**Descriptor Processed Interrupt Enable (DPE):** When set, GHC.IE is set, and P0IS.DPS is set, the HBA shall generate an interrupt.
4	0x0 RW	**Unknown FIS Interrupt Enable (UFE):** When set, GHC.IE is set, and PxIS.UFS is set to 1, the HBA shall generate an interrupt.
3	0x0 RW	**Set Device Bits FIS Interrupt Enable (SDBE):** When set, GHC.IE is set, and P0IS.SDBS is set, the HBA shall generate an interrupt.
2	0x0 RW	**DMA Setup FIS Interrupt Enable (DSE):** When set, GHC.IE is set, and P0IS.DSS is set, the HBA shall generate an interrupt.
1	0x0 RW	**PIO Setup FIS Interrupt Enable (PSE):** When set, GHC.IE is set, and P0IS.PSS is set, the HBA shall generate an interrupt.
0	0x0 RW	**Device to Host Register FIS Interrupt Enable (DHRE):** When set, GHC.IE is set, and P0IS.DHRS is set, the HBA shall generate an interrupt.

50.4.44 Port [0-7] Command (PxCMD2)—Offset 218h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000004h

BAR and Offset: [ABAR] + 218h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RW	**Interface Communication Control (ICC):** This is a four bit field which can be used to control reset and power states of the interface. If the Link layer is currently in the L_IDLE state, writes to this field shall cause the HBA to initiate a transition to the interface power management state requested. If the Link layer is not currently in the L_IDLE state, writes to this field shall have no effect.
27	0x0 RW	**Aggressive Slumber Partial (ASP):** When set to 1, and the ALPE bit is set, the HBA shall aggressively enter the Slumber state when it clears a bit in the PxCI or PxSACT register and the register values are then PxCI = 0h and PxSACT = 0h. When cleared, and the ALPE bit is set, the HBA will aggressively enter the Partial state when it clears a bit in the PxCI or PxSACT register and the register values are then PxCI = 0h and PxSACT = 0h. If CAP.SALP is cleard to 0., software shall treat this bit as reserved.
26	0x0 RW	**Aggressive Link Power Management Enable (ALPE):** When set, the HBA will aggressively enter a lower link power state (Partial or Slumber) based upon the setting of the ASP bit. Software shall only set this bit to 1 if CAP.SALP is set to 1. If CAP.SALP is cleared to 0, software shall treat this bit as reserved. BIOS is recommended to program this field to 1.
25	0x0 RW	**Drive LED on ATAPI Enable (DLAE):** When set, the HBA will drive the LED pin active for commands regardless of the state of PxCMD.ATAPI. When cleared, the HBA will only drive the LED pin active for commands if PxCMD.ATAPI is set to 0. This bit is set by software.
24	0x0 RW	**Device is ATAPI (ATAPI):** When set, the connected device is an ATAPI device. This bit is used by the HBA to control whether or not to generate the desktop LED when commands are active.
23	0x0 RW	**Automatic Partial to Slumber Transitions Enabled (APSTE):** When set to 1., the HBA may perform Automatic Partial to Slumber Transitions. When cleared to 0. the port shall not perform Automatic Partial to Slumber Transitions. Software shall only set this bit to 1. if CAP2.APST is set to 1.; if CAP2.APST is cleared to 0. software shall treat this bit as reserved.
22	0x0 RO	**FIS-based Switching Capable Port (FBSCP):** The SATA controller does not support FIS-Based Switching.
21	0x0 RW/O	**External SATA Port (ESP):** When set to 1, indicates that this port is routed externally and will be used with an external SATA device. When set to 1, CAP.SXS must also be set to 1. When cleared (0), indicates that this port is not routed externally and supports internal SATA devices only. If ESP is set to '1', then the port may experience hot plug events.
20	0x0 RO	**Cold Presence Detection (CPD):** The SATA controller does not support cold presence detect.
19	0x0 RW/O	**Mechanical Presence Switch Attached to Port (MPSP):** If set to 1, the platform supports a mechanical presence switch attached to this port. If cleared to 0, the platform does not support a mechanical presence switch attached to this port.
18	0x0 RW/O	**Hot Plug Capable Port (HPCP):** This indicates whether the this port is connected to a device which can be hot plugged. SATA by definition is hot-pluggable, but not all platforms are constructed to allow the device to be removed (it may be screwed into the chassis, for example). This bit can be used by system software to indicate a feature such as eject device to the end-user.
17	0x0 RW/V	**Port Multiplier Attached (PMA):** When set, a Port Multiplier is attached to the HBA for this port. When cleared, a Port Multiplier is not attached to the HBA for this port. This bit is a read only 0. when CAP.PMS = 0., and read/write when CAP.PMS = 1. Note that this bit is set by software; hardware does not auto-detect that a Port Multiplier is attached.

Bit Range	Default & Access	Field Name (ID): Description
16	0x0 RO	**RSVD0:** Reserved
15	0x0 RO/V	**Command List Running (CR):** When this bit is set it indicates that the command list DMA engine for the port is running.
14	0x0 RO/V	**FIS Receive Running (FR):** When this bit is set it indicates that the FIS Receive DMA engine for the port is running. Note to software: When FR bit stays set, please read the PxIS.PCS and PxSERR.DET.X to service the PCS interrupt accordingly if any
13	0x0 RO/V	**Mechanical Presence Switch State (MPSS):** The MPSS bit reports the state of a mechanical presence switch attached to this port. If CAP.SMPS is set to 1 and the mechanical presence switch is closed then this bit is cleared to 0. If CAP.SMPS is set to 1 and the mechanical presence switch is open then this bit is set to 1. If CAP.SMPS is set to 0 then this bit is cleared to 0. Software should only use this bit if both CAP.SMPS and PxCMD.MPSP are set to 1.
12:8	0x0 RO	**Current Command Slot (CCS):** Indicates the current command slot the HBA is processing. This field is valid when the PxCMD.ST bit is set, and is constantly updated by the HBA. This field can be updated as soon as the HBA recognizes an active command slot, or at some point soon after when it begins processing the command. When PxCMD.ST transitions from a 1 to a 0, the HBA will reset this field to 0. After PxCMD.ST transitions from 0 to 1, the highest priority slot to issue from next is command slot 0. After the first command has been issued, the highest priority slot to issue from next is PxCMD.CCS + 1. For example, after the HBA has issued its first command, if PxCMD.CCS = 0h and PxCI is set to 3h, the next command that will be issued is from command slot 1.
7:5	0x0 RO	**RSVD1:** Reserved
4	0x0 RW	**FIS Receive Enable (FRE):** When set, the HBA may post received FISes into the FIS receive area pointed to by PxFB and PxFBU. When cleared, received FISes are not accepted by the HBA, except for the first D2H register FIS after the initialization sequence.
3	0x0 RW/1S	**Command List Override (CLO):** Setting this bit to 1 causes PxTFD.STS.BSY and PxTFD.STS.DRQ to be cleared to 0. This allows a software reset to be transmitted to the device regardless of whether the BSY and DRQ bits are still set in the PxTFD.STS register. The HBA sets this bit to 0 when PxTFD.STS.BSY and PxTFD.STS.DRQ have been cleared to 0. A write to this register with a value of 0 shall have no effect.
2	0x1 RO	**Power On Device (POD):** The SATA controller does not support cold presence detect.
1	0x0 RW/V	**Spin-Up Device (SUD):** This bit is read/write for HBAs that support staggered spin-up via CAP.SSS. This bit is read only 1. for HBAs that do not support staggered spin-up. On an edge detect from 0. to 1, the HBA shall start a COMRESET initialization sequence to the device. Clearing this bit causes no action on the interface. Clearing this bit to0 does not cause any OOB signal to be sent on the interface. When this bit is cleared to 0. and PxSCTL.DET = 0h, the HBA will enter listen mode.
0	0x0 RW	**Start (ST):** When set, the HBA may process the command list. When cleared, the HBA may not process the command list. Whenever this bit is changed from a 0 to a 1, the HBA starts processing the command list at entry 0. Whenever this bit is changed from a 1 to a 0, the PxCI and PxSACT register is cleared by the HBA upon the HBA putting the controller into an idle state. PxTFD shall be updated also.

50.4.45 Port [0-7] Serial ATA Status (PxSSTS2)—Offset 228h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 228h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RO	**RSVD0:** Reserved
11:8	0x0 RO/V	**Interface Power Management (IPM):** Indicates the current interface state
7:4	0x0 RO/V	**Current Interface Speed (SPD):** Indicates the negotiated interface communication speed.
3:0	0x0 RO/V	**Device Detection (DET):** Indicates the interface device detection and Phy state.

50.4.46 Port [0-7] Serial ATA Control (PxSCTL2)—Offset 22Ch

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 22Ch

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RO	**RSVD0:** Reserved
19:16	0x0 RW	**Port Multiplier Port (PMP):** This field is not used by AHCI.
15:12	0x0 RW	**Select Power Management (SPM):** This field is not used by AHCI.
11:8	0x0 RW	**Interface Power Management Transitions Allowed (IPM):** Indicates which power states the HBA is allowed to transition to. If an interface power management state is not allowed via this register field, the HBA will not initiate that state and the HBA will PMNAKP any request from the device to enter that state.
7:4	0x0 RW	**Speed Allowed (SPD):** Indicates the highest allowable speed of the interface.
3:0	0x0 RW	**Device Detection Initialization (DET):** Controls the HBA.s device detection and interface initialization.

50.4.47 Port [0-7] Serial ATA Error (PxSERR2)—Offset 230h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 230h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW/1C/V	**Diagnostics (DIAG):** Contains diagnostic error information for use by diagnostic software in validating correct operation or isolating failure modes.
15:0	0x0 RW/1C/V	**Error (ERR):** The ERR field contains error information for use by host software in determining the appropriate response to the error condition. If one or more of bits 11:8 of this register are set, the controller will stop the current transfer.

50.4.48 Port [0-7] Serial ATA Active (PxSACT2)—Offset 234h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 234h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/1S/V	**Device Status (DS):** System software sets this bit for native command queuing commands prior to setting the PxCI.CI bit in the same command slot entry. This field is cleared via the Set Device Bits FIS.

50.4.49 Port [0-7] Commands Issued (PxCI2)—Offset 238h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 238h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/1S/V	**Commands Issued (CI):** This field is set by software to indicate to the HBA that a command has been built in system memory for a command slot and may be sent to the device. When the HBA receives a FIS which clears the BSY, ERR, and DRQ bits for the command, it clears the corresponding bit in this register for that command slot. Bits in this field shall only be set to 1 by software when PxCMD.ST is set to 1.

50.4.50 Port [0-7] SNotification (PxSNTF2)—Offset 23Ch

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 23Ch

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD0:** Reserved
15:0	0x0 RW/1C	**PM Notify (PMN):** This field indicates whether a particular device with the corresponding PM Port number issued a Set Device Bits FIS to the host with the Notification bit set. PM Port 0h sets bit 0. PM Port Fh sets bit 15. Individual bits are cleared by software writing 1's to the corresponding bit positions. Note that, while this field is reset to default on a HBA Reset, it is not reset by COMRESET or SRST

50.4.51 Port [0-7] Command List Base Address (PxCLB3)—Offset 280h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 280h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0x0 RW	**Command List Base Address (CLB):** Indicates the 32-bit base for the command list for this port. This base is used when fetching commands to execute. This address must be 1K aligned as indicated by bits 31:10 being read/write. ***Note:*** These bits are not reset on a HBA reset.
9:0	0x0 RO	**RSVD0:** Reserved

50.4.52 Port [0-7] Command List Base Address Upper 32-bits (PxCLBU3)—Offset 284h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 284h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Command List Base Address Upper (CLBU):** Indicates the upper 32-bits for the command list base address for this port. This base is used when fetching commands to execute. Note that these bits are not reset on a HBA reset.

50.4.53 Port [0-7] FIS Base Address (PxFB3)—Offset 288h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 288h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RW	**FIS Base Address (FB):** Indicates the 32-bit base for received FISes. This address must be 256-byte aligned as indicated by bits 31:08 being read/write. When FIS-based switching is in use, this structure is 4KB in length and the address shall be 4KB aligned. ***Note:*** These bits are not reset on a HBA reset.
7:0	0x0 RO	**RSVD0:** Reserved

50.4.54 Port [0-7] FIS Base Address Upper 32-bits (PxFBU3)—Offset 28Ch

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 28Ch

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**FIS Base Address Upper (FBU):** Indicates the upper 32-bits for the received FIS base for this port. ***Note:*** These bits are not reset on a HBA reset.

50.4.55 Port [0-7] Interrupt Status (PxIS3)—Offset 290h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 290h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**Cold Presence Detect Status (CPDS):** The SATA controller does not support cold presence detect.
30	0x0 RW/1C/V	**Task File Error Status (TFES):** This bit is set whenever the status register is updated by the device and the error bit (bit 0 of the Status field in the received FIS) is set.
29	0x0 RW/1C/V	**Host Bus Fatal Error Status (HBFS):** Indicates that the HBA encountered a host bus error that it cannot recover from, such as a bad software pointer. In PCI, such an indication would be a target or master abort.
28	0x0 RW/1C/V	**Host Bus Data Error Status (HBDS):** Indicates that the HBA encountered a data error (uncorrectable ECC / parity) when reading from or writing to system memory.
27	0x0 RW/1C/V	**Interface Fatal Error Status (IFS):** Indicates that the HBA encountered an error on the SATA interface which caused the transfer to stop.
26	0x0 RW/1C/V	**Interface Non-fatal Error Status (INFS):** Indicates that the HBA encountered an error on the SATA interface but was able to continue operation.
25	0x0 RO	**RSVD0:** Reserved
24	0x0 RW/1C/V	**Overflow Status (OFS):** Indicates that the HBA received more bytes from a device than was specified in the PRD table for the command.
23	0x0 RW/1C	**Incorrect Port Multiplier Status (IPMS):** Indicates that the HBA received a FIS from a device whose port multiplier field did not match what was expected. The IPMS bit may be set during enumeration process. It is recommended that IPMS only be used after enumeration is complete on the Port Multiplier.
22	0x0 RO/V	**PhyRdy Change Status (PRCS):** When set to one indicates the internal PhyRdy signal changed state. This bit reflects the state of PxSERR.DIAG.N. This bit is RO and is only cleared when PxSERR.DIAG.N is cleared.
21:8	0x0 RO	**RSVD1:** Reserved
7	0x0 RW/1C/V	**Device Mechanical Presence Status (DMPS):** When set, indicates that a platform mechanical presence switch has been opened or closed, which may lead to a change in the connection state of the device. This bit is only valid in systems that support mechanical presence switch (CAP.SMPS and PxCMD.MPSP are set).
6	0x0 RO/V	**Port Connect Change Status (PCS):** 1=Change in Current Connect Status. 0=No change in Current Connect Status. This bit reflects the state of PxSERR.DIAG.X. This bit is only cleared when PxSERR.DIAG.X is cleared.
5	0x0 RW/1C/V	**Descriptor Processed (DPS):** A PRD with the I. bit set has transferred all of its data.
4	0x0 RO/V	**Unknown FIS Interrupt (UFS):** When set to 1 indicates that an unknown FIS was received and has been copied into system memory. This bit is cleared to 0 by software clearing the PxSERR.DIAG.F bit to 0. ***Note:*** This bit does not directly reflect the PxSERR.DIAG.F bit. PxSERR.DIAG.F is set immediately when an unknown FIS is detected, whereas this bit is set when the FIS is posted to memory. Software should wait to act on an unknown FIS until this bit is set to 1 or the two bits may become out of sync.

Bit Range	Default & Access	Field Name (ID): Description
3	0x0 RW/1C/V	**Set Device Bits Interrupt (SDBS):** A Set Device Bits FIS has been received with the I. bit set and has been copied into system memory.
2	0x0 RW/1C/V	**DMA Setup FIS Interrupt (DSS):** A DMA Setup FIS has been received with the I. bit set and has been copied into system memory.
1	0x0 RW/1C/V	**PIO Setup FIS Interrupt (PSS):** A PIO Setup FIS has been received with the I. bit set, it has been copied into system memory, and the data related to that FIS has been transferred. This bit shall be set even if the data transfer resulted in an error.
0	0x0 RW/1C/V	**Device to Host Register FIS Interrupt (DHRS):** A D2H register FIS has been received with the I. bit set, and has been copied into system memory.

50.4.56 Port [0-7] Interrupt Enable (PxIE3)—Offset 294h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 294h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**Cold Presence Detect Enable (CPDS):** The SATA controller does not support cold presence detect.
30	0x0 RW	**Task File Error Enable (TFEE):** When set, GHC.IE is set, and P0S.TFES is set, the HBA shall generate an interrupt.
29	0x0 RW	**Host Bus Fatal Error Enable (HBFE):** When set, GHC.IE is set, and P0IS.HBFS is set, the HBA shall generate an interrupt.
28	0x0 RW	**Host Bus Data Error Enable (HBDE):** when set, GHC.IE is set, and P0IS.HBDS is set, the HBA shall generate an interrupt.
27	0x0 RW	**Interface Fatal Error Enable (IFE):** When set, GHC.IE is set, and P0IS.IFS is set, the HBA shall generate an interrupt.
26	0x0 RW	**Interface Non-fatal Error Enable (INFE):** When set, GHC.IE is set, and P0IS.INFS is set, the HBA shall generate an interrupt.
25	0x0 RO	**RSVD0:** Reserved
24	0x0 RW	**Overflow Enable (OFE):** When set, and GHC.IE and P0IS.OFS are set, the HBA shall generate an interrupt.
23	0x0 RW	**Incorrect Port Multiplier Enable (IPME):** When set, and GHC.IE and P0IS.IPMS are set, the HBA shall generate an interrupt. BIOS is required to program this field to '0'. The same applies to AHCI driver.
22	0x0 RW	**PhyRdy Change Interrupt Enable (PRCE):** When set, and GHC.IE is set, and PxIS.PRCS is set, the HBA shall generate an interrupt.
21:8	0x0 RO	**RSVD1:** Reserved
7	0x0 RW/V	**Device Mechanical Enable (DMPE):** When set, and P0IS.DMPS is set, the HBA shall generate an interrupt.
6	0x0 RW	**Port Change Interrupt Enable (PCE):** When set, GHC.IE is set, and P0IS.PCS is set, the HBA shall generate an interrupt.
5	0x0 RW	**Descriptor Processed Interrupt Enable (DPE):** When set, GHC.IE is set, and P0IS.DPS is set, the HBA shall generate an interrupt.
4	0x0 RW	**Unknown FIS Interrupt Enable (UFE):** When set, GHC.IE is set, and PxIS.UFS is set to 1, the HBA shall generate an interrupt.
3	0x0 RW	**Set Device Bits FIS Interrupt Enable (SDBE):** When set, GHC.IE is set, and P0IS.SDBS is set, the HBA shall generate an interrupt.
2	0x0 RW	**DMA Setup FIS Interrupt Enable (DSE):** When set, GHC.IE is set, and P0IS.DSS is set, the HBA shall generate an interrupt.
1	0x0 RW	**PIO Setup FIS Interrupt Enable (PSE):** When set, GHC.IE is set, and P0IS.PSS is set, the HBA shall generate an interrupt.
0	0x0 RW	**Device to Host Register FIS Interrupt Enable (DHRE):** When set, GHC.IE is set, and P0IS.DHRS is set, the HBA shall generate an interrupt.

50.4.57 Port [0-7] Command (PxCMD3)—Offset 298h

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [ABAR] + 298h

Default: 00000004h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RW	**Interface Communication Control (ICC):** This is a four bit field which can be used to control reset and power states of the interface. If the Link layer is currently in the L_IDLE state, writes to this field shall cause the HBA to initiate a transition to the interface power management state requested. If the Link layer is not currently in the L_IDLE state, writes to this field shall have no effect.
27	0x0 RW	**Aggressive Slumber Partial (ASP):** When set to 1, and the ALPE bit is set, the HBA shall aggressively enter the Slumber state when it clears a bit in the PxCI or PxSACT register and the register values are then PxCI = 0h and PxSACT = 0h. When cleared, and the ALPE bit is set, the HBA will aggressively enter the Partial state when it clears a bit in the PxCI or PxSACT register and the register values are then PxCI = 0h and PxSACT = 0h. If CAP.SALP is cleared to 0., software shall treat this bit as reserved.
26	0x0 RW	**Aggressive Link Power Management Enable (ALPE):** When set, the HBA will aggressively enter a lower link power state (Partial or Slumber) based upon the setting of the ASP bit. Software shall only set this bit to 1 if CAP.SALP is set to 1. If CAP.SALP is cleared to 0, software shall treat this bit as reserved. BIOS is recommended to program this field to 1.
25	0x0 RW	**Drive LED on ATAPI Enable (DLAE):** When set, the HBA will drive the LED pin active for commands regardless of the state of PxCMD.ATAPI. When cleared, the HBA will only drive the LED pin active for commands if PxCMD.ATAPI is set to 0. This bit is set by software.
24	0x0 RW	**Device is ATAPI (ATAPI):** When set, the connected device is an ATAPI device. This bit is used by the HBA to control whether or not to generate the desktop LED when commands are active.
23	0x0 RW	**Automatic Partial to Slumber Transitions Enabled (APSTE):** When set to 1., the HBA may perform Automatic Partial to Slumber Transitions. When cleared to 0. the port shall not perform Automatic Partial to Slumber Transitions. Software shall only set this bit to 1. if CAP2.APST is set to 1.; if CAP2.APST is cleared to 0. software shall treat this bit as reserved.
22	0x0 RO	**FIS-based Switching Capable Port (FBSCP):** The SATA controller does not support FIS-Based Switching.
21	0x0 RW/O	**External SATA Port (ESP):** When set to 1, indicates that this port is routed externally and will be used with an external SATA device. When set to 1, CAP.SXS must also be set to 1. When cleared (0), indicates that this port is not routed externally and supports internal SATA devices only. If ESP is set to '1', then the port may experience hot plug events.
20	0x0 RO	**Cold Presence Detection (CPD):** The SATA controller does not support cold presence detect.
19	0x0 RW/O	**Mechanical Presence Switch Attached to Port (MPSP):** If set to 1, the platform supports a mechanical presence switch attached to this port. If cleared to 0, the platform does not support a mechanical presence switch attached to this port.
18	0x0 RW/O	**Hot Plug Capable Port (HPCP):** This indicates whether the this port is connected to a device which can be hot plugged. SATA by definition is hot-pluggable, but not all platforms are constructed to allow the device to be removed (it may be screwed into the chassis, for example). This bit can be used by system software to indicate a feature such as eject device to the end-user.
17	0x0 RW/V	**Port Multiplier Attached (PMA):** When set, a Port Multiplier is attached to the HBA for this port. When cleared, a Port Multiplier is not attached to the HBA for this port. This bit is a read only 0. when CAP.PMS = 0., and read/write when CAP.PMS = 1. Note that this bit is set by software; hardware does not auto-detect that a Port Multiplier is attached.

Bit Range	Default & Access	Field Name (ID): Description
16	0x0 RO	**RSVD0:** Reserved
15	0x0 RO/V	**Command List Running (CR):** When this bit is set it indicates that the command list DMA engine for the port is running.
14	0x0 RO/V	**FIS Receive Running (FR):** When this bit is set it indicates that the FIS Receive DMA engine for the port is running. Note to software: When FR bit stays set, please read the PxIS.PCS and PxSERR.DET.X to service the PCS interrupt accordingly if any
13	0x0 RO/V	**Mechanical Presence Switch State (MPSS):** The MPSS bit reports the state of a mechanical presence switch attached to this port. If CAP.SMPS is set to 1 and the mechanical presence switch is closed then this bit is cleared to 0. If CAP.SMPS is set to 1 and the mechanical presence switch is open then this bit is set to 1. If CAP.SMPS is set to 0 then this bit is cleared to 0. Software should only use this bit if both CAP.SMPS and PxCMD.MPSP are set to 1.
12:8	0x0 RO	**Current Command Slot (CCS):** Indicates the current command slot the HBA is processing. This field is valid when the PxCMD.ST bit is set, and is constantly updated by the HBA. This field can be updated as soon as the HBA recognizes an active command slot, or at some point soon after when it begins processing the command. When PxCMD.ST transitions from a 1 to a 0, the HBA will reset this field to 0. After PxCMD.ST transitions from 0 to 1, the highest priority slot to issue from next is command slot 0. After the first command has been issued, the highest priority slot to issue from next is PxCMD.CCS + 1. For example, after the HBA has issued its first command, if PxCMD.CCS = 0h and PxCI is set to 3h, the next command that will be issued is from command slot 1.
7:5	0x0 RO	**RSVD1:** Reserved
4	0x0 RW	**FIS Receive Enable (FRE):** When set, the HBA may post received FISes into the FIS receive area pointed to by PxFB and PxFBU. When cleared, received FISes are not accepted by the HBA, except for the first D2H register FIS after the initialization sequence.
3	0x0 RW/1S	**Command List Override (CLO):** Setting this bit to 1 causes PxTFD.STS.BSY and PxTFD.STS.DRQ to be cleared to 0. This allows a software reset to be transmitted to the device regardless of whether the BSY and DRQ bits are still set in the PxTFD.STS register. The HBA sets this bit to 0 when PxTFD.STS.BSY and PxTFD.STS.DRQ have been cleared to 0. A write to this register with a value of 0 shall have no effect.
2	0x1 RO	**Power On Device (POD):** The SATA controller does not support cold presence detect.
1	0x0 RW/V	**Spin-Up Device (SUD):** This bit is read/write for HBAs that support staggered spin-up via CAP.SSS. This bit is read only 1. for HBAs that do not support staggered spin-up. On an edge detect from 0. to 1, the HBA shall start a COMRESET initialization sequence to the device. Clearing this bit causes no action on the interface. Clearing this bit to0 does not cause any OOB signal to be sent on the interface. When this bit is cleared to 0. and PxSCTL.DET = 0h, the HBA will enter listen mode.
0	0x0 RW	**Start (ST):** When set, the HBA may process the command list. When cleared, the HBA may not process the command list. Whenever this bit is changed from a 0 to a 1, the HBA starts processing the command list at entry 0. Whenever this bit is changed from a 1 to a 0, the PxCI and PxSACT register is cleared by the HBA upon the HBA putting the controller into an idle state. PxTFD shall be updated also.

50.4.58 Port [0-7] Serial ATA Status (PxSSTS3)—Offset 2A8h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 2A8h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RO	**RSVD0:** Reserved
11:8	0x0 RO/V	**Interface Power Management (IPM):** Indicates the current interface state
7:4	0x0 RO/V	**Current Interface Speed (SPD):** Indicates the negotiated interface communication speed.
3:0	0x0 RO/V	**Device Detection (DET):** Indicates the interface device detection and Phy state.

50.4.59 Port [0-7] Serial ATA Control (PxSCTL3)—Offset 2ACh

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 2ACh

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RO	**RSVD0:** Reserved
19:16	0x0 RW	**Port Multiplier Port (PMP):** This field is not used by AHCI.
15:12	0x0 RW	**Select Power Management (SPM):** This field is not used by AHCI.
11:8	0x0 RW	**Interface Power Management Transitions Allowed (IPM):** Indicates which power states the HBA is allowed to transition to. If an interface power management state is not allowed via this register field, the HBA will not initiate that state and the HBA will PMNAKP any request from the device to enter that state.
7:4	0x0 RW	**Speed Allowed (SPD):** Indicates the highest allowable speed of the interface.
3:0	0x0 RW	**Device Detection Initialization (DET):** Controls the HBA.s device detection and interface initialization.

50.4.60 Port [0-7] Serial ATA Error (PxSERR3)—Offset 2B0h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 2B0h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW/1C/V	**Diagnostics (DIAG):** Contains diagnostic error information for use by diagnostic software in validating correct operation or isolating failure modes.
15:0	0x0 RW/1C/V	**Error (ERR):** The ERR field contains error information for use by host software in determining the appropriate response to the error condition. If one or more of bits 11:8 of this register are set, the controller will stop the current transfer.

50.4.61 Port [0-7] Serial ATA Active (PxSACT3)—Offset 2B4h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 2B4h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/1S/V	**Device Status (DS):** System software sets this bit for native command queuing commands prior to setting the PxCI.CI bit in the same command slot entry. This field is cleared via the Set Device Bits FIS.

50.4.62 Port [0-7] Commands Issued (PxCI3)—Offset 2B8h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 2B8h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/1S/V	**Commands Issued (CI):** This field is set by software to indicate to the HBA that a command has been built in system memory for a command slot and may be sent to the device. When the HBA receives a FIS which clears the BSY, ERR, and DRQ bits for the command, it clears the corresponding bit in this register for that command slot. Bits in this field shall only be set to 1 by software when PxCMD.ST is set to 1.

50.4.63 Port [0-7] SNotification (PxSNTF3)—Offset 2BCh

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 2BCh

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD0:** Reserved
15:0	0x0 RW/1C/V	**PM Notify (PMN):** This field indicates whether a particular device with the corresponding PM Port number issued a Set Device Bits FIS to the host with the Notification bit set. PM Port 0h sets bit 0. PM Port Fh sets bit 15. Individual bits are cleared by software writing 1's to the corresponding bit positions. Note that, while this field is reset to default on a HBA Reset, it is not reset by COMRESET or SRST

50.4.64 Port [0-7] Command List Base Address (PxCLB4)—Offset 300h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 300h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0x0 RW	**Command List Base Address (CLB):** Indicates the 32-bit base for the command list for this port. This base is used when fetching commands to execute. This address must be 1K aligned as indicated by bits 31:10 being read/write. Note that these bits are not reset on a HBA reset.
9:0	0x0 RO	**RSVD0:** Reserved

50.4.65 Port [0-7] Command List Base Address Upper 32-bits (PxCLBU4)—Offset 304h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 304h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Command List Base Address Upper (CLBU):** Indicates the upper 32-bits for the command list base address for this port. This base is used when fetching commands to execute. ***Note:*** These bits are not reset on a HBA reset.

50.4.66 Port [0-7] FIS Base Address (PxFB4)—Offset 308h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 308h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RW	**FIS Base Address (FB):** Indicates the 32-bit base for received FISes. This address must be 256-byte aligned as indicated by bits 31:08 being read/write. When FIS-based switching is in use, this structure is 4KB in length and the address shall be 4KB aligned. ***Note:*** These bits are not reset on a HBA reset.
7:0	0x0 RO	**RSVD0:** Reserved

50.4.67 Port [0-7] FIS Base Address Upper 32-bits (PxFBU4)—Offset 30Ch

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 30Ch

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**FIS Base Address Upper (FBU):** Indicates the upper 32-bits for the received FIS base for this port. ***Note:*** These bits are not reset on a HBA reset.

50.4.68 Port [0-7] Interrupt Status (PxIS4)—Offset 310h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 310h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**Cold Presence Detect Status (CPDS):** The SATA controller does not support cold presence detect.
30	0x0 RW/1C/V	**Task File Error Status (TFES):** This bit is set whenever the status register is updated by the device and the error bit (bit 0 of the Status field in the received FIS) is set.
29	0x0 RW/1C/V	**Host Bus Fatal Error Status (HBFS):** Indicates that the HBA encountered a host bus error that it cannot recover from, such as a bad software pointer. In PCI, such an indication would be a target or master abort.
28	0x0 RW/1C/V	**Host Bus Data Error Status (HBDS):** Indicates that the HBA encountered a data error (uncorrectable ECC / parity) when reading from or writing to system memory.
27	0x0 RW/1C/V	**Interface Fatal Error Status (IFS):** Indicates that the HBA encountered an error on the SATA interface which caused the transfer to stop.
26	0x0 RW/1C/V	**Interface Non-fatal Error Status (INFS):** Indicates that the HBA encountered an error on the SATA interface but was able to continue operation.
25	0x0 RO	**RSVD0:** Reserved
24	0x0 RW/1C/V	**Overflow Status (OFS):** Indicates that the HBA received more bytes from a device than was specified in the PRD table for the command.
23	0x0 RW/1C/V	**Incorrect Port Multiplier Status (IPMS):** Indicates that the HBA received a FIS from a device whose port multiplier field did not match what was expected. The IPMS bit may be set during enumeration process. It is recommended that IPMS only be used after enumeration is complete on the Port Multiplier.
22	0x0 RO/V	**PhyRdy Change Status (PRCS):** When set to one indicates the internal PhyRdy signal changed state. This bit reflects the state of PxSERR.DIAG.N. This bit is RO and is only cleared when PxSERR.DIAG.N is cleared.
21:8	0x0 RO	**RSVD1:** Reserved
7	0x0 RW/1C/V	**Device Mechanical Presence Status (DMPS):** When set, indicates that a platform mechanical presence switch has been opened or closed, which may lead to a change in the connection state of the device. This bit is only valid in systems that support mechanical presence switch (CAP.SMPS and PxCMD.MPSP are set).
6	0x0 RO/V	**Port Connect Change Status (PCS):** • 1=Change in Current Connect Status. • 0=No change in Current Connect Status. This bit reflects the state of PxSERR.DIAG.X. This bit is only cleared when PxSERR.DIAG.X is cleared.
5	0x0 RW/1C/V	**Descriptor Processed (DPS):** A PRD with the I. bit set has transferred all of its data.
4	0x0 RO/V	**Unknown FIS Interrupt (UFS):** When set to 1 indicates that an unknown FIS was received and has been copied into system memory. This bit is cleared to 0 by software clearing the PxSERR.DIAG.F bit to 0. ***Note:*** This bit does not directly reflect the PxSERR.DIAG.F bit. PxSERR.DIAG.F is set immediately when an unknown FIS is detected, whereas this bit is set when the FIS is posted to memory. Software should wait to act on an unknown FIS until this bit is set to 1 or the two bits may become out of sync.

Bit Range	Default & Access	Field Name (ID): Description
3	0x0 RW/1C/V	**Set Device Bits Interrupt (SDBS):** A Set Device Bits FIS has been received with the I. bit set and has been copied into system memory.
2	0x0 RW/1C/V	**DMA Setup FIS Interrupt (DSS):** A DMA Setup FIS has been received with the I. bit set and has been copied into system memory.
1	0x0 RW/1C/V	**PIO Setup FIS Interrupt (PSS):** A PIO Setup FIS has been received with the I. bit set, it has been copied into system memory, and the data related to that FIS has been transferred. This bit shall be set even if the data transfer resulted in an error.
0	0x0 RW/1C/V	**Device to Host Register FIS Interrupt (DHRS):** A D2H register FIS has been received with the I. bit set, and has been copied into system memory.

50.4.69 Port [0-7] Interrupt Enable (PxIE4)—Offset 314h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 314h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**Cold Presence Detect Enable (CPDS):** The SATA controller does not support cold presence detect.
30	0x0 RW	**Task File Error Enable (TFEE):** When set, GHC.IE is set, and P0S.TFES is set, the HBA shall generate an interrupt.
29	0x0 RW	**Host Bus Fatal Error Enable (HBFE):** When set, GHC.IE is set, and P0IS.HBFS is set, the HBA shall generate an interrupt.
28	0x0 RW	**Host Bus Data Error Enable (HBDE):** when set, GHC.IE is set, and P0IS.HBDS is set, the HBA shall generate an interrupt.
27	0x0 RW	**Interface Fatal Error Enable (IFE):** When set, GHC.IE is set, and P0IS.IFS is set, the HBA shall generate an interrupt.
26	0x0 RW	**Interface Non-fatal Error Enable (INFE):** When set, GHC.IE is set, and P0IS.INFS is set, the HBA shall generate an interrupt.
25	0x0 RO	**RSVD0:** Reserved
24	0x0 RW	**Overflow Enable (OFE):** When set, and GHC.IE and P0IS.OFS are set, the HBA shall generate an interrupt.
23	0x0 RW	**Incorrect Port Multiplier Enable (IPME):** When set, and GHC.IE and P0IS.IPMS are set, the HBA shall generate an interrupt. BIOS is required to program this field to '0'. The same applies to AHCI driver.
22	0x0 RW	**PhyRdy Change Interrupt Enable (PRCE):** When set, and GHC.IE is set, and PxIS.PRCS is set, the HBA shall generate an interrupt.
21:8	0x0 RO	**RSVD1:** Reserved
7	0x0 RW/V	**Device Mechanical Enable (DMPE):** When set, and P0IS.DMPS is set, the HBA shall generate an interrupt.
6	0x0 RW	**Port Change Interrupt Enable (PCE):** When set, GHC.IE is set, and P0IS.PCS is set, the HBA shall generate an interrupt.
5	0x0 RW	**Descriptor Processed Interrupt Enable (DPE):** When set, GHC.IE is set, and P0IS.DPS is set, the HBA shall generate an interrupt.
4	0x0 RW	**Unknown FIS Interrupt Enable (UFE):** When set, GHC.IE is set, and PxIS.UFS is set to 1, the HBA shall generate an interrupt.
3	0x0 RW	**Set Device Bits FIS Interrupt Enable (SDBE):** When set, GHC.IE is set, and P0IS.SDBS is set, the HBA shall generate an interrupt.
2	0x0 RW	**DMA Setup FIS Interrupt Enable (DSE):** When set, GHC.IE is set, and P0IS.DSS is set, the HBA shall generate an interrupt.
1	0x0 RW	**PIO Setup FIS Interrupt Enable (PSE):** When set, GHC.IE is set, and P0IS.PSS is set, the HBA shall generate an interrupt.
0	0x0 RW	**Device to Host Register FIS Interrupt Enable (DHRE):** When set, GHC.IE is set, and P0IS.DHRS is set, the HBA shall generate an interrupt.

50.4.70 Port [0-7] Command (PxCMD4)—Offset 318h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000004h

BAR and Offset: [ABAR] + 318h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RW	**Interface Communication Control (ICC):** This is a four bit field which can be used to control reset and power states of the interface. If the Link layer is currently in the L_IDLE state, writes to this field shall cause the HBA to initiate a transition to the interface power management state requested. If the Link layer is not currently in the L_IDLE state, writes to this field shall have no effect.
27	0x0 RW	**Aggressive Slumber Partial (ASP):** When set to 1, and the ALPE bit is set, the HBA shall aggressively enter the Slumber state when it clears a bit in the PxCI or PxSACT register and the register values are then PxCI = 0h and PxSACT = 0h. When cleared, and the ALPE bit is set, the HBA will aggressively enter the Partial state when it clears a bit in the PxCI or PxSACT register and the register values are then PxCI = 0h and PxSACT = 0h. If CAP.SALP is cleard to 0., software shall treat this bit as reserved.
26	0x0 RW	**Aggressive Link Power Management Enable (ALPE):** When set, the HBA will aggressively enter a lower link power state (Partial or Slumber) based upon the setting of the ASP bit. Software shall only set this bit to 1 if CAP.SALP is set to 1. If CAP.SALP is cleared to 0, software shall treat this bit as reserved. BIOS is recommended to program this field to 1.
25	0x0 RW	**Drive LED on ATAPI Enable (DLAE):** When set, the HBA will drive the LED pin active for commands regardless of the state of PxCMD.ATAPI. When cleared, the HBA will only drive the LED pin active for commands if PxCMD.ATAPI is set to 0. This bit is set by software.
24	0x0 RW	**Device is ATAPI (ATAPI):** When set, the connected device is an ATAPI device. This bit is used by the HBA to control whether or not to generate the desktop LED when commands are active.
23	0x0 RW	**Automatic Partial to Slumber Transitions Enabled (APSTE):** When set to 1., the HBA may perform Automatic Partial to Slumber Transitions. When cleared to 0. the port shall not perform Automatic Partial to Slumber Transitions. Software shall only set this bit to 1. if CAP2.APST is set to 1.; if CAP2.APST is cleared to 0. software shall treat this bit as reserved.
22	0x0 RO	**FIS-based Switching Capable Port (FBSCP):** The SATA controller does not support FIS-Based Switching.
21	0x0 RW/O	**External SATA Port (ESP):** When set to 1, indicates that this port is routed externally and will be used with an external SATA device. When set to 1, CAP.SXS must also be set to 1. When cleared (0), indicates that this port is not routed externally and supports internal SATA devices only. If ESP is set to '1', then the port may experience hot plug events.
20	0x0 RO	**Cold Presence Detection (CPD):** The SATA controller does not support cold presence detect.
19	0x0 RW/O	**Mechanical Presence Switch Attached to Port (MPSP):** If set to 1, the platform supports a mechanical presence switch attached to this port. If cleared to 0, the platform does not support a mechanical presence switch attached to this port.
18	0x0 RW/O	**Hot Plug Capable Port (HPCP):** This indicates whether this port is connected to a device which can be hot plugged. SATA by definition is hot-pluggable, but not all platforms are constructed to allow the device to be removed (it may be screwed into the chassis, for example). This bit can be used by system software to indicate a feature such as eject device to the end-user.
17	0x0 RW/V	**Port Multiplier Attached (PMA):** When set, a Port Multiplier is attached to the HBA for this port. When cleared, a Port Multiplier is not attached to the HBA for this port. This bit is a read only 0 when CAP.PMS = 0., and read/write when CAP.PMS = 1. Note that this bit is set by software; hardware does not auto-detect that a Port Multiplier is attached.

Bit Range	Default & Access	Field Name (ID): Description
16	0x0 RO	**RSVD0:** Reserved
15	0x0 RO/V	**Command List Running (CR):** When this bit is set it indicates that the command list DMA engine for the port is running.
14	0x0 RO/V	**FIS Receive Running (FR):** When this bit is set it indicates that the FIS Receive DMA engine for the port is running. Note to software: When FR bit stays set, please read the PxIS.PCS and PxSERR.DET.X to service the PCS interrupt accordingly if any
13	0x0 RO/V	**Mechanical Presence Switch State (MPSS):** The MPSS bit reports the state of a mechanical presence switch attached to this port. If CAP.SMPS is set to 1 and the mechanical presence switch is closed then this bit is cleared to 0. If CAP.SMPS is set to 1 and the mechanical presence switch is open then this bit is set to 1. If CAP.SMPS is set to 0 then this bit is cleared to 0. Software should only use this bit if both CAP.SMPS and PxCMD.MPSP are set to 1.
12:8	0x0 RO	**Current Command Slot (CCS):** Indicates the current command slot the HBA is processing. This field is valid when the PxCMD.ST bit is set, and is constantly updated by the HBA. This field can be updated as soon as the HBA recognizes an active command slot, or at some point soon after when it begins processing the command. When PxCMD.ST transitions from a 1 to a 0, the HBA will reset this field to 0. After PxCMD.ST transitions from 0 to 1, the highest priority slot to issue from next is command slot 0. After the first command has been issued, the highest priority slot to issue from next is PxCMD.CCS + 1. For example, after the HBA has issued its first command, if PxCMD.CCS = 0h and PxCI is set to 3h, the next command that will be issued is from command slot 1.
7:5	0x0 RO	**RSVD1:** Reserved
4	0x0 RW	**FIS Receive Enable (FRE):** When set, the HBA may post received FISes into the FIS receive area pointed to by PxFB and PxFBU. When cleared, received FISes are not accepted by the HBA, except for the first D2H register FIS after the initialization sequence.
3	0x0 RW/1S	**Command List Override (CLO):** Setting this bit to 1 causes PxTFD.STS.BSY and PxTFD.STS.DRQ to be cleared to 0. This allows a software reset to be transmitted to the device regardless of whether the BSY and DRQ bits are still set in the PxTFD.STS register. The HBA sets this bit to 0 when PxTFD.STS.BSY and PxTFD.STS.DRQ have been cleared to 0. A write to this register with a value of 0 shall have no effect.
2	0x1 RO	**Power On Device (POD):** The SATA controller does not support cold presence detect.
1	0x0 RW/V	**Spin-Up Device (SUD):** This bit is read/write for HBAs that support staggered spin-up via CAP.SSS. This bit is read only 1. for HBAs that do not support staggered spin-up. On an edge detect from 0. to 1, the HBA shall start a COMRESET initialization sequence to the device. Clearing this bit causes no action on the interface. Clearing this bit to0 does not cause any OOB signal to be sent on the interface. When this bit is cleared to 0. and PxSCTL.DET = 0h, the HBA will enter listen mode.
0	0x0 RW	**Start (ST):** When set, the HBA may process the command list. When cleared, the HBA may not process the command list. Whenever this bit is changed from a 0 to a 1, the HBA starts processing the command list at entry 0. Whenever this bit is changed from a 1 to a 0, the PxCI and PxSACT register is cleared by the HBA upon the HBA putting the controller into an idle state. PxTFD shall be updated also.

50.4.71 Port [0-7] Serial ATA Status (PxSSTS4)—Offset 328h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 328h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RO	**RSVD0:** Reserved
11:8	0x0 RO/V	**Interface Power Management (IPM):** Indicates the current interface state
7:4	0x0 RO/V	**Current Interface Speed (SPD):** Indicates the negotiated interface communication speed.
3:0	0x0 RO/V	**Device Detection (DET):** Indicates the interface device detection and Phy state.

50.4.72 Port [0-7] Serial ATA Control (PxSCTL4)—Offset 32Ch

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 32Ch

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RO	**RSVD0:** Reserved
19:16	0x0 RW	**Port Multiplier Port (PMP):** This field is not used by AHCI.
15:12	0x0 RW	**Select Power Management (SPM):** This field is not used by AHCI.
11:8	0x0 RW	**Interface Power Management Transitions Allowed (IPM):** Indicates which power states the HBA is allowed to transition to. If an interface power management state is not allowed via this register field, the HBA will not initiate that state and the HBA will PMNAKP any request from the device to enter that state.
7:4	0x0 RW	**Speed Allowed (SPD):** Indicates the highest allowable speed of the interface.
3:0	0x0 RW	**Device Detection Initialization (DET):** Controls the HBA.s device detection and interface initialization.

50.4.73 Port [0-7] Serial ATA Error (PxSERR4)—Offset 330h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 330h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW/1C/V	**Diagnostics (DIAG):** Contains diagnostic error information for use by diagnostic software in validating correct operation or isolating failure modes.
15:0	0x0 RW/1C/V	**Error (ERR):** The ERR field contains error information for use by host software in determining the appropriate response to the error condition. If one or more of bits 11:8 of this register are set, the controller will stop the current transfer.

50.4.74 Port [0-7] Serial ATA Active (PxSACT4)—Offset 334h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 334h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/1S/V	**Device Status (DS):** System software sets this bit for native command queuing commands prior to setting the PxCI.CI bit in the same command slot entry. This field is cleared via the Set Device Bits FIS.

50.4.75 Port [0-7] Commands Issued (PxCI4)—Offset 338h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 338h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/1S/V	**Commands Issued (CI):** This field is set by software to indicate to the HBA that a command has been built in system memory for a command slot and may be sent to the device. When the HBA receives a FIS which clears the BSY, ERR, and DRQ bits for the command, it clears the corresponding bit in this register for that command slot. Bits in this field shall only be set to 1 by software when PxCMD.ST is set to 1.

50.4.76 Port [0-7] SNotification (PxSNTF4)—Offset 33Ch

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 33Ch

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD0:** Reserved
15:0	0x0 RW/1C/V	**PM Notify (PMN):** This field indicates whether a particular device with the corresponding PM Port number issued a Set Device Bits FIS to the host with the Notification bit set. PM Port 0h sets bit 0. PM Port Fh sets bit 15. Individual bits are cleared by software writing 1's to the corresponding bit positions. Note that, while this field is reset to default on a HBA Reset, it is not reset by COMRESET or SRST

50.4.77 Port [0-7] Command List Base Address (PxCLB5)—Offset 380h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 380h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0x0 RW	**Command List Base Address (CLB):** Indicates the 32-bit base for the command list for this port. This base is used when fetching commands to execute. This address must be 1K aligned as indicated by bits 31:10 being read/write. ***Note:*** These bits are not reset on a HBA reset.
9:0	0x0 RO	**RSVD0:** Reserved

50.4.78 Port [0-7] Command List Base Address Upper 32-bits (PxCLBU5)—Offset 384h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 384h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Command List Base Address Upper (CLBU):** Indicates the upper 32-bits for the command list base address for this port. This base is used when fetching commands to execute. ***Note:*** These bits are not reset on a HBA reset.

50.4.79 Port [0-7] FIS Base Address (PxFB5)—Offset 388h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 388h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RW	**FIS Base Address (FB):** Indicates the 32-bit base for received FISes. This address must be 256-byte aligned as indicated by bits 31:08 being read/write. When FIS-based switching is in use, this structure is 4KB in length and the address shall be 4KB aligned. ***Note:*** These bits are not reset on a HBA reset.
7:0	0x0 RO	**RSVD0:** Reserved

50.4.80 Port [0-7] FIS Base Address Upper 32-bits (PxFBU5)—Offset 38Ch

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 38Ch

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**FIS Base Address Upper (FBU):** Indicates the upper 32-bits for the received FIS base for this port. ***Note:*** These bits are not reset on a HBA reset.

50.4.81 Port [0-7] Interrupt Status (PxIS5)—Offset 390h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 390h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**Cold Presence Detect Status (CPDS):** The SATA controller does not support cold presence detect.
30	0x0 RW/1C/V	**Task File Error Status (TFES):** This bit is set whenever the status register is updated by the device and the error bit (bit 0 of the Status field in the received FIS) is set.
29	0x0 RW/1C/V	**Host Bus Fatal Error Status (HBFS):** Indicates that the HBA encountered a host bus error that it cannot recover from, such as a bad software pointer. In PCI, such an indication would be a target or master abort.
28	0x0 RW/1C/V	**Host Bus Data Error Status (HBDS):** Indicates that the HBA encountered a data error (uncorrectable ECC / parity) when reading from or writing to system memory.
27	0x0 RW/1C/V	**Interface Fatal Error Status (IFS):** Indicates that the HBA encountered an error on the SATA interface which caused the transfer to stop.
26	0x0 RW/1C/V	**Interface Non-fatal Error Status (INFS):** Indicates that the HBA encountered an error on the SATA interface but was able to continue operation.
25	0x0 RO	**RSVD0:** Reserved
24	0x0 RW/1C/V	**Overflow Status (OFS):** Indicates that the HBA received more bytes from a device than was specified in the PRD table for the command.
23	0x0 RW/1C/V	**Incorrect Port Multiplier Status (IPMS):** Indicates that the HBA received a FIS from a device whose port multiplier field did not match what was expected. The IPMS bit may be set during enumeration process. It is recommended that IPMS only be used after enumeration is complete on the Port Multiplier.
22	0x0 RO/V	**PhyRdy Change Status (PRCS):** When set to one indicates the internal PhyRdy signal changed state. This bit reflects the state of PxSERR.DIAG.N. This bit is RO and is only cleared when PxSERR.DIAG.N is cleared.
21:8	0x0 RO	**RSVD1:** Reserved
7	0x0 RW/1C/V	**Device Mechanical Presence Status (DMPS):** When set, indicates that a platform mechanical presence switch has been opened or closed, which may lead to a change in the connection state of the device. This bit is only valid in systems that support mechanical presence switch (CAP.SMPS and PxCMD.MPSP are set).
6	0x0 RO/V	**Port Connect Change Status (PCS):** • 1=Change in Current Connect Status. • 0=No change in Current Connect Status. This bit reflects the state of PxSERR.DIAG.X. This bit is only cleared when PxSERR.DIAG.X is cleared.
5	0x0 RW/1C/V	**Descriptor Processed (DPS):** A PRD with the I. bit set has transferred all of its data.
4	0x0 RO/V	**Unknown FIS Interrupt (UFS):** When set to 1 indicates that an unknown FIS was received and has been copied into system memory. This bit is cleared to 0 by software clearing the PxSERR.DIAG.F bit to 0. Note that this bit does not directly reflect the PxSERR.DIAG.F bit. PxSERR.DIAG.F is set immediately when an unknown FIS is detected, whereas this bit is set when the FIS is posted to memory. Software should wait to act on an unknown FIS until this bit is set to 1 or the two bits may become out of sync.
3	0x0 RW/1C/V	**Set Device Bits Interrupt (SDBS):** A Set Device Bits FIS has been received with the I. bit set and has been copied into system memory.

Bit Range	Default & Access	Field Name (ID): Description
2	0x0 RW/1C/V	**DMA Setup FIS Interrupt (DSS):** A DMA Setup FIS has been received with the I. bit set and has been copied into system memory.
1	0x0 RW/1C/V	**PIO Setup FIS Interrupt (PSS):** A PIO Setup FIS has been received with the I. bit set, it has been copied into system memory, and the data related to that FIS has been transferred. This bit shall be set even if the data transfer resulted in an error.
0	0x0 RW/1C/V	**Device to Host Register FIS Interrupt (DHRS):** A D2H register FIS has been received with the I. bit set, and has been copied into system memory.

50.4.82 Port [0-7] Interrupt Enable (PxIE5)—Offset 394h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 394h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**Cold Presence Detect Enable (CPDS):** The SATA controller does not support cold presence detect.
30	0x0 RW	**Task File Error Enable (TFEE):** When set, GHC.IE is set, and P0S.TFES is set, the HBA shall generate an interrupt.
29	0x0 RW	**Host Bus Fatal Error Enable (HBFE):** When set, GHC.IE is set, and P0IS.HBFS is set, the HBA shall generate an interrupt.
28	0x0 RW	**Host Bus Data Error Enable (HBDE):** when set, GHC.IE is set, and P0IS.HBDS is set, the HBA shall generate an interrupt.
27	0x0 RW	**Interface Fatal Error Enable (IFE):** When set, GHC.IE is set, and P0IS.IFS is set, the HBA shall generate an interrupt.
26	0x0 RW	**Interface Non-fatal Error Enable (INFE):** When set, GHC.IE is set, and P0IS.INFS is set, the HBA shall generate an interrupt.
25	0x0 RO	**RSVD0:** Reserved
24	0x0 RW	**Overflow Enable (OFE):** When set, and GHC.IE and P0IS.OFS are set, the HBA shall generate an interrupt.
23	0x0 RW	**Incorrect Port Multiplier Enable (IPME):** When set, and GHC.IE and P0IS.IPMS are set, the HBA shall generate an interrupt. BIOS is required to program this field to '0'. The same applies to AHCI driver.
22	0x0 RW	**PhyRdy Change Interrupt Enable (PRCE):** When set, and GHC.IE is set, and PxIS.PRCS is set, the HBA shall generate an interrupt.
21:8	0x0 RO	**RSVD1:** Reserved
7	0x0 RW/V	**Device Mechanical Enable (DMPE):** When set, and P0IS.DMPS is set, the HBA shall generate an interrupt.
6	0x0 RW	**Port Change Interrupt Enable (PCE):** When set, GHC.IE is set, and P0IS.PCS is set, the HBA shall generate an interrupt.
5	0x0 RW	**Descriptor Processed Interrupt Enable (DPE):** When set, GHC.IE is set, and P0IS.DPS is set, the HBA shall generate an interrupt.
4	0x0 RW	**Unknown FIS Interrupt Enable (UFE):** When set, GHC.IE is set, and PxIS.UFS is set to 1, the HBA shall generate an interrupt.
3	0x0 RW	**Set Device Bits FIS Interrupt Enable (SDBE):** When set, GHC.IE is set, and P0IS.SDBS is set, the HBA shall generate an interrupt.
2	0x0 RW	**DMA Setup FIS Interrupt Enable (DSE):** When set, GHC.IE is set, and P0IS.DSS is set, the HBA shall generate an interrupt.
1	0x0 RW	**PIO Setup FIS Interrupt Enable (PSE):** When set, GHC.IE is set, and P0IS.PSS is set, the HBA shall generate an interrupt.
0	0x0 RW	**Device to Host Register FIS Interrupt Enable (DHRE):** When set, GHC.IE is set, and P0IS.DHRS is set, the HBA shall generate an interrupt.

50.4.83 Port [0-7] Serial ATA Status (PxSSTS5)—Offset 3A8h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 3A8h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RO	**RSVD0:** Reserved
11:8	0x0 RO/V	**Interface Power Management (IPM):** Indicates the current interface state
7:4	0x0 RO/V	**Current Interface Speed (SPD):** Indicates the negotiated interface communication speed.
3:0	0x0 RO/V	**Device Detection (DET):** Indicates the interface device detection and Phy state.

