| 22 | 0x0<br>RO | **FIS-based Switching Capable Port (FBSCP):** The SATA controller does not support FIS-Based Switching. |
| 21 | 0x0<br>RW/O | **External SATA Port (ESP):** When set to 1, indicates that this port is routed externally and will be used with an external SATA device.<br>When set to 1, CAP.SXS must also be set to 1.<br>When cleared (0), indicates that this port is not routed externally and supports internal SATA devices only.<br>If ESP is set to '1', then the port may experience hot plug events. |
| 20 | 0x0<br>RO | **Cold Presence Detection (CPD):** The SATA controller does not support cold presence detect. |
| 19 | 0x0<br>RW/O | **Mechanical Presence Switch Attached to Port (MPSP):**<br>If set to 1, the platform supports a mechanical presence switch attached to this port.<br>If cleared to 0, the platform does not support a mechanical presence switch attached to this port. |
| 18 | 0x0<br>RW/O | **Hot Plug Capable Port (HPCP):** This indicates whether the this port is connected to a device which can be hot plugged.<br>SATA by definition is hot-pluggable, but not all platforms are constructed to allow the device to be removed (it may be screwed into the chassis, for example).<br>This bit can be used by system software to indicate a feature such as eject device to the end-user. |
| 17 | 0x0<br>RW/V | **Port Multiplier Attached (PMA):** When set, a Port Multiplier is attached to the HBA for this port.<br>When cleared, a Port Multiplier is not attached to the HBA for this port.<br>This bit is a read only 0. when CAP.PMS = 0., and read/write when CAP.PMS = 1.<br>***Note:*** This bit is set by software; hardware does not auto-detect that a Port Multiplier is attached. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 16 | 0x0<br>RO | **RSVD0:** Reserved |
| 15 | 0x0<br>RO/V | **Command List Running (CR):** When this bit is set it indicates that the command list DMA engine for the port is running. |
| 14 | 0x0<br>RO/V | **FIS Receive Running (FR):** When this bit is set it indicates that the FIS Receive DMA engine for the port is running.<br>Note to software: When FR bit stays set, please read the PxIS.PCS and PxSERR.DET.X to service the PCS interrupt accordingly if any |
| 13 | 0x0<br>RO/V | **Mechanical Presence Switch State (MPSS):** The MPSS bit reports the state of a mechanical presence switch attached to this port.<br>If CAP.SMPS is set to 1 and the mechanical presence switch is closed then this bit is cleared to 0.<br>If CAP.SMPS is set to 1 and the mechanical presence switch is open then this bit is set to 1.<br>If CAP.SMPS is set to 0 then this bit is cleared to 0.<br>Software should only use this bit if both CAP.SMPS and PxCMD.MPSP are set to 1. |
| 12:8 | 0x0<br>RO | **Current Command Slot (CCS):** Indicates the current command slot the HBA is processing.<br>This field is valid when the PxCMD.ST bit is set, and is constantly updated by the HBA.<br>This field can be updated as soon as the HBA recognizes an active command slot, or at some point soon after when it begins processing the command.<br>When PxCMD.ST transitions from a 1 to a 0, the HBA will reset this field to 0.<br>After PxCMD.ST transitions from 0 to 1, the highest priority slot to issue from next is command slot 0.<br>After the first command has been issued, the highest priority slot to issue from next is PxCMD.CCS + 1.<br>For example, after the HBA has issued its first command, if PxCMD.CCS = 0h and PxCI is set to 3h, the next command that will be issued is from command slot 1. |
| 7:5 | 0x0<br>RO | **RSVD1:** Reserved |
| 4 | 0x0<br>RW | **FIS Receive Enable (FRE):** When set, the HBA may post received FISes into the FIS receive area pointed to by PxFB and PxFBU. When cleared, received FISes are not accepted by the HBA, except for the first D2H register FIS after the initialization sequence. |
| 3 | 0x0<br>RW/1S | **Command List Override (CLO):** Setting this bit to 1 causes PxTFD.STS.BSY and PxTFD.STS.DRQ to be cleared to 0.<br>This allows a software reset to be transmitted to the device regardless of whether the BSY and DRQ bits are still set in the PxTFD.STS register.<br>The HBA sets this bit to 0 when PxTFD.STS.BSY and PxTFD.STS.DRQ have been cleared to 0.<br>A write to this register with a value of 0 shall have no effect. |
| 2 | 0x1<br>RO | **Power On Device (POD):** The SATA controller does not support cold presence detect. |
| 1 | 0x0<br>RW/V | **Spin-Up Device (SUD):** This bit is read/write for HBAs that support staggered spin-up via CAP.SSS. This bit is read only 1. for HBAs that do not support staggered spin-up.<br>On an edge detect from 0. to 1, the HBA shall start a COMRESET initialization sequence to the device.<br>Clearing this bit causes no action on the interface.<br>Clearing this bit to0 does not cause any OOB signal to be sent on the interface.<br>When this bit is cleared to 0. and PxSCTL.DET = 0h, the HBA will enter listen mode. |
| 0 | 0x0<br>RW | **Start (ST):** When set, the HBA may process the command list.<br>When cleared, the HBA may not process the command list.<br>Whenever this bit is changed from a 0 to a 1, the HBA starts processing the command list at entry 0.<br>Whenever this bit is changed from a 1 ot a 0, the PxCI and PxSACT register is cleared by the HBA upon the HBA putting the controller into an idle state. PxTFD shall be updated also. |

## 50.4.97 Port [0-7] Task File Data (PxTFD6)—Offset 420h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 0000007Fh

**BAR and Offset:** [ABAR] + 420h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **RSVD0:** Reserved |
| 15:8 | 0x0<br>RO/V | **Error (ERR):** Contains the latest copy of the task file error register. |
| 7 | 0x0<br>RO/V | **Status Busy (STS_BSY):** Status - Indicates the interface is busy. |
| 6:4 | 0x7<br>RO/V | **Status Rsvd0 (STS_RSVD0):** Status - Not Applicable. |
| 3 | 0x1<br>RO/V | **Status Drq (STS_DRQ):** Status - Indicates a data transfer is requested. |
| 2:1 | 0x3<br>RO/V | **Status Rsvd1 (STS_RSVD1):** Status - Not Applicable. |
| 0 | 0x1<br>RO/V | **Status Err (STS_ERR):** Status - Indicates an error during the transfer. |

## 50.4.98 Port [0-7] Signature (PxSIG6)—Offset 424h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** FFFFFFFFh

**BAR and Offset:** [ABAR] + 424h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0xffffffff<br>RO/V | **Signature (SIG):** Contains the signature received from a device on the first D2H Register FIS. |

## 50.4.99 Port [0-7] Serial ATA Status (PxSSTS6)—Offset 428h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 428h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:12 | 0x0<br>RO | **RSVD0:** Reserved |
| 11:8 | 0x0<br>RO/V | **Interface Power Management (IPM):** Indicates the current interface state |
| 7:4 | 0x0<br>RO/V | **Current Interface Speed (SPD):** Indicates the negotiated interface communication speed. |
| 3:0 | 0x0<br>RO/V | **Device Detection (DET):** Indicates the interface device detection and Phy state. |

## 50.4.100 Port [0-7] Serial ATA Control (PxSCTL6)—Offset 42Ch

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 42Ch

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:20 | 0x0<br>RO | **RSVD0:** Reserved |
| 19:16 | 0x0<br>RW | **Port Multiplier Port (PMP):** This field is not used by AHCI. |
| 15:12 | 0x0<br>RW | **Select Power Management (SPM):** This field is not used by AHCI. |
| 11:8 | 0x0<br>RW | **Interface Power Management Transitions Allowed (IPM):** Indicates which power states the HBA is allowed to transition to.<br>If an interface power management state is not allowed via this register field, the HBA will not initiate that state and the HBA will PMNAKP any request from the device to enter that state. |
| 7:4 | 0x0<br>RW | **Speed Allowed (SPD):** Indicates the highest allowable speed of the interface. |
| 3:0 | 0x0<br>RW | **Device Detection Initialization (DET):** Controls the HBA.s device detection and interface initialization. |

## 50.4.101 Port [0-7] Serial ATA Error (PxSERR6)—Offset 430h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 430h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0 RW/1C/V | **Diagnostics (DIAG):** Contains diagnostic error information for use by diagnostic software in validating correct operation or isolating failure modes. |
| 15:0 | 0x0 RW/1C/V | **Error (ERR):** The ERR field contains error information for use by host software in determining the appropriate response to the error condition.<br>If one or more of bits 11:8 of this register are set, the controller will stop the current transfer. |

## 50.4.102 Port [0-7] Serial ATA Active (PxSACT6)—Offset 434h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 434h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0 RW/1S/V | **Device Status (DS):** System software sets this bit for native command queuing commands prior to setting the PxCI.CI bit in the same command slot entry.<br>This field is cleared via the Set Device Bits FIS. |

## 50.4.103 Port [0-7] Commands Issued (PxCI6)—Offset 438h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 438h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0 RW/1S/V | **Commands Issued (CI):** This field is set by software to indicate to the HBA that a command has been built in system memory for a command slot and may be sent to the device.<br>When the HBA receives a FIS which clears the BSY, ERR, and DRQ bits for the command, it clears the corresponding bit in this register for that command slot.<br>Bits in this field shall only be set to 1 by software when PxCMD.ST is set to 1. |

## 50.4.104 Port [0-7] SNotification (PxSNTF6)—Offset 43Ch

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 43Ch

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **RSVD0:** Reserved |
| 15:0 | 0x0<br>RW/1C/V | **PM Notify (PMN):** This field indicates whether a particular device with the corresponding PM Port number issued a Set Device Bits FIS to the host with the Notification bit set.<br>PM Port 0h sets bit 0.<br>PM Port Fh sets bit 15.<br>Individual bits are cleared by software writing 1's to the corresponding bit positions.<br>***Note:*** While this field is reset to default on a HBA Reset, it is not reset by COMRESET or SRST |

## 50.4.105 Port [0-7] Device Sleep (PxDEVSLP6)—Offset 444h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 1E022852h

**BAR and Offset:** [ABAR] + 444h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:29 | 0x0<br>RO | **RSVD0:** Reserved |
| 28:25 | 0xf<br>RW/O/V | **DITO Multiplier (DM):** 0's based value that specifies the DITO multiplier that the HBA applies to the specified DITO value, effectively extending the range of DITO from 1ms to 16368ms.<br>A value of 0h indicates a multiplier of 1. A maximum multiplier of 16 may be applied. |
| 24:15 | 0x4<br>RW/V | **DEVSLP Idle Timeout (DITO):** This field specifies the amount of the time (in approximate 1ms granularity) that the HBA shall wait before driving the DEVSLP signal.<br>Hardware reloads its port specific DEVSLP timer with this value each time the port transitions out of DEVSLP state. |
| 14:10 | 0xa<br>RW/V | **DEVSLP Minimum Assertion Time (MDAT):** This field specifies the minimum amount of time (in 1ms granularity) that the HBA must assert the DEVSLP signal before it may be de-asserted.<br>The nominal value is 10ms and the minimum is 1ms depending on device identification information. |
| 9:2 | 0x14<br>RW/V | **DEVSLP Exit Timeout (DETO):** This field specifies the maximum duration (in approximate 1ms granularity) from DEVSLP de-assertion until the device is ready to accept OOB.<br>The nominal value is 20ms while the max value is 255ms depending on device identification information. |
| 1 | 0x1<br>RW/O | **DEVSLP Present (DSP):** If set to '1', the platform supports DEVSLP on this port.<br>If cleared to '0', the platform does not support DEVSLP on this port. |
| 0 | 0x0<br>RW/V | **Aggressive DEVSLP Enable (ADSE):** This bit is read/write for HBAs that support aggressive DEVSLP management (CAP2. SADM = 1). |

## 50.4.106 Port [0-7] Command List Base Address (PxCLB7)—Offset 480h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 480h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:10 | 0x0<br>RW | **Command List Base Address (CLB):** Indicates the 32-bit base for the command list for this port. This base is used when fetching commands to execute.<br>This address must be 1K aligned as indicated by bits 31:10 being read/write.<br>***Note:*** These bits are not reset on a HBA reset. |
| 9:0 | 0x0<br>RO | **RSVD0:** Reserved |

## 50.4.107 Port [0-7] Command List Base Address Upper 32-bits (PxCLBU7)—Offset 484h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 484h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Command List Base Address Upper (CLBU):** Indicates the upper 32-bits for the command list base address for this port.<br>This base is used when fetching commands to execute.<br>***Note:*** These bits are not reset on a HBA reset. |

## 50.4.108 Port [0-7] FIS Base Address (PxFB7)—Offset 488h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 488h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0x0<br>RW | **FIS Base Address (FB):** Indicates the 32-bit base for received FISes.<br>This address must be 256-byte aligned as indicated by bits 31:08 being read/write.<br>When FIS-based switching is in use, this structure is 4KB in length and the address shall be 4KB aligned.<br>***Note:*** These bits are not reset on a HBA reset. |
| 7:0 | 0x0<br>RO | **RSVD0:** Reserved |

## 50.4.109 Port [0-7] FIS Base Address Upper 32-bits (PxFBU7)—Offset 48Ch

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 48Ch

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **FIS Base Address Upper (FBU):** Indicates the upper 32-bits for the received FIS base for this port.<br>***Note:*** These bits are not reset on a HBA reset. |

## 50.4.110 Port [0-7] Interrupt Status (PxIS7)—Offset 490h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 490h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **Cold Presence Detect Status (CPDS):** The SATA controller does not support cold presence detect. |
| 30 | 0x0<br>RW/1C/V | **Task File Error Status (TFES):** This bit is set whenever the status register is updated by the device and the error bit (bit 0 of the Status field in the received FIS) is set. |
| 29 | 0x0<br>RW/1C/V | **Host Bus Fatal Error Status (HBFS):** Indicates that the HBA encountered a host bus error that it cannot recover from, such as a bad software pointer.<br>In PCI, such an indication would be a target or master abort. |
| 28 | 0x0<br>RW/1C/V | **Host Bus Data Error Status (HBDS):** Indicates that the HBA encountered a data error (uncorrectable ECC / parity) when reading from or writing to system memory. |
| 27 | 0x0<br>RW/1C/V | **Interface Fatal Error Status (IFS):** Indicates that the HBA encountered an error on the SATA interface which caused the transfer to stop. |
| 26 | 0x0<br>RW/1C/V | **Interface Non-fatal Error Status (INFS):** Indicates that the HBA encountered an error on the SATA interface but was able to continue operation. |
| 25 | 0x0<br>RO | **RSVD0:** Reserved |
| 24 | 0x0<br>RW/1C/V | **Overflow Status (OFS):** Indicates that the HBA received more bytes from a device than was specified in the PRD table for the command. |
| 23 | 0x0<br>RW/1C/V | **Incorrect Port Multiplier Status (IPMS):** Indicates that the HBA received a FIS from a device whose port multiplier field did not match what was expected.<br>The IPMS bit may be set during enumeration process.<br>It is recommended that IPMS only be used after enumeration is complete on the Port Multiplier. |
| 22 | 0x0<br>RO/V | **PhyRdy Change Status (PRCS):** When set to one indicates the internal PhyRdy signal changed state.<br>This bit reflects the state of PxSERR.DIAG.N.<br>This bit is RO and is only cleared when PxSERR.DIAG.N is cleared. |
| 21:8 | 0x0<br>RO | **RSVD1:** Reserved |
| 7 | 0x0<br>RW/1C/V | **Device Mechanical Presence Status (DMPS):** When set, indicates that a platform mechanical presence switch has been opened or closed, which may lead to a change in the connection state of the device.<br>This bit is only valid in systems that support mechanical presence switch (CAP.SMPS and PxCMD.MPSP are set). |
| 6 | 0x0<br>RO/V | **Port Connect Change Status (PCS):**<br>• 1=Change in Current Connect Status.<br>• 0=No change in Current Connect Status.<br>This bit reflects the state of PxSERR.DIAG.X. This bit is only cleared when PxSERR.DIAG.X is cleared. |
| 5 | 0x0<br>RW/1C/V | **Descriptor Processed (DPS):** A PRD with the I. bit set has transferred all of its data. |
| 4 | 0x0<br>RO/V | **Unknown FIS Interrupt (UFS):** When set to 1 indicates that an unknown FIS was received and has been copied into system memory.<br>This bit is cleared to 0 by software clearing the PxSERR.DIAG.F bit to 0.<br>Note that this bit does not directly reflect the PxSERR.DIAG.F bit. PxSERR.DIAG.F is set immediately when an unknown FIS is detected, whereas this bit is set when the FIS is posted to memory.<br>Software should wait to act on an unknown FIS until this bit is set to 1 or the two bits may become out of sync. |
| 3 | 0x0<br>RW/1C/V | **Set Device Bits Interrupt (SDBS):** A Set Device Bits FIS has been received with the I. bit set and has been copied into system memory. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 2 | 0x0<br>RW/1C/V | **DMA Setup FIS Interrupt (DSS):** A DMA Setup FIS has been received with the I. bit set and has been copied into system memory. |
| 1 | 0x0<br>RW/1C/V | **PIO Setup FIS Interrupt (PSS):** A PIO Setup FIS has been received with the I. bit set, it has been copied into system memory, and the data related to that FIS has been transferred.<br>This bit shall be set even if the data transfer resulted in an error. |
| 0 | 0x0<br>RW/1C/V | **Device to Host Register FIS Interrupt (DHRS):** A D2H register FIS has been received with the I. bit set, and has been copied into system memory. |

## 50.4.111 Port [0-7] Interrupt Enable (PxIE7)—Offset 494h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 494h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **Cold Presence Detect Enable (CPDS):** The SATA controller does not support cold presence detect. |
| 30 | 0x0<br>RW | **Task File Error Enable (TFEE):** When set, GHC.IE is set, and P0S.TFES is set, the HBA shall generate an interrupt. |
| 29 | 0x0<br>RW | **Host Bus Fatal Error Enable (HBFE):** When set, GHC.IE is set, and P0IS.HBFS is set, the HBA shall generate an interrupt. |
| 28 | 0x0<br>RW | **Host Bus Data Error Enable (HBDE):** when set, GHC.IE is set, and P0IS.HBDS is set, the HBA shall generate an interrupt. |
| 27 | 0x0<br>RW | **Interface Fatal Error Enable (IFE):** When set, GHC.IE is set, and P0IS.IFS is set, the HBA shall generate an interrupt. |
| 26 | 0x0<br>RW | **Interface Non-fatal Error Enable (INFE):** When set, GHC.IE is set, and P0IS.INFS is set, the HBA shall generate an interrupt. |
| 25 | 0x0<br>RO | **RSVD0:** Reserved |
| 24 | 0x0<br>RW | **Overflow Enable (OFE):** When set, and GHC.IE and P0IS.OFS are set, the HBA shall generate an interrupt. |
| 23 | 0x0<br>RW | **Incorrect Port Multiplier Enable (IPME):** When set, and GHC.IE and P0IS.IPMS are set, the HBA shall generate an interrupt.<br>BIOS is required to program this field to '0'. The same applies to AHCI driver. |
| 22 | 0x0<br>RW | **PhyRdy Change Interrupt Enable (PRCE):** When set, and GHC.IE is set, and PxIS.PRCS is set, the HBA shall generate an interrupt. |
| 21:8 | 0x0<br>RO | **RSVD1:** Reserved |
| 7 | 0x0<br>RW/V | **Device Mechanical Enable (DMPE):** When set, and P0IS.DMPS is set, the HBA shall generate an interrupt. |
| 6 | 0x0<br>RW | **Port Change Interrupt Enable (PCE):** When set, GHC.IE is set, and P0IS.PCS is set, the HBA shall generate an interrupt. |
| 5 | 0x0<br>RW | **Descriptor Processed Interrupt Enable (DPE):** When set, GHC.IE is set, and P0IS.DPS is set, the HBA shall generate an interrupt. |
| 4 | 0x0<br>RW | **Unknown FIS Interrupt Enable (UFE):** When set, GHC.IE is set, and PxIS.UFS is set to 1, the HBA shall generate an interrupt. |
| 3 | 0x0<br>RW | **Set Device Bits FIS Interrupt Enable (SDBE):** When set, GHC.IE is set, and P0IS.SDBS is set, the HBA shall generate an interrupt. |
| 2 | 0x0<br>RW | **DMA Setup FIS Interrupt Enable (DSE):** When set, GHC.IE is set, and P0IS.DSS is set, the HBA shall generate an interrupt. |
| 1 | 0x0<br>RW | **PIO Setup FIS Interrupt Enable (PSE):** When set, GHC.IE is set, and P0IS.PSS is set, the HBA shall generate an interrupt. |
| 0 | 0x0<br>RW | **Device to Host Register FIS Interrupt Enable (DHRE):** When set, GHC.IE is set, and P0IS.DHRS is set, the HBA shall generate an interrupt. |