50.4.84 Port [0-7] Serial ATA Control (PxSCTL5)—Offset 3ACh

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 3ACh

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RO	**RSVD0:** Reserved
19:16	0x0 RW	**Port Multiplier Port (PMP):** This field is not used by AHCI.
15:12	0x0 RW	**Select Power Management (SPM):** This field is not used by AHCI.
11:8	0x0 RW	**Interface Power Management Transitions Allowed (IPM):** Indicates which power states the HBA is allowed to transition to. If an interface power management state is not allowed via this register field, the HBA will not initiate that state and the HBA will PMNAKP any request from the device to enter that state.
7:4	0x0 RW	**Speed Allowed (SPD):** Indicates the highest allowable speed of the interface.
3:0	0x0 RW	**Device Detection Initialization (DET):** Controls the HBA.s device detection and interface initialization.

50.4.85 Port [0-7] Serial ATA Error (PxSERR5)—Offset 3B0h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 3B0h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW/1C/V	**Diagnostics (DIAG):** Contains diagnostic error information for use by diagnostic software in validating correct operation or isolating failure modes.
15:0	0x0 RW/1C/V	**Error (ERR):** The ERR field contains error information for use by host software in determining the appropriate response to the error condition. If one or more of bits 11:8 of this register are set, the controller will stop the current transfer.

50.4.86 Port [0-7] Serial ATA Active (PxSACT5)—Offset 3B4h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 3B4h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/1S/V	**Device Status (DS):** System software sets this bit for native command queuing commands prior to setting the PxCI.CI bit in the same command slot entry. This field is cleared via the Set Device Bits FIS.

50.4.87 Port [0-7] Commands Issued (PxCI5)—Offset 3B8h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 3B8h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/1S/V	**Commands Issued (CI):** This field is set by software to indicate to the HBA that a command has been built in system memory for a command slot and may be sent to the device. When the HBA receives a FIS which clears the BSY, ERR, and DRQ bits for the command, it clears the corresponding bit in this register for that command slot. Bits in this field shall only be set to 1 by software when PxCMD.ST is set to 1.

50.4.88 Port [0-7] SNotification (PxSNTF5)—Offset 3BCh

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 3BCh

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD0:** Reserved
15:0	0x0 RW/1C/V	**PM Notify (PMN):** This field indicates whether a particular device with the corresponding PM Port number issued a Set Device Bits FIS to the host with the Notification bit set. PM Port 0h sets bit 0. PM Port Fh sets bit 15. Individual bits are cleared by software writing 1's to the corresponding bit positions. ***Note:*** While this field is reset to default on a HBA Reset, it is not reset by COMRESET or SRST

50.4.89 Port [0-7] Device Sleep (PxDEVSLP5)—Offset 3C4h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 1E022852h

BAR and Offset: [ABAR] + 3C4h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RO	**RSVD0:** Reserved
28:25	0xf RW/O/V	**DITO Multiplier (DM):** 0's based value that specifies the DITO multiplier that the HBA applies to the specified DITO value, effectively extending the range of DITO from 1ms to 16368ms. A value of 0h indicates a multiplier of 1. A maximum multiplier of 16 may be applied.
24:15	0x4 RW/V	**DEVSLP Idle Timeout (DITO):** This field specifies the amount of the time (in approximate 1ms granularity) that the HBA shall wait before driving the DEVSLP signal.
14:10	0xa RW/V	**DEVSLP Minimum Assertion Time (MDAT):** This field specifies the minimum amount of time (in 1ms granularity) that the HBA must assert the DEVSLP signal before it may be de-asserted. The nominal value is 10ms and the minimum is 1ms depending on device identification information.
9:2	0x14 RW/V	**DEVSLP Exit Timeout (DETO):** This field specifies the maximum duration (in approximate 1ms granularity) from DEVSLP de-assertion until the device is ready to accept OOB. The nominal value is 20ms while the max value is 255ms depending on device identification information.
1	0x1 RW/O	**DEVSLP Present (DSP):** If set to '1', the platform supports DEVSLP on this port. If cleared to '0', the platform does not support DEVSLP on this port.
0	0x0 RW/V	**Aggressive DEVSLP Enable (ADSE):** This bit is read/write for HBAs that support aggressive DEVSLP management (CAP2. SADM = 1).

50.4.90 Port [0-7] Command List Base Address (PxCLB6)—Offset 400h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 400h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0x0 RW	**Command List Base Address (CLB):** Indicates the 32-bit base for the command list for this port. This base is used when fetching commands to execute. This address must be 1K aligned as indicated by bits 31:10 being read/write. ***Note:*** These bits are not reset on a HBA reset.
9:0	0x0 RO	**RSVD0:** Reserved

50.4.91 Port [0-7] Command List Base Address Upper 32-bits (PxCLBU6)—Offset 404h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 404h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Command List Base Address Upper (CLBU):** Indicates the upper 32-bits for the command list base address for this port. This base is used when fetching commands to execute. Note that these bits are not reset on a HBA reset.

50.4.92 Port [0-7] FIS Base Address (PxFB6)—Offset 408h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 408h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RW	**FIS Base Address (FB):** Indicates the 32-bit base for received FISes. This address must be 256-byte aligned as indicated by bits 31:08 being read/write. When FIS-based switching is in use, this structure is 4KB in length and the address shall be 4KB aligned. ***Note:*** These bits are not reset on a HBA reset.
7:0	0x0 RO	**RSVD0:** Reserved

50.4.93 Port [0-7] FIS Base Address Upper 32-bits (PxFBU6)—Offset 40Ch

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 40Ch

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**FIS Base Address Upper (FBU):** Indicates the upper 32-bits for the received FIS base for this port. ***Note:*** These bits are not reset on a HBA reset.

50.4.94 Port [0-7] Interrupt Status (PxIS6)—Offset 410h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 410h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**Cold Presence Detect Status (CPDS):** The SATA controller does not support cold presence detect.
30	0x0 RW/1C/V	**Task File Error Status (TFES):** This bit is set whenever the status register is updated by the device and the error bit (bit 0 of the Status field in the received FIS) is set.
29	0x0 RW/1C/V	**Host Bus Fatal Error Status (HBFS):** Indicates that the HBA encountered a host bus error that it cannot recover from, such as a bad software pointer. In PCI, such an indication would be a target or master abort.
28	0x0 RW/1C/V	**Host Bus Data Error Status (HBDS):** Indicates that the HBA encountered a data error (uncorrectable ECC / parity) when reading from or writing to system memory.
27	0x0 RW/1C/V	**Interface Fatal Error Status (IFS):** Indicates that the HBA encountered an error on the SATA interface which caused the transfer to stop.
26	0x0 RW/1C/V	**Interface Non-fatal Error Status (INFS):** Indicates that the HBA encountered an error on the SATA interface but was able to continue operation.
25	0x0 RO	**RSVD0:** Reserved
24	0x0 RW/1C/V	**Overflow Status (OFS):** Indicates that the HBA received more bytes from a device than was specified in the PRD table for the command.
23	0x0 RW/1C/V	**Incorrect Port Multiplier Status (IPMS):** Indicates that the HBA received a FIS from a device whose port multiplier field did not match what was expected. The IPMS bit may be set during enumeration process. It is recommended that IPMS only be used after enumeration is complete on the Port Multiplier.
22	0x0 RO/V	**PhyRdy Change Status (PRCS):** When set to one indicates the internal PhyRdy signal changed state. This bit reflects the state of PxSERR.DIAG.N. This bit is RO and is only cleared when PxSERR.DIAG.N is cleared.
21:8	0x0 RO	**RSVD1:** Reserved
7	0x0 RW/1C/V	**Device Mechanical Presence Status (DMPS):** When set, indicates that a platform mechanical presence switch has been opened or closed, which may lead to a change in the connection state of the device. This bit is only valid in systems that support mechanical presence switch (CAP.SMPS and PxCMD.MPSP are set).
6	0x0 RO/V	**Port Connect Change Status (PCS):** • 1=Change in Current Connect Status. • 0=No change in Current Connect Status. This bit reflects the state of PxSERR.DIAG.X. This bit is only cleared when PxSERR.DIAG.X is cleared.
5	0x0 RW/1C/V	**Descriptor Processed (DPS):** A PRD with the I. bit set has transferred all of its data.
4	0x0 RO/V	**Unknown FIS Interrupt (UFS):** When set to 1 indicates that an unknown FIS was received and has been copied into system memory. This bit is cleared to 0 by software clearing the PxSERR.DIAG.F bit to 0. Note that this bit does not directly reflect the PxSERR.DIAG.F bit. PxSERR.DIAG.F is set immediately when an unknown FIS is detected, whereas this bit is set when the FIS is posted to memory. Software should wait to act on an unknown FIS until this bit is set to 1 or the two bits may become out of sync.

Bit Range	Default & Access	Field Name (ID): Description
3	0x0 RW/1C/V	**Set Device Bits Interrupt (SDBS):** A Set Device Bits FIS has been received with the I. bit set and has been copied into system memory.
2	0x0 RW/1C/V	**DMA Setup FIS Interrupt (DSS):** A DMA Setup FIS has been received with the I. bit set and has been copied into system memory.
1	0x0 RW/1C/V	**PIO Setup FIS Interrupt (PSS):** A PIO Setup FIS has been received with the I. bit set, it has been copied into system memory, and the data related to that FIS has been transferred. This bit shall be set even if the data transfer resulted in an error.
0	0x0 RW/1C/V	**Device to Host Register FIS Interrupt (DHRS):** A D2H register FIS has been received with the I. bit set, and has been copied into system memory.

50.4.95 Port [0-7] Interrupt Enable (PxIE6)—Offset 414h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 414h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**Cold Presence Detect Enable (CPDS):** The SATA controller does not support cold presence detect.
30	0x0 RW	**Task File Error Enable (TFEE):** When set, GHC.IE is set, and P0S.TFES is set, the HBA shall generate an interrupt.
29	0x0 RW	**Host Bus Fatal Error Enable (HBFE):** When set, GHC.IE is set, and P0IS.HBFS is set, the HBA shall generate an interrupt.
28	0x0 RW	**Host Bus Data Error Enable (HBDE):** when set, GHC.IE is set, and P0IS.HBDS is set, the HBA shall generate an interrupt.
27	0x0 RW	**Interface Fatal Error Enable (IFE):** When set, GHC.IE is set, and P0IS.IFS is set, the HBA shall generate an interrupt.
26	0x0 RW	**Interface Non-fatal Error Enable (INFE):** When set, GHC.IE is set, and P0IS.INFS is set, the HBA shall generate an interrupt.
25	0x0 RO	**RSVD0:** Reserved
24	0x0 RW	**Overflow Enable (OFE):** When set, and GHC.IE and P0IS.OFS are set, the HBA shall generate an interrupt.
23	0x0 RW	**Incorrect Port Multiplier Enable (IPME):** When set, and GHC.IE and P0IS.IPMS are set, the HBA shall generate an interrupt. BIOS is required to program this field to '0'. The same applies to AHCI driver.
22	0x0 RW	**PhyRdy Change Interrupt Enable (PRCE):** When set, and GHC.IE is set, and PxIS.PRCS is set, the HBA shall generate an interrupt.
21:8	0x0 RO	**RSVD1:** Reserved
7	0x0 RW/V	**Device Mechanical Enable (DMPE):** When set, and P0IS.DMPS is set, the HBA shall generate an interrupt.
6	0x0 RW	**Port Change Interrupt Enable (PCE):** When set, GHC.IE is set, and P0IS.PCS is set, the HBA shall generate an interrupt.
5	0x0 RW	**Descriptor Processed Interrupt Enable (DPE):** When set, GHC.IE is set, and P0IS.DPS is set, the HBA shall generate an interrupt.
4	0x0 RW	**Unknown FIS Interrupt Enable (UFE):** When set, GHC.IE is set, and PxIS.UFS is set to 1, the HBA shall generate an interrupt.
3	0x0 RW	**Set Device Bits FIS Interrupt Enable (SDBE):** When set, GHC.IE is set, and P0IS.SDBS is set, the HBA shall generate an interrupt.
2	0x0 RW	**DMA Setup FIS Interrupt Enable (DSE):** When set, GHC.IE is set, and P0IS.DSS is set, the HBA shall generate an interrupt.
1	0x0 RW	**PIO Setup FIS Interrupt Enable (PSE):** When set, GHC.IE is set, and P0IS.PSS is set, the HBA shall generate an interrupt.
0	0x0 RW	**Device to Host Register FIS Interrupt Enable (DHRE):** When set, GHC.IE is set, and P0IS.DHRS is set, the HBA shall generate an interrupt.

50.4.96 Port [0-7] Command (PxCMD6)—Offset 418h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000004h

BAR and Offset: [ABAR] + 418h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RW	**Interface Communication Control (ICC):** This is a four bit field which can be used to control reset and power states of the interface. If the Link layer is currently in the L_IDLE state, writes to this field shall cause the HBA to initiate a transition to the interface power management state requested. If the Link layer is not currently in the L_IDLE state, writes to this field shall have no effect.
27	0x0 RW	**Aggressive Slumber Partial (ASP):** When set to 1, and the ALPE bit is set, the HBA shall aggressively enter the Slumber state when it clears a bit in the PxCI or PxSACT register and the register values are then PxCI = 0h and PxSACT = 0h. When cleared, and the ALPE bit is set, the HBA will aggressively enter the Partial state when it clears a bit in the PxCI or PxSACT register and the register values are then PxCI = 0h and PxSACT = 0h. If CAP.SALP is cleared to 0., software shall treat this bit as reserved.
26	0x0 RW	**Aggressive Link Power Management Enable (ALPE):** When set, the HBA will aggressively enter a lower link power state (Partial or Slumber) based upon the setting of the ASP bit. Software shall only set this bit to 1 if CAP.SALP is set to 1. If CAP.SALP is cleared to 0, software shall treat this bit as reserved. BIOS is recommended to program this field to 1.
25	0x0 RW	**Drive LED on ATAPI Enable (DLAE):** When set, the HBA will drive the LED pin active for commands regardless of the state of PxCMD.ATAPI.When cleared, the HBA will only drive the LED pin active for commands if PxCMD.ATAPI is set to 0. This bit is set by software.
24	0x0 RW	**Device is ATAPI (ATAPI):** When set, the connected device is an ATAPI device. This bit is used by the HBA to control whether or not to generate the desktop LED when commands are active.
23	0x0 RW	**Automatic Partial to Slumber Transitions Enabled (APSTE):** When set to 1., the HBA may perform Automatic Partial to Slumber Transitions. When cleared to 0. the port shall not perform Automatic Partial to Slumber Transitions. Software shall only set this bit to 1. if CAP2.APST is set to 1.; if CAP2.APST is cleared to 0. software shall treat this bit as reserved.
22	0x0 RO	**FIS-based Switching Capable Port (FBSCP):** The SATA controller does not support FIS-Based Switching.
21	0x0 RW/O	**External SATA Port (ESP):** When set to 1, indicates that this port is routed externally and will be used with an external SATA device. When set to 1, CAP.SXS must also be set to 1. When cleared (0), indicates that this port is not routed externally and supports internal SATA devices only. If ESP is set to '1', then the port may experience hot plug events.
20	0x0 RO	**Cold Presence Detection (CPD):** The SATA controller does not support cold presence detect.
19	0x0 RW/O	**Mechanical Presence Switch Attached to Port (MPSP):** If set to 1, the platform supports a mechanical presence switch attached to this port. If cleared to 0, the platform does not support a mechanical presence switch attached to this port.
18	0x0 RW/O	**Hot Plug Capable Port (HPCP):** This indicates whether the this port is connected to a device which can be hot plugged. SATA by definition is hot-pluggable, but not all platforms are constructed to allow the device to be removed (it may be screwed into the chassis, for example). This bit can be used by system software to indicate a feature such as eject device to the end-user.
17	0x0 RW/V	**Port Multiplier Attached (PMA):** When set, a Port Multiplier is attached to the HBA for this port. When cleared, a Port Multiplier is not attached to the HBA for this port. This bit is a read only 0. when CAP.PMS = 0., and read/write when CAP.PMS = 1. ***Note:*** This bit is set by software; hardware does not auto-detect that a Port Multiplier is attached.

Bit Range	Default & Access	Field Name (ID): Description
16	0x0 RO	**RSVD0:** Reserved
15	0x0 RO/V	**Command List Running (CR):** When this bit is set it indicates that the command list DMA engine for the port is running.
14	0x0 RO/V	**FIS Receive Running (FR):** When this bit is set it indicates that the FIS Receive DMA engine for the port is running. Note to software: When FR bit stays set, please read the PxIS.PCS and PxSERR.DET.X to service the PCS interrupt accordingly if any
13	0x0 RO/V	**Mechanical Presence Switch State (MPSS):** The MPSS bit reports the state of a mechanical presence switch attached to this port. If CAP.SMPS is set to 1 and the mechanical presence switch is closed then this bit is cleared to 0. If CAP.SMPS is set to 1 and the mechanical presence switch is open then this bit is set to 1. If CAP.SMPS is set to 0 then this bit is cleared to 0. Software should only use this bit if both CAP.SMPS and PxCMD.MPSP are set to 1.
12:8	0x0 RO	**Current Command Slot (CCS):** Indicates the current command slot the HBA is processing. This field is valid when the PxCMD.ST bit is set, and is constantly updated by the HBA. This field can be updated as soon as the HBA recognizes an active command slot, or at some point soon after when it begins processing the command. When PxCMD.ST transitions from a 1 to a 0, the HBA will reset this field to 0. After PxCMD.ST transitions from 0 to 1, the highest priority slot to issue from next is command slot 0. After the first command has been issued, the highest priority slot to issue from next is PxCMD.CCS + 1. For example, after the HBA has issued its first command, if PxCMD.CCS = 0h and PxCI is set to 3h, the next command that will be issued is from command slot 1.
7:5	0x0 RO	**RSVD1:** Reserved
4	0x0 RW	**FIS Receive Enable (FRE):** When set, the HBA may post received FISes into the FIS receive area pointed to by PxFB and PxFBU. When cleared, received FISes are not accepted by the HBA, except for the first D2H register FIS after the initialization sequence.
3	0x0 RW/1S	**Command List Override (CLO):** Setting this bit to 1 causes PxTFD.STS.BSY and PxTFD.STS.DRQ to be cleared to 0. This allows a software reset to be transmitted to the device regardless of whether the BSY and DRQ bits are still set in the PxTFD.STS register. The HBA sets this bit to 0 when PxTFD.STS.BSY and PxTFD.STS.DRQ have been cleared to 0. A write to this register with a value of 0 shall have no effect.
2	0x1 RO	**Power On Device (POD):** The SATA controller does not support cold presence detect.
1	0x0 RW/V	**Spin-Up Device (SUD):** This bit is read/write for HBAs that support staggered spin-up via CAP.SSS. This bit is read only 1. for HBAs that do not support staggered spin-up. On an edge detect from 0. to 1, the HBA shall start a COMRESET initialization sequence to the device. Clearing this bit causes no action on the interface. Clearing this bit to0 does not cause any OOB signal to be sent on the interface. When this bit is cleared to 0. and PxSCTL.DET = 0h, the HBA will enter listen mode.
0	0x0 RW	**Start (ST):** When set, the HBA may process the command list. When cleared, the HBA may not process the command list. Whenever this bit is changed from a 0 to a 1, the HBA starts processing the command list at entry 0. Whenever this bit is changed from a 1 ot a 0, the PxCI and PxSACT register is cleared by the HBA upon the HBA putting the controller into an idle state. PxTFD shall be updated also.

50.4.97 Port [0-7] Task File Data (PxTFD6)—Offset 420h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 0000007Fh

BAR and Offset: [ABAR] + 420h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD0:** Reserved
15:8	0x0 RO/V	**Error (ERR):** Contains the latest copy of the task file error register.
7	0x0 RO/V	**Status Busy (STS_BSY):** Status - Indicates the interface is busy.
6:4	0x7 RO/V	**Status Rsvd0 (STS_RSVD0):** Status - Not Applicable.
3	0x1 RO/V	**Status Drq (STS_DRQ):** Status - Indicates a data transfer is requested.
2:1	0x3 RO/V	**Status Rsvd1 (STS_RSVD1):** Status - Not Applicable.
0	0x1 RO/V	**Status Err (STS_ERR):** Status - Indicates an error during the transfer.

50.4.98 Port [0-7] Signature (PxSIG6)—Offset 424h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: FFFFFFFFh

BAR and Offset: [ABAR] + 424h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0xffffffff RO/V	**Signature (SIG):** Contains the signature received from a device on the first D2H Register FIS.

50.4.99 Port [0-7] Serial ATA Status (PxSSTS6)—Offset 428h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 428h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RO	**RSVD0:** Reserved
11:8	0x0 RO/V	**Interface Power Management (IPM):** Indicates the current interface state
7:4	0x0 RO/V	**Current Interface Speed (SPD):** Indicates the negotiated interface communication speed.
3:0	0x0 RO/V	**Device Detection (DET):** Indicates the interface device detection and Phy state.

50.4.100 Port [0-7] Serial ATA Control (PxSCTL6)—Offset 42Ch

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 42Ch

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RO	**RSVD0:** Reserved
19:16	0x0 RW	**Port Multiplier Port (PMP):** This field is not used by AHCI.
15:12	0x0 RW	**Select Power Management (SPM):** This field is not used by AHCI.
11:8	0x0 RW	**Interface Power Management Transitions Allowed (IPM):** Indicates which power states the HBA is allowed to transition to. If an interface power management state is not allowed via this register field, the HBA will not initiate that state and the HBA will PMNAKP any request from the device to enter that state.
7:4	0x0 RW	**Speed Allowed (SPD):** Indicates the highest allowable speed of the interface.
3:0	0x0 RW	**Device Detection Initialization (DET):** Controls the HBA.s device detection and interface initialization.

50.4.101 Port [0-7] Serial ATA Error (PxSERR6)—Offset 430h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 430h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW/1C/V	**Diagnostics (DIAG):** Contains diagnostic error information for use by diagnostic software in validating correct operation or isolating failure modes.
15:0	0x0 RW/1C/V	**Error (ERR):** The ERR field contains error information for use by host software in determining the appropriate response to the error condition. If one or more of bits 11:8 of this register are set, the controller will stop the current transfer.

50.4.102 Port [0-7] Serial ATA Active (PxSACT6)—Offset 434h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 434h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/1S/V	**Device Status (DS):** System software sets this bit for native command queuing commands prior to setting the PxCI.CI bit in the same command slot entry. This field is cleared via the Set Device Bits FIS.

50.4.103 Port [0-7] Commands Issued (PxCI6)—Offset 438h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 438h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/1S/V	**Commands Issued (CI):** This field is set by software to indicate to the HBA that a command has been built in system memory for a command slot and may be sent to the device. When the HBA receives a FIS which clears the BSY, ERR, and DRQ bits for the command, it clears the corresponding bit in this register for that command slot. Bits in this field shall only be set to 1 by software when PxCMD.ST is set to 1.

50.4.104 Port [0-7] SNotification (PxSNTF6)—Offset 43Ch

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 43Ch

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD0:** Reserved
15:0	0x0 RW/1C/V	**PM Notify (PMN):** This field indicates whether a particular device with the corresponding PM Port number issued a Set Device Bits FIS to the host with the Notification bit set. PM Port 0h sets bit 0. PM Port Fh sets bit 15. Individual bits are cleared by software writing 1's to the corresponding bit positions. ***Note:*** While this field is reset to default on a HBA Reset, it is not reset by COMRESET or SRST

50.4.105 Port [0-7] Device Sleep (PxDEVSLP6)—Offset 444h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 1E022852h

BAR and Offset: [ABAR] + 444h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RO	**RSVD0:** Reserved
28:25	0xf RW/O/V	**DITO Multiplier (DM):** 0's based value that specifies the DITO multiplier that the HBA applies to the specified DITO value, effectively extending the range of DITO from 1ms to 16368ms. A value of 0h indicates a multiplier of 1. A maximum multiplier of 16 may be applied.
24:15	0x4 RW/V	**DEVSLP Idle Timeout (DITO):** This field specifies the amount of the time (in approximate 1ms granularity) that the HBA shall wait before driving the DEVSLP signal. Hardware reloads its port specific DEVSLP timer with this value each time the port transitions out of DEVSLP state.
14:10	0xa RW/V	**DEVSLP Minimum Assertion Time (MDAT):** This field specifies the minimum amount of time (in 1ms granularity) that the HBA must assert the DEVSLP signal before it may be de-asserted. The nominal value is 10ms and the minimum is 1ms depending on device identification information.
9:2	0x14 RW/V	**DEVSLP Exit Timeout (DETO):** This field specifies the maximum duration (in approximate 1ms granularity) from DEVSLP de-assertion until the device is ready to accept OOB. The nominal value is 20ms while the max value is 255ms depending on device identification information.
1	0x1 RW/O	**DEVSLP Present (DSP):** If set to '1', the platform supports DEVSLP on this port. If cleared to '0', the platform does not support DEVSLP on this port.
0	0x0 RW/V	**Aggressive DEVSLP Enable (ADSE):** This bit is read/write for HBAs that support aggressive DEVSLP management (CAP2. SADM = 1).

50.4.106 Port [0-7] Command List Base Address (PxCLB7)—Offset 480h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 480h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0x0 RW	**Command List Base Address (CLB):** Indicates the 32-bit base for the command list for this port. This base is used when fetching commands to execute. This address must be 1K aligned as indicated by bits 31:10 being read/write. ***Note:*** These bits are not reset on a HBA reset.
9:0	0x0 RO	**RSVD0:** Reserved

50.4.107 Port [0-7] Command List Base Address Upper 32-bits (PxCLBU7)—Offset 484h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 484h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Command List Base Address Upper (CLBU):** Indicates the upper 32-bits for the command list base address for this port. This base is used when fetching commands to execute. ***Note:*** These bits are not reset on a HBA reset.

50.4.108 Port [0-7] FIS Base Address (PxFB7)—Offset 488h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 488h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RW	**FIS Base Address (FB):** Indicates the 32-bit base for received FISes. This address must be 256-byte aligned as indicated by bits 31:08 being read/write. When FIS-based switching is in use, this structure is 4KB in length and the address shall be 4KB aligned. ***Note:*** These bits are not reset on a HBA reset.
7:0	0x0 RO	**RSVD0:** Reserved

50.4.109 Port [0-7] FIS Base Address Upper 32-bits (PxFBU7)—Offset 48Ch

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 48Ch

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**FIS Base Address Upper (FBU):** Indicates the upper 32-bits for the received FIS base for this port. ***Note:*** These bits are not reset on a HBA reset.

50.4.110 Port [0-7] Interrupt Status (PxIS7)—Offset 490h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 490h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**Cold Presence Detect Status (CPDS):** The SATA controller does not support cold presence detect.
30	0x0 RW/1C/V	**Task File Error Status (TFES):** This bit is set whenever the status register is updated by the device and the error bit (bit 0 of the Status field in the received FIS) is set.
29	0x0 RW/1C/V	**Host Bus Fatal Error Status (HBFS):** Indicates that the HBA encountered a host bus error that it cannot recover from, such as a bad software pointer. In PCI, such an indication would be a target or master abort.
28	0x0 RW/1C/V	**Host Bus Data Error Status (HBDS):** Indicates that the HBA encountered a data error (uncorrectable ECC / parity) when reading from or writing to system memory.
27	0x0 RW/1C/V	**Interface Fatal Error Status (IFS):** Indicates that the HBA encountered an error on the SATA interface which caused the transfer to stop.
26	0x0 RW/1C/V	**Interface Non-fatal Error Status (INFS):** Indicates that the HBA encountered an error on the SATA interface but was able to continue operation.
25	0x0 RO	**RSVD0:** Reserved
24	0x0 RW/1C/V	**Overflow Status (OFS):** Indicates that the HBA received more bytes from a device than was specified in the PRD table for the command.
23	0x0 RW/1C/V	**Incorrect Port Multiplier Status (IPMS):** Indicates that the HBA received a FIS from a device whose port multiplier field did not match what was expected. The IPMS bit may be set during enumeration process. It is recommended that IPMS only be used after enumeration is complete on the Port Multiplier.
22	0x0 RO/V	**PhyRdy Change Status (PRCS):** When set to one indicates the internal PhyRdy signal changed state. This bit reflects the state of PxSERR.DIAG.N. This bit is RO and is only cleared when PxSERR.DIAG.N is cleared.
21:8	0x0 RO	**RSVD1:** Reserved
7	0x0 RW/1C/V	**Device Mechanical Presence Status (DMPS):** When set, indicates that a platform mechanical presence switch has been opened or closed, which may lead to a change in the connection state of the device. This bit is only valid in systems that support mechanical presence switch (CAP.SMPS and PxCMD.MPSP are set).
6	0x0 RO/V	**Port Connect Change Status (PCS):** • 1=Change in Current Connect Status. • 0=No change in Current Connect Status. This bit reflects the state of PxSERR.DIAG.X. This bit is only cleared when PxSERR.DIAG.X is cleared.
5	0x0 RW/1C/V	**Descriptor Processed (DPS):** A PRD with the I. bit set has transferred all of its data.
4	0x0 RO/V	**Unknown FIS Interrupt (UFS):** When set to 1 indicates that an unknown FIS was received and has been copied into system memory. This bit is cleared to 0 by software clearing the PxSERR.DIAG.F bit to 0. Note that this bit does not directly reflect the PxSERR.DIAG.F bit. PxSERR.DIAG.F is set immediately when an unknown FIS is detected, whereas this bit is set when the FIS is posted to memory. Software should wait to act on an unknown FIS until this bit is set to 1 or the two bits may become out of sync.
3	0x0 RW/1C/V	**Set Device Bits Interrupt (SDBS):** A Set Device Bits FIS has been received with the I. bit set and has been copied into system memory.

Bit Range	Default & Access	Field Name (ID): Description
2	0x0 RW/1C/V	**DMA Setup FIS Interrupt (DSS):** A DMA Setup FIS has been received with the I. bit set and has been copied into system memory.
1	0x0 RW/1C/V	**PIO Setup FIS Interrupt (PSS):** A PIO Setup FIS has been received with the I. bit set, it has been copied into system memory, and the data related to that FIS has been transferred. This bit shall be set even if the data transfer resulted in an error.
0	0x0 RW/1C/V	**Device to Host Register FIS Interrupt (DHRS):** A D2H register FIS has been received with the I. bit set, and has been copied into system memory.

50.4.111 Port [0-7] Interrupt Enable (PxIE7)—Offset 494h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 494h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**Cold Presence Detect Enable (CPDS):** The SATA controller does not support cold presence detect.
30	0x0 RW	**Task File Error Enable (TFEE):** When set, GHC.IE is set, and P0S.TFES is set, the HBA shall generate an interrupt.
29	0x0 RW	**Host Bus Fatal Error Enable (HBFE):** When set, GHC.IE is set, and P0IS.HBFS is set, the HBA shall generate an interrupt.
28	0x0 RW	**Host Bus Data Error Enable (HBDE):** when set, GHC.IE is set, and P0IS.HBDS is set, the HBA shall generate an interrupt.
27	0x0 RW	**Interface Fatal Error Enable (IFE):** When set, GHC.IE is set, and P0IS.IFS is set, the HBA shall generate an interrupt.
26	0x0 RW	**Interface Non-fatal Error Enable (INFE):** When set, GHC.IE is set, and P0IS.INFS is set, the HBA shall generate an interrupt.
25	0x0 RO	**RSVD0:** Reserved
24	0x0 RW	**Overflow Enable (OFE):** When set, and GHC.IE and P0IS.OFS are set, the HBA shall generate an interrupt.
23	0x0 RW	**Incorrect Port Multiplier Enable (IPME):** When set, and GHC.IE and P0IS.IPMS are set, the HBA shall generate an interrupt. BIOS is required to program this field to '0'. The same applies to AHCI driver.
22	0x0 RW	**PhyRdy Change Interrupt Enable (PRCE):** When set, and GHC.IE is set, and PxIS.PRCS is set, the HBA shall generate an interrupt.
21:8	0x0 RO	**RSVD1:** Reserved
7	0x0 RW/V	**Device Mechanical Enable (DMPE):** When set, and P0IS.DMPS is set, the HBA shall generate an interrupt.
6	0x0 RW	**Port Change Interrupt Enable (PCE):** When set, GHC.IE is set, and P0IS.PCS is set, the HBA shall generate an interrupt.
5	0x0 RW	**Descriptor Processed Interrupt Enable (DPE):** When set, GHC.IE is set, and P0IS.DPS is set, the HBA shall generate an interrupt.
4	0x0 RW	**Unknown FIS Interrupt Enable (UFE):** When set, GHC.IE is set, and PxIS.UFS is set to 1, the HBA shall generate an interrupt.
3	0x0 RW	**Set Device Bits FIS Interrupt Enable (SDBE):** When set, GHC.IE is set, and P0IS.SDBS is set, the HBA shall generate an interrupt.
2	0x0 RW	**DMA Setup FIS Interrupt Enable (DSE):** When set, GHC.IE is set, and P0IS.DSS is set, the HBA shall generate an interrupt.
1	0x0 RW	**PIO Setup FIS Interrupt Enable (PSE):** When set, GHC.IE is set, and P0IS.PSS is set, the HBA shall generate an interrupt.
0	0x0 RW	**Device to Host Register FIS Interrupt Enable (DHRE):** When set, GHC.IE is set, and P0IS.DHRS is set, the HBA shall generate an interrupt.

50.4.112 Port [0-7] Command (PxCMD7)—Offset 498h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000004h

BAR and Offset: [ABAR] + 498h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RW	**Interface Communication Control (ICC):** This is a four bit field which can be used to control reset and power states of the interface. If the Link layer is currently in the L_IDLE state, writes to this field shall cause the HBA to initiate a transition to the interface power management state requested. If the Link layer is not currently in the L_IDLE state, writes to this field shall have no effect.
27	0x0 RW	**Aggressive Slumber Partial (ASP):** When set to 1, and the ALPE bit is set, the HBA shall aggressively enter the Slumber state when it clears a bit in the PxCI or PxSACT register and the register values are then PxCI = 0h and PxSACT = 0h. When cleared, and the ALPE bit is set, the HBA will aggressively enter the Partial state when it clears a bit in the PxCI or PxSACT register and the register values are then PxCI = 0h and PxSACT = 0h. If CAP.SALP is cleard to 0., software shall treat this bit as reserved.
26	0x0 RW	**Aggressive Link Power Management Enable (ALPE):** When set, the HBA will aggressively enter a lower link power state (Partial or Slumber) based upon the setting of the ASP bit. Software shall only set this bit to 1 if CAP.SALP is set to 1. If CAP.SALP is cleared to 0, software shall treat this bit as reserved. BIOS is recommended to program this field to 1.
25	0x0 RW	**Drive LED on ATAPI Enable (DLAE):** When set, the HBA will drive the LED pin active for commands regardless of the state of PxCMD.ATAPI. When cleared, the HBA will only drive the LED pin active for commands if PxCMD.ATAPI is set to 0. This bit is set by software.
24	0x0 RW	**Device is ATAPI (ATAPI):** When set, the connected device is an ATAPI device. This bit is used by the HBA to control whether or not to generate the desktop LED when commands are active.
23	0x0 RW	**Automatic Partial to Slumber Transitions Enabled (APSTE):** When set to 1., the HBA may perform Automatic Partial to Slumber Transitions. When cleared to 0. the port shall not perform Automatic Partial to Slumber Transitions. Software shall only set this bit to 1. if CAP2.APST is set to 1.; if CAP2.APST is cleared to 0. software shall treat this bit as reserved.
22	0x0 RO	**FIS-based Switching Capable Port (FBSCP):** The SATA controller does not support FIS-Based Switching.
21	0x0 RW/O	**External SATA Port (ESP):** When set to 1, indicates that this port is routed externally and will be used with an external SATA device. When set to 1, CAP.SXS must also be set to 1. When cleared (0), indicates that this port is not routed externally and supports internal SATA devices only. If ESP is set to '1', then the port may experience hot plug events.
20	0x0 RO	**Cold Presence Detection (CPD):** The SATA controller does not support cold presence detect.
19	0x0 RW/O	**Mechanical Presence Switch Attached to Port (MPSP):** If set to 1, the platform supports a mechanical presence switch attached to this port. If cleared to 0, the platform does not support a mechanical presence switch attached to this port.
18	0x0 RW/O	**Hot Plug Capable Port (HPCP):** This indicates whether the this port is connected to a device which can be hot plugged. SATA by definition is hot-pluggable, but not all platforms are constructed to allow the device to be removed (it may be screwed into the chassis, for example). This bit can be used by system software to indicate a feature such as eject device to the end-user.
17	0x0 RW/V	**Port Multiplier Attached (PMA):** When set, a Port Multiplier is attached to the HBA for this port. When cleared, a Port Multiplier is not attached to the HBA for this port. This bit is a read only 0. when CAP.PMS = 0., and read/write when CAP.PMS = 1. Note that this bit is set by software; hardware does not auto-detect that a Port Multiplier is attached.

Bit Range	Default & Access	Field Name (ID): Description
16	0x0 RO	**RSVD0:** Reserved
15	0x0 RO/V	**Command List Running (CR):** When this bit is set it indicates that the command list DMA engine for the port is running.
14	0x0 RO/V	**FIS Receive Running (FR):** When this bit is set it indicates that the FIS Receive DMA engine for the port is running. Note to software: When FR bit stays set, please read the PxIS.PCS and PxSERR.DET.X to service the PCS interrupt accordingly if any
13	0x0 RO/V	**Mechanical Presence Switch State (MPSS):** The MPSS bit reports the state of a mechanical presence switch attached to this port. If CAP.SMPS is set to 1 and the mechanical presence switch is closed then this bit is cleared to 0. If CAP.SMPS is set to 1 and the mechanical presence switch is open then this bit is set to 1. If CAP.SMPS is set to 0 then this bit is cleared to 0. Software should only use this bit if both CAP.SMPS and PxCMD.MPSP are set to 1.
12:8	0x0 RO	**Current Command Slot (CCS):** Indicates the current command slot the HBA is processing. This field is valid when the PxCMD.ST bit is set, and is constantly updated by the HBA. This field can be updated as soon as the HBA recognizes an active command slot, or at some point soon after when it begins processing the command. When PxCMD.ST transitions from a 1 to a 0, the HBA will reset this field to 0. After PxCMD.ST transitions from 0 to 1, the highest priority slot to issue from next is command slot 0. After the first command has been issued, the highest priority slot to issue from next is PxCMD.CCS + 1. For example, after the HBA has issued its first command, if PxCMD.CCS = 0h and PxCI is set to 3h, the next command that will be issued is from command slot 1.
7:5	0x0 RO	**RSVD1:** Reserved
4	0x0 RW	**FIS Receive Enable (FRE):** When set, the HBA may post received FISes into the FIS receive area pointed to by PxFB and PxFBU. When cleared, received FISes are not accepted by the HBA, except for the first D2H register FIS after the initialization sequence.
3	0x0 RW/1S	**Command List Override (CLO):** Setting this bit to 1 causes PxTFD.STS.BSY and PxTFD.STS.DRQ to be cleared to 0. This allows a software reset to be transmitted to the device regardless of whether the BSY and DRQ bits are still set in the PxTFD.STS register. The HBA sets this bit to 0 when PxTFD.STS.BSY and PxTFD.STS.DRQ have been cleared to 0. A write to this register with a value of 0 shall have no effect.
2	0x1 RO	**Power On Device (POD):** The SATA controller does not support cold presence detect.
1	0x0 RW/V	**Spin-Up Device (SUD):** This bit is read/write for HBAs that support staggered spin-up via CAP.SSS. This bit is read only 1. for HBAs that do not support staggered spin-up. On an edge detect from 0. to 1, the HBA shall start a COMRESET initialization sequence to the device. Clearing this bit causes no action on the interface. Clearing this bit to0 does not cause any OOB signal to be sent on the interface. When this bit is cleared to 0. and PxSCTL.DET = 0h, the HBA will enter listen mode.
0	0x0 RW	**Start (ST):** When set, the HBA may process the command list. When cleared, the HBA may not process the command list. Whenever this bit is changed from a 0 to a 1, the HBA starts processing the command list at entry 0. Whenever this bit is changed from a 1 to a 0, the PxCI and PxSACT register is cleared by the HBA upon the HBA putting the controller into an idle state. PxTFD shall be updated also.

50.4.113 Port [0-7] Task File Data (PxTFD7)—Offset 4A0h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 0000007Fh

BAR and Offset: [ABAR] + 4A0h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD0:** Reserved
15:8	0x0 RO/V	**Error (ERR):** Contains the latest copy of the task file error register.
7	0x0 RO/V	**Status Busy (STS_BSY):** Status - Indicates the interface is busy.
6:4	0x7 RO/V	**Status Rsvd0 (STS_RSVD0):** Status - Not Applicable.
3	0x1 RO/V	**Status Drq (STS_DRQ):** Status - Indicates a data transfer is requested.
2:1	0x3 RO/V	**Status Rsvd1 (STS_RSVD1):** Status - Not Applicable.
0	0x1 RO/V	**Status Err (STS_ERR):** Status - Indicates an error during the transfer.

50.4.114 Port [0-7] Signature (PxSIG7)—Offset 4A4h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: FFFFFFFFh

BAR and Offset: [ABAR] + 4A4h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0xffffffff RO/V	**Signature (SIG):** Contains the signature received from a device on the first D2H Register FIS.

50.4.115 Port [0-7] Serial ATA Status (PxSSTS7)—Offset 4A8h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 4A8h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RO	**RSVD0:** Reserved
11:8	0x0 RO/V	**Interface Power Management (IPM):** Indicates the current interface state
7:4	0x0 RO/V	**Current Interface Speed (SPD):** Indicates the negotiated interface communication speed.
3:0	0x0 RO/V	**Device Detection (DET):** Indicates the interface device detection and Phy state.

50.4.116 Port [0-7] Serial ATA Control (PxSCTL7)—Offset 4ACh

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 4ACh

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RO	**RSVD0:** Reserved
19:16	0x0 RW	**Port Multiplier Port (PMP):** This field is not used by AHCI.
15:12	0x0 RW	**Select Power Management (SPM):** This field is not used by AHCI.
11:8	0x0 RW	**Interface Power Management Transitions Allowed (IPM):** Indicates which power states the HBA is allowed to transition to. If an interface power management state is not allowed via this register field, the HBA will not initiate that state and the HBA will PMNAKP any request from the device to enter that state.
7:4	0x0 RW	**Speed Allowed (SPD):** Indicates the highest allowable speed of the interface.
3:0	0x0 RW	**Device Detection Initialization (DET):** Controls the HBA.s device detection and interface initialization.

50.4.117 Port [0-7] Serial ATA Error (PxSERR7)—Offset 4B0h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 4B0h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW/1C/V	**Diagnostics (DIAG):** Contains diagnostic error information for use by diagnostic software in validating correct operation or isolating failure modes.
15:0	0x0 RW/1C/V	**Error (ERR):** The ERR field contains error information for use by host software in determining the appropriate response to the error condition. If one or more of bits 11:8 of this register are set, the controller will stop the current transfer.

50.4.118 Port [0-7] Serial ATA Active (PxSACT7)—Offset 4B4h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 4B4h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/1S/V	**Device Status (DS):** System software sets this bit for native command queuing commands prior to setting the PxCI.CI bit in the same command slot entry. This field is cleared via the Set Device Bits FIS.

50.4.119 Port [0-7] Commands Issued (PxCI7)—Offset 4B8h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 4B8h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW/1S/V	**Commands Issued (CI):** This field is set by software to indicate to the HBA that a command has been built in system memory for a command slot and may be sent to the device. When the HBA receives a FIS which clears the BSY, ERR, and DRQ bits for the command, it clears the corresponding bit in this register for that command slot. Bits in this field shall only be set to 1 by software when PxCMD.ST is set to 1.

50.4.120 Port [0-7] SNotification (PxSNTF7)—Offset 4BCh

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 4BCh

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**RSVD0:** Reserved
15:0	0x0 RW/1C/V	**PM Notify (PMN):** This field indicates whether a particular device with the corresponding PM Port number issued a Set Device Bits FIS to the host with the Notification bit set. PM Port 0h sets bit 0. PM Port Fh sets bit 15. Individual bits are cleared by software writing 1's to the corresponding bit positions. ***Note:*** While this field is reset to default on a HBA Reset, it is not reset by COMRESET or SRST

50.4.121 Enclosure Management Message Format (EM_MF)—Offset 580h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 580h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RO	**RSVD0:** Reserved
27:24	0x0 RW	**Message Type (MTYPE):** Specifies the type of the message. The message types are: • 0h = LED • 1h = SAF-TE • 2h = SES-2 • 3h = SGPIO (register based interface) • All other values reserved.
23:16	0x0 RW	**Data Size (DSIZE):** Specifies the data size in bytes. If the message (enclosure services command) has a data buffer that is associated with it that is transferred, the size of that data buffer is specified in this field. If there is no separate data buffer, this field shall have a value of '0'. The data directly follows the message in the message buffer. This value should always be '0'.
15:8	0x0 RW	**Message Size (MSIZE):** Specifies the size of the message in bytes. The message size does not include the one Dword header. A value of '0'. is invalid. The message size is always 4 bytes.
7:0	0x0 RO	**RSVD1:** Reserved

50.4.122 Enclosure Management LED (EM_LED)—Offset 584h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [ABAR] + 584h

ABAR Type: PCI Configuration Register (Size: 32 bits)
ABAR Reference: [B:0, D:(19,20), F:0] + 24h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**Value (VAL):** This field describes the state of each LED for a particular location. There are three LEDs that may be supported by the HBA. Each LED has 3 bits of control. LED values are: • 000b - LED shall be off • 001b - LED shall be solid on as perceived by human eye • All other values reserved. The LED bit locations are: • Bits 2:0 - Activity LED (may be driven by hardware) • Bits 5:3 - Vendor Specific LED (e.g. locate) • Bits 8:6 - Vendor Specific LED (e.g. fault) • Bits 15:9 - Reserved. Vendor specific message is: Bit 3:0 - Vendor Specific Pattern; Bit 15:4 - Reserved.
15:8	0x0 RW	**Port Multiplier Information (PM):** Specifies slot specific information related to Port Multiplier. Bits 3:0 specify the Port Multiplier port number for the slot that requires the status update. • If a Port Multiplier is not attached to the device in the affected slot, the Port Multiplier port number shall be '0'. • Bits 7:4 are reserved. SATA does not support LED messages for devices behind a Port Multiplier. This byte should be 0.
7:0	0x0 RW	**HBA Information (HBA):** Specifies slot specific information related to the HBA. • Bits 4:0 - HBA port number for the slot that requires the status update. • Bit 5 - If set to '1', Value is a vendor specific message that applies to the entire enclosure. If cleared to '0', Value applies to the port specified in bits 4:0. • Bits 7:6 - Reserved.

§ §

51 USB Combo Controller - B0, D21, F0

51.1 Introduction and Index

The host-accessible registers for the USB Combo Controller are described here.

To determine the number of devices/functions available refer to the following:

- Table 1-1, "Features by product SKU - Server and Cloud Storage SKUs 0 through 4"
- Table 1-2, "Features by Product SKU - Network and Enterprise Storage SKUs 5 through 10"
- Table 1-3, "Features by Product SKU - Extended Temperature SKUs 11 through 14".

The legend for the register access codes are described in Chapter 43, "Introduction."

51.1.1 Host Configuration Space

These registers are discovered in Host Configuration Space starting at Bus 0, Device 21 (decimal), Function 0. The offset addresses are listed.

Table 51-1. Summary of PCI Configuration Registers—0/21/0

Offset (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
0	2	8086	"Vendor ID (VID)—Offset 0h" on page 2006
2	2	19D0	"Device ID (DID)—Offset 2h" on page 2006
4	2	0000	"Command (CMD)—Offset 4h" on page 2007
6	2	0290	"Device Status (STS)—Offset 6h" on page 2008
8	1	00	"Revision ID (RID)—Offset 8h" on page 2010
9	1	30	"Programming Interface (PI)—Offset 9h" on page 2010
A	1	03	"Sub Class Code (SCC)—Offset Ah" on page 2010
B	2	0C	"Base Class Code (BCC)—Offset Bh" on page 2010
D	1	00	"Master Latency Timer (MLT)—Offset Dh" on page 2011
E	2	00	"Header Type (HT)—Offset Eh" on page 2011
10	8	0000000000000004	"Memory Base Address (MBAR)—Offset 10h" on page 2012
2C	2	0000	"USB Subsystem Vendor ID (SSVID)—Offset 2Ch" on page 2012
2E	2	0000	"USB Subsystem ID (SSID)—Offset 2Eh" on page 2013
34	1	70	"Capabilities Pointer (CAP_PTR)—Offset 34h" on page 2013
3C	1	00	"Interrupt Line (ILINE)—Offset 3Ch" on page 2013
3D	3	00	"Interrupt Pin (IPIN)—Offset 3Dh" on page 2014
40	4	000001FD	"XHC System Bus Configuration 1 (XHCC1)—Offset 40h" on page 2014
44	4	0003C000	"XHC System Bus Configuration 2 (XHCC2)—Offset 44h" on page 2016
50	4	00000000	"Clock Gating (XHCLKGTEN)—Offset 50h" on page 2018
58	4	00000000	"Audio Time Synchronization (AUDSYNC)—Offset 58h" on page 2021
60	1	30	"Serial Bus Release Number (SBRN)—Offset 60h" on page 2021
61	1	60	"Frame Length Adjustment (FLADJ)—Offset 61h" on page 2022
62	1	00	"Best Effort Service Latency (BESL)—Offset 62h" on page 2023
70	1	01	"PCI Power Management Capability ID (PM_CID)—Offset 70h" on page 2023
71	1	80	"Next Item Pointer #1 (PM_NEXT)—Offset 71h" on page 2023
72	2	C1C2	"Power Management Capabilities (PM_CAP)—Offset 72h" on page 2024
74	2	0008	"Power Management Control/Status (PM_CS)—Offset 74h" on page 2025
80	1	05	"Message Signaled Interrupt CID (MSI_CID)—Offset 80h" on page 2026
81	1	00	"Next item pointer (MSI_NEXT)—Offset 81h" on page 2026
82	2	0086	"Message Signaled Interrupt Message Control (MSI_MCTL)—Offset 82h" on page 2027
84	4	00000000	"Message Signaled Interrupt Message Address (MSI_MAD)—Offset 84h" on page 2028
88	4	00000000	"Message Signaled Interrupt Upper Address (MSI_MUAD)—Offset 88h" on page 2028
8C	2	0000	"Message Signaled Interrupt Message Data (MSI_MD)—Offset 8Ch" on page 2028
90	4	F0140009	"Device Idle Capability (DEVIDLE)—Offset 90h" on page 2029

Table 51-1. Summary of PCI Configuration Registers—0/21/0 (Continued)

Offset (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
94	4	01400010	"Vendor Specific Header (VSHDR)—Offset 94h" on page 2029
98	4	00000000	"SW LTR POINTER (SWLTRPTR)—Offset 98h" on page 2030
9C	4	00080AC1	"Device Idle Pointer Register (DEVIDLEPTR)—Offset 9Ch" on page 2030
A0	2	0800	"Device Idle Power ON Latency (DEVIDLEPOL)—Offset A0h" on page 2031
A4	4	00002000	"High Speed Configuration 2 (HSCFG2)—Offset A4h" on page 2032
B0	4	00000000	"XHCI USB2 Overcurrent Pin Mapping 1 (U2OCM1)—Offset B0h" on page 2033
D0	4	00000000	"XHCI USB3 Overcurrent Pin Mapping 1 (U3OCM1)—Offset D0h" on page 2033
FC	4	00000002	"XHCC3—Offset FCh" on page 2034

51.1.2 Host Memory Space—MBAR

An index of the registers that are accessible in Host Memory Space is shown here.