## 50.4.112 Port [0-7] Command (PxCMD7)—Offset 498h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000004h

**BAR and Offset:** [ABAR] + 498h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0x0<br>RW | **Interface Communication Control (ICC):** This is a four bit field which can be used to control reset and power states of the interface.<br>If the Link layer is currently in the L_IDLE state, writes to this field shall cause the HBA to initiate a transition to the interface power management state requested.<br>If the Link layer is not currently in the L_IDLE state, writes to this field shall have no effect. |
| 27 | 0x0<br>RW | **Aggressive Slumber Partial (ASP):** When set to 1, and the ALPE bit is set, the HBA shall aggressively enter the Slumber state when it clears a bit in the PxCI or PxSACT register and the register values are then PxCI = 0h and PxSACT = 0h.<br>When cleared, and the ALPE bit is set, the HBA will aggressively enter the Partial state when it clears a bit in the PxCI or PxSACT register and the register values are then PxCI = 0h and PxSACT = 0h.<br>If CAP.SALP is cleard to 0., software shall treat this bit as reserved. |
| 26 | 0x0<br>RW | **Aggressive Link Power Management Enable (ALPE):** When set, the HBA will aggressively enter a lower link power state (Partial or Slumber) based upon the setting of the ASP bit.<br>Software shall only set this bit to 1 if CAP.SALP is set to 1.<br>If CAP.SALP is cleared to 0, software shall treat this bit as reserved.<br>BIOS is recommended to program this field to 1. |
| 25 | 0x0<br>RW | **Drive LED on ATAPI Enable (DLAE):** When set, the HBA will drive the LED pin active for commands regardless of the state of PxCMD.ATAPI.<br>When cleared, the HBA will only drive the LED pin active for commands if PxCMD.ATAPI is set to 0.<br>This bit is set by software. |
| 24 | 0x0<br>RW | **Device is ATAPI (ATAPI):** When set, the connected device is an ATAPI device.<br>This bit is used by the HBA to control whether or not to generate the desktop LED when commands are active. |
| 23 | 0x0<br>RW | **Automatic Partial to Slumber Transitions Enabled (APSTE):** When set to 1., the HBA may perform Automatic Partial to Slumber Transitions.<br>When cleared to 0. the port shall not perform Automatic Partial to Slumber Transitions.<br>Software shall only set this bit to 1. if CAP2.APST is set to 1.; if CAP2.APST is cleared to 0. software shall treat this bit as reserved. |
| 22 | 0x0<br>RO | **FIS-based Switching Capable Port (FBSCP):** The SATA controller does not support FIS-Based Switching. |
| 21 | 0x0<br>RW/O | **External SATA Port (ESP):** When set to 1, indicates that this port is routed externally and will be used with an external SATA device.<br>When set to 1, CAP.SXS must also be set to 1.<br>When cleared (0), indicates that this port is not routed externally and supports internal SATA devices only.<br>If ESP is set to '1', then the port may experience hot plug events. |
| 20 | 0x0<br>RO | **Cold Presence Detection (CPD):** The SATA controller does not support cold presence detect. |
| 19 | 0x0<br>RW/O | **Mechanical Presence Switch Attached to Port (MPSP):** If set to 1, the platform supports a mechanical presence switch attached to this port.<br>If cleared to 0, the platform does not support a mechanical presence switch attached to this port. |
| 18 | 0x0<br>RW/O | **Hot Plug Capable Port (HPCP):** This indicates whether the this port is connected to a device which can be hot plugged.<br>SATA by definition is hot-pluggable, but not all platforms are constructed to allow the device to be removed (it may be screwed into the chassis, for example).<br>This bit can be used by system software to indicate a feature such as eject device to the end-user. |
| 17 | 0x0<br>RW/V | **Port Multiplier Attached (PMA):** When set, a Port Multiplier is attached to the HBA for this port.<br>When cleared, a Port Multiplier is not attached to the HBA for this port.<br>This bit is a read only 0. when CAP.PMS = 0., and read/write when CAP.PMS = 1.<br>Note that this bit is set by software; hardware does not auto-detect that a Port Multiplier is attached. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 16 | 0x0<br>RO | **RSVD0:** Reserved |
| 15 | 0x0<br>RO/V | **Command List Running (CR):** When this bit is set it indicates that the command list DMA engine for the port is running. |
| 14 | 0x0<br>RO/V | **FIS Receive Running (FR):** When this bit is set it indicates that the FIS Receive DMA engine for the port is running.<br>Note to software: When FR bit stays set, please read the PxIS.PCS and PxSERR.DET.X to service the PCS interrupt accordingly if any |
| 13 | 0x0<br>RO/V | **Mechanical Presence Switch State (MPSS):** The MPSS bit reports the state of a mechanical presence switch attached to this port.<br>If CAP.SMPS is set to 1 and the mechanical presence switch is closed then this bit is cleared to 0.<br>If CAP.SMPS is set to 1 and the mechanical presence switch is open then this bit is set to 1.<br>If CAP.SMPS is set to 0 then this bit is cleared to 0.<br>Software should only use this bit if both CAP.SMPS and PxCMD.MPSP are set to 1. |
| 12:8 | 0x0<br>RO | **Current Command Slot (CCS):** Indicates the current command slot the HBA is processing.<br>This field is valid when the PxCMD.ST bit is set, and is constantly updated by the HBA.<br>This field can be updated as soon as the HBA recognizes an active command slot, or at some point soon after when it begins processing the command.<br>When PxCMD.ST transitions from a 1 to a 0, the HBA will reset this field to 0.<br>After PxCMD.ST transitions from 0 to 1, the highest priority slot to issue from next is command slot 0.<br>After the first command has been issued, the highest priority slot to issue from next is PxCMD.CCS + 1. For example, after the HBA has issued its first command, if PxCMD.CCS = 0h and PxCI is set to 3h, the next command that will be issued is from command slot 1. |
| 7:5 | 0x0<br>RO | **RSVD1:** Reserved |
| 4 | 0x0<br>RW | **FIS Receive Enable (FRE):** When set, the HBA may post received FISes into the FIS receive area pointed to by PxFB and PxFBU.<br>When cleared, received FISes are not accepted by the HBA, except for the first D2H register FIS after the initialization sequence. |
| 3 | 0x0<br>RW/1S | **Command List Override (CLO):** Setting this bit to 1 causes PxTFD.STS.BSY and PxTFD.STS.DRQ to be cleared to 0.<br>This allows a software reset to be transmitted to the device regardless of whether the BSY and DRQ bits are still set in the PxTFD.STS register.<br>The HBA sets this bit to 0 when PxTFD.STS.BSY and PxTFD.STS.DRQ have been cleared to 0.<br>A write to this register with a value of 0 shall have no effect. |
| 2 | 0x1<br>RO | **Power On Device (POD):** The SATA controller does not support cold presence detect. |
| 1 | 0x0<br>RW/V | **Spin-Up Device (SUD):** This bit is read/write for HBAs that support staggered spin-up via CAP.SSS.<br>This bit is read only 1. for HBAs that do not support staggered spin-up.<br>On an edge detect from 0. to 1, the HBA shall start a COMRESET initialization sequence to the device.<br>Clearing this bit causes no action on the interface.<br>Clearing this bit to0 does not cause any OOB signal to be sent on the interface.<br>When this bit is cleared to 0. and PxSCTL.DET = 0h, the HBA will enter listen mode. |
| 0 | 0x0<br>RW | **Start (ST):** When set, the HBA may process the command list. When cleared, the HBA may not process the command list. Whenever this bit is changed from a 0 to a 1, the HBA starts processing the command list at entry 0.<br>Whenever this bit is changed from a 1 to a 0, the PxCI and PxSACT register is cleared by the HBA upon the HBA putting the controller into an idle state. PxTFD shall be updated also. |

## 50.4.113 Port [0-7] Task File Data (PxTFD7)—Offset 4A0h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 0000007Fh

**BAR and Offset:** [ABAR] + 4A0h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **RSVD0:** Reserved |
| 15:8 | 0x0<br>RO/V | **Error (ERR):** Contains the latest copy of the task file error register. |
| 7 | 0x0<br>RO/V | **Status Busy (STS_BSY):** Status - Indicates the interface is busy. |
| 6:4 | 0x7<br>RO/V | **Status Rsvd0 (STS_RSVD0):** Status - Not Applicable. |
| 3 | 0x1<br>RO/V | **Status Drq (STS_DRQ):** Status - Indicates a data transfer is requested. |
| 2:1 | 0x3<br>RO/V | **Status Rsvd1 (STS_RSVD1):** Status - Not Applicable. |
| 0 | 0x1<br>RO/V | **Status Err (STS_ERR):** Status - Indicates an error during the transfer. |

## 50.4.114 Port [0-7] Signature (PxSIG7)—Offset 4A4h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** FFFFFFFFh

**BAR and Offset:** [ABAR] + 4A4h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0xffffffff<br>RO/V | **Signature (SIG):** Contains the signature received from a device on the first D2H Register FIS. |

## 50.4.115 Port [0-7] Serial ATA Status (PxSSTS7)—Offset 4A8h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 4A8h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:12 | 0x0<br>RO | **RSVD0:** Reserved |
| 11:8 | 0x0<br>RO/V | **Interface Power Management (IPM):** Indicates the current interface state |
| 7:4 | 0x0<br>RO/V | **Current Interface Speed (SPD):** Indicates the negotiated interface communication speed. |
| 3:0 | 0x0<br>RO/V | **Device Detection (DET):** Indicates the interface device detection and Phy state. |

## 50.4.116 Port [0-7] Serial ATA Control (PxSCTL7)—Offset 4ACh

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 4ACh

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:20 | 0x0<br>RO | **RSVD0:** Reserved |
| 19:16 | 0x0<br>RW | **Port Multiplier Port (PMP):** This field is not used by AHCI. |
| 15:12 | 0x0<br>RW | **Select Power Management (SPM):** This field is not used by AHCI. |
| 11:8 | 0x0<br>RW | **Interface Power Management Transitions Allowed (IPM):** Indicates which power states the HBA is allowed to transition to.<br>If an interface power management state is not allowed via this register field, the HBA will not initiate that state and the HBA will PMNAKP any request from the device to enter that state. |
| 7:4 | 0x0<br>RW | **Speed Allowed (SPD):** Indicates the highest allowable speed of the interface. |
| 3:0 | 0x0<br>RW | **Device Detection Initialization (DET):** Controls the HBA.s device detection and interface initialization. |

## 50.4.117 Port [0-7] Serial ATA Error (PxSERR7)—Offset 4B0h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 4B0h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0 RW/1C/V | **Diagnostics (DIAG):** Contains diagnostic error information for use by diagnostic software in validating correct operation or isolating failure modes. |
| 15:0 | 0x0 RW/1C/V | **Error (ERR):** The ERR field contains error information for use by host software in determining the appropriate response to the error condition.<br>If one or more of bits 11:8 of this register are set, the controller will stop the current transfer. |

## 50.4.118 Port [0-7] Serial ATA Active (PxSACT7)—Offset 4B4h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 4B4h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0 RW/1S/V | **Device Status (DS):** System software sets this bit for native command queuing commands prior to setting the PxCI.CI bit in the same command slot entry.<br>This field is cleared via the Set Device Bits FIS. |

## 50.4.119 Port [0-7] Commands Issued (PxCI7)—Offset 4B8h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 4B8h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0 RW/1S/V | **Commands Issued (CI):** This field is set by software to indicate to the HBA that a command has been built in system memory for a command slot and may be sent to the device.<br>When the HBA receives a FIS which clears the BSY, ERR, and DRQ bits for the command, it clears the corresponding bit in this register for that command slot.<br>Bits in this field shall only be set to 1 by software when PxCMD.ST is set to 1. |

## 50.4.120 Port [0-7] SNotification (PxSNTF7)—Offset 4BCh

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 4BCh

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **RSVD0:** Reserved |
| 15:0 | 0x0<br>RW/1C/V | **PM Notify (PMN):** This field indicates whether a particular device with the corresponding PM Port number issued a Set Device Bits FIS to the host with the Notification bit set.<br>PM Port 0h sets bit 0. PM Port Fh sets bit 15.<br>Individual bits are cleared by software writing 1's to the corresponding bit positions.<br>***Note:*** While this field is reset to default on a HBA Reset, it is not reset by COMRESET or SRST |

## 50.4.121 Enclosure Management Message Format (EM_MF)—Offset 580h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 580h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0x0<br>RO | **RSVD0:** Reserved |
| 27:24 | 0x0<br>RW | **Message Type (MTYPE):** Specifies the type of the message.<br>The message types are:<br>• 0h = LED<br>• 1h = SAF-TE<br>• 2h = SES-2<br>• 3h = SGPIO (register based interface)<br>• All other values reserved. |
| 23:16 | 0x0<br>RW | **Data Size (DSIZE):** Specifies the data size in bytes.<br>If the message (enclosure services command) has a data buffer that is associated with it that is transferred, the size of that data buffer is specified in this field.<br>If there is no separate data buffer, this field shall have a value of '0'.<br>The data directly follows the message in the message buffer. This value should always be '0'. |
| 15:8 | 0x0<br>RW | **Message Size (MSIZE):** Specifies the size of the message in bytes.<br>The message size does not include the one Dword header.<br>A value of '0'. is invalid. The message size is always 4 bytes. |
| 7:0 | 0x0<br>RO | **RSVD1:** Reserved |

## 50.4.122 Enclosure Management LED (EM_LED)—Offset 584h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABAR] + 584h

**ABAR Type:** PCI Configuration Register (Size: 32 bits)
**ABAR Reference:** [B:0, D:(19,20), F:0] + 24h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **Value (VAL):** This field describes the state of each LED for a particular location. There are three LEDs that may be supported by the HBA. Each LED has 3 bits of control.<br>LED values are:<br>• 000b - LED shall be off<br>• 001b - LED shall be solid on as perceived by human eye<br>• All other values reserved.<br>The LED bit locations are:<br>• Bits 2:0 - Activity LED (may be driven by hardware)<br>• Bits 5:3 - Vendor Specific LED (e.g. locate)<br>• Bits 8:6 - Vendor Specific LED (e.g. fault)<br>• Bits 15:9 - Reserved.<br>Vendor specific message is: Bit 3:0 - Vendor Specific Pattern; Bit 15:4 - Reserved. |
| 15:8 | 0x0<br>RW | **Port Multiplier Information (PM):** Specifies slot specific information related to Port Multiplier. Bits 3:0 specify the Port Multiplier port number for the slot that requires the status update.<br>• If a Port Multiplier is not attached to the device in the affected slot, the Port Multiplier port number shall be '0'.<br>• Bits 7:4 are reserved. SATA does not support LED messages for devices behind a Port Multiplier. This byte should be 0. |
| 7:0 | 0x0<br>RW | **HBA Information (HBA):** Specifies slot specific information related to the HBA.<br>• Bits 4:0 - HBA port number for the slot that requires the status update.<br>• Bit 5 - If set to '1', Value is a vendor specific message that applies to the entire enclosure. If cleared to '0', Value applies to the port specified in bits 4:0.<br>• Bits 7:6 - Reserved. |

§ §

# 51 USB Combo Controller - B0, D21, F0

## 51.1 Introduction and Index

The host-accessible registers for the USB Combo Controller are described here.

To determine the number of devices/functions available refer to the following:

- Table 1-1, "Features by product SKU - Server and Cloud Storage SKUs 0 through 4"
- Table 1-2, "Features by Product SKU - Network and Enterprise Storage SKUs 5 through 10"
- Table 1-3, "Features by Product SKU - Extended Temperature SKUs 11 through 14".

The legend for the register access codes are described in Chapter 43, "Introduction."

### 51.1.1 Host Configuration Space

These registers are discovered in Host Configuration Space starting at Bus 0, Device 21 (decimal), Function 0. The offset addresses are listed.

**Table 51-1. Summary of PCI Configuration Registers—0/21/0**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 0 | 2 | 8086 | "Vendor ID (VID)—Offset 0h" on page 2006 |
| 2 | 2 | 19D0 | "Device ID (DID)—Offset 2h" on page 2006 |
| 4 | 2 | 0000 | "Command (CMD)—Offset 4h" on page 2007 |
| 6 | 2 | 0290 | "Device Status (STS)—Offset 6h" on page 2008 |
| 8 | 1 | 00 | "Revision ID (RID)—Offset 8h" on page 2010 |
| 9 | 1 | 30 | "Programming Interface (PI)—Offset 9h" on page 2010 |
| A | 1 | 03 | "Sub Class Code (SCC)—Offset Ah" on page 2010 |
| B | 2 | 0C | "Base Class Code (BCC)—Offset Bh" on page 2010 |
| D | 1 | 00 | "Master Latency Timer (MLT)—Offset Dh" on page 2011 |
| E | 2 | 00 | "Header Type (HT)—Offset Eh" on page 2011 |
| 10 | 8 | 0000000000000004 | "Memory Base Address (MBAR)—Offset 10h" on page 2012 |
| 2C | 2 | 0000 | "USB Subsystem Vendor ID (SSVID)—Offset 2Ch" on page 2012 |
| 2E | 2 | 0000 | "USB Subsystem ID (SSID)—Offset 2Eh" on page 2013 |
| 34 | 1 | 70 | "Capabilities Pointer (CAP_PTR)—Offset 34h" on page 2013 |
| 3C | 1 | 00 | "Interrupt Line (ILINE)—Offset 3Ch" on page 2013 |
| 3D | 3 | 00 | "Interrupt Pin (IPIN)—Offset 3Dh" on page 2014 |
| 40 | 4 | 000001FD | "XHC System Bus Configuration 1 (XHCC1)—Offset 40h" on page 2014 |
| 44 | 4 | 0003C000 | "XHC System Bus Configuration 2 (XHCC2)—Offset 44h" on page 2016 |
| 50 | 4 | 00000000 | "Clock Gating (XHCLKGTEN)—Offset 50h" on page 2018 |
| 58 | 4 | 00000000 | "Audio Time Synchronization (AUDSYNC)—Offset 58h" on page 2021 |
| 60 | 1 | 30 | "Serial Bus Release Number (SBRN)—Offset 60h" on page 2021 |
| 61 | 1 | 60 | "Frame Length Adjustment (FLADJ)—Offset 61h" on page 2022 |
| 62 | 1 | 00 | "Best Effort Service Latency (BESL)—Offset 62h" on page 2023 |
| 70 | 1 | 01 | "PCI Power Management Capability ID (PM_CID)—Offset 70h" on page 2023 |
| 71 | 1 | 80 | "Next Item Pointer #1 (PM_NEXT)—Offset 71h" on page 2023 |
| 72 | 2 | C1C2 | "Power Management Capabilities (PM_CAP)—Offset 72h" on page 2024 |
| 74 | 2 | 0008 | "Power Management Control/Status (PM_CS)—Offset 74h" on page 2025 |
| 80 | 1 | 05 | "Message Signaled Interrupt CID (MSI_CID)—Offset 80h" on page 2026 |
| 81 | 1 | 00 | "Next item pointer (MSI_NEXT)—Offset 81h" on page 2026 |
| 82 | 2 | 0086 | "Message Signaled Interrupt Message Control (MSI_MCTL)—Offset 82h" on page 2027 |
| 84 | 4 | 00000000 | "Message Signaled Interrupt Message Address (MSI_MAD)—Offset 84h" on page 2028 |
| 88 | 4 | 00000000 | "Message Signaled Interrupt Upper Address (MSI_MUAD)—Offset 88h" on page 2028 |
| 8C | 2 | 0000 | "Message Signaled Interrupt Message Data (MSI_MD)—Offset 8Ch" on page 2028 |
| 90 | 4 | F0140009 | "Device Idle Capability (DEVIDLE)—Offset 90h" on page 2029 |

## Table 51-1. Summary of PCI Configuration Registers—0/21/0 (Continued)

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 94 | 4 | 01400010 | "Vendor Specific Header (VSHDR)—Offset 94h" on page 2029 |
| 98 | 4 | 00000000 | "SW LTR POINTER (SWLTRPTR)—Offset 98h" on page 2030 |
| 9C | 4 | 00080AC1 | "Device Idle Pointer Register (DEVIDLEPTR)—Offset 9Ch" on page 2030 |
| A0 | 2 | 0800 | "Device Idle Power ON Latency (DEVIDLEPOL)—Offset A0h" on page 2031 |
| A4 | 4 | 00002000 | "High Speed Configuration 2 (HSCFG2)—Offset A4h" on page 2032 |
| B0 | 4 | 00000000 | "XHCI USB2 Overcurrent Pin Mapping 1 (U2OCM1)—Offset B0h" on page 2033 |
| D0 | 4 | 00000000 | "XHCI USB3 Overcurrent Pin Mapping 1 (U3OCM1)—Offset D0h" on page 2033 |
| FC | 4 | 00000002 | "XHCC3—Offset FCh" on page 2034 |

### 51.1.2 Host Memory Space—MBAR

An index of the registers that are accessible in Host Memory Space is shown here.

**Table 51-2. Summary of Memory Mapped I/O Registers—MBAR**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 0 | 2 | 80 | "Capability Registers Length (CAPLENGTH)—Offset 0h" on page 2035 |
| 2 | 2 | 0100 | "Host Controller Interface Version Number (HCIVERSION)—Offset 2h" on page 2035 |
| 4 | 4 | 08000820 | "Structural Parameters 1 (HCSPARAMS1)—Offset 4h" on page 2036 |
| 8 | 4 | 94000054 | "Structural Parameters 2 (HCSPARAMS2)—Offset 8h" on page 2036 |

## 51.2 Registers in Configuration Space

### 51.2.1 Vendor ID (VID)—Offset 0h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:21, F:0] + 0h

**Default:** 8086h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0x8086<br>RO | **Vendor ID (VID):** Reserved.<br><br>**Power Well:** Core |

### 51.2.2 Device ID (DID)—Offset 2h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:21, F:0] + 2h

**Default:** 19D0h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0x19d0<br>RO/V | **Device ID (DID):**<br><br>**Power Well:** Core |

## 51.2.3 Command (CMD)—Offset 4h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:21, F:0] + 4h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:11 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 10 | 0x0<br>RW | **Interrupt Disable (ID):** When cleared to 0, the function is capable of generating interrupts. When 1, the function can not generate its interrupt to the interrupt controller<br>***Note:*** The corresponding Interrupt Status bit is not affected by the interrupt enable.<br><br>**Power Well:** Core |
| 9 | 0x0<br>RO | **Fast Back to Back Enable (FBE):** Reserved.<br><br>**Power Well:** Core |
| 8 | 0x0<br>RW | **SERR# Enable (SERR):** When set to 1, the XHC is capable of generating (internally) SERR#.<br><br>**Power Well:** Core |
| 7 | 0x0<br>RO | **Wait Cycle Control (WCC):** Reserved.<br><br>**Power Well:** Core |
| 6 | 0x0<br>RW | **Parity Error Response (PER):** When set to 1, the XHCI Host Controller will check for correct parity (on its internal interface) and halt operation when bad parity is detected during the data phase as recommended by the XHCI specification.<br>***Note:*** This applies to both requests and completions from the system interface.<br>This bit must be set in order for the parity errors to generate SERR#.<br><br>**Power Well:** Core |
| 5 | 0x0<br>RO | **VGA Palette Snoop (VPS):** Reserved.<br><br>**Power Well:** Core |
| 4 | 0x0<br>RO | **Memory Write Invalidate (MWI):** Reserved.<br><br>**Power Well:** Core |
| 3 | 0x0<br>RO | **Special Cycle Enable (SCE):** Reserved.<br><br>**Power Well:** Core |
| 2 | 0x0<br>RW | **Bus Master Enable (BME):** When set, it allows XHC to act as a bus master.<br>When cleared, it disable XHC from initiating transactions on the system bus.<br><br>**Power Well:** Core |
| 1 | 0x0<br>RW | **Memory Space Enable (MSE):** This bit controls access to the XHC Memory Space registers.<br>If this bit is set, accesses to the XHC registers are enabled.<br>The Base Address register for the XHC should be programmed before this bit is set.<br><br>**Power Well:** Core |
| 0 | 0x0<br>RO | **I/O Space Enable (IOSE):** Reserved as 0. Read-Only.<br><br>**Power Well:** Core |