Table 51-2. Summary of Memory Mapped I/O Registers—MBAR

Offset (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
0	2	80	"Capability Registers Length (CAPLENGTH)—Offset 0h" on page 2035
2	2	0100	"Host Controller Interface Version Number (HCIVERSION)—Offset 2h" on page 2035
4	4	08000820	"Structural Parameters 1 (HCSPARAMS1)—Offset 4h" on page 2036
8	4	94000054	"Structural Parameters 2 (HCSPARAMS2)—Offset 8h" on page 2036
C	4	00040001	"Structural Parameters 3 (HCSPARAMS3)—Offset Ch" on page 2037
10	4	200077C1	"Capability Parameters (HCCPARAMS)—Offset 10h" on page 2038
14	4	00003000	"Doorbell Offset (DBOFF)—Offset 14h" on page 2039
18	4	00002000	"Runtime Register Space Offset (RTSOFF)—Offset 18h" on page 2039
80	4	00000000	"USB Command (USBCMD)—Offset 80h" on page 2040
84	4	00000001	"USB Status (USBSTS)—Offset 84h" on page 2041
88	4	00000001	"Page Size (PAGESIZE)—Offset 88h" on page 2042
94	4	00000000	"Device Notification Control (DNCTRL)—Offset 94h" on page 2042
98	4	00000000	"Command Ring Low (CRCR_LO)—Offset 98h" on page 2043
9C	4	00000000	"Command Ring High (CRCR_HI)—Offset 9Ch" on page 2043
B0	4	00000000	"Device Context Base Address Array Pointer Low (DCBAAP_LO)—Offset B0h" on page 2044
B4	4	00000000	"Device Context Base Address Array Pointer High (DCBAAP_HI)—Offset B4h" on page 2044
B8	4	00000000	"Configure (CONFIG)—Offset B8h" on page 2044
480	4	000002A0	"Port Status and Control USB2 (PORTSC1)—Offset 480h" on page 2045
484	4	00000000	"Port Power Management Status and Control USB2 (PORTPMSC1)—Offset 484h" on page 2047
48C	4	00000000	"Port X Hardware LPM Control Register (PORTHLPMC1)—Offset 48Ch" on page 2048
490	4	000002A0	"Port Status and Control USB2 (PORTSC2)—Offset 490h" on page 2049
494	4	00000000	"Port Power Management Status and Control USB2 (PORTPMSC2)—Offset 494h" on page 2051
49C	4	00000000	"Port X Hardware LPM Control Register (PORTHLPMC2)—Offset 49Ch" on page 2052
4A0	4	000002A0	"Port Status and Control USB2 (PORTSC3)—Offset 4A0h" on page 2053
4A4	4	00000000	"Port Power Management Status and Control USB2 (PORTPMSC3)—Offset 4A4h" on page 2055
4AC	4	00000000	"Port X Hardware LPM Control Register (PORTHLPMC3)—Offset 4ACh" on page 2056
4B0	4	000002A0	"Port Status and Control USB2 (PORTSC4)—Offset 4B0h" on page 2057
4B4	4	00000000	"Port Power Management Status and Control USB2 (PORTPMSC4)—Offset 4B4h" on page 2059
4BC	4	00000000	"Port X Hardware LPM Control Register (PORTHLPMC4)—Offset 4BCh" on page 2060
4C0	4	000002A0	"Port Status and Control USB3 (PORTSC5)—Offset 4C0h" on page 2061

Table 51-2. Summary of Memory Mapped I/O Registers—MBAR (Continued)

Offset (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
4C4	4	00000000	"Port Power Management Status and Control USB3 (PORTPMSC5)—Offset 4C4h" on page 2064
4C8	4	00000000	"USB3 Port Link Info (PORTLI5)—Offset 4C8h" on page 2064
4D0	4	000002A0	"Port Status and Control USB3 (PORTSC6)—Offset 4D0h" on page 2065
4D4	4	00000000	"Port Power Management Status and Control USB3 (PORTPMSC6)—Offset 4D4h" on page 2068
4D8	4	00000000	"USB3 Port Link Info (PORTLI6)—Offset 4D8h" on page 2068
4E0	4	000002A0	"Port Status and Control USB3 (PORTSC7)—Offset 4E0h" on page 2069
4E4	4	00000000	"Port Power Management Status and Control USB3 (PORTPMSC7)—Offset 4E4h" on page 2072
4E8	4	00000000	"USB3 Port Link Info (PORTLI7)—Offset 4E8h" on page 2072
4F0	4	000002A0	"Port Status and Control USB3 (PORTSC8)—Offset 4F0h" on page 2073
4F4	4	00000000	"Port Power Management Status and Control USB3 (PORTPMSC8)—Offset 4F4h" on page 2076
4F8	4	00000000	"USB3 Port Link Info (PORTLI8)—Offset 4F8h" on page 2076
2000	4	00000000	"Microframe Index (RTMFINDEX)—Offset 2000h" on page 2076
2020	4	00000000	"Interrupter 1 Management (IMAN0)—Offset 2020h" on page 2077

51.2 Registers in Configuration Space

51.2.1 Vendor ID (VID)—Offset 0h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:21, F:0] + 0h

Default: 8086h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x8086 RO	**Vendor ID (VID):** Reserved. **Power Well:** Core

51.2.2 Device ID (DID)—Offset 2h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:21, F:0] + 2h

Default: 19D0h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x19d0 RO/V	**Device ID (DID):** **Power Well:** Core

51.2.3 Command (CMD)—Offset 4h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:21, F:0] + 4h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
10	0x0 RW	**Interrupt Disable (ID):** When cleared to 0, the function is capable of generating interrupts. When 1, the function can not generate its interrupt to the interrupt controller ***Note:*** The corresponding Interrupt Status bit is not affected by the interrupt enable. **Power Well:** Core
9	0x0 RO	**Fast Back to Back Enable (FBE):** Reserved. **Power Well:** Core
8	0x0 RW	**SERR# Enable (SERR):** When set to 1, the XHC is capable of generating (internally) SERR#. **Power Well:** Core
7	0x0 RO	**Wait Cycle Control (WCC):** Reserved. **Power Well:** Core
6	0x0 RW	**Parity Error Response (PER):** When set to 1, the XHCI Host Controller will check for correct parity (on its internal interface) and halt operation when bad parity is detected during the data phase as recommended by the XHCI specification. ***Note:*** This applies to both requests and completions from the system interface. This bit must be set in order for the parity errors to generate SERR#. **Power Well:** Core
5	0x0 RO	**VGA Palette Snoop (VPS):** Reserved. **Power Well:** Core
4	0x0 RO	**Memory Write Invalidate (MWI):** Reserved. **Power Well:** Core
3	0x0 RO	**Special Cycle Enable (SCE):** Reserved. **Power Well:** Core
2	0x0 RW	**Bus Master Enable (BME):** When set, it allows XHC to act as a bus master. When cleared, it disable XHC from initiating transactions on the system bus. **Power Well:** Core
1	0x0 RW	**Memory Space Enable (MSE):** This bit controls access to the XHC Memory Space registers. If this bit is set, accesses to the XHC registers are enabled. The Base Address register for the XHC should be programmed before this bit is set. **Power Well:** Core
0	0x0 RO	**I/O Space Enable (IOSE):** Reserved as 0. Read-Only. **Power Well:** Core

51.2.4 Device Status (STS)—Offset 6h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:21, F:0] + 6h

Default: 0290h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW/1C	**Detected Parity Error (DPE):** This bit is set by the SoC whenever a parity error is seen on the internal interface to the XHC host controller, regardless of the setting of bit 6 or bit 8 in the Command register or any other conditions. Software clears this bit by writing a 1 to this bit location. **Power Well:** Core
14	0x0 RW/1C	**Signaled System Error (SSE):** This bit is set by the SoC whenever it signals SERR# (internally). The SERR_EN bit (bit 8 in the Command Register) must be 1 for this bit to be set. Software clears this bit by writing a 1 to this bit location. **Power Well:** Core
13	0x0 RW/1C	**Received Master-Abort Status (RMA):** This bit is set when XHC, as a master, receives a master-abort status on a memory access. This is treated as a Host Error and halts the DMA engines. Software clears this bit by writing a 1 to this bit location. **Power Well:** Core
12	0x0 RW/1C	**Received Target Abort Status (RTA):** This bit is set when XHC, as a master, receives a target abort status on a memory access. This is treated as a Host Error and halts the DMA engines. Software clears this bit by writing a 1 to this bit location. **Power Well:** Core
11	0x0 RW/1C	**Signaled Target-Abort Status (STA):** This bit is used to indicate when the XHC function responds to a cycle with a target abort. **Power Well:** Core
10:9	0x1 RO	**DEVSEL# Timing Status (DEVT):** This 2-bit field defines the timing for DEVSEL# assertion. Read-Only. **Power Well:** Core
8	0x0 RW/1C	**Master Data Parity Error Detected (MDPED):** This bit is set by the SoC whenever a data parity error is detected on a XHC read completion packet on the internal interface to the XHC host controller and bit 6 of the Command register is set to 1. Software clears this bit by writing a 1 to this bit location. **Power Well:** Core
7	0x1 RO	**Fast Back-to-Back Capable (FBBC):** Reserved as 1 Read-Only. **Power Well:** Core
6	0x0 RO	**User Definable Features (UDF):** Reserved as 0. Read-Only. **Power Well:** Core
5	0x0 RO	**66 MHz Capable (MC):** Reserved as 0. Read-Only. **Power Well:** Core
4	0x1 RO	**Capabilities List (CL):** Hardwired to 1 indicating that offset 34h contains a valid capabilities pointer. **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
3	0x0 RO/V	**Interrupt Status (IS):** This read-only bit reflects the state of this function's interrupt at the input of the enable/disable logic. This bit is a 1 when the interrupt is asserted. This bit will be 0 when the interrupt is deasserted. The value reported in this bit is independent of the value in the Interrupt Enable bit. **Power Well:** Core
2:0	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core

51.2.5 Revision ID (RID)—Offset 8h

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:21, F:0] + 8h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO/V	**Revision ID (RID):** **Power Well:** Core

51.2.6 Programming Interface (PI)—Offset 9h

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:21, F:0] + 9h

Default: 30h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x30 RO	**Programming Interface (PI):** A value of 30h indicates that this USB Host Controller conforms to the XHCI specification. **Power Well:** Core

51.2.7 Sub Class Code (SCC)—Offset Ah

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:21, F:0] + Ah

Default: 03h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x3 RO	**Sub Class Code (SCC):** A value of 03h indicates that this is a Universal Serial Bus Host Controller. **Power Well:** Core

51.2.8 Base Class Code (BCC)—Offset Bh

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:21, F:0] + Bh

Default: 0Ch

Bit Range	Default & Access	Field Name (ID): Description
7:0	0xc RO	**Base Class Code (BCC):** A value of 0Ch indicates that this is a Serial Bus controller. **Power Well:** Core

51.2.9 Master Latency Timer (MLT)—Offset Dh

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:21, F:0] + Dh

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO	**Master Latency Timer (MLT):** Because the XHC controller is internally implemented with arbitration on an internal interface, it does not need a master latency timer. The bits will be fixed at 0. **Power Well:** Core

51.2.10 Header Type (HT)—Offset Eh

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:21, F:0] + Eh

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RO	**Multi-Function Bit (MFB):** Read only indicating single function device. **Power Well:** Core
6:0	0x0 RO	**Configuration layout (CL):** Hardwired to 0 to indicate a standard PCI configuration layout. **Power Well:** Core

51.2.11 Memory Base Address (MBAR)—Offset 10h

Value in this register will be different after the enumeration process.

Type: PCI Configuration Register (Size: 64 bits)

Offset: [B:0, D:21, F:0] + 10h

Default: 0000000000000004h

Bit Range	Default & Access	Field Name (ID): Description
63:16	0x0 RW	**Base Address (BA):** Bits (63:16) correspond to memory address signals (63:16), respectively. This gives 64 KB of relocatable memory space aligned to 64 KB boundaries. **Power Well:** Core
15:4	0x0 RO	**Reserved (RSVD):** Reserved. Read-Only 0, this indicates that this function is requesting an 64KB block of memory. **Power Well:** Core
3	0x0 RO	**Prefetchable:** This bit is hardwired to 0 indicating that this range should not be pre-fetched. **Power Well:** Core
2:1	0x2 RO	**Type:** If this field is hardwired to 00 it indicates that this range can be mapped anywhere within 32-bit address space. If this field is hardwired to 10 it indicates that this range can be mapped anywhere within 64-bit address space. **Power Well:** Core
0	0x0 RO	**Resource Type Indicator (RTE):** This bit is hardwired to 0 indicating that the base address field in this register maps to memory space. **Power Well:** Core

51.2.12 USB Subsystem Vendor ID (SSVID)—Offset 2Ch

This register is modified and maintained by BIOS

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:21, F:0] + 2Ch

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x0 RW/L	**USB Subsystem Vendor ID (SSVID):** This register, in combination with the USB Subsystem ID register, enables the operating system to distinguish each subsystem from the others. **Power Well:** Core

51.2.13 USB Subsystem ID (SSID)—Offset 2Eh

This register is modified and maintained by BIOS

Type: PCI Configuration Register
(Size: 16 bits)

Offset: [B:0, D:21, F:0] + 2Eh

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x0 RW/L	**USB Subsystem ID (SSID):** BIOS sets the value in this register to identify the Subsystem ID. This register, in combination with the Subsystem Vendor ID register, enables the operating system to distinguish each subsystem from other(s). **Power Well:** Core

51.2.14 Capabilities Pointer (CAP_PTR)—Offset 34h

Type: PCI Configuration Register
(Size: 8 bits)

Offset: [B:0, D:21, F:0] + 34h

Default: 70h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x70 RO	**Capabilities Pointer (CAP_PTR):** This register points to the starting offset of the capabilities ranges. **Power Well:** Core

51.2.15 Interrupt Line (ILINE)—Offset 3Ch

Type: PCI Configuration Register
(Size: 8 bits)

Offset: [B:0, D:21, F:0] + 3Ch

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Interrupt Line (ILINE):** This data is not used by the SoC. It is used as a scratchpad register to communicate to software the interrupt line that the interrupt pin is connected to. **Power Well:** Core

51.2.16 Interrupt Pin (IPIN)—Offset 3Dh

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:21, F:0] + 3Dh

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW/L	**Interrupt pin (IPIN):** Bits 7:0 reflect the Interrupt Pin assigned to the host controller by the platform (and are hardwired). **Power Well:** Core

51.2.17 XHC System Bus Configuration 1 (XHCC1)—Offset 40h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:21, F:0] + 40h

Default: 000001FDh

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/O	**Access Control (ACCTRL):** This bit is used by BIOS to lock/unlock lockable bits. When set to '1' the write access to bits locked by this bit is disabled (locked state). When set to '0', the write access to bit locked by this bit is enabled (unlocked state). Writable once after platform reset. **Power Well:** Core
30:25	0x0 RW	**ECO1:** **Power Well:** Core
24	0x0 RW	**Master/Target Abort SERR (RMTASERR):** When set, it allows the out-of-band error reporting from the xHCI Controller to be reported as SERR# (if SERR# reporting is enabled) and thus set the STS.SSE bit. **Power Well:** Core
23	0x0 RW/C	**Unsupported Request Detected (URD):** Set the HW when xHCI Controller received an unsupported request posted cycle. Cleared by SW when the bit is written with value of '1'. **Power Well:** Core
22	0x0 RW	**Unsupported Request Report Enable (URRE):** When set this bit allows the URD bit to be reported as SERR# (if SERR# reporting is enabled) and thus set the STS.SSE bit. **Power Well:** Core
21:19	0x0 RW	**Inactivity Initiated L1 Enable (IIL1E):** If programmed to non-zero, it allows L1 power managed to be enabled after the time-out period specified. • 000: Disabled • 001: 32 bb_cclk • 010: 64 bb_cclk • 011: 128 bb_cclk • 100: 256 bb_cclk • 101: 512 bb_cclk • 110: 1024 bb_cclk • 111: 131072 bb_cclk **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
18	0x0 RW	**XHC Initiated L1 Enable (XHCIL1E):** If set, allow the XHC initiated L1 power management to be enabled. **Power Well:** Core
17	0x0 RW	**D3 Initiated L1 Enable (D3IL1E):** If set, allow PCI device state D3 initiated L1 power management to be enables. This bit can only be set if the XHCI L1 Override P2 chicken bit is set. **Power Well:** Core
16:12	0x0 RW	**Periodic Complete Pre Wake Time (PCPWT):** This allows for platform wake time before the next scheduled periodic transaction. The value programmed in this field represents the # of bytes consumed in the current micro-frame which is required to allow for the periodic complete to de-assert. This allows for a programmable time to cause the periodic complete to de-assert prior to the start of the next micro-frame. Register Format: Bits (16:12) represents the # of bytes remaining with a 256B granularity. Periodic Complete will de-assert if the bytes consumed in the current micro-frame is less **Power Well:** Core
11	0x0 RW	**SW Assisted xHC Idle (SWAXHCI):** This bit being set will indicate xHC idleness (through SW means), which must be a '1' to allow L1 entry, and subsequently allow backbone clock to be gated. This bit is to be set by Intel xHCI driver after checking that the xHCI Controller will stay in idle state for a significant period of time, e.g. all ports disconnected. This bit can be cleared under the following conditions (see SWAXHCI Policy bits in xHC System Bus Configuration 2 register): n SW: SW could write 0 to clear this bit. n HW: HW, under policy control, will clear this bit on an MMIO access to the Host Controller. n HW: HW, under policy control, will clear this bit when HW exits Idle state. **Power Well:** Core
10:8	0x1 RW	**L23 to Host Reset Acknowledge Wait Count (L23HRAWC):** If programmed to non zero, it allows a wait period after the L23 PHY has shutdown before returning host reset acknowledge to PMC. • 000: Disabled • 001: 128 bb_cclk • 010: 256 bb_cclk • 011: 512 bb_cclk • 100: 1024 bb_cclk • 101: 2048 bb_cclk • 110: 4096 bb_cclk • 111: 131072 bb_cclk **Power Well:** Core
7:6	0x3 RW	**Upstream Type Arbiter Grant Count Posted (UTAGCP):** Grant count for IOSF upstream L2 request type arbiter for posted type. **Power Well:** Core
5:4	0x3 RW	**Upstream Type Arbiter Grant Count Non Posted (UDAGCNP):** Grant count for IOSF upstream L2 type arbiter for non-posted type. **Power Well:** Core
3:2	0x3 RW	**Upstream Type Arbiter Grant Count Completion (UDAGCCP) (UDAGCCP):** Grant count for IOSF upstream L2 type arbiter for completion type. **Power Well:** Core
1:0	0x1 RW	**Upstream Device Arbiter Grant Count (UDAGC) (UDAGC):** Grant count for IOSF upstream L1 device arbiter. **Power Well:** Core

51.2.18 XHC System Bus Configuration 2 (XHCC2)—Offset 44h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:21, F:0] + 44h

Default: 0003C000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**OC Configuration Done (OCCFGDONE):** This bit is used by BIOS to prevent spurious switching during OC configuration. It must be set by BIOS after configuration of the OC mapping bits is complete. Once this bit is set, OC mapping shall not be changed by SW. **Power Well:** SUS
30:26	0x0 RW	**ECO1:** **Power Well:** Core
25	0x0 RW	**DMA Request Boundary Crossing Control (DREQBCC):** This bit controls the boundary crossing limit of each Read/Write Request. • 0: 4KB • 1: 64B **Power Well:** Core
24:22	0x0 RW	**IDMA Write Request Size Control (IDMA_WRREQSZCTRL):** Write Request Size Control: This bit controls the maximum size of each Write Request. • 000: 128B • 001: 256B • 011 - 110: Reserved • 111: 64B **Power Well:** Core
21	0x0 RW	**XHC Upstream Read Relaxed Ordering Enable (XHCUPRDROE):** This policy controls the Relaxed Ordering attribute for upstream reads. • 0 - xHC will clear RO for all upstream read requests. • 1 - xHC will set RO for all upstream read requests. **Power Well:** Core
20	0x0 RW	**IOSF Sideband Register Access Disable (IOSFSRAD):** When set, it disables the IOSF sideband interface from accepting any host space register access. **Power Well:** Core
19:14	0xf RW	**Upstream Non-Posted Pre-Allocation (UNPPA):** This field reserves data sizes, in 64 byte chunks, of the downstream completion resource. This value is zero based. 000000 - 111111: Pre-allocate 64 bytes - 4096 bytes If set greater than the default allows over-allocation. If set less than default allows under-allocation. Only allowed to be programmed when BME = 0 and no outstanding downstream completion. **Power Well:** Core
13:12	0x0 RW	**SW Assisted xHC Idle Policy (SWAXHCIP):** Note: Irrespective of the setting of this field, SW write of 0 to SWAXHCI will clear the bit. • 00b (default): xHC HW clears SWAXHCI bit upon: n MMIO access to Host Controller OR n xHC HW exits Idle state • 01b: xHC HW does not autonomously clear SWAXHCI bit. The bit could be cleared only by SW. • 10b: xHC HW clears SWAXHCI upon MMIO acces to Host Controller. xHC HW exit from Idle state will not clear SWAXHCI. • 11b: Reserved **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
11	0x0 RW	**MMIO Read After MMIO Write Delay Disable (RAWDD):** This field controls delay on MMIO Read after MMIO Write. • 0b (Default): Delay MMIO Read after MMIO Write • 1b: Do not delay MMIO Read after MMIO Write Note that this delay applies after the second of the two DW writes in the case where the IOSF Gasket splits a QW write into two single DW writes to the IP. **Power Well:** Core
10	0x0 RW	**MMIO Write After MMIO Write Delay Enable (WAWDE):** This field controls delay on MMIO Write after previous MMIO Write. • 0b (Default): Do not delay MMIO Write after previous MMIO Write • 1b: Delay MMIO Write after previous MMIO Write Note that the delay count does not apply on the second of the two DW writes that are generated by IOSF Gasket when it splits a QW write into two. In other words, the second of the two DW writes could happen without any delay with respect to the first DW write. This choice is being made for ease of ECO. The delay count, in this case, will apply after the second of the two DW writes. **Power Well:** Core
9:8	0x0 RW	**SW Assisted Cx Inhibit (SWACXIHB):** This field controls how the DMI L1 inhibit signal from USB3 to PMC will behave. • 00: Never inhibit Cx • 01: Inhibit Cx when Isochronous Endpoint is active (PPT Behavior) • 10: Inhibit Cx when Periodic Active as defined in 40.4.3.2.1 • 11: Always inhibit Cx **Power Well:** Core
7:6	0x0 RW	**SW Assisted DMI L1 Inhibit (SWADMIL1IHB):** This field controls how the DMI L1 inhibit signal from USB3 to DMI will behave. • 00: Never inhibit DMI L1. • 01: Inhibit DMI L1 when Isochronous Endpoint is active (PPT Behavior). • 10: Inhibit DMI L1 when Priodic Active as defined in 40.4.3.2.1. • 11: Inhibit DMI L1 if XHCC1.SWAXHCI = 0. **Power Well:** Core
5:3	0x0 RW	**L1 Force P2 Clock Gating Wait Count (L1FP2CGWC):** If programmed to non zero, it allows L1 force P2 gating off the clock to be delayed after the time-out period specified. If wake up event is detected before the time-out, pclk remains alive and trigger L1 exit as though CPU host is causing the wake, • 000: Disabled • 001: 128 bb_cclk • 010: 256 bb_cclk • 011: 512 bb_cclk • 100: 1024 bb_cclk • 101: 2048 bb_cclk • 110: 4096 bb_cclk • 111: 131072 bb_cclk **Power Well:** Core
2:0	0x0 RW	**Read Request Size Control (RDREQSZCTRL):** Read Request Size Control: This bit controls the maximum size of each Read Request. • 000: 128B • 001: 256B • 010: 512B • 011 - 110: Reserved • 111: 64B **Power Well:** Core

51.2.19 Clock Gating (XHCLKGTEN)—Offset 50h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:21, F:0] + 50h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RO	**Rsvd2:** Reserved **Power Well:** Core
28	0x0 RW	**Naking USB2.0 EPs for Backbone Clock Gating and PLL Shutdown (NUEFBCGPS):** This field controls whether Naking USB2.0 EPs, once in Naking low priority schedule, should be considered as active for the considerations for backbone clock gating and PLL shutdown or not. • 0: Naking USB2.0 EPs are not considered to be active for Backbone Clock Gating and PLL Shutdown evaluation. • 1: Naking USB2.0 EPs are considered to be active for Backbone clock gating and PLL shutdown evaluation. **Power Well:** Core
27	0x0 RW	**SRAM Power Gate Enable (SRAMPGTEN):** This register enables the SRAM Power Gating when PLL shutdown conditions for all clock domains have been met • 0 - Disallow SRAM Power Gating. • 1 - Allow SRAM Power Gating **Power Well:** Core
26	0x0 RW	**SS Link PLL Shutdown Enable (SSLSE):** This register enables the SS P3 state to be exposed to PXP PLL Shutdown conditions on behalf of all USB SS Ports on top of trunk clock gating. • 0 - P3 state NOT allowed to result in PXP PLL shutdown. • 1- P3 state allowed to result in PXP PLL shutdown **Power Well:** Core
25	0x0 RW	**USB2 PLL Shutdown Enable (USB2PLLSE):** When set, this bit allows USB2 PLL to be shutdown when HS Link trunk clock is gated, and xHC can tolerate PLL spin up time for subsequent clock request. ***Note:*** If USB2 PLL Shutdown Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value. **Power Well:** Core
24	0x0 RW	**IOSF Sideband Trunk Clock Gating Enable (IOSFSTCGE):** When set, this bit allows the IOSF sideband clock trunk to be gated when idle conditions are met. **Power Well:** Core
23:20	0x0 RW	**HS Backbone PXP Trunk Clock Gate Enable (HSTCGE):** This register determines the HS Ux state(s) which will be exposed to Backbone PXP trunk gating of core clock. Uy is a state allowed to result in trunk gating when ss_tcg_ux_en(x) is asserted. • (0) ==) U0 or deeper • (1) ==) NA (no support for U1) • (2) ==) U2 (L1) or deeper • (3) ==) U3 (L2) or deeper **Power Well:** Core
19:16	0x0 RW	**SS Backbone PXP Trunk Clock Gate Enable (SSTCGE):** This register determines the SS Ux state(s) which will be exposed to Backbone PXP trunk gating of core clock. Uy is a state allowed to result in trunk gating when ss_tcg_ux_en(x) is asserted. (0) ==) U0 or deeper (1) ==) U1 or deeper (2) ==) U2 or deeper (3) ==) U3 or deeper **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW	**XHC Ignore_EU3S (XHCIGEU3S):** This register determines if the xHC will use the EU3S as a condition to allow for Frame timer gating. • 0 - xHC may allow frame timer to be gated when EU3S is set and all ports are in the required state. • 1 - xHC may allow frame timer to be gated regardless of EU3S. **Power Well:** Core
14	0x0 RW	**XHC Frame Timer Clock Shutdown Enable (XHCFTCLKSE):** This register determines if the xHC will allow the frame timer clock to be gated. • 0 - xHC will not allow ICC PLL 96MHz output to be shutdown thus keeping the frame timer running. • 1 - xHC will allow ICC PLL 96MHz output to be shutdown under specific conditions. **Power Well:** Core
13	0x0 RW	**XHC Backbone PXP Trunk Clock Gate In Presence of ISOCH EP (XHCBBTCGIPISO):** This register controls the policy on allowing Backbone PXP trunk clock gate in the presence of IDLE ISOCH EP s with active DB. Allows the periodic active to be used in enabling Backbone PXP trunk clock gating of core clock. • 0 Trunk gate of core clock is not allowed when ISOCH EP DB is set and ISOCH EP s are idle. • 1 Allow trunk gate of core clock when ISOCH EP DB is set and ISOCH EP s are idle. **Power Well:** Core
12	0x0 RW	**XHC HS Backbone PXP Trunk Clock Gate U2 non RWE (XHCHSTCGU2NRWE):** This register controls the policy on allowing Backbone PXP trunk gating of core clock when there is at least 1 non Remote Wake Enabled HS Port in U2. • 0 Prevent trunk gate of core clock when a non RWE HS Port is in U2. • 1 Allow trunk gate of core clock when a non RWE HS Port is in U2. **Power Well:** Core
11:10	0x0 RW	**XHC USB2 PLL Shutdown Lx Enable (XHCUSB2PLLSDLE):** This register determines the HS Link state(s) which will be exposed to USB2 PLL Shutdown conditions on behalf of all USB2 HS Ports. Ly is a state allowed to result in USB2 PLL Shutdown when en(x) is asserted. • (0) ==) L1 or deeper • (1) ==) L2 or deeper **Power Well:** Core
9:8	0x0 RW	**HS Backbone PXP PLL Shutdown Ux Enable (HSUXDMIPLLSE):** This register determines the Ux state(s) which will be exposed to PXP PLL Shutdown conditions. PLL Shutdown is allowed in: • 00b Disabled (Link states shall be disabled for DMI PLL shutdown) • 01b U0 or conditions for 10b setting. • 10b U2 or conditions for 11b setting. • 10b U3, Disconnected, Disabled or Powered-Off. **Power Well:** Core
7:5	0x0 RW	**SS Backbone PXP PLL Shutdown Ux Enable (SSPLLSUE):** This register determines the Ux state(s) which will be exposed to DMI PLL Shutdown conditions. PLL Shutdown is allowed in: • 000b Disabled (Link states shall be ignored for DMI PLL shutdown). • 001b U0 or conditions for 010b setting • 010b U1 or conditions for 011b setting • 011b U2 or conditions for 100b setting • 100b U3, Disconnected, Disabled or Powered-Off **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
4	0x0 RW	**XHC Backbone Local Clock Gating Enable (XHCBLCGE):** When set, this bit allows XHCI Controller IP backbone clock to be locally gated when idle conditions are met. ***Note:*** If XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value. **Power Well:** Core
3	0x0 RW	**HS Link Trunk Clock Gating Enable (HSLTCGE):** When set, this bit allows High Speed Link control's 480 MHz and its 48/60 MHz link clock trunk to be gated when idle conditions are met. ***Note:*** If XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value. BIOS need to query fuses to see if HW is enabled. **Power Well:** Core
2	0x0 RW	**SS Link Trunk Clock Gating Enable (SSLTCGE):** When set, this bit allows the SuperSpeed Link control's 250 MHz and its divided 125 MHz link clock trunk to ge gated when idle conditions are met. ***Note:*** If XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value. BIOS need to query fuses to see if HW is enabled. **Power Well:** Core
1	0x0 RW	**IOSF Backbone Trunk Clock Gating Enable (IOSFBTCGE):** When set, this bit allows the IOSF backbone clock trunk to be gated when idle conditions are met. **Power Well:** Core
0	0x0 RW	**IOSF Gasket Backbone Local Clock Gating Enable (IOSFBLCGE):** When set, this bit allows the IOSF Gasket backbone clock to be locally gated when idle conditions are met. ***Note:*** If XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value. BIOS need to query fuses to see if HW is enabled. **Power Well:** Core

51.2.20 Audio Time Synchronization (AUDSYNC)—Offset 58h

This 32 bit register is used for audio stream synchronization across different devices. Global signal sample_now captures a value in AUDSYNC register.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:21, F:0] + 58h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RO	**Rsvd2:** Reserved. **Power Well:** Core
29:16	0x0 RO/V	**Captured Frame List Current Index/Frame Number (CMFI):** The value in this register is updated in response to sample_now signal. Bits (29:16) reflect state of bits (13:0) of FRINDEX **Power Well:** Core
15:13	0x0 RO	**Rsvd1:** Reserved. **Power Well:** Core
12:0	0x0 RO/V	**Captured Micro-frame BLIF (CMFB):** The value is updated in response to sample_now signal and provides information about offset within micro-frame. Captured value represents number of 8 high-speed bit time units from start of micro-frame. At the beginning of micro-frame captured value will be 0 and increase to maximum value at the end. Default maximum value is 7499 but it may be changed as result of adjustment done in FLA. **Power Well:** Core

51.2.21 Serial Bus Release Number (SBRN)—Offset 60h

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:21, F:0] + 60h

Default: 30h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x30 RO	**Serial Bus Release Number (SBRN):** A value of 30h indicates that this controller follows USB release 3.0. **Power Well:** SUS

51.2.22 Frame Length Adjustment (FLADJ)—Offset 61h

This feature is used to adjust any offset from the clock source that generates the clock that drives the SOF counter. When a new value is written into these six bits, the length of the frame is adjusted. Its initial programmed value is system dependent based on the accuracy of hardware USB clock and is initialized by system BIOS. This register should only be modified when the HChalted bit in the USBSTS register is a one. Changing value of this register while the host controller is operating yields undefined results.

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:21, F:0] + 61h

Default: 60h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RO	**Reserved (RSVD):** **Power Well:** SUS
6	0x1 RO	**No Frame Length Timing Capability (NO_FRAME_LENGTH_TIMING_CAP):** This flag is set to 1 to indicate that the host controller does not support a programmable Frame Length Timing Value field. **Power Well:** Core
5:0	0x20 RO	**Frame Length Timing Value (FLTV):** SOF micro-frame length) is equal to 59488 + value in this field. The default value is decimal 32 (20h), which gives a SOF cycle time of 60000. Frame Length (number of High Speed bit times) FLADJ Value (decimal) (decimal) • 59488 0 (00h) • 59504 1 (01h) • 59520 2 (02h) • ... • 59984 31 (1Fh) • 60000 32 (20h) • ... • 60480 62 (3Eh) • 60496 63 (3Fh) Each decimal value change to this register corresponds to 16 high-speed bit times. The SOF cycle time (number of SOF counter clock periods to generate a SOF micro-frame length) is equal to 59488 + value in this field. The default value is decimal 32 (20h), which gives a SOF cycle time of 60000. Frame Length (# High Speed bit times) FLADJ Value **Power Well:** SUS

51.2.23 Best Effort Service Latency (BESL)—Offset 62h

Best Effort Service Latency.

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:21, F:0] + 62h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:4	0x0 RW/L	**Default Best Effort Service Latency Deep (DBESLD):** Default Best Effort Service Latency (DBESLD) If the value of this field is non-zero, it defines the recommended value for programming the PORTPMSC register BESLD field. This is programmed by BIOS based on platform parameters. **Power Well:** Core
3:0	0x0 RW/L	**Default Best Effort Service Latency (DBESL):** If the value of this field is non-zero, it defines the recommended value for programming the PORTPMSC register BESL field. This is programmed by BIOS based on platform parameters. **Power Well:** Core

51.2.24 PCI Power Management Capability ID (PM_CID)—Offset 70h

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:21, F:0] + 70h

Default: 01h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x1 RO	**PCI Power Management Capability ID (PM_CID):** A value of 01h indicates that this is a PCI Power Management capabilities field. **Power Well:** Core

51.2.25 Next Item Pointer #1 (PM_NEXT)—Offset 71h

This register is modified and maintained by BIOS

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:21, F:0] + 71h

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x80 RW/L	**Next Item Pointer #1 (PM_NEXT):** This register defaults to 80h, which indicates that the next capability registers begin at configuration offset 80h. This register is writable when the Access Control bit is set to '0'. This allows BIOS to effectively hide the next capability registers, if necessary. This register should only be written during system initialization before the plug-and-play software has enabled any master-initiated traffic. Values of: 80h implies next capability is MSI 00h implies that MSI capability is hidden. ***Note:*** This value is never expected to be programmed. **Power Well:** Core

51.2.26 Power Management Capabilities (PM_CAP)—Offset 72h

Normally, this register is read-only to report capabilities to the power management software. In order to report different power management capabilities depending on the system in which the SoC is used, the write access to this register is controlled by the Access Control bit (ACCTRL). The value written to this register does not affect the hardware other than changing the value returned during a read. This register is modified and maintained by BIOS

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:21, F:0] + 72h

Default: C1C2h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0x18 RW/L	**PME_Support:** This 5-bit field indicates the power states in which the function may assert PME#. The SoC XHC does not support the D1 or D2 states. For all other states, the SoC XHC is capable of generating PME#. Software should never need to modify this field. **Power Well:** Core
10	0x0 RW/L	**D2_Support:** The D2 state is not supported. **Power Well:** Core
9	0x0 RW/L	**D1_Support:** The D1 state is not supported. **Power Well:** Core
8:6	0x7 RW/L	**Aux_Current:** The SoC XHC reports 375mA maximum Suspend well current required when in the D3cold state. This value can be written by BIOS when a more accurate value is known. **Power Well:** Core
5	0x0 RW/L	**DSI:** The SoC reports 0, indicating that no device-specific initialization is required. **Power Well:** Core
4	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
3	0x0 RW/L	**PME Clock (PMEClock):** The SoC reports 0, indicating that no PCI clock is required to generate PME#. **Power Well:** Core
2:0	0x2 RW/L	**Version:** The SoC reports 010, indicating that it complies with Revision 1.1 of the PCI Power Management Specification. **Power Well:** Core

51.2.27 Power Management Control/Status (PM_CS)—Offset 74h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:21, F:0] + 74h

Default: 0008h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW/1C	**PME_Status:** This bit is set when the SoC XHC would normally assert the PME# signal independent of the state of the PME_En bit. Writing a 1 to this bit will clear it and cause the internal PME to deassert (if enabled). Writing a 0 has no effect. This bit must be explicitly cleared by the operating system each time the operating system is loaded. **Power Well:** SUS
14:13	0x0 RO	**RSVD:** Reserved **Power Well:** Core
12:9	0x0 RO	**RSVD:** Reserved **Power Well:** Core
8	0x0 RW	**PME_En:** A 1 enables the SoC XHC to generate an internal PME signal when PME_Status is 1. This bit must be explicitly cleared by the operating system each time it is initially loaded. **Power Well:** SUS
7:4	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
3	0x1 RO	**No Soft Reset (NSR):** This bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. **Power Well:** Core
2	0x0 RO	**Reserved (RSVD2):** Reserved. **Power Well:** Core
1:0	0x0 RW	**PowerState:** This 2-bit field is used both to determine the current power state of XHC function and to set a new power state. The definition of the field values are: • 00b - D0 state • 11b - D3hot state **Power Well:** Core

51.2.28 Message Signaled Interrupt CID (MSI_CID)—Offset 80h

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:21, F:0] + 80h

Default: 05h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x5 RO	**Capability ID (CID):** Indicates that this is an MSI capability. **Power Well:** Core

51.2.29 Next item pointer (MSI_NEXT)—Offset 81h

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:21, F:0] + 81h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO	**Next Pointer (NEXT):** Indicates that this is the last item on the capability list. **Power Well:** Core

51.2.30 Message Signaled Interrupt Message Control (MSI_MCTL)—Offset 82h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:21, F:0] + 82h

Default: 0086h

Bit Range	Default & Access	Field Name (ID): Description
15:9	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
8	0x0 RO	**Per-Vector Masking Capable (PVM):** Specifies whether controller supports MSI per vector masking. Not supported **Power Well:** Core
7	0x1 RO	**64 Bit Address Capable (C64):** Specifies whether capable of generating 64-bit messages. This device is 64-bit capable. **Power Well:** Core
6:4	0x0 RW	**Multiple Message Enable (MME):** Indicates the number of messages the controller should assert. This device supports multiple message MSI. **Power Well:** Core
3:1	0x3 RO	**Multiple Message Capable (MMC):** Indicates the number of messages the controller wishes to assert. This field must be set by HW to reflect the number of Interrupters supported. Encoding number of Vectors requested (number of Interrupters) • 000 1 • 001 2 • 010 4 • 011 8 • 100 16 • 101 32 • 110-111 Reserved **Power Well:** Core
0	0x0 RW	**MSI Enable (MSIE):** If set to 1, MSI is enabled and the traditional interrupt pins are not used to generate interrupts. If cleared to 0, MSI operation is disabled and the traditional interrupt pins are used. **Power Well:** Core

51.2.31 Message Signaled Interrupt Message Address (MSI_MAD)—Offset 84h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:21, F:0] + 84h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**Addr:** Lower DW of system specified message address, always DWORD aligned. **Power Well:** Core
1:0	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core

51.2.32 Message Signaled Interrupt Upper Address (MSI_MUAD)—Offset 88h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:21, F:0] + 88h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Upper Addr (UpperAddr):** Upper DW of system specified message address. **Power Well:** Core

51.2.33 Message Signaled Interrupt Message Data (MSI_MD)—Offset 8Ch

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:21, F:0] + 8Ch

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x0 RW	**Data:** This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the lower word (PCI AD(15:0)) during the data phase of the MSI memory write transaction. **Power Well:** Core

51.2.34 Device Idle Capability (DEVIDLE)—Offset 90h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:21, F:0] + 90h

Default: F0140009h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0xf RO	**VID:** Reserved. **Power Well:** Core
27:24	0x0 RO	**REV:** Reserved. **Power Well:** Core
23:16	0x14 RO	**Length (LENGTH):** Indicates that this capability is 16 bytes long. **Power Well:** Core
15:8	0x0 RO	**Next Capability Pointer (NCP):** This field contains the offset to the next PCI Capability structure or 000h if no other items exist in the linked list of Capabilities. **Power Well:** Core
7:0	0x9 RO	**Capability ID (CID):** Reserved. **Power Well:** Core

51.2.35 Vendor Specific Header (VSHDR)—Offset 94h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:21, F:0] + 94h

Default: 01400010h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0x14 RO	**VSEC Length (VSEC_LENGTH):** This field indicates the number of bytes in the entire VSEC structure, including the PCI Extended Capability header, the Vendor- Specific header, and the Vendor-Specific register **Power Well:** Core
19:16	0x0 RO	**VSEC Rev (VSEC_REV):** This field is a vendor-defined version number that indicates the version of the VSEC structure. Software must qualify the Vendor ID and VSEC ID before interpreting this field. **Power Well:** Core
15:0	0x10 RO	**VSEC ID (VSEC_ID):** This field is a vendor-defined ID number that indicates the nature and format of the VSEC structure. Software must qualify the Vendor ID before interpreting this field. **Power Well:** Core

51.2.36 SW LTR POINTER (SWLTRPTR)—Offset 98h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:21, F:0] + 98h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0x0 RO	**SW LTR Update MMIO Offset Location (SW_LTR_UPDT_MMIO_OFFSET):** This register contains the location pointer to the SW LTR register in MMIO space, as an offset from the specified BAR. The value of this register is a don't care, if the Valid bit is not set. **Power Well:** Core
3:1	0x0 RO	**Base Address Register Number (BARNUM):** Contains the 0s based AR Number of the BAR which contains the location of the SW LTR MMIO register. When counting BAR Numbers, all BARs, regardless of size and type, consume one BAR Number. Bar 0 is the 1st BAR. The value of this register is a don't care, if the Valid bit is not set. **Power Well:** Core
0	0x0 RO	**Valid (VALID):** Set to 1 to indicate that the function has implemented a SW LTR register as specified in the DevIdle that can be located using the SWLTRLOC register and BARNUM. Set to 0 to indicate that the function has not implemented a SW LTR register that is compliant to the DevIdle definition. This could be because the function has not implemented SW LTR at all, or has a device specific version of SW LTR. **Power Well:** Core

51.2.37 Device Idle Pointer Register (DEVIDLEPTR)—Offset 9Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:21, F:0] + 9Ch

Default: 00080AC1h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0x80ac RW/L	**DevIdle MMIO Offset Location (DEVIDLELOC):** This register contains the location pointer to the DevIdle register in MMIO space, as an offset from the specified BAR. The value of this register is a don't care, if the Valid bit is not set. **Power Well:** Core
3:1	0x0 RO	**Base Address Register Number (BARNUM):** Contains the 0s based BAR Number of the BAR which contains the location of the DevIdle MMIO register. When counting BAR Numbers, all BARs, regardless of size and type, consume one BAR Number. Bar 0 is the 1st BAR. The value of this register is a don't care, if the Valid bit is not set. **Power Well:** Core
0	0x1 RW/L	**Valid (VALID):** Set to 1 to indicate that the function has implemented a DevIdle register as specified in the DevIdle that can be located using the DEVIDLELOC register and BARNUM. Set to 0 to indicate that the function has not implemented a DevIdle register that is compliant to the DevIdle definition. This could be because the function has not implemented DevIdle at all, or has a device specific version of DevIdle. **Power Well:** Core

51.2.38 Device Idle Power ON Latency (DEVIDLEPOL)—Offset A0h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:21, F:0] + A0h

Default: 0800h

Bit Range	Default & Access	Field Name (ID): Description
15:13	0x0 RO	**Rsvd1:** Reserved. **Power Well:** Core
12:10	0x2 RW/L	**Power On Latency Scale (POLS):** Latency Scale multiplier: • 010: 1us • 011: 32us • All other settings are reserved. The value of this register is multiplied with the Power On Latency Value (POLV) to provide the DevIdle power on exit latency multiplier scale from 1us to 32ms. This register is defined to be RWO (read-write-once) to allow BIOS to set the initial value. This register is undefined if the DevIdle.Valid bit is 0. **Power Well:** Core
9:0	0x0 RW/L	**Power On Latency Value (POLV):** 10-bit value that is multiplied by the Power On Latency Scale. A value of 0 indicates a power on latency of less than 1us. This register is defined to be RWO (read-write-once) to allow BIOS to set the initial value. This register is undefined if the DevIdle.Valid bit is 0. **Power Well:** Core

51.2.39 High Speed Configuration 2 (HSCFG2)—Offset A4h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:21, F:0] + A4h

Default: 00002000h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0x0 RO	**Rsvd1:** Reserved. **Power Well:** Core
18	0x0 RW	**PORT1_HOST_MODE_OVERRIDE:** When set, this bit causes the Host_Device mux on port 1 to be forced into the Host mode. **Power Well:** Core
17:16	0x0 RW	**eUSB2SEL:** The two bits are associate with USB2 ports 1 - bit 16 and 2 - bit 2 • 0: Port is mapped to USB2 • 1: Port is mapped to eUSB2 **Power Well:** Core
15	0x0 RW	**HS ASYNC Active IN Mask (HSAAIM):** Determines if the Async Active will mask/ignore IN EP s. • 0 HS ASYNC Active will include IN EP s. • 1 HS ASYNC Active will mask/ignore IN EP s. **Power Well:** Core
14	0x0 RW	**HS OUT ASYNC Active Polling EP Mask (HSOAAPEPM):** Determines if the Async Active for OUT HS/FS/LS masks/ignores EP s that are polling/PINGing (HS) due to NAK. • 0 HS OUT ASYNC Active will include EP s that are polling. • 1 HS OUT ASYNC Active will mask/ignore EP s that are polling. **Power Well:** Core
13	0x1 RW	**HS IN ASYNC Active Polling EP Mask (HSIAAPEPM):** Determines if the Async Active for IN HS/FS/LS masks/ignores EP s that are polling due to NAK. • 0 HS IN ASYNC Active will include EP s that are polling. • 1 HS IN ASYNC Active will mask/ignore EP s that are polling. **Power Well:** Core
12:11	0x0 RW	**HS INTR IN Periodic Active Policy Control (HSIIPAPC):** Controls how the HS INTR IN periodic active is used to generate the global periodic active. This will determine how the smallest service interval among active EP s and number of active EP s are used. • 0 HS INTR IN periodic active will be used to generate periodic active if Service Interval Threshold OR Numb of EP Threshold values meet the requirement. • 1 HS INTR IN periodic active will be used to generate periodic active if Service Interval Threshold AND Numb of EP Threshold values meet the requirement. • 2 Always allow HS INTR EP s to be used in the generation of the global Periodic Active indication. • 3 Never allow HS INTR EP s to be used in the generation of the global Periodic Active indication **Power Well:** Core
10:4	0x0 RW	**HS INTR IN Periodic Active Num of EP Threshold (HSIIPANEPT):** Defines the threshold used to determine if Periodic Active may include HS/FS/LS INTR IN EP active indication. **Power Well:** Core
3:0	0x0 RW	**HS INTR IN Periodic Active Service Interval Threshold (HSIIPASIT):** Defines the Service Interval threshold used to determine if Periodic Active will include HS/FS/LS INTR IN EP active indication. **Power Well:** Core

51.2.40 XHCI USB2 Overcurrent Pin Mapping 1 (U2OCM1)—Offset B0h

The RW/L property of this register is controlled by OCCFDONE bit.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:21, F:0] + B0h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0x0 RO	**Rsvd:** Reserved **Power Well:** SUS
3:0	0x0 RW/L	**OC Mapping (OCM):** Reserved. **Power Well:** SUS

51.2.41 XHCI USB3 Overcurrent Pin Mapping 1 (U3OCM1)—Offset D0h

The RW/L property of this register is controlled by OCCFDONE bit.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:21, F:0] + D0h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0x0 RO	**Rsvd:** Reserved. **Power Well:** Core
3:0	0x0 RW/L	**OC Mapping (OCM):** Reserved. **Power Well:** SUS

51.2.42 XHCC3—Offset FCh

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:21, F:0] + FCh

Default: 00000002h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0x0 RO	**Reserved (Rsvd1):** Reserved **Power Well:** SUS
3	0x0 RW	**Error Handling : Disable Command Parity Check (DISABLE_COMMAND_PARITY_CHECK):** When set to 1, XHCI Host Controller disables checking of Command Parity on command received as a target on its IOSF Primary interface **Power Well:** SUS
2	0x0 RW	**Error Handling : Disable Data Parity Check (DISABLE_DATA_PARITY_CHECK):** When set to 1, XHCI Host Controller disables checking of Data Parity on data received as a target on its IOSF Primary interface **Power Well:** SUS
1	0x1 RW	**Error Handling : Enable ECC Error Response (ENABLE_ECC_ERROR_RESPONSE):** When set to 1, XHCI Host Controller will check for ECC on RFs (that support ECC) and halt operation when uncorrectable ECC is detected **Power Well:** SUS
0	0x0 RW/L	**Function Disable (FXN_DISABLE):** When set will disable the xHC from being operational. **Power Well:** SUS

51.3 Registers in Memory Space—MBAR

These registers are accessed in Host Memory Space starting at the relocatable memory address defined by the Base Address Register (BAR) MBAR described in Section 51.2.11, "Memory Base Address (MBAR)—Offset 10h" on page 2012.

51.3.1 Capability Registers Length (CAPLENGTH)—Offset 0h

This register is modified and maintained by BIOS

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 80h

BAR and Offset: [MBAR] + 0h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x80 RW/L	**Capability Registers Length (CAPLENGTH):** Reserved. **Power Well:** Core

51.3.2 Host Controller Interface Version Number (HCIVERSION)—Offset 2h

This register is modified and maintained by BIOS

Type: Memory Mapped I/O Register (Size: 16 bits)

Default: 0100h

BAR and Offset: [MBAR] + 2h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x100 RW/L	**Host Controller Interface Version Number (HCIVERSION):** Reserved. **Power Well:** Core

51.3.3 Structural Parameters 1 (HCSPARAMS1)—Offset 4h

This register is modified and maintained by BIOS.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 08000820h

BAR and Offset: [MBAR] + 4h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x8 RW/L	**Number of Ports (MaxPorts):** Reserved. **Power Well:** Core
23:19	0x0 RW/L	**Rsvd1:** Reserved. **Power Well:** Core
18:8	0x8 RW/L	**Number of Interrupters (MaxIntrs):** Reserved. **Power Well:** Core
7:0	0x20 RW/L	**Number of Device Slots (MaxSlots):** Reserved. **Power Well:** Core

51.3.4 Structural Parameters 2 (HCSPARAMS2)—Offset 8h

This register is modified and maintained by BIOS.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 94000054h

BAR and Offset: [MBAR] + 8h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0x12 RW/L	**Max Scratchpad Buffers LO (MaxScratchpadBufs):** Reserved. **Power Well:** Core
26	0x1 RW/L	**Scratchpad Restore (SPR):** Reserved. **Power Well:** Core
25:21	0x0 RW/L	**Max Scratchpad Buffers HI (MaxScratchpadBufs_HI):** Reserved. **Power Well:** Core
20:8	0x0 RW/L	**Rsvd1:** Reserved. **Power Well:** Core

51.3.5 Structural Parameters 3 (HCSPARAMS3)—Offset Ch

This register is modified and maintained by BIOS.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00040001h

BAR and Offset: [MBAR] + Ch

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x4 RW/L	**U2 Device Exit Latency (U2DEL):** Reserved. **Power Well:** Core
15:8	0x0 RW/L	**Rsvd1:** Reserved. **Power Well:** Core
7:0	0x1 RW/L	**U1 Device Exit Latency (U1DEL):** Reserved. **Power Well:** Core

51.3.6 Capability Parameters (HCCPARAMS)—Offset 10h

This register is modified and maintained by BIOS.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MBAR] + 10h

Default: 200077C1h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x2000 RW/L	**xHCI Extended Capabilities Pointer (xECP):** Reserved. **Power Well:** Core
15:12	0x7 RW/L	**Maximum Primary Stream Array Size (MaxPSASize):** Reserved. **Power Well:** Core

51.3.19 Port Power Management Status and Control USB2 (PORTPMSC1)—Offset 484h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MBAR] + 484h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RW	**Port Test Control (PTC):** When this field is '0', the port is not operating in a test mode. (Default) A non-zero value indicates that the port is operating in test mode in indicated by the specific value. A non-zero Port Test Control value is only valid to a port that is in the Disabled state. If the port is not in this state, the xHC shall respond with the Port Test Control field set to Port Test Control Error. The encoding of the Test Mode bits for a USB 2.0 port are: Value Test Mode • 0h - Test mode not enabled • 1h - Test J_STATE • 2h - Test K_STATE • 3h - Test SE0_NAK • 4h - Test Packet • 5h - Test FORCE_ENABLE • 6h-14h - Reserved. • 15 - Port Test Control Error
27:17	0x0 RO	Reserved.
16	0x0 RW	**Hardware LPM Enable (HLE):** • 0 - Disable • 1 - Enable. When this bit is a 1, hardware controlled LPM shall be enabled for this port. Refer to Section 4 of the USB 2.0 LPM Specification for more information.
15:8	0x0 RO	Reserved.
7:4	0x0 RW	**Best Effort Service Latency:** System software sets this field to indicate the recipient device how long the xHCI will driver resume if it initiates an exit from L1.
3	0x0 RW	**Remote Wake Enable (RWE):** The host system sets this flag to enable or disable the device for remote wake from L1. • 0 - disable • 1 - enable The value of this flag will temporarily (while in L1) override the current setting of the Remote Wake feature set by the standard Set/ClearFeature() commands defined in Universal Serial Bus Specification, Revision 2.0, Chapter 9.
2:0	0x0 RW	**L1 Status (L1S):** This field is used by software to determine whether an L1-based suspend request was successful.

51.3.20 Port X Hardware LPM Control Register (PORTHLPMC1)—Offset 48Ch

There are 9 PORTHLPMC registers at offsets 48Ch, 49Ch, 4ACh, 4BCh, 4CCh, 4DCh, 4ECh, 4FCh, 50Ch This register is reset only by platform hardware during cold reset or in response to a Host Controller Reset (HCRST). The definition for the fields depend on the protocol supported. For USB3 this register is reserved and shall be treated by software as RsvdP. For USB2 the definition is given below. Fields contain parameters necessary for xHC to automatically generate an LPM Token to the downstream device.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MBAR] + 48Ch

Default: 00000000h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**RESERVED (RSVD):** Reserved. **Power Well:** Core
13:10	0x0 RW	**Host Initiated Resume Duration-Deep (HIRDD):** System software sets this field to indicate to the recipient device how long the xHC will drive resume if an exit from L1. The HIRDD value is is encoded as follows: • 0h: 50 us (default) • 1h: 125 us • 2h: 200 us • ... • Fh: 1.175ms The value of 0h is interpreted as 50 us. Each incrementing value adds 75 us to the previous value. **Power Well:** SUS
9:2	0x0 RW	**L1 Timeout (L1_TO):** Timeout value for L1 inactivity timer. This field shall be set to 00h by assertion of PR to '1'. Following are permissible values: • 00h: 128 us (default) • 01h: 256 us • ... • FFh: 65,280us ***Note:*** This register is sticky. **Power Well:** SUS
1:0	0x0 RW	**Host Initiated Resume Duration Mode (HIRDM):** Indicates which HIRD value should be used. Following are permissible values: • 0: Initiate L1 using HIRD only time out (default) • 1: Initiate HIRDDon timeout. If rejected by device, initiate L1 using HIRD • 2: Reserved • 3: Reserved ***Note:*** This register is sticky. **Power Well:** SUS

51.3.21 Port Status and Control USB2 (PORTSC2)—Offset 490h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 000002A0h

BAR and Offset: [MBAR] + 490h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description

51.3.25 Port Power Management Status and Control USB2 (PORTPMSC3)—Offset 4A4h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MBAR] + 4A4h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RW	**Port Test Control (PTC):** When this field is '0', the port is not operating in a test mode. (Default) A non-zero value indicates that the port is operating in test mode in indicated by the specific value. A non-zero Port Test Control value is only valid to a port that is in the Disabled state. If the port is not in this state, the xHC shall respond with the Port Test Control field set to Port Test Control Error. The encoding of the Test Mode bits for a USB 2.0 port are: Value Test Mode • 0h - Test mode not enabled • 1h - Test J_STATE • 2h - Test K_STATE • 3h - Test SE0_NAK • 4h - Test Packet • 5h - Test FORCE_ENABLE • 6h-14h - Reserved. • 15 - Port Test Control Error
27:17	0x0 RO	Reserved.
16	0x0 RW	**Hardware LPM Enable (HLE):** • 0 - Disable • 1 - Enable. When this bit is a 1, hardware controlled LPM shall be enabled for this port. Refer to Section 4 of the USB 2.0 LPM Specification for more information.
15:8	0x0 RO	Reserved.
7:4	0x0 RW	**Best Effort Service Latency:** System software sets this field to indicate the recipient device how long the xHCI will driver resume if it initiates an exit from L1.
3	0x0 RW	**Remote Wake Enable (RWE):** The host system sets this flag to enable or disable the device for remote wake from L1. • 0 - disable • 1 - enable The value of this flag will temporarily (while in L1) override the current setting of the Remote Wake feature set by the standard Set/ClearFeature() commands defined in Universal Serial Bus Specification, Revision 2.0, Chapter 9.
2:0	0x0 RW	**L1 Status (L1S):** This field is used by software to determine whether an L1-based suspend request was successful.

51.3.26 Port X Hardware LPM Control Register (PORTHLPMC3)—Offset 4ACh

There are 9 PORTHLPMC registers at offsets 48Ch, 49Ch, 4ACh, 4BCh, 4CCh, 4DCh, 4ECh, 4FCh, 50Ch This register is reset only by platform hardware during cold reset or in response to a Host Controller Reset (HCRST). The definition for the fields depend on the protocol supported. For USB3 this register is reserved and shall be treated by software as RsvdP. For USB2 the definition is given below. Fields contain parameters necessary for xHC to automatically generate an LPM Token to the downstream device.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MBAR] + 4ACh

Default: 00000000h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**RESERVED (RSVD):** Reserved. **Power Well:** Core
13:10	0x0 RW	**Host Initiated Resume Duration-Deep (HIRDD):** System software sets this field to indicate to the recipient device how long the xHC will drive resume if an exit from L1. The HIRDD value is is encoded as follows: • 0h: 50 us (default) • 1h: 125 us • 2h: 200 us • ... • Fh: 1.175ms The value of 0h is interpreted as 50 us. Each incrementing value adds 75 us to the previous value. **Power Well:** SUS
9:2	0x0 RW	**L1 Timeout (L1_TO):** Timeout value for L1 inactivity timer. This field shall be set to 00h by assertion of PR to '1'. Following are permissible values: • 00h: 128 us (default) • 01h: 256 us • ... • FFh: 65,280us ***Note:*** This register is sticky. **Power Well:** SUS
1:0	0x0 RW	**Host Initiated Resume Duration Mode (HIRDM):** Indicates which HIRD value should be used. Following are permissible values: • 0: Initiate L1 using HIRD only time out (default) • 1: Initiate HIRDDon timeout. If rejected by device, initiate L1 using HIRD • 2: Reserved • 3: Reserved ***Note:*** This register is sticky. **Power Well:** SUS

51.3.27 Port Status and Control USB2 (PORTSC4)—Offset 4B0h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 000002A0h

BAR and Offset: [MBAR] + 4B0h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description

51.3.28 Port Power Management Status and Control USB2 (PORTPMSC4)—Offset 4B4h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MBAR] + 4B4h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RW	**Port Test Control (PTC):** When this field is '0', the port is not operating in a test mode. (Default) A non-zero value indicates that the port is operating in test mode in indicated by the specific value. A non-zero Port Test Control value is only valid to a port that is in the Disabled state. If the port is not in this state, the xHC shall respond with the Port Test Control field set to Port Test Control Error. The encoding of the Test Mode bits for a USB 2.0 port are: Value Test Mode • 0h - Test mode not enabled • 1h - Test J_STATE • 2h - Test K_STATE • 3h - Test SE0_NAK • 4h - Test Packet • 5h - Test FORCE_ENABLE • 6h-14h - Reserved. • 15 - Port Test Control Error
27:17	0x0 RO	Reserved.
16	0x0 RW	**Hardware LPM Enable (HLE):** • 0 - Disable • 1 - Enable. When this bit is a 1, hardware controlled LPM shall be enabled for this port. Refer to Section 4 of the USB 2.0 LPM Specification for more information.
15:8	0x0 RO	Reserved.
7:4	0x0 RW	**Best Effort Service Latency:** System software sets this field to indicate the recipient device how long the xHCI will driver resume if it initiates an exit from L1.
3	0x0 RW	**Remote Wake Enable (RWE):** The host system sets this flag to enable or disable the device for remote wake from L1. • 0 - disable • 1 - enable The value of this flag will temporarily (while in L1) override the current setting of the Remote Wake feature set by the standard Set/ClearFeature() commands defined in Universal Serial Bus Specification, Revision 2.0, Chapter 9.
2:0	0x0 RW	**L1 Status (L1S):** This field is used by software to determine whether an L1-based suspend request was successful.

51.3.29 Port X Hardware LPM Control Register (PORTHLPMC4)—Offset 4BCh

There are 9 PORTHLPMC registers at offsets 48Ch, 49Ch, 4ACh, 4BCh, 4CCh, 4DCh, 4ECh, 4FCh, 50Ch This register is reset only by platform hardware during cold reset or in response to a Host Controller Reset (HCRST). The definition for the fields depend on the protocol supported. For USB3 this register is reserved and shall be treated by software as RsvdP. For USB2 the definition is given below. Fields contain parameters neccessary for xHC to automatically generate an LPM Token to the downstream device.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MBAR] + 4BCh

Default: 00000000h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	**RESERVED (RSVD):** Reserved. **Power Well:** Core
13:10	0x0 RW	**Host Initiated Resume Duration-Deep (HIRDD):** System software sets this field to indicate to the recipient device how long the xHC will drive resume if an exit from L1. The HIRDD value is is encoded as follows: 0h: 50 us (default) 1h: 125 us 2h: 200 us ... Fh: 1.175ms The value of 0h is interpreted as 50 us. Each incrementing value adds 75 us to the previous value. **Power Well:** SUS
9:2	0x0 RW	**L1 Timeout (L1_TO):** Timeout value for L1 inactivity timer. This field shall be set to 00h by assertion of PR to '1'. Following are permissible values: 00h: 128 us (default) 01h: 256 us. ... FFh: 65,280us Note: This register is sticky. **Power Well:** SUS
1:0	0x0 RW	**Host Initiated Resume Duration Mode (HIRDM):** Indicates which HIRD value should be used. Following are permissible values: 0: Initiate L1 using HIRD only time out (default) 1: Initiate HIRDDon timeout. If rejected by device, initiate L1 using HIRD 2,3: Reserved Note: This register is sticky. **Power Well:** SUS

51.3.30 Port Status and Control USB3 (PORTSC5)—Offset 4C0h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 02A0h

BAR and Offset: [MBAR] + 4C0h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/1S	**Warm Port Reset (WPR):** When software sets this bit to be "1", the Warm Reset sequence as defined in the USB3 specification is initiated and the PR flag is set to "1". This flag shall always return "0" when read. This flag only applies to USB3 protocol ports.
30	0x0 RW/L	**Device Removable (DR):** This bit indicates if this port has a removable device. • 0 - Device is removable • 1 - Device is non-removable
29:28	0x0 RO	Reserved.
27	0x0 RW	**Wake on Over-current Enable (WOE):** • 0 - Disable. (Default) • 1 - Enable. Writing this but to a 1b enables the port to be sensitive to over-current conditions as system wake-up events.
26	0x0 RW	**Wake on Disconnect Enable (WDE):** • 0 - Disable. (Default) • 1 - Enable. Writing this but to a 1b enables the port to be sensitive to device disconnects as system wake-up events.
25	0x0 RW	**Wake on Connect Enable (WCE):** • 0 - Disable. (Default) • 1 - Enable. Writing this but to a 1b enables the port to be sensitive to device connects as system wake-up events.
24	0x0 RO	**Cold Attach Status (CAS):** This bit indicates that far-end terminations were detected in the Disconnected state and the Root Hub Port State Machine was unable to advance to the Enabled state. Software shall clear this bit by writing a 1b to the WPR bit or the xHC shall clear this bit if the CSS bit transitions to 1.
23	0x0 RW/C	**Port Config Error Change (CEC):** This flag indicates that port failed to configure its link partner. • 0= No change. • 1= Port Config Error Detected. Software shall clear this but by writing a "1" to it.
22	0x0 RW/C	**Port Link State Change (PLC):** • 0 - No change • 1 - Link Status Change This flag is set to '1' due to the following Port Link (PLS) transitions:
21	0x0 RW/C	**Port Reset Change (PRC):** This flag is set to '1' due to a '1' to '0' transition of Port Reset (PR). For example, when any reset processing on this port is complete. • 0 - No change • 1 - Reset Complete
20	0x0 RW/C	**Over-current Change (OCC):** The functionality of this bit is not dependent upon the port owner. Software clears this bit by writing a 1 to it. • 0 - No change. (Default) • 1 - There is a change to Overcurrent Active.
19	0x0 RW/C	**Warm Port Reset Change (WRC):** This bit is set when Warm Reset processing on this port completes. • 0 - No change. (Default) • 1 - Warm reset complete

Bit Range	Default & Access	Field Name (ID): Description
18	0x0 RW/C	**Port Enabled Disabled Change (PEC):** • 0 - No change. (Default) • 1 - There is a change to PED bit.
17	0x0 RW/C	**Connect Status Change (CSC):** R?WC. This flag indicates a change has occurred in the port's Current Connect Status (CCS) or Cold Attach Status (CAS) bits. • 0 - No change. (Default) • 1 - There is a change to the CCS or CAS bit. The xHC sets this bit to 1b for all changes to the port device connect status, even if system software has not cleared an existing Connect Status Change. For example, the insertion status changes twice before system software has cleared the change condition root hub hardware will be "setting" an already-set bit (that is, the bit will remain 1b).
16	0x0 RW	**Port Link State Write Strobe (LWS):** • 0 - When 0b, write data in PLS field is ignored. (Default) • 1 - When this bit is set to 1b on a write references to this register, this flag enables writes to the PLS field. Reads to this bit return '0'.
15:14	0x0 RW	**Port Indicator Control (PIC):** Note: This register is sticky.
13:10	0x0 RW	**Port Speed (PortSpeed):** A device attached to this port operates at a speed defined by the following codes: Value Speed • 0001b - full-speed • 0010b - low speed • 0011b - Highspeed • All other values reserved. Refer to the eXtensible Host Controller Interface for Universal Serial Bus Specification for additional details.
9	0x1 RW	**Port Power (PP):** Read-only with a value of 1. This indicates that the port does have power.

Bit Range	Default & Access	Field Name (ID): Description
8:5	0x5 RW	**Port Link State (PLS):** This field is used to power manage the port and reflects its currentlink state. When the port is in the Enabled state, system software may set the link U-state by writing this field. System software may also write this field to force a Disabled to Disconnected state transition of the port. Write Value Description • 0 - The link shall transition to a U0 state from any of the U-states. • 2 - USB 2.0 ports only. The link should transition to the U2 State. • 3 - The link shall transition to a U3 state from any of the U-states. This action selectively suspends the device connected to this port. While the Port LinkState = U3 the hub does not propagate downstream-directed traffic to this port, but the hub will respond to resume signaling from the port. • 5 - USB 3.0 ports only. If the port is in the Disabled state (PLS = Disabled, PP = 1), then the link shall transition to a Rx Detect state and the port shall transition to the Disconnected state, else ignored. • 15 - USB 2.0 ports only. If the port is in the U3 state (PLS = U3), then the link shall remain in the U3 state and the port shall transition to the U3Exit substate, else ignored. • All other values Ignored Read Value Definition • 0 - Link is in the U0 State • 1 - Link is in the U1 State • 2 - Link is in the U2 State • 3 - Link is in the U3 State (Device Suspended) • 4 - Link is in the Disabled State • 5 - Link is in the RxDetect State • 6 - Link is in the Inactive State • 7 - Link is in the Polling State • 8 - Link is in the Recovery State • 9 - Link is in the Hot Reset State • 10 - Link is in the Compliance Mode State • 11 - Link is in the Test Mode State • 12-14 - Reserved • 15 Link is in the Resume State
4	0x0 RW/1S	**Port Reset (PR):** When software writes a 1 to this bit (from a 0), the bus reset sequence as • 1 - port in reset • 0 - port not in reset
3	0x0 RW	**Over-current Active (OCA):** • 0 - This port does not have an overcurrent condition. (Default) • 1 - This port currently has an overcurrent condition. This bit will automatically transition from 1 to 0 when the over current condition is removed. The PCH automatically disables the port when the overcurrent active bit is 1.
2	0x0 RO	Reserved.
1	0x0 RW/C	**Port Enabled Disabled (PED):** Ports can only be enabled by the host controller as a part of the reset and enable. Software cannot enable a port by writing a 1 to this bit. Ports can be disabled by either a fault condition (disconnect even or other fault condition) or by host software. The bit status does not change until the port state actually changes. There may be a delay in disabling or enabling a port due to other host controller and bus events. • 0 - disable • 1 - enable (default)
0	0x0 RW	**Current Connect Status (CCS):** This value reflects the current state of the port and may not correspond directly to the event that caused the Connect Status Change bit (Bit 1) to be set. • 0 - no device is present • 1 - device is present on port.

51.3.31 Port Power Management Status and Control USB3 (PORTPMSC5)—Offset 4C4h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MBAR] + 4C4h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

15:0	0x0 RO	**Link Error Count (LEC):** Reserved. **Power Well:** Core

51.3.33 Port Status and Control USB3 (PORTSC6)—Offset 4D0h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 000002A0h

BAR and Offset: [MBAR] + 4D0h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/1S	**Warm Port Reset (WPR):** When software sets this bit to be "1", the Warm Reset sequence as defined in the USB3 specification is initiated and the PR flag is set to "1". This flag shall always return "0" when read. This flag only applies to USB3 protocol ports.
30	0x0 RW/L	**Device Removable (DR):** This bit indicates if this port has a removable device. • 0 - Device is removable • 1 - Device is non-removable
29:28	0x0 RO	Reserved.
27	0x0 RW	**Wake on Over-current Enable (WOE):** • 0 - Disable. (Default) • 1 - Enable. Writing this but to a 1b enables the port to be sensitive to over-current conditions as system wake-up events.
26	0x0 RW	**Wake on Disconnect Enable (WDE):** • 0 - Disable. (Default) • 1 - Enable. Writing this but to a 1b enables the port to be sensitive to device disconnects as system wake-up events.
25	0x0 RW	**Wake on Connect Enable (WCE):** • 0 - Disable. (Default) • 1 - Enable. Writing this but to a 1b enables the port to be sensitive to device connects as system wake-up events.
24	0x0 RO	**Cold Attach Status (CAS):** This bit indicates that far-end terminations were detected in the Disconnected state and the Root Hub Port State Machine was unable to advance to the Enabled state. Software shall clear this bit by writing a 1b to the WPR bit or the xHC shall clear this bit if the CSS bit transitions to 1.
23	0x0 RW/C	**Port Config Error Change (CEC):** This flag indicates that port failed to configure its link partner. • 0= No change. • 1= Port Config Error Detected. Software shall clear this but by writing a "1" to it.
22	0x0 RW/C	**Port Link State Change (PLC):** • 0 - No change • 1 - Link Status Change This flag is set to '1' due to the following Port Link (PLS) transitions:
21	0x0 RW/C	**Port Reset Change (PRC):** This flag is set to '1' due to a '1' to '0' transition of Port Reset (PR). For example, when any reset processing on this port is complete. • 0 - No change • 1 - Reset Complete
20	0x0 RW/C	**Over-current Change (OCC):** The functionality of this bit is not dependent upon the port owner. Software clears this bit by writing a 1 to it. • 0 - No change. (Default) • 1 - There is a change to Overcurrent Active.
19	0x0 RW/C	**Warm Port Reset Change (WRC):** This bit is set when Warm Reset processing on this port completes. • 0 - No change. (Default) • 1 - Warm reset complete

Bit Range	Default & Access	Field Name (ID): Description
18	0x0 RW/C	**Port Enabled Disabled Change (PEC):** • 0 - No change. (Default) • 1 - There is a change to PED bit.
17	0x0 RW/C	**Connect Status Change (CSC):** R?WC. This flag indicates a change has occurred in the port's Current Connect Status (CCS) or Cold Attach Status (CAS) bits. • 0 - No change. (Default) • 1 - There is a change to the CCS or CAS bit. The xHC sets this bit to 1b for all changes to the port device connect status, even if system software has not cleared an existing Connect Status Change. For example, the insertion status changes twice before system software has cleared the change condition root hub hardware will be "setting" an already-set bit (that is, the bit will remain 1b).
16	0x0 RW	**Port Link State Write Strobe (LWS):** • 0 - When 0b, write data in PLS field is ignored. (Default) • 1 - When this bit is set to 1b on a write references to this register, this flag enables writes to the PLS field. Reads to this bit return '0'.
15:14	0x0 RW	**Port Indicator Control (PIC):** Note: This register is sticky.
13:10	0x0 RW	**Port Speed (PortSpeed):** A device attached to this port operates at a speed defined by the following codes: Value Speed • 0001b - full-speed • 0010b - low speed • 0011b - Highspeed • All other values reserved. Refer to the eXtensible Host Controller Interface for Universal Serial Bus Specification for additional details.
9	0x1 RW	**Port Power (PP):** Read-only with a value of 1. This indicates that the port does have power.

Bit Range	Default & Access	Field Name (ID): Description
8:5	0x5 RW	**Port Link State (PLS):** This field is used to power manage the port and reflects its currentlink state. When the port is in the Enabled state, system software may set the link U-state by writing this field. System software may also write this field to force a Disabled to Disconnected state transition of the port. Write Value Description • 0 - The link shall transition to a U0 state from any of the U-states. • 2 - USB 2.0 ports only. The link should transition to the U2 State. • 3 - The link shall transition to a U3 state from any of the U-states. This action selectively suspends the device connected to this port. While the Port LinkState = U3 the hub does not propagate downstream-directed traffic to this port, but the hub will respond to resume signaling from the port. • 5 - USB 3.0 ports only. If the port is in the Disabled state (PLS = Disabled, PP = 1), then the link shall transition to a Rx Detect state and the port shall transition to the Disconnected state, else ignored. • 15 - USB 2.0 ports only. If the port is in the U3 state (PLS = U3), then the link shall remain in the U3 state and the port shall transition to the U3Exit substate, else ignored. • All other values Ignored Read Value Definition • 0 - Link is in the U0 State • 1 - Link is in the U1 State • 2 - Link is in the U2 State • 3 - Link is in the U3 State (Device Suspended) • 4 - Link is in the Disabled State • 5 - Link is in the RxDetect State • 6 - Link is in the Inactive State • 7 - Link is in the Polling State • 8 - Link is in the Recovery State • 9 - Link is in the Hot Reset State • 10 - Link is in the Compliance Mode State • 11 - Link is in the Test Mode State • 12-14 - Reserved • 15 Link is in the Resume State
4	0x0 RW/1S	**Port Reset (PR):** When software writes a 1 to this bit (from a 0), the bus reset sequence as • 1 - port in reset • 0 - port not in reset
3	0x0 RW	**Over-current Active (OCA):** • 0 - This port does not have an overcurrent condition. (Default) • 1 - This port currently has an overcurrent condition. This bit will automatically transition from 1 to 0 when the over current condition is removed. The PCH automatically disables the port when the overcurrent active bit is 1.
2	0x0 RO	Reserved.
1	0x0 RW/C	**Port Enabled Disabled (PED):** Ports can only be enabled by the host controller as a part of the reset and enable. Software cannot enable a port by writing a 1 to this bit. Ports can be disabled by either a fault condition (disconnect even or other fault condition) or by host software. The bit status does not change until the port state actually changes. There may be a delay in disabling or enabling a port due to other host controller and bus events. • 0 - disable • 1 - enable (default)
0	0x0 RW	**Current Connect Status (CCS):** This value reflects the current state of the port and may not correspond directly to the event that caused the Connect Status Change bit (Bit 1) to be set. • 0 - no device is present • 1 - device is present on port.

51.3.34 Port Power Management Status and Control USB3 (PORTPMSC6)—Offset 4D4h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MBAR] + 4D4h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:17	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
16	0x0 RW	**Force Link PM Accept (FLA):** Reserved. **Power Well:** SUS

7:0	0x0 RW/S	**U1 Timeout (U1T):** Reserved. **Power Well:** SUS

51.3.35 USB3 Port Link Info (PORTLI6)—Offset 4D8h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MBAR] + 4D8h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**Rsvd1:** Reserved. **Power Well:** Core
15:0	0x0 RO	**Link Error Count (LEC):** Reserved. **Power Well:** Core

51.3.36 Port Status and Control USB3 (PORTSC7)—Offset 4E0h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 000002A0h

BAR and Offset: [MBAR] + 4E0h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/1S	**Warm Port Reset (WPR):** When software sets this bit to be "1", the Warm Reset sequence as defined in the USB3 specification is initiated and the PR flag is set to "1". This flag shall always return "0" when read. This flag only applies to USB3 protocol ports.
30	0x0 RW/L	**Device Removable (DR):** This bit indicates if this port has a removable device. • 0 - Device is removable • 1 - Device is non-removable
29:28	0x0 RO	Reserved.
27	0x0 RW	**Wake on Over-current Enable (WOE):** • 0 - Disable. (Default) • 1 - Enable. Writing this but to a 1b enables the port to be sensitive to over-current conditions as system wake-up events.
26	0x0 RW	**Wake on Disconnect Enable (WDE):** • 0 - Disable. (Default) • 1 - Enable. Writing this but to a 1b enables the port to be sensitive to device disconnects as system wake-up events.
25	0x0 RW	**Wake on Connect Enable (WCE):** • 0 - Disable. (Default) • 1 - Enable. Writing this but to a 1b enables the port to be sensitive to device connects as system wake-up events.
24	0x0 RO	**Cold Attach Status (CAS):** This bit indicates that far-end terminations were detected in the Disconnected state and the Root Hub Port State Machine was unable to advance to the Enabled state. Software shall clear this bit by writing a 1b to the WPR bit or the xHC shall clear this bit if the CSS bit transitions to 1.
23	0x0 RW/C	**Port Config Error Change (CEC):** This flag indicates that port failed to configure its link partner. • 0= No change. • 1= Port Config Error Detected. Software shall clear this but by writing a "1" to it.
22	0x0 RW/C	**Port Link State Change (PLC):** • 0 - No change • 1 - Link Status Change This flag is set to '1' due to the following Port Link (PLS) transitions:
21	0x0 RW/C	**Port Reset Change (PRC):** This flag is set to '1' due to a '1' to '0' transition of Port Reset (PR). For example, when any reset processing on this port is complete. • 0 - No change • 1 - Reset Complete
20	0x0 RW/C	**Over-current Change (OCC):** The functionality of this bit is not dependent upon the port owner. Software clears this bit by writing a 1 to it. • 0 - No change. (Default) • 1 - There is a change to Overcurrent Active.
19	0x0 RW/C	**Warm Port Reset Change (WRC):** This bit is set when Warm Reset processing on this port completes. • 0 - No change. (Default) • 1 - Warm reset complete

Bit Range	Default & Access	Field Name (ID): Description
18	0x0 RW/C	**Port Enabled Disabled Change (PEC):** • 0 - No change. (Default) • 1 - There is a change to PED bit.
17	0x0 RW/C	**Connect Status Change (CSC):** R?WC. This flag indicates a change has occurred in the port's Current Connect Status (CCS) or Cold Attach Status (CAS) bits. • 0 - No change. (Default) • 1 - There is a change to the CCS or CAS bit. The xHC sets this bit to 1b for all changes to the port device connect status, even if system software has not cleared an existing Connect Status Change. For example, the insertion status changes twice before system software has cleared the change condition root hub hardware will be "setting" an already-set bit (that is, the bit will remain 1b).
16	0x0 RW	**Port Link State Write Strobe (LWS):** • 0 - When 0b, write data in PLS field is ignored. (Default) • 1 - When this bit is set to 1b on a write references to this register, this flag enables writes to the PLS field. Reads to this bit return '0'.
15:14	0x0 RW	**Port Indicator Control (PIC):** Note: This register is sticky.
13:10	0x0 RW	**Port Speed (PortSpeed):** A device attached to this port operates at a speed defined by the following codes: Value Speed • 0001b - full-speed • 0010b - low speed • 0011b - Highspeed • All other values reserved. Refer to the eXtensible Host Controller Interface for Universal Serial Bus Specification for additional details.
9	0x1 RW	**Port Power (PP):** Read-only with a value of 1. This indicates that the port does have power.

Bit Range	Default & Access	Field Name (ID): Description
8:5	0x5 RW	**Port Link State (PLS):** This field is used to power manage the port and reflects its currentlink state. When the port is in the Enabled state, system software may set the link U-state by writing this field. System software may also write this field to force a Disabled to Disconnected state transition of the port. Write Value Description • 0 - The link shall transition to a U0 state from any of the U-states. • 2 - USB 2.0 ports only. The link should transition to the U2 State. • 3 - The link shall transition to a U3 state from any of the U-states. This action selectively suspends the device connected to this port. While the Port LinkState = U3 the hub does not propagate downstream-directed traffic to this port, but the hub will respond to resume signaling from the port. • 5 - USB 3.0 ports only. If the port is in the Disabled state (PLS = Disabled, PP = 1), then the link shall transition to a Rx Detect state and the port shall transition to the Disconnected state, else ignored. • 15 - USB 2.0 ports only. If the port is in the U3 state (PLS = U3), then the link shall remain in the U3 state and the port shall transition to the U3Exit substate, else ignored. • All other values Ignored Read Value Definition • 0 - Link is in the U0 State • 1 - Link is in the U1 State • 2 - Link is in the U2 State • 3 - Link is in the U3 State (Device Suspended) • 4 - Link is in the Disabled State • 5 - Link is in the RxDetect State • 6 - Link is in the Inactive State • 7 - Link is in the Polling State • 8 - Link is in the Recovery State • 9 - Link is in the Hot Reset State • 10 - Link is in the Compliance Mode State • 11 - Link is in the Test Mode State • 12-14 - Reserved • 15 Link is in the Resume State
4	0x0 RW/1S	**Port Reset (PR):** When software writes a 1 to this bit (from a 0), the bus reset sequence as • 1 - port in reset • 0 - port not in reset
3	0x0 RW	**Over-current Active (OCA):** • 0 - This port does not have an overcurrent condition. (Default) • 1 - This port currently has an overcurrent condition. This bit will automatically transition from 1 to 0 when the over current condition is removed. The PCH automatically disables the port when the overcurrent active bit is 1.
2	0x0 RO	Reserved.
1	0x0 RW/C	**Port Enabled Disabled (PED):** Ports can only be enabled by the host controller as a part of the reset and enable. Software cannot enable a port by writing a 1 to this bit. Ports can be disabled by either a fault condition (disconnect even or other fault condition) or by host software. The bit status does not change until the port state actually changes. There may be a delay in disabling or enabling a port due to other host controller and bus events. • 0 - disable • 1 - enable (default)
0	0x0 RW	**Current Connect Status (CCS):** This value reflects the current state of the port and may not correspond directly to the event that caused the Connect Status Change bit (Bit 1) to be set. • 0 - no device is present • 1 - device is present on port.

BAR and Offset: [MBAR] + 2040h

Default: 00000000h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RO	**Rsvd1:** Reserved. **Power Well:** Core
1	0x0 RW	**Interrupt Enable (IE):** Reserved. **Power Well:** Core
0	0x0 RW/C	**Interrupt Pending (IP):** Reserved. **Power Well:** Core

51.3.51 Interrupter 2 Moderation (IMOD1)—Offset 2044h

There are 8 IMOD registers. x = 1, 2, ..., 8

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MBAR] + 2044h

Default: 00000FA0h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**Interrupt Moderation Counter (IMODC):** Reserved. **Power Well:** Core
15:0	0xfa0 RW	**Interrupt Moderation Interval (IMODI):** Reserved. **Power Well:** Core

51.3.52 Event Ring Segment Table Size 2 (ERSTSZ1)—Offset 2048h

There are 8 ERSTSZ register. x = 1, 2, ..., 8

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MBAR] + 2048h

Default: 00000000h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**Rsvd1:** Reserved. **Power Well:** Core
15:0	0x0 RW	**Event Ring Segment Table Size (ERSTS):** Reserved. **Power Well:** Core

51.3.53 Event Ring Segment Table Base Address Low 2 (ERSTBA_LO1)—Offset 2050h

There are 8 ERSTBA_LO registers x = 1, 2, ..., 8

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MBAR] + 2050h

Default: 00000000h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0x0 RW	**Event Ring Segment Table Base Address Register (ERSTBA):** Reserved. **Power Well:** Core
5:0	0x0 RO	**Rsvd1:** Reserved. **Power Well:** Core

51.3.54 Event Ring Segment Table Base Address High 2 (ERSTBA_HI1)—Offset 2054h

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MBAR] + 2054h

Default: 00000000h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Event Ring Segment Table Base Address (ERSTBA):** Reserved. **Power Well:** Core

51.3.55 Event Ring Dequeue Pointer Low 2 (ERDP_LO1)—Offset 2058h

There are 8 ERDP_LO registers. x = 1, 2, ...,8

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MBAR] + 2058h

Default: 00000000h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0x0 RW	**Event Ring Dequeue Pointer (ERDP):** Reserved. **Power Well:** Core
3	0x0 RW/C	**Event Handler Busy (EHB):** Reserved. **Power Well:** Core
2:0	0x0 RW	**Dequeue ERST Segment Index (DESI):** Reserved. **Power Well:** Core

51.3.56 Event Ring Dequeue Pointer High 2 (ERDP_HI1)—Offset 205Ch

There are 8 ERDP_HI registers. x = 1, 2, ..., 8

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MBAR] + 205Ch

Default: 00000000h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Event Ring Dequeue Pointer (ERDP):** Reserved. **Power Well:** Core

51.3.57 Interrupter 3 Management (IMAN2)—Offset 2060h

There are 8 IMAN registers. x = 1, 2, ..., 8

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MBAR] + 2060h

Default: 00000000h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description

There are 8 ERSTBA_LO registers x = 1, 2, ..., 8

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MBAR] + 20F0h

Default: 00000000h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0x0 RW	**Event Ring Segment Table Base Address Register (ERSTBA):** Reserved. **Power Well:** Core
5:0	0x0 RO	**Rsvd1:** Reserved. **Power Well:** Core

51.3.89 Event Ring Segment Table Base Address High 7 (ERSTBA_HI6)—Offset 20F4h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MBAR] + 20F4h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Event Ring Segment Table Base Address (ERSTBA):** Reserved. **Power Well:** Core

51.3.90 Event Ring Dequeue Pointer Low 7 (ERDP_LO6)—Offset 20F8h

There are 8 ERDP_LO registers. x = 1, 2, ...,8

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MBAR] + 20F8h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0x0 RW	**Event Ring Dequeue Pointer (ERDP):** Reserved. **Power Well:** Core
3	0x0 RW/C	**Event Handler Busy (EHB):** Reserved. **Power Well:** Core
2:0	0x0 RW	**Dequeue ERST Segment Index (DESI):** Reserved. **Power Well:** Core

51.3.91 Event Ring Dequeue Pointer High 7 (ERDP_HI6)—Offset 20FCh

There are 8 ERDP_HI registers. x = 1, 2, ..., 8

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MBAR] + 20FCh

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Event Ring Dequeue Pointer (ERDP):** Reserved. **Power Well:** Core

51.3.92 Interrupter 8 Management (IMAN7)—Offset 2100h

There are 8 IMAN registers. x = 1, 2, ..., 8

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MBAR] + 2100h

Default: 00000000h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RO	**Rsvd1:** Reserved. **Power Well:** Core
1	0x0 RW	**Interrupt Enable (IE):** Reserved. **Power Well:** Core
0	0x0 RW/C	**Interrupt Pending (IP):** Reserved. **Power Well:** Core

51.3.93 Interrupter 8 Moderation (IMOD7)—Offset 2104h

There are 8 IMOD registers. x = 1, 2, ..., 8

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MBAR] + 2104h

Default: 00000FA0h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**Interrupt Moderation Counter (IMODC):** Reserved. **Power Well:** Core
15:0	0xfa0 RW	**Interrupt Moderation Interval (IMODI):** Reserved. **Power Well:** Core

51.3.94 Event Ring Segment Table Size 8 (ERSTSZ7)—Offset 2108h

There are 8 ERSTSZ register. x = 1, 2, ..., 8

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MBAR] + 2108h

Default: 00000000h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**Rsvd1:** Reserved. **Power Well:** Core
15:0	0x0 RW	**Event Ring Segment Table Size (ERSTS):** Reserved. **Power Well:** Core

51.3.95 Event Ring Segment Table Base Address Low 8 (ERSTBA_LO7)—Offset 2110h

There are 8 ERSTBA_LO registers x = 1, 2, ..., 8

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MBAR] + 2110h

Default: 00000000h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:6	0x0 RW	**Event Ring Segment Table Base Address Register (ERSTBA):** Reserved. **Power Well:** Core
5:0	0x0 RO	**Rsvd1:** Reserved. **Power Well:** Core

51.3.96 Event Ring Segment Table Base Address High 8 (ERSTBA_HI7)—Offset 2114h

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MBAR] + 2114h

Default: 00000000h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Event Ring Segment Table Base Address (ERSTBA):** Reserved. **Power Well:** Core

51.3.97 Event Ring Dequeue Pointer Low 8 (ERDP_LO7)—Offset 2118h

There are 8 ERDP_LO registers. x = 1, 2, ...,8

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MBAR] + 2118h

Default: 00000000h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0x0 RW	**Event Ring Dequeue Pointer (ERDP):** Reserved. **Power Well:** Core
3	0x0 RW/C	**Event Handler Busy (EHB):** Reserved. **Power Well:** Core
2:0	0x0 RW	**Dequeue ERST Segment Index (DESI):** Reserved. **Power Well:** Core

51.3.98 Event Ring Dequeue Pointer High 8 (ERDP_HI7)—Offset 211Ch

There are 8 ERDP_HI registers. x = 1, 2, ..., 8

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MBAR] + 211Ch

Default: 00000000h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Event Ring Dequeue Pointer (ERDP):** Reserved. **Power Well:** Core

51.3.99 Door Bell 1 (DB0)—Offset 3000h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MBAR] + 3000h

Default: 00000000h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**DB Stream ID (DSI):** Reserved. **Power Well:** Core
15:8	0x0 RO	**Rsvd1:** Reserved. **Power Well:** Core
7:0	0x0 RW	**DB Target (DT):** This field defines the target of the doorbell reference. Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers. **Power Well:** Core

51.3.100 Door Bell 2 (DB1)—Offset 3004h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MBAR] + 3004h

Default: 00000000h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**DB Stream ID (DSI):** Reserved. **Power Well:** Core
15:8	0x0 RO	**Rsvd1:** Reserved. **Power Well:** Core
7:0	0x0 RW	**DB Target (DT):** This field defines the target of the doorbell reference. Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers. **Power Well:** Core

51.3.101 Door Bell 3 (DB2)—Offset 3008h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MBAR] + 3008h

Default: 00000000h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**DB Stream ID (DSI):** Reserved. **Power Well:** Core
15:8	0x0 RO	**Rsvd1:** Reserved. **Power Well:** Core
7:0	0x0 RW	**DB Target (DT):** This field defines the target of the doorbell reference. Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers. **Power Well:** Core

51.3.102 Door Bell 4 (DB3)—Offset 300Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MBAR] + 300Ch

Default: 00000000h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**DB Stream ID (DSI):** Reserved. **Power Well:** Core
15:8	0x0 RO	**Rsvd1:** Reserved. **Power Well:** Core
7:0	0x0 RW	**DB Target (DT):** This field defines the target of the doorbell reference. Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers. **Power Well:** Core

51.3.103 Door Bell 5 (DB4)—Offset 3010h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MBAR] + 3010h

Default: 00000000h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**DB Stream ID (DSI):** Reserved. **Power Well:** Core
15:8	0x0 RO	**Rsvd1:** Reserved. **Power Well:** Core
7:0	0x0 RW	**DB Target (DT):** This field defines the target of the doorbell reference. Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers. **Power Well:** Core

51.3.104 Door Bell 6 (DB5)—Offset 3014h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MBAR] + 3014h

Default: 00000000h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**DB Stream ID (DSI):** Reserved. **Power Well:** Core
15:8	0x0 RO	**Rsvd1:** Reserved. **Power Well:** Core
7:0	0x0 RW	**DB Target (DT):** This field defines the target of the doorbell reference. Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers. **Power Well:** Core

51.3.105 Door Bell 7 (DB6)—Offset 3018h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MBAR] + 3018h

Default: 00000000h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**DB Stream ID (DSI):** Reserved. **Power Well:** Core
15:8	0x0 RO	**Rsvd1:** Reserved. **Power Well:** Core
7:0	0x0 RW	**DB Target (DT):** This field defines the target of the doorbell reference. Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers. **Power Well:** Core

51.3.106 Door Bell 8 (DB7)—Offset 301Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MBAR] + 301Ch

Default: 00000000h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**DB Stream ID (DSI):** Reserved. **Power Well:** Core
15:8	0x0 RO	**Rsvd1:** Reserved. **Power Well:** Core
7:0	0x0 RW	**DB Target (DT):** This field defines the target of the doorbell reference. Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers. **Power Well:** Core

51.3.107 Door Bell 9 (DB8)—Offset 3020h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MBAR] + 3020h

Default: 00000000h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**DB Stream ID (DSI):** Reserved. **Power Well:** Core
15:8	0x0 RO	**Rsvd1:** Reserved. **Power Well:** Core
7:0	0x0 RW	**DB Target (DT):** This field defines the target of the doorbell reference. Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers. **Power Well:** Core

51.3.108 Door Bell 10 (DB9)—Offset 3024h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MBAR] + 3024h

Default: 00000000h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**DB Stream ID (DSI):** Reserved. **Power Well:** Core
15:8	0x0 RO	**Rsvd1:** Reserved. **Power Well:** Core
7:0	0x0 RW	**DB Target (DT):** This field defines the target of the doorbell reference. Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers. **Power Well:** Core

51.3.109 Door Bell 11 (DB10)—Offset 3028h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MBAR] + 3028h

Default: 00000000h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**DB Stream ID (DSI):** Reserved. **Power Well:** Core
15:8	0x0 RO	**Rsvd1:** Reserved. **Power Well:** Core
7:0	0x0 RW	**DB Target (DT):** This field defines the target of the doorbell reference. Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers. **Power Well:** Core

51.3.110 Door Bell 12 (DB11)—Offset 302Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MBAR] + 302Ch

Default: 00000000h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**DB Stream ID (DSI):** Reserved. **Power Well:** Core
15:8	0x0 RO	**Rsvd1:** Reserved. **Power Well:** Core

51.3.120 Door Bell 22 (DB21)—Offset 3054h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MBAR] + 3054h

Default: 00000000h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**DB Stream ID (DSI):** Reserved. **Power Well:** Core
15:8	0x0 RO	**Rsvd1:** Reserved. **Power Well:** Core
7:0	0x0 RW	**DB Target (DT):** This field defines the target of the doorbell reference. Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers. **Power Well:** Core

51.3.121 Door Bell 23 (DB22)—Offset 3058h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MBAR] + 3058h

Default: 00000000h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**DB Stream ID (DSI):** Reserved. **Power Well:** Core
15:8	0x0 RO	**Rsvd1:** Reserved. **Power Well:** Core
7:0	0x0 RW	**DB Target (DT):** This field defines the target of the doorbell reference. Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers. **Power Well:** Core

51.3.122 Door Bell 24 (DB23)—Offset 305Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MBAR] + 305Ch

Default: 00000000h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**DB Stream ID (DSI):** Reserved. **Power Well:** Core
15:8	0x0 RO	**Rsvd1:** Reserved. **Power Well:** Core
7:0	0x0 RW	**DB Target (DT):** This field defines the target of the doorbell reference. Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers. **Power Well:** Core

51.3.123 Door Bell 25 (DB24)—Offset 3060h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MBAR] + 3060h

Default: 00000000h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**DB Stream ID (DSI):** Reserved. **Power Well:** Core
15:8	0x0 RO	**Rsvd1:** Reserved. **Power Well:** Core
7:0	0x0 RW	**DB Target (DT):** This field defines the target of the doorbell reference. Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers. **Power Well:** Core

51.3.124 Door Bell 26 (DB25)—Offset 3064h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MBAR] + 3064h

Default: 00000000h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**DB Stream ID (DSI):** Reserved. **Power Well:** Core
15:8	0x0 RO	**Rsvd1:** Reserved. **Power Well:** Core
7:0	0x0 RW	**DB Target (DT):** This field defines the target of the doorbell reference. Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers. **Power Well:** Core

51.3.125 Door Bell 27 (DB26)—Offset 3068h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MBAR] + 3068h

Default: 00000000h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**DB Stream ID (DSI):** Reserved. **Power Well:** Core
15:8	0x0 RO	**Rsvd1:** Reserved. **Power Well:** Core
7:0	0x0 RW	**DB Target (DT):** This field defines the target of the doorbell reference. Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers. **Power Well:** Core

51.3.126 Door Bell 28 (DB27)—Offset 306Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MBAR] + 306Ch

Default: 00000000h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**DB Stream ID (DSI):** Reserved. **Power Well:** Core
15:8	0x0 RO	**Rsvd1:** Reserved. **Power Well:** Core
7:0	0x0 RW	**DB Target (DT):** This field defines the target of the doorbell reference. Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers. **Power Well:** Core

51.3.127 Door Bell 29 (DB28)—Offset 3070h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MBAR] + 3070h

Default: 00000000h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**DB Stream ID (DSI):** Reserved. **Power Well:** Core
15:8	0x0 RO	**Rsvd1:** Reserved. **Power Well:** Core
7:0	0x0 RW	**DB Target (DT):** This field defines the target of the doorbell reference. Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers. **Power Well:** Core

51.3.128 Door Bell 30 (DB29)—Offset 3074h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MBAR] + 3074h

Default: 00000000h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**DB Stream ID (DSI):** Reserved. **Power Well:** Core
15:8	0x0 RO	**Rsvd1:** Reserved. **Power Well:** Core
7:0	0x0 RW	**DB Target (DT):** This field defines the target of the doorbell reference. Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers. **Power Well:** Core

51.3.129 Door Bell 31 (DB30)—Offset 3078h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MBAR] + 3078h

Default: 00000000h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**DB Stream ID (DSI):** Reserved. **Power Well:** Core
15:8	0x0 RO	**Rsvd1:** Reserved. **Power Well:** Core
7:0	0x0 RW	**DB Target (DT):** This field defines the target of the doorbell reference. Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers. **Power Well:** Core

51.3.130 Door Bell 32 (DB31)—Offset 307Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MBAR] + 307Ch

Default: 00000000h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**DB Stream ID (DSI):** Reserved. **Power Well:** Core
15:8	0x0 RO	**Rsvd1:** Reserved. **Power Well:** Core
7:0	0x0 RW	**DB Target (DT):** This field defines the target of the doorbell reference. Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers. **Power Well:** Core

51.3.131 Door Bell 32 (DB32)—Offset 3080h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MBAR] + 3080h

Default: 00000000h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**DB Stream ID (DSI):** Reserved. **Power Well:** Core
15:8	0x0 RO	**Rsvd1:** Reserved. **Power Well:** Core
7:0	0x0 RW	**DB Target (DT):** This field defines the target of the doorbell reference. Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers. **Power Well:** Core

51.3.132 XECP_SUPP_USB2_1—Offset 8004h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 20425355h

BAR and Offset: [MBAR] + 8004h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x20425355 RO	**XECP_SUPP_USB2_1:** Namestring USB **Power Well:** Core

51.3.133 XECP_SUPP_USB2_2—Offset 8008h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 30190401h

BAR and Offset: [MBAR] + 8008h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0x3 RO	**Protocol Speed ID Count (PROT_SPD_ID_CNT):** 3 USB 2.0 Speed (High, Full, Low) **Power Well:** Core
27:21	0x0 RO	**Rsvd0:** Reserved. **Power Well:** Core
20	0x1 RW/L	**BESL LPM Capability (BLC):** Bit is set to 1 to indicate that the the ports described by this xHCI Supported Protocol Capability will apply BESL timing to BESL and BESLD fields of the PORTPMSC and PORTHLPMCC registers. **Power Well:** Core
19	0x1 RW/L	**Protocol Defined - Hardware LMP Capability (HLC):** Reserved. **Power Well:** Core

15:8	0x4 RO	**Compatible Port Count (CPC):** Reserved. **Power Well:** Core
7:0	0x1 RO	**Compatible Port Offset (CPO):** Reserved. **Power Well:** Core

51.3.134 XECP_SUPP_USB3_1—Offset 8024h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 20425355h

BAR and Offset: [MBAR] + 8024h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x20425355 RO	**XECP_SUPP_USB2_1:** Namestring USB **Power Well:** Core

51.3.135 XECP_SUPP_USB3_2—Offset 8028h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 10000405h

BAR and Offset: [MBAR] + 8028h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0x1 RO	**Protocol Speed ID Count (PROT_SPD_ID_CNT):** 1 USB 3.0 Speed (Supper Speed) **Power Well:** Core
27:16	0x0 RO	**Rsvd0:** Reserved. **Power Well:** Core
15:8	0x4 RO	**Compatible Port Count (CPC):** Reserved. **Power Well:** Core
7:0	0x5 RO	**Compatible Port Offset (CPO):** Reserved. **Power Well:** Core

51.3.136 Host Controller Capability (HOST_CTRL_CAP_REG)—Offset 8070h

This is a register that describe the host controller the extended cap location. It includes the , XECP_HOST_NEXT_CAP_OFFSET and VEND_DEF_HOST_CAP_ID_192. This register is not subject to HW save and restore.

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 004DFFC0h

BAR and Offset: [MBAR] + 8070h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
23:16	0x4d RW/L	**Valid Length (VALID_LENGTH):** Indicates the number of valid DWords in the capability, that need to be saved and restored This value needs to be updated as new chicken bit registers are added. 47h -) 818Bh is the last valid byte **Power Well:** Core
15:8	0xff RW/L	**Next Capability Pointer (XECP_HOST_NEXT_CAP_OFFSET):** Reserved. **Power Well:** Core
7:0	0xc0 RW/L	**Supported Protocol ID (VEND_DEF_HOST_CAP_ID):** Reserved. **Power Well:** Core

51.3.137 Override EP Flow Control (HOST_CLR_MASK_REG)—Offset 8078h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MBAR] + 8078h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0x0 RO	**RESERVED (RSVD):** Reserved. **Power Well:** Core
9:5	0x0 WO	**Slot Number Default Config (SNDC):** 5bits of slot number as a default configuration. It can scale to max of 128 slots **Power Well:** Core
4:1	0x0 WO	**EP Number (EP_NUM):** 4bits of EP number **Power Well:** Core
0	0x0 WO	**Clear Internal Scheduler's Mask (CISM):** This is a register that is used to clear the internal scheduler's mask that is used to stop scheduling a particular EP. Bit0 indicates the direction of the EP **Power Well:** Core

51.3.138 Clear Active IN EP ID Control (HOST_CLR_IN_EP_VALID_REG)—Offset 807Ch

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MBAR] + 807Ch

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 WO	**Clear Active IN EP ID Control (HOST_CLR_IN_EP_VALID_REG):** This register is used to clear the internal valid IN EP array that TRM stored in order to guarantee one IN EP per port. This register allows software to clear the valid bit of each port IN EP. This field indicates the port number. For a 2port configuration, only bit1:0 are valid. It can scale for the max number of ports that we support. **Power Well:** Core

51.3.139 Clear Poll Mask Control (HOST_CLR_PMASK_REG)—Offset 8080h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MBAR] + 8080h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0x0 RO	**RESERVED (RSVD):** Reserved. **Power Well:** Core
9:5	0x0 WO	**Slot Number Default Config (SNDC):** 5bits of slot number as a default configuration. It can scale to max of 128 slots **Power Well:** Core
4:1	0x0 WO	**EP Number (EP_NUM):** 4bits of EP number **Power Well:** Core
0	0x0 WO	**Clear Internal Scheduler's Poll Mask (CISPM):** This is a register that is used to clear the internal scheduler's poll mask that is used to indicate whether we need to poll this EP. This is used for USB2. Bit0 indicates the direction of the EP **Power Well:** Core

51.3.140 Host Control Scheduler (HOST_CTRL_SCH_REG)—Offset 8094h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00008100h

BAR and Offset: [MBAR] + 8094h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:21	0x0 RW	**Scheduler Host Control Reg Cont (SCHED_HOST_CTRL_CONT):** method of USB2 port periodic done check (off by default) **Power Well:** Core
20:13	0x4 RW	**TTE Host Control (TTE_HOST_CTRL):** (0): disable interrupt complete split limit to 3 microframes (1): disable checking of missed microframes (2): disable split error request w/NULL pointer on speculative INs with data payload and no TRB. (3): disable deferred split error request on speculative IN with data payload and no TRB. (7:4): reserved **Power Well:** Core
12:11	0x0 RW	**Cache Size Control Reg (CACHE_SZ_CTRL):** 0: 64 1: 32 2,3: 16 **Power Well:** Core
10:9	0x0 RW	**Maximum EP Per Slot (MAX_EP_SLOT):** 0: 32 1: 16 2: 8 3: 4 **Power Well:** Core
8	0x1 RW	**Turn on scratch_pad_en (TO_SCRATCH_PAD_EN):** Reserved. **Power Well:** Core
7:0	0x0 RW	**Scheduler Host Control Reg (SCHED_HOST_CTRL):** (0): disable poll delay (1): disable TRM active in EP valid check (2): enable TTE overlap prevention on interrupt IN EPs (at cost of possible service interval slip) (3) enable TTE overlap prevention on interrupt OUT EPs (at cost of possible service interval slip) (5:4) scheduler sort pattern 00 (default) search ISO ahead of interrupt within each service interval 01 - search USB2-ISO, USB3-ISO, USB2-Interrupt, USB3-Interrupt within each service interval 10 - search strictly by interval 11 - search all ISO intervals ahead interrupt intervals and within each interval, USB2 ahead of USB3 (6): disable 1 pack scheduling limit when ISO pending in present microframe (7): enable check to stop scheduling on port that are not connected **Power Well:** Core

51.3.141 Power Management Control (PMCTRL_REG)—Offset 80A4h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 002DFF90h

BAR and Offset: [MBAR] + 80A4h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**Async PME Source Enable (ASYNC_PME_SRC_EN):** This field allows the async PME source to be allowed to generate PME. This is specifically required for SOCs that do not allow for any clock other than RTC to be available during RTD3. **Power Well:** SUS
30	0x0 RW	**Legacy PME Source Enable (LEGACY_PME_SRC_EN):** This field allows the legacy PME source to be used in PME generation. The legacy source in in reference to the source prior to the RTD3 changes. **Power Well:** SUS
29	0x0 RW	**Reset Warn Power Gate Trigger Disable (RESET_WARN_PWR_GATE_TRIGGER_DISABLE):** This field controls the actions taken for due to reset warn. 0 - Reset Warn will trigger a HW autonomous Power Gate 1 - Reset Warn will not trigger a HW autonomous Power Gate **Power Well:** SUS
28	0x0 RW	**CLR_PME_FLAG_PULSE_AUX_CCLK:** Reserved. **Power Well:** SUS
27	0x0 RW	**RESERVED (RSVD):** Reserved. **Power Well:** SUS
26	0x0 RW	**XLFPSCOUNTSRC:** XLFPSCOUNTSRC (Source for LFPS OFF Counter) 0: Central RTC Counter for LFPS detection 1: Local Counter for LFPS detection **Power Well:** SUS
25	0x0 RW	**XELFPSRTC:** XELFPSRTC (Enable LFPS Filtering on RTC) 0: Use Oscillator clock for LFPS Filtering during P3 1: Use RTC Clock for LFPS Filtering during P3 **Power Well:** SUS
24	0x0 RW	**XMPHYSPGDD0I2:** XMPHYSPGDD0I2 (ModPhy Sus Well Power Gate Disable for D0I2) 0 : Modphy sus well power gating enabled 1 : Modphy sus well power gating disabled **Power Well:** SUS
23	0x0 RW	**XMPHYSPGDD0I3:** XMPHYSPGDD0I3 (ModPhy Sus Well Power Gate Disable for D0I3) 0 : Modphy sus well power gating enabled 1 : Modphy sus well power gating disabled **Power Well:** SUS
22	0x0 RW	**XMPHYSPGDRTD3:** XMPHYSPGDRTD3 (ModPhy Sus Well Power Gate Disable for RTD3) 0 : Modphy sus well power gating enabled 1 : Modphy sus well power gating disabled **Power Well:** SUS
21:18	0xb RW	**XD3RTCPTTM:** XD3RTCPTTM (D3 RTC Port Timer Tick Multiplier) This register will be the multiplication factor for determining SSIC Wake Detection Frequency and RXDET based on the XD3RTCPTTC value. If XD3RTCPTTC is 9h and this register is Bh, frequency for RXDET and SSIC H8EXIT detection while MODPHY SUS Power gating is enabled would be 99ms. **Power Well:** SUS

Bit Range	Default & Access	Field Name (ID): Description
17	0x0 RW	**U3 LFPS Periodic Sampling ON Time Control (U3_LFPS_PRDC_SAMPLING_ON_TIME_CTRL):** This field controls the ON time for the LFPS periodic sampling for USB3/SSIC ports. 0 ON time is 2 rtc clocks 1 ON time is 3 rtc clocks Note: This field is ignored if USB3/SSIC PHY SUS Well Power Gating is enabled. **Power Well:** SUS
16	0x1 RW	**AON LFPS Detector Enable Mode (AON_LFPS_DETECTOR_EN_MODE):** 1 - Allow the LFSP Detector in AON to own LFPS detection when the port is in PS3 for U2/U3 - not RxD regardless of port ownership. 0 - Allow the LFPS Detector in AON to own the LFPS detection only when the AON owns the port and in U2/U3 - not RxD **Power Well:** SUS
15:8	0xff RW	**SS U3 LFPS Detection Threshold (SS_U3_LFPS_DETECTION_THRESHOLD):** This field controls the threshold used to determine when a valid U3 Wake is detected through when using the unfiltered LFPS source. The value on this field will reflect the binary count required to have been detected on the counter being clocked by the unfiltered lfps source to result in a valid U3 wake detection. **Power Well:** SUS
7:4	0x9 RW	**SS_U3_LFPS_PRDC_SAMPLING_OFFTIME_CTRL:** This field controls the OFF time for the LFPS periodic sampling for USB3 Ports 0x0 periodic sampling is disabled. 0x1 OFF time is 1ms 0x2 OFF time is 2ms 0xF OFF time is 15ms The ON Time is determined by the amount of time required to reliably determine if there is a valid LFPS and is HW implementation specific. A speed up mode shall be implemented where this field is in units of us. i.e. 0x1 = 1 us OFF time, 0x2 = 2 us OFF time, etc. **Power Well:** SUS
3	0x0 RW	**PS3 LFPS Source Select (PS3_LFPS_SRC_SEL):** 0 LFPS Source is unfiltered 1 LFPS Source is filtered (Rx-Elec-Idle) LFPS Source is Rx-Elec-Idle for any non PS3 state. **Power Well:** SUS
2	0x0 RW	**XHCI Engine Autonomous Power Gate Exit Reset Policy (XHC_AUTO_PWRGATE_EXITRST_POLICY):** Controls when the xHCI engine is brought out of reset due to a power ungate. 0 Engine is brought out of reset when D3 to D0 is triggered. This allows for a quick power up sequence while leaving the virtual PCIe LTSSM in L23 is power ungate is not due to D3 to D0. 1 Engine is brought out of reset along with the rest of the IP. This is required for PMC save/restore flow. **Power Well:** SUS
1	0x0 RW	**USB2 Port Wake Unit Coupling Policy (USB2_PORT_WAKE_COUPLING_POLICY):** Controls the trigger for USB2 Port Wake Units to initiate Port Level Power Off Preparation. 0 RTD3 triggered 1 - Port Triggered when in L1, L2 or Disabled, Disconnected **Power Well:** SUS
0	0x0 RW	**USB3 Port Wake Unit Coupling Policy (USB3_PORT_WAKE_COUPLING_POLICY):** Controls the trigger for USB3 Port Wake Units to initiate Port Level Power Off Preparation. 0 - RTD3 Triggered 1 - Port Triggered when in PS3 due to RxDetect, U3, U2 or Disabled **Power Well:** SUS

51.3.142 PGCB Control (PGCBCTRL_REG)—Offset 80A8h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00315555h

BAR and Offset: [MBAR] + 80A8h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RO	**RESERVED (RSVD):** Reserved. **Power Well:** SUS
27:25	0x0 RW	**IP_INACCESSIBLE_HYSTERESIS_TIMER:** • 000 =50us • 001 =100us • 010 =150us • 011 =200us • 000 =250us • 001 =300us • 010 =350us • 111 =400us **Power Well:** SUS
24	0x0 RW	**Override_Disable (OVERRIDE_DISABLE):** Reserved. **Power Well:** SUS
23:20	0x3 RW	**CDH Aggregation Minimum Wait Time (CDH_MIN_WAIT_TIME):** This field controls the minimum time that we must wait for resets to propagate before allowing Power Up flow to complete. The Power Up flow requires special handling of clocks, reset and sleep signaling which requires the CDH to monitor reset propagation. This timer allow for flexibility on when we consider all resets propagated. • 0h Disabled • 1h 2 clocks • 2h 4 clocks • 3h 8 clocks • 4h 16 clocks • 5h 32 clocks • 6h 64 clocks • 7h 128 clocks **Power Well:** SUS
19	0x0 RW	**RESERVED (CDH_RST_PROPAGATION_CNTRL):** This bit will indicate the mode of operation for the CDH Reset Propagation Aggregator. It allows for a mode where the aggregation will wait for an indication from each CDH before proceeding OR ignore the CDH indication before proceeding. Regardless of the mode, the aggregator will enforce the CDH Aggregation Mini Wait Time. 0 Aggregate all the CDH indications before triggering the CDH Aggregation Mini Wait Time. Once the Min Wait Time is met a notification to the Power Sequencer/Control will be initiated 1 Trigger the CDH Aggregation Mini Wait Time w/o waiting for CDH indication. Once the Min Wait time is met a notification to the Power Sequencer/Control will be initiated. **Power Well:** SUS
18	0x0 RW	**MMP_PFET_REQ_OVRD:** This bit will disable the MMP PFET request condition for PGCB control. • 1 MMP PFET Request Ignored • 0 Default **Power Well:** SUS