## 51.2.4 Device Status (STS)—Offset 6h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:21, F:0] + 6h

**Default:** 0290h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RW/1C | **Detected Parity Error (DPE):** This bit is set by the SoC whenever a parity error is seen on the internal interface to the XHC host controller, regardless of the setting of bit 6 or bit 8 in the Command register or any other conditions.<br>Software clears this bit by writing a 1 to this bit location.<br><br>**Power Well:** Core |
| 14 | 0x0<br>RW/1C | **Signaled System Error (SSE):** This bit is set by the SoC whenever it signals SERR# (internally). The SERR_EN bit (bit 8 in the Command Register) must be 1 for this bit to be set. Software clears this bit by writing a 1 to this bit location.<br><br>**Power Well:** Core |
| 13 | 0x0<br>RW/1C | **Received Master-Abort Status (RMA):** This bit is set when XHC, as a master, receives a master-abort status on a memory access.<br>This is treated as a Host Error and halts the DMA engines. Software clears this bit by writing a 1 to this bit location.<br><br>**Power Well:** Core |
| 12 | 0x0<br>RW/1C | **Received Target Abort Status (RTA):** This bit is set when XHC, as a master, receives a target abort status on a memory access.<br>This is treated as a Host Error and halts the DMA engines. Software clears this bit by writing a 1 to this bit location.<br><br>**Power Well:** Core |
| 11 | 0x0<br>RW/1C | **Signaled Target-Abort Status (STA):** This bit is used to indicate when the XHC function responds to a cycle with a target abort.<br><br>**Power Well:** Core |
| 10:9 | 0x1<br>RO | **DEVSEL# Timing Status (DEVT):** This 2-bit field defines the timing for DEVSEL# assertion.<br>Read-Only.<br><br>**Power Well:** Core |
| 8 | 0x0<br>RW/1C | **Master Data Parity Error Detected (MDPED):** This bit is set by the SoC whenever a data parity error is detected on a XHC read completion packet on the internal interface to the XHC host controller and bit 6 of the Command register is set to 1.<br>Software clears this bit by writing a 1 to this bit location.<br><br>**Power Well:** Core |
| 7 | 0x1<br>RO | **Fast Back-to-Back Capable (FBBC):** Reserved as 1 Read-Only.<br><br>**Power Well:** Core |
| 6 | 0x0<br>RO | **User Definable Features (UDF):** Reserved as 0. Read-Only.<br><br>**Power Well:** Core |
| 5 | 0x0<br>RO | **66 MHz Capable (MC):** Reserved as 0. Read-Only.<br><br>**Power Well:** Core |
| 4 | 0x1<br>RO | **Capabilities List (CL):** Hardwired to 1 indicating that offset 34h contains a valid capabilities pointer.<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 3 | 0x0<br>RO/V | **Interrupt Status (IS):** This read-only bit reflects the state of this function's interrupt at the input of the enable/disable logic.<br>This bit is a 1 when the interrupt is asserted.<br>This bit will be 0 when the interrupt is deasserted.<br>The value reported in this bit is independent of the value in the Interrupt Enable bit.<br><br>**Power Well:** Core |
| 2:0 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |

### 51.2.5 Revision ID (RID)—Offset 8h

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:21, F:0] + 8h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO/V | **Revision ID (RID):**<br><br>**Power Well:** Core |

### 51.2.6 Programming Interface (PI)—Offset 9h

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:21, F:0] + 9h

**Default:** 30h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x30<br>RO | **Programming Interface (PI):** A value of 30h indicates that this USB Host Controller conforms to the XHCI specification.<br><br>**Power Well:** Core |

### 51.2.7 Sub Class Code (SCC)—Offset Ah

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:21, F:0] + Ah

**Default:** 03h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x3<br>RO | **Sub Class Code (SCC):** A value of 03h indicates that this is a Universal Serial Bus Host Controller.<br><br>**Power Well:** Core |

### 51.2.8 Base Class Code (BCC)—Offset Bh

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:21, F:0] + Bh

**Default:** 0Ch

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0xc<br>RO | **Base Class Code (BCC):** A value of 0Ch indicates that this is a Serial Bus controller.<br><br>**Power Well:** Core |

## 51.2.9 Master Latency Timer (MLT)—Offset Dh

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:21, F:0] + Dh

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO | **Master Latency Timer (MLT):** Because the XHC controller is internally implemented with arbitration on an internal interface, it does not need a master latency timer.<br>The bits will be fixed at 0.<br><br>**Power Well:** Core |

## 51.2.10 Header Type (HT)—Offset Eh

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:21, F:0] + Eh

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RO | **Multi-Function Bit (MFB):** Read only indicating single function device.<br><br>**Power Well:** Core |
| 6:0 | 0x0<br>RO | **Configuration layout (CL):** Hardwired to 0 to indicate a standard PCI configuration layout.<br><br>**Power Well:** Core |

## 51.2.11 Memory Base Address (MBAR)—Offset 10h

Value in this register will be different after the enumeration process.

**Type:** PCI Configuration Register (Size: 64 bits)

**Offset:** [B:0, D:21, F:0] + 10h

**Default:** 0000000000000004h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:16 | 0x0<br>RW | **Base Address (BA):** Bits (63:16) correspond to memory address signals (63:16), respectively. This gives 64 KB of relocatable memory space aligned to 64 KB boundaries.<br><br>**Power Well:** Core |
| 15:4 | 0x0<br>RO | **Reserved (RSVD):** Reserved. Read-Only 0, this indicates that this function is requesting an 64KB block of memory.<br><br>**Power Well:** Core |
| 3 | 0x0<br>RO | **Prefetchable:** This bit is hardwired to 0 indicating that this range should not be pre-fetched.<br><br>**Power Well:** Core |

| 0 | 0x0<br>RO | **Resource Type Indicator (RTE):** This bit is hardwired to 0 indicating that the base address field in this register maps to memory space.<br><br>**Power Well:** Core |

## 51.2.12 USB Subsystem Vendor ID (SSVID)—Offset 2Ch

This register is modified and maintained by BIOS

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:21, F:0] + 2Ch

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0x0<br>RW/L | **USB Subsystem Vendor ID (SSVID):** This register, in combination with the USB Subsystem ID register, enables the operating system to distinguish each subsystem from the others.<br><br>**Power Well:** Core |

## 51.2.13 USB Subsystem ID (SSID)—Offset 2Eh

This register is modified and maintained by BIOS

**Type:** PCI Configuration Register
(Size: 16 bits)

**Offset:** [B:0, D:21, F:0] + 2Eh

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0x0<br>RW/L | **USB Subsystem ID (SSID):** BIOS sets the value in this register to identify the Subsystem ID. This register, in combination with the Subsystem Vendor ID register, enables the operating system to distinguish each subsystem from other(s).<br><br>**Power Well:** Core |

## 51.2.14 Capabilities Pointer (CAP_PTR)—Offset 34h

**Type:** PCI Configuration Register
(Size: 8 bits)

**Offset:** [B:0, D:21, F:0] + 34h

**Default:** 70h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x70<br>RO | **Capabilities Pointer (CAP_PTR):** This register points to the starting offset of the capabilities ranges.<br><br>**Power Well:** Core |

## 51.2.15 Interrupt Line (ILINE)—Offset 3Ch

**Type:** PCI Configuration Register
(Size: 8 bits)

**Offset:** [B:0, D:21, F:0] + 3Ch

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Interrupt Line (ILINE):** This data is not used by the SoC. It is used as a scratchpad register to communicate to software the interrupt line that the interrupt pin is connected to.<br><br>**Power Well:** Core |

## 51.2.16 Interrupt Pin (IPIN)—Offset 3Dh

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:21, F:0] + 3Dh

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW/L | **Interrupt pin (IPIN):** Bits 7:0 reflect the Interrupt Pin assigned to the host controller by the platform (and are hardwired).<br><br>**Power Well:** Core |

## 51.2.17 XHC System Bus Configuration 1 (XHCC1)—Offset 40h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:21, F:0] + 40h

**Default:** 000001FDh

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW/O | **Access Control (ACCTRL):** This bit is used by BIOS to lock/unlock lockable bits.<br>When set to '1' the write access to bits locked by this bit is disabled (locked state).<br>When set to '0', the write access to bit locked by this bit is enabled (unlocked state).<br>Writable once after platform reset.<br><br>**Power Well:** Core |
| 30:25 | 0x0<br>RW | **ECO1:**<br><br>**Power Well:** Core |
| 24 | 0x0<br>RW | **Master/Target Abort SERR (RMTASERR):** When set, it allows the out-of-band error reporting from the xHCI Controller to be reported as SERR# (if SERR# reporting is enabled) and thus set the STS.SSE bit.<br><br>**Power Well:** Core |
| 23 | 0x0<br>RW/C | **Unsupported Request Detected (URD):** Set the HW when xHCI Controller received an unsupported request posted cycle.<br>Cleared by SW when the bit is written with value of '1'.<br><br>**Power Well:** Core |
| 22 | 0x0<br>RW | **Unsupported Request Report Enable (URRE):** When set this bit allows the URD bit to be reported as SERR# (if SERR# reporting is enabled) and thus set the STS.SSE bit.<br><br>**Power Well:** Core |
| 21:19 | 0x0<br>RW | **Inactivity Initiated L1 Enable (IIL1E):** If programmed to non-zero, it allows L1 power managed to be enabled after the time-out period specified.<br>• 000: Disabled<br>• 001: 32 bb_cclk<br>• 010: 64 bb_cclk<br>• 011: 128 bb_cclk<br>• 100: 256 bb_cclk<br>• 101: 512 bb_cclk<br>• 110: 1024 bb_cclk<br>• 111: 131072 bb_cclk<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 18 | 0x0<br>RW | **XHC Initiated L1 Enable (XHCIL1E):** If set, allow the XHC initiated L1 power management to be enabled.<br><br>**Power Well:** Core |
| 17 | 0x0<br>RW | **D3 Initiated L1 Enable (D3IL1E):** If set, allow PCI device state D3 initiated L1 power management to be enables.<br>This bit can only be set if the XHCI L1 Override P2 chicken bit is set.<br><br>**Power Well:** Core |
| 16:12 | 0x0<br>RW | **Periodic Complete Pre Wake Time (PCPWT):** This allows for platform wake time before the next scheduled periodic transaction.<br>The value programmed in this field represents the # of bytes consumed in the current micro-frame which is required to allow for the periodic complete to de-assert.<br>This allows for a programmable time to cause the periodic complete to de-assert prior to the start of the next micro-frame.<br>Register Format: Bits (16:12) represents the # of bytes remaining with a 256B granularity.<br>Periodic Complete will de-assert if the bytes consumed in the current micro-frame is less<br><br>**Power Well:** Core |
| 11 | 0x0<br>RW | **SW Assisted xHC Idle (SWAXHCI):** This bit being set will indicate xHC idleness (through SW means), which must be a '1' to allow L1 entry, and subsequently allow backbone clock to be gated.<br>This bit is to be set by Intel xHCI driver after checking that the xHCI Controller will stay in idle state for a significant period of time, e.g. all ports disconnected.<br>This bit can be cleared under the following conditions (see SWAXHCI Policy bits in xHC System Bus Configuration 2 register): n SW: SW could write 0 to clear this bit. n HW: HW, under policy control, will clear this bit on an MMIO access to the Host Controller. n HW: HW, under policy control, will clear this bit when HW exits Idle state.<br><br>**Power Well:** Core |
| 10:8 | 0x1<br>RW | **L23 to Host Reset Acknowledge Wait Count (L23HRAWC):** If programmed to non zero, it allows a wait period after the L23 PHY has shutdown before returning host reset acknowledge to PMC.<br>• 000: Disabled<br>• 001: 128 bb_cclk<br>• 010: 256 bb_cclk<br>• 011: 512 bb_cclk<br>• 100: 1024 bb_cclk<br>• 101: 2048 bb_cclk<br>• 110: 4096 bb_cclk<br>• 111: 131072 bb_cclk<br><br>**Power Well:** Core |
| 7:6 | 0x3<br>RW | **Upstream Type Arbiter Grant Count Posted (UTAGCP):** Grant count for IOSF upstream L2 request type arbiter for posted type.<br><br>**Power Well:** Core |
| 5:4 | 0x3<br>RW | **Upstream Type Arbiter Grant Count Non Posted (UDAGCNP):** Grant count for IOSF upstream L2 type arbiter for non-posted type.<br><br>**Power Well:** Core |

| 7:5 | 0x0<br>RW | **SS Backbone PXP PLL Shutdown Ux Enable (SSPLLSUE):** This register determines the Ux state(s) which will be exposed to DMI PLL Shutdown conditions.<br>PLL Shutdown is allowed in:<br>• 000b Disabled (Link states shall be ignored for DMI PLL shutdown).<br>• 001b U0 or conditions for 010b setting<br>• 010b U1 or conditions for 011b setting<br>• 011b U2 or conditions for 100b setting<br>• 100b U3, Disconnected, Disabled or Powered-Off<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 4 | 0x0<br>RW | **XHC Backbone Local Clock Gating Enable (XHCBLCGE):** When set, this bit allows XHCI Controller IP backbone clock to be locally gated when idle conditions are met.<br>***Note:*** If XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value.<br><br>**Power Well:** Core |
| 3 | 0x0<br>RW | **HS Link Trunk Clock Gating Enable (HSLTCGE):** When set, this bit allows High Speed Link control's 480 MHz and its 48/60 MHz link clock trunk to be gated when idle conditions are met.<br>***Note:*** If XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value. BIOS need to query fuses to see if HW is enabled.<br><br>**Power Well:** Core |
| 2 | 0x0<br>RW | **SS Link Trunk Clock Gating Enable (SSLTCGE):** When set, this bit allows the SuperSpeed Link control's 250 MHz and its divided 125 MHz link clock trunk to ge gated when idle conditions are met.<br>***Note:*** If XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value. BIOS need to query fuses to see if HW is enabled.<br><br>**Power Well:** Core |
| 1 | 0x0<br>RW | **IOSF Backbone Trunk Clock Gating Enable (IOSFBTCGE):** When set, this bit allows the IOSF backbone clock trunk to be gated when idle conditions are met.<br><br>**Power Well:** Core |
| 0 | 0x0<br>RW | **IOSF Gasket Backbone Local Clock Gating Enable (IOSFBLCGE):** When set, this bit allows the IOSF Gasket backbone clock to be locally gated when idle conditions are met.<br>***Note:*** If XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value. BIOS need to query fuses to see if HW is enabled.<br><br>**Power Well:** Core |

## 51.2.20 Audio Time Synchronization (AUDSYNC)—Offset 58h

This 32 bit register is used for audio stream synchronization across different devices. Global signal sample_now captures a value in AUDSYNC register.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:21, F:0] + 58h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:30 | 0x0<br>RO | **Rsvd2:** Reserved.<br><br>**Power Well:** Core |
| 29:16 | 0x0<br>RO/V | **Captured Frame List Current Index/Frame Number (CMFI):** The value in this register is updated in response to sample_now signal.<br>Bits (29:16) reflect state of bits (13:0) of FRINDEX<br><br>**Power Well:** Core |
| 15:13 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 12:0 | 0x0<br>RO/V | **Captured Micro-frame BLIF (CMFB):** The value is updated in response to sample_now signal and provides information about offset within micro-frame.<br>Captured value represents number of 8 high-speed bit time units from start of micro-frame.<br>At the beginning of micro-frame captured value will be 0 and increase to maximum value at the end.<br>Default maximum value is 7499 but it may be changed as result of adjustment done in FLA.<br><br>**Power Well:** Core |

## 51.2.21 Serial Bus Release Number (SBRN)—Offset 60h

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:21, F:0] + 60h

**Default:** 30h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x30<br>RO | **Serial Bus Release Number (SBRN):** A value of 30h indicates that this controller follows USB release 3.0.<br><br>**Power Well:** SUS |

## 51.2.22 Frame Length Adjustment (FLADJ)—Offset 61h

This feature is used to adjust any offset from the clock source that generates the clock that drives the SOF counter. When a new value is written into these six bits, the length of the frame is adjusted. Its initial programmed value is system dependent based on the accuracy of hardware USB clock and is initialized by system BIOS. This register should only be modified when the HChalted bit in the USBSTS register is a one. Changing value of this register while the host controller is operating yields undefined results.

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:21, F:0] + 61h

**Default:** 60h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RO | **Reserved (RSVD):**<br><br>**Power Well:** SUS |
| 6 | 0x1<br>RO | **No Frame Length Timing Capability (NO_FRAME_LENGTH_TIMING_CAP):** This flag is set to 1 to indicate that the host controller does not support a programmable Frame Length Timing Value field.<br><br>**Power Well:** Core |
| 5:0 | 0x20<br>RO | **Frame Length Timing Value (FLTV):** SOF micro-frame length) is equal to 59488 + value in this field.<br>The default value is decimal 32 (20h), which gives a SOF cycle time of 60000.<br>Frame Length (number of High Speed bit times) FLADJ Value (decimal) (decimal)<br>• 59488 0 (00h)<br>• 59504 1 (01h)<br>• 59520 2 (02h)<br>• ...<br>• 59984 31 (1Fh)<br>• 60000 32 (20h)<br>• ...<br>• 60480 62 (3Eh)<br>• 60496 63 (3Fh)<br>Each decimal value change to this register corresponds to 16 high-speed bit times.<br>The SOF cycle time (number of SOF counter clock periods to generate a SOF micro-frame length) is equal to 59488 + value in this field.<br>The default value is decimal 32 (20h), which gives a SOF cycle time of 60000. Frame Length (# High Speed bit times) FLADJ Value<br><br>**Power Well:** SUS |

## 51.2.23 Best Effort Service Latency (BESL)—Offset 62h

Best Effort Service Latency.

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:21, F:0] + 62h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:4 | 0x0<br>RW/L | **Default Best Effort Service Latency Deep (DBESLD):** Default Best Effort Service Latency (DBESLD) If the value of this field is non-zero, it defines the recommended value for programming the PORTPMSC register BESLD field.<br>This is programmed by BIOS based on platform parameters.<br><br>**Power Well:** Core |
| 3:0 | 0x0<br>RW/L | **Default Best Effort Service Latency (DBESL):** If the value of this field is non-zero, it defines the recommended value for programming the PORTPMSC register BESL field.<br>This is programmed by BIOS based on platform parameters.<br><br>**Power Well:** Core |

## 51.2.24 PCI Power Management Capability ID (PM_CID)—Offset 70h

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:21, F:0] + 70h

**Default:** 01h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x1<br>RO | **PCI Power Management Capability ID (PM_CID):** A value of 01h indicates that this is a PCI Power Management capabilities field.<br><br>**Power Well:** Core |

## 51.2.25 Next Item Pointer #1 (PM_NEXT)—Offset 71h

This register is modified and maintained by BIOS

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:21, F:0] + 71h

**Default:** 80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x80<br>RW/L | **Next Item Pointer #1 (PM_NEXT):** This register defaults to 80h, which indicates that the next capability registers begin at configuration offset 80h.<br>This register is writable when the Access Control bit is set to '0'.<br>This allows BIOS to effectively hide the next capability registers, if necessary.<br>This register should only be written during system initialization before the plug-and-play software has enabled any master-initiated traffic.<br>Values of: 80h implies next capability is MSI 00h implies that MSI capability is hidden.<br>***Note:*** This value is never expected to be programmed.<br><br>**Power Well:** Core |

## 51.2.26 Power Management Capabilities (PM_CAP)—Offset 72h

Normally, this register is read-only to report capabilities to the power management software. In order to report different power management capabilities depending on the system in which the SoC is used, the write access to this register is controlled by the Access Control bit (ACCTRL). The value written to this register does not affect the hardware other than changing the value returned during a read. This register is modified and maintained by BIOS

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:21, F:0] + 72h

**Default:** C1C2h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:11 | 0x18<br>RW/L | **PME_Support:** This 5-bit field indicates the power states in which the function may assert PME#.<br>The SoC XHC does not support the D1 or D2 states.<br>For all other states, the SoC XHC is capable of generating PME#.<br>Software should never need to modify this field.<br><br>**Power Well:** Core |
| 10 | 0x0<br>RW/L | **D2_Support:** The D2 state is not supported.<br><br>**Power Well:** Core |
| 9 | 0x0<br>RW/L | **D1_Support:** The D1 state is not supported.<br><br>**Power Well:** Core |
| 8:6 | 0x7<br>RW/L | **Aux_Current:** The SoC XHC reports 375mA maximum Suspend well current required when in the D3cold state.<br>This value can be written by BIOS when a more accurate value is known.<br><br>**Power Well:** Core |
| 5 | 0x0<br>RW/L | **DSI:** The SoC reports 0, indicating that no device-specific initialization is required.<br><br>**Power Well:** Core |
| 4 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 3 | 0x0<br>RW/L | **PME Clock (PMEClock):** The SoC reports 0, indicating that no PCI clock is required to generate PME#.<br><br>**Power Well:** Core |
| 2:0 | 0x2<br>RW/L | **Version:** The SoC reports 010, indicating that it complies with Revision 1.1 of the PCI Power Management Specification.<br><br>**Power Well:** Core |

## 51.2.27 Power Management Control/Status (PM_CS)—Offset 74h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:21, F:0] + 74h

**Default:** 0008h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RW/1C | **PME_Status:** This bit is set when the SoC XHC would normally assert the PME# signal independent of the state of the PME_En bit.<br>Writing a 1 to this bit will clear it and cause the internal PME to deassert (if enabled).<br>Writing a 0 has no effect.<br>This bit must be explicitly cleared by the operating system each time the operating system is loaded.<br><br>**Power Well:** SUS |
| 14:13 | 0x0<br>RO | **RSVD:** Reserved<br><br>**Power Well:** Core |
| 12:9 | 0x0<br>RO | **RSVD:** Reserved<br><br>**Power Well:** Core |
| 8 | 0x0<br>RW | **PME_En:** A 1 enables the SoC XHC to generate an internal PME signal when PME_Status is 1.<br>This bit must be explicitly cleared by the operating system each time it is initially loaded.<br><br>**Power Well:** SUS |
| 7:4 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 3 | 0x1<br>RO | **No Soft Reset (NSR):** This bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset.<br><br>**Power Well:** Core |
| 2 | 0x0<br>RO | **Reserved (RSVD2):** Reserved.<br><br>**Power Well:** Core |
| 1:0 | 0x0<br>RW | **PowerState:** This 2-bit field is used both to determine the current power state of XHC function and to set a new power state.<br>The definition of the field values are:<br>• 00b - D0 state<br>• 11b - D3hot state<br><br>**Power Well:** Core |

## 51.2.28 Message Signaled Interrupt CID (MSI_CID)—Offset 80h

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:21, F:0] + 80h

**Default:** 05h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x5<br>RO | **Capability ID (CID):** Indicates that this is an MSI capability.<br><br>**Power Well:** Core |

## 51.2.29 Next item pointer (MSI_NEXT)—Offset 81h

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:21, F:0] + 81h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO | **Next Pointer (NEXT):** Indicates that this is the last item on the capability list.<br><br>**Power Well:** Core |

## 51.2.30 Message Signaled Interrupt Message Control (MSI_MCTL)—Offset 82h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:21, F:0] + 82h

**Default:** 0086h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:9 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 8 | 0x0<br>RO | **Per-Vector Masking Capable (PVM):** Specifies whether controller supports MSI per vector masking. Not supported<br><br>**Power Well:** Core |
| 7 | 0x1<br>RO | **64 Bit Address Capable (C64):** Specifies whether capable of generating 64-bit messages. This device is 64-bit capable.<br><br>**Power Well:** Core |
| 6:4 | 0x0<br>RW | **Multiple Message Enable (MME):** Indicates the number of messages the controller should assert. This device supports multiple message MSI.<br><br>**Power Well:** Core |
| 3:1 | 0x3<br>RO | **Multiple Message Capable (MMC):** Indicates the number of messages the controller wishes to assert.<br>This field must be set by HW to reflect the number of Interrupters supported.<br>Encoding number of Vectors requested (number of Interrupters)<br>• 000 1<br>• 001 2<br>• 010 4<br>• 011 8<br>• 100 16<br>• 101 32<br>• 110-111 Reserved<br><br>**Power Well:** Core |
| 0 | 0x0<br>RW | **MSI Enable (MSIE):** If set to 1, MSI is enabled and the traditional interrupt pins are not used to generate interrupts.<br>If cleared to 0, MSI operation is disabled and the traditional interrupt pins are used.<br><br>**Power Well:** Core |