Bit Range	Default & Access	Field Name (ID): Description
17:16	0x1 RW	**PGCB Clock Gate Request to PGCB Sleep (PGCB_CLK_GATE_REQ_2_PGCB_SLEEP):** Value representing the minimum number of delay clocks required between the assertion of pgcb_ip_clkgate_b to the deassertion of pgcb_sleep on PG exit. (This is only applicable for IP-Accessible PG with state-retention enabled.) Please see the description of cfg_tsleepact for more details. **Power Well:** SUS
15:14	0x1 RW	**PGCB Sleep Deassertion to PGCB ISM Unlock Req (PGCB_SLEEP_DEASRTN_2_ISM_UNLOCK_REQ):** For IP-Accessible PG (with state retention): Value representing the minimum number of delay clocks required between the deassertion of gcb_sleepto the deassertion of pgcb_ip_*_lock_req_b. For IP-Inaccessible PG (or with state-retention disabled): Value representing the minimum number of delay clocks required between the deassertion of pgcb_sleep to the deassertion of pgcb_isol_en_b. **Power Well:** SUS
13:12	0x1 RW	**PGCB Prim Reset Deassertion to PGCB Next State (PGCB_PRIMRST_DEASRTN_2_NSTATE):** For IP-Accessible PG (with state retention): Value representing the minimum number of delay clocks required between the deassertion of pgcb_sleep to the deassertion of pgcb_ip_*_lock_req_b. For IP-Inaccessible PG (or with state-retention disabled): Value representing the minimum number of delay clocks required between the deassertion of pgcb_sleep to the deassertion of pgcb_isol_en_b. **Power Well:** SUS
11:10	0x1 RW	**PGCB Side Reset Deassertion to PGCB Prim Reset Deassertion (PGCB_SIDERST_DEASRTN_2_PRIMERST_DEASRTN):** Value representing the number of delay clocks required between the deassertion of gcb_force_rst_bto the deassertion of gcb_force_prim_rst_b (This is only applicable for IP-Accessible PG.) Please see the description of cfg_tsleepact for more details. **Power Well:** SUS
9:8	0x1 RW	**PGCB Latch Isolation High to PGCB Clock Ungate Request (PGCB_LATCH_ISO_HI_2_PGCB_CLK_UNGATE_REQ):** Value representing the number of delay clocks required between the assertion of pgcb_isol_latchen to the deassertion of pgcb_ip_clkgate_req_b. Please see the description of cfg_tsleepact for more details. **Power Well:** SUS
7:6	0x1 RW	**PGCB Isolation Deassertion to PGCB Latch Isolation High Count (PGCB_ISO_DEASRTN_2_PGCB_ISO_HI_CNT):** Value representing the minimum number of delay clocks required between the deassertion of pgcb_isol_en_b to the assertion of gcb_isol_latchen. Please see the description of cfg_tsleepact for more details. **Power Well:** SUS
5:4	0x1 RW	**PGCB Reset Assertion to PGCB Power Down Request Count (PGCB_RST_2_PGCB_PWRDOWN_REQCNT):** For IP-Accessible PG (with state retention): Value representing the minimum number of delay clocks required between the assertion of pgcb_force_prim_rst_b and pgcb_force_rst_b to the assertion of pgcb_pmc_pg_req_b. For IP-Inaccessible PG (or with state-retention disabled): Value representing the minimum number of delay clocks required between the assertion of pgcb_force_prim_rst_b and pgcb_force_rst_b to the assertion of pgcb_sleep. Please see the description of cfg_tsleepact for more details. **Power Well:** SUS
3:2	0x1 RW	**PGCB Isolation Assertion to PGCB Reset Assertion Count (PGCB_ISO_ASRTN_2_PGCB_RST_ASRTN_CNT):** Value representing the minimum number of delay clocks required between the assertion of gcb_isol_en_bto the assertion of gcb_force_prim_rst_band gcb_force_rst_b Please see the description of [1:0] for more details. **Power Well:** SUS

Bit Range	Default & Access	Field Name (ID): Description
1:0	0x1 RW	**PGCB Sleep Assertion to PGCB Isolation Enable Count (PGCB_SLEEP_ASRTN_2_PGCB_ISO_EN_CNT):** For IP-Accessible PG (with state retention): Value representing the minimum number of delay clocks required between the assertion of pgcb_sleep (and the deassertion of pgcb_isol_latchen) to the assertion of pgcb_isol_en_b. For IP-Inaccessible PG (or with state-retention disabled): Value representing the minimum number of delay clocks required between the deassertion of pgcb_isol_latchen to the assertion of pgcb_isol_en_b, as well as the minimum number of delay clocks required between the assertion of pgcb_sleep to the assertion of pgcb_pmc_pg_req_b. Common for all cfg_t* inputs: 0 1 clock 1 2 clocks 0 8 clocks 1 256 clocks For any of the cfg_t* inputs that an IP may feel are a don-care and the IP does not feel they will be useful for post-silicon debug, the recommendation is to tie the input to 201 (2 clocks). Otherwise, the inputs may be tied to another relevant value or connected to a configuration register. ***Note:*** These signals may only change while pgcb_pwrupidle is asserted, if pgcb_pwrupidle is deasserted it should be valid and stable. (It may change the same cycle that ip_pgcb_pg_rdy_req_b asserts.) **Power Well:** SUS

51.3.143 D0I3 Control (DOI3CTRL_REG)—Offset 80ACh

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000008h

BAR and Offset: [MBAR] + 80ACh

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0x0 RO	**RESERVED (RSVD):** Reserved. **Power Well:** SUS
3	0x1 RW/1C	**RestoreRequired (RESTORE_REQUIRED):** When set (by HW), SW must restore state to the IP. The state may have been lost due to a reset or full power lost. SW clears the bit by writing a 1. This bit will be set on initial power up. **Power Well:** SUS
2	0x0 RW	**D0I3:** SW sets this bit to 1 to move the IP into the D0i3 state. Writing this bit to 0 will return the IP to the fully active D0 state (D0i0). **Power Well:** SUS
1:0	0x0 RO	**RESERVED (RSVD1):** Reserved. **Power Well:** SUS

51.3.144 HOST_CTRL_MISC_REG—Offset 80B0h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 0001037Fh

BAR and Offset: [MBAR] + 80B0h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**USB2_LTRUPDT_DIS:** Reserved. **Power Well:** Core
30	0x0 RW	**USB2 Line State Debounce During Port Reset Policy (USB2_LINE_STATE_DEBOUNCE_DURING_PORT_RESET_POLICY):** This register controls how the debounce is enforced during the Port Reset phase. 0 do not enable the line state debounce during port reset. 1 enable the line state debounce during port reset. **Power Well:** Core
29	0x0 RW	**TTE PEXE Credit Fix Disable (TTE_PEXE_CREDIT_FIX_DISABLE):** When set, it disables a fix implemented to re-deem PEXE credits when a port is disconnected **Power Well:** Core
28	0x0 RW	**TTE Scheduling policy (TTE_SCHEDULING_POLICY):** This register controls a fix made to prevent over-scheduling by not account for 188B in each uFrame. Setting this bit will disable the fix and allow for over-scheduling. **Power Well:** Core
27	0x0 RW	**USB3 ITP Delta Timer Source Select (USB3_ITP_DELTA_TIMER_SOURCE_SELECT):** This register selects the source for the delta timer tracking used for ITP generation. 0 the source is a 16.666 ns tick generated from a crystal reference clock 1 - the source is a 16.666 ns tick generated from the aux_cclk. This field needs to remain in sync with Frame Timer Source Select to ensure the are both set or both cleared. There is no support for any other combination. **Power Well:** Core
26	0x0 RW	**Frame Timer Source Select (FRAME_TIMER_SOURCE_SELECT):** This register controls the source for the frame timer. 0 the source for the frame timer is a crystal reference clock 1 the source for the frame timer is the aux_cclk. **Power Well:** Core
25	0x0 RW	**uFrame Masking Enable (UFRAME_MASKING_ENABLE):** If set, enables the uFrame tick to be masked due to ports being in U3/NC. This controls a fix made to disable the auto masking of uFrame tick due to port state w/o any pipeline idle condition. When cleared, we rely on gating of frame timer due to proper port state and idleness tracking from the pipeline. **Power Well:** Core
24	0x0 RW	**Late FID Check Disable (LATE_FID_CHECK_DISABLE):** This register disables the Late FID Check performed when starting an ISOCH stream. **Power Well:** Core
23:20	0x0 RW	**RESERVED (RSVD1):** Reserved. **Power Well:** Core
19	0x0 RW	**USB2 Resume Cx Inhibit Disable (USB2_RESUME_CX_INHIBIT_DISABLE):** Controls if USB2 L1 Resume is allowed to contribute to DMA Active which will inhibit Cx state. 0 USB2 L1 Resume is allowed to inhibit Cx via DMA Active 1 USB2 L1 Resume is NOT allowed to inhibit Cx via DMA Active When cleared, Cx will only be inhibited when the DMA traffic for the port begins. **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
18:16	0x1 RW	**Extra uFrame (EXTRA_UFRAME):** This register controls the extra number of uFrames added onto the advancing of late FID check. **Power Well:** Core
15:0	0x37f RW	**Valid Isoch Scheduling Range (VALID_ISOCH_SCHEDULING_RANGE):** This register defines the window in miliseconds from the current Frame that will be considered for scheduling in an upcoming Frame. Anything scheduled outside of this window will be considered as late and will trigger the Missed Service Error. **Power Well:** Core

51.3.145 reg_SSPITPE_type (SSPITPE)—Offset 80BCh

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 0000000Fh

BAR and Offset: [MBAR] + 80BCh

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0x0 RW	**RSVD:** Reserved. **Power Well:** Core
3:0	0xf RW	**ITP Transmit Enable (ITP_TRANSMIT_EN):** Width is scaled with USB3 Port Count PortCount=4 **Power Well:** Core

51.3.146 AUX Reset Control (AUX_CTRL_REG)—Offset 80C0h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 015FC0F0h

BAR and Offset: [MBAR] + 80C0h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**Reset USB3 AUX/Main PD Logic (RST_U3_AM_PDL):** A reset that is designed to reset all USB3 port AUX + Main power domain logic. This is a debug function. It is called cold reset. Write 1 to this register will issue a cold reset to USB3 ports. **Power Well:** SUS
30	0x0 RW	**RESERVED (RSVD):** Reserved. **Power Well:** SUS
29	0x0 RW	**Enable PCIe PIPE Reset As PCIe PHY Reset (EN_PPIPE_PPHY_RST):** This bit set to 1 selects the PCIe PIPE reset as a PCIe PHY power on reset. 0 selects the AUX powerup reset as a PCIe PHY powerup reset. **Power Well:** SUS
28	0x0 RW	**Ensure PIPE Powerdown On PERST# (EN_PPWRDN_PERST):** This bit ensures any PERST# being asserted will cause PIPE powerdown state transition to P1. **Power Well:** SUS
27	0x0 RW	**Disable PERST# Main RST (DIS_PERST_MRST):** There is a feature where we only allow PERST# to be treated as a main powerdown reset when it is asserted during the state that is not in D3. This bit disables this feature when it is set to 1. If this bit is set to 1, it means that any PERST# will be treated as a main power domain reset regardless of its Dstate. **Power Well:** SUS
26	0x0 RW	**Disable PCIe PERST# Host Controller (DIS_PERST_HC):** There is a feature where we can disable PCIe PERST# from reset the host controller until power management control module has done its clock switching. This is for a case where PM entered L23 and immediately PERST# asserted. This bit is designed to enable this feature when set to 1. **Power Well:** SUS
25	0x0 RW	**Enable Fast Simulation Reset Mode (EN_FAST_RST):** Enable a fast simulation mode for reset function. This is a feature for GLS **Power Well:** SUS
24	0x1 RW	**Prevent USB3 Link Down Reset (PREV_U3_LDRST):** When set to 1 prevent a reset being generated due to the USB3 port link down condition. **Power Well:** SUS
23	0x0 RW	**Ignore Main Power Up Reset (IGN_MPU_RST):** When set to 1 ignore the main power up reset for USB3 PIPE PHY reset. **Power Well:** SUS
22	0x1 RW	**RESERVED (RSVD_1):** Reserved. **Power Well:** SUS
21	0x0 RW	**Ignore HC Reset USB2 (IGN_HC_RST_U2):** When set to '1' ignore HC reset to reset the USB2 Port logic **Power Well:** SUS

Bit Range	Default & Access	Field Name (ID): Description
20	0x1 RW	**Ignore HC Reset USB PHY (IGN_HC_RST_UP_POR):** When set to '1' ignore HC reset to the USB PHY power-on reset **Power Well:** SUS
19	0x1 RW	**Enable PCIe Link-Down Reset (EN_PLD_RST):** Enable a reset due to a PCIe link-down condition. The PCIe link down condition will cause a HC reset liked. If this bit is set 1, the PCIe link down condition will only reset the PCIe core. **Power Well:** SUS
18	0x1 RW	**Enable EEPROM Reload On Power Up (EN_EEP_REL_PU):** When set to '1' enable EEPROM reload on every main power-up **Power Well:** SUS
17	0x1 RW	**Ignore HC Reset PCIe PHY PIPE (IGN_HC_RST_PPP):** When set to '1' ignore HC reset to the PCIe PHY PIPE reset **Power Well:** SUS
16	0x1 RW	**Ignore LTSSM Reset USB PHY PIPE (IGN_LRST_UPP):** When set to '1' ignore the LTSSM of USB link state transition caused reset to USB PHY PIPE reset **Power Well:** SUS
15	0x1 RW	**Ignore Warm Reset USB PHY Power (IGN_WR_UPP):** When set to '1' ignore warm reset the USB PHY power on reset **Power Well:** SUS
14	0x1 RW	**Allow Core PCIe Link Down Reset (ALL_CPLD_RST):** When set to '1' allow PCIe link down to cause a reset to the rest of the core **Power Well:** SUS
13	0x0 RW	**Ignore Hot Reset USB3 (IGN_HR_U3):** When set to '1' ignore hot reset to the USB3 port logic **Power Well:** SUS
12	0x0 RW	**Ignore Warm Reset USB3 (IGN_WR_U3):** When set to '1' ignore warm reset to the USB3 port logic **Power Well:** SUS
11	0x0 RW	**Ignore Main Power Up Reset USB3 (IGN_MPU_RST_U3):** When set to '1' ignore main power up reset to USB3 port logic **Power Well:** SUS
10	0x0 RW	**Ignore Main Power Up Reset USB2 (IGN_MPU_RST_U2):** When set to '1' ignore main power up reset to USB2 port logic **Power Well:** SUS
9	0x0 RW	**Ignore Main Power Up Reset PCIe Core (IGN_MPU_RST_PC):** When set to '1' ignore main power up reset to PCIe core **Power Well:** SUS
8	0x0 RW	**Ignore Main Power Up Reset PCIe PHY (IGN_MPU_RST_PP):** When set to '1' ignore main power up reset to PCIe PHY **Power Well:** SUS
7	0x1 RW	**Ignore HC Reset USB PHY (IGN_HC_RST_UP):** When set to '1' ignore HC reset to the USB PHY **Power Well:** SUS

Bit Range	Default & Access	Field Name (ID): Description
6	0x1 RW	**Ignore Warm Reset USB PHY (IGN_WRST_UP):** When set to '1' ignore warm reset to the USB PHY **Power Well:** SUS
5	0x1 RW	**Enable HC Reset Per Port Isolation (EN_HC_RST_PPI):** Enables the HC reset or per port reset isolation function **Power Well:** Core
4	0x1 RW	**Allow Power Off Power Domain Reset (ALL_PO_PDRST):** When set to '1' allow main power off condition to trigger a main power domain reset **Power Well:** SUS
3	0x0 RW	**Ignore Wait For PERST# During Power Show Down (IGN_PERST_PSD):** When set to '1' ignore waiting for PERST# deassertion during main power show down. **Power Well:** SUS
2	0x0 RW	**Ignore Fundamental Reset During AUX Power Up (IGN_FRST_AUX_PU):** When fundamental reset is asserted during AUX power up, if this bit is set, then we will ignore PERST# such that purely wait for timeout to deassert fundamental reset. **Power Well:** SUS
1:0	0x0 RW	**Trigger Fundamental Reset (TRIG_FRST):** Writing to bit(1:0) to value of 2'b11 will cause a fundamental reset **Power Well:** SUS

51.3.147 Super Speed Bandwidth Overload (HOST_BW_OV_SS_REG)—Offset 80C4h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 004A4008h

BAR and Offset: [MBAR] + 80C4h

MBAR Type: PCI Configuration Register (Size: 64 bits)

51.3.161 Power Scheduler Control-0 (PWR_SCHED_CTRL0)—Offset 8140h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 0A019132h

BAR and Offset: [MBAR] + 8140h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0xa RW	**Engine Idle Hysteresis (EIH):** This register controls the min. idle span that has to be observed from the engine idle indicators before the power state flags (xhc_*_idle) will indicate a 1. **Power Well:** Core
23:12	0x19 RW	**Backbone PLL Shutdown Advance Wake (BPSAW):** This register controls the time before the next scheduled transaction where the Backbone PLL request will assert. Register Format: Bits [11:7] # of 125us uframes Bits [6:0] # of microseconds (0-124) **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
11:0	0x132 RW	**Backbone PLL Shutdown Min. Idle Duration (BPSMID):** The sum of this register plus the Backbone PLL Shutdown Advance Wake form to a Total Idle time. When the next scheduled periodic transaction is after present time + Total Idle, the Backbone PLL request will de-assert, allowing the PLL to shutdwon. Register Format: Bits [11:7] # of 125us uframes Bits [6:0] # of microseconds (0-124) **Power Well:** Core

51.3.162 AUX Power Management Control (AUX_CTRL_REG2)—Offset 8154h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 81390206h

BAR and Offset: [MBAR] + 8154h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x1 RW	**DIS_L1P2_EXIT_ON_WAKE_EN:** This bit disables the dependency on Wake Enables defined in PORTSC for L1P2 exit when in D0 **Power Well:** SUS
30:28	0x0 RW	**RESERVED0 (RSVD0):** Reserved. **Power Well:** SUS
27:25	0x0 RW	**RESERVED (RSVD):** Reserved. **Power Well:** SUS
24	0x1 RW	**Enable L1 exit notification to SNPS PCIe core (EN_L1_EXIT_NOTIF_PCIE):** This bit enables a L1 exit notification to SNPS PCIe core. There is a case where USB ports have waked up and AUX PM module has started the wakeup process. The AUX PM control state got into a wait for P0 state because it needs to wait until PCie core to signal powerdown state change. Due to the fact that the core is in D3Hot, there is no run_stop bit set such that no internal interrupt will be fired. This causes the LTSSM of PCIe stayed in L1 even though AUX PM has known that it needs an L1 exit. This bit works together with bit21 of this register. 1: enables this feature 0: disables this feature. **Power Well:** SUS
23	0x0 RW	**DISABLE PLC ON DISCONNECT (DIS_PLC_ON_DISCONNECT):** 1: do not assert PLC for disconnection 0: assert PLC for disconnection **Power Well:** SUS
22	0x0 RW	**TREAT_IDLE_AS_TS2_IN_LTSSM_WAIT_4_TS2:** This bit enables a feature in PCie core LTSSM to treat IDLE received as TS2 when LTSSM is in wait for TS2 receive state. This is a function requested from PHY where it is possible to not able to receive TS2 without error. 1: treat Logic IDLE as TS2 received when in some PCIe LTSSM state. 0: disable this feature. **Power Well:** SUS
21	0x1 RW	**Disable p2 overwrite due to the D3HOT where PCIe core enters the L1 (DIS_P2_OVERWRITE_DUE2_D3HOT):** We added a feature where if PCIe core LTSSM enters L1 due to the D3hot, the aux PM control will not start a P2 overwrite function in anticipating for the next L23 enter. 1: disables p2 overwrite due to the D3HOT where PCIe core enters the L1. 0: enables P2 overwrite even if we are in D3Hot. **Power Well:** SUS
20	0x1 RW	**Enable the port to enter U3 automatically when in U1/U2 (ENABLE_AUTO_U3_ENTRY_FROM_U2_U3):** 1: enables the port to enter U3 automatically when in U1/U2 0: disables the port to enter U3 automatically when in U1/U2 **Power Well:** SUS
19	0x1 RW	**No linkdown reset is issue during low power state (DIS_LINKDOWN_RST_DURING_LOW_POWER):** No linkdown reset is issue during low power state **Power Well:** SUS
18	0x0 RW	**EN_EXIT_DEEP_SLEEP_IF_PCIE_IN_P0:** This bit enables a feature in AUX PM module where if PCIe core LTSSM is in P0 for a duration of time, we will exit the deep sleep state. This is for failure control in case. 1: enables this feature 0: disable this feature **Power Well:** SUS

Bit Range	Default & Access	Field Name (ID): Description
17	0x0 RW	**U2_EXIT_LFPS_TIMER_VALUE:** This bit selects U2 exit LFPS timer value 0: 320ns 400ns in 25MHz domain 1: 240ns 320ns in 25MHz domain **Power Well:** SUS
16	0x1 RW	**EN_EXIT_DEEP_SLEEP_ON_USB_PORT_WAKEUP:** This bit enables a function that AUX PM module exits from the deep sleep state due to the USB ports wakeup level signal. We have added this feature where USB ports will generated a wakeup level signal to wakeup the AUX PM module if it is in deep sleep state and this level signal will be cleared if the change bits are updated by software. 1: enables this function 0: disables this function which means that a wakeup pulse generated from each USB PortSC event will wake up the AUX PM module from deep sleep if the D3 state is programmed. **Power Well:** SUS
15:14	0x0 RW	**P3_ENTRY_TIMEOUT:** This field defines the timeout value to enter P3 mode in U2. 00: 7us 8us 01: 511us 512us 10: disables the timer (0us) 11: disables the timer (0us) **Power Well:** SUS
13	0x0 RW	**Enable U2 P3 Mode (EN_U2_P3):** 0: Disable U2 P3 mode 1: Enable U2 P3 mode **Power Well:** SUS
12:11	0x0 RW	**Fine Debug Mode Select (FINE_DM_SEL):** Reserved. **Power Well:** SUS
10	0x0 RW	**Enable Low Power State Based Core Clock Gating (EN_LP_CORE_CG):** When set to '1' enable core clock gating based on low power state entered **Power Well:** SUS
9	0x1 RW	**Disable USB3 Port Status Changed Event (DIS_U3_PORT_SCE):** 0: Enable USB3 port status change event generation if any change bit is not cleared 1: Disable USB3 port status change event generation if any change bit is not cleared Bit 12 default 0 **Power Well:** SUS
8:4	0x0 RW	**Debug Mode Select Register (DEB_MODE_SEL):** Reserved. **Power Well:** SUS
3	0x0 RW	**Enable Auto Wakeup Non-IDLE (EN_AWAK_NIDLE):** When set to 1 enables the auto wakeup function when engine has identified non IDLE condition. **Power Well:** SUS
2	0x1 RW	**Enable PM Control P1 Exit P2 (EN_PMC_P1_EXIT_P2):** When set 1 enables the PM control module to transition to P1 instead of P0 when exit P2. **Power Well:** SUS
1	0x1 RW	**Enable PCIe PIPE CLK Isolation (EN_PP_CLK_ISOL):** When set to 1 enables the PCIe PIPE CLK to be isolated when main power is removed. **Power Well:** SUS
0	0x0 RW	**Enable P2 Overwrite P1 Allowed Detect (EN_P2OVRP1_ADET):** When set to 1 enables a function that can detect whether or not enable P2 overwrite P1 function. The condition to get to P2 overwrite is when engine is in idle conditions. This means that there is no ISO EP pending. **Power Well:** SUS

51.3.163 USB2 PHY Power Management Control (USB2_PHY_PMC)—Offset 8164h

Type: Memory Mapped I/O Register (Size: 32 bits)

51.3.164 USB Power Gating Control (USB_PGC)—Offset 8168h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 000282EEh

BAR and Offset: [MBAR] + 8168h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:1	0x14177 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
0	0x0 RW	**USB SRAM power gating enable (USB_SRAM_PGE):** When set enables power gating on USB ports. Usage of this bit is further qualified with xHCI SRAM Dynamic Power Gating Disable fuse. If the fuse disables dynamic power gating, setting this bit to 1 shall not enable power gating feature. This bit always returns the value that was written to it irrespective of the setting of xHCI SRAM Dynamic Power Gating Disable fuse. **Power Well:** Core

51.3.165 xHCI Aux Clock Control Register (XHCI_AUX_CCR)—Offset 816Ch

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000400h

BAR and Offset: [MBAR] + 816Ch

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0x0 RO	**Reserved (RSVD):** Reserved.
19	0x0 RW	**USB3 Partition Engine/Link trunk gating Enable (PARUSB3_ENG_GEN):** When set to 1 enables gating of the SOSC trunk to the XHCI engine and link in the PARUSB3 partition. **Power Well:** SUS
18	0x0 RW	**USB3 Partition Frame Timer trunk gating Enable (PARUSB3_LINK_GEN):** When set to 1 enables gating of the SOSC trunk to the Frame timer in the PARUSB3 partition. **Power Well:** SUS
17	0x0 RW	**USB2 link partition clock gating enable (PARUSB2_CLK_GEN):** When set to 1 enables gating of the SOSC trunk to the USB2 link and Phy logic in the PARUSB2 partition. **Power Well:** SUS
16	0x0 RW	**USB2/USHIP 12.5 MHz partition clock gating enable (USHIP_PCGEN):** When set to 1 enables gating of the 12.5 MHz SOSC trunk to the USB2 and USHIP logic in the PARUSB2 partition. **Power Well:** SUS
15	0x0 RO	**Reserved1 (RSVD1):** Reserved
14	0x0 RW	**USB3 Port Aux/Core clock gating enable (USB3_AC_CGE):** When set, allows the aux_cclk clock into the USB3 port to be gated when conditions are met. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse. **Power Well:** SUS
13:12	0x0 RW	**Rx Detect Timer when port Aux Clock is Gated (RX_DT_ACG):** This field defines the value of the timer used to perform Rx Detect when port Aux Clock has been gated. 0x0: 100ms 0x1: 12ms Others: Reserved Note: This timer shall use the Fast Training Timer Tick (about 1us tick) for simulation purposes. For Fast Training mode, the above timeouts will become about 11us and about 100us, +/- implementation uncertainty, respectively. **Power Well:** SUS
11:8	0x4 RW	**U2 Residency Before ModPHY Clock Gating (U2R_BM_CG):** Before gating ModPHY Aux clock, Host Controller shall wait for this time in U2. This time is meant to ensure that the attached device has entered U2 as well. 0x0: 1us 0x1: 128us 0x2: 256us 0x3: 512us 0x4: 640us 0x5: 768us 0x6: 896us 0x7: 1024us Others: Reserved Note: This counter shall start counting once pipe has entered PS3 state in response to link in U2. **Power Well:** SUS
7	0x0 RW	**Frame Timer Clock Gating Ports in U2 Enable (FTCGPU2E):** This bit, when set, allows Host Controller to gate the clock to the Frame Timer when ports are in U2. **Power Well:** SUS
6	0x0 RW	**USB2 port clock throttle enable (USB2_PC_TE):** When set, allows the Aux clock into the USB2 ports to be throttled when conditions allow. **Power Well:** SUS

Bit Range	Default & Access	Field Name (ID): Description
5	0x0 RW	**XHCI Engine Aux clock gating enable (XHCI_AC_GE):** When set, allows the aux clock into the XHCI engine to be gated when idle. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse. **Power Well:** SUS
4	0x0 RW	**XHCI Aux PM block clock gating enable (XHCI_APMB_CGE):** When set, allows the aux clock into the Aux PM block to be gated when idle. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse. **Power Well:** SUS
3	0x0 RW	**USB3 Aux Clock Trunk Gating Enable (USB3_AC_TGE):** When set, allows Aux Clock Trunk feeding to USB3.0 ports to be gated when port Aux clock is gated at all USB3.0 ports and all USB3.0 modPHY instances. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse. **Power Well:** SUS
2	0x0 RW	**USB3 Port Aux/Port clock gating enable (USB3_AP_CGE):** When set, allows the aux_pclk clock into the USB3 port to be gated when conditions are met. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse. **Power Well:** SUS
1	0x0 RW	**ModPHY port Aux clock gating enable in U2 (MPP_AC_GEU2):** When set, allows the aux clock into the ModPhy to be gated when Link is in U2 and pipe has been in PS3 for at least the time defined by U2 Residency Before ModPHY Clock Gating field. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse. **Power Well:** SUS
0	0x0 RW	**ModPHY port Aux clock gating enable in Disconnected, U3 or Disabled (MPP_AC_GE_DDU3):** When set, allows the aux clock into the ModPHY to be gated when Link is in Disconnected, U3 or Disabled state. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse. **Power Well:** SUS

51.3.166 USB LPM Parameters (USB_LPM_PARAM)—Offset 8170h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 96090032h

BAR and Offset: [MBAR] + 8170h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

17:16	0x0 RW	**U2P3 LFPS Periodic Sampling Control (XU2P3LPSC):** This field controls the OFF time for the LFPS periodic sampling for SS and SSIC ports in U2P3. If LFPSPM for a port is 1, it will override the OFF time and LFPS receiver will remain OFF permanently. For Fast Sim mode, 500us will be equivalent to 5us. 0x0 Polling Disable. (RXDET Polling will become 100ms.) 0x1 500us OFF Time 0x2 1ms OFF Time 0x3 1.5ms OFF Time **Power Well:** SUS
15:10	0x8 RW	**XLFPSONCNTSSIC:** This time would describe the number of clocks SSIC LFPS will remain ON. SSIC LFPS detection operation may be carried out on using RTC clock or Oscillator clock. The value of this register should be adjusted accordingly. For RTC recommended value is 2. For Oscillator clock, recommended value is 8. **Power Well:** SUS

Bit Range	Default & Access	Field Name (ID): Description
9:0	0xc8 RW	**XLFPSONCNTSS:** This time would describe the number of clocks LFPS will remain ON. LFPS detection operation may be carried out on using RTC clock or Oscillator clock. The value of this register should be adjusted accordingly. For RTC recommended value is 2. For Oscillator clock, recommended value is 200. **Power Well:** SUS

51.3.176 reg_D0i2_CTRL_REG_type (D0i2_CTRL_REG)—Offset 81BCh

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 084204B0h

BAR and Offset: [MBAR] + 81BCh

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
29:26	0x2 RW	**D0i2 Minimum Residency (D0I2_MIN_RESIDENCY):** This field controls the minimum time that we must stay in D0i2 to ensure that the entry sequence has settled before we attempt to exit. 0h Disabled 1h 8 clocks 2h 16 clocks 3h 32 clocks 4h 128 clocks 5h 256 clocks 6h 512 clocks 7h 1024 clocks **Power Well:** SUS
25:22	0x1 RW	**D0i2 Entry Hysteresis Timer (D0I2_ENTRY_HYSTERESIS_TIMER):** This field allows for a hysteresis timer to be implemented specifically for D0i2. This will allow for D0i2 entry to be controlled independently from the timer used for D0i3 and D3. 0h Disabled 1h 8 clocks 2h 16 clocks 3h 32 clocks 4h 64 clocks 5h 128 clocks 6h 256 clocks 7h 512 clocks **Power Well:** SUS
21	0x0 RW	**Active Periodic EP Disable (ACTIVE_PERIODIC_EP_DISABLE):** This field allows the xHC to control how aggressive it enters D0i2 in the presence of active Periodic EPs. Setting this field will allow D0i2 only when there are no active Periodic EPs on the schedule. Either there are no active DB or any active Interrupt EP is flow controlled. **Power Well:** SUS
20:16	0x2 RW	**MSI D0i2 Pre Wake Time (MSID0I2PWT):** This is the latency that is expected to be incurred to exit the D0i2 state. This wake latency is the latency to be added to the tracked D0i2 wake by the MSI module. Example: If while allowing D0i2 there is an MSI generation that will trigger in 250 us from now ,the MSI module will trigger a D0i2 wake up 250 us MSI D0i2 Pre Wake Time. The D0I2WL is to ensure that the act of D0i2 exit does not impact the action(s) required by the alarm(s) that was enabled prior to D0i2. 3:0 250 ns ticks 0h 0 ns 1h 250 ns . 1Fh 3750 ns **Power Well:** SUS
15:4	0x4b RW	**MSI Idle Threshold (MSI_IDLE_THRESHOLD):** This field allows the xHC to control how aggressive it enters D0i2 in the presence of pending MSI. This field is valid only if Pending MSI Disable is 0, allowing D0i2 in the presence of pending MSIs. D0i2 will be prevented if the amount of idle time between Event Ring being idle to the time an MSI will be generated does not exceed this time. Register Format: Bits [11:7] # of 125us uframes Bits [6:0] # of microseconds (0-124) **Power Well:** SUS
3	0x0 RW	**Pending MSI Disable (PENDING_MSI_DISABLE):** This field allows the xHC to disable D0i2 when there are pending MSIs in the event manager. Setting this field will require all IMOD counters to be 0h and all MSIs delivered. Clearing this field will allow for D0i2 power gating while there are 1 or more IMOD counters decrementing which implies that an MSI is pending and will be generated once the corresponding IMOD counter reaches 0h. **Power Well:** SUS
2	0x0 RW	**Frame Timer Run Disable (FRAME_TIMER_RUN_DISABLE):** This field allows the xHC to disable D0i2 when the frame timer is running. Clearing this field will allow D0i2 when the frame timer is required as defined in the XHCI Spec. Setting this field will not allow D0i2 when the frame timer is required and will limit D0i2 for the condition where the frame timer is not required. **Power Well:** SUS
1	0x0 RW	**USB2 L1 Disable (USB2_L1_DISABLE):** This field allows the xHC to disable D0i2 when USB2 ports are in L1. This implies that D0i2 will only be triggered when ports are in L2 or deeper. **Power Well:** SUS

Bit Range	Default & Access	Field Name (ID): Description
0	0x0 RW	**USB3 U2 Disable (USB3_U2_DISABLE):** This field allows the xHC to disable D0i2 when USB3 ports are in U2. This implies that D0i2 will only be triggered when ports are in U3 or deeper. **Power Well:** SUS

51.3.177 reg_D0i2_SCH_ALARM_CTRL_REG_type (D0i2_SCH_ALARM_CTRL_REG)—Offset 81C0h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MBAR] + 81C0h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** SUS
28:16	0x0 RW	**D0i2 Idle Time (D0I2IT):** This is the minimum schedule idle time that must be available before D0i2 can allowed. 12:7 Time value in # of 125s Bus Intervals (0 8ms) 6:0 Fractional BI Time value in s (0 124s) This field controls how much scheduler idle time is required to trigger D0i2. The scheduler idle time is the same idle time that is used by other functions implementing alarm timers such as PLL shutdown, LTR and USB2 L1 override. If there is a need to require other alarm timers to have been set such as LTR has triggered a Low Idle time, then this field needs to be as aggressive as LTR Low Min Idle Time to ensure D0i2 is triggered once the scheduler has detected IDLE in the schedule. This is only to be used as alternate modes of operation or back up modes. **Power Well:** SUS
15:13	0x0 RO	**Reserved (RSVD1):** Reserved. **Power Well:** SUS
12:0	0x0 RW	**D0i2 Wake Latency (D0I2WL):** This is the latency that is expected to be incurred to exit the D0i2 state. This wake latency is the latency to be added to the tracked D0i2 wake by the scheduler. Example: If while allowing D0i2 there is an alarm that will trigger in 250 us from now , the scheduler will allow D0i2 and track this alarm with an adjustment to wake up 250ns D0I2WL) from. The D0I2WL is to ensure that the act of D0i2 exit does not impact the action(s) required by the alarm(s) that was enabled prior to D0i2. 12:7 Time value in # of 125s Bus Intervals (0 8ms) 6:0 Fractional BI Time value in s (0124s) **Power Well:** SUS

51.3.178 reg_USB2PMCTRL_REG_type (USB2PMCTRL_REG)—Offset 81C4h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MBAR] + 81C4h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** SUS
11	0x0 RW	**USB2 PHY SUS Power Gate PORTSC Block Policy (U2PSPGPSCBP):** This controls the policy for blocking PORTSC Updates while the USB2 PHY SUS Well is power gated. When set, the controller will block any updates to the PORTSC caused by port status change if the USB2 PHY SUS is power gated. 0 Do not **Power Well:** SUS
10:8	0x0 RW	**USB2 PHY SUS Well Power Gate Entry Hysteresis Count (U2PSPGEHC):** This controls the amount of hysteresis time the controller will enforce after detecting the USB2 PHY SUS Power Gate entry condition. 0h 0 clocks 1h 32 clocks 2h 64 clocks 3h 128 clocks 4h 256 clocks 5h 512 clocks 6h 1024 clocks 7h 2048 clocks **Power Well:** SUS
7:4	0x0 RW	**USB2 PHY SUS Power Gate PORTSC Block Policy (U2CLPGLAT):** This field represents the worst case latency for the USB2 Common Lane to enter and exit its power gate state. This fields is required to be compared to a ports HIRD/HIRD value for the ports that have allowed L1 to L2 mapping to determine if the Common Lane can be allowed to power off. If the power gate entry/exit latency is greater than the HIRD/HIRDD then the common lane should not be allowed to power gate as this will result in a L1 exit violation. 0h 100 us 1h 200 us 2h 300 us Eh 1500us Fh 1600 us **Power Well:** SUS
3:2	0x0 RW	**USB2 PHY SUS Well Power Gate Policy (U2PSUSPGP):** This field controls when to enable the USB2 PHY SUS Well Power Gating when the proper conditions are met. 00 USB2 PHY SUS Power Gating is Disabled. 01 USB2 PHY SUS Power Gating is Enabled in Only D0 and D0i2 (Excludes D0i3 and D3) 10 USB2 PHY SUS Power Gating is Eanabled in only in D0, D0i2 and D0i3 (Excludes D3) 11 USB2 PHY SUS Power Gating is Eanabled in D0/D0i2/D0i3/D3 **Power Well:** SUS
1	0x0 RW	**USB2 Common Lane Power Gating Enable During L1 to L2 Mapping for USB2 PHY Power Gating (U2CLPGEL1L2):** This field when set enables the controller to allow for the common lane power gating to be enabled when all ports are exposed as in L2 to the USB2 PHY while at least 1 port has been mapped to L2 from L1. This field alone does not guarantee power gating since the L1 HIRD/HIRDD Value must be compared with the PHYs power gate exit latency (U2CLPGLAT) held in this register to ensure that L1 exit is not violated. 0 USB2 Common Lane Power Gating is disabled when any port has been mapped from L1 to L2. 1 USB2 Common Lane Power Gating is allowed when any port has been mapped to L2 from L1 with the additional condition that the HIRD/HIRDD is greater than the PHYs Power Gate exit latency. **Power Well:** SUS
0	0x0 RW	**USB2 Data Lane L1 to L2 Mapping Enable for USB2 PHY Power Gating (U2DLL1L2ME):** This field when set enables the controller to map an L1 entry directly to L2 to allow the USB2 PHY to trigger its Autonomous Power Gating. The USB2 PHY will trigger PG only when in L2 since it does not fully understand the requirements for L1. 0 USB2 L1 to L2 mapping is disabled for all ports 1 USB2 L1 to L2 mapping is enabled for all ports **Power Well:** SUS

51.3.179 ECC_PARITY_ERROR_LOG_REG—Offset 83F8h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MBAR] + 83F8h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**Loopback Pattern (UTMILPBKPAT):** 2-byte pattern for loopback Note: This 2-byte pattern will be replicated to the upper 2-byte to form the DW pattern **Power Well:** Core
15:2	0x0 RW	**Loopback Lane Select (UTMILPBKSEL_13_0):** Port is selected if the corresponding bit is selected Note: MSB is for UTMI+ Port13, LSB is for UTMI+ Port0 **Power Well:** Core
1	0x0 RW	**Loopback Pattern (UTMILPBKPATSEL):** Near end loopback pattern generation type: 0b: Fixed pattern 1b: USB2 test packet **Power Well:** Core
0	0x0 RW	**Loopback Type (UTMILPBKTYPE):** Loopback Type in test mode. This signal selects between DNELB and ANELB, and will only take effect if DTUTMILPBKEN is set. 0b: Digital Near-End Loopback (DNELB) 1b: Analog Near-End Loopback (ANELB) Note: Analog Far-End Loopback (AFELB) is not supported **Power Well:** Core

51.3.191 dft_reg4 (DFT_REG4)—Offset 843Ch

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MBAR] + 843Ch

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:11	0x0 RW	**RSVD:** Reserved. **Power Well:** Core
10:0	0x0 RW	**Loopback Pattern (UTMILPBKPATSEL):** Loopback Lane Select (UTMILPBKSEL): Port is selected if the corresponding bit (zero based) is selected Bit 0 = Port 1 Bit 1 = Port 2 Etc. **Power Well:** Core

51.3.192 dft_reg5 (DFT_REG5)—Offset 8440h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MBAR] + 8440h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RW/L	**High Speed Bypass Enable (HIGH_SPEED_BYPASS_ENABLE):** 0000 - Disable all HBP 0001 - Enable SS HBP 0010 - Enable HS HBP 0011 - Enable HSIC HBP 0100 - Enable SSIC HBP Others - Reserved **Power Well:** Core
27	0x0 RW	**DFTIDPINSEL (DFTIDPINSEL):** Select Between Device and Host Controller in HBP mode 0h : Device Controller is selected 1h : Host Controller is selected **Power Well:** Core
26	0x0 RW/O	**Lock Bit (LOCK):** This bit is used by BIOS to lock/unlock lockable bits. When set to '1' the write access to HBP Enable is disabled (locked state). When set to '0', the write access to bit locked are enable (unlocked state). Writable once after platform reset. **Power Well:** Core
25	0x0 RW/L	**Loopback Enable (UTMILPBKEN):** Enable loopback test mode. If asserted, loopback test mode is enabled **Power Well:** Core
24:0	0x0 RO	**Rsvd:** Reserved. **Power Well:** Core

51.3.193 XECP_CMDM_STS0—Offset 8448h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MBAR] + 8448h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**IDMA_OWNS_CNTX:** Indicates that IDMA module owns the context access currently **Power Well:** Core
30	0x0 RO	**ODMA_OWNS_CNTX:** Indicates that ODMA module owns the context access currently **Power Well:** Core
29	0x0 RO	**TRM_OWNS_CNTX:** Indicates that TRM modules owns the context access currently **Power Well:** Core
28	0x0 RO	**CMD_RING_REQUESTED_CNTX_LOCK:** Indicates that Command Manager has requested a context lock **Power Well:** Core
27	0x0 RO	**CMD_RING_STOP_IN_PROGRESS:** Indicates that Command Ring stop command is in progress **Power Well:** Core
26	0x0 RO	**SCH_UPDATE_CLR_EP_IN_PROGRESS:** Indicates that clearing an EP out of schedule is in progress **Power Well:** Core
25	0x0 RO	**ADDR_DEV_DONE:** Indicates that current address device command is done by ODMA **Power Well:** Core
24	0x0 RO	**ADDR_DEV_IN_PROGRESS:** Indicates that ODMA has an address device command in progress **Power Well:** Core
23	0x0 RO	**EP_STATE_UPDATE_IN_PROGRESS:** Indicates that updating of EP state is in progress **Power Well:** Core
22	0x0 RO	**EP_STATE_IN_PROGRESS_FROM_STOP_DUE_TO_DB:** Indicates that doorbell manager is issuing and EP update due to a doorbell ring on an EP that is in stop state **Power Well:** Core
21	0x0 RO	**EP_STATE_UPDATE_IN_PROGRESS_DUE_TO_EP_ERROR:** Indicates that transfer ring manager is isuing and EP update due to an EP error condition detected **Power Well:** Core
20	0x0 RO	**EP_STATE_UPDATE_IN_PROGRESS_DUE_TO_STALL:** Indicates that transfere ring manager is issuing an EP state update due to stall received **Power Well:** Core
19	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
18	0x0 RO	**STOP in progress (STOP_IN_PROGRESS):** Indicates that a STOP on the Command Ring is in progress **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
17	0x0 RO	**commend ring has doorbell pending (CMD_RING_DB_PENDING):** Indicates that the commend ring has doorbell pending **Power Well:** Core
16	0x0 RO	**commend ring running (CMD_RING_RUNNING):** Indicates that the commend ring is running **Power Well:** Core
15:8	0x0 RO	**Command next capability offset (CMD_NEXT_CAP_OFFSET):** Reserved. **Power Well:** Core
7:0	0x0 RO	**Vendor defined capability ID (VID):** Reserved. **Power Well:** Core

51.3.194 XECP_CMDM_STS2—Offset 8450h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MBAR] + 8450h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:5	0x0 RO	**Rsvd0:** Reserved. **Power Well:** Core
4:0	0x0 RO	**Event Ring Segment Table (ERST):** count low **Power Well:** Core

51.3.195 XECP_CMDM_STS3—Offset 8454h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MBAR] + 8454h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**Rsvd0:** Reserved. **Power Well:** Core
15:0	0x0 RO	**Event Ring Segment Table (ERST):** count high **Power Well:** Core

51.3.196 AUX Power PHY Reset (UPORTS_PON_RST_REG)—Offset 8460h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MBAR] + 8460h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0x0 RO	**RESERVED (RSVD):** Reserved. **Power Well:** Core
3:0	0x0 WO	**Allow Software USB PHY RST (ALL_SW_UP_RST):** Allow a USB PHY reset being issued by software. Writing to this register with bit set to 1 will reset the USB PHY that is connected to the port. Bit3:0 indicates the port number of the USB PHY **Power Well:** SUS

51.3.197 Latency Tolerance Control 0 (HOST_IF_LAT_TOL_CTRL_REG0)—Offset 8464h

The Latency Tolerance Control Register is used by SW to control which BELT is returned when this register is read. SW shall write to this register to program a Slot-ID, Port-ID and BELT Select to determine which BELT is selected. When this register is read the selected BELT is returned.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MBAR] + 8464h

Default: 000D0000h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 WO	**BELT Select (BELT_SEL):** This field determines what value will be selected to read back from SW when reading this register 0: Returns the SW programmed Latency Tolerance Value 1: Returns the Lowest BELT in the Host 2: Returns the BELT for the requested Slot-ID (Slot Select) 3: Returns the BELT for the requested Port-ID (Port Select) **Power Well:** Core
29:20	0x0 RO	**Rsvd1:** Reserved. **Power Well:** Core
19:16	0xd WO	**Port Select (PORT_SEL):** Used to select the BELT for a given Port # when the BELT Select is programmed to select the Port-ID (this field is 0 based) **Power Well:** Core
15:12	0x0 RO	**Rsvd:** Reserved. **Power Well:** Core
11:5	0x0 RO	**BELT Value (BELTV):** Value of selected BELT is return in this field **Power Well:** Core
4:0	0x0 RW	**Slot Select (SLOT_SEL):** Reads will return: BELT Value (BELTV) [4:0]: Value of selected BELT is return in this field Writes will control : Slot Select (): Used to select the BELT for a given Slot # when the BELT Select is programmed to select the Slot-ID (this field is zero based) **Power Well:** Core

51.3.198 USB Legacy Support Capability (USBLEGSUP)—Offset 846Ch

This register is modified and maintained by BIOS

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00002201h

BAR and Offset: [MBAR] + 846Ch

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0x0 RO	Reserved.
24	0x0 RW	**HC OS Owned Semaphore (HCOSOS):** Default = '0'. System software sets this bit to request ownership of the xHC. Ownership is obtained when this bit reads as '1' and the HC BIOS Owned Semaphore bit reads as '0'.
23:17	0x0 RO	Reserved.
16	0x0 RW	**HC BIOS Owned Semaphore (HCBIOSOS):** Default = '0'. The BIOS sets this bit to establish ownership of the xHC. System BIOS will set this bit to a '0' in response to a request for ownership of the xHC by system software.
15:8	0x22 RW/S	**Next Capability Pointer (NextCP):** This field indicates the location of the next capability with respect to the effective address of this capacity. Refer to Table 145 for more information on this field.
7:0	0x1 RW/L	**Capability ID (CID):** This field identifies the extended capability. Refer to Table 146 for the value that identifies the capability as Legacy Support. This extended capability requires one additional 32-bit register for control/status information (USBLEGCTLSTS), and this register is located at offset xECP+04h.

51.3.199 USB2 Port Disable Override (USB2PDO)—Offset 84F8h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MBAR] + 84F8h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:14	0x0 RO	Reserved.
13:0	0x0 RW/O	**USB2PDO (USB2PDO):** A '1' in a bit position prevents the corresponding USB 2 port from reporting a Device Connection to the xHC. This applies across all USB2 protocol ports • 0 - Allows corresponding USB port to report a device connection to the xHC. • 1 - Prevents the corresponding USB port from reporting a device Connection to the xHC. Port to bit mapping is in one-hot encoding, this is bit 0 controls port 1 and so on. • Bit 0 - USB 2.0 port 0 • ... • Bit N - USB 2.0 port N

51.3.200 USB3 Port Disable Override (USB3PDO)—Offset 84FCh

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MBAR] + 84FCh

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:10	0x0 RO	Reserved.
9:0	0x0 RW/O	**USB3 Port Disable Override (USB3PDO):** • 0 - Allows corresponding USB port to report a Device Connection to the xHC. • 1 - Prevents the corresponding USB port from reporting a Device Connection to the xHC. • Bit 0 - USB 3.0 Port 1 • ... • Bit N - USB 3.0 Port N

51.3.201 Command (CMD_MMIO)—Offset 8604h

Type: Memory Mapped I/O Register (Size: 16 bits)

Default: 0000h

BAR and Offset: [MBAR] + 8604h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
10	0x0 RW	**Interrupt Disable (ID):** When cleared to 0, the function is capable of generating interrupts. When 1, the function can not generate its interrupt to the interrupt controller. Note that the corresponding Interrupt Status bit is not affected by the interrupt enable. **Power Well:** Core
9	0x0 RO	**Fast Back to Back Enable (FBE):** Reserved. **Power Well:** Core
8	0x0 RW	**SERR# Enable (SERR):** When set to 1, the XHC is capable of generating (internally) SERR#. **Power Well:** Core
7	0x0 RO	**Wait Cycle Control (WCC):** Reserved. **Power Well:** Core
6	0x0 RW	**Parity Error Response (PER):** When set to 1, the XHCI Host Controller will check for correct parity (on its internal interface) and halt operation when bad parity is detected during the data phase as recommended by the XHCI specification. Note that this applies to both requests and completions from the system interface. This bit must be set in order for the parity errors to generate SERR#. **Power Well:** Core
5	0x0 RO	**VGA Palette Snoop (VPS):** Reserved. **Power Well:** Core
4	0x0 RO	**Memory Write Invalidate (MWI):** Reserved. **Power Well:** Core
3	0x0 RO	**Special Cycle Enable (SCE):** Reserved. **Power Well:** Core
2	0x0 RW	**Bus Master Enable (BME):** When set, it allows XHC to act as a bus master. When cleared, it disable XHC from initiating transactions on the system bus. **Power Well:** Core
1	0x0 RW	**Memory Space Enable (MSE):** This bit controls access to the XHC Memory Space registers. If this bit is set, accesses to the XHC registers are enabled. The Base Address register for the XHC should be programmed before this bit is set. **Power Well:** Core
0	0x0 RO	**I/O Space Enable (IOSE):** Reserved as 0. Read-Only. **Power Well:** Core

51.3.202 Device Status (STS_MMIO)—Offset 8606h

Type: Memory Mapped I/O Register (Size: 16 bits)

Default: 0290h

BAR and Offset: [MBAR] + 8606h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW/1C	**Detected Parity Error (DPE):** This bit is set by the SoC whenever a parity error is seen on the internal interface to the XHC host controller, regardless of the setting of bit 6 or bit 8 in the Command register or any other conditions. Software clears this bit by writing a 1 to this bit location. **Power Well:** Core
14	0x0 RW/1C	**Signaled System Error (SSE):** This bit is set by the SoC whenever it signals SERR# (internally). The SERR_EN bit (bit 8 in the Command Register) must be 1 for this bit to be set. **Power Well:** Core
13	0x0 RW/1C	**Received Master-Abort Status (RMA):** This bit is set when XHC, as a master, receives a master-abort status on a memory access. This is treated as a Host Error and halts the DMA engines. Software clears this bit by writing a 1 to this bit location. **Power Well:** Core
12	0x0 RW/1C	**Received Target Abort Status (RTA):** This bit is set when XHC, as a master, receives a target abort status on a memory access. This is treated as a Host Error and halts the DMA engines. Software clears this bit by writing a 1 to this bit location. **Power Well:** Core
11	0x0 RW/1C	**Signaled Target-Abort Status (STA):** This bit is used to indicate when the XHC function responds to a cycle with a target abort. **Power Well:** Core
10:9	0x1 RO	**DEVSEL# Timing Status (DEVT):** This 2-bit field defines the timing for DEVSEL# assertion. Read-Only. **Power Well:** Core
8	0x0 RW/1C	**Master Data Parity Error Detected (MDPED):** This bit is set by the SoC whenever a data parity error is detected on a XHC read completion packet on the internal interface to the XHC host controller and bit 6 of the Command register is set to 1. Software clears this bit by writing a 1 to this bit location. **Power Well:** Core
7	0x1 RO	**Fast Back-to-Back Capable (FBBC):** Reserved as 1 Read-Only. **Power Well:** Core
6	0x0 RO	**User Definable Features (UDF):** Reserved as 0. Read-Only. **Power Well:** Core
5	0x0 RO	**66 MHz Capable (MC):** Reserved as 0. Read-Only. **Power Well:** Core
4	0x1 RO	**Capabilities List (CL):** Hardwired to 1 indicating that offset 34h contains a valid capabilities pointer. **Power Well:** Core
3	0x0 RO/V	**Interrupt Status (IS):** This read-only bit reflects the state of this function's interrupt at the input of the enable/disable logic. This bit is a 1 when the interrupt is asserted. This bit will be 0 when the interrupt is deasserted. The value reported in this bit is independent of the value in the Interrupt Enable bit. **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
2:0	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core

51.3.203 Revision ID (RID_MMIO)—Offset 8608h

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [MBAR] + 8608h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO/V	**Revision ID (RID):** **Power Well:** Core

51.3.204 Programming Interface (PI_MMIO)—Offset 8609h

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 30h

BAR and Offset: [MBAR] + 8609h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x30 RO	**Programming Interface (PI):** A value of 30h indicates that this USB Host Controller conforms to the XHCI specification. **Power Well:** Core

51.3.205 Sub Class Code (SCC_MMIO)—Offset 860Ah

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 03h

BAR and Offset: [MBAR] + 860Ah

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x3 RO	**Sub Class Code (SCC):** A value of 03h indicates that this is a Universal Serial Bus Host Controller. **Power Well:** Core

51.3.206 Base Class Code (BCC_MMIO)—Offset 860Bh

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 0Ch

BAR and Offset: [MBAR] + 860Bh

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0xc RO	**Base Class Code (BCC):** A value of 0Ch indicates that this is a Serial Bus controller. **Power Well:** Core

51.3.207 Master Latency Timer (MLT_MMIO)—Offset 860Dh

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [MBAR] + 860Dh

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO	**Master Latency Timer (MLT):** Because the XHC controller is internally implemented with arbitration on an internal interface, it does not need a master latency timer. The bits will be fixed at 0. **Power Well:** Core

51.3.208 Header Type (HT_MMIO)—Offset 860Eh

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [MBAR] + 860Eh

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RO	**Multi-Function Bit (MFB):** Read only indicating single function device. **Power Well:** Core
6:0	0x0 RO	**Configuration layout (CL):** Hardwired to 0 to indicate a standard PCI configuration layout. **Power Well:** Core

51.3.209 Memory Base Address (MBAR_MMIO)—Offset 8610h

Value in this register will be different after the enumeration process.