## 51.2.31 Message Signaled Interrupt Message Address (MSI_MAD)—Offset 84h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:21, F:0] + 84h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:2 | 0x0<br>RW | **Addr:** Lower DW of system specified message address, always DWORD aligned.<br><br>**Power Well:** Core |
| 1:0 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |

## 51.2.32 Message Signaled Interrupt Upper Address (MSI_MUAD)—Offset 88h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:21, F:0] + 88h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Upper Addr (UpperAddr):** Upper DW of system specified message address.<br><br>**Power Well:** Core |

## 51.2.33 Message Signaled Interrupt Message Data (MSI_MD)—Offset 8Ch

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:21, F:0] + 8Ch

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0x0<br>RW | **Data:** This 16-bit field is programmed by system software if MSI is enabled.<br>Its content is driven onto the lower word (PCI AD(15:0)) during the data phase of the MSI memory write transaction.<br><br>**Power Well:** Core |

## 51.2.34 Device Idle Capability (DEVIDLE)—Offset 90h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:21, F:0] + 90h

**Default:** F0140009h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0xf<br>RO | **VID:** Reserved.<br><br>**Power Well:** Core |
| 27:24 | 0x0<br>RO | **REV:** Reserved.<br><br>**Power Well:** Core |
| 23:16 | 0x14<br>RO | **Length (LENGTH):** Indicates that this capability is 16 bytes long.<br><br>**Power Well:** Core |
| 15:8 | 0x0<br>RO | **Next Capability Pointer (NCP):** This field contains the offset to the next PCI Capability structure or 000h if no other items exist in the linked list of Capabilities.<br><br>**Power Well:** Core |
| 7:0 | 0x9<br>RO | **Capability ID (CID):** Reserved.<br><br>**Power Well:** Core |

## 51.2.35 Vendor Specific Header (VSHDR)—Offset 94h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:21, F:0] + 94h

**Default:** 01400010h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:20 | 0x14<br>RO | **VSEC Length (VSEC_LENGTH):** This field indicates the number of bytes in the entire VSEC structure, including the PCI Extended Capability header, the Vendor- Specific header, and the Vendor-Specific register<br><br>**Power Well:** Core |
| 19:16 | 0x0<br>RO | **VSEC Rev (VSEC_REV):** This field is a vendor-defined version number that indicates the version of the VSEC structure. Software must qualify the Vendor ID and VSEC ID before interpreting this field.<br><br>**Power Well:** Core |
| 15:0 | 0x10<br>RO | **VSEC ID (VSEC_ID):** This field is a vendor-defined ID number that indicates the nature and format of the VSEC structure. Software must qualify the Vendor ID before interpreting this field.<br><br>**Power Well:** Core |

## 51.2.36 SW LTR POINTER (SWLTRPTR)—Offset 98h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:21, F:0] + 98h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:4 | 0x0<br>RO | **SW LTR Update MMIO Offset Location (SW_LTR_UPDT_MMIO_OFFSET):** This register contains the location pointer to the SW LTR register in MMIO space, as an offset from the specified BAR.<br>The value of this register is a don't care, if the Valid bit is not set.<br><br>**Power Well:** Core |
| 3:1 | 0x0<br>RO | **Base Address Register Number (BARNUM):** Contains the 0s based AR Number of the BAR which contains the location of the SW LTR MMIO register.<br>When counting BAR Numbers, all BARs, regardless of size and type, consume one BAR Number.<br>Bar 0 is the 1st BAR. The value of this register is a don't care, if the Valid bit is not set.<br><br>**Power Well:** Core |
| 0 | 0x0<br>RO | **Valid (VALID):** Set to 1 to indicate that the function has implemented a SW LTR register as specified in the DevIdle that can be located using the SWLTRLOC register and BARNUM.<br>Set to 0 to indicate that the function has not implemented a SW LTR register that is compliant to the DevIdle definition.<br>This could be because the function has not implemented SW LTR at all, or has a device specific version of SW LTR.<br><br>**Power Well:** Core |

## 51.2.37 Device Idle Pointer Register (DEVIDLEPTR)—Offset 9Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:21, F:0] + 9Ch

**Default:** 00080AC1h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:4 | 0x80ac<br>RW/L | **DevIdle MMIO Offset Location (DEVIDLELOC):** This register contains the location pointer to the DevIdle register in MMIO space, as an offset from the specified BAR.<br>The value of this register is a don't care, if the Valid bit is not set.<br><br>**Power Well:** Core |
| 3:1 | 0x0<br>RO | **Base Address Register Number (BARNUM):** Contains the 0s based BAR Number of the BAR which contains the location of the DevIdle MMIO register.<br>When counting BAR Numbers, all BARs, regardless of size and type, consume one BAR Number.<br>Bar 0 is the 1st BAR. The value of this register is a don't care, if the Valid bit is not set.<br><br>**Power Well:** Core |
| 0 | 0x1<br>RW/L | **Valid (VALID):** Set to 1 to indicate that the function has implemented a DevIdle register as specified in the DevIdle that can be located using the DEVIDLELOC register and BARNUM.<br>Set to 0 to indicate that the function has not implemented a DevIdle register that is compliant to the DevIdle definition.<br>This could be because the function has not implemented DevIdle at all, or has a device specific version of DevIdle.<br><br>**Power Well:** Core |

## 51.2.38 Device Idle Power ON Latency (DEVIDLEPOL)—Offset A0h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:21, F:0] + A0h

**Default:** 0800h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:13 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 12:10 | 0x2<br>RW/L | **Power On Latency Scale (POLS):** Latency Scale multiplier:<br>• 010: 1us<br>• 011: 32us<br>• All other settings are reserved.<br>The value of this register is multiplied with the Power On Latency Value (POLV) to provide the DevIdle power on exit latency multiplier scale from 1us to 32ms.<br>This register is defined to be RWO (read-write-once) to allow BIOS to set the initial value.<br>This register is undefined if the DevIdle.Valid bit is 0.<br><br>**Power Well:** Core |
| 9:0 | 0x0<br>RW/L | **Power On Latency Value (POLV):** 10-bit value that is multiplied by the Power On Latency Scale. A value of 0 indicates a power on latency of less than 1us.<br>This register is defined to be RWO (read-write-once) to allow BIOS to set the initial value.<br>This register is undefined if the DevIdle.Valid bit is 0.<br><br>**Power Well:** Core |

## 51.2.39 High Speed Configuration 2 (HSCFG2)—Offset A4h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:21, F:0] + A4h

**Default:** 00002000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:19 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 18 | 0x0<br>RW | **PORT1_HOST_MODE_OVERRIDE:** When set, this bit causes the Host_Device mux on port 1 to be forced into the Host mode.<br><br>**Power Well:** Core |
| 17:16 | 0x0<br>RW | **eUSB2SEL:** The two bits are associate with USB2 ports 1 - bit 16 and 2 - bit 2<br>• 0: Port is mapped to USB2<br>• 1: Port is mapped to eUSB2<br><br>**Power Well:** Core |
| 15 | 0x0<br>RW | **HS ASYNC Active IN Mask (HSAAIM):** Determines if the Async Active will mask/ignore IN EP s.<br>• 0 HS ASYNC Active will include IN EP s.<br>• 1 HS ASYNC Active will mask/ignore IN EP s.<br><br>**Power Well:** Core |
| 14 | 0x0<br>RW | **HS OUT ASYNC Active Polling EP Mask (HSOAAPEPM):** Determines if the Async Active for OUT HS/FS/LS masks/ignores EP s that are polling/PINGing (HS) due to NAK.<br>• 0 HS OUT ASYNC Active will include EP s that are polling.<br>• 1 HS OUT ASYNC Active will mask/ignore EP s that are polling.<br><br>**Power Well:** Core |
| 13 | 0x1<br>RW | **HS IN ASYNC Active Polling EP Mask (HSIAAPEPM):** Determines if the Async Active for IN HS/FS/LS masks/ignores EP s that are polling due to NAK.<br>• 0 HS IN ASYNC Active will include EP s that are polling.<br>• 1 HS IN ASYNC Active will mask/ignore EP s that are polling.<br><br>**Power Well:** Core |
| 12:11 | 0x0<br>RW | **HS INTR IN Periodic Active Policy Control (HSIIPAPC):** Controls how the HS INTR IN periodic active is used to generate the global periodic active.<br>This will determine how the smallest service interval among active EP s and number of active EP s are used.<br>• 0 HS INTR IN periodic active will be used to generate periodic active if Service Interval Threshold OR Numb of EP Threshold values meet the requirement.<br>• 1 HS INTR IN periodic active will be used to generate periodic active if Service Interval Threshold AND Numb of EP Threshold values meet the requirement.<br>• 2 Always allow HS INTR EP s to be used in the generation of the global Periodic Active indication.<br>• 3 Never allow HS INTR EP s to be used in the generation of the global Periodic Active indication<br><br>**Power Well:** Core |
| 10:4 | 0x0<br>RW | **HS INTR IN Periodic Active Num of EP Threshold (HSIIPANEPT):** Defines the threshold used to determine if Periodic Active may include HS/FS/LS INTR IN EP active indication.<br><br>**Power Well:** Core |
| 3:0 | 0x0<br>RW | **HS INTR IN Periodic Active Service Interval Threshold (HSIIPASIT):** Defines the Service Interval threshold used to determine if Periodic Active will include HS/FS/LS INTR IN EP active indication.<br><br>**Power Well:** Core |

## 51.2.40 XHCI USB2 Overcurrent Pin Mapping 1 (U2OCM1)—Offset B0h

The RW/L property of this register is controlled by OCCFDONE bit.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:21, F:0] + B0h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:4 | 0x0<br>RO | **Rsvd:** Reserved<br><br>**Power Well:** SUS |
| 3:0 | 0x0<br>RW/L | **OC Mapping (OCM):** Reserved.<br><br>**Power Well:** SUS |

## 51.2.41 XHCI USB3 Overcurrent Pin Mapping 1 (U3OCM1)—Offset D0h

The RW/L property of this register is controlled by OCCFDONE bit.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:21, F:0] + D0h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:4 | 0x0<br>RO | **Rsvd:** Reserved.<br><br>**Power Well:** Core |
| 3:0 | 0x0<br>RW/L | **OC Mapping (OCM):** Reserved.<br><br>**Power Well:** SUS |

## 51.2.42 XHCC3—Offset FCh

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:21, F:0] + FCh

**Default:** 00000002h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:4 | 0x0<br>RO | **Reserved (Rsvd1):** Reserved<br><br>**Power Well:** SUS |
| 3 | 0x0<br>RW | **Error Handling : Disable Command Parity Check (DISABLE_COMMAND_PARITY_CHECK):** When set to 1, XHCI Host Controller disables checking of Command Parity on command received as a target on its IOSF Primary interface<br><br>**Power Well:** SUS |
| 2 | 0x0<br>RW | **Error Handling : Disable Data Parity Check (DISABLE_DATA_PARITY_CHECK):** When set to 1, XHCI Host Controller disables checking of Data Parity on data received as a target on its IOSF Primary interface<br><br>**Power Well:** SUS |
| 1 | 0x1<br>RW | **Error Handling : Enable ECC Error Response (ENABLE_ECC_ERROR_RESPONSE):** When set to 1, XHCI Host Controller will check for ECC on RFs (that support ECC) and halt operation when uncorrectable ECC is detected<br><br>**Power Well:** SUS |
| 0 | 0x0<br>RW/L | **Function Disable (FXN_DISABLE):** When set will disable the xHC from being operational.<br><br>**Power Well:** SUS |

## 51.3 Registers in Memory Space—MBAR

These registers are accessed in Host Memory Space starting at the relocatable memory address defined by the Base Address Register (BAR) MBAR described in Section 51.2.11, "Memory Base Address (MBAR)—Offset 10h" on page 2012.

### 51.3.1 Capability Registers Length (CAPLENGTH)—Offset 0h

This register is modified and maintained by BIOS

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 80h

**BAR and Offset:** [MBAR] + 0h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x80<br>RW/L | **Capability Registers Length (CAPLENGTH):** Reserved.<br><br>**Power Well:** Core |

### 51.3.2 Host Controller Interface Version Number (HCIVERSION)—Offset 2h

This register is modified and maintained by BIOS

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**Default:** 0100h

**BAR and Offset:** [MBAR] + 2h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0x100<br>RW/L | **Host Controller Interface Version Number (HCIVERSION):** Reserved.<br><br>**Power Well:** Core |

## 51.3.3 Structural Parameters 1 (HCSPARAMS1)—Offset 4h

This register is modified and maintained by BIOS.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 08000820h

**BAR and Offset:** [MBAR] + 4h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x8 RW/L | **Number of Ports (MaxPorts):** Reserved.<br>**Power Well:** Core |
| 23:19 | 0x0 RW/L | **Rsvd1:** Reserved.<br>**Power Well:** Core |
| 18:8 | 0x8 RW/L | **Number of Interrupters (MaxIntrs):** Reserved.<br>**Power Well:** Core |
| 7:0 | 0x20 RW/L | **Number of Device Slots (MaxSlots):** Reserved.<br>**Power Well:** Core |

## 51.3.4 Structural Parameters 2 (HCSPARAMS2)—Offset 8h

This register is modified and maintained by BIOS.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 94000054h

**BAR and Offset:** [MBAR] + 8h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:27 | 0x12 RW/L | **Max Scratchpad Buffers LO (MaxScratchpadBufs):** Reserved.<br>**Power Well:** Core |
| 26 | 0x1 RW/L | **Scratchpad Restore (SPR):** Reserved.<br>**Power Well:** Core |
| 25:21 | 0x0 RW/L | **Max Scratchpad Buffers HI (MaxScratchpadBufs_HI):** Reserved.<br>**Power Well:** Core |
| 20:8 | 0x0 RW/L | **Rsvd1:** Reserved.<br>**Power Well:** Core |
| 7:4 | 0x5 RW/L | **Event Ring Segment Table Max (ERSTMax):** Reserved.<br>**Power Well:** Core |
| 3:0 | 0x4 RW/L | **Isochronous Scheduling Threshold (IST):** Reserved.<br>**Power Well:** Core |

## 51.3.5 Structural Parameters 3 (HCSPARAMS3)—Offset Ch

This register is modified and maintained by BIOS.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00040001h

**BAR and Offset:** [MBAR] + Ch

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x4<br>RW/L | **U2 Device Exit Latency (U2DEL):** Reserved.<br><br>**Power Well:** Core |
| 15:8 | 0x0<br>RW/L | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 0x1<br>RW/L | **U1 Device Exit Latency (U1DEL):** Reserved.<br><br>**Power Well:** Core |

## 51.3.6 Capability Parameters (HCCPARAMS)—Offset 10h

This register is modified and maintained by BIOS.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 10h

**Default:** 200077C1h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x2000<br>RW/L | **xHCI Extended Capabilities Pointer (xECP):** Reserved.<br>**Power Well:** Core |
| 15:12 | 0x7<br>RW/L | **Maximum Primary Stream Array Size (MaxPSASize):** Reserved.<br>**Power Well:** Core |
| 11 | 0x0<br>RW/L | **Contiguous Frame ID Capability (CFC):** Reserved.<br>**Power Well:** Core |
| 10 | 0x1<br>RW/L | **Stopped EDLTA Capabilty (SEC):** Reserved.<br>**Power Well:** Core |
| 9 | 0x1<br>RW/L | **Stopped - Short Packet Capability (SPC):** Reserved.<br>**Power Well:** Core |
| 8 | 0x1<br>RW/L | **Parst All Event Data (PAE):** Reserved.<br>**Power Well:** Core |
| 7 | 0x1<br>RW/L | **No Secondary SID Support (NSS):** Reserved.<br>**Power Well:** Core |
| 6 | 0x1<br>RW/L | **Latency Tolerance Messaging Capability (LTC):** Reserved.<br>**Power Well:** Core |
| 5 | 0x0<br>RW/L | **Light HC Reset Capability (LHRC):** Reserved.<br>**Power Well:** Core |
| 4 | 0x0<br>RW/L | **Port Indicators (PIND):** Reserved.<br>**Power Well:** Core |
| 3 | 0x0<br>RW/L | **Port Power Control (PPC):** Reserved.<br>**Power Well:** Core |
| 2 | 0x0<br>RW/L | **Context Size (CSZ):** Reserved.<br>**Power Well:** Core |
| 1 | 0x0<br>RW/L | **BW Negotiation Capability (BNC):** Reserved.<br>**Power Well:** Core |
| 0 | 0x1<br>RW/L | **64-bit Addressing Capability (AC64):** Reserved.<br>**Power Well:** Core |

## 51.3.7 Doorbell Offset (DBOFF)—Offset 14h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00003000h

**BAR and Offset:** [MBAR] + 14h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:2 | 0xc00<br>RO | **Doorbell Array Offset (DBAO):** Reserved.<br><br>**Power Well:** Core |
| 1:0 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |

## 51.3.8 Runtime Register Space Offset (RTSOFF)—Offset 18h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00002000h

**BAR and Offset:** [MBAR] + 18h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:5 | 0x100<br>RO | **Runtime Register Space Offset (RTRSO):** Reserved.<br><br>**Power Well:** Core |
| 4:0 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |

## 51.3.9 USB Command (USBCMD)—Offset 80h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MBAR] + 80h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:12 | 0x0<br>RO | **Rsvd2:** Reserved.<br><br>**Power Well:** Core |
| 11 | 0x0<br>RW | **Enable U3 MFINDEX Stop (EU3S):** Reserved.<br><br>**Power Well:** Core |
| 10 | 0x0<br>RW | **Enable Wrap Event (EWE):** Reserved.<br><br>**Power Well:** Core |
| 9 | 0x0<br>RW | **Controller Restore State (CRS):** Reserved.<br><br>**Power Well:** Core |
| 8 | 0x0<br>RW | **Controller Save State (CSS):** Reserved.<br><br>**Power Well:** Core |
| 7 | 0x0<br>RW | **Light Host Controller Reset (LHCRST):** Reserved.<br><br>**Power Well:** Core |
| 6:4 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 3 | 0x0<br>RW | **Host System Error Enable (HSEE):** Reserved.<br><br>**Power Well:** Core |
| 2 | 0x0<br>RW | **Interrupter Enable (INTE):** Reserved.<br><br>**Power Well:** Core |
| 1 | 0x0<br>RW | **Host Controller Reset (HCRST):** Reserved.<br><br>**Power Well:** Core |
| 0 | 0x0<br>RW | **Run/Stop (RS):** Reserved.<br><br>**Power Well:** Core |

## 51.3.10 USB Status (USBSTS)—Offset 84h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000001h

**BAR and Offset:** [MBAR] + 84h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:13 | 0x0<br>RO | **Rsvd3:** Reserved.<br><br>**Power Well:** Core |
| 12 | 0x0<br>RO | **Host Controller Error (HCE):** This bit is not preset in HC, this is deviation from XHCI 1.0 spec.<br><br>**Power Well:** Core |
| 11 | 0x0<br>RO | **Controller Not Ready (CNR):** This is deviation from XHCI 1.0 spec.<br><br>**Power Well:** Core |
| 10 | 0x0<br>RW/C | **Save/Restore Error (SRE):** Reserved.<br><br>**Power Well:** Core |
| 9 | 0x0<br>RO | **Restore State Status (RSS):** Reserved.<br><br>**Power Well:** Core |
| 8 | 0x0<br>RO | **Save State Status (SSS):** Reserved.<br><br>**Power Well:** Core |
| 7:5 | 0x0<br>RO | **Rsvd2:** Reserved.<br><br>**Power Well:** Core |
| 4 | 0x0<br>RW/C | **Port Change Detect (PCD):** Reserved.<br><br>**Power Well:** Core |
| 3 | 0x0<br>RW/C | **Event Interrupt (EINT):** Reserved.<br><br>**Power Well:** Core |
| 2 | 0x0<br>RW/C | **Host System Error (HSE):** Reserved.<br><br>**Power Well:** Core |

| 0 | 0x1<br>RO | **HCHalted (HCH):** Reserved.<br><br>**Power Well:** Core |

## 51.3.11 Page Size (PAGESIZE)—Offset 88h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000001h

**BAR and Offset:** [MBAR] + 88h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 15:0 | 0x1<br>RO | **Page Size (PAGESIZE):** Reserved.<br><br>**Power Well:** Core |

## 51.3.12 Device Notification Control (DNCTRL)—Offset 94h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MBAR] + 94h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 15:0 | 0x0<br>RW | **Notification Enable (N0_N15):** Reserved.<br><br>**Power Well:** Core |

## 51.3.13 Command Ring Low (CRCR_LO)—Offset 98h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MBAR] + 98h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:6 | 0x0<br>RW | **Command Ring Pointer (CRP):** Reserved.<br><br>**Power Well:** Core |
| 5:4 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 3 | 0x0<br>RO | **Command Ring Running (CRR):** Reserved.<br><br>**Power Well:** Core |
| 2 | 0x0<br>RW/1S | **Command Abort (CA):** Reserved.<br><br>**Power Well:** Core |
| 1 | 0x0<br>RW/1S | **Command Stop (CS):** Reserved.<br><br>**Power Well:** Core |
| 0 | 0x0<br>RW | **Ring Cycle State (RCS):** Reserved.<br><br>**Power Well:** Core |

## 51.3.14 Command Ring High (CRCR_HI)—Offset 9Ch

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MBAR] + 9Ch

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Command Ring Pointer (CRP):** Reserved.<br><br>**Power Well:** Core |

## 51.3.15 Device Context Base Address Array Pointer Low (DCBAAP_LO)—Offset B0h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MBAR] + B0h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:6 | 0x0<br>RW | **Device Context Base Address Array Pointer (DCBAAP):** Reserved.<br><br>**Power Well:** Core |
| 5:0 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |

## 51.3.16 Device Context Base Address Array Pointer High (DCBAAP_HI)—Offset B4h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MBAR] + B4h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Device Context Base Address Array Pointer (DCBAAP):** Reserved.<br><br>**Power Well:** Core |

## 51.3.17 Configure (CONFIG)—Offset B8h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MBAR] + B8h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RW | **Max Device Slots Enabled (MaxSlotsEn):** Reserved.<br><br>**Power Well:** Core |

## 51.3.18 Port Status and Control USB2 (PORTSC1)—Offset 480h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 000002A0h

**BAR and Offset:** [MBAR] + 480h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW/1S | **Reserved:** Reserved.<br><br>**Power Well:** SUS |
| 30 | 0x0<br>RW/L | **Device Removable (DR):** Reserved.<br><br>**Power Well:** Core |

## 51.3.19 Port Power Management Status and Control USB2 (PORTPMSC1)—Offset 484h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MBAR] + 484h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0x0<br>RW | **Port Test Control (PTC):** When this field is '0', the port is not operating in a test mode. (Default) A non-zero value indicates that the port is operating in test mode in indicated by the specific value. A non-zero Port Test Control value is only valid to a port that is in the Disabled state. If the port is not in this state, the xHC shall respond with the Port Test Control field set to Port Test Control Error.<br>The encoding of the Test Mode bits for a USB 2.0 port are:<br>Value Test Mode<br>• 0h - Test mode not enabled<br>• 1h - Test J_STATE<br>• 2h - Test K_STATE<br>• 3h - Test SE0_NAK<br>• 4h - Test Packet<br>• 5h - Test FORCE_ENABLE<br>• 6h-14h - Reserved.<br>• 15 - Port Test Control Error |
| 27:17 | 0x0<br>RO | Reserved. |
| 16 | 0x0<br>RW | **Hardware LPM Enable (HLE):**<br>• 0 - Disable<br>• 1 - Enable. When this bit is a 1, hardware controlled LPM shall be enabled for this port. Refer to Section 4 of the USB 2.0 LPM Specification for more information. |
| 15:8 | 0x0<br>RO | Reserved. |
| 7:4 | 0x0<br>RW | **Best Effort Service Latency:** System software sets this field to indicate the recipient device how long the xHCI will driver resume if it initiates an exit from L1. |
| 3 | 0x0<br>RW | **Remote Wake Enable (RWE):** The host system sets this flag to enable or disable the device for remote wake from L1.<br>• 0 - disable<br>• 1 - enable<br>The value of this flag will temporarily (while in L1) override the current setting of the Remote Wake feature set by the standard Set/ClearFeature() commands defined in Universal Serial Bus Specification, Revision 2.0, Chapter 9. |
| 2:0 | 0x0<br>RW | **L1 Status (L1S):** This field is used by software to determine whether an L1-based suspend request was successful. |

## 51.3.20 Port X Hardware LPM Control Register (PORTHLPMC1)—Offset 48Ch

There are 9 PORTHLPMC registers at offsets 48Ch, 49Ch, 4ACh, 4BCh, 4CCh, 4DCh, 4ECh, 4FCh, 50Ch This register is reset only by platform hardware during cold reset or in response to a Host Controller Reset (HCRST). The definition for the fields depend on the protocol supported. For USB3 this register is reserved and shall be treated by software as RsvdP. For USB2 the definition is given below. Fields contain parameters necessary for xHC to automatically generate an LPM Token to the downstream device.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 48Ch

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:14 | 0x0<br>RO | **RESERVED (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 13:10 | 0x0<br>RW | **Host Initiated Resume Duration-Deep (HIRDD):** System software sets this field to indicate to the recipient device how long the xHC will drive resume if an exit from L1.<br>The HIRDD value is is encoded as follows:<br>• 0h: 50 us (default)<br>• 1h: 125 us<br>• 2h: 200 us<br>• ...<br>• Fh: 1.175ms<br>The value of 0h is interpreted as 50 us.<br>Each incrementing value adds 75 us to the previous value.<br><br>**Power Well:** SUS |
| 9:2 | 0x0<br>RW | **L1 Timeout (L1_TO):** Timeout value for L1 inactivity timer.<br>This field shall be set to 00h by assertion of PR to '1'.<br>Following are permissible values:<br>• 00h: 128 us (default)<br>• 01h: 256 us<br>• ...<br>• FFh: 65,280us<br>***Note:*** This register is sticky.<br><br>**Power Well:** SUS |
| 1:0 | 0x0<br>RW | **Host Initiated Resume Duration Mode (HIRDM):** Indicates which HIRD value should be used.<br>Following are permissible values:<br>• 0: Initiate L1 using HIRD only time out (default)<br>• 1: Initiate HIRDDon timeout. If rejected by device, initiate L1 using HIRD<br>• 2: Reserved<br>• 3: Reserved<br>***Note:*** This register is sticky.<br><br>**Power Well:** SUS |

## 51.3.21 Port Status and Control USB2 (PORTSC2)—Offset 490h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 000002A0h

**BAR and Offset:** [MBAR] + 490h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |

## 51.3.22 Port Power Management Status and Control USB2 (PORTPMSC2)—Offset 494h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MBAR] + 494h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0x0<br>RW | **Port Test Control (PTC):** When this field is '0', the port is not operating in a test mode. (Default) A non-zero value indicates that the port is operating in test mode in indicated by the specific value. A non-zero Port Test Control value is only valid to a port that is in the Disabled state. If the port is not in this state, the xHC shall respond with the Port Test Control field set to Port Test Control Error.<br>The encoding of the Test Mode bits for a USB 2.0 port are:<br>Value Test Mode<br>• 0h - Test mode not enabled<br>• 1h - Test J_STATE<br>• 2h - Test K_STATE<br>• 3h - Test SE0_NAK<br>• 4h - Test Packet<br>• 5h - Test FORCE_ENABLE<br>• 6h-14h - Reserved.<br>• 15 - Port Test Control Error |
| 27:17 | 0x0<br>RO | Reserved. |
| 16 | 0x0<br>RW | **Hardware LPM Enable (HLE):**<br>• 0 - Disable<br>• 1 - Enable. When this bit is a 1, hardware controlled LPM shall be enabled for this port. Refer to Section 4 of the USB 2.0 LPM Specification for more information. |
| 15:8 | 0x0<br>RO | Reserved. |
| 7:4 | 0x0<br>RW | **Best Effort Service Latency:** System software sets this field to indicate the recipient device how long the xHCI will driver resume if it initiates an exit from L1. |
| 3 | 0x0<br>RW | **Remote Wake Enable (RWE):** The host system sets this flag to enable or disable the device for remote wake from L1.<br>• 0 - disable<br>• 1 - enable<br>The value of this flag will temporarily (while in L1) override the current setting of the Remote Wake feature set by the standard Set/ClearFeature() commands defined in Universal Serial Bus Specification, Revision 2.0, Chapter 9. |
| 2:0 | 0x0<br>RW | **L1 Status (L1S):** This field is used by software to determine whether an L1-based suspend request was successful. |

## 51.3.23 Port X Hardware LPM Control Register (PORTHLPMC2)—Offset 49Ch

There are 9 PORTHLPMC registers at offsets 48Ch, 49Ch, 4ACh, 4BCh, 4CCh, 4DCh, 4ECh, 4FCh, 50Ch This register is reset only by platform hardware during cold reset or in response to a Host Controller Reset (HCRST). The definition for the fields depend on the protocol supported. For USB3 this register is reserved and shall be treated by software as RsvdP. For USB2 the definition is given below. Fields contain parameters necessary for xHC to automatically generate an LPM Token to the downstream device.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 49Ch

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:14 | 0x0<br>RO | **RESERVED (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 13:10 | 0x0<br>RW | **Host Initiated Resume Duration-Deep (HIRDD):** System software sets this field to indicate to the recipient device how long the xHC will drive resume if an exit from L1.<br>• The HIRDD value is encoded as follows:<br>• 0h: 50 us (default)<br>• 1h: 125 us<br>• 2h: 200 us<br>• ...<br>• Fh: 1.175ms<br>The value of 0h is interpreted as 50 us.<br>Each incrementing value adds 75 us to the previous value.<br><br>**Power Well:** SUS |
| 9:2 | 0x0<br>RW | **L1 Timeout (L1_TO):** Timeout value for L1 inactivity timer.<br>This field shall be set to 00h by assertion of PR to '1'.<br>Following are permissible values:<br>• 00h: 128 us (default)<br>• 01h: 256 us.<br>• ...<br>• FFh: 65,280us<br>***Note:*** This register is sticky.<br><br>**Power Well:** SUS |
| 1:0 | 0x0<br>RW | **Host Initiated Resume Duration Mode (HIRDM):** Indicates which HIRD value should be used.<br>Following are permissible values:<br>• 0: Initiate L1 using HIRD only time out (default)<br>• 1: Initiate HIRDDon timeout. If rejected by device, initiate L1 using HIRD<br>• 2: Reserved<br>• 3: Reserved<br>***Note:*** This register is sticky.<br><br>**Power Well:** SUS |

## 51.3.24 Port Status and Control USB2 (PORTSC3)—Offset 4A0h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 000002A0h

**BAR and Offset:** [MBAR] + 4A0h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)

## 51.3.29 Port X Hardware LPM Control Register (PORTHLPMC4)—Offset 4BCh

There are 9 PORTHLPMC registers at offsets 48Ch, 49Ch, 4ACh, 4BCh, 4CCh, 4DCh, 4ECh, 4FCh, 50Ch This register is reset only by platform hardware during cold reset or in response to a Host Controller Reset (HCRST). The definition for the fields depend on the protocol supported. For USB3 this register is reserved and shall be treated by software as RsvdP. For USB2 the definition is given below. Fields contain parameters neccessary for xHC to automatically generate an LPM Token to the downstream device.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 4BCh

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:14 | 0x0<br>RO | **RESERVED (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 13:10 | 0x0<br>RW | **Host Initiated Resume Duration-Deep (HIRDD):** System software sets this field to indicate to the recipient device how long the xHC will drive resume if an exit from L1. The HIRDD value is is encoded as follows: 0h: 50 us (default) 1h: 125 us 2h: 200 us ... Fh: 1.175ms The value of 0h is interpreted as 50 us. Each incrementing value adds 75 us to the previous value.<br><br>**Power Well:** SUS |
| 9:2 | 0x0<br>RW | **L1 Timeout (L1_TO):** Timeout value for L1 inactivity timer. This field shall be set to 00h by assertion of PR to '1'. Following are permissible values: 00h: 128 us (default) 01h: 256 us. ... FFh: 65,280us Note: This register is sticky.<br><br>**Power Well:** SUS |
| 1:0 | 0x0<br>RW | **Host Initiated Resume Duration Mode (HIRDM):** Indicates which HIRD value should be used. Following are permissible values: 0: Initiate L1 using HIRD only time out (default) 1: Initiate HIRDDon timeout. If rejected by device, initiate L1 using HIRD 2,3: Reserved Note: This register is sticky.<br><br>**Power Well:** SUS |

## 51.3.30 Port Status and Control USB3 (PORTSC5)—Offset 4C0h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 02A0h

**BAR and Offset:** [MBAR] + 4C0h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW/1S | **Warm Port Reset (WPR):**<br>When software sets this bit to be "1", the Warm Reset sequence as defined in the USB3 specification is initiated and the PR flag is set to "1". This flag shall always return "0" when read. This flag only applies to USB3 protocol ports. |
| 30 | 0x0<br>RW/L | **Device Removable (DR):** This bit indicates if this port has a removable device.<br>• 0 - Device is removable<br>• 1 - Device is non-removable |
| 29:28 | 0x0<br>RO | Reserved. |
| 27 | 0x0<br>RW | **Wake on Over-current Enable (WOE):**<br>• 0 - Disable. (Default)<br>• 1 - Enable. Writing this but to a 1b enables the port to be sensitive to over-current conditions as system wake-up events. |
| 26 | 0x0<br>RW | **Wake on Disconnect Enable (WDE):**<br>• 0 - Disable. (Default)<br>• 1 - Enable. Writing this but to a 1b enables the port to be sensitive to device disconnects as system wake-up events. |
| 25 | 0x0<br>RW | **Wake on Connect Enable (WCE):**<br>• 0 - Disable. (Default)<br>• 1 - Enable. Writing this but to a 1b enables the port to be sensitive to device connects as system wake-up events. |
| 24 | 0x0<br>RO | **Cold Attach Status (CAS):** This bit indicates that far-end terminations were detected in the Disconnected state and the Root Hub Port State Machine was unable to advance to the Enabled state. Software shall clear this bit by writing a 1b to the WPR bit or the xHC shall clear this bit if the CSS bit transitions to 1. |
| 23 | 0x0<br>RW/C | **Port Config Error Change (CEC):** This flag indicates that port failed to configure its link partner.<br>• 0= No change.<br>• 1= Port Config Error Detected.<br>Software shall clear this but by writing a "1" to it. |
| 22 | 0x0<br>RW/C | **Port Link State Change (PLC):**<br>• 0 - No change<br>• 1 - Link Status Change<br>This flag is set to '1' due to the following Port Link (PLS) transitions: |
| 21 | 0x0<br>RW/C | **Port Reset Change (PRC):** This flag is set to '1' due to a '1' to '0' transition of Port Reset (PR). For example, when any reset processing on this port is complete.<br>• 0 - No change<br>• 1 - Reset Complete |
| 20 | 0x0<br>RW/C | **Over-current Change (OCC):** The functionality of this bit is not dependent upon the port owner. Software clears this bit by writing a 1 to it.<br>• 0 - No change. (Default)<br>• 1 - There is a change to Overcurrent Active. |
| 19 | 0x0<br>RW/C | **Warm Port Reset Change (WRC):** This bit is set when Warm Reset processing on this port completes.<br>• 0 - No change. (Default)<br>• 1 - Warm reset complete |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 18 | 0x0<br>RW/C | **Port Enabled Disabled Change (PEC):**<br>• 0 - No change. (Default)<br>• 1 - There is a change to PED bit. |
| 17 | 0x0<br>RW/C | **Connect Status Change (CSC):** R?WC. This flag indicates a change has occurred in the port's Current Connect Status (CCS) or Cold Attach Status (CAS) bits.<br>• 0 - No change. (Default)<br>• 1 - There is a change to the CCS or CAS bit.<br>The xHC sets this bit to 1b for all changes to the port device connect status, even if system software has not cleared an existing Connect Status Change. For example, the insertion status changes twice before system software has cleared the change condition root hub hardware will be "setting" an already-set bit (that is, the bit will remain 1b). |
| 16 | 0x0<br>RW | **Port Link State Write Strobe (LWS):**<br>• 0 - When 0b, write data in PLS field is ignored. (Default)<br>• 1 - When this bit is set to 1b on a write references to this register, this flag enables writes to the PLS field.<br>Reads to this bit return '0'. |
| 15:14 | 0x0<br>RW | **Port Indicator Control (PIC):** Note: This register is sticky. |
| 13:10 | 0x0<br>RW | **Port Speed (PortSpeed):** A device attached to this port operates at a speed defined by the following codes:<br>Value Speed<br>• 0001b - full-speed<br>• 0010b - low speed<br>• 0011b - Highspeed<br>• All other values reserved.<br>Refer to the eXtensible Host Controller Interface for Universal Serial Bus Specification for additional details. |
| 9 | 0x1<br>RW | **Port Power (PP):** Read-only with a value of 1. This indicates that the port does have power. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 8:5 | 0x5<br>RW | **Port Link State (PLS):** This field is used to power manage the port and reflects its currentlink state. When the port is in the Enabled state, system software may set the link U-state by writing this field. System software may also write this field to force a Disabled to Disconnected state transition of the port.<br><br>Write Value Description<br>• 0 - The link shall transition to a U0 state from any of the U-states.<br>• 2 - USB 2.0 ports only. The link should transition to the U2 State.<br>• 3 - The link shall transition to a U3 state from any of the U-states. This action selectively suspends the device connected to this port. While the Port LinkState = U3 the hub does not propagate downstream-directed traffic to this port, but the hub will respond to resume signaling from the port.<br>• 5 - USB 3.0 ports only. If the port is in the Disabled state (PLS = Disabled, PP = 1), then the link shall transition to a Rx Detect state and the port shall transition to the Disconnected state, else ignored.<br>• 15 - USB 2.0 ports only. If the port is in the U3 state (PLS = U3), then the link shall remain in the U3 state and the port shall transition to the U3Exit substate, else ignored.<br>• All other values Ignored<br><br>Read Value Definition<br>• 0 - Link is in the U0 State<br>• 1 - Link is in the U1 State<br>• 2 - Link is in the U2 State<br>• 3 - Link is in the U3 State (Device Suspended)<br>• 4 - Link is in the Disabled State<br>• 5 - Link is in the RxDetect State<br>• 6 - Link is in the Inactive State<br>• 7 - Link is in the Polling State<br>• 8 - Link is in the Recovery State<br>• 9 - Link is in the Hot Reset State<br>• 10 - Link is in the Compliance Mode State<br>• 11 - Link is in the Test Mode State<br>• 12-14 - Reserved<br>• 15 Link is in the Resume State |
| 4 | 0x0<br>RW/1S | **Port Reset (PR):** When software writes a 1 to this bit (from a 0), the bus reset sequence as<br>• 1 - port in reset<br>• 0 - port not in reset |
| 3 | 0x0<br>RW | **Over-current Active (OCA):**<br>• 0 - This port does not have an overcurrent condition. (Default)<br>• 1 - This port currently has an overcurrent condition. This bit will automatically transition from 1 to 0 when the over current condition is removed. The PCH automatically disables the port when the overcurrent active bit is 1. |
| 2 | 0x0<br>RO | Reserved. |
| 1 | 0x0<br>RW/C | **Port Enabled Disabled (PED):** Ports can only be enabled by the host controller as a part of the reset and enable. Software cannot enable a port by writing a 1 to this bit. Ports can be disabled by either a fault condition (disconnect even or other fault condition) or by host software. The bit status does not change until the port state actually changes. There may be a delay in disabling or enabling a port due to other host controller and bus events.<br>• 0 - disable<br>• 1 - enable (default) |
| 0 | 0x0<br>RW | **Current Connect Status (CCS):** This value reflects the current state of the port and may not correspond directly to the event that caused the Connect Status Change bit (Bit 1) to be set.<br>• 0 - no device is present<br>• 1 - device is present on port. |

|---|---|---|
| 31 | 0x0<br>RW/1S | **Warm Port Reset (WPR):**<br>When software sets this bit to be "1", the Warm Reset sequence as defined in the USB3 specification is initiated and the PR flag is set to "1". This flag shall always return "0" when read. This flag only applies to USB3 protocol ports. |
| 30 | 0x0<br>RW/L | **Device Removable (DR):** This bit indicates if this port has a removable device.<br>• 0 - Device is removable<br>• 1 - Device is non-removable |
| 29:28 | 0x0<br>RO | Reserved. |
| 27 | 0x0<br>RW | **Wake on Over-current Enable (WOE):**<br>• 0 - Disable. (Default)<br>• 1 - Enable. Writing this but to a 1b enables the port to be sensitive to over-current conditions as system wake-up events. |
| 26 | 0x0<br>RW | **Wake on Disconnect Enable (WDE):**<br>• 0 - Disable. (Default)<br>• 1 - Enable. Writing this but to a 1b enables the port to be sensitive to device disconnects as system wake-up events. |
| 25 | 0x0<br>RW | **Wake on Connect Enable (WCE):**<br>• 0 - Disable. (Default)<br>• 1 - Enable. Writing this but to a 1b enables the port to be sensitive to device connects as system wake-up events. |
| 24 | 0x0<br>RO | **Cold Attach Status (CAS):** This bit indicates that far-end terminations were detected in the Disconnected state and the Root Hub Port State Machine was unable to advance to the Enabled state. Software shall clear this bit by writing a 1b to the WPR bit or the xHC shall clear this bit if the CSS bit transitions to 1. |
| 23 | 0x0<br>RW/C | **Port Config Error Change (CEC):** This flag indicates that port failed to configure its link partner.<br>• 0= No change.<br>• 1= Port Config Error Detected.<br>Software shall clear this but by writing a "1" to it. |
| 22 | 0x0<br>RW/C | **Port Link State Change (PLC):**<br>• 0 - No change<br>• 1 - Link Status Change<br>This flag is set to '1' due to the following Port Link (PLS) transitions: |
| 21 | 0x0<br>RW/C | **Port Reset Change (PRC):** This flag is set to '1' due to a '1' to '0' transition of Port Reset (PR). For example, when any reset processing on this port is complete.<br>• 0 - No change<br>• 1 - Reset Complete |
| 20 | 0x0<br>RW/C | **Over-current Change (OCC):** The functionality of this bit is not dependent upon the port owner. Software clears this bit by writing a 1 to it.<br>• 0 - No change. (Default)<br>• 1 - There is a change to Overcurrent Active. |
| 19 | 0x0<br>RW/C | **Warm Port Reset Change (WRC):** This bit is set when Warm Reset processing on this port completes.<br>• 0 - No change. (Default)<br>• 1 - Warm reset complete |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 18 | 0x0<br>RW/C | **Port Enabled Disabled Change (PEC):**<br>• 0 - No change. (Default)<br>• 1 - There is a change to PED bit. |
| 17 | 0x0<br>RW/C | **Connect Status Change (CSC):** R?WC. This flag indicates a change has occurred in the port's Current Connect Status (CCS) or Cold Attach Status (CAS) bits.<br>• 0 - No change. (Default)<br>• 1 - There is a change to the CCS or CAS bit.<br>The xHC sets this bit to 1b for all changes to the port device connect status, even if system software has not cleared an existing Connect Status Change. For example, the insertion status changes twice before system software has cleared the change condition root hub hardware will be "setting" an already-set bit (that is, the bit will remain 1b). |
| 16 | 0x0<br>RW | **Port Link State Write Strobe (LWS):**<br>• 0 - When 0b, write data in PLS field is ignored. (Default)<br>• 1 - When this bit is set to 1b on a write references to this register, this flag enables writes to the PLS field.<br>Reads to this bit return '0'. |
| 15:14 | 0x0<br>RW | **Port Indicator Control (PIC):** Note: This register is sticky. |
| 13:10 | 0x0<br>RW | **Port Speed (PortSpeed):** A device attached to this port operates at a speed defined by the following codes:<br>Value Speed<br>• 0001b - full-speed<br>• 0010b - low speed<br>• 0011b - Highspeed<br>• All other values reserved.<br>Refer to the eXtensible Host Controller Interface for Universal Serial Bus Specification for additional details. |
| 9 | 0x1<br>RW | **Port Power (PP):** Read-only with a value of 1. This indicates that the port does have power. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 8:5 | 0x5<br>RW | **Port Link State (PLS):** This field is used to power manage the port and reflects its currentlink state. When the port is in the Enabled state, system software may set the link U-state by writing this field. System software may also write this field to force a Disabled to Disconnected state transition of the port.<br><br>Write Value Description<br>• 0 - The link shall transition to a U0 state from any of the U-states.<br>• 2 - USB 2.0 ports only. The link should transition to the U2 State.<br>• 3 - The link shall transition to a U3 state from any of the U-states. This action selectively suspends the device connected to this port. While the Port LinkState = U3 the hub does not propagate downstream-directed traffic to this port, but the hub will respond to resume signaling from the port.<br>• 5 - USB 3.0 ports only. If the port is in the Disabled state (PLS = Disabled, PP = 1), then the link shall transition to a Rx Detect state and the port shall transition to the Disconnected state, else ignored.<br>• 15 - USB 2.0 ports only. If the port is in the U3 state (PLS = U3), then the link shall remain in the U3 state and the port shall transition to the U3Exit substate, else ignored.<br>• All other values Ignored<br><br>Read Value Definition<br>• 0 - Link is in the U0 State<br>• 1 - Link is in the U1 State<br>• 2 - Link is in the U2 State<br>• 3 - Link is in the U3 State (Device Suspended)<br>• 4 - Link is in the Disabled State<br>• 5 - Link is in the RxDetect State<br>• 6 - Link is in the Inactive State<br>• 7 - Link is in the Polling State<br>• 8 - Link is in the Recovery State<br>• 9 - Link is in the Hot Reset State<br>• 10 - Link is in the Compliance Mode State<br>• 11 - Link is in the Test Mode State<br>• 12-14 - Reserved<br>• 15 Link is in the Resume State |
| 4 | 0x0<br>RW/1S | **Port Reset (PR):** When software writes a 1 to this bit (from a 0), the bus reset sequence as<br>• 1 - port in reset<br>• 0 - port not in reset |
| 3 | 0x0<br>RW | **Over-current Active (OCA):**<br>• 0 - This port does not have an overcurrent condition. (Default)<br>• 1 - This port currently has an overcurrent condition. This bit will automatically transition from 1 to 0 when the over current condition is removed. The PCH automatically disables the port when the overcurrent active bit is 1. |
| 2 | 0x0<br>RO | Reserved. |
| 1 | 0x0<br>RW/C | **Port Enabled Disabled (PED):** Ports can only be enabled by the host controller as a part of the reset and enable. Software cannot enable a port by writing a 1 to this bit. Ports can be disabled by either a fault condition (disconnect even or other fault condition) or by host software. The bit status does not change until the port state actually changes. There may be a delay in disabling or enabling a port due to other host controller and bus events.<br>• 0 - disable<br>• 1 - enable (default) |
| 0 | 0x0<br>RW | **Current Connect Status (CCS):** This value reflects the current state of the port and may not correspond directly to the event that caused the Connect Status Change bit (Bit 1) to be set.<br>• 0 - no device is present<br>• 1 - device is present on port. |