Type: Memory Mapped I/O Register (Size: 64 bits)

Default: 0000000000000004h

BAR and Offset: [MBAR] + 8610h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
63:16	0x0 RW	**Base Address (BA):** Bits (63:16) correspond to memory address signals (63:16), respectively. This gives 64 KB of relocatable memory space aligned to 64 KB boundaries. **Power Well:** Core
15:4	0x0 RO	**Reserved (RSVD):** Reserved. Read-Only 0, this indicates that this function is requesting an 64KB block of memory. **Power Well:** Core
3	0x0 RO	**Prefetchable:** This bit is hardwired to 0 indicating that this range should not be prefetched. **Power Well:** Core
2:1	0x2 RO	**Type:** If this field is hardwired to 00 it indicates that this range can be mapped anywhere within 32-bit address space. If this field is hardwired to 10 it indicates that this range can be mapped anywhere within 64-bit address space. **Power Well:** Core
0	0x0 RO	**Resource Type Indicator (RTE):** This bit is hardwired to 0 indicating that the base address field in this register maps to memory space **Power Well:** Core

51.3.210 USB Subsystem Vendor ID (SSVID_MMIO)—Offset 862Ch

This register is modified and maintained by BIOS

Type: Memory Mapped I/O Register (Size: 16 bits)

Default: 0000h

BAR and Offset: [MBAR] + 862Ch

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x0 RW/L	**USB Subsystem Vendor ID (SSVID):** This register, in combination with the USB Subsystem ID register, enables the operating system to distinguish each subsystem from the others. **Power Well:** Core

51.3.211 USB Subsystem ID (SSID_MMIO)—Offset 862Eh

This register is modified and maintained by BIOS

Type: Memory Mapped I/O Register (Size: 16 bits)

Default: 0000h

BAR and Offset: [MBAR] + 862Eh

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x0 RW/L	**USB Subsystem ID (SSID):** BIOS sets the value in this register to identify the Subsystem ID. This register, in combination with the Subsystem Vendor ID register, enables the operating system to distinguish each subsystem from other(s). **Power Well:** Core

51.3.212 Capabilities Pointer (CAP_PTR_MMIO)—Offset 8634h

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 70h

BAR and Offset: [MBAR] + 8634h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x70 RO	**Capabilities Pointer (CAP_PTR):** This register points to the starting offset of the capabilities ranges. **Power Well:** Core

51.3.213 Interrupt Line (ILINE_MMIO)—Offset 863Ch

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [MBAR] + 863Ch

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW	**Interrupt Line (ILINE):** This data is not used by the SoC. It is used as a scratchpad register to communicate to software the interrupt line that the interrupt pin is connected to. **Power Well:** Core

51.3.214 Interrupt Pin (IPIN_MMIO)—Offset 863Dh

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [MBAR] + 863Dh

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RW/L	**Interrupt pin (IPIN):** Bits 7:0 reflect the Interrupt Pin assigned to the host controller by the platform (and are hardwired). **Power Well:** Core

51.3.215 XHC System Bus Configuration 1 (XHCC1_MMIO)—Offset 8640h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 000001FDh

BAR and Offset: [MBAR] + 8640h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW/O	**Access Control (ACCTRL):** This bit is used by BIOS to lock/unlock lockable bits. When set to '1' the write access to bits locked by this bit is disabled (locked state). When set to '0', the write access to bit locked by this bit is enabled (unlocked state). Writable once after platform reset. **Power Well:** Core
30:25	0x0 RW	**ECO1:** **Power Well:** Core
24	0x0 RW	**Master/Target Abort SERR (RMTASERR):** When set, it allows the out-of-band error reporting from the xHCI Controller to be reported as SERR# (if SERR# reporting is enabled) and thus set the STS.SSE bit. **Power Well:** Core
23	0x0 RW/C	**Unsupported Request Detected (URD):** Set the HW when xHCI Controller received an unsupported request posted cycle. Cleared by SW when the bit is written with value of '1'. **Power Well:** Core
22	0x0 RW	**Unsupported Request Report Enable (URRE):** When set this bit allows the URD bit to be reported as SERR# (if SERR# reporting is enabled) and thus set the STS.SSE bit. **Power Well:** Core
21:19	0x0 RW	**Inactivity Initiated L1 Enable (IIL1E):** If programmed to non-zero, it allows L1 power managed to be enabled after the time-out period specified. 000: Disabled 001: 32 bb_cclk 010: 64 bb_cclk 011: 128 bb_cclk 100: 256 bb_cclk 101: 512 bb_cclk 110: 1024 bb_cclk 111: 131072 bb_cclk **Power Well:** Core
18	0x0 RW	**XHC Initiated L1 Enable (XHCIL1E):** If set, allow the XHC initiated L1 power mangement to be enabled. **Power Well:** Core
17	0x0 RW	**D3 Initiated L1 Enable (D3IL1E):** If set, allow PCI device state D3 initiated L1 power managment to be enables. This bit can only be set if the XHCI L1 Override P2 chicken bit is set. **Power Well:** Core
16:12	0x0 RW	**Periodic Complete Pre Wake Time (PCPWT):** signal . This allows for platform wake time before the next scheduled periodic transaction. The value programmed in this field represents the # of bytes consumed in the current micro-frame which is required to allow for the periodic complete to de-assert. This allows for a programmable time to cause the periodic complete to de-assert prior to the start of the next micro-frame. Register Format: Bits (16:12) represnets the # of bytes remaining with a 256B granularity. Periodic Complete will de-assert if the bytes consumed in the current micro-frame is less **Power Well:** Core
11	0x0 RW	**SW Assisted xHC Idle (SWAXHCI):** This bit being set will indicate xHC idleness (through SW means), which must be a '1' to allow L1 entry, and subsequently allow backbone clock to be gated. This bit is to be set by Intel xHCI driver after checking that the xHCI Controller will stay in idle state for a significant period of time, e.g. all ports disconnected. This bit can be cleared under the following conditions (see SWAXHCI Policy bits in xHC System Bus Configuration 2 register): n SW: SW could write 0 to clear this bit. n HW: HW, under policy control, will clear this bit on an MMIO access to the Host Controller. n HW: HW, under policy control, will clear this bit when HW exits Idle state. **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
10:8	0x1 RW	**L23 to Host Reset Acknowledge Wait Count (L23HRAWC):** If programmed to non zero, it allows a wait period after the L23 PHY has shutdown before returning host reset acknowledge to PMC. 000: Disabled 001: 128 bb_cclk 010: 256 bb_cclk 011: 512 bb_cclk 100: 1024 bb_cclk 101: 2048 bb_cclk 110: 4096 bb_cclk 111: 131072 bb_cclk **Power Well:** Core
7:6	0x3 RW	**Upstream Type Arbiter Grant Count Posted (UTAGCP):** Grant count for IOSF upstream L2 request type arbiter for posted type **Power Well:** Core
5:4	0x3 RW	**Upstream Type Arbiter Grant Count Non Posted (UDAGCNP):** Grant count for IOSF upstream L2 type arbiter for non-posted type **Power Well:** Core
3:2	0x3 RW	**Upstream Type Arbiter Grant Count Completion (UDAGCCP) (UDAGCCP):** Grant count for IOSF upstream L2 type arbiter for completion type **Power Well:** Core
1:0	0x1 RW	**Upstream Device Arbiter Grant Count (UDAGC) (UDAGC):** Grant count for IOSF upstream L1 device arbiter **Power Well:** Core

51.3.216 XHC System Bus Configuration 2 (XHCC2_MMIO)—Offset 8644h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 0003C000h

BAR and Offset: [MBAR] + 8644h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**OC Configuration Done (OCCFGDONE):** This bit is used by BIOS to prevent spurious switching during OC configuration. It must be set by BIOS after configuration of the OC mapping bits is complete. Once this bit is set, OC mapping shall not be changed by SW. **Power Well:** SUS
30:26	0x0 RW	**ECO1:** **Power Well:** Core
25	0x0 RW	**DMA Request Boundary Crossing Control (DREQBCC):** This bit controls the boundary crossing limit of each Read/Write Request. • 0: 4KB • 1: 64B **Power Well:** Core
24:22	0x0 RW	**IDMA Write Request Size Control (IDMA_WRREQSZCTRL):** Write Request Size Control: This bit controls the maximum size of each Write Request. • 000: 128B • 001: 256B • 011 - 110: Reserved • 111: 64B **Power Well:** Core
21	0x0 RW	**XHC Upstream Read Relaxed Ordering Enable (XHCUPRDROE):** This policy controls the Relaxed Ordering attribute for upstream reads. • 0 - xHC will clear RO for all upstream read requests. • 1 - xHC will set RO for all upstream read requests. **Power Well:** Core
20	0x0 RW	**IOSF Sideband Register Access Disable (IOSFSRAD):** When set, it disables the IOSF sideband interface from accepting any host space register access. **Power Well:** Core
19:14	0xf RW	**Upstream Non-Posted Pre-Allocation (UNPPA):** This field reserves data sizes, in 64 byte chunks, of the downstream completion resource. This value is zero based. 000000 - 111111: Pre-allocate 64 bytes - 4096 bytes If set greater than the default allows over-allocation If set less than default allows under-allocation Only allowed to be programmed when BME = 0 and no outstanding downstream completion **Power Well:** Core
13:12	0x0 RW	**SW Assisted xHC Idle Policy (SWAXHCIP):** Note: Irrespective of the setting of this field, SW write of 0 to SWAXHCI will clear the bit. • 00b (default): xHC HW clears SWAXHCI bit upon: n MMIO access to Host Controller OR n xHC HW exits Idle state • 01b: xHC HW does not autonomously clear SWAXHCI bit. The bit could be cleared only by SW. • 10b: xHC HW clears SWAXHCI upon MMIO acces to Host Controller. xHC HW exit from Idle state will not clear SWAXHCI. • 11b: Reserved **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
11	0x0 RW	**MMIO Read After MMIO Write Delay Disable (RAWDD):** This field controls delay on MMIO Read after MMIO Write. • 0b (Default): Delay MMIO Read after MMIO Write • 1b: Do not delay MMIO Read after MMIO Write ***Note:*** This delay applies after the second of the two DW writes in the case where the IOSF Gasket splits a QW write into two single DW writes to the IP. **Power Well:** Core
10	0x0 RW	**MMIO Write After MMIO Write Delay Enable (WAWDE):** This field controls delay on MMIO Write after previous MMIO Write. • 0b (Default): Do not delay MMIO Write after previous MMIO Write • 1b: Delay MMIO Write after previous MMIO Write ***Note:*** The delay count does not apply on the second of the two DW writes that are generated by IOSF Gasket when it splits a QW write into two. In other words, the second of the two DW writes could happen without any delay with respect to the first DW write. This choice is being made for ease of ECO. The delay count, in this case, will apply after the second of the two DW writes. **Power Well:** Core
9:8	0x0 RW	**SW Assisted Cx Inhibit (SWACXIHB):** This field controls how the DMI L1 inhibit signal from USB3 to PMC will behave. • 00: Never inhibit Cx • 01: Inhibit Cx when Isochronous Endpoint is active (PPT Behavior) • 10: Inhibit Cx when Periodic Active as defined in 40.4.3.2.1 • 11: Always inhibit Cx **Power Well:** Core
7:6	0x0 RW	**SW Assisted DMI L1 Inhibit (SWADMIL1IHB):** This field controls how the DMI L1 inhibit signal from USB3 to DMI will behave. • 00: Never inhibit DMI L1. • 01: Inhibit DMI L1 when Isochronous Endpoint is active (PPT Behavior). • 10: Inhibit DMI L1 when Priodic Active as defined in 40.4.3.2.1. • 11: Inhibit DMI L1 if XHCC1.SWAXHCI = 0. **Power Well:** Core
5:3	0x0 RW	**L1 Force P2 Clock Gating Wait Count (L1FP2CGWC):** If programmed to non zero, it allows L1 force P2 gating off the clock to be delayed after the time-out period specified. If wake up event is detected before the time-out, pclk remains alive and trigger L1 exit as though CPU host is causing the wake, • 000: Disabled • 001: 128 bb_cclk • 010: 256 bb_cclk • 011: 512 bb_cclk • 100: 1024 bb_cclk • 101: 2048 bb_cclk • 110: 4096 bb_cclk • 111: 131072 bb_cclk **Power Well:** Core
2:0	0x0 RW	**Read Request Size Control (RDREQSZCTRL):** Read Request Size Control: This bit controls the maximum size of each Read Request. • 000: 128B • 001: 256B • 010: 512B • 011 - 110: Reserved • 111: 64B **Power Well:** Core

51.3.217 Clock Gating (XHCLKGTEN_MMIO)—Offset 8650h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MBAR] + 8650h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:29	0x0 RO	**Rsvd2:** Reserved **Power Well:** Core
28	0x0 RW	**Naking USB2.0 EPs for Backbone Clock Gating and PLL Shutdown (NUEFBCGPS):** This field controls whether Naking USB2.0 EPs, once in Naking low priority schedule, should be considered as active for the considerations for backbone clock gating and PLL shutdown or not. 0: Naking USB2.0 EPs are not considered to be active for Backbone Clock Gating and PLL Shutdown evaluation. 1: Naking USB2.0 EPs are considered to be active for Backbone clock gating and PLL shutdown evaluation. **Power Well:** Core
27	0x0 RW	**SRAM Power Gate Enable (SRAMPGTEN):** This register enables the SRAM Power Gating when PLL shutdown conditions for all clock domains have been met 0 - Disallow SRAM Power Gating. 1 - Allow SRAM Power Gating **Power Well:** Core
26	0x0 RW	**SS Link PLL Shutdown Enable (SSLSE):** This register enables the SS P3 state to be exposed to PXP PLL Shutdown conditions on behalf of all USB SS Ports ontop of trunk clock gating. 0 - P3 state NOT allowed to result in PXP PLL shutdown. 1- P3 state allowed to result in PXP PLL shutdown **Power Well:** Core
25	0x0 RW	**USB2 PLL Shutdown Enable (USB2PLLSE):** When set, this bit allows USB2 PLL to be shutdown when HS Link trunk clock is gated, and xHC can tolerate PLL spin up time for subsequent clock request. Note: if USB2 PLL Shutdown Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value. **Power Well:** Core
24	0x0 RW	**IOSF Sideband Trunk Clock Gating Enable (IOSFSTCGE):** When set, this bit allows the IOSF sideband clock trunk to be gated when idle conditions are met. **Power Well:** Core
23:20	0x0 RW	**HS Backbone PXP Trunk Clock Gate Enable (HSTCGE):** This register determines the HS Ux state(s) which will be exposed to Backbone PXP trunk gating of core clock. Uy is a state allowed to result in trunk gating when ss_tcg_ux_en(x) is asserted. (0) ==) U0 or deeper (1) ==) NA (no support for U1) (2) ==) U2 (L1) or deeper (3) ==) U3 (L2) or deeper **Power Well:** Core
19:16	0x0 RW	**SS Backbone PXP Trunk Clock Gate Enable (SSTCGE):** This register determines the SS Ux state(s) which will be exposed to Backbone PXP trunk gating of core clock. Uy is a state allowed to result in trunk gating when ss_tcg_ux_en(x) is asserted. (0) ==) U0 or deeper (1) ==) U1 or deeper (2) ==) U2 or deeper (3) ==) U3 or deeper **Power Well:** Core
15	0x0 RW	**XHC Ignore_EU3S (XHCIGEU3S):** This register determines if the xHC will use the EU3S as a condition to allow for Frame timer gating. 0 - xHC may allow frame timer to be gated when EU3S is set and all ports are in the required state. 1 - xHC may allow frame timer to be gated regardless of EU3S. **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
14	0x0 RW	**XHC Frame Timer Clock Shutdown Enable (XHCFTCLKSE):** This register determines if the xHC will allow the frame timer clock to be gated. 0 - xHC will not allow ICC PLL 96MHz output to be shutdown thus keeping the frame timer running. 1 - xHC will allow ICC PLL 96MHz output to be shutdown under specific conditions. **Power Well:** Core
13	0x0 RW	**XHC Backbone PXP Trunk Clock Gate In Presence of ISOCH EP (XHCBBTCGIPISO):** This register controls the policy on allowing Backbone PXP trunk clock gate in the presence of IDLE ISOCH EP s with active DB. Allows the periodic active to be used in enabling Backbone PXP trunk clock gating of core clock. 0 Trunk gate of core clock is not allowed when ISOCH EP DB is set and ISOCH EP s are idle. 1 Allow trunk gate of core clock when ISOCH EP DB is set and ISOCH EP s are idle. **Power Well:** Core
12	0x0 RW	**XHC HS Backbone PXP Trunk Clock Gate U2 non RWE (XHCHSTCGU2NRWE):** This register controls the policy on allowing Backbone PXP trunk gating of core clock when there is atleast 1 non Remote Wake Enabled HS Port in U2. 0 Prevent trunk gate of core clock when a non RWE HS Port is in U2. 1 Allow trunk gate of core clock when a non RWE HS Port is in U2. **Power Well:** Core
11:10	0x0 RW	**XHC USB2 PLL Shutdown Lx Enable (XHCUSB2PLLSDLE):** This register determines the HS Link state(s) which will be exposed to USB2 PLL Shutdown conditions on behalf of all USB2 HS Ports. Ly is a state allowed to result in USB2 PLL Shutdown when en(x) is asserted. (0) ==) L1 or deeper (1) ==) L2 or deeper **Power Well:** Core
9:8	0x0 RW	**HS Backbone PXP PLL Shutdown Ux Enable (HSUXDMIPLLSE):** This register determines the Ux state(s) which will be exposed to PXP PLL Shutdown conditions. PLL Shutdown is allowed in: 00b Disabled (Link states shall be disabled for DMI PLL shutdown) 01b U0 or conditions for 10b setting. 10b U2 or conditions for 11b setting. 10b U3, Disconnected, Disabled or Powered-Off. **Power Well:** Core
7:5	0x0 RW	**SS Backbone PXP PLL Shutdown Ux Enable (SSPLLSUE):** This register determines the Ux state(s) which will be exposed to DMI PLL Shutdown conditions. PLL Shutdown is allowed in: 000b Disabled (Link states shall be ignored for DMI PLL shutdown). 001b U0 or conditions for 010b setting 010b U1 or conditions for 011b setting 011b U2 or conditions for 100b setting 100b U3, Disconnected, Disabled or Powered-Off **Power Well:** Core
4	0x0 RW	**XHC Backbone Local Clock Gating Enable (XHCBLCGE):** When set, this bit allows XHCI Controller IP backbone clock to be locally gated when idle conditions are met. Note: if XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value. **Power Well:** Core
3	0x0 RW	**HS Link Trunk Clock Gating Enable (HSLTCGE):** When set, this bit allows High Speed Link control's 480 MHz and its 48/60 MHz link clock trunk to be gated when idle conditions are met. Note: if XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value. BIOS need to query fuses to see if HW is enabled. **Power Well:** Core
2	0x0 RW	**SS Link Trunk Clock Gating Enable (SSLTCGE):** When set, this bit allows the SuperSpeed Link control's 250 MHz and its divided 125 MHz link clock trunk to ge gated when idle conditions are met. Note: if XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value. BIOS need to query fuses to see if HW is enabled. **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RW	**IOSF Backbone Trunk Clock Gating Enable (IOSFBTCGE):** When set, this bit allows the IOSF backbone clock trunk to be gated when idle conditions are met. **Power Well:** Core
0	0x0 RW	**IOSF Gasket Backbone Local Clock Gating Enable (IOSFBLCGE):** When set, this bit allows the IOSF Gasket backbone clock to be locally gated when idle conditions are met. Note: if XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value. BIOS need to query fuses to see if HW is enabled. **Power Well:** Core

51.3.218 Audio Time Synchronization (AUDSYNC_MMIO)—Offset 8658h

This 32 bit register is used for audio stream synchronization across different devices. Global signal sample_now captures a value in AUDSYNC register.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MBAR] + 8658h

Default: 00000000h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:30	0x0 RO	**Rsvd2:** Reserved. **Power Well:** Core
29:16	0x0 RO/V	**Captured Frame List Current Index/Frame Number (CMFI):** The value in this register is updated in response to sample_now signal. Bits (29:16) reflect state of bits (13:0) of FRINDEX **Power Well:** Core
15:13	0x0 RO	**Rsvd1:** Reserved. **Power Well:** Core
12:0	0x0 RO/V	**Captured Micro-frame BLIF (CMFB):** The value is updated in response to sample_now signal and provides information about offset within micro-frame. Captured value represents number of 8 high-speed bit time units from start of micro-frame. At the beginning of micro-frame captured value will be 0 and increase to maximum value at the end. Default maximum value is 7499 but it may be changed as result of adjustment done in FLA. **Power Well:** Core

51.3.219 Serial Bus Release Number (SBRN_MMIO)—Offset 8660h

Type: Memory Mapped I/O Register (Size: 8 bits)

BAR and Offset: [MBAR] + 8660h

Default: 30h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x30 RO	**Serial Bus Release Number (SBRN):** A value of 30h indicates that this controller follows USB release 3.0. **Power Well:** SUS

51.3.220 Frame Length Adjustment (FLADJ_MMIO)—Offset 8661h

This feature is used to adjust any offset from the clock source that generates the clock that drives the SOF counter. When a new value is written into these six bits, the length of the frame is adjusted. Its initial programmed value is system dependent based on the accuracy of hardware USB clock and is initialized by system BIOS. This register should only be modified when the HChalted bit in the USBSTS register is a one. Changing value of this register while the host controller is operating yields undefined results.

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 60h

BAR and Offset: [MBAR] + 8661h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RO	**Reserved (RSVD):** . **Power Well:** SUS
6	0x1 RO	**No Frame Length Timing Capability (NO_FRAME_LENGTH_TIMING_CAP):** This flag is set to 1 to indicate that the host controller does not support a programmable Frame Length Timing Value field. **Power Well:** Core
5:0	0x20 RO	**Frame Length Timing Value (FLTV):** SOF micro-frame length) is equal to 59488 + value in this field. The default value is decimal 32 (20h), which gives a SOF cycle time of 60000. Frame Length (number of High Speed bit times) FLADJ Value (decimal) (decimal) 59488 0 (00h) 59504 1 (01h) 59520 2 (02h) ... 59984 31 (1Fh) 60000 32 (20h) ... 60480 62 (3Eh) 60496 63 (3Fh) Each decimal value change to this register corresponds to 16 high-speed bit times. The SOF cycle time (number of SOF counter clock periods to generate a SOF micro-frame length) is equal to 59488 + value in this field. The default value is decimal 32 (20h), which gives a SOF cycle time of 60000. Frame Length (# High Speed bit times) FLADJ Value **Power Well:** SUS

51.3.221 Best Effort Service Latency (BESL_MMIO)—Offset 8662h

Bset Effort Service Latency.

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [MBAR] + 8662h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:4	0x0 RW/L	**Default Best Effort Service Latency Deep (DBESLD):** Default Best Effort Service Latency (DBESLD) If the value of this field is non-zero, it defines the recommended value for programming the PORTPMSC register BESLD field. This is programmed by BIOS based on platform parameters. **Power Well:** Core
3:0	0x0 RW/L	**Default Best Effort Service Latency (DBESL):** If the value of this field is non-zero, it defines the recommended value for programming the PORTPMSC register BESL field. This is programmed by BIOS based on platform parameters. **Power Well:** Core

51.3.222 PCI Power Management Capability ID (PM_CID_MMIO)—Offset 8670h

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 01h

BAR and Offset: [MBAR] + 8670h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x1 RO	**PCI Power Management Capability ID (PM_CID):** A value of 01h indicates that this is a PCI Power Management capabilities field. **Power Well:** Core

51.3.223 Next Item Pointer #1 (PM_NEXT_MMIO)—Offset 8671h

This register is modified and maintained by BIOS

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 80h

BAR and Offset: [MBAR] + 8671h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x80 RW/L	**Next Item Pointer #1 (PM_NEXT):** This register defaults to 80h, which indicates that the next capability registers begin at configuration offset 80h. This register is writable when the Access Control bit is set to '0'. This allows BIOS to effectively hide the next capability registers, if necessary. This register should only be written during system initialization before the plug-and-play software has enabled any master-initiated traffic. Values of: 80h implies next capability is MSI 00h implies that MSI capability is hidden. Note: This value is never expected to be programmed. **Power Well:** Core

51.3.224 Power Management Capabilities (PM_CAP_MMIO)—Offset 8672h

Normally, this register is read-only to report capabilities to the power management software. In order to report different power management capabilities depending on the system in which the SoC is used, the write access to this register is controlled by the Access Control bit (ACCTRL). The value written to this register does not affect the hardware other than changing the value returned during a read. This register is modified and maintained by BIOS

Type: Memory Mapped I/O Register (Size: 16 bits)

BAR and Offset: [MBAR] + 8672h

Default: C1C2h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0x18 RW/L	**PME_Support:** This 5-bit field indicates the power states in which the function may assert PME#. The SoC XHC does not support the D1 or D2 states. For all other states, the SoC XHC is capable of generating PME#. Software should never need to modify this field. **Power Well:** Core
10	0x0 RW/L	**D2_Support:** The D2 state is not supported. **Power Well:** Core
9	0x0 RW/L	**D1_Support:** The D1 state is not supported. **Power Well:** Core
8:6	0x7 RW/L	**Aux_Current:** The SoC XHC reports 375mA maximum Suspend well current required when in the D3cold state. This value can be written by BIOS when a more accurate value is known. **Power Well:** Core
5	0x0 RW/L	**DSI:** The SoC reports 0, indicating that no device-specific initialization is required. **Power Well:** Core
4	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
3	0x0 RW/L	**PME Clock (PMEClock):** The SoC reports 0, indicating that no PCI clock is required to generate PME#. **Power Well:** Core
2:0	0x2 RW/L	**Version:** The SoC reports 010, indicating that it complies with Revision 1.1 of the PCI Power Management Specification. **Power Well:** Core

51.3.225 Power Management Control/Status (PM_CS_MMIO)—Offset 8674h

Type: Memory Mapped I/O Register (Size: 16 bits)

Default: 0008h

BAR and Offset: [MBAR] + 8674h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW/1C	**PME_Status:** This bit is set when the SoC XHC would normally assert the PME# signal independent of the state of the PME_En bit. Writing a 1 to this bit will clear it and cause the internal PME to deassert (if enabled). Writing a 0 has no effect. This bit must be explicitly cleared by the operating system each time the operating system is loaded. **Power Well:** SUS
14:13	0x0 RO	**Data_Scale:** The SoC hardwires these bits to 00 because it does not support the associated Data register. **Power Well:** Core
12:9	0x0 RO	**Data_Select:** The SoC hardwires these bits to 0000 because it does not support the associated Data register. **Power Well:** Core
8	0x0 RW	**PME_En:** A 1 enables the SoC XHC to generate an internal PME signal when PME_Status is 1. This bit must be explicitly cleared by the operating system each time it is initially loaded. **Power Well:** SUS
7:4	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
3	0x1 RO	**No Soft Reset (NSR):**), this bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved. Upon transition from the D3hot to the D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the PowerState bits. Transition from D3hot to D0 by a system or bus segment reset will return to the device state D0 Uninitialized with only PME context preserved if PME is supported and enabled. **Power Well:** Core
2	0x0 RO	**Reserved (RSVD2):** Reserved. **Power Well:** Core
1:0	0x0 RW	**PowerState:** This 2-bit field is used both to determine the current power state of XHC function and to set a new power state. The definition of the field values are: 00b - D0 state 11b - D3hot state If software attempts to write a value of 10b or 01b in to this field, the write operation must complete normally, however, the data is discarded and no state change occurs. When in the D3hot state, the SoC must not accept accesses to the XHC memory range, but the configuration space must still be accessible. **Power Well:** Core

51.3.226 Message Signaled Interrupt CID (MSI_CID_MMIO)—Offset 8680h

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 05h

BAR and Offset: [MBAR] + 8680h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x5 RO	**Capability ID (CID):** Indicates that this is an MSI capability **Power Well:** Core

51.3.227 Next item pointer (MSI_NEXT_MMIO)—Offset 8681h

Type: Memory Mapped I/O Register (Size: 8 bits)

Default: 00h

BAR and Offset: [MBAR] + 8681h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO	**Next Pointer (NEXT):** Indicates that this is the last item on the capability list **Power Well:** Core

51.3.228 Message Signaled Interrupt Message Control (MSI_MCTL_MMIO)—Offset 8682h

Type: Memory Mapped I/O Register (Size: 16 bits)

Default: 0086h

BAR and Offset: [MBAR] + 8682h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
15:9	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
8	0x0 RO	**Per-Vector Masking Capable (PVM):** Specifies whether controller supports MSI per vector masking. Not supported **Power Well:** Core
7	0x1 RO	**64 Bit Address Capable (C64):** Specifies whether capable of generating 64-bit messages. This device is 64-bit capable. **Power Well:** Core
6:4	0x0 RW	**Multiple Message Enable (MME):** Indicates the number of messages the controller should assert. This device supports multiple message MSI. **Power Well:** Core
3:1	0x3 RO	**Multiple Message Capable (MMC):** Indicates the number of messages the controller wishes to assert. This field must be set by HW to reflect the number of Interrupters supported. Encoding number of Vectors requested (number of Interrupters) 000 1 001 2 010 4 011 8 100 16 101 32 110-111 Reserved **Power Well:** Core
0	0x0 RW	**MSI Enable (MSIE):** If set to 1, MSI is enabled and the traditional interrupt pins are not used to generate interrupts. If cleared to 0, MSI operation is disabled and the traditional interrupt pins are used. **Power Well:** Core

51.3.229 Message Signaled Interrupt Message Address (MSI_MAD_MMIO)—Offset 8684h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MBAR] + 8684h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**Addr:** Lower DW of system specified message address, always DWORD aligned **Power Well:** Core
1:0	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core

51.3.230 Message Signaled Interrupt Upper Address (MSI_MUAD_MMIO)—Offset 8688h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MBAR] + 8688h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Upper Addr (UpperAddr):** Upper DW of system specified message address. **Power Well:** Core

51.3.231 Message Signaled Interrupt Message Data (MSI_MD_MMIO)—Offset 868Ch

Type: Memory Mapped I/O Register (Size: 16 bits)

Default: 0000h

BAR and Offset: [MBAR] + 868Ch

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x0 RW	**Data:** This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the lower word (PCI AD(15:0)) during the data phase of the MSI memory write transaction. The Multiple Message Enable field (bits 6-4 of the Message Control register) defines the number of low order message data bits the function is permitted to modify to generate its system software allocated vectors. For example, a Multiple Message Enable encoding of 010 indicates the function has been allocated four vectors and is permitted to modify message data bits 1 and 0 (a function modifies the lower message data bits to generate the allocated number of vectors). If the Multiple Message Enable field is 000, the function is not permitted to modify the message data. **Power Well:** Core

51.3.232 Device Idle Capability (DEVIDLE_MMIO)—Offset 8690h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: F0140009h

BAR and Offset: [MBAR] + 8690h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0xf RO	**VID:** Reserved. **Power Well:** Core
27:24	0x0 RO	**REV:** Reserved. **Power Well:** Core
23:16	0x14 RO	**Length (LENGTH):** Indicates that this capability is 16 bytes long. **Power Well:** Core
15:8	0x0 RO	**Next Capability Pointer (NCP):** This field contains the offset to the next PCI Capability structure or 000h if no other items exist in the linked list of Capabilities. **Power Well:** Core
7:0	0x9 RO	**Capability ID (CID):** Reserved. **Power Well:** Core

51.3.233 Vendor Specific Header (VSHDR_MMIO)—Offset 8694h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 01400010h

BAR and Offset: [MBAR] + 8694h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:20	0x14 RO	**VSEC Length (VSEC_LENGTH):** This field indicates the number of bytes in the entire VSEC structure, including the PCI Extended Capability header, the Vendor- Specific header, and the Vendor-Specific register **Power Well:** Core
19:16	0x0 RO	**VSEC Rev (VSEC_REV):** This field is a vendor-defined version number that indicates the version of the VSEC structure. Software must qualify the Vendor ID and VSEC ID before interpreting this field. **Power Well:** Core
15:0	0x10 RO	**VSEC ID (VSEC_ID):** This field is a vendor-defined ID number that indicates the nature and format of the VSEC structure. Software must qualify the Vendor ID before interpreting this field. **Power Well:** Core

51.3.234 SW LTR POINTER (SWLTRPTR_MMIO)—Offset 8698h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MBAR] + 8698h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0x0 RO	**SW LTR Update MMIO Offset Location (SW_LTR_UPDT_MMIO_OFFSET):** This register contains the location pointer to the SW LTR register in MMIO space, as an offset from the specified BAR. The value of this register is a dont care, if the Valid bit is not set. **Power Well:** Core
3:1	0x0 RO	**Base Address Register Number (BARNUM):** Contains the 0s based AR Number of the BAR which contains the location of the SW LTR MMIO register. When counting BAR Numbers, all BARs, regardless of size and type, consume one BAR Number. Bar 0 is the 1st BAR. The value of this register is a dont care, if the Valid bit is not set. **Power Well:** Core
0	0x0 RO	**Valid (VALID):** Set to 1 to indicate that the function has implemented a SW LTR register as specified in the DevIdle that can be located using the SWLTRLOC register and BARNUM. Set to 0 to indicate that the function has not implemented a SW LTR register that is compliant to the DevIdle definition. This could be because the function has not implemented SW LTR at all, or has a device specific version of SW LTR. **Power Well:** Core

51.3.235 Device Idle Pointer Register (DEVIDLEPTR_MMIO)—Offset 869Ch

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00080AC1h

BAR and Offset: [MBAR] + 869Ch

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0x80ac RW/L	**DevIdle MMIO Offset Location (DEVIDLELOC):** This register contains the location pointer to the DevIdle register in MMIO space, as an offset from the specified BAR. The value of this register is a dont care, if the Valid bit is not set. **Power Well:** Core
3:1	0x0 RO	**Base Address Register Number (BARNUM):** Contains the 0s based BAR Number of the BAR which contains the location of the DevIdle MMIO register. When counting BAR Numbers, all BARs, regardless of size and type, consume one BAR Number. Bar 0 is the 1st BAR. The value of this register is a dont care, if the Valid bit is not set. **Power Well:** Core
0	0x1 RW/L	**Valid (VALID):** Set to 1 to indicate that the function has implemented a DevIdle register as specified in the DevIdle that can be located using the DEVIDLELOC register and BARNUM. Set to 0 to indicate that the function has not implemented a DevIdle register that is compliant to the DevIdle definition. This could be because the function has not implemented DevIdle at all, or has a device specific version of DevIdle. **Power Well:** Core

51.3.236 Device Idle Power ON Latency (DEVIDLEPOL_MMIO)—Offset 86A0h

Type: Memory Mapped I/O Register (Size: 16 bits)

Default: 0800h

BAR and Offset: [MBAR] + 86A0h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
15:13	0x0 RO	**Rsvd1:** Reserved. **Power Well:** Core
12:10	0x2 RW/L	**Power On Latency Scale (POLS):** Latency Scale multiplier: 010: 1us 011: 32us All other settings are reserved. The value of this register is multiplied with the Power On Latency Value (POLV) to provide the DevIdle power on exit latency multiplier scale from 1us to 32ms. This register is defined to be RWO (read-write-once) to allow BIOS to set the initial value. This register is undefined if the DevIdle.Valid bit is 0. **Power Well:** Core
9:0	0x0 RW/L	**Power On Latency Value (POLV):** 10-bit value that is multiplied by the Power On Latency Scale. A value of 0 indicates a power on latency of less than 1us. This register is defined to be RWO (read-write-once) to allow BIOS to set the initial value. This register is undefined if the DevIdle.Valid bit is 0. **Power Well:** Core

51.3.237 High Speed Configuration 2 (HSCFG2_MMIO)—Offset 86A4h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00002000h

BAR and Offset: [MBAR] + 86A4h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0x0 RO	**Rsvd1:** Reserved. **Power Well:** Core
18	0x0 RW	**PORT1_HOST_MODE_OVERRIDE:** When set, this bit causes the Host_Device mux on port 1 to be forced into the Host mode. **Power Well:** Core
17:16	0x0 RW	**eUSB2SEL:** The two bits are associate with USB2 ports 1 - bit 16 and 2 - bit 2 0: Port is mapped to USB2 1: Port is mapped to eUSB2 **Power Well:** Core
15	0x0 RW	**HS ASYNC Active IN Mask (HSAAIM):** Determines if the Async Active will mask/ignore IN EP s. 0 HS ASYNC Active will include IN EP s. 1 HS ASYNC Active will mask/ignore IN EP s. **Power Well:** Core
14	0x0 RW	**HS OUT ASYNC Active Polling EP Mask (HSOAAPEPM):** Determines if the Async Active for OUT HS/FS/LS masks/ignores EP s that are polling/PINGing (HS) due to NAK. 0 HS OUT ASYNC Active will include EP s that are polling. 1 HS OUT ASYNC Active will mask/ignore EP s that are polling. **Power Well:** Core
13	0x1 RW	**HS IN ASYNC Active Polling EP Mask (HSIAAPEPM):** Determines if the Async Active for IN HS/FS/LS masks/ignores EP s that are polling due to NAK. 0 HS IN ASYNC Active will include EP s that are polling. 1 HS IN ASYNC Active will mask/ignore EP s that are polling. **Power Well:** Core
12:11	0x0 RW	**HS INTR IN Periodic Active Policy Control (HSIIPAPC):** Controls how the HS INTR IN periodic active is used to generate the global periodic active. This will determine how the smallest service interval among active EP s and number of active EP s are used. 0 HS INTR IN periodic active will be used to generate periodic active if Service Interval Threshold OR Numb of EP Threshold values meet the requirement. 1 HS INTR IN periodic active will be used to generate periodic active if Service Interval Threshold AND Numb of EP Threshold values meet the requirement. 2 Always allow HS INTR EP s to be used in the generation of the global Periodic Active indication. 3 Never allow HS INTR EP s to be used in the generation of the global Periodic Active indicaiton **Power Well:** Core
10:4	0x0 RW	**HS INTR IN Periodic Active Num of EP Threshold (HSIIPANEPT):** Defines the threshold used to determine if Periodic Acive may include HS/FS/LS INTR IN EP active indication. If there are more than NumEPThreshold active HS/FS/LS INTR EP s then they may be included as part of the periodic active generation. **Power Well:** Core
3:0	0x0 RW	**HS INTR IN Periodic Active Service Interval Threshold (HSIIPASIT):** Defines the Service Interval threshold used to determine if Periodic Acive will include HS/FS/LS INTR IN EP active indication. If there are any active HS/FS/LS INTR EP s with a service interval less than or equal to this threshold then they may be included as part of the periodic active generation. **Power Well:** Core

51.3.238 XHCI USB2 Overcurrent Pin Mapping 1 (U2OCM1_MMIO)—Offset 86B0h

The RW/L property of this register is controlled by OCCFDONE bit.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MBAR] + 86B0h

Default: 00000000h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description

51.3.243 Debug Capability Event Ring Segment Table Size Register (DCERSTSZ)—Offset 8708h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MBAR] + 8708h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**Reserved (RSVD):** Reserved. **Power Well:** Core
15:0	0x0 RW	**Event Ring Segment Table Size (ERSTS):** This field identifies the number of valid Event Ring Segment Table entries in the Event Ring Segment Table pointed to by the Debug Capability Event Ring Segment Table Base Address register. The maximum value supported by an xHC implementation for this register is defined by the DCERST Max field in the DCID register Software shall initialize this register before setting the Debug Capability Enable field in the DCCTRL register to '1'. **Power Well:** Core

51.3.244 Debug Capability Event Ring Segment Table Base Address Register (DCERSTBA)—Offset 8710h

Type: Memory Mapped I/O Register (Size: 64 bits)

Default: 0000000000000000h

BAR and Offset: [MBAR] + 8710h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
63:4	0x0 RW	**Event Ring Segment Table Base Address Register (ERSTBAR):** This field defines the high order bits of the start address of the Debug Capability Event Ring Segment Table. Software shall initialize this register before setting the Debug Capability Enable field in the DCCTRL register to '1'. **Power Well:** Core
3:0	0x0 RW	**Reserved (RSVD):** Reserved. **Power Well:** Core

51.3.245 Debug Capability Event Ring Dequeue Pointer Register (DCERDP)—Offset 8718h

Type: Memory Mapped I/O Register (Size: 64 bits)

Default: 0000000000000000h

BAR and Offset: [MBAR] + 8718h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
63:4	0x0 RW	**Dequeue Pointer (DQP):** This field defines the high order bits of the 64-bit address of the current Debug Capability Event Ring Dequeue Pointer. Software shall initialize this register before setting the Debug Capability Enable field in the DCCTRL register to '1'. **Power Well:** Core
3	0x0 RW	**Reserved (RSVD):** Reserved. **Power Well:** Core
2:0	0x0 RW	**Dequeue ERST Segment Index (DESI):** This field may be used by the xHC to accelerate checking the Event Ring full condition. This field is written with the low order 3 bits of the offset of the ERST entry which defines the Event Ring segment that the Event Ring Dequeue Pointer resides in. **Power Well:** Core

51.3.246 Debug Capability Control Register (DCCTRL)—Offset 8720h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MBAR] + 8720h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RW	**Debug Capability Enable (DCE):** Reserved. **Power Well:** Core
30:24	0x0 RO	**Device Address (DADDR):** Reserved. **Power Well:** Core
23:16	0x0 RO	**Debug Max Burst Size (DMBS):** LPT-LP USB Debug Device does not support bursting. **Power Well:** Core

51.3.247 Debug Capability Status Register (DCST)—Offset 8724h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MBAR] + 8724h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**Debug Port Number (DPNUM):** This field provides the ID of the Root Hub port that the Debug Capability has been automatically attached to. The value is '0' when the Debug Capability is not attached to a Root Hub port. **Power Well:** Core
23:1	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
0	0x0 RO	**Event Ring Not Empty (ERNE):** When '1', this field indicates that the Debug Capability Event Ring has a Transfer Event on it. It is automatically cleared to '0' by the xHC when the Debug Capability Event Ring is empty, i.e. the Debug Capability Enqueue Pointer is equal to the Debug Capability Event Ring Dequeue Pointer register. **Power Well:** Core

51.3.248 Debug Capability Port Status and Control Register (DCPORTSC)—Offset 8728h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000080h

BAR and Offset: [MBAR] + 8728h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
23	0x0 RW/C	**Port Config Error Change (CEC):** This flag indicates that the port failed to configure its link partner. 0 = No change. 1 = Port Config Error detected. Software shall clear this bit by writing a '1' to it. **Power Well:** Core
22	0x0 RW/C	**Port Link Status Change (PLC):** This flag is set to '1' due to the following PLS transitions: U0 -) U3 Suspend signaling detected from Debug Host U3 -) U0 Resume complete Polling -) Disabled Training Error Ux or Recovery -) Inactive Error Software shall clear this bit by writing a '1' to it. This field is '0' if DCE is '0' **Power Well:** Core
21	0x0 RW/C	**Port Reset Change (PRC):** This bit is set when reset processing on this port is complete (i.e. a '1' to '0' transition of PR). '0' = No change. '1' = Reset complete.Software shall clear this bit by writing a '1' to it. This field is '0' if DCE is '0'. **Power Well:** Core
20:18	0x0 RO	**Reserved (RSVD_1):** Reserved. **Power Well:** Core
17	0x0 RW/C	**Connect Status Change (CSC):** an already-set bit (i.e., the bit will remain '1'). Software shall clear this bit by writing a '1' to it. This field is '0' if DCE is '0'. **Power Well:** Core
16:14	0x0 RO	**Reserved (RSVD_2):** Reserved. **Power Well:** Core
13:10	0x0 RO	**Port Speed (PSPD):** This field identifies the speed of the port. This field is only relevant when a Debug Host is attached (CCS = '1') in all other cases this field shall indicate Undefined Speed. 0 Undefined Speed 1-15 Protocol Speed ID (PSI) Note: The Debug Capability onlydoes not supports LS, FS, or HS operation. **Power Well:** Core
9	0x0 RO	**Reserved (RSVD_3):** Reserved. **Power Well:** Core
8:5	0x4 RO	**Port Link State (PLS):** This field reflects its current link state. This field is only relevant when a Debug Host is attached (Debug Port Number) '0'). Value Meaning 0 Link is in the U0 State 1 Link is in the U1 State 2 Link is in the U2 State 3 Link is in the U3 State (Device Suspended) 4 Link is in the Disabled State 5 Link is in the RxDetect State 6 Link is in the Inactive State 7 Link is in the Polling State 8 Link is in the Recovery State 9 Link is in the Hot Reset State 15:10 Reserved Note: Transitions between different states are not reflected until the transition is complete. **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
4	0x0 RO	**Port Reset (PR):** '1' = Port is in Reset. '0' = Port is not in Reset. This bit is set to '1' when the bus reset sequence as defined in the USB Specification is detected on the Root Hub port assigned to the Debug capability. It is cleared when the bus reset sequence is completed by the Debug Host, and the DbC shall transition to the USB Default state. A '0' to '1' transition of this bit shall clear DCPORTSC PED ('0'). This field is '0' if DCE or CCS are '0'. **Power Well:** Core
3:2	0x0 RO	**Reserved (RSVD_4):** Reserved. **Power Well:** Core
1	0x0 RW	**Port Enabled/Disabled (PED):** Default = '0'. '1' = Enabled. '0' = Disabled. This flag shall be set to '1' by a '0' to '1' transition of CCS or a '1' to '0' transition of the PR. When PED transitions from '1' to '0' due to the assertion of PR, the port's link shall transition to the Rx.Detect state. This flag may be used by software to enable or disable the operation of the Root Hub port assigned to the Debug Capability. The Debug Capability Root Hub port operation may be disabled by a fault condition (disconnect event or other fault condition, e.g. a LTSSM Polling substate timeout, tPortConfiguration timeout error, etc.), the assertion of DCPORTSC PR, or by software. 0 = Debug Capability Root Hub port is disabled. 1 = Debug Capability Root Hub port is enabled. When the port is disabled (PED = '0') the port's link shall enter the SS.Disabled state and remain there until PED is reasserted ('1') or DCE is negated ('0'). Note that the Root Hub port is remains mapped to Debug Capability while PED = '0'. While PED = '0' the Debug Capability will appear to be disconnected to the Debug Host. Note, this bit is not affected by PORTSC PR bit transitions. This field is '0' if DCE or CCS are '0'. **Power Well:** Core
0	0x0 RO	**Current Connect Status (CCS):** '1' = A Root Hub port is connected to a Debug Host and assigned to the Debug Capability. '0' = No Debug Host is present. This value reflects the current state of the port, and may not correspond to the value reported by the Connect Status Change (CSC) field in the Port Status Change Event that was generated by a '0' to '1' transition of this bit. This flag is '0' if Debug Capability Enable (DCE) is '0'. **Power Well:** Core

51.3.249 Debug Capability Context Pointer Register (DCCP)—Offset 8730h

Type: Memory Mapped I/O Register (Size: 64 bits)

Default: 0000000000000000h

BAR and Offset: [MBAR] + 8730h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
63:4	0x0 RW	**Debug Capability Context Pointer Register (DCCPR):** This field defines the high order bits of the start address of the Debug Capability Context data structure associated with the Debug Capability. Software shall initialize this register before setting the Debug Capability Enable bit in the Debug Capability Control Register to '1'. **Power Well:** Core
3:0	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core

51.3.250 Debug Capability Device Descriptor Info Register 1 (DCDDI1)—Offset 8738h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 80870000h

BAR and Offset: [MBAR] + 8738h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x8087 RW	**Vendor ID (VID):** This field is presented by the Debug Device in the USB Device Descriptor idVendor field. **Power Well:** Core
15:8	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
7:0	0x0 RW	**DbC Protocol (DBCPR):** This field is presented by the Debug Device in the USB Interface Descriptor bInterfaceProtocol field. Value Function 0 Debug Target vendor defined. 1 GNU Remote Debug Command Set supported. 2-255 Reserved. **Power Well:** Core

51.3.251 Debug Capability Device Descriptor Info Register 2 (DCDDI2)—Offset 873Ch

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MBAR] + 873Ch

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW	**Device Revision (DREV):** This field is presented by the Debug Device in the USB Device Descriptor bcdDevice field. **Power Well:** Core
15:0	0x0 RW	**Product ID (PID):** This field is presented by the Debug Device in the USB Device Descriptor idProduct field. **Power Well:** Core

51.3.252 Debug Capability Descriptor Parameters (DCDP)—Offset 8740h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 000030C3h

BAR and Offset: [MBAR] + 8740h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**Reserved (RSVD):** Reserved. **Power Well:** Core
23:16	0x0 RW	**Max Power Field (MPF):** This field will be used by USB Debug Device to report maximum power consumption when the device is fully operational. This value is returned by bMaxPower field in response to Configuration Descriptor read from the debug device. Note: bU1DevExitLat and bU2DevExitLat fields returned in BOS Descriptor read will be taken from the corresponding fields from the Host Controller space. **Power Well:** Core
15:8	0x30 RW/S	**NEXT CAPABILITY POINTER (NCP):** Reserved. **Power Well:** Core
7:0	0xc3 RW/S	**Capability ID (CID):** Reserved. **Power Well:** Core

51.3.253 Debug Device Control ODMA (DBGDEV_CTRL_ODMA_REG)—Offset 8748h

This register contains a number of fields that provide a specific level of configurability for the OUT DMA that is part of Debug Device logic. This configurability is above and beyond that defined in the xHCI specification.

Type: Memory Mapped I/O Register (Size: 32 bits)

BAR and Offset: [MBAR] + 8748h

Default: 00000000h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:19	0x0 RW	**Reserved (RSVD):** Reserved. **Power Well:** Core
18	0x0 RW	**Enable ACK FIFO credit accounting (EN_ACK_FCA):** Setting this field will enable ACK FIFO credit accounting. ODMA will ensure that ample room exists in the ACK FIFO for expected device responses prior to initiating a given DP **Power Well:** Core
17:14	0x0 RW	**Reserved (RSVD_1):** Reserved. **Power Well:** Core
13	0x0 RW	**Enable ACK FIFO ICA mechanisms (EN_ACK_FIFO_ICA):** Setting this field will enable ACK FIFO individual credit accounting mechanisms for Async vs. Periodic Endpoints. ODMA will ensure that ample room exists in the ACK FIFO for expected device responses prior to initiating a given DP **Power Well:** Core
12:9	0x0 RW	**Reserved (RSVD_2):** Reserved. **Power Well:** Core
8	0x0 RW	**Clear ownership of context semaphore (CL_OWN_CS):** Setting this field generates a pulse that clears the ownership of the context semaphore that is shared between the Out DMA Response and Completion Finite State Machines **Power Well:** Core
7	0x0 RW	**Return OD ACK credits (RET_OD_ACK_CR):** Setting this field generates a pulse that implicitly returns all of the Out DMA ACK credits on all ports **Power Well:** Core
6	0x0 RW	**Reserved (RSVD_3):** Reserved. **Power Well:** Core
5	0x0 RW	**Return ODCF SM to idle state (RET_ODCF_SM_IS):** Setting this field generates a pulse that returns the Out DMA Completion Finite State Machine into the IDLE state **Power Well:** Core
4	0x0 RW	**Return ODRF SM to idle state (RET_ODRF_SM_IS):** Setting this field generates a pulse that returns the Out DMA Response Finite State Machine into the IDLE state **Power Well:** Core
3	0x0 RW	**Return ODRDF SM to idle state (RET_ODRDF_SM_IS):** Setting this field generates a pulse that returns the Out DMA Read Finite State Machine into the IDLE state **Power Well:** Core

Bit Range	Default & Access	Field Name (ID): Description
2:0	0x0 RW	**Reserved (RSVD_4):** Reserved. **Power Well:** Core

51.3.254 DBC Control Register 1 (DBCCTL_REG)—Offset 8760h

Type: Memory Mapped I/O Register (Size: 32 bits)

Default: 00000000h

BAR and Offset: [MBAR] + 8760h

MBAR Type: PCI Configuration Register (Size: 64 bits)
MBAR Reference: [B:0, D:21, F:0] + 10h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**Reserved (RSVD):** RSVD **Power Well:** Core
7	0x0 RW	**SW_DCE_SEL:** Reserved. **Power Well:** Core
6:3	0x0 RW	**DISC_RXD_CNT:** Reserved. **Power Well:** Core
2	0x0 RO	**RSVD0:** Reserved
1	0x0 RW	**Force DCE Mode (FORCE_DCE_MODE):** 0: When DCE is set, the DbC switches to Mode 2 1: When DCE is set, the DbC switches to Mode 3 **Power Well:** Core
0	0x0 RW	**Force Disconnect upon DCE (FORCE_DISCONNECT_ON_DCE):** If this bit is set by BIOS, the DbC will temporarily disconnect from the remote host if the DCE is set, and shortly thereafter re-connect. This allows the DbC to switch from Mode1 to Mode2 or Mode 3 operation upon DCE being set. **Power Well:** Core

52 System Management - B0, D24, F(0, 1, 3, 4)

52.1 Introduction and Index

The host-accessible registers for the System Management are described here.

To determine the number of devices/functions available refer to the following:

- Table 1-1, "Features by product SKU - Server and Cloud Storage SKUs 0 through 4"
- Table 1-2, "Features by Product SKU - Network and Enterprise Storage SKUs 5 through 10"
- Table 1-3, "Features by Product SKU - Extended Temperature SKUs 11 through 14".

The legend for the register access codes are described in Chapter 43, "Introduction."

52.1.1 Host Configuration Space—HECI1 (F:0)

These registers are discovered in Host Configuration Space starting at Bus 0, Device 24 (decimal), Function 0. The offset addresses are listed.

Table 52-1. Summary of PCI Configuration Registers—0/24/0

Offset (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
0	4	19D38086	"Identifiers (HECI1_ID)—Offset 0h" on page 2239
4	2	0000	"Command (HECI1_CMD)—Offset 4h" on page 2240
6	2	0010	"Status (HECI1_STS)—Offset 6h" on page 2241
8	4	07800000	"Revision ID and Class Code (HECI1_RID_CC)—Offset 8h" on page 2242
C	1	00	"Cache Line Size (HECI1_CLS)—Offset Ch" on page 2242
D	1	00	"Master Latency Timer (HECI1_MLT)—Offset Dh" on page 2242
E	1	80	"Header Type (HECI1_HTYPE)—Offset Eh" on page 2243
F	1	00	"Built In Self-Test (HECI1_BIST)—Offset Fh" on page 2243
10	4	00000004	"HECI MMIO Base Address Low (HECI1_MMIO_MBAR_LO)—Offset 10h" on page 2243
14	4	00000000	"HECI MMIO Base Address High (HECI1_MMIO_MBAR_HI)—Offset 14h" on page 2244
2C	4	00000000	"Sub System Identifiers (HECI1_SS)—Offset 2Ch" on page 2244
34	1	50	"Capabilities Pointer (HECI1_CAP)—Offset 34h" on page 2244
3C	2	0100	"Interrupt Information (HECI1_INTR)—Offset 3Ch" on page 2245
3E	1	00	"Minimum Grant (HECI1_MGNT)—Offset 3Eh" on page 2245
3F	1	00	"Maximum Latency (HECI1_MLAT)—Offset 3Fh" on page 2245
40	4	00000000	"Host Firmware Status (HECI1_HFS)—Offset 40h" on page 2246
44	4	80000000	"Miscellaneous Shadow (HECI1_MISC_SHDW)—Offset 44h" on page 2248
48	4	00000000	"General Status Shadow 1 (HECI1_GS_SHDW1)—Offset 48h" on page 2249
4C	4	00000000	"Host General Status (HECI1_H_GS1)—Offset 4Ch" on page 2250

52.1.6 Host Memory Space—HECI1_MMIO_MBAR

An index of the registers that are accessible in Host Memory Space is shown here.

Table 52-6. Summary of Memory Mapped I/O Registers—HECI1_MMIO_MBAR

Offset (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
0	4	00000000	"Host CB Write Window (HECI1_H_CB_WW)—Offset 0h" on page 2318
4	4	80000000	"Host Control and Status Register (HECI1_H_CSR)—Offset 4h" on page 2319
8	4	FFFFFFFF	"CSE Circular Buffer Read Window (HECI1_CSE_CB_RW)—Offset 8h" on page 2320
C	4	80000000	"CSE Control and Status Register Host Access (HECI1_CSE_CSR_HA)—Offset Ch" on page 2320
800	4	00000000	"D0i3 Control (HECI1_D0I3C)—Offset 800h" on page 2321

52.1.7 Host Memory Space—HECI2_MMIO_MBAR

An index of the registers that are accessible in Host Memory Space is shown here.

Table 52-7. Summary of Memory Mapped I/O Registers—HECI2_MMIO_MBAR

Offset (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
0	4	00000000	"Host CB Write Window (HECI2_H_CB_WW)—Offset 0h" on page 2322
4	4	80000000	"Host Control and Status Register (HECI2_H_CSR)—Offset 4h" on page 2323
8	4	FFFFFFFF	"CSE Circular Buffer Read Window (HECI2_CSE_CB_RW)—Offset 8h" on page 2324
C	4	80000000	"CSE Control and Status Register Host Access (HECI2_CSE_CSR_HA)—Offset Ch" on page 2324
800	4	00000000	"D0i3 Control (HECI2_D0I3C)—Offset 800h" on page 2325

52.1.8 Host Memory Space—HECI3_MMIO_MBAR

An index of the registers that are accessible in Host Memory Space is shown here.

Table 52-8. Summary of Memory Mapped I/O Registers—HECI3_MMIO_MBAR

Offset (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
0	4	00000000	"Host CB Write Window (HECI3_H_CB_WW)—Offset 0h" on page 2326
4	4	80000000	"Host Control and Status Register (HECI3_H_CSR)—Offset 4h" on page 2327
8	4	FFFFFFFF	"CSE Circular Buffer Read Window (HECI3_CSE_CB_RW)—Offset 8h" on page 2328
C	4	80000000	"CSE Control and Status Register Host Access (HECI3_CSE_CSR_HA)—Offset Ch" on page 2328
800	4	00000000	"D0i3 Control (HECI3_D0I3C)—Offset 800h" on page 2329

52.1.9 Host Memory Space—KT_HOST_MEMBAR

An index of the registers that are accessible in Host Memory Space is shown here.

Table 52-9. Summary of Memory Mapped I/O Registers—KT_HOST_MEMBAR

Offset (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
0	1	00	"KT Receive Buffer Register (MEM_KTRBR)—Offset 0h" on page 2330
0	1	00	"KT Transmitter Holding Register (MEM_KTTHR)—Offset 0h" on page 2330
0	1	00	"KT Divisor Latch LSB Register (MEM_KTDLLR)—Offset 0h" on page 2331
1	1	00	"KT Interrupt Enable register (MEM_KTIER)—Offset 1h" on page 2331
1	1	00	"KT Divisor Latch MSB Register (MEM_KTDLMR)—Offset 1h" on page 2332
2	1	01	"KT Interrupt Identification Register (MEM_KTIIR)—Offset 2h" on page 2333
2	1	00	"KT FIFO Control register (MEM_KTFCR)—Offset 2h" on page 2334
3	1	03	"KT Line Control register (MEM_KTLCR)—Offset 3h" on page 2335
4	1	00	"KT Modem Control register (MEM_KTMCR)—Offset 4h" on page 2336
5	1	60	"KT Line Status register (MEM_KTLSR)—Offset 5h" on page 2337
6	1	00	"KT Modem Status register (MEM_KTMSR)—Offset 6h" on page 2338
7	1	00	"KT Scratch register (MEM_KTSCR)—Offset 7h" on page 2338

52.1.10 Host Memory Space—Fixed Address

An index of the registers that are accessible in Host Memory Space is shown here.

Table 52-10. Summary of Memory Mapped I/O Registers—Fixed Addresses

Memory Address (hex)	Bytes (decimal)	Default Value (hex)	Register Name (Register Symbol)
FED40000	4	00000000	"FTPM Locality State (HOST_LOC_0_LOC_STATE_HROA)—Offset FED40000h" on page 2339
FED40004	4	00000000	"FTPM Locality Reserved (HOST_LOC_0_LOC_RSVD)—Offset FED40004h" on page 2340
FED40008	4	00000000	"FTPM Locality n Control Register (HOST_LOC_0_LOC_CTRL)—Offset FED40008h" on page 2340
FED4000C	4	00000000	"FTPM Locality n Status Register Host Read Only Access. (HOST_LOC_0_LOC_STS_HROA)—Offset FED4000Ch" on page 2340
FED40010	4	00000000	"FTPM Locality Config Area Reserved Read Write[0-7] (HOST_LOC_0_RSVD_RW1[0-7])—Offset FED40010h, Count 8, Stride 4h" on page 2341
FED40030	4	00000000	"FTPM Interface ID Host Read Only Access 0 (HOST_LOC_0_INTF_ID_0)—Offset FED40030h" on page 2341
FED40034	4	00000000	"FTPM Interface ID Host Read Only Access 1 (HOST_LOC_0_INTF_ID_1)—Offset FED40034h" on page 2341
FED40038	4	00000000	"FTPM Locality Config Area Reserved Read Write[0-1] (HOST_LOC_0_RSVD_RW2[0-1])—Offset FED40038h, Count 2, Stride 4h" on page 2342
FED40040	4	00000000	"Control Area Request (HOST_LOC_0_CA_REQUEST)—Offset FED40040h" on page 2342
FED40044	4	00000000	"Control Area Status (HOST_LOC_0_CA_STATUS)—Offset FED40044h" on page 2342
FED40048	4	00000000	"Control Area Cancel (HOST_LOC_0_CA_CANCEL)—Offset FED40048h" on page 2343
FED4004C	4	00000000	"Control Area Start (HOST_LOC_0_CA_START)—Offset FED4004Ch" on page 2343
FED40050	4	00000000	"Control Area Interrupt Reserved Part 1 (HOST_LOC_0_CA_INT_RSVD1)—Offset FED40050h" on page 2343
FED40054	4	00000000	"Control Area Interrupt Reserved Part 2 (HOST_LOC_0_CA_INT_RSVD2)—Offset FED40054h" on page 2344
FED40058	4	00000000	"Control Area Command Size (HOST_LOC_0_CA_CMD_SZ)—Offset FED40058h" on page 2344
FED4005C	4	00000000	"Control Area Command Part 1 (HOST_LOC_0_CA_CMD1)—Offset FED4005Ch" on page 2344
FED40060	4	00000000	"Control Area Command Part 2 (HOST_LOC_0_CA_CMD2)—Offset FED40060h" on page 2345
FED40064	4	00000000	"Control Area Response Size (HOST_LOC_0_CA_RSP_SZ)—Offset FED40064h" on page 2345
FED40068	4	00000000	"Control Area Response Part 1 (HOST_LOC_0_CA_RSP1)—Offset FED40068h" on page 2345
FED4006C	4	00000000	"Control Area Response Part 2 (HOST_LOC_0_CA_RSP2)—Offset FED4006Ch" on page 2346
FED40070	4 x 4	00000000	"FTPM Reserved Read Write[0-3] (HOST_LOC_0_RSVD_RW3[0-3])—Offset FED40070h, Count 4, Stride 4h" on page 2346
FED40080	4 x 992	00000000	"FTPM Command and Response Buffer[0-991] (HOST_LOC_0_FTPM_CRB[0-991])—Offset FED40080h, Count 992, Stride 4h" on page 2346

52.1.11 Host I/O Space—KT_HOST_IOBAR

An index of the registers that are accessible in Host I/O Space is shown here.

Table 52-11. Summary of I/O Registers—KT_HOST_IOBAR

Offset (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
0	1	00	"KT Receive Buffer Register (IO_KTRBR)—Offset 0h" on page 2347
0	1	00	"KT Transmitter Holding Register (IO_KTTHR)—Offset 0h" on page 2347
0	1	00	"KT Divisor Latch LSB Register (IO_KTDLLR)—Offset 0h" on page 2348
1	1	00	"KT Interrupt Enable register (IO_KTIER)—Offset 1h" on page 2348
1	1	00	"KT Divisor Latch MSB Register (IO_KTDLMR)—Offset 1h" on page 2349
2	1	01	"KT Interrupt Identification Register (IO_KTIIR)—Offset 2h" on page 2349
2	1	00	"KT FIFO Control register (IO_KTFCR)—Offset 2h" on page 2350
3	1	03	"KT Line Control register (IO_KTLCR)—Offset 3h" on page 2351
4	1	00	"KT Modem Control register (IO_KTMCR)—Offset 4h" on page 2352
5	1	60	"KT Line Status register (IO_KTLSR)—Offset 5h" on page 2353
6	1	00	"KT Modem Status register (IO_KTMSR)—Offset 6h" on page 2354
7	1	00	"KT Scratch register (IO_KTSCR)—Offset 7h" on page 2355

52.1.12 Host I/O Space—IDE_HOST_PCMDIOBAR

An index of the registers that are accessible in Host I/O Space is shown here.

Table 52-12. Summary of I/O Registers—IDE_HOST_PCMDIOBAR

Offset (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
0	1	0000	"IDE Data Register (IDEDATA)—Offset 0h" on page 2356
1	1	00	"IDE Features Register (IDEFR)—Offset 1h" on page 2356
1	1	00	"IDE Error Register DEV0 (IDEERD0)—Offset 1h" on page 2357
1	1	00	"IDE Error Register DEV1 (IDEERD1)—Offset 1h" on page 2357
2	1	00	"IDE Sector Count In Register (IDESCIR)—Offset 2h" on page 2358
2	1	00	"IDE Sector Count Out Register DEV0 (IDESCOR0)—Offset 2h" on page 2358
2	1	00	"IDE Sector Count Out Register DEV1 (IDESCOR1)—Offset 2h" on page 2358
3	1	00	"IDE Sector Number In Register (IDESNIR)—Offset 3h" on page 2359
3	1	00	"IDE Sector Number Out Register DEV0 (IDESNOR0)—Offset 3h" on page 2359
3	1	00	"IDE Sector Number Out Register DEV1 (IDESNOR1)—Offset 3h" on page 2360
4	1	00	"IDE Cylinder Low In Register (IDECLIR)—Offset 4h" on page 2360
4	1	00	"IDE Cylinder Low Out Register DEV0 (IDCLOR0)—Offset 4h" on page 2361
4	1	00	"IDE Cylinder Low Out Register DEV1 (IDCLOR1)—Offset 4h" on page 2361
5	1	00	"IDE Cylinder High In Register (IDECHIR)—Offset 5h" on page 2362
5	1	00	"IDE Cylinder High Out Register DEV0 (IDCHOR0)—Offset 5h" on page 2362
5	1	00	"IDE Cylinder High Out Register DEV1 (IDCHOR1)—Offset 5h" on page 2363
6	1	00	"IDE Drive/Head In Register (IDEDHIR)—Offset 6h" on page 2363
6	1	00	"IDE Drive/Head Out Register DEV0 (IDDHOR0)—Offset 6h" on page 2364
6	1	00	"IDE Drive/Head Out Register DEV1 (IDDHOR1)—Offset 6h" on page 2364
7	1	00	"IDE Command Register (IDECR)—Offset 7h" on page 2365
7	1	80	"IDE Status Register DEV0 (IDESR0)—Offset 7h" on page 2366
7	1	80	"IDE Status Register DEV1 (IDESR1)—Offset 7h" on page 2367

52.1.13 Host I/O Space—IDE_HOST_PCTLIOBAR

An index of the registers that are accessible in Host I/O Space is shown here.

Table 52-13. Summary of I/O Registers—IDE_HOST_PCTLIOBAR

Offset (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
2	1	00	"IDE Device Control Register (IDDCR)—Offset 2h" on page 2368
2	1	00	"IDE Alternate Status Register (IDASR)—Offset 2h" on page 2368

52.1.14 Host I/O Space—IDE_HOST_BMIOBAR

An index of the registers that are accessible in Host I/O Space is shown here.

Table 52-14. Summary of I/O Registers—IDE_HOST_BMIOBAR

Offset (hex)	Bytes	Default Value (hex)	Register Name (Register Symbol)
0	1	00	"IDE Primary Bus Master Command Register (IDEPBMCR)—Offset 0h" on page 2369
1	1	00	"IDE Primary Bus Master Device Specific 0 Register (IDEPBMDS0R)—Offset 1h" on page 2370
2	1	80	"IDE Primary Bus Master Status Register (IDEPBMSR)—Offset 2h" on page 2371
3	1	00	"IDE Primary Bus Master Device Specific 1 Register (IDEPBMDS1R)—Offset 3h" on page 2373
4	1	00	"IDE Primary Bus Master Descriptor Table Pointer Register Byte 0 (IDEPBMDTPR0)—Offset 4h" on page 2373
5	1	00	"IDE Primary Bus Master Descriptor Table Pointer Register Byte 1 (IDEPBMDTPR1)—Offset 5h" on page 2373
6	1	00	"IDE Primary Bus Master Descriptor Table Pointer Register Byte 2 (IDEPBMDTPR2)—Offset 6h" on page 2374
7	1	00	"IDE Primary Bus Master Descriptor Table Pointer Register Byte 3 (IDEPBMDTPR3)—Offset 7h" on page 2374
8	1	00	"IDE Secondary Bus Master Command Register (IDESBMCR)—Offset 8h" on page 2375
9	1	00	"IDE Secondary Bus Master Device Specific 0 Register (IDESBMDS0R)—Offset 9h" on page 2375
A	1	80	"IDE Secondary Bus Master Status Register (IDESBMSR)—Offset Ah" on page 2376
B	1	00	"IDE Secondary Bus Master Device Specific 1 Register (IDESBMDS1R)—Offset Bh" on page 2377
C	1	00	"IDE Secondary Bus Master Descriptor Table Pointer Register Byte 0 (IDESBMDTPR0)—Offset Ch" on page 2377
D	1	00	"IDE Secondary Bus Master Descriptor Table Pointer Register Byte 1 (IDESBMDTPR1)—Offset Dh" on page 2378
E	1	00	"IDE Secondary Bus Master Descriptor Table Pointer Register Byte 2 (IDESBMDTPR2)—Offset Eh" on page 2378
F	1	00	"IDE Secondary Bus Master Descriptor Table Pointer Register Byte 3 (IDESBMDTPR3)—Offset Fh" on page 2379

52.1.15 Sideband Registers

An index of the Sideband registers that are accessible to the Host are listed here. Each is accessible in Host Memory Space using the Sideband Base Address Register (SBREG_BAR). See Section 3.4.1, "Using SBREG_BAR Method" on page 187.

Table 52-15. Summary of Sideband Registers for KT (Host)—0xe4

Offset (hex)	Default Value (hex)	Register Name (Register Symbol)
0	00000000	"KT Host Interrupt Pin Register (KTHIPINR)—Offset 0h" on page 2380
4	00000000	"BIOS KT Host PCI Function Disable Register (BKTHDISR)—Offset 4h" on page 2380

Table 52-16. Summary of Sideband Registers for IDE (Host)—0xe4

Offset (hex)	Default Value (hex)	Register Name (Register Symbol)
0	00000000	"IDE Host Interrupt Pin Register (IDEHIPINR)—Offset 0h" on page 2381
4	00000000	"BIOS IDE Host PCI Function Disable Register (BIDEHDISR)—Offset 4h" on page 2381

52.2 Registers in Configuration Space—HECI1

52.2.1 Identifiers (HECI1_ID)—Offset 0h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:0] + 0h

Default: 19D38086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x19d3 RO/V	**Device ID (DID):** Indicates what device number assigned by Intel.
15:0	0x8086 RO	**Vendor ID (VID):** 16-bit field which indicates Intel is the vendor, assigned by the PCI SIG.

52.2.2 Command (HECI1_CMD)—Offset 4h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:24, F:0] + 4h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0x0 RO	**RSVD:** Reserved
10	0x0 RW	**Interrupt Disable (ID):** Disables this device from generating PCI line based interrupts. This bit does not have any effect on MSI operation.
9	0x0 RO	**Fast Back-to-Back Enable (FBE):** Not implemented, hardwired to 0.
8	0x0 RO	**SERR# Enable (SEE):** Not implemented, hardwired to 0.
7	0x0 RO	**Wait Cycle Enable (WCC):** Not implemented, hardwired to 0.
6	0x0 RO	**Parity Error Response Enable (PEE):** Not implemented, hardwired to 0.
5	0x0 RO	**VGA Palette Snooping Enable (VAG):** Not implemented, hardwired to 0
4	0x0 RO	**Memory Write and Invalidate Enable (MWIE):** Not implemented, hardwired to 0.
3	0x0 RO	**Special Cycle Enable (SCE):** Not implemented, hardwired to 0.
2	0x0 RW	**Bus Master Enable (BME):** Controls the HECI host controller's abiity to act as a system memory master for data transfers. When this bit is cleared, HECI bus master activity stops and any active DMA engines return to an idle condition. This bit is made visible to firmware through the H_PCI_CSR register, and changes to this bit may be configured by the H_PCI_CSR register to generate an MSI to mIA. When this bit is '0', HECI is blocked from generating MSI to the host CPU. ***Note:*** This bit does not block HECI accesses to CSE-UMA
1	0x0 RW	**Memory Space Enable (MSE):** Controls access to the HECI host controllers memory mapped register space.
0	0x0 RO	**I/O Space Enable (IOSE):** Not implemented, hardwired to 0.

52.2.3 Status (HECI1_STS)—Offset 6h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:24, F:0] + 6h

Default: 0010h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RO	**Detected Parity Error (DPE):** Not implemented, hardwired to 0.
14	0x0 RO	**Signaled System Error (SSE):** Not implemented, hardwired to 0.
13	0x0 RO	**Received Master-Abort (RMA):** Not implemented, hardwired to 0.
12	0x0 RO	**Received Target Abort (RTA):** Not implemented, hardwired to 0.
11	0x0 RO	**Signaled Target-Abort (STA):** Not implemented, hardwired to 0.
10:9	0x0 RO	**DEVSEL# Timing (DEVT):** These bits are hardwired to 00.
8	0x0 RO	**Master Data Parity Error Detected (DPD):** Not implemented, hardwired to 0.
7	0x0 RO	**Fast Back-to-Back Capable (FBC):** Not implemented, hardwired to 0.
6	0x0 RO	**RSVD (RSVD_6_6):** Reserved.
5	0x0 RO	**66 MHz Capable (C66):** Not implemented, hardwired to 0.
4	0x1 RO	**Capabilities List (CL):** Indicates the presence of a capabilities list, hardwired to 1.
3	0x0 RO/V	**Interrupt Status (IS):** Reflects the state of the INTx# signal at the input of the enable/disable circuit. This bit is a 1 when the INTx# is asserted. This bit is a 0 after the interrupt is cleared (independent of the state of the Interrupt Disable bit in the command register). ***Note:*** This bit is not set by an MSI.
2:0	0x0 RO	**RSVD (RSVD_2_0):** Reserved

52.2.4 Revision ID and Class Code (HECI1_RID_CC)—Offset 8h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:0] + 8h

Default: 07800000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x7 RO	**Base Class Code (BCC):** Indicates the base class code of the HECI host controller device.
23:16	0x80 RO	**Sub Class Code (SCC):** Indicates the sub class code of the HECI host controller device.
15:8	0x0 RO	**Programming Interface (PI):** Indicates the programming interface of the HECI host controller device.
7:0	0x0 RO/V	**Revision ID (RID):** Indicates stepping of the HECI host controller.

52.2.5 Cache Line Size (HECI1_CLS)—Offset Ch

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:24, F:0] + Ch

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO	**Cache Line Size (CLS):** Not implemented, hardwired to 0.

52.2.6 Master Latency Timer (HECI1_MLT)—Offset Dh

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:24, F:0] + Dh

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO	**Master Latency Timer (MLT):** Not implemented, hardwired to 0.

52.2.7 Header Type (HECI1_HTYPE)—Offset Eh

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:24, F:0] + Eh

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7	0x1 RO	**Multi-Function Device (MFD):** Indicates the HECI host controller is part of a multi- function device.
6:0	0x0 RO	**Header Layout (HL):** Indicates that the HECI host controller uses a target device layout.

52.2.8 Built In Self-Test (HECI1_BIST)—Offset Fh

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:24, F:0] + Fh

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RO	**BIST Capable (BC):** Not implemented, hardwired to 0.
6:0	0x0 RO	**RSVD:** Reserved.

52.2.9 HECI MMIO Base Address Low (HECI1_MMIO_MBAR_LO)—Offset 10h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:0] + 10h

Default: 00000004h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RW	**Base Address Low (BA_LO):** Lower 32 bits of base address of register memory space.
11:4	0x0 RO	**Memory Size (MS):** This field is hardwired to 0 to indicate that HECI device requests 4KB of memory space.
3	0x0 RO	**Prefetchable (PF):** Indicates that this range is not pre-fetchable.
2:1	0x2 RO	**Type (TP):** Indicates that this range can be mapped anywhere in 64-bit address space.
0	0x0 RO	**Resource Type Indicator (RTE):** Indicates a request for register memory space.

52.2.10 HECI MMIO Base Address High (HECI1_MMIO_MBAR_HI)—Offset 14h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:0] + 14h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Base Address High (BA_HI):** Upper 32 bits of base address of register memory space.

52.2.11 Sub System Identifiers (HECI1_SS)—Offset 2Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:0] + 2Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW/O	**Subsystem ID (SSID):** Indicates the sub- system identifier. This field should be programmed by BIOS during boot-up. Once written, this register becomes Read Only.
15:0	0x0 RW/O	**Subsystem Vendor ID (SSVID):** Indicates the sub-system vendor identifier. This field should be programmed by BIOS during boot- up. Once written, this register becomes Read Only.

52.2.12 Capabilities Pointer (HECI1_CAP)—Offset 34h

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:24, F:0] + 34h

Default: 50h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x50 RO	**Capability Pointer (CP):** Indicates the first capability pointer offset. It points to the PCI power management capability offset.

52.2.13 Interrupt Information (HECI1_INTR)—Offset 3Ch

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:24, F:0] + 3Ch

Default: 0100h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x1 RO/V	**Interrupt Pin (IPIN):** This field indicates the virtual interrupt pin the HECI host controller uses. A value of 0x1/0x2/0x3/0x4 indicates that this function implements legacy interrupt on INTA/INTB/INTC/INTD, respectively. When legacy interrupt is not used this register should be set to 0x0.
7:0	0x0 RW	**Interrupt Line (ILINE):** Software written value to indicate which interrupt line (vector) the interrupt is connected to. No hardware action is taken on this field.

52.2.14 Minimum Grant (HECI1_MGNT)—Offset 3Eh

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:24, F:0] + 3Eh

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO	**Grant (GNT):** Not implemented, hardwired to 0.

52.2.15 Maximum Latency (HECI1_MLAT)—Offset 3Fh

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:24, F:0] + 3Fh

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO	**Latency (LAT):** Not implemented, hardwired to 0.

52.2.16 Host Firmware Status (HECI1_HFS)—Offset 40h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:0] + 40h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RO	**BIOS MSG ACK:** Acknowledge for register based BIOS message in MEI 1 H_GS Register.
27:25	0x0 RO	**BIOS MSG ACK Data:** Message specific data for acknowledged BIOS message.
24:20	0x0 RO	Reserved
19:16	0x0 RO	**Operating Mode:** This field describes the current operating mode of Intel® ME. • 1:0 - Reserved • 2 - Debug Mode • 14:3 - Reserved • 15 - Intel® SPS firmware is running in Intel® ME
15:12	0x0 RO	**Error Code:** If set to nonzero value the Intel® ME firmware has encountered a fatal error and stopped normal operation. • 0 - No Error • 1 - Uncategorized Failure - The Intel® ME firmware has experienced an uncategorized error. Further details of the failure can be found in the Extended Status Data. • 2 - Disabled - Firmware was disabled on this platform. • 3 - Image Failure - The Intel® ME firmware stored in the system flash is not valid.
11	0x0 RO	**Update in Progress:** The bit is set if any type of Intel® ME firmware update is in progress.
10	0x0 RO	**Recovery BUP Load Fault:** This bit is set when firmware is not able to load recovery bring-up from the flash. It means that the recovery section in Intel® ME region on the SPI flash.
9	0x0 RO	**Init Complete:** When this but is not set firmware is still in initialization phase. When firmware has fully entered a stable state, this but is set to 1 and "Current State" field of this register provides the steady state of the Intel® ME subsystem.
8:6	0x0 RO	**Operating State:** This field describes the current operating state of Intel® ME. • 000 - Preboot • 001 - M0 with UMA • 010 - Reserved • 011 - Reserved • 100 - M3 without UMA • 101 - M0 without UMA - normal state for Intel® SPS firmware • 110 - Bring up • 111 - M0 without UMA but with error
5	0x0 RO	**FPT or Factory Defaults Bad:** This bit is set when the firmware discovers a bad checksum of Intel® ME region Flash Partition Table (FPT) or Factory Defaults. When this bit set, it may or may not have the error code shown in bit [15:12]. The system can get this bit clear only by re-flashing the whole Intel® ME region in the SPI Flash.
4	0x0 RO	**Manufacturing Mode:** When this bit is set, the platform is still in manufacturing mode. Host can use this bit to inform user that the platform is NOT READY for production yet. This but is set as long as Intel® ME Region access is not locked for flash masters other than Intel® ME. For shipping machine, this bit MUST be 0.

Bit Range	Default & Access	Field Name (ID): Description
3:0	0x0 RO	**Current State:** This field describes the current operation state of the firmware. • 0 - Reset - Intel® ME is in reset state, will exit this state within 1 millisecond • 1 - Initialization - Intel® ME is initializing, will exit this state within 2 seconds • 2 - Recovery - Intel® ME is in recovery mode, check ME1.GMES register to determine cause • 3 - Reserved • 4 - Disabled - Intel® ME functionality has been disabled, it executes idle loop • 5 - Operational - Intel® ME is in normal operational state • 6 - Reserved • 7 - State Transition - Intel® ME sets this state before starting a transition to a new Operating State. It is a temporary state, may appear on transition between Initialization and Operational.

52.2.17 Miscellaneous Shadow (HECI1_MISC_SHDW)—Offset 44h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:0] + 44h

Default: 80000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x1 RO	**Miscellaneous Shadow Valid (MSVLD):** This bit is hardwired to 1 to indicate that this HECI device implements the Miscellaneous Shadow register. This bit can be used by host software that is bus/dev/function number agnostic (such as HECI operating system driver) to discover whether the Miscellaneous Shadow register is implemented or not.
30:17	0x0 RO	**RSVD_30_17:** Reserved.
16	0x0 RO/V	**CSE UMA Size Valid (CUSZV):** This bit indicates that FW has written the CUSZ field. This field reflects the value of CSE CUBA.CUSZV.
15:7	0x0 RO	**Reserved (RSVD_15_7):** Reserved.
6:0	0x0 RO/V	**CSE UMA Size (CUSZ):** These bits reflect firmware's desired size of CSEUMA memory region. It is configured by firmware prior to bring up core power and allowing BIOS to initialize memory. The legal CSEUMA sizes and encodings for this field are: • 0000000b (0MB, no CSEUMA region) • 0000001b (1MB) • 0000010b (2MB) • 0000100b (4MB) • 0001000b (8MB) • 0010000b (16MB) • 0100000b (32MB) • 1000000b (64MB). This field reflects the value of CSE CUBA.CUSZ.

52.2.18 General Status Shadow 1 (HECI1_GS_SHDW1)—Offset 48h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:0] + 48h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**EOP Status:** This bit presents the Intel® ME notion of EOP status. If BIOS encounters this bit set to '1' during POST it signals an error in platform power flow.
30:28	0x0 RO	**Infrastructure Progress Code:** This field identifies the infrastructure progress code: • 0 - ROM - Intel® ME is in ROM phase • 1 - BUP - Intel® ME is in BRINGUP phase • 2 - uKernel - Intel® ME is in Micro Kernel phase • 3 - Policy Module - Intel® ME is in Policy Module phase • 4 - Other Module - Intel® ME is loading modules in M0 or M3 Operating State
27:16	0x0 RO	**Extended Status Data:** These bits provide extended status data for the current state of operating of the firmware. Or, if the firmware is in a fatal error state, these bits provide extended error code information.
15:13	0x0 RO	**Firmware Heartbeat:** This number increments approximately every second if Intel® ME firmware is running.
12	0x0 RO	Intel® ME Target Image Boot Fault • 0 - Target image loaded successfully • 1 - Target image boot failed, switched to backup image or recovery image
11:8	0x0 RO	Reserved
7	0x0 RO	**Warm Reset Request:** If this bit is set, Intel® ME informs BIOS that a warm reset is requested by Intel® ME.
6	0x0 RO	**MFS Failure:** If this bit is set, Intel® ME informs BIOS that Intel® ME File System failure has been detected during recent Intel® ME boot.
5:4	0x0 RO	Reserved

3:1	0x0
	RO
		Recovery Cause: If ME1.HFS.Current State indicates that Intel® ME firmware is running in recovery mode these bits provide the cause of this mode:
		• 0 - Intel® ME recovery jumper asserted
		• 1 - Security strap override jumper asserted
		• 2 - Recovery forced with IPMI command
		• 3 - Invalid flash configuration, either:
		  • flash master access permissions configuration is wrong
		  • VSCC entry is missing or wrong
		  • flash erase block size in Intel® ME region configuration
		• 4 - Intel® ME internal error
		  Intel® ME could not start in operational mode because of some firmware problems.
		• 5..7 - Reserved for future extensions

0	0x0 RO	**BIST in Progress:** If this bit is set Intel® ME Built In Self-Test is in Progress.

52.2.19 Host General Status (HECI1_H_GS1)—Offset 4Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:0] + 4Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Host General Status (H_GS1):** General status of Host. This field is not used by hardware.

52.2.20 PCI Power Management Capability ID (HECI1_PID)—Offset 50h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:24, F:0] + 50h

Default: 8C01h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x8c RO	**Next Capability (NEXT):** Indicates the location of the next capability item in the list. This is the Message Signaled Interrupts capability.
7:0	0x1 RO	**Cap ID (CID):** Indicates that this pointer is a PCI power management.

52.2.21 PCI Power Management Capabilities (HECI1_PC)—Offset 52h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:24, F:0] + 52h

Default: 4003h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0x8 RO	**PME Support (PSUP):** Indicates the states that can generate PME#. HECI can assert PME# from D3hot only.
10	0x0 RO	**D2 Support (D2S):** The D2 state is not supported for the HECI host controller.
9	0x0 RO	**D _Support (D1S):** The D1 state is not supported for the HECI host controller.
8:6	0x0 RO	**Aux_Current (AUXC):** Reports the maximum Suspend well current required when in the D3COLD state. Value of 0 is reported.
5	0x0 RO	**Device Specific Initialization (DSI):** Indicates whether device-specific initialization is required.
4	0x0 RO	**Reserved (RSVD):** Reserved.
3	0x0 RO	**PME Clock (PMEC):** Indicates that PCI clock is not required to generate PME#.
2:0	0x3 RO	**Version (VS):** Indicates support for Revision 1.2 of the PCI Power Management Specification.

52.2.22 PCI Power Management Control and Status (HECI1_PMCS)—Offset 54h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:24, F:0] + 54h

Default: 0008h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW/1C/V	**PME Status (PMES):** The PME Status bit in HECI space can be set to '1' by CSE FW performing a write into CSE side register to set PMES. This bit is cleared by host CPU writing a '1' to it. CSE cannot clear this bit. Host CPU writes with value '0' have no effect on this bit.
14:9	0x0 RO	**Reserved (RSVD_14_9):** Reserved.
8	0x0 RW	**PME Enable (PMEE):** When set, PME_assert and PME_deassert messages are sent over Sideband to PMC based on the PMES bit. When reset these messages may not be sent.
7:4	0x0 RO	**Reserved (RSVD_7_4):** Reserved.
3	0x1 RO	**No Soft Reset (NSR):** This bit indicates that when the HECI host controller is transitioning from D3hot to D0 due to power state command, it does not perform and internal reset.
2	0x0 RO	**Reserved (RSVD_2_2):** Reserved.
1:0	0x0 RW	**Power State (PS):** This field is used both to determine the current power state of the HECI host controller and to set a new power state. The values are: • 00 - D0 state • 11 - D3HOT state. The D1 and D2 states are not supported for this HECI host controller. If software attempts to write an unsupported, optional state to this field, the write operation must complete normally on the bus; however, the data is discarded and no state change occurs. When in the D3HOT state, the HBA's configuration space is available, but the registers memory space is not. Additionally, interrupts are blocked. This field is visible to firmware through the H_PCI_CSR register, and changes to this field may be configured by the H_PCI_CSR register to generate an MSI to mIA.

52.2.23 General Status Shadow 2 (HECI1_GS_SHDW2)—Offset 60h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:0] + 60h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**General Status Shadow 2 (GSS2):** This field is host side shadow of CSE General Status 2 (CSE_GS2).

52.2.24 General Status Shadow 3 (HECI1_GS_SHDW3)—Offset 64h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:0] + 64h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**General Status Shadow 3 (GSS3):** This field is host side shadow of CSE General Status 3 (CSE_GS3).

52.2.25 General Status Shadow 4 (HECI1_GS_SHDW4)—Offset 68h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:0] + 68h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**General Status Shadow 4 (GSS4):** This field is host side shadow of CSE General Status 4 (CSE_GS4).

52.2.26 General Status Shadow 5 (HECI1_GS_SHDW5)—Offset 6Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:0] + 6Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**General Status Shadow 5 (GSS5):** This field is host side shadow of CSE General Status 5 (CSE_GS5).

52.2.27 Host General Status 2 (HECI1_H_GS2)—Offset 70h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:0] + 70h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Host General Status 2 (H_GS2):** General status of Host. This field is not used by hardware.

52.2.28 Host General Status 3 (HECI1_H_GS3)—Offset 74h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:0] + 74h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Host General Status 3 (H_GS3):** General status of Host. This field is not used by hardware.

52.2.29 Message Signaled Interrupt Identifiers (HECI1_MID)—Offset 8Ch

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:24, F:0] + 8Ch

Default: 0005h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x0 RO	**Next Pointer (NEXT):** Indicates the next item in the list. This can be other capability pointers (such as PCI-X or PCI- Express) or it can be the last item in the list.
7:0	0x5 RO	**Capability ID (CID):** Indicates MSI.

52.2.30 Message Signaled Interrupt Message Control (HECI1_MC)—Offset 8Eh

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:24, F:0] + 8Eh

Default: 0080h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x0 RO	**Reserved (RSVD):** Reserved.
7	0x1 RO	**64 Bit Address Capable (C64):** Specifies whether capable of generating 64-bit messages.
6:4	0x0 RO	**Multiple Message Enable (MME):** Not implemented, hardwired to 0.
3:1	0x0 RO	**Multiple Message Capable (MMC):** Not implemented, hardwired to 0.
0	0x0 RW	**MSI Enable (MSIE):** If set, MSI is enabled and INTx virtual wires are not used to generate interrupts.

52.2.31 Message Signaled Interrupt Message Address (HECI1_MA)—Offset 90h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:0] + 90h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**Address (ADDR):** Lower 32 bits of the system specified message address, always DW aligned.
1:0	0x0 RO	**Reserved (RSVD):** Reserved.

52.2.32 Message Signaled Interrupt Upper Address (HECI1_MUA)—Offset 94h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:0] + 94h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Upper Address (UADDR):** Upper 32 bits of the system specified message address. This register is optional and only implemented if MC.C64=1.

52.2.33 Message Signaled Interrupt Message Data (HECI1_MD)—Offset 98h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:24, F:0] + 98h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x0 RW	**Data (DATA):** This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the FSB during the data phase of the MSI memory write transaction.

52.2.34 HECI Interrupt Delivery Mode (HECI1_HIDM)—Offset A0h

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:24, F:0] + A0h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0x0 RO	**Reserved (RSVD):** Reserved.
2	0x0 RW/1S	**HIDM Lock (HIDM_L):** Writing 1 to this bit locks the HIDM field.
1:0	0x0 RW/L	**HECI Interrupt Delivery Mode (HIDM):** These bits control what type of interrupt the HECI will send when CSE FW writes to set the CSE_IG bit. They are interpreted as follows: • 00 - Generate Legacy or MSI interrupt; • 01 - Generate SCI; • 10 - Generate SMI; This field may be locked by writing 1 to HIDM_L bit.

52.2.35 Host Extend Register Status (HECI1_HERS)—Offset BCh

This register is used to communicate the CSE FW measurement status information to host.

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:0] + BCh

Default: 40000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO/V	**Extend Register Valid (ERV):** Set by FW after all FW has been loaded and the measurement data has been stored in HERx registers. If ERA field is SHA-1, the result of the extend operation is in HER:5-1. If ERA field is SHA-256, the result is in HER:8-1.
30	0x1 RO	**Extend Feature Present (EFP):** This bit is hardwired to 1 to allow driver software to easily detect the chipset supports the Extend Registers FW measurement feature.
29:4	0x0 RO	**Reserved (RSVD_29_4):** Reserved.
3:0	0x0 RO/V	**Extend Register Algorithm (ERA):** This field indicates the hash algorithm used in the FW measurement Extend operation. Encodings are: 0x0: SHA-1, 0x2: SHA-256. Other values: reserved. This field is set by FW with the used hash algorithm value when the ERV bit is set to 1. This field is meaningless when the ERV bit is 0. This field does NOT have any defined reset value.

52.2.36 Host Extend Register DW1. (HECI1_HER1)—Offset C0h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:0] + C0h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**Host Extend Register DW1 (ERDW1):** Reserved.

52.2.37 Host Extend Register DW2. (HECI1_HER2)—Offset C4h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:0] + C4h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**Host Extend Register DW2 (ERDW2):** Reserved.

52.2.38 Host Extend Register DW3. (HECI1_HER3)—Offset C8h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:0] + C8h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**Host Extend Register DW3 (ERDW3):** Reserved.

52.2.39 Host Extend Register DW4. (HECI1_HER4)—Offset CCh

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:0] + CCh

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**Host Extend Register DW4 (ERDW4):** Reserved.

52.2.40 Host Extend Register DW5. (HECI1_HER5)—Offset D0h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:0] + D0h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**Host Extend Register DW5 (ERDW5):** Reserved.

52.2.41 Host Extend Register DW6. (HECI1_HER6)—Offset D4h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:0] + D4h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**Host Extend Register DW6 (ERDW6):** Reserved.

52.2.42 Host Extend Register DW7. (HECI1_HER7)—Offset D8h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:0] + D8h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**Host Extend Register DW7 (ERDW7):** Reserved.

52.2.43 Host Extend Register DW8. (HECI1_HER8)—Offset DCh

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:0] + DCh

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**Host Extend Register DW8 (ERDW8):** Reserved.

52.2.44 Manufacturer's ID (HECI1_MANID)—Offset F8h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:0] + F8h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RO	**Reserved (RSVD_31_28):** Reserved.
27:24	0x0 RO/V	**Dot Portion of Process ID (DPOP):** Indicates the dot process.
23:16	0x0 RO/V	**Manufacturing Stepping ID (MSID):** This field is incremented for each stepping of the part. Note that this field can be used by software to differentiate steppings when Revision ID may not change.
15:8	0x0 RO/V	**Manufacturing ID (MID):** Set by Intel.
7:0	0x0 RO/V	**Process Portion of Process ID (PPOP):** Indicates the process. The dot portion of the process is reflected in bits [27:24]. Note that this field can be used by software to differentiate steppings when Revision ID may not change.

52.3 Registers in Configuration Space—HECI2

AR Author and Tech Comm: HIDE this sub-chapter if the device has no such registers.

52.3.1 Identifiers (HECI2_ID)—Offset 0h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:1] + 0h

Default: 19D48086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x19d4 RO/V	**Device ID (DID):** Indicates what device number assigned by Intel.
15:0	0x8086 RO	**Vendor ID (VID):** 16-bit field which indicates Intel is the vendor, assigned by the PCI SIG.

52.3.2 Command (HECI2_CMD)—Offset 4h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:24, F:1] + 4h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0x0 RO	**RSVD:** Reserved
10	0x0 RW	**Interrupt Disable (ID):** Disables this device from generating PCI line based interrupts. This bit does not have any effect on MSI operation.
9	0x0 RO	**Fast Back-to-Back Enable (FBE):** Not implemented, hardwired to 0.
8	0x0 RO	**SERR# Enable (SEE):** Not implemented, hardwired to 0.
7	0x0 RO	**Wait Cycle Enable (WCC):** Not implemented, hardwired to 0.
6	0x0 RO	**Parity Error Response Enable (PEE):** Not implemented, hardwired to 0.
5	0x0 RO	**VGA Palette Snooping Enable (VAG):** Not implemented, hardwired to 0
4	0x0 RO	**Memory Write and Invalidate Enable (MWIE):** Not implemented, hardwired to 0.
3	0x0 RO	**Special Cycle Enable (SCE):** Not implemented, hardwired to 0.
2	0x0 RW	**Bus Master Enable (BME):** Controls the HECI host controller's ability to act as a system memory master for data transfers. When this bit is cleared, HECI bus master activity stops and any active DMA engines return to an idle condition. This bit is made visible to firmware through the H_PCI_CSR register, and changes to this bit may be configured by the H_PCI_CSR register to generate an MSI to mIA. When this bit is '0', HECI is blocked from generating MSI to the host CPU. Note that this bit does not block HECI accesses to CSE-UMA

Bit Range	Default & Access	Field Name (ID): Description
1	0x0 RW	**Memory Space Enable (MSE):** Controls access to the HECI host controllers memory mapped register space.
0	0x0 RO	**I/O Space Enable (IOSE):** Not implemented, hardwired to 0.

52.3.3 Status (HECI2_STS)—Offset 6h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:24, F:1] + 6h

Default: 0010h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RO	**Detected Parity Error (DPE):** Not implemented, hardwired to 0.
14	0x0 RO	**Signaled System Error (SSE):** Not implemented, hardwired to 0.
13	0x0 RO	**Received Master-Abort (RMA):** Not implemented, hardwired to 0.
12	0x0 RO	**Received Target Abort (RTA):** Not implemented, hardwired to 0.
11	0x0 RO	**Signaled Target-Abort (STA):** Not implemented, hardwired to 0.
10:9	0x0 RO	**DEVSEL# Timing (DEVT):** These bits are hardwired to 00.
8	0x0 RO	**Master Data Pariy Error Detected (DPD):** Not implemented, hardwired to 0.
7	0x0 RO	**Fast Back-to-Back Capable (FBC):** Not implemented, hardwired to 0.
6	0x0 RO	**RSVD (RSVD_6_6):** Reserved
5	0x0 RO	**66 MHz Capable (C66):** Not implemented, hardwired to 0.
4	0x1 RO	**Capabilities List (CL):** Indicates the presence of a capabilities list, hardwired to 1.
3	0x0 RO/V	**Interrupt Status (IS):** Reflects the state of the INTx# signal at the input of the enable/disable circuit. This bit is a 1 when the INTx# is asserted. This bit is a 0 after the interrupt is cleared (independent of the state of the Interrupt Disable bit in the command register). ***Note:*** This bit is not set by an MSI.
2:0	0x0 RO	**RSVD (RSVD_2_0):** Reserved

52.3.4 Revision ID and Class Code (HECI2_RID_CC)—Offset 8h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:1] + 8h

Default: 07800000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x7 RO	**Base Class Code (BCC):** Indicates the base class code of the HECI host controller device.
23:16	0x80 RO	**Sub Class Code (SCC):** Indicates the sub class code of the HECI host controller device.
15:8	0x0 RO	**Programming Interface (PI):** Indicates the programming interface of the HECI host controller device.
7:0	0x0 RO/V	**Revision ID (RID):** Indicates stepping of the HECI host controller.

52.3.5 Cache Line Size (HECI2_CLS)—Offset Ch

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:24, F:1] + Ch

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO	**Cache Line Size (CLS):** Not implemented, hardwired to 0.

52.3.6 Master Latency Timer (HECI2_MLT)—Offset Dh

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:24, F:1] + Dh

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO	**Master Latency Timer (MLT):** Not implemented, hardwired to 0.

52.3.7 Header Type (HECI2_HTYPE)—Offset Eh

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:24, F:1] + Eh

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7	0x1 RO	**Multi-Function Device (MFD):** Indicates the HECI host controller is part of a multi- function device.
6:0	0x0 RO	**Header Layout (HL):** Indicates that the HECI host controller uses a target device layout.

52.3.8 Built In Self-Test (HECI2_BIST)—Offset Fh

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:24, F:1] + Fh

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RO	**BIST Capable (BC):** Not implemented, hardwired to 0.
6:0	0x0 RO	**RSVD:** Reserved

52.3.9 HECI MMIO Base Address Low (HECI2_MMIO_MBAR_LO)—Offset 10h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:1] + 10h

Default: 00000004h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RW	**Base Address Low (BA_LO):** Lower 32 bits of base address of register memory space.
11:4	0x0 RO	**Memory Size (MS):** This field is hardwired to 0 to indicate that HECI device requests 4KB of memory space.
3	0x0 RO	**Prefetchable (PF):** Indicates that this range is not pre-fetchable
2:1	0x2 RO	**Type (TP):** Indicates that this range can be mapped anywhere in 64-bit address space.
0	0x0 RO	**Resource Type Indicator (RTE):** Indicates a request for register memory space.

52.3.10 HECI MMIO Base Address High (HECI2_MMIO_MBAR_HI)—Offset 14h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:1] + 14h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Base Address High (BA_HI):** Upper 32 bits of base address of register memory space.

52.3.11 Sub System Identifiers (HECI2_SS)—Offset 2Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:1] + 2Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW/O	**Subsystem ID (SSID):** Indicates the sub- system identifier. This field should be programmed by BIOS during boot-up. Once written, this register becomes Read Only.
15:0	0x0 RW/O	**Subsystem Vendor ID (SSVID):** Indicates the sub-system vendor identifier. This field should be programmed by BIOS during boot- up. Once written, this register becomes Read Only.

52.3.12 Capabilities Pointer (HECI2_CAP)—Offset 34h

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:24, F:1] + 34h

Default: 50h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x50 RO	**Capability Pointer (CP):** Indicates the first capability pointer offset. It points to the PCI power management capability offset.

52.3.13 Interrupt Information (HECI2_INTR)—Offset 3Ch

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:24, F:1] + 3Ch

Default: 0100h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x1 RO/V	**Interrupt Pin (IPIN):** This field indicates the virtual interrupt pin the HECI host controller uses. A value of 0x1/0x2/0x3/0x4 indicates that this function implements legacy interrupt on INTA/INTB/INTC/INTD, respectively. When legacy interrupt is not used this register should be set to 0x0.
7:0	0x0 RW	**Interrupt Line (ILINE):** Software written value to indicate which interrupt line (vector) the interrupt is connected to. No hardware action is taken on this field.

52.3.14 Minimum Grant (HECI2_MGNT)—Offset 3Eh

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:24, F:1] + 3Eh

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO	**Grant (GNT):** Not implemented, hardwired to 0.

52.3.15 Maximum Latency (HECI2_MLAT)—Offset 3Fh

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:24, F:1] + 3Fh

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO	**Latency (LAT):** Not implemented, hardwired to 0.

52.3.16 Host Firmware Status (HECI2_HFS)—Offset 40h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:1] + 40h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RO	**BIOS MSG ACK:** Acknowledge for register based BIOS message in MEI 1 H_GS Register.
27:25	0x0 RO	**BIOS MSG ACK Data:** Message specific data for acknowledged BIOS message.
24:20	0x0 RO	Reserved
19:16	0x0 RO	**Operating Mode:** This field describes the current operating mode of Intel® ME. • 1:0 - Reserved • 2 - Debug Mode • 14:3 - Reserved • 15 - Intel® SPS firmware is running in Intel® ME
15:12	0x0 RO	**Error Code:** If set to nonzero value the Intel® ME firmware has encountered a fatal error and stopped normal operation. • 0 - No Error • 1 - Uncategorized Failure - The Intel® ME firmware has experienced an uncategorized error. Further details of the failure can be found in the Extended Status Data. • 2 - Disabled - Firmware was disabled on this platform. • 3 - Image Failure - The Intel® ME firmware stored in the system flash is not valid.
11	0x0 RO	**Update in Progress:** The bit is set if any type of Intel® ME firmware update is in progress.
10	0x0 RO	**Recovery BUP Load Fault:** This bit is set when firmware is not able to load recovery bring-up from the flash. It means that the recovery section in Intel® ME region on the SPI flash.
9	0x0 RO	**Init Complete:** When this but is not set firmware is still in initialization phase. When firmware has fully entered a stable state, this but is set to 1 and "Current State" field of this register provides the steady state of the Intel® ME subsystem.
8:6	0x0 RO	**Operating State:** This field describes the current operating state of Intel® ME. • 000 - Preboot • 001 - M0 with UMA • 010 - Reserved • 011 - Reserved • 100 - M3 without UMA • 101 - M0 without UMA - normal state for Intel® SPS firmware • 110 - Bring up • 111 - M0 without UMA but with error
5	0x0 RO	**FPT or Factory Defaults Bad:** This bit is set when the firmware discovers a bad checksum of Intel® ME region Flash Partition Table (FPT) or Factory Defaults. When this bit set, it may or may not have the error code shown in bit [15:12]. The system can get this bit clear only by re-flashing the whole Intel® ME region in the SPI Flash.
4	0x0 RO	**Manufacturing Mode:** When this bit is set, the platform is still in manufacturing mode. Host can use this bit to inform user that the platform is NOT READY for production yet. This but is set as long as Intel® ME Region access is not locked for flash masters other than Intel® ME. For shipping machine, this bit MUST be 0.

Bit Range	Default & Access	Field Name (ID): Description
3:0	0x0 RO	**Current State:** This field describes the current operation state of the firmware. • 0 - Reset - Intel® ME is in reset state, will exit this state within 1 millisecond • 1 - Initialization - Intel® ME is initializing, will exit this state within 2 seconds • 2 - Recovery - Intel® ME is in recovery mode, check ME1.GMES register to determine cause • 3 - Reserved • 4 - Disabled - Intel® ME functionality has been disabled, it executes idle loop • 5 - Operational - Intel® ME is in normal operational state • 6 - Reserved • 7 - State Transition - Intel® ME sets this state before starting a transition to a new Operating State. It is a temporary state, may appear on transition between Initialization and Operational.

52.3.17 General Status Shadow 1 (HECI2_GS_SHDW1)—Offset 48h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:1] + 48h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**EOP Status:** This bit presents the Intel® ME notion of EOP status. If BIOS encounters this bit set to '1' during POST it signals an error in platform power flow.
30:28	0x0 RO	**Infrastructure Progress Code:** This field identifies the infrastructure progress code: • 0 - ROM - Intel® ME is in ROM phase • 1 - BUP - Intel® ME is in BRINGUP phase • 2 - uKernel - Intel® ME is in Micro Kernel phase • 3 - Policy Module - Intel® ME is in Policy Module phase • 4 - Other Module - Intel® ME is loading modules in M0 or M3 Operating State
27:16	0x0 RO	**Extended Status Data:** These bits provide extended status data for the current state of operating of the firmware. Or, if the firmware is in a fatal error state, these bits provide extended error code information.
15:13	0x0 RO	**Firmware Heartbeat:** This number increments approximately every second if Intel® ME firmware is running.
12	0x0 RO	Intel® ME Target Image Boot Fault • 0 - Target image loaded successfully • 1 - Target image boot failed, switched to backup image or recovery image
11:8	0x0 RO	Reserved
7	0x0 RO	**Warm Reset Request:** If this bit is set, Intel® ME informs BIOS that a warm reset is requested by Intel® ME.
6	0x0 RO	**MFS Failure:** If this bit is set, Intel® ME informs BIOS that Intel® ME File System failure has been detected during recent Intel® ME boot.
5:4	0x0 RO	Reserved

3:1	0x0
	RO
		Recovery Cause: If ME1.HFS.Current State indicates that Intel® ME firmware is running in recovery mode these bits provide the cause of this mode:
		• 0 - Intel® ME recovery jumper asserted
		• 1 - Security strap override jumper asserted
		• 2 - Recovery forced with IPMI command
		• 3 - Invalid flash configuration, either:
		  • flash master access permissions configuration is wrong
		  • VSCC entry is missing or wrong
		  • flash erase block size in Intel® ME region configuration
		• 4 - Intel® ME internal error
		  Intel® ME could not start in operational mode because of some firmware problems.
		• 5..7 - Reserved for future extensions

0	0x0 RO	**BIST in Progress:** If this bit is set Intel® ME Built In Self-Test is in Progress.

52.3.18 Host General Status (HECI2_H_GS1)—Offset 4Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:1] + 4Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Host General Status (H_GS1):** General status of Host. This field is not used by hardware.

52.3.19 PCI Power Management Capability ID (HECI2_PID)—Offset 50h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:24, F:1] + 50h

Default: 8C01h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x8c RO	**Next Capability (NEXT):** Indicates the location of the next capability item in the list. This is the Message Signaled Interrupts capability.
7:0	0x1 RO	**Cap ID (CID):** Indicates that this pointer is a PCI power management.

52.3.20 PCI Power Management Capabilities (HECI2_PC)—Offset 52h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:24, F:1] + 52h

Default: 4003h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0x8 RO	**PME Support (PSUP):** Indicates the states that can generate PME#. HECI can assert PME# from D3hot only.
10	0x0 RO	**D2 Support (D2S):** The D2 state is not supported for the HECI host controller.
9	0x0 RO	**D _Support (D1S):** The D1 state is not supported for the HECI host controller.
8:6	0x0 RO	**Aux_Current (AUXC):** Reports the maximum Suspend well current required when in the D3COLD state. Value of 0 is reported.
5	0x0 RO	**Device Specific Initialization (DSI):** Indicates whether device-specific initialization is required.
4	0x0 RO	**Reserved (RSVD):** Reserved.
3	0x0 RO	**PME Clock (PMEC):** Indicates that PCI clock is not required to generate PME#.
2:0	0x3 RO	**Version (VS):** Indicates support for Revision 1.2 of the PCI Power Management Specification.

52.3.21 PCI Power Management Control and Status (HECI2_PMCS)—Offset 54h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:24, F:1] + 54h

Default: 0008h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW/1C/V	**PME Status (PMES):** The PME Status bit in HECI space can be set to '1' by CSE FW performing a write into CSE side register to set PMES. This bit is cleared by host CPU writing a '1' to it. CSE cannot clear this bit. Host CPU writes with value '0' have no effect on this bit.
14:9	0x0 RO	**Reserved (RSVD_14_9):** Reserved.
8	0x0 RW	**PME Enable (PMEE):** When set, PME_assert and PME_deassert messages are sent over Sideband to PMC based on the PMES bit. When reset these messages may not be sent.
7:4	0x0 RO	**Reserved (RSVD_7_4):** Reserved.
3	0x1 RO	**No Soft Reset (NSR):** This bit indicates that when the HECI host controller is transitioning from D3hot to D0 due to power state command, it does not perform and internal reset.
2	0x0 RO	**Reserved (RSVD_2_2):** Reserved.
1:0	0x0 RW	**Power State (PS):** This field is used both to determine the current power state of the HECI host controller and to set a new power state. The values are: • 00 - D0 state • 11 - D3HOT state. The D1 and D2 states are not supported for this HECI host controller.

52.3.22 General Status Shadow 2 (HECI2_GS_SHDW2)—Offset 60h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:1] + 60h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**General Status Shadow 2 (GSS2):** This field is host side shadow of CSE General Status 2 (CSE_GS2).

52.3.23 General Status Shadow 3 (HECI2_GS_SHDW3)—Offset 64h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:1] + 64h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**General Status Shadow 3 (GSS3):** This field is host side shadow of CSE General Status 3 (CSE_GS3).

52.3.24 General Status Shadow 4 (HECI2_GS_SHDW4)—Offset 68h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:1] + 68h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**General Status Shadow 4 (GSS4):** This field is host side shadow of CSE General Status 4 (CSE_GS4).

52.3.25 General Status Shadow 5 (HECI2_GS_SHDW5)—Offset 6Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:1] + 6Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**General Status Shadow 5 (GSS5):** This field is host side shadow of CSE General Status 5 (CSE_GS5).

52.3.26 Host General Status 2 (HECI2_H_GS2)—Offset 70h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:1] + 70h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Host General Status 2 (H_GS2):** General status of Host. This field is not used by hardware.

52.3.27 Host General Status 3 (HECI2_H_GS3)—Offset 74h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:1] + 74h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Host General Status 3 (H_GS3):** General status of Host. This field is not used by hardware.

52.3.28 Message Signaled Interrupt Identifiers (HECI2_MID)—Offset 8Ch

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:24, F:1] + 8Ch

Default: 0005h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x0 RO	**Next Pointer (NEXT):** Indicates the next item in the list. This can be other capability pointers (such as PCI-X or PCI- Express) or it can be the last item in the list.
7:0	0x5 RO	**Capability ID (CID):** Indicates MSI.

52.3.29 Message Signaled Interrupt Message Control (HECI2_MC)—Offset 8Eh

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:24, F:1] + 8Eh

Default: 0080h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x0 RO	**Reserved (RSVD):** Reserved.
7	0x1 RO	**64 Bit Address Capable (C64):** Specifies whether capable of generating 64-bit messages.
6:4	0x0 RO	**Multiple Message Enable (MME):** Not implemented, hardwired to 0.
3:1	0x0 RO	**Multiple Message Capable (MMC):** Not implemented, hardwired to 0.
0	0x0 RW	**MSI Enable (MSIE):** If set, MSI is enabled and INTx virtual wires are not used to generate interrupts.