## 51.3.40 Port Power Management Status and Control USB3 (PORTPMSC8)—Offset 4F4h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MBAR] + 4F4h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:17 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 16 | 0x0<br>RW | **Force Link PM Accept (FLA):** Reserved.<br><br>**Power Well:** SUS |
| 15:8 | 0x0<br>RW/S | **U2 Timeout (U2T):** Reserved.<br><br>**Power Well:** SUS |
| 7:0 | 0x0<br>RW/S | **U1 Timeout (U1T):** Reserved.<br><br>**Power Well:** SUS |

## 51.3.41 USB3 Port Link Info (PORTLI8)—Offset 4F8h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MBAR] + 4F8h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 15:0 | 0x0<br>RO | **Link Error Count (LEC):** Reserved.<br><br>**Power Well:** Core |

## 51.3.42 Microframe Index (RTMFINDEX)—Offset 2000h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MBAR] + 2000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:14 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 13:0 | 0x0<br>RO | **Microframe Index (IMAN0):** Reserved.<br><br>**Power Well:** Core |

## 51.3.43 Interrupter 1 Management (IMAN0)—Offset 2020h

There are 8 IMAN registers. x = 1, 2, ..., 8

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 2020h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:2 | 0x0<br>RO | **Rsvd1:** Reserved.<br>**Power Well:** Core |
| 1 | 0x0<br>RW | **Interrupt Enable (IE):** Reserved.<br>**Power Well:** Core |
| 0 | 0x0<br>RW/C | **Interrupt Pending (IP):** Reserved.<br>**Power Well:** Core |

## 51.3.44 Interrupter 1 Moderation (IMOD0)—Offset 2024h

There are 8 IMOD registers. x = 1, 2, ..., 8

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 2024h

**Default:** 00000FA0h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **Interrupt Moderation Counter (IMODC):** Reserved.<br>**Power Well:** Core |
| 15:0 | 0xfa0<br>RW | **Interrupt Moderation Interval (IMODI):** Reserved.<br>**Power Well:** Core |

## 51.3.45 Event Ring Segment Table Size 1 (ERSTSZ0)—Offset 2028h

There are 8 ERSTSZ register. x = 1, 2, ..., 8

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 2028h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **Rsvd1:** Reserved.<br>**Power Well:** Core |
| 15:0 | 0x0<br>RW | **Event Ring Segment Table Size (ERSTS):** Reserved.<br>**Power Well:** Core |

## 51.3.46 Event Ring Segment Table Base Address Low 1 (ERSTBA_LO0)—Offset 2030h

There are 8 ERSTBA_LO registers x = 1, 2, ..., 8

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 2030h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:6 | 0x0<br>RW | **Event Ring Segment Table Base Address Register (ERSTBA):** Reserved.<br><br>**Power Well:** Core |
| 5:0 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |

## 51.3.47 Event Ring Segment Table Base Address High 1 (ERSTBA_HI0)—Offset 2034h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 2034h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Event Ring Segment Table Base Address (ERSTBA):** Reserved.<br><br>**Power Well:** Core |

## 51.3.48 Event Ring Dequeue Pointer Low 1 (ERDP_LO0)—Offset 2038h

There are 8 ERDP_LO registers. x = 1, 2, ...,8

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MBAR] + 2038h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:4 | 0x0<br>RW | **Event Ring Dequeue Pointer (ERDP):** Reserved.<br><br>**Power Well:** Core |
| 3 | 0x0<br>RW/C | **Event Handler Busy (EHB):** Reserved.<br><br>**Power Well:** Core |
| 2:0 | 0x0<br>RW | **Dequeue ERST Segment Index (DESI):** Reserved.<br><br>**Power Well:** Core |

## 51.3.49 Event Ring Dequeue Pointer High 1 (ERDP_HI0)—Offset 203Ch

There are 8 ERDP_HI registers. x = 1, 2, ..., 8

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MBAR] + 203Ch

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Event Ring Dequeue Pointer (ERDP):** Reserved.<br><br>**Power Well:** Core |

## 51.3.50 Interrupter 2 Management (IMAN1)—Offset 2040h

There are 8 IMAN registers. x = 1, 2, ..., 8

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 2040h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:2 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 1 | 0x0<br>RW | **Interrupt Enable (IE):** Reserved.<br><br>**Power Well:** Core |
| 0 | 0x0<br>RW/C | **Interrupt Pending (IP):** Reserved.<br><br>**Power Well:** Core |

## 51.3.51 Interrupter 2 Moderation (IMOD1)—Offset 2044h

There are 8 IMOD registers. x = 1, 2, ..., 8

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 2044h

**Default:** 00000FA0h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **Interrupt Moderation Counter (IMODC):** Reserved.<br><br>**Power Well:** Core |
| 15:0 | 0xfa0<br>RW | **Interrupt Moderation Interval (IMODI):** Reserved.<br><br>**Power Well:** Core |

## 51.3.52 Event Ring Segment Table Size 2 (ERSTSZ1)—Offset 2048h

There are 8 ERSTSZ register. x = 1, 2, ..., 8

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 2048h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 15:0 | 0x0<br>RW | **Event Ring Segment Table Size (ERSTS):** Reserved.<br><br>**Power Well:** Core |

## 51.3.53 Event Ring Segment Table Base Address Low 2 (ERSTBA_LO1)—Offset 2050h

There are 8 ERSTBA_LO registers x = 1, 2, ..., 8

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 2050h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:6 | 0x0<br>RW | **Event Ring Segment Table Base Address Register (ERSTBA):** Reserved.<br><br>**Power Well:** Core |
| 5:0 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |

## 51.3.54 Event Ring Segment Table Base Address High 2 (ERSTBA_HI1)—Offset 2054h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 2054h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Event Ring Segment Table Base Address (ERSTBA):** Reserved.<br><br>**Power Well:** Core |

## 51.3.55 Event Ring Dequeue Pointer Low 2 (ERDP_LO1)—Offset 2058h

There are 8 ERDP_LO registers. x = 1, 2, ...,8

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 2058h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:4 | 0x0<br>RW | **Event Ring Dequeue Pointer (ERDP):** Reserved.<br><br>**Power Well:** Core |
| 3 | 0x0<br>RW/C | **Event Handler Busy (EHB):** Reserved.<br><br>**Power Well:** Core |

## 51.3.63 Event Ring Dequeue Pointer High 3 (ERDP_HI2)—Offset 207Ch

There are 8 ERDP_HI registers. x = 1, 2, ..., 8

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 207Ch

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Event Ring Dequeue Pointer (ERDP):** Reserved.<br><br>**Power Well:** Core |

## 51.3.64 Interrupter 4 Management (IMAN3)—Offset 2080h

There are 8 IMAN registers. x = 1, 2, ..., 8

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 2080h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:2 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 1 | 0x0<br>RW | **Interrupt Enable (IE):** Reserved.<br><br>**Power Well:** Core |
| 0 | 0x0<br>RW/C | **Interrupt Pending (IP):** Reserved.<br><br>**Power Well:** Core |

## 51.3.65 Interrupter 4 Moderation (IMOD3)—Offset 2084h

There are 8 IMOD registers. x = 1, 2, ..., 8

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 2084h

**Default:** 00000FA0h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **Interrupt Moderation Counter (IMODC):** Reserved.<br><br>**Power Well:** Core |
| 15:0 | 0xfa0<br>RW | **Interrupt Moderation Interval (IMODI):** Reserved.<br><br>**Power Well:** Core |

## 51.3.66 Event Ring Segment Table Size 4 (ERSTSZ3)—Offset 2088h

There are 8 ERSTSZ register. x = 1, 2, ..., 8

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 2088h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 15:0 | 0x0<br>RW | **Event Ring Segment Table Size (ERSTS):** Reserved.<br><br>**Power Well:** Core |

## 51.3.67 Event Ring Segment Table Base Address Low 4 (ERSTBA_LO3)—Offset 2090h

There are 8 ERSTBA_LO registers x = 1, 2, ..., 8

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 2090h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:6 | 0x0<br>RW | **Event Ring Segment Table Base Address Register (ERSTBA):** Reserved.<br><br>**Power Well:** Core |
| 5:0 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |

## 51.3.68 Event Ring Segment Table Base Address High 4 (ERSTBA_HI3)—Offset 2094h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MBAR] + 2094h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Event Ring Segment Table Base Address (ERSTBA):** Reserved.<br><br>**Power Well:** Core |

## 51.3.69 Event Ring Dequeue Pointer Low 4 (ERDP_LO3)—Offset 2098h

There are 8 ERDP_LO registers. x = 1, 2, ...,8

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MBAR] + 2098h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:4 | 0x0<br>RW | **Event Ring Dequeue Pointer (ERDP):** Reserved.<br><br>**Power Well:** Core |
| 3 | 0x0<br>RW/C | **Event Handler Busy (EHB):** Reserved.<br><br>**Power Well:** Core |
| 2:0 | 0x0<br>RW | **Dequeue ERST Segment Index (DESI):** Reserved.<br><br>**Power Well:** Core |

## 51.3.70 Event Ring Dequeue Pointer High 4 (ERDP_HI3)—Offset 209Ch

There are 8 ERDP_HI registers. x = 1, 2, ..., 8

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MBAR] + 209Ch

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Event Ring Dequeue Pointer (ERDP):** Reserved.<br><br>**Power Well:** Core |

## 51.3.71 Interrupter 5 Management (IMAN4)—Offset 20A0h

There are 8 IMAN registers. x = 1, 2, ..., 8

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 20A0h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:2 | 0x0<br>RO | **Rsvd1:** Reserved.<br>**Power Well:** Core |
| 1 | 0x0<br>RW | **Interrupt Enable (IE):** Reserved.<br>**Power Well:** Core |
| 0 | 0x0<br>RW/C | **Interrupt Pending (IP):** Reserved.<br>**Power Well:** Core |

## 51.3.72 Interrupter 5 Moderation (IMOD4)—Offset 20A4h

There are 8 IMOD registers. x = 1, 2, ..., 8

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 20A4h

**Default:** 00000FA0h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **Interrupt Moderation Counter (IMODC):** Reserved.<br>**Power Well:** Core |
| 15:0 | 0xfa0<br>RW | **Interrupt Moderation Interval (IMODI):** Reserved.<br>**Power Well:** Core |

## 51.3.73 Event Ring Segment Table Size 5 (ERSTSZ4)—Offset 20A8h

There are 8 ERSTSZ register. x = 1, 2, ..., 8

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 20A8h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **Rsvd1:** Reserved.<br>**Power Well:** Core |
| 15:0 | 0x0<br>RW | **Event Ring Segment Table Size (ERSTS):** Reserved.<br>**Power Well:** Core |

## 51.3.74 Event Ring Segment Table Base Address Low 5 (ERSTBA_LO4)—Offset 20B0h

There are 8 ERSTBA_LO registers x = 1, 2, ..., 8

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 20B0h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:6 | 0x0<br>RW | **Event Ring Segment Table Base Address Register (ERSTBA):** Reserved.<br><br>**Power Well:** Core |
| 5:0 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |

## 51.3.75 Event Ring Segment Table Base Address High 5 (ERSTBA_HI4)—Offset 20B4h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 20B4h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Event Ring Segment Table Base Address (ERSTBA):** Reserved.<br><br>**Power Well:** Core |

## 51.3.76 Event Ring Dequeue Pointer Low 5 (ERDP_LO4)—Offset 20B8h

There are 8 ERDP_LO registers. x = 1, 2, ...,8

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 20B8h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:4 | 0x0<br>RW | **Event Ring Dequeue Pointer (ERDP):** Reserved.<br><br>**Power Well:** Core |
| 3 | 0x0<br>RW/C | **Event Handler Busy (EHB):** Reserved.<br><br>**Power Well:** Core |
| 2:0 | 0x0<br>RW | **Dequeue ERST Segment Index (DESI):** Reserved.<br><br>**Power Well:** Core |

## 51.3.77 Event Ring Dequeue Pointer High 5 (ERDP_HI4)—Offset 20BCh

There are 8 ERDP_HI registers. x = 1, 2, ..., 8

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MBAR] + 20BCh

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Event Ring Dequeue Pointer (ERDP):** Reserved.<br><br>**Power Well:** Core |

## 51.3.78 Interrupter 6 Management (IMAN5)—Offset 20C0h

There are 8 IMAN registers. x = 1, 2, ..., 8

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MBAR] + 20C0h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:2 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 1 | 0x0<br>RW | **Interrupt Enable (IE):** Reserved.<br><br>**Power Well:** Core |
| 0 | 0x0<br>RW/C | **Interrupt Pending (IP):** Reserved.<br><br>**Power Well:** Core |

## 51.3.79 Interrupter 6 Moderation (IMOD5)—Offset 20C4h

There are 8 IMOD registers. x = 1, 2, ..., 8

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000FA0h

**BAR and Offset:** [MBAR] + 20C4h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **Interrupt Moderation Counter (IMODC):** Reserved.<br><br>**Power Well:** Core |
| 15:0 | 0xfa0<br>RW | **Interrupt Moderation Interval (IMODI):** Reserved.<br><br>**Power Well:** Core |

## 51.3.80 Event Ring Segment Table Size 6 (ERSTSZ5)—Offset 20C8h

There are 8 ERSTSZ register. x = 1, 2, ..., 8

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 20C8h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 15:0 | 0x0<br>RW | **Event Ring Segment Table Size (ERSTS):** Reserved.<br><br>**Power Well:** Core |

## 51.3.81 Event Ring Segment Table Base Address Low 6 (ERSTBA_LO5)—Offset 20D0h

There are 8 ERSTBA_LO registers x = 1, 2, ..., 8

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 20D0h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:6 | 0x0<br>RW | **Event Ring Segment Table Base Address Register (ERSTBA):** Reserved.<br><br>**Power Well:** Core |
| 5:0 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |

## 51.3.82 Event Ring Segment Table Base Address High 6 (ERSTBA_HI5)—Offset 20D4h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 20D4h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Event Ring Segment Table Base Address (ERSTBA):** Reserved.<br><br>**Power Well:** Core |

## 51.3.83 Event Ring Dequeue Pointer Low 6 (ERDP_LO5)—Offset 20D8h

There are 8 ERDP_LO registers. x = 1, 2, ...,8

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 20D8h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:4 | 0x0<br>RW | **Event Ring Dequeue Pointer (ERDP):** Reserved.<br><br>**Power Well:** Core |
| 3 | 0x0<br>RW/C | **Event Handler Busy (EHB):** Reserved.<br><br>**Power Well:** Core |
| 2:0 | 0x0<br>RW | **Dequeue ERST Segment Index (DESI):** Reserved.<br><br>**Power Well:** Core |

## 51.3.84 Event Ring Dequeue Pointer High 6 (ERDP_HI5)—Offset 20DCh

There are 8 ERDP_HI registers. x = 1, 2, ..., 8

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 20DCh

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Event Ring Dequeue Pointer (ERDP):** Reserved.<br><br>**Power Well:** Core |

## 51.3.85 Interrupter 7 Management (IMAN6)—Offset 20E0h

There are 8 IMAN registers. x = 1, 2, ..., 8

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 20E0h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:2 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 1 | 0x0<br>RW | **Interrupt Enable (IE):** Reserved.<br><br>**Power Well:** Core |
| 0 | 0x0<br>RW/C | **Interrupt Pending (IP):** Reserved.<br><br>**Power Well:** Core |

## 51.3.86 Interrupter 7 Moderation (IMOD6)—Offset 20E4h

There are 8 IMOD registers. x = 1, 2, ..., 8

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 20E4h

**Default:** 00000FA0h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **Interrupt Moderation Counter (IMODC):** Reserved.<br><br>**Power Well:** Core |
| 15:0 | 0xfa0<br>RW | **Interrupt Moderation Interval (IMODI):** Reserved.<br><br>**Power Well:** Core |

## 51.3.87 Event Ring Segment Table Size 7 (ERSTSZ6)—Offset 20E8h

There are 8 ERSTSZ register. x = 1, 2, ..., 8

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 20E8h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 15:0 | 0x0<br>RW | **Event Ring Segment Table Size (ERSTS):** Reserved.<br><br>**Power Well:** Core |

## 51.3.88 Event Ring Segment Table Base Address Low 7 (ERSTBA_LO6)—Offset 20F0h

There are 8 ERSTBA_LO registers x = 1, 2, ..., 8

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 20F0h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:6 | 0x0<br>RW | **Event Ring Segment Table Base Address Register (ERSTBA):** Reserved.<br><br>**Power Well:** Core |
| 5:0 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |

## 51.3.89 Event Ring Segment Table Base Address High 7 (ERSTBA_HI6)—Offset 20F4h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MBAR] + 20F4h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Event Ring Segment Table Base Address (ERSTBA):** Reserved.<br><br>**Power Well:** Core |

## 51.3.90 Event Ring Dequeue Pointer Low 7 (ERDP_LO6)—Offset 20F8h

There are 8 ERDP_LO registers. x = 1, 2, ...,8

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MBAR] + 20F8h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:4 | 0x0<br>RW | **Event Ring Dequeue Pointer (ERDP):** Reserved.<br><br>**Power Well:** Core |
| 3 | 0x0<br>RW/C | **Event Handler Busy (EHB):** Reserved.<br><br>**Power Well:** Core |
| 2:0 | 0x0<br>RW | **Dequeue ERST Segment Index (DESI):** Reserved.<br><br>**Power Well:** Core |

## 51.3.91 Event Ring Dequeue Pointer High 7 (ERDP_HI6)—Offset 20FCh

There are 8 ERDP_HI registers. x = 1, 2, ..., 8

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MBAR] + 20FCh

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Event Ring Dequeue Pointer (ERDP):** Reserved.<br><br>**Power Well:** Core |

## 51.3.92 Interrupter 8 Management (IMAN7)—Offset 2100h

There are 8 IMAN registers. x = 1, 2, ..., 8

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 2100h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:2 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 1 | 0x0<br>RW | **Interrupt Enable (IE):** Reserved.<br><br>**Power Well:** Core |
| 0 | 0x0<br>RW/C | **Interrupt Pending (IP):** Reserved.<br><br>**Power Well:** Core |

## 51.3.93 Interrupter 8 Moderation (IMOD7)—Offset 2104h

There are 8 IMOD registers. x = 1, 2, ..., 8

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 2104h

**Default:** 00000FA0h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **Interrupt Moderation Counter (IMODC):** Reserved.<br><br>**Power Well:** Core |
| 15:0 | 0xfa0<br>RW | **Interrupt Moderation Interval (IMODI):** Reserved.<br><br>**Power Well:** Core |

## 51.3.94 Event Ring Segment Table Size 8 (ERSTSZ7)—Offset 2108h

There are 8 ERSTSZ register. x = 1, 2, ..., 8

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 2108h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 15:0 | 0x0<br>RW | **Event Ring Segment Table Size (ERSTS):** Reserved.<br><br>**Power Well:** Core |

## 51.3.95 Event Ring Segment Table Base Address Low 8 (ERSTBA_LO7)—Offset 2110h

There are 8 ERSTBA_LO registers x = 1, 2, ..., 8

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 2110h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:6 | 0x0<br>RW | **Event Ring Segment Table Base Address Register (ERSTBA):** Reserved.<br><br>**Power Well:** Core |
| 5:0 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |

## 51.3.96 Event Ring Segment Table Base Address High 8 (ERSTBA_HI7)—Offset 2114h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 2114h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Event Ring Segment Table Base Address (ERSTBA):** Reserved.<br><br>**Power Well:** Core |

## 51.3.97 Event Ring Dequeue Pointer Low 8 (ERDP_LO7)—Offset 2118h

There are 8 ERDP_LO registers. x = 1, 2, ...,8

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 2118h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:4 | 0x0<br>RW | **Event Ring Dequeue Pointer (ERDP):** Reserved.<br><br>**Power Well:** Core |
| 3 | 0x0<br>RW/C | **Event Handler Busy (EHB):** Reserved.<br><br>**Power Well:** Core |
| 2:0 | 0x0<br>RW | **Dequeue ERST Segment Index (DESI):** Reserved.<br><br>**Power Well:** Core |

## 51.3.98 Event Ring Dequeue Pointer High 8 (ERDP_HI7)—Offset 211Ch

There are 8 ERDP_HI registers. x = 1, 2, ..., 8

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 211Ch

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Event Ring Dequeue Pointer (ERDP):** Reserved.<br><br>**Power Well:** Core |

## 51.3.99 Door Bell 1 (DB0)—Offset 3000h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 3000h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **DB Stream ID (DSI):** Reserved.<br><br>**Power Well:** Core |
| 15:8 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RW | **DB Target (DT):** This field defines the target of the doorbell reference.<br>Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers.<br><br>**Power Well:** Core |

## 51.3.100 Door Bell 2 (DB1)—Offset 3004h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 3004h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **DB Stream ID (DSI):** Reserved.<br><br>**Power Well:** Core |
| 15:8 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RW | **DB Target (DT):** This field defines the target of the doorbell reference.<br>Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers.<br><br>**Power Well:** Core |

## 51.3.101 Door Bell 3 (DB2)—Offset 3008h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 3008h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **DB Stream ID (DSI):** Reserved.<br><br>**Power Well:** Core |
| 15:8 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RW | **DB Target (DT):** This field defines the target of the doorbell reference.<br>Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers.<br><br>**Power Well:** Core |

## 51.3.102 Door Bell 4 (DB3)—Offset 300Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 300Ch

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **DB Stream ID (DSI):** Reserved.<br><br>**Power Well:** Core |
| 15:8 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RW | **DB Target (DT):** This field defines the target of the doorbell reference.<br>Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers.<br><br>**Power Well:** Core |

## 51.3.103 Door Bell 5 (DB4)—Offset 3010h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 3010h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **DB Stream ID (DSI):** Reserved.<br><br>**Power Well:** Core |
| 15:8 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RW | **DB Target (DT):** This field defines the target of the doorbell reference.<br>Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers.<br><br>**Power Well:** Core |

## 51.3.104 Door Bell 6 (DB5)—Offset 3014h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 3014h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **DB Stream ID (DSI):** Reserved.<br><br>**Power Well:** Core |
| 15:8 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RW | **DB Target (DT):** This field defines the target of the doorbell reference.<br>Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers.<br><br>**Power Well:** Core |

## 51.3.105 Door Bell 7 (DB6)—Offset 3018h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 3018h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **DB Stream ID (DSI):** Reserved.<br><br>**Power Well:** Core |
| 15:8 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RW | **DB Target (DT):** This field defines the target of the doorbell reference.<br>Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers.<br><br>**Power Well:** Core |

## 51.3.106 Door Bell 8 (DB7)—Offset 301Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 301Ch

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **DB Stream ID (DSI):** Reserved.<br><br>**Power Well:** Core |
| 15:8 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RW | **DB Target (DT):** This field defines the target of the doorbell reference.<br>Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers.<br><br>**Power Well:** Core |

## 51.3.107 Door Bell 9 (DB8)—Offset 3020h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 3020h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **DB Stream ID (DSI):** Reserved.<br><br>**Power Well:** Core |
| 15:8 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RW | **DB Target (DT):** This field defines the target of the doorbell reference.<br>Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers.<br><br>**Power Well:** Core |

## 51.3.108 Door Bell 10 (DB9)—Offset 3024h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 3024h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **DB Stream ID (DSI):** Reserved.<br><br>**Power Well:** Core |
| 15:8 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RW | **DB Target (DT):** This field defines the target of the doorbell reference.<br>Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers.<br><br>**Power Well:** Core |

## 51.3.109 Door Bell 11 (DB10)—Offset 3028h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 3028h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **DB Stream ID (DSI):** Reserved.<br><br>**Power Well:** Core |
| 15:8 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RW | **DB Target (DT):** This field defines the target of the doorbell reference.<br>Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers.<br><br>**Power Well:** Core |

## 51.3.110 Door Bell 12 (DB11)—Offset 302Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 302Ch

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **DB Stream ID (DSI):** Reserved.<br><br>**Power Well:** Core |
| 15:8 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RW | **DB Target (DT):** This field defines the target of the doorbell reference.<br>Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers.<br><br>**Power Well:** Core |

## 51.3.111 Door Bell 13 (DB12)—Offset 3030h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 3030h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **DB Stream ID (DSI):** Reserved.<br><br>**Power Well:** Core |
| 15:8 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RW | **DB Target (DT):** This field defines the target of the doorbell reference.<br>Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers.<br><br>**Power Well:** Core |

## 51.3.112 Door Bell 14 (DB13)—Offset 3034h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 3034h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **DB Stream ID (DSI):** Reserved.<br><br>**Power Well:** Core |
| 15:8 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RW | **DB Target (DT):** This field defines the target of the doorbell reference.<br>Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers.<br><br>**Power Well:** Core |

## 51.3.113 Door Bell 15 (DB14)—Offset 3038h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 3038h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **DB Stream ID (DSI):** Reserved.<br><br>**Power Well:** Core |
| 15:8 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RW | **DB Target (DT):** This field defines the target of the doorbell reference.<br>Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers.<br><br>**Power Well:** Core |

## 51.3.114 Door Bell 16 (DB15)—Offset 303Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 303Ch

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **DB Stream ID (DSI):** Reserved.<br><br>**Power Well:** Core |
| 15:8 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RW | **DB Target (DT):** This field defines the target of the doorbell reference.<br>Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers.<br><br>**Power Well:** Core |

## 51.3.115 Door Bell 17 (DB16)—Offset 3040h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 3040h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **DB Stream ID (DSI):** Reserved.<br><br>**Power Well:** Core |
| 15:8 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RW | **DB Target (DT):** This field defines the target of the doorbell reference.<br>Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers.<br><br>**Power Well:** Core |

## 51.3.116 Door Bell 18 (DB17)—Offset 3044h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 3044h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **DB Stream ID (DSI):** Reserved.<br><br>**Power Well:** Core |
| 15:8 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RW | **DB Target (DT):** This field defines the target of the doorbell reference.<br>Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers.<br><br>**Power Well:** Core |

## 51.3.117 Door Bell 19 (DB18)—Offset 3048h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 3048h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **DB Stream ID (DSI):** Reserved.<br><br>**Power Well:** Core |
| 15:8 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RW | **DB Target (DT):** This field defines the target of the doorbell reference.<br>Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers.<br><br>**Power Well:** Core |

## 51.3.118 Door Bell 20 (DB19)—Offset 304Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 304Ch

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **DB Stream ID (DSI):** Reserved.<br><br>**Power Well:** Core |
| 15:8 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RW | **DB Target (DT):** This field defines the target of the doorbell reference.<br>Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers.<br><br>**Power Well:** Core |

## 51.3.119 Door Bell 21 (DB20)—Offset 3050h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 3050h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **DB Stream ID (DSI):** Reserved.<br><br>**Power Well:** Core |
| 15:8 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RW | **DB Target (DT):** This field defines the target of the doorbell reference.<br>Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers.<br><br>**Power Well:** Core |

## 51.3.120 Door Bell 22 (DB21)—Offset 3054h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 3054h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **DB Stream ID (DSI):** Reserved.<br><br>**Power Well:** Core |
| 15:8 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RW | **DB Target (DT):** This field defines the target of the doorbell reference.<br>Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers.<br><br>**Power Well:** Core |

## 51.3.121 Door Bell 23 (DB22)—Offset 3058h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 3058h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **DB Stream ID (DSI):** Reserved.<br><br>**Power Well:** Core |
| 15:8 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RW | **DB Target (DT):** This field defines the target of the doorbell reference.<br>Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers.<br><br>**Power Well:** Core |

## 51.3.122 Door Bell 24 (DB23)—Offset 305Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 305Ch

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **DB Stream ID (DSI):** Reserved.<br><br>**Power Well:** Core |
| 15:8 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RW | **DB Target (DT):** This field defines the target of the doorbell reference.<br>Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers.<br><br>**Power Well:** Core |

## 51.3.123 Door Bell 25 (DB24)—Offset 3060h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 3060h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **DB Stream ID (DSI):** Reserved.<br><br>**Power Well:** Core |
| 15:8 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RW | **DB Target (DT):** This field defines the target of the doorbell reference.<br>Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers.<br><br>**Power Well:** Core |

## 51.3.124 Door Bell 26 (DB25)—Offset 3064h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 3064h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **DB Stream ID (DSI):** Reserved.<br><br>**Power Well:** Core |
| 15:8 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RW | **DB Target (DT):** This field defines the target of the doorbell reference.<br>Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers.<br><br>**Power Well:** Core |

## 51.3.125 Door Bell 27 (DB26)—Offset 3068h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 3068h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **DB Stream ID (DSI):** Reserved.<br><br>**Power Well:** Core |
| 15:8 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RW | **DB Target (DT):** This field defines the target of the doorbell reference.<br>Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers.<br><br>**Power Well:** Core |

## 51.3.126 Door Bell 28 (DB27)—Offset 306Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 306Ch

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **DB Stream ID (DSI):** Reserved.<br><br>**Power Well:** Core |
| 15:8 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RW | **DB Target (DT):** This field defines the target of the doorbell reference.<br>Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers.<br><br>**Power Well:** Core |

## 51.3.127 Door Bell 29 (DB28)—Offset 3070h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 3070h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **DB Stream ID (DSI):** Reserved.<br><br>**Power Well:** Core |
| 15:8 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RW | **DB Target (DT):** This field defines the target of the doorbell reference.<br>Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers.<br><br>**Power Well:** Core |

## 51.3.128 Door Bell 30 (DB29)—Offset 3074h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 3074h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **DB Stream ID (DSI):** Reserved.<br><br>**Power Well:** Core |
| 15:8 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RW | **DB Target (DT):** This field defines the target of the doorbell reference.<br>Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers.<br><br>**Power Well:** Core |

## 51.3.129 Door Bell 31 (DB30)—Offset 3078h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 3078h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **DB Stream ID (DSI):** Reserved.<br><br>**Power Well:** Core |
| 15:8 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RW | **DB Target (DT):** This field defines the target of the doorbell reference.<br>Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers.<br><br>**Power Well:** Core |

## 51.3.130 Door Bell 32 (DB31)—Offset 307Ch

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 307Ch

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **DB Stream ID (DSI):** Reserved.<br><br>**Power Well:** Core |
| 15:8 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RW | **DB Target (DT):** This field defines the target of the doorbell reference.<br>Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers.<br><br>**Power Well:** Core |

## 51.3.131 Door Bell 32 (DB32)—Offset 3080h

Door Bell registers are an array of 64 registers, with 0 to 32 being used by the XHC and the rest being reserved.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 3080h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **DB Stream ID (DSI):** Reserved.<br><br>**Power Well:** Core |
| 15:8 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RW | **DB Target (DT):** This field defines the target of the doorbell reference.<br>Doorbell register 0: Dedicated to Command Ring and decodes this field differently than other doorbell registers.<br><br>**Power Well:** Core |

## 51.3.132 XECP_SUPP_USB2_1—Offset 8004h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 20425355h

**BAR and Offset:** [MBAR] + 8004h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x20425355<br>RO | **XECP_SUPP_USB2_1:** Namestring USB<br><br>**Power Well:** Core |

## 51.3.133 XECP_SUPP_USB2_2—Offset 8008h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 30190401h

**BAR and Offset:** [MBAR] + 8008h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0x3<br>RO | **Protocol Speed ID Count (PROT_SPD_ID_CNT):** 3 USB 2.0 Speed (High, Full, Low)<br><br>**Power Well:** Core |
| 27:21 | 0x0<br>RO | **Rsvd0:** Reserved.<br><br>**Power Well:** Core |
| 20 | 0x1<br>RW/L | **BESL LPM Capability (BLC):** Bit is set to 1 to indicate that the the ports described by this xHCI Supported Protocol Capability will apply BESL timing to BESL and BESLD fields of the PORTPMSC and PORTHLPMCC registers.<br><br>**Power Well:** Core |
| 19 | 0x1<br>RW/L | **Protocol Defined - Hardware LMP Capability (HLC):** Reserved.<br><br>**Power Well:** Core |
| 18 | 0x0<br>RO | **Protocol Defined - Integrated Hub Implementation (IHI):** Reserved.<br><br>**Power Well:** Core |

## 51.3.134 XECP_SUPP_USB3_1—Offset 8024h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 20425355h

**BAR and Offset:** [MBAR] + 8024h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x20425355<br>RO | **XECP_SUPP_USB2_1:** Namestring USB<br><br>**Power Well:** Core |

## 51.3.135 XECP_SUPP_USB3_2—Offset 8028h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 10000405h

**BAR and Offset:** [MBAR] + 8028h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0x1<br>RO | **Protocol Speed ID Count (PROT_SPD_ID_CNT):** 1 USB 3.0 Speed (Supper Speed)<br><br>**Power Well:** Core |
| 27:16 | 0x0<br>RO | **Rsvd0:** Reserved.<br><br>**Power Well:** Core |
| 15:8 | 0x4<br>RO | **Compatible Port Count (CPC):** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 0x5<br>RO | **Compatible Port Offset (CPO):** Reserved.<br><br>**Power Well:** Core |

## 51.3.136 Host Controller Capability (HOST_CTRL_CAP_REG)—Offset 8070h

This is a register that describe the host controller the extended cap location. It includes the , XECP_HOST_NEXT_CAP_OFFSET and VEND_DEF_HOST_CAP_ID_192. This register is not subject to HW save and restore.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 004DFFC0h

**BAR and Offset:** [MBAR] + 8070h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 23:16 | 0x4d<br>RW/L | **Valid Length (VALID_LENGTH):** Indicates the number of valid DWords in the capability, that need to be saved and restored This value needs to be updated as new chicken bit registers are added. 47h -) 818Bh is the last valid byte<br><br>**Power Well:** Core |
| 15:8 | 0xff<br>RW/L | **Next Capability Pointer (XECP_HOST_NEXT_CAP_OFFSET):** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 0xc0<br>RW/L | **Supported Protocol ID (VEND_DEF_HOST_CAP_ID):** Reserved.<br><br>**Power Well:** Core |

## 51.3.137 Override EP Flow Control (HOST_CLR_MASK_REG)—Offset 8078h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MBAR] + 8078h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:10 | 0x0<br>RO | **RESERVED (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 9:5 | 0x0<br>WO | **Slot Number Default Config (SNDC):** 5bits of slot number as a default configuration. It can scale to max of 128 slots<br><br>**Power Well:** Core |
| 4:1 | 0x0<br>WO | **EP Number (EP_NUM):** 4bits of EP number<br><br>**Power Well:** Core |
| 0 | 0x0<br>WO | **Clear Internal Scheduler's Mask (CISM):** This is a register that is used to clear the internal scheduler's mask that is used to stop scheduling a particular EP. Bit0 indicates the direction of the EP<br><br>**Power Well:** Core |

## 51.3.138 Clear Active IN EP ID Control (HOST_CLR_IN_EP_VALID_REG)—Offset 807Ch

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MBAR] + 807Ch

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>WO | **Clear Active IN EP ID Control (HOST_CLR_IN_EP_VALID_REG):** This register is used to clear the internal valid IN EP array that TRM stored in order to guarantee one IN EP per port. This register allows software to clear the valid bit of each port IN EP. This field indicates the port number. For a 2port configuration, only bit1:0 are valid. It can scale for the max number of ports that we support.<br><br>**Power Well:** Core |

## 51.3.139 Clear Poll Mask Control (HOST_CLR_PMASK_REG)—Offset 8080h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MBAR] + 8080h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:10 | 0x0<br>RO | **RESERVED (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 9:5 | 0x0<br>WO | **Slot Number Default Config (SNDC):** 5bits of slot number as a default configuration. It can scale to max of 128 slots<br><br>**Power Well:** Core |
| 4:1 | 0x0<br>WO | **EP Number (EP_NUM):** 4bits of EP number<br><br>**Power Well:** Core |
| 0 | 0x0<br>WO | **Clear Internal Scheduler's Poll Mask (CISPM):** This is a register that is used to clear the internal scheduler's poll mask that is used to indicate whether we need to poll this EP. This is used for USB2. Bit0 indicates the direction of the EP<br><br>**Power Well:** Core |

## 51.3.140 Host Control Scheduler (HOST_CTRL_SCH_REG)—Offset 8094h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00008100h

**BAR and Offset:** [MBAR] + 8094h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:21 | 0x0<br>RW | **Scheduler Host Control Reg Cont (SCHED_HOST_CTRL_CONT):** method of USB2 port periodic done check (off by default)<br><br>**Power Well:** Core |
| 20:13 | 0x4<br>RW | **TTE Host Control (TTE_HOST_CTRL):** (0): disable interrupt complete split limit to 3 microframes (1): disable checking of missed microframes (2): disable split error request w/NULL pointer on speculative INs with data payload and no TRB. (3): disable deferred split error request on speculative IN with data payload and no TRB. (7:4): reserved<br><br>**Power Well:** Core |
| 12:11 | 0x0<br>RW | **Cache Size Control Reg (CACHE_SZ_CTRL):** 0: 64 1: 32 2,3: 16<br><br>**Power Well:** Core |
| 10:9 | 0x0<br>RW | **Maximum EP Per Slot (MAX_EP_SLOT):** 0: 32 1: 16 2: 8 3: 4<br><br>**Power Well:** Core |
| 8 | 0x1<br>RW | **Turn on scratch_pad_en (TO_SCRATCH_PAD_EN):** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RW | **Scheduler Host Control Reg (SCHED_HOST_CTRL):** (0): disable poll delay (1): disable TRM active in EP valid check (2): enable TTE overlap prevention on interrupt IN EPs (at cost of possible service interval slip) (3) enable TTE overlap prevention on interrupt OUT EPs (at cost of possible service interval slip) (5:4) scheduler sort pattern 00 (default) search ISO ahead of interrupt within each service interval 01 - search USB2-ISO, USB3-ISO, USB2-Interrupt, USB3-Interrupt within each service interval 10 - search strictly by interval 11 - search all ISO intervals ahead interrupt intervals and within each interval, USB2 ahead of USB3 (6): disable 1 pack scheduling limit when ISO pending in present microframe (7): enable check to stop scheduling on port that are not connected<br><br>**Power Well:** Core |

## 51.3.141 Power Management Control (PMCTRL_REG)—Offset 80A4h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 002DFF90h

**BAR and Offset:** [MBAR] + 80A4h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **Async PME Source Enable (ASYNC_PME_SRC_EN):** This field allows the async PME source to be allowed to generate PME. This is specifically required for SOCs that do not allow for any clock other than RTC to be available during RTD3.<br><br>**Power Well:** SUS |
| 30 | 0x0<br>RW | **Legacy PME Source Enable (LEGACY_PME_SRC_EN):** This field allows the legacy PME source to be used in PME generation. The legacy source in in reference to the source prior to the RTD3 changes.<br><br>**Power Well:** SUS |
| 29 | 0x0<br>RW | **Reset Warn Power Gate Trigger Disable (RESET_WARN_PWR_GATE_TRIGGER_DISABLE):** This field controls the actions taken for due to reset warn. 0 - Reset Warn will trigger a HW autonomous Power Gate 1 - Reset Warn will not trigger a HW autonomous Power Gate<br><br>**Power Well:** SUS |
| 28 | 0x0<br>RW | **CLR_PME_FLAG_PULSE_AUX_CCLK:** Reserved.<br><br>**Power Well:** SUS |
| 27 | 0x0<br>RW | **RESERVED (RSVD):** Reserved.<br><br>**Power Well:** SUS |
| 26 | 0x0<br>RW | **XLFPSCOUNTSRC:** XLFPSCOUNTSRC (Source for LFPS OFF Counter) 0: Central RTC Counter for LFPS detection 1: Local Counter for LFPS detection<br><br>**Power Well:** SUS |
| 25 | 0x0<br>RW | **XELFPSRTC:** XELFPSRTC (Enable LFPS Filtering on RTC) 0: Use Oscillator clock for LFPS Filtering during P3 1: Use RTC Clock for LFPS Filtering during P3<br><br>**Power Well:** SUS |
| 24 | 0x0<br>RW | **XMPHYSPGDD0I2:** XMPHYSPGDD0I2 (ModPhy Sus Well Power Gate Disable for D0I2) 0 : Modphy sus well power gating enabled 1 : Modphy sus well power gating disabled<br><br>**Power Well:** SUS |
| 23 | 0x0<br>RW | **XMPHYSPGDD0I3:** XMPHYSPGDD0I3 (ModPhy Sus Well Power Gate Disable for D0I3) 0 : Modphy sus well power gating enabled 1 : Modphy sus well power gating disabled<br><br>**Power Well:** SUS |
| 22 | 0x0<br>RW | **XMPHYSPGDRTD3:** XMPHYSPGDRTD3 (ModPhy Sus Well Power Gate Disable for RTD3) 0 : Modphy sus well power gating enabled 1 : Modphy sus well power gating disabled<br><br>**Power Well:** SUS |
| 21:18 | 0xb<br>RW | **XD3RTCPTTM:** XD3RTCPTTM (D3 RTC Port Timer Tick Multiplier) This register will be the multiplication factor for determining SSIC Wake Detection Frequency and RXDET based on the XD3RTCPTTC value. If XD3RTCPTTC is 9h and this register is Bh, frequency for RXDET and SSIC H8EXIT detection while MODPHY SUS Power gating is enabled would be 99ms.<br><br>**Power Well:** SUS |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 17 | 0x0<br>RW | **U3 LFPS Periodic Sampling ON Time Control (U3_LFPS_PRDC_SAMPLING_ON_TIME_CTRL):** This field controls the ON time for the LFPS periodic sampling for USB3/SSIC ports. 0 ON time is 2 rtc clocks 1 ON time is 3 rtc clocks Note: This field is ignored if USB3/SSIC PHY SUS Well Power Gating is enabled.<br><br>**Power Well:** SUS |
| 16 | 0x1<br>RW | **AON LFPS Detector Enable Mode (AON_LFPS_DETECTOR_EN_MODE):** 1 - Allow the LFSP Detector in AON to own LFPS detection when the port is in PS3 for U2/U3 - not RxD regardless of port ownership. 0 - Allow the LFPS Detector in AON to own the LFPS detection only when the AON owns the port and in U2/U3 - not RxD<br><br>**Power Well:** SUS |
| 15:8 | 0xff<br>RW | **SS U3 LFPS Detection Threshold (SS_U3_LFPS_DETECTION_THRESHOLD):** This field controls the threshold used to determine when a valid U3 Wake is detected through when using the unfiltered LFPS source. The value on this field will reflect the binary count required to have been detected on the counter being clocked by the unfiltered lfps source to result in a valid U3 wake detection.<br><br>**Power Well:** SUS |
| 7:4 | 0x9<br>RW | **SS_U3_LFPS_PRDC_SAMPLING_OFFTIME_CTRL:** This field controls the OFF time for the LFPS periodic sampling for USB3 Ports 0x0 periodic sampling is disabled. 0x1 OFF time is 1ms 0x2 OFF time is 2ms 0xF OFF time is 15ms The ON Time is determined by the amount of time required to reliably determine if there is a valid LFPS and is HW implementation specific. A speed up mode shall be implemented where this field is in units of us. i.e. 0x1 = 1 us OFF time, 0x2 = 2 us OFF time, etc.<br><br>**Power Well:** SUS |
| 3 | 0x0<br>RW | **PS3 LFPS Source Select (PS3_LFPS_SRC_SEL):** 0 LFPS Source is unfiltered 1 LFPS Source is filtered (Rx-Elec-Idle) LFPS Source is Rx-Elec-Idle for any non PS3 state.<br><br>**Power Well:** SUS |
| 2 | 0x0<br>RW | **XHCI Engine Autonomous Power Gate Exit Reset Policy (XHC_AUTO_PWRGATE_EXITRST_POLICY):** Controls when the xHCI engine is brought out of reset due to a power ungate. 0 Engine is brought out of reset when D3 to D0 is triggered. This allows for a quick power up sequence while leaving the virtual PCIe LTSSM in L23 is power ungate is not due to D3 to D0. 1 Engine is brought out of reset along with the rest of the IP. This is required for PMC save/restore flow.<br><br>**Power Well:** SUS |

For IP-Inaccessible PG (or with state-retention disabled): Value representing the minimum number of delay clocks required between the deassertion of pgcb_isol_latchen to the assertion of pgcb_isol_en_b, as well as the minimum number of delay clocks required between the assertion of pgcb_sleep to the assertion of pgcb_pmc_pg_req_b.<br>Common for all cfg_t* inputs:<br>0 1 clock<br>1 2 clocks<br>0 8 clocks<br>1 256 clocks<br>For any of the cfg_t* inputs that an IP may feel are a don-care and the IP does not feel they will be useful for post-silicon debug, the recommendation is to tie the input to 201 (2 clocks).<br>Otherwise, the inputs may be tied to another relevant value or connected to a configuration register.<br>***Note:*** These signals may only change while pgcb_pwrupidle is asserted, if pgcb_pwrupidle is deasserted it should be valid and stable. (It may change the same cycle that ip_pgcb_pg_rdy_req_b asserts.)<br><br>**Power Well:** SUS |