52.3.30 Message Signaled Interrupt Message Address (HECI2_MA)—Offset 90h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:1] + 90h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**Address (ADDR):** Lower 32 bits of the system specified message address, always DW aligned.
1:0	0x0 RO	**Reserved (RSVD):** Reserved.

52.3.31 Message Signaled Interrupt Upper Address (HECI2_MUA)—Offset 94h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:1] + 94h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Upper Address (UADDR):** Upper 32 bits of the system specified message address. This register is optional and only implemented if MC.C64=1.

52.3.32 Message Signaled Interrupt Message Data (HECI2_MD)—Offset 98h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:24, F:1] + 98h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x0 RW	**Data (DATA):** This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the FSB during the data phase of the MSI memory write transaction.

52.3.33 HECI Interrupt Delivery Mode (HECI2_HIDM)—Offset A0h

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:24, F:1] + A0h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0x0 RO	**Reserved (RSVD):** Reserved.
2	0x0 RW/1S	**HIDM Lock (HIDM_L):** Writing 1 to this bit locks the HIDM field.
1:0	0x0 RW/L	**HECI Interrupt Delivery Mode (HIDM):** These bits control what type of interrupt the HECI will send when CSE FW writes to set the CSE_IG bit. They are interpreted as follows: • 00 - Generate Legacy or MSI interrupt; • 01 - Generate SCI; • 10 - Generate SMI; This field may be locked by writing 1 to HIDM_L bit.

52.3.34 Manufacturer's ID (HECI2_MANID)—Offset F8h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:1] + F8h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RO	**Reserved (RSVD_31_28):** Reserved.
27:24	0x0 RO/V	**Dot Portion of Process ID (DPOP):** Indicates the dot process.
23:16	0x0 RO/V	**Manufacturing Stepping ID (MSID):** This field is incremented for each stepping of the part. ***Note:*** This field can be used by software to differentiate steppings when Revision ID may not change.
15:8	0x0 RO/V	**Manufacturing ID (MID):** This field is set by Intel.
7:0	0x0 RO/V	**Process Portion of Process ID (PPOP):** Indicates the process. The dot portion of the process is reflected in bits [27:24]. ***Note:*** This field can be used by software to differentiate steppings when Revision ID may not change.

52.4 Registers in Configuration Space—HECI3

52.4.1 Identifiers (HECI3_ID)—Offset 0h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:4] + 0h

Default: 19D68086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x19d6 RO/V	**Device ID (DID):** Indicates what device number assigned by Intel.
15:0	0x8086 RO	**Vendor ID (VID):** 16-bit field which indicates Intel is the vendor, assigned by the PCI SIG.

52.4.2 Command (HECI3_CMD)—Offset 4h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:24, F:4] + 4h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0x0 RO	**RSVD:** Reserved
10	0x0 RW	**Interrupt Disable (ID):** Disables this device from generating PCI line based interrupts. This bit does not have any effect on MSI operation.
9	0x0 RO	**Fast Back-to-Back Enable (FBE):** Not implemented, hardwired to 0.
8	0x0 RO	**SERR# Enable (SEE):** Not implemented, hardwired to 0.
7	0x0 RO	**Wait Cycle Enable (WCC):** Not implemented, hardwired to 0.
6	0x0 RO	**Parity Error Response Enable (PEE):** Not implemented, hardwired to 0.
5	0x0 RO	**VGA Palette Snooping Enable (VAG):** Not implemented, hardwired to 0
4	0x0 RO	**Memory Write and Invalidate Enable (MWIE):** Not implemented, hardwired to 0.
3	0x0 RO	**Special Cycle Enable (SCE):** Not implemented, hardwired to 0.
2	0x0 RW	**Bus Master Enable (BME):** Controls the HECI host controller's ability to act as a system memory master for data transfers. When this bit is cleared, HECI bus master activity stops and any active DMA engines return to an idle condition. This bit is made visible to firmware through the H_PCI_CSR register, and changes to this bit may be configured by the H_PCI_CSR register to generate an MSI to mIA. When this bit is '0', HECI is blocked from generating MSI to the host CPU. ***Note:*** This bit does not block HECI accesses to CSE-UMA
1	0x0 RW	**Memory Space Enable (MSE):** Controls access to the HECI host controllers memory mapped register space.
0	0x0 RO	**I/O Space Enable (IOSE):** Not implemented, hardwired to 0.

52.4.3 Status (HECI3_STS)—Offset 6h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:24, F:4] + 6h

Default: 0010h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RO	**Detected Parity Error (DPE):** Not implemented, hardwired to 0.
14	0x0 RO	**Signaled System Error (SSE):** Not implemented, hardwired to 0.
13	0x0 RO	**Received Master-Abort (RMA):** Not implemented, hardwired to 0.
12	0x0 RO	**Received Target Abort (RTA):** Not implemented, hardwired to 0.
11	0x0 RO	**Signaled Target-Abort (STA):** Not implemented, hardwired to 0.
10:9	0x0 RO	**DEVSEL# Timing (DEVT):** These bits are hardwired to 00.
8	0x0 RO	**Master Data Parity Error Detected (DPD):** Not implemented, hardwired to 0.
7	0x0 RO	**Fast Back-to-Back Capable (FBC):** Not implemented, hardwired to 0.
6	0x0 RO	**RSVD (RSVD_6_6):** Reserved
5	0x0 RO	**66 MHz Capable (C66):** Not implemented, hardwired to 0.
4	0x1 RO	**Capabilities List (CL):** Indicates the presence of a capabilities list, hardwired to 1.
3	0x0 RO/V	**Interrupt Status (IS):** Reflects the state of the INTx# signal at the input of the enable/disable circuit. This bit is a 1 when the INTx# is asserted. This bit is a 0 after the interrupt is cleared (independent of the state of the Interrupt Disable bit in the command register). ***Note:*** This bit is not set by an MSI.
2:0	0x0 RO	**RSVD (RSVD_2_0):** Reserved

52.4.4 Revision ID and Class Code (HECI3_RID_CC)—Offset 8h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:4] + 8h

Default: 07800000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x7 RO	**Base Class Code (BCC):** Indicates the base class code of the HECI host controller device.
23:16	0x80 RO	**Sub Class Code (SCC):** Indicates the sub class code of the HECI host controller device.
15:8	0x0 RO	**Programming Interface (PI):** Indicates the programming interface of the HECI host controller device.
7:0	0x0 RO/V	**Revision ID (RID):** Indicates stepping of the HECI host controller.

52.4.5 Cache Line Size (HECI3_CLS)—Offset Ch

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:24, F:4] + Ch

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO	**Cache Line Size (CLS):** Not implemented, hardwired to 0.

52.4.6 Master Latency Timer (HECI3_MLT)—Offset Dh

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:24, F:4] + Dh

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO	**Master Latency Timer (MLT):** Not implemented, hardwired to 0.

52.4.7 Header Type (HECI3_HTYPE)—Offset Eh

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:24, F:4] + Eh

Default: 80h

Bit Range	Default & Access	Field Name (ID): Description
7	0x1 RO	**Multi-Function Device (MFD):** Indicates the HECI host controller is part of a multi- function device.
6:0	0x0 RO	**Header Layout (HL):** Indicates that the HECI host controller uses a target device layout.

52.4.8 Built In Self-Test (HECI3_BIST)—Offset Fh

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:24, F:4] + Fh

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7	0x0 RO	**BIST Capable (BC):** Not implemented, hardwired to 0.
6:0	0x0 RO	**RSVD:** Reserved

52.4.9 HECI MMIO Base Address Low (HECI3_MMIO_MBAR_LO)—Offset 10h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:4] + 10h

Default: 00000004h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RW	**Base Address Low (BA_LO):** Lower 32 bits of base address of register memory space.
11:4	0x0 RO	**Memory Size (MS):** This field is hardwired to 0 to indicate that HECI device requests 4KB of memory space.
3	0x0 RO	**Prefetchable (PF):** Indicates that this range is not pre-fetchable
2:1	0x2 RO	**Type (TP):** Indicates that this range can be mapped anywhere in 64-bit address space.
0	0x0 RO	**Resource Type Indicator (RTE):** Indicates a request for register memory space.

52.4.10 HECI MMIO Base Address High (HECI3_MMIO_MBAR_HI)—Offset 14h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:4] + 14h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Base Address High (BA_HI):** Upper 32 bits of base address of register memory space.

52.4.11 Sub System Identifiers (HECI3_SS)—Offset 2Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:4] + 2Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW/O	**Subsystem ID (SSID):** Indicates the sub- system identifier. This field should be programmed by BIOS during boot-up. Once written, this register becomes Read Only.
15:0	0x0 RW/O	**Subsystem Vendor ID (SSVID):** Indicates the sub-system vendor identifier. This field should be programmed by BIOS during boot- up. Once written, this register becomes Read Only.

52.4.12 Capabilities Pointer (HECI3_CAP)—Offset 34h

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:24, F:4] + 34h

Default: 50h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x50 RO	**Capability Pointer (CP):** Indicates the first capability pointer offset. It points to the PCI power management capability offset.

52.4.13 Interrupt Information (HECI3_INTR)—Offset 3Ch

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:24, F:4] + 3Ch

Default: 0100h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x1 RO/V	**Interrupt Pin (IPIN):** This field indicates the virtual interrupt pin the HECI host controller uses. A value of 0x1/0x2/0x3/0x4 indicates that this function implements legacy interrupt on INTA/INTB/INTC/INTD, respectively. When legacy interrupt is not used this register should be set to 0x0.
7:0	0x0 RW	**Interrupt Line (ILINE):** Software written value to indicate which interrupt line (vector) the interrupt is connected to. No hardware action is taken on this field.

52.4.14 Minimum Grant (HECI3_MGNT)—Offset 3Eh

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:24, F:4] + 3Eh

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO	**Grant (GNT):** Not implemented, hardwired to 0.

52.4.15 Maximum Latency (HECI3_MLAT)—Offset 3Fh

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:24, F:4] + 3Fh

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:0	0x0 RO	**Latency (LAT):** Not implemented, hardwired to 0.

52.4.16 Host Firmware Status (HECI3_HFS)—Offset 40h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:4] + 40h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RO	**BIOS MSG ACK:** Acknowledge for register based BIOS message in MEI 1 H_GS Register.
27:25	0x0 RO	**BIOS MSG ACK Data:** Message specific data for acknowledged BIOS message.
24:20	0x0 RO	Reserved
19:16	0x0 RO	**Operating Mode:** This field describes the current operating mode of Intel® ME. • 1:0 - Reserved • 2 - Debug Mode • 14:3 - Reserved • 15 - Intel® SPS firmware is running in Intel® ME
15:12	0x0 RO	**Error Code:** If set to nonzero value the Intel® ME firmware has encountered a fatal error and stopped normal operation. • 0 - No Error • 1 - Uncategorized Failure - The Intel® ME firmware has experienced an uncategorized error. Further details of the failure can be found in the Extended Status Data. • 2 - Disabled - Firmware was disabled on this platform. • 3 - Image Failure - The Intel® ME firmware stored in the system flash is not valid.
11	0x0 RO	**Update in Progress:** The bit is set if any type of Intel® ME firmware update is in progress.
10	0x0 RO	**Recovery BUP Load Fault:** This bit is set when firmware is not able to load recovery bring-up from the flash. It means that the recovery section in Intel® ME region on the SPI flash.
9	0x0 RO	**Init Complete:** When this but is not set firmware is still in initialization phase. When firmware has fully entered a stable state, this but is set to 1 and "Current State" field of this register provides the steady state of the Intel® ME subsystem.
8:6	0x0 RO	**Operating State:** This field describes the current operating state of Intel® ME. • 000 - Preboot • 001 - M0 with UMA • 010 - Reserved • 011 - Reserved • 100 - M3 without UMA • 101 - M0 without UMA - normal state for Intel® SPS firmware • 110 - Bring up • 111 - M0 without UMA but with error
5	0x0 RO	**FPT or Factory Defaults Bad:** This bit is set when the firmware discovers a bad checksum of Intel® ME region Flash Partition Table (FPT) or Factory Defaults. When this bit set, it may or may not have the error code shown in bit [15:12]. The system can get this bit clear only by re-flashing the whole Intel® ME region in the SPI Flash.
4	0x0 RO	**Manufacturing Mode:** When this bit is set, the platform is still in manufacturing mode. Host can use this bit to inform user that the platform is NOT READY for production yet. This but is set as long as Intel® ME Region access is not locked for flash masters other than Intel® ME. For shipping machine, this bit MUST be 0.

Bit Range	Default & Access	Field Name (ID): Description
3:0	0x0 RO	**Current State:** This field describes the current operation state of the firmware. • 0 - Reset - Intel® ME is in reset state, will exit this state within 1 millisecond • 1 - Initialization - Intel® ME is initializing, will exit this state within 2 seconds • 2 - Recovery - Intel® ME is in recovery mode, check ME1.GMES register to determine cause • 3 - Reserved • 4 - Disabled - Intel® ME functionality has been disabled, it executes idle loop • 5 - Operational - Intel® ME is in normal operational state • 6 - Reserved • 7 - State Transition - Intel® ME sets this state before starting a transition to a new Operating State. It is a temporary state, may appear on transition between Initialization and Operational.

52.4.17 General Status Shadow 1 (HECI3_GS_SHDW1)—Offset 48h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:4] + 48h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**EOP Status:** This bit presents the Intel® ME notion of EOP status. If BIOS encounters this bit set to '1' during POST it signals an error in platform power flow.
30:28	0x0 RO	**Infrastructure Progress Code:** This field identifies the infrastructure progress code: • 0 - ROM - Intel® ME is in ROM phase • 1 - BUP - Intel® ME is in BRINGUP phase • 2 - uKernel - Intel® ME is in Micro Kernel phase • 3 - Policy Module - Intel® ME is in Policy Module phase • 4 - Other Module - Intel® ME is loading modules in M0 or M3 Operating State
27:16	0x0 RO	**Extended Status Data:** These bits provide extended status data for the current state of operating of the firmware. Or, if the firmware is in a fatal error state, these bits provide extended error code information.
15:13	0x0 RO	**Firmware Heartbeat:** This number increments approximately every second if Intel® ME firmware is running.
12	0x0 RO	Intel® ME Target Image Boot Fault • 0 - Target image loaded successfully • 1 - Target image boot failed, switched to backup image or recovery image
11:8	0x0 RO	Reserved
7	0x0 RO	**Warm Reset Request:** If this bit is set, Intel® ME informs BIOS that a warm reset is requested by Intel® ME.
6	0x0 RO	**MFS Failure:** If this bit is set, Intel® ME informs BIOS that Intel® ME File System failure has been detected during recent Intel® ME boot.
5:4	0x0 RO	Reserved

3:1	0x0
	RO
		Recovery Cause: If ME1.HFS.Current State indicates that Intel® ME firmware is running in recovery mode these bits provide the cause of this mode:
		• 0 - Intel® ME recovery jumper asserted
		• 1 - Security strap override jumper asserted
		• 2 - Recovery forced with IPMI command
		• 3 - Invalid flash configuration, either:
		  • flash master access permissions configuration is wrong
		  • VSCC entry is missing or wrong
		  • flash erase block size in Intel® ME region configuration
		• 4 - Intel® ME internal error
		  Intel® ME could not start in operational mode because of some firmware problems.
		• 5..7 - Reserved for future extensions

0	0x0 RO	**BIST in Progress:** If this bit is set Intel® ME Built In Self-Test is in Progress.

52.4.18 Host General Status (HECI3_H_GS1)—Offset 4Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:4] + 4Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Host General Status (H_GS1):** General status of Host. This field is not used by hardware.

52.4.19 PCI Power Management Capability ID (HECI3_PID)—Offset 50h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:24, F:4] + 50h

Default: 8C01h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x8c RO	**Next Capability (NEXT):** Indicates the location of the next capability item in the list. This is the Message Signaled Interrupts capability.
7:0	0x1 RO	**Cap ID (CID):** Indicates that this pointer is a PCI power management.

52.4.20 PCI Power Management Capabilities (HECI3_PC)—Offset 52h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:24, F:4] + 52h

Default: 4003h

Bit Range	Default & Access	Field Name (ID): Description
15:11	0x8 RO	**PME Support (PSUP):** Indicates the states that can generate PME#. HECI can assert PME# from D3hot only.
10	0x0 RO	**D2 Support (D2S):** The D2 state is not supported for the HECI host controller.
9	0x0 RO	**D _Support (D1S):** The D1 state is not supported for the HECI host controller.
8:6	0x0 RO	**Aux_Current (AUXC):** Reports the maximum Suspend well current required when in the D3COLD state. Value of 0 is reported.
5	0x0 RO	**Device Specific Initialization (DSI):** Indicates whether device-specific initialization is required.
4	0x0 RO	**Reserved (RSVD):** Reserved.
3	0x0 RO	**PME Clock (PMEC):** Indicates that PCI clock is not required to generate PME#.
2:0	0x3 RO	**Version (VS):** Indicates support for Revision 1.2 of the PCI Power Management Specification.

52.4.21 PCI Power Management Control and Status (HECI3_PMCS)—Offset 54h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:24, F:4] + 54h

Default: 0008h

Bit Range	Default & Access	Field Name (ID): Description
15	0x0 RW/1C/V	**PME Status (PMES):** The PME Status bit in HECI space can be set to '1' by CSE FW performing a write into CSE side register to set PMES. This bit is cleared by host CPU writing a '1' to it. CSE cannot clear this bit. Host CPU writes with value '0' have no effect on this bit.
14:9	0x0 RO	**Reserved (RSVD_14_9):** Reserved.
8	0x0 RW	**PME Enable (PMEE):** When set, PME_assert and PME_deassert messages are sent over Sideband to PMC based on the PMES bit. When reset these messages may not be sent.
7:4	0x0 RO	**Reserved (RSVD_7_4):** Reserved.
3	0x1 RO	**No Soft Reset (NSR):** This bit indicates that when the HECI host controller is transitioning from D3hot to D0 due to power state command, it does not perform and internal reset.
2	0x0 RO	**Reserved (RSVD_2_2):** Reserved.
1:0	0x0 RW	**Power State (PS):** This field is used both to determine the current power state of the HECI host controller and to set a new power state. The values are: • 00 - D0 state • 11 - D3HOT state. The D1 and D2 states are not supported for this HECI host controller.

52.4.22 General Status Shadow 2 (HECI3_GS_SHDW2)—Offset 60h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:4] + 60h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**General Status Shadow 2 (GSS2):** This field is host side shadow of CSE General Status 2 (CSE_GS2).

52.4.23 General Status Shadow 3 (HECI3_GS_SHDW3)—Offset 64h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:4] + 64h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**General Status Shadow 3 (GSS3):** This field is host side shadow of CSE General Status 3 (CSE_GS3).

52.4.24 General Status Shadow 4 (HECI3_GS_SHDW4)—Offset 68h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:4] + 68h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**General Status Shadow 4 (GSS4):** This field is host side shadow of CSE General Status 4 (CSE_GS4).

52.4.25 General Status Shadow 5 (HECI3_GS_SHDW5)—Offset 6Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:4] + 6Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO/V	**General Status Shadow 5 (GSS5):** This field is host side shadow of CSE General Status 5 (CSE_GS5).

52.4.26 Host General Status 2 (HECI3_H_GS2)—Offset 70h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:4] + 70h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Host General Status 2 (H_GS2):** General status of Host. This field is not used by hardware.

52.4.27 Host General Status 3 (HECI3_H_GS3)—Offset 74h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:4] + 74h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Host General Status 3 (H_GS3):** General status of Host. This field is not used by hardware.

52.4.28 Message Signaled Interrupt Identifiers (HECI3_MID)—Offset 8Ch

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:24, F:4] + 8Ch

Default: 0005h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x0 RO	**Next Pointer (NEXT):** Indicates the next item in the list. This can be other capability pointers (such as PCI-X or PCI- Express) or it can be the last item in the list.
7:0	0x5 RO	**Capability ID (CID):** Indicates MSI.

52.4.29 Message Signaled Interrupt Message Control (HECI3_MC)—Offset 8Eh

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:24, F:4] + 8Eh

Default: 0080h

Bit Range	Default & Access	Field Name (ID): Description
15:8	0x0 RO	**Reserved (RSVD):** Reserved.
7	0x1 RO	**64 Bit Address Capable (C64):** Specifies whether capable of generating 64-bit messages.
6:4	0x0 RO	**Multiple Message Enable (MME):** Not implemented, hardwired to 0.
3:1	0x0 RO	**Multiple Message Capable (MMC):** Not implemented, hardwired to 0.
0	0x0 RW	**MSI Enable (MSIE):** If set, MSI is enabled and INTx virtual wires are not used to generate interrupts.

52.4.30 Message Signaled Interrupt Message Address (HECI3_MA)—Offset 90h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:4] + 90h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**Address (ADDR):** Lower 32 bits of the system specified message address, always DW aligned.
1:0	0x0 RO	**Reserved (RSVD):** Reserved.

52.4.31 Message Signaled Interrupt Upper Address (HECI3_MUA)—Offset 94h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:4] + 94h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Upper Address (UADDR):** Upper 32 bits of the system specified message address. This register is optional and only implemented if MC.C64=1.

52.4.32 Message Signaled Interrupt Message Data (HECI3_MD)—Offset 98h

Type: PCI Configuration Register (Size: 16 bits)

Offset: [B:0, D:24, F:4] + 98h

Default: 0000h

Bit Range	Default & Access	Field Name (ID): Description
15:0	0x0 RW	**Data (DATA):** This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the FSB during the data phase of the MSI memory write transaction.

52.4.33 HECI Interrupt Delivery Mode (HECI3_HIDM)—Offset A0h

Type: PCI Configuration Register (Size: 8 bits)

Offset: [B:0, D:24, F:4] + A0h

Default: 00h

Bit Range	Default & Access	Field Name (ID): Description
7:3	0x0 RO	**Reserved (RSVD):** Reserved.
2	0x0 RW/1S	**HIDM Lock (HIDM_L):** Writing 1 to this bit locks the HIDM field.
1:0	0x0 RW/L	**HECI Interrupt Delivery Mode (HIDM):** These bits control what type of interrupt the HECI will send when CSE FW writes to set the CSE_IG bit. They are interpreted as follows: • 00 - Generate Legacy or MSI interrupt; • 01 - Generate SCI; • 10 - Generate SMI; This field may be locked by writing 1 to HIDM_L bit.

52.4.34 Manufacturer's ID (HECI3_MANID)—Offset F8h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:4] + F8h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RO	**Reserved (RSVD_31_28):** Reserved.
27:24	0x0 RO/V	**Dot Portion of Process ID (DPOP):** Indicates the dot process.
23:16	0x0 RO/V	**Manufacturing Stepping ID (MSID):** This field is incremented for each stepping of the part. ***Note:*** Note that this field can be used by software to differentiate steppings when Revision ID may not change.
15:8	0x0 RO/V	**Manufacturing ID (MID):** This field is set by Intel.
7:0	0x0 RO/V	**Process Portion of Process ID (PPOP):** Indicates the process. The dot portion of the process is reflected in bits [27:24]. ***Note:*** This field can be used by software to differentiate steppings when Revision ID may not change. This field is set by a special IOSF SB message (SetIDValue).

52.5 Registers in Configuration Space—KT (Host)

52.5.1 Device ID and Vendor ID (KT_HOST_DID_VID)—Offset 0h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:3] + 0h

Default: 19D58086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x19d5 RO/V	**Device ID (DID):** This field identifies the particular device.
15:0	0x8086 RO	**Vendor ID (VID):** This field identifies the manufacturer of the device. Valid vendor identifiers are allocated by the PCI SIG to ensure uniqueness. The value of 0x8086 indicates Intel

52.5.2 Status and Command (KT_HOST_STS_CMD)—Offset 4h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:3] + 4h

Default: 00B00000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**Detected Parity Error (DPE):** Not implemented. Hardwired to 0.
30	0x0 RO	**Signaled System Error (SSE):** Not implemented. Hardwired to 0.
29	0x0 RW/1C/V	**Received Master Abort (RMA):** This bit must be set by a master device whenever its transaction (except for Special Cycle) is completed with Unsupported Request Completion Status (a.k.a. Master-Abort). All master devices must implement this bit.
28	0x0 RW/1C/V	**Received Target Abort (RTA):** This bit must be set by a master device whenever its transaction is completed with Completer Abort Completion Status (a.k.a. Target-Abort). All master devices must implement this bit.
27	0x0 RW/1C/V	**Signaled Target Abort (STA):** This bit must be set by a target device whenever it completes a Posted or Non-Posted transaction with a Completer Abort (a.k.a. Target-Abort) error. Devices that will never signal Completer Abort (a.k.a. Target-Abort) do not need to implement this bit.
26:25	0x0 RO	**Devsel Timing (DEVT):** These bits encode the timing of DEVSEL#. There are three allowable timings for assertion of DEVSEL# as described below: • 00b: fast • 01b: medium • 10b: slow • 11b: reserved These bits are read-only and must indicate the slowest time that a device asserts DEVSEL# for any bus command except Configuration Read and Configuration Write. Hardwired to 00b.
24	0x0 RO	**Master Data Parity Error (MDPE):** Not implemented. Hardwired to 0.
23	0x1 RO	**Fast Back to Back Capable (FBTBC):** This bit indicates whether or not the target is capable of accepting fast back-to-back transactions when the transactions are not to the same agent. This bit can be set to 1 if the device can accept these transactions and must be set to 0 otherwise. Hardwired to 1.
22	0x0 RO	**Reserved (RSVD3):** Reserved (RSVD)
21	0x1 RO	**66 Mhz Capable (MCAP):** This bit indicates whether or not this device is capable of running at 66 MHz. • A value of 0 indicates 33 MHz. • A value of 1 indicates that the device is 66 MHz capable. Hardwired to 1.
20	0x1 RO	**Capabilities List (CAPL):** This optional read-only bit indicates whether or not this device implements the pointer for a New Capabilities linked list at offset 34h. A value of zero indicates that no New Capabilities linked list is available. A value of one indicates that the value read at offset 34h is a pointer in Configuration Space to a linked list of new capabilities.
19	0x0 RO	**Interrupt Status (INTS):** This read-only bit reflects the state of the interrupt in the device/function. Only when the Interrupt Disable bit in the command register is a 0 and this Interrupt Status bit is a 1, will the device's/function's INTx# signal be asserted. Setting the Interrupt Disable bit to a 1 has no effect on the state of this bit. Read-only and hardwired to 0 for a device that does NOT support pin-based interrupt.
18:16	0x0 RO	**Reserved (RSVD2):**

Bit Range	Default & Access	Field Name (ID): Description
15:11	0x0 RO	**Reserved (RSVD1):**
10	0x0 RW	**Interrupt Disable (INTD):** This bit disables the device/function from asserting INTx#. A value of 0 enables the assertion of its INTx# signal. A value of 1 disables the assertion of its INTx# signal. This bit's state after RST# is 0.
9	0x0 RO	**Fast Back to Back Enable (FBTBEN):** Not implemented. Hardwired to 0.
8	0x0 RO	**System Error Enable (SERREN):** Not implemented. Hardwired to 0.
7	0x0 RO	**Reserved (RSVD0):**
6	0x0 RO	**Parity Error Response (PERRR):** Not implemented. Hardwired to 0.
5	0x0 RO	**VGA Palette Snoop (VGAPS):** Not implemented. Hardwired to 0.
4	0x0 RO	**Memory Write and Invalidate Enable (MWRIEN):** Not implemented. Hardwired to 0.
3	0x0 RO	**Special Cycles (SPCYC):** Not implemented. Hardwired to 0.
2	0x0 RW	**Bus Master Enable (BME):** Controls the ability of a PCI device to issue Memory and I/O Read/Write Requests, and the ability of a PCI bridge to forward Memory and I/O Read/Write Requests in the Upstream direction. When this bit is Set, the PCI device function is allowed to issue Memory or I/O Requests. When this bit is Clear, the PCI device function is not allowed to issue any Memory or I/O Requests. ***Note:*** As MSI/MSI-X interrupt Messages are in-band memory writes, setting the Bus Master Enable bit to 0b disables MSI/MSI-X interrupt Messages as well. Requests other than Memory or I/O Requests are not controlled by this bit. Default value of this bit is 0b. This bit is hardwired to 0b if a PCI device function does not generate Memory or I/O Requests. Default value of this bit is 0b.
1	0x0 RW	**Memory Space Enable (MSE):** Controls a device's response to Memory Space accesses. • A value of 0 disables the device response. • A value of 1 allows the device to respond to Memory Space accesses. State after RST# is 0.
0	0x0 RW	**IO Space Enable (IOSE):** Controls a device's response to I/O Space accesses. A value of 0 disables the device response. A value of 1 allows the device to respond to I/O Space accesses. State after RST# is 0.

52.5.3 Class Code and Revision ID (KT_HOST_CC_RID)—Offset 8h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:3] + 8h

Default: 07000200h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x7 RO	**Base Class Code (BCC):** Identifies the Base Class Code of an external 16550-compatible serial controller device driver.
23:16	0x0 RO	**Sub-Class Code (SCC):** Identifies the Sub-Class Code of an external 16550-compatible serial controller device driver.
15:8	0x2 RO	**Programming Interface (PI):** Identifies the Programming Interface of an external 16550-compatible serial controller device driver.
7:0	0x0 RO/V	**Revision ID (RID):** This register specifies a device specific revision identifier. The value is chosen by the vendor. Zero is an acceptable value. This field should be viewed as a vendor defined extension to the Device ID.

52.5.4 BIST, Header Type, Latency Timer, and Cache Line Size (KT_HOST_BIST_HTYPE_LT_CLS)—Offset Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:3] + Ch

Default: 00800000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**Built In Self Test (BIST):** Not implemented. Hardwired to 0.
23	0x1 RO/V	**Header Type 1 (HTYPE1):** This bit identifies whether or not the device contains multiple functions. • If the bit is 0, then the device is single function. • If the bit is 1, then the device has multiple functions.
22:16	0x0 RO	**Header Type 0 (HTYPE0):** This field identifies the layout of the second part of the predefined header (beginning at byte 10h in Configuration Space). • The encoding 00h specifies the non-bridge Configuration Space Header. • The encoding 01h specifies the PCI-to-PCI bridge Configuration Space Header. • The encoding 02h specifies the CardBus bridge Configuration Space Header. • All other encodings are reserved. Hardwired to 0 to identify the non-bridge Configuration Space Header.
15:8	0x0 RO	**Latency Timer (LT):** Not implemented. Hardwired to 0.
7:0	0x0 RO	**Cache Line Size (CLS):** Not implemented. Hardwired to 0.

52.5.5 KT IO BAR (KT_HOST_IOBAR)—Offset 10h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:3] + 10h

Default: 00000001h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0x0 RW	**IO BAR (IOBAR):** Software programs this space with the base address of the device's IO region
2	0x0 RO	**IO Size (IOSIZE):** Hardwired to 0 to indicate 8B of IO space
1	0x0 RO	**Reserved (RSVD):** Hardwired to 0 for an IO BAR.
0	0x1 RO	**IO Space Indicator (IOSPACE):** Hardwired to 1 to identify an IO BAR.

52.5.6 KT Memory BAR (KT_HOST_MEMBAR)—Offset 14h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:3] + 14h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:12	0x0 RW	**Memory BAR (MEMBAR):** Software programs this register with the base address of the device's memory region
11:4	0x0 RO	**Memory Size (MEMSIZE):** Hardwired to 0 to indicate 4KB of memory space
3	0x0 RO	**Prefetchable (PREFETCH):** A device can mark a range as prefetchable if there are no side effects on reads, the device returns all bytes on reads regardless of the byte enables. Hardwired to 0 to indicate the device's memory space as non-prefetchable.
2:1	0x0 RO	**Type (TYP):** Hardwired to 0 to indicate that Base register is 32 bits wide and mapping can be done anywhere in the 32-bit Memory Space.
0	0x0 RO	**Memory Space Indicator (MEMSPACE):** Hardwired to 0 to identify a Memory BAR.

52.5.7 Cardbus CIS Pointer (KT_HOST_CCP)—Offset 28h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:3] + 28h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO	**Cardbus CIS Pointer (CCP):** Not implemented. Hardwired to 0.

52.5.8 Subsystem ID and Subsystem Vendor ID (KT_HOST_SID_SVID)—Offset 2Ch

These registers are used to uniquely identify the add-in card or subsystem where the PCI device resides. They provide a mechanism for add-in card vendors to distinguish their add-in cards from one another even though the add-in cards may have the same PCI controller on them (and, therefore, the same Vendor ID and Device ID).

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:3] + 2Ch

Default: 00008086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW/O	**Subsystem ID (SID):** Value of this field is vendor-specific. This is written by BIOS. No hardware action will be taken on this value. Implementation Note: The Write-Once lock must be implemented per field. SID should have its own lock.
15:0	0x8086 RW/O	**Subsystem Vendor ID (SVID):** This field identifies the vendor of the add-in card or subsystem. This is written by BIOS. No hardware action will be taken on this value. Implementation Note: The Write-Once lock must be implemented per field. SVID should have its own lock.

52.5.9 Expansion ROM Base Address (KT_HOST_XRBAR)—Offset 30h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:3] + 30h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO	**Expansion ROM Base Address (XRBAR):** Not implemented. Hardwired to 0.

52.5.10 Capabilities List Pointer (KT_HOST_CAPP)—Offset 34h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:3] + 34h

Default: 00000040h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**Reserved (RSVD):**
7:0	0x40 RO	**Capabilities Pointer (CAPP):** Indicates the pointer for the first entry in the capabilities list which is the MSI Capability.

52.5.11 Maximum Latency, Minimum Grant, Interrupt Pin and Interrupt Line (KT_HOST_MAXL_MING_INTP_INTL)—Offset 3Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:3] + 3Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**Maximum Latency (MAXL):** Not implemented. Hardwired to 0.
23:16	0x0 RO	**Minimum Grant (MING):** Not implemented. Hardwired to 0.
15:8	0x0 RO/V	**Interrupt Pin (INTP):** This register specifies which interrupt pin KT uses in PCI interrupt mode. Value Decoding • 00h The function does NOT use an interrupt pin. • 01h INTA • 02h INTB • 03h INTC • 04h INTD • 05h - FFh Reserved.
7:0	0x0 RW	**Interrupt Line (INTL):** This register is used to communicate interrupt line routing information. POST software will write the routing information into this register as it initializes and configures the system. The value in this register tells which input of the system interrupt controller(s) the device's interrupt pin is connected to. The device itself does not use this value, rather it is used by device drivers and operating systems. Device drivers and operating systems can use this information to determine priority and vector information. Values in this register are system architecture specific.

52.5.12 MSI Message Control, Next Pointer and Capability ID (KT_HOST_MSIMC_MSINP_MSICID)—Offset 40h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:3] + 40h

Default: 00805005h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0x0 RO	**Reserved (RSVD):**
24	0x0 RO	**Per Vector Masking Capable (PVMC):** Not implemented. Hardwired to 0 to indicate the function does NOT support MSI per-vector masking.
23	0x1 RO	**64 bit address capable (XAC):** Hardwired to 1 to indicate the function is capable of sending a 64-bit message address.
22:20	0x0 RW	**Multiple Message Enable (MMEN):** Encoded number of interrupt vectors allocated by SW. This field is RW for software compatibility, but only one interrupt vector is ever sent by the function.
19:17	0x0 RO	**Multiple Message Capable (MMC):** Encoded number of interrupt vectors requested by a device. Hardwired to 0 to indicate one requested interrupt vector.
16	0x0 RW	**MSI Enable (MSIE):** If set, MSI interrupt delivery is enabled whereas pin-based interrupt delivery SHALL be disabled. If cleared, prior to returning the configuration write (that clears this field) completion, the function must send any pending MSI(s).
15:8	0x50 RO	**Next Item Pointer (NP):** Indicates the pointer for the next entry in the capabilities list. Hardwired to 50h to point to the PM Capability list
7:0	0x5 RO	**Capability ID (CID):** Hardwired to 05h to indicate the linked list item as the MSI Capability registers

52.5.13 MSI Message Address (KT_HOST_MSIMA)—Offset 44h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:3] + 44h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**Message Address (MA):** 32-bit DW-aligned MSI message address.
1:0	0x0 RO	**Reserved (RSVD):**

52.5.14 MSI Message Upper Address (KT_HOST_MSIMUA)—Offset 48h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:3] + 48h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RW	**Message Upper Address (MUA):** Upper 32-bit of a 64-bit DW-aligned MSI message address.

52.5.15 MSI Message Data (KT_HOST_MSIMD)—Offset 4Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:3] + 4Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RO	**Reserved (RSVD):**
15:0	0x0 RW	**Message Data (MD):** MSI Message Data

52.5.16 Power Management Capabilities, Next Pointer and Capability ID (KT_HOST_PMCAP_PMNP_PMCID)—Offset 50h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:3] + 50h

Default: 00230001h

Bit Range	Default & Access	Field Name (ID): Description
31:27	0x0 RO	**PME Support (PMES):** This 5-bit field indicates the power states in which the function may assert PME#. A value of 0b for any bit indicates that the function is not capable of asserting the PME# signal while in that power state. • bit(27) X XXX1b - PME# can be asserted from D0 • bit(28) X XX1Xb - PME# can be asserted from D1 • bit(29) X X1XXb - PME# can be asserted from D2 • bit(30) X 1XXXb - PME# can be asserted from D3hot • bit(31) 1 XXXXb - PME# can be asserted from D3cold
26	0x0 RO	**D2 Support (D2S):** Hardwired to 0 to indicate that this device does not support D2
25	0x0 RO	**D1 Support (D1S):** Hardwired to 0 to indicate that this device does not support D1
24:22	0x0 RO	**Aux Current (AUXC):** Not implemented. Hardwired to 0.
21	0x1 RO	**Device Specific Initialization (DSI):** indicates whether special initialization of this function is required (beyond the standard PCI configuration header) before the generic class device driver is able to use it. A 1 indicates that the function requires a device specific initialization sequence following transition to the D0 uninitialized state. Hardwired to 1 to indicate Device Specific Initialization is required.
20	0x0 RO	**Reserved (RSVD):**
19	0x0 RO	**PME Clock (PMECLK):** Not implemented. Hardwired to 0.
18:16	0x3 RO	**Version (VER):** Hardwired to value of 011b indicates that this function complies with rev 1.2 of PCI Power Management Interface Spec
15:8	0x0 RO	**Next Item Pointer (NP):** Indicates the pointer for the next entry in the capabilities list. Hardwired to 0 to indicate no more linked list item.
7:0	0x1 RO	**Capability ID (CID):** Hardwired to 01h to indicate the linked list item as the PCI Power Management registers

52.5.17 Power Management Data, Control/Status Register Bridge Support Extensions, Control and Status (KT_HOST_PMD_PMCSRBSE_PMCSR)—Offset 54h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:3] + 54h

Default: 00000008h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**Data:** Not implemented. Hardwired to 0.
23:16	0x0 RO	**Control/Status Register Bridge Support Extensions (CSRBSE):** Not implemented. Hardwired to 0.
15	0x0 RO	**PME Status (PMESTS):** This bit is set when the function would normally assert the PME signal independent of the state of the PME_En bit. • Writing a 1 to this bit will clear it and cause the function to stop asserting a PME (if enabled). • Writing a 0 has no effect. If the function supports PME from D3cold, then this bit is sticky and must be explicitly cleared by the operating system each time the operating system is initially loaded. Not implemented. Hardwired to 0.
14:13	0x0 RO	**Data Scale (DS):** Not implemented. Hardwired to 0.
12:9	0x0 RO	**Data Select (DSEL):** Not implemented. Hardwired to 0.
8	0x0 RO	**PME Enable (PMEEN):** A 1 enables the function to assert PME. When 0, PME assertion is disabled. This bit defaults to 0 if the function does not support PME generation from D3cold. If the function supports PME from D3cold then this bit is sticky and must be explicitly cleared by the operating system each time it is initially loaded. Not implemented. Hardwired to 0.
7:4	0x0 RO	**Reserved (RSVD1):**
3	0x1 RO	**No Soft Reset (NSR):** When set to 1, this bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved. Upon transition from the D3hot to the D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the PowerState bits.
2	0x0 RO	**Reserved (RSVD0):**
1:0	0x0 RW	**Power State (PWRST):** This 2-bit field is used both to determine the current power state of a function and to set the function into a new power state. The definition of the field values is given below: • 00b - D0 • 01b - D1 • 10b - D2 • 11b - D3hot If software attempts to write an unsupported, optional state to this field, the write operation must complete normally on the bus; however, the data is discarded and no state change occurs.

52.5.18 Process Stepping Information (KT_HOST_PSI)—Offset F8h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:3] + F8h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:28	0x0 RO	**Reserved (RSVD):** Not implemented. Hardwired to 0.
27:24	0x0 RO/V	**Dot Portion of Process ID (DPOP):** Reserved.
23:16	0x0 RO/V	**Manufacturing Stepping (MSID):** Reserved.
15:8	0x0 RO/V	**Manufacturing ID (MID):** Reserved.
7:0	0x0 RO/V	**Process Portion of Process ID (PPOP):** Reserved.

52.6 Registers in Configuration Space—IDE (Host)

AR Author and Tech Comm: HIDE this sub-chapter if the device has no such registers.

52.6.1 Device ID and Vendor ID (IDE_HOST_DID_VID)—Offset 0h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:2] + 0h

Default: 19EA8086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x19ea RO/V	**Device ID (DID):** This field identifies the particular device.
15:0	0x8086 RO	**Vendor ID (VID):** This field identifies the manufacturer of the device. Valid vendor identifiers are allocated by the PCI SIG to ensure uniqueness. The value of 0x8086 indicates Intel

52.6.2 Status and Command (IDE_HOST_STS_CMD)—Offset 4h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:2] + 4h

Default: 00B00000h

Bit Range	Default & Access	Field Name (ID): Description
31	0x0 RO	**Detected Parity Error (DPE):** Not implemented. Hardwired to 0.
30	0x0 RO	**Signaled System Error (SSE):** Not implemented. Hardwired to 0.
29	0x0 RW/1C/V	**Received Master Abort (RMA):** This bit must be set by a master device whenever its transaction (except for Special Cycle) is completed with Unsupported Request Completion Status (a.k.a. Master-Abort). All master devices must implement this bit.
28	0x0 RW/1C/V	**Received Target Abort (RTA):** This bit must be set by a master device whenever its transaction is completed with Completer Abort Completion Status (a.k.a. Target-Abort). All master devices must implement this bit.
27	0x0 RW/1C/V	**Signaled Target Abort (STA):** This bit must be set by a target device whenever it completes a Posted or Non-Posted transaction with a Completer Abort (a.k.a. Target-Abort) error. Devices that will never signal Completer Abort (a.k.a. Target-Abort) do not need to implement this bit.
26:25	0x0 RO	**Devsel Timing (DEVT):** These bits encode the timing of DEVSEL#. There are three allowable timings for assertion of DEVSEL# as described below: • 00b: fast; • 01b: medium; • 10b: slow; • 11b: reserved. These bits are read-only and must indicate the slowest time that a device asserts DEVSEL# for any bus command except Configuration Read and Configuration Write. Hardwired to 00b.
24	0x0 RO	**Master Data Parity Error (MDPE):** Not implemented. Hardwired to 0.
23	0x1 RO	**Fast Back to Back Capable (FBTBC):** This bit indicates whether or not the target is capable of accepting fast back-to-back transactions when the transactions are not to the same agent. This bit can be set to 1 if the device can accept these transactions and must be set to 0 otherwise. Hardwired to 1.
22	0x0 RO	**Reserved (RSVD3):** Reserved (RSVD)
21	0x1 RO	**66 Mhz Capable (MCAP):** This bit indicates whether or not this device is capable of running at 66 MHz. • A value of 0 indicates 33 MHz. • A value of 1 indicates that the device is 66 MHz capable. Hardwired to 1.
20	0x1 RO	**Capabilities List (CAPL):** This optional read-only bit indicates whether or not this device implements the pointer for a New Capabilities linked list at offset 34h. A value of zero indicates that no New Capabilities linked list is available. A value of one indicates that the value read at offset 34h is a pointer in Configuration Space to a linked list of new capabilities.
19	0x0 RO	**Interrupt Status (INTS):** This read-only bit reflects the state of the interrupt in the device/function. Only when the Interrupt Disable bit in the command register is a 0 and this Interrupt Status bit is a 1, will the device's/function's INTx# signal be asserted. Setting the Interrupt Disable bit to a 1 has no effect on the state of this bit. Read-only and hardwired to 0 for a device that does NOT support pin-based interrupt.

Bit Range	Default & Access	Field Name (ID): Description
18:16	0x0 RO	**Reserved (RSVD2):**
15:11	0x0 RO	**Reserved (RSVD1):**
10	0x0 RW	**Interrupt Disable (INTD):** This bit disables the device/function from asserting INTx#. • A value of 0 enables the assertion of its INTx# signal. • A value of 1 disables the assertion of its INTx# signal. This bit's state after RST# is 0.
9	0x0 RO	**Fast Back to Back Enable (FBTBEN):** Not implemented. Hardwired to 0.
8	0x0 RO	**System Error Enable (SERREN):** Not implemented. Hardwired to 0.
7	0x0 RO	**Reserved (RSVD0):**
6	0x0 RO	**Parity Error Response (PERRR):** Not implemented. Hardwired to 0.
5	0x0 RO	**VGA Palette Snoop (VGAPS):** Not implemented. Hardwired to 0.
4	0x0 RO	**Memory Write and Invalidate Enable (MWRIEN):** Not implemented. Hardwired to 0.
3	0x0 RO	**Special Cycles (SPCYC):** Not implemented. Hardwired to 0.
2	0x0 RW	**Bus Master Enable (BME):** Controls the ability of a PCI device to issue Memory and I/O Read/Write Requests, and the ability of a PCI bridge to forward Memory and I/O Read/Write Requests in the Upstream direction. When this bit is Set, the PCI device function is allowed to issue Memory or I/O Requests. When this bit is Clear, the PCI device function is not allowed to issue any Memory or I/O Requests. ***Note:*** As MSI/MSI-X interrupt Messages are in-band memory writes, setting the Bus Master Enable bit to 0b disables MSI/MSI-X interrupt Messages as well. Requests other than Memory or I/O Requests are not controlled by this bit. Default value of this bit is 0b. This bit is hardwired to 0b if a PCI device function does not generate Memory or I/O Requests. Default value of this bit is 0b.
1	0x0 RO	**Memory Space Enable (MSE):** Controls a device's response to Memory Space accesses. • A value of 0 disables the device response. • A value of 1 allows the device to respond to Memory Space accesses. State after RST# is 0. Read-only and hardwired to 0 because IDE does NOT support Memory Space accesses.
0	0x0 RW	**IO Space Enable (IOSE):** Controls a device's response to I/O Space accesses. • A value of 0 disables the device response. • A value of 1 allows the device to respond to I/O Space accesses. State after RST# is 0.

52.6.3 Class Code and Revision ID (IDE_HOST_CC_RID)—Offset 8h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:2] + 8h

Default: 01018500h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x1 RO	**Base Class Code (BCC):** Identifies the Base Class Code of an external IDE controller device driver.
23:16	0x1 RO	**Sub-Class Code (SCC):** Identifies the Sub-Class Code of an external IDE controller device driver.
15:8	0x85 RO	**Programming Interface (PI):** Identifies the Programming Interface of an IDE controller device driver.
7:0	0x0 RO/V	**Revision ID (RID):** This register specifies a device specific revision identifier. The value is chosen by the vendor. Zero is an acceptable value. This field should be viewed as a vendor defined extension to the Device ID.

52.6.4 BIST, Header Type, Latency Timer, and Cache Line Size (IDE_HOST_BIST_HTYPE_LT_CLS)—Offset Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:2] + Ch

Default: 00800000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**Built In Self Test (BIST):** Not implemented. Hardwired to 0.
23	0x1 RO/V	**Header Type 1 (HTYPE1):** This bit identifies whether or not the device contains multiple functions. • If the bit is 0, then the device is single function. • If the bit is 1, then the device has multiple functions.
22:16	0x0 RO	**Header Type 0 (HTYPE0):** This field identifies the layout of the second part of the predefined header (beginning at byte 10h in Configuration Space). • The encoding 00h specifies the non-bridge Configuration Space Header. • The encoding 01h specifies the PCI-to-PCI bridge Configuration Space Header. • The encoding 02h specifies the CardBus bridge Configuration Space Header. • All other encodings are reserved. Hardwired to 0 to identify the non-bridge Configuration Space Header.
15:8	0x0 RO	**Latency Timer (LT):** Not implemented. Hardwired to 0.
7:0	0x0 RO	**Cache Line Size (CLS):** Not implemented. Hardwired to 0.

52.6.5 IDE Primary Command Block IO BAR (IDE_HOST_PCMDIOBAR)—Offset 10h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:2] + 10h

Default: 00000001h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0x0 RW	**IO BAR (IOBAR):** Software programs this space with the base address of the device's IO region
2	0x0 RO	**IO Size (IOSIZE):** Hardwired to 0 to indicate 8B of IO space
1	0x0 RO	**Reserved (RSVD):** Hardwired to 0 for an IO BAR.
0	0x1 RO	**IO Space Indicator (IOSPACE):** Hardwired to 1 to identify an IO BAR.

52.6.6 IDE Primary Control Block IO BAR (IDE_HOST_PCTLIOBAR)—Offset 14h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:2] + 14h

Default: 00000001h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**IO BAR (IOBAR):** Software programs this space with the base address of the device's IO region
1	0x0 RO	**Reserved (RSVD):** Hardwired to 0 for an IO BAR.
0	0x1 RO	**IO Space Indicator (IOSPACE):** Hardwired to 1 to identify an IO BAR.

52.6.7 IDE Secondary Command Block IO BAR (IDE_HOST_SCMDIOBAR)—Offset 18h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:2] + 18h

Default: 00000001h

Bit Range	Default & Access	Field Name (ID): Description
31:3	0x0 RW	**IO BAR (IOBAR):** Software programs this space with the base address of the device's IO region
2	0x0 RO	**IO Size (IOSIZE):** Hardwired to 0 to indicate 8B of IO space
1	0x0 RO	**Reserved (RSVD):** Hardwired to 0 for an IO BAR.
0	0x1 RO	**IO Space Indicator (IOSPACE):** Hardwired to 1 to identify an IO BAR.

52.6.8 IDE Secondary Control Block IO BAR (IDE_HOST_SCTLIOBAR)—Offset 1Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:2] + 1Ch

Default: 00000001h

Bit Range	Default & Access	Field Name (ID): Description
31:2	0x0 RW	**IO BAR (IOBAR):** Software programs this space with the base address of the device's IO region.
1	0x0 RO	**Reserved (RSVD):** Hardwired to 0 for an IO BAR.
0	0x1 RO	**IO Space Indicator (IOSPACE):** Hardwired to 1 to identify an IO BAR.

52.6.9 IDE Bus Master Block IO BAR (IDE_HOST_BMIOBAR)—Offset 20h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:2] + 20h

Default: 00000001h

Bit Range	Default & Access	Field Name (ID): Description
31:4	0x0 RW	**IO BAR (IOBAR):** Software programs this space with the base address of the device's IO region.
3:2	0x0 RO	**IO Size (IOSIZE):** Hardwired to 0 to indicate 16B of IO space.
1	0x0 RO	**Reserved (RSVD):** Hardwired to 0 for an IO BAR.
0	0x1 RO	**IO Space Indicator (IOSPACE):** Hardwired to 1 to identify an IO BAR.

52.6.10 Cardbus CIS Pointer (IDE_HOST_CCP)—Offset 28h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:2] + 28h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO	**Cardbus CIS Pointer (CCP):** Not implemented. Hardwired to 0.

52.6.11 Subsystem ID and Subsystem Vendor ID (IDE_HOST_SID_SVID)—Offset 2Ch

These registers are used to uniquely identify the add-in card or subsystem where the PCI device resides. They provide a mechanism for add-in card vendors to distinguish their add-in cards from one another even though the add-in cards may have the same PCI controller on them (and, therefore, the same Vendor ID and Device ID).

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:2] + 2Ch

Default: 00008086h

Bit Range	Default & Access	Field Name (ID): Description
31:16	0x0 RW/O	**Subsystem ID (SID):** Value of this field is vendor-specific. This is written by BIOS. No hardware action will be taken on this value. Implementation Note: The Write-Once lock must be implemented per field. SID should have its own lock.
15:0	0x8086 RW/O	**Subsystem Vendor ID (SVID):** This field identifies the vendor of the add-in card or subsystem. This is written by BIOS. No hardware action will be taken on this value. Implementation Note: The Write-Once lock must be implemented per field. SVID should have its own lock.

52.6.12 Expansion ROM Base Address (IDE_HOST_XRBAR)—Offset 30h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:2] + 30h

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:0	0x0 RO	**Expansion ROM Base Address (XRBAR):** Not implemented. Hardwired to 0.

52.6.13 Capabilities List Pointer (IDE_HOST_CAPP)—Offset 34h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:2] + 34h

Default: 00000040h

Bit Range	Default & Access	Field Name (ID): Description
31:8	0x0 RO	**Reserved (RSVD):**
7:0	0x40 RO	**Capabilities Pointer (CAPP):** Indicates the pointer for the first entry in the capabilities list which is the MSI Capability.

52.6.14 Maximum Latency, Minimum Grant, Interrupt Pin and Interrupt Line (IDE_HOST_MAXL_MING_INTP_INTL)—Offset 3Ch

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:2] + 3Ch

Default: 00000000h

Bit Range	Default & Access	Field Name (ID): Description
31:24	0x0 RO	**Maximum Latency (MAXL):** Not implemented. Hardwired to 0.
23:16	0x0 RO	**Minimum Grant (MING):** Not implemented. Hardwired to 0.
15:8	0x0 RO/V	**Interrupt Pin (INTP):** This register specifies which interrupt pin IDE uses in PCI interrupt mode. Value Decoding 00h The function does NOT use an interrupt pin. 01h INTA 02h INTB 03h INTC 04h INTD 05h - FFh Reserved. ***Note:*** This field shadows the IDEHIPINR.IPIN field in the PTIO Host private CR space which is configured by BIOS over IOSF SB.
7:0	0x0 RW	**Interrupt Line (INTL):** This register is used to communicate interrupt line routing information. POST software will write the routing information into this register as it initializes and configures the system. The value in this register tells which input of the system interrupt controller(s) the device's interrupt pin is connected to. The device itself does not use this value, rather it is used by device drivers and operating systems. Device drivers and operating systems can use this information to determine priority and vector information. Values in this register are system architecture specific.

52.6.15 MSI Message Control, Next Pointer and Capability ID (IDE_HOST_MSIMC_MSINP_MSICID)—Offset 40h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:2] + 40h

Default: 00805005h

Bit Range	Default & Access	Field Name (ID): Description
31:25	0x0 RO	**Reserved (RSVD):**
24	0x0 RO	**Per Vector Masking Capable (PVMC):** Not implemented. Hardwired to 0 to indicate the function does NOT support MSI per-vector masking.
23	0x1 RO	**64 bit address capable (XAC):** Hardwired to 1 to indicate the function is capable of sending a 64-bit message address.
22:20	0x0 RW	**Multiple Message Enable (MMEN):** Encoded number of interrupt vectors allocated by SW. This field is RW for software compatibility, but only one interrupt vector is ever sent by the function.
19:17	0x0 RO	**Multiple Message Capable (MMC):** Encoded number of interrupt vectors requested by a device. Hardwired to 0 to indicate one requested interrupt vector.
16	0x0 RW	**MSI Enable (MSIE):** If set, MSI interrupt delivery is enabled whereas pin-based interrupt delivery SHALL be disabled. If cleared, prior to returning the configuration write (that clears this field) completion, the function must send any pending MSI(s).
15:8	0x50 RO	**Next Item Pointer (NP):** Indicates the pointer for the next entry in the capabilities list. Hardwired to 50h to point to the PM Capability list
7:0	0x5 RO	**Capability ID (CID):** Hardwired to 05h to indicate the linked list item as the MSI Capability registers

52.6.16 MSI Message Address (IDE_HOST_MSIMA)—Offset 44h

Type: PCI Configuration Register (Size: 32 bits)

Offset: [B:0, D:24, F:2] + 44h