## 51.3.143 D0I3 Control (DOI3CTRL_REG)—Offset 80ACh

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000008h

**BAR and Offset:** [MBAR] + 80ACh

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:4 | 0x0<br>RO | **RESERVED (RSVD):** Reserved.<br><br>**Power Well:** SUS |
| 3 | 0x1<br>RW/1C | **RestoreRequired (RESTORE_REQUIRED):** When set (by HW), SW must restore state to the IP. The state may have been lost due to a reset or full power lost. SW clears the bit by writing a 1. This bit will be set on initial power up.<br><br>**Power Well:** SUS |
| 2 | 0x0<br>RW | **D0I3:** SW sets this bit to 1 to move the IP into the D0i3 state. Writing this bit to 0 will return the IP to the fully active D0 state (D0i0).<br><br>**Power Well:** SUS |
| 1:0 | 0x0<br>RO | **RESERVED (RSVD1):** Reserved.<br><br>**Power Well:** SUS |

## 51.3.144 HOST_CTRL_MISC_REG—Offset 80B0h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 0001037Fh

**BAR and Offset:** [MBAR] + 80B0h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **USB2_LTRUPDT_DIS:** Reserved.<br><br>**Power Well:** Core |
| 30 | 0x0<br>RW | **USB2 Line State Debounce During Port Reset Policy (USB2_LINE_STATE_DEBOUNCE_DURING_PORT_RESET_POLICY):** This register controls how the debounce is enforced during the Port Reset phase. 0 do not enable the line state debounce during port reset. 1 enable the line state debounce during port reset.<br><br>**Power Well:** Core |
| 29 | 0x0<br>RW | **TTE PEXE Credit Fix Disable (TTE_PEXE_CREDIT_FIX_DISABLE):** When set, it disables a fix implemented to re-deem PEXE credits when a port is disconnected<br><br>**Power Well:** Core |
| 28 | 0x0<br>RW | **TTE Scheduling policy (TTE_SCHEDULING_POLICY):** This register controls a fix made to prevent over-scheduling by not account for 188B in each uFrame. Setting this bit will disable the fix and allow for over-scheduling.<br><br>**Power Well:** Core |
| 27 | 0x0<br>RW | **USB3 ITP Delta Timer Source Select (USB3_ITP_DELTA_TIMER_SOURCE_SELECT):** This register selects the source for the delta timer tracking used for ITP generation. 0 the source is a 16.666 ns tick generated from a crystal reference clock 1 - the source is a 16.666 ns tick generated from the aux_cclk. This field needs to remain in sync with Frame Timer Source Select to ensure the are both set or both cleared. There is no support for any other combination.<br><br>**Power Well:** Core |
| 26 | 0x0<br>RW | **Frame Timer Source Select (FRAME_TIMER_SOURCE_SELECT):** This register controls the source for the frame timer. 0 the source for the frame timer is a crystal reference clock 1 the source for the frame timer is the aux_cclk.<br><br>**Power Well:** Core |
| 25 | 0x0<br>RW | **uFrame Masking Enable (UFRAME_MASKING_ENABLE):** If set, enables the uFrame tick to be masked due to ports being in U3/NC. This controls a fix made to disable the auto masking of uFrame tick due to port state w/o any pipeline idle condition. When cleared, we rely on gating of frame timer due to proper port state and idleness tracking from the pipeline.<br><br>**Power Well:** Core |
| 24 | 0x0<br>RW | **Late FID Check Disable (LATE_FID_CHECK_DISABLE):** This register disables the Late FID Check performed when starting an ISOCH stream.<br><br>**Power Well:** Core |
| 23:20 | 0x0<br>RW | **RESERVED (RSVD1):** Reserved.<br><br>**Power Well:** Core |
| 19 | 0x0<br>RW | **USB2 Resume Cx Inhibit Disable (USB2_RESUME_CX_INHIBIT_DISABLE):** Controls if USB2 L1 Resume is allowed to contribute to DMA Active which will inhibit Cx state. 0 USB2 L1 Resume is allowed to inhibit Cx via DMA Active 1 USB2 L1 Resume is NOT allowed to inhibit Cx via DMA Active When cleared, Cx will only be inhibited when the DMA traffic for the port begins.<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 18:16 | 0x1<br>RW | **Extra uFrame (EXTRA_UFRAME):** This register controls the extra number of uFrames added onto the advancing of late FID check.<br><br>**Power Well:** Core |
| 15:0 | 0x37f<br>RW | **Valid Isoch Scheduling Range (VALID_ISOCH_SCHEDULING_RANGE):** This register defines the window in miliseconds from the current Frame that will be considered for scheduling in an upcoming Frame. Anything scheduled outside of this window will be considered as late and will trigger the Missed Service Error.<br><br>**Power Well:** Core |

## 51.3.145 reg_SSPITPE_type (SSPITPE)—Offset 80BCh

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 0000000Fh

**BAR and Offset:** [MBAR] + 80BCh

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:4 | 0x0<br>RW | **RSVD:** Reserved.<br><br>**Power Well:** Core |
| 3:0 | 0xf<br>RW | **ITP Transmit Enable (ITP_TRANSMIT_EN):** Width is scaled with USB3 Port Count PortCount=4<br><br>**Power Well:** Core |

## 51.3.146 AUX Reset Control (AUX_CTRL_REG)—Offset 80C0h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 015FC0F0h

**BAR and Offset:** [MBAR] + 80C0h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **Reset USB3 AUX/Main PD Logic (RST_U3_AM_PDL):** A reset that is designed to reset all USB3 port AUX + Main power domain logic. This is a debug function. It is called cold reset. Write 1 to this register will issue a cold reset to USB3 ports.<br><br>**Power Well:** SUS |
| 30 | 0x0<br>RW | **RESERVED (RSVD):** Reserved.<br><br>**Power Well:** SUS |
| 29 | 0x0<br>RW | **Enable PCIe PIPE Reset As PCIe PHY Reset (EN_PPIPE_PPHY_RST):** This bit set to 1 selects the PCIe PIPE reset as a PCIe PHY power on reset. 0 selects the AUX powerup reset as a PCIe PHY powerup reset.<br><br>**Power Well:** SUS |
| 28 | 0x0<br>RW | **Ensure PIPE Powerdown On PERST# (EN_PPWRDN_PERST):** This bit ensures any PERST# being asserted will cause PIPE powerdown state transition to P1.<br><br>**Power Well:** SUS |
| 27 | 0x0<br>RW | **Disable PERST# Main RST (DIS_PERST_MRST):** There is a feature where we only allow PERST# to be treated as a main powerdown reset when it is asserted during the state that is not in D3. This bit disables this feature when it is set to 1. If this bit is set to 1, it means that any PERST# will be treated as a main power domain reset regardless of its Dstate.<br><br>**Power Well:** SUS |
| 26 | 0x0<br>RW | **Disable PCIe PERST# Host Controller (DIS_PERST_HC):** There is a feature where we can disable PCIe PERST# from reset the host controller until power management control module has done its clock switching. This is for a case where PM entered L23 and immediately PERST# asserted. This bit is designed to enable this feature when set to 1.<br><br>**Power Well:** SUS |
| 25 | 0x0<br>RW | **Enable Fast Simulation Reset Mode (EN_FAST_RST):** Enable a fast simulation mode for reset function. This is a feature for GLS<br><br>**Power Well:** SUS |
| 24 | 0x1<br>RW | **Prevent USB3 Link Down Reset (PREV_U3_LDRST):** When set to 1 prevent a reset being generated due to the USB3 port link down condition.<br><br>**Power Well:** SUS |
| 23 | 0x0<br>RW | **Ignore Main Power Up Reset (IGN_MPU_RST):** When set to 1 ignore the main power up reset for USB3 PIPE PHY reset.<br><br>**Power Well:** SUS |

## 51.3.152 AUX Power Management Control (AUX_CTRL_REG1)—Offset 80E0h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 808DBCA0h

**BAR and Offset:** [MBAR] + 80E0h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x1<br>RW | **D3 Hot function enable register (D3_HOT_FXN_EN):** This bit is from pin input which is set 1. But we allow software to alter it if it is needed. 1: D3 hot enabled 0: D3 hot not abled.<br><br>**Power Well:** SUS |
| 30 | 0x0<br>RW | **Allow L1 Core Clock Gating (ALL_L1_CORE_CG):** When set to 1 allows core clock being gated during L1 state.<br><br>**Power Well:** SUS |
| 29 | 0x0<br>RW | **Allow Engine PHY Status Extension (AL_EP_SEXT):** When set to 1 allows the engine to extend PHY status of PCIe PIPE for one more cycle. This is due to the fact that our rate change function has a potential of not being able to sample the phystatus signal.<br><br>**Power Well:** SUS |
| 28 | 0x0<br>RW | **Allow Engine PCIe Rate Change Passing (ALL_EP_RCP):** When set to 1 allows the engine to pass PCIe rate change signal as it is from PCIe core to PCIe PHY.<br><br>**Power Well:** SUS |
| 27 | 0x0<br>RW | **Allow Engine PERST Fundamental Reset (AL_PERST_FRST):** When set to 1 allow engine to treat PERST# as a foundamental reset<br><br>**Power Well:** SUS |
| 26 | 0x0<br>RW | **Overwrite PCIe P2 to P1 (OVR_PCIE_P2_P1):** When set to 1 will overwrite a PCIe powerdown state of P2 to P1.<br><br>**Power Well:** SUS |
| 25 | 0x0<br>RW | **Set Internal SSV 1 (SET_ISSV_1):** When set to 1 set the internal SSV to 1.<br><br>**Power Well:** SUS |
| 24 | 0x0<br>RW | **Clear Internal SSV 0 (CLR_ISSV_0):** When set to 1 clear the internal SSV to 0.<br><br>**Power Well:** SUS |
| 23 | 0x1<br>RW | **Enable save_restore_enable SW Loading (EN_SRE_SW_LD):** This is a bit that enables the save_restore_enable signal being loaded when a software command has set Save bit. This is a debug function.<br><br>**Power Well:** SUS |
| 22 | 0x0<br>RW | **RESERVED (RSVD_1):** Reserved.<br><br>**Power Well:** SUS |
| 21 | 0x0<br>RW | **Force save_restore 1 (FORCE_SR1):** When set to 1, it will force the save_restore flag to 1. This flag is an bit to ensure that we have masked the update during low power state. If software write this bit to 1, it must write it to 0 in order to resume the normal save and restore function.<br><br>**Power Well:** SUS |
| 20 | 0x0<br>RW | **cfg pcie txreg rd (CPTR):** Reserved.<br><br>**Power Well:** SUS |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 19 | 0x1<br>RW | **cfg iob drivestrength[1] (CIDS1):** Reserved.<br><br>**Power Well:** SUS |
| 18 | 0x1<br>RW | **cfg iob drivestrength[0] (CIDS0):** Reserved.<br><br>**Power Well:** SUS |
| 17 | 0x0<br>RW | **Enable CFG USB P2 (EN_CFG_UP2):** When set to '1' enable cfg usb p2<br><br>**Power Well:** SUS |
| 16 | 0x1<br>RW | **cfg clk gate dis (CCGD):** Reserved.<br><br>**Power Well:** SUS |
| 15 | 0x1<br>RW | **Enable CFG RXDET P3 (EN_CFG_RDP3):** When set to '1' enable cfg rxdet p3<br><br>**Power Well:** SUS |
| 14 | 0x0<br>RW | **Enable CFG PIPE Reset (EN_CFG_PIPE_RST):** When set to '1' enable cfg pipe rst<br><br>**Power Well:** SUS |
| 13 | 0x1<br>RW | **Enable Filter TX Idle (EN_FILT_TX_IDLE):** When set to 1 enables a filter function to TX electrical idle signal at PCie PIPE. We have a filter that will set TXelecidle signal of PCIe PIPE to 1 whenever we are in isolation state or power down transition states.<br><br>**Power Well:** SUS |
| 12 | 0x1<br>RW | **Enable Host Engine Generate PME (EN_HE_GEN_PME):** This is a global switch to whether or not eable this host engine to generate PME message.<br><br>**Power Well:** SUS |
| 11 | 0x1<br>RW | **Enable Isolation (EN_ISOL):** When set to '1' enable isolation<br><br>**Power Well:** SUS |
| 10 | 0x1<br>RW | **Enable L1 Caused P2 Overwrite (EN_L1_P2_OVR):** Set 1 to enable a new feature. This new feature is designed to use L1 as a state to identify whether we should do P2 Overwrite or not. We used to use P1 state to identify whether or not to invoke P2 overwrite function.<br><br>**Power Well:** SUS |
| 9 | 0x0<br>RW | **Enable Core Clock Gating (EN_CORE_CG):** When set to '1' enable core clock gating based on low power state entered<br><br>**Power Well:** SUS |
| 8 | 0x0<br>RW | **Enable PHY Status Timeout (EN_PHY_STS_TO):** When set to '1' enable PHY status timeout function which is designed to cover the PCIePHY issue that we may have not able to detect the PHY status toggle.<br><br>**Power Well:** SUS |
| 7 | 0x1<br>RW | **Ignore aux_pm_en PCIe Core (IGN_APE_PC):** When set to '1' ignore the aux_pm_en reg from PCIe core to continue the remote wake/clock switching support<br><br>**Power Well:** SUS |
| 6 | 0x0<br>RW | **Enable P2 Overwrite P1 (EN_P2_OVR_P1):** When set to '1' enable P2 overwrite P1 when PCIe core has indicated the transition from P0 to P1. This is to enable entering the even lower power state.<br><br>**Power Well:** SUS |
| 5 | 0x1<br>RW | **Enable P2 Remote Wake (EN_P2_REM_WAKE):** When set 1 '1' enable the remote wake function by allowing P2 clock/switching and P2 entering<br><br>**Power Well:** SUS |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 4:1 | 0x0<br>RW | **Forced PM State (FORCED_PM_STATE):** Reserved.<br><br>**Power Well:** SUS |
| 0 | 0x0<br>RW | **Initiate Force PM State (INIT_FPMS):** When set to '1' force PM state to go to the state indicated in bit 4:1<br><br>**Power Well:** SUS |

## 51.3.153 Battery Charge (BATTERY_CHARGE_REG)—Offset 80E4h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MBAR] + 80E4h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **Enable DM_SRC Battery Charge (EN_DS_BC):** 1 - Always enable battery charge DM_SRC if not connected. Don't wait for portable device detect. (spec. ver. 1.2) 0 - Battery charge spec ver. 1.1.<br><br>**Power Well:** SUS |
| 30:4 | 0x0<br>RO | **RESERVED (RSVD):** Reserved.<br><br>**Power Well:** Core |

## 51.3.156 USB2 Port Link Control 2 (USB2_LINK_MGR_CTRL_REG2)—Offset 80F4h

These set of registers is used to control jey USB set of timers. They are spread over 4 registers each 32 bits wide.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 80F4h

**Default:** 80C40620h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x1<br>RW | **Total Reset Duration[0] (TOT_RST_DUR_0):** # of microseconds for total reset duration<br><br>**Power Well:** SUS |
| 30:18 | 0x31<br>RW | **Chirp-K Duration (CHIRPK_DUR):** # of microseconds of Chirp-K to register that a device is chirping<br><br>**Power Well:** SUS |
| 17:5 | 0x31<br>RW | **K/J Disconnect Connect Delay (KJ_DIS_CON_DEL):** # of microseconds of K/J in disconnected state to register connect has occurred.<br><br>**Power Well:** SUS |
| 4:0 | 0x0<br>RW | **FS/LS Mode SE0 Disconnect Delay[12:8] (FSLS_SE0_DIS_DEL_12_8):** # of microseconds of SE0 in FS/LS mode to register disconnect had occurred.<br><br>**Power Well:** SUS |

## 51.3.157 USB2 Port Link Control 3 (USB2_LINK_MGR_CTRL_REG3)—Offset 80F8h

These set of registers is used to control jey USB set of timers. They are spread over 4 registers each 32 bits wide.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 80F8h

**Default:** F865EB6Bh

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0xf<br>RW | **U2 Entry Ignore Linestate Changes Duration[3:0] (U2_IGN_LS_DUR_3_0):** # of microseconds after entering U2, linestate changes are ignored as bus settles<br><br>**Power Well:** SUS |
| 27:15 | 0x10cb<br>RW | **U3 Entry Ignore Linestate Changes Duration (U3_IGN_LS_DUR):** # of microseconds after entering U3, linestate changes are ignored as bus settles<br><br>**Power Well:** SUS |
| 14:0 | 0x6b6b<br>RW | **Total Reset Duration[15:1] (TOT_RST_DUR_15_1):** # of microseconds for total reset duration<br><br>**Power Well:** SUS |

## 51.3.158 USB2 Port Link Control 4 (USB2_LINK_MGR_CTRL_REG4)—Offset 80FCh

These set of registers is used to control jey USB set of timers. They are spread over 4 registers each 32 bits wide.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00008003h

**BAR and Offset:** [MBAR] + 80FCh

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

## 51.3.161 Power Scheduler Control-0 (PWR_SCHED_CTRL0)—Offset 8140h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 0A019132h

**BAR and Offset:** [MBAR] + 8140h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0xa<br>RW | **Engine Idle Hysteresis (EIH):** This register controls the min. idle span that has to be observed from the engine idle indicators before the power state flags (xhc_*_idle) will indicate a 1.<br><br>**Power Well:** Core |
| 23:12 | 0x19<br>RW | **Backbone PLL Shutdown Advance Wake (BPSAW):** This register controls the time before the next scheduled transaction where the Backbone PLL request will assert. Register Format: Bits [11:7] # of 125us uframes Bits [6:0] # of microseconds (0-124)<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 11:0 | 0x132<br>RW | **Backbone PLL Shutdown Min. Idle Duration (BPSMID):** The sum of this register plus the Backbone PLL Shutdown Advance Wake form to a Total Idle time. When the next scheduled periodic transaction is after present time + Total Idle, the Backbone PLL request will de-assert, allowing the PLL to shutdwon. Register Format: Bits [11:7] # of 125us uframes Bits [6:0] # of microseconds (0-124)<br><br>**Power Well:** Core |

## 51.3.162 AUX Power Management Control (AUX_CTRL_REG2)—Offset 8154h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 81390206h

**BAR and Offset:** [MBAR] + 8154h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x1<br>RW | **DIS_L1P2_EXIT_ON_WAKE_EN:** This bit disables the dependency on Wake Enables defined in PORTSC for L1P2 exit when in D0<br><br>**Power Well:** SUS |
| 30:28 | 0x0<br>RW | **RESERVED0 (RSVD0):** Reserved.<br><br>**Power Well:** SUS |
| 27:25 | 0x0<br>RW | **RESERVED (RSVD):** Reserved.<br><br>**Power Well:** SUS |
| 24 | 0x1<br>RW | **Enable L1 exit notification to SNPS PCIe core (EN_L1_EXIT_NOTIF_PCIE):** This bit enables a L1 exit notification to SNPS PCIe core. There is a case where USB ports have waked up and AUX PM module has started the wakeup process. The AUX PM control state got into a wait for P0 state because it needs to wait until PCie core to signal powerdown state change. Due to the fact that the core is in D3Hot, there is no run_stop bit set such that no internal interrupt will be fired. This causes the LTSSM of PCIe stayed in L1 even though AUX PM has known that it needs an L1 exit. This bit works together with bit21 of this register. 1: enables this feature 0: disables this feature.<br><br>**Power Well:** SUS |
| 23 | 0x0<br>RW | **DISABLE PLC ON DISCONNECT (DIS_PLC_ON_DISCONNECT):** 1: do not assert PLC for disconnection 0: assert PLC for disconnection<br><br>**Power Well:** SUS |
| 22 | 0x0<br>RW | **TREAT_IDLE_AS_TS2_IN_LTSSM_WAIT_4_TS2:** This bit enables a feature in PCie core LTSSM to treat IDLE received as TS2 when LTSSM is in wait for TS2 receive state. This is a function requested from PHY where it is possible to not able to receive TS2 without error. 1: treat Logic IDLE as TS2 received when in some PCIe LTSSM state. 0: disable this feature.<br><br>**Power Well:** SUS |
| 21 | 0x1<br>RW | **Disable p2 overwrite due to the D3HOT where PCIe core enters the L1 (DIS_P2_OVERWRITE_DUE2_D3HOT):** We added a feature where if PCIe core LTSSM enters L1 due to the D3hot, the aux PM control will not start a P2 overwrite function in anticipating for the next L23 enter. 1: disables p2 overwrite due to the D3HOT where PCIe core enters the L1. 0: enables P2 overwrite even if we are in D3Hot.<br><br>**Power Well:** SUS |
| 20 | 0x1<br>RW | **Enable the port to enter U3 automatically when in U1/U2 (ENABLE_AUTO_U3_ENTRY_FROM_U2_U3):** 1: enables the port to enter U3 automatically when in U1/U2 0: disables the port to enter U3 automatically when in U1/U2<br><br>**Power Well:** SUS |
| 19 | 0x1<br>RW | **No linkdown reset is issue during low power state (DIS_LINKDOWN_RST_DURING_LOW_POWER):** No linkdown reset is issue during low power state<br><br>**Power Well:** SUS |
| 18 | 0x0<br>RW | **EN_EXIT_DEEP_SLEEP_IF_PCIE_IN_P0:** This bit enables a feature in AUX PM module where if PCIe core LTSSM is in P0 for a duration of time, we will exit the deep sleep state. This is for failure control in case. 1: enables this feature 0: disable this feature<br><br>**Power Well:** SUS |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 17 | 0x0<br>RW | **U2_EXIT_LFPS_TIMER_VALUE:** This bit selects U2 exit LFPS timer value 0: 320ns 400ns in 25MHz domain 1: 240ns 320ns in 25MHz domain<br><br>**Power Well:** SUS |
| 16 | 0x1<br>RW | **EN_EXIT_DEEP_SLEEP_ON_USB_PORT_WAKEUP:** This bit enables a function that AUX PM module exits from the deep sleep state due to the USB ports wakeup level signal. We have added this feature where USB ports will generated a wakeup level signal to wakeup the AUX PM module if it is in deep sleep state and this level signal will be cleared if the change bits are updated by software. 1: enables this function 0: disables this function which means that a wakeup pulse generated from each USB PortSC event will wake up the AUX PM module from deep sleep if the D3 state is programmed.<br><br>**Power Well:** SUS |
| 15:14 | 0x0<br>RW | **P3_ENTRY_TIMEOUT:** This field defines the timeout value to enter P3 mode in U2. 00: 7us 8us 01: 511us 512us 10: disables the timer (0us) 11: disables the timer (0us)<br><br>**Power Well:** SUS |
| 13 | 0x0<br>RW | **Enable U2 P3 Mode (EN_U2_P3):** 0: Disable U2 P3 mode 1: Enable U2 P3 mode<br><br>**Power Well:** SUS |
| 12:11 | 0x0<br>RW | **Fine Debug Mode Select (FINE_DM_SEL):** Reserved.<br><br>**Power Well:** SUS |
| 10 | 0x0<br>RW | **Enable Low Power State Based Core Clock Gating (EN_LP_CORE_CG):** When set to '1' enable core clock gating based on low power state entered<br><br>**Power Well:** SUS |
| 9 | 0x1<br>RW | **Disable USB3 Port Status Changed Event (DIS_U3_PORT_SCE):** 0: Enable USB3 port status change event generation if any change bit is not cleared 1: Disable USB3 port status change event generation if any change bit is not cleared Bit 12 default 0<br><br>**Power Well:** SUS |
| 8:4 | 0x0<br>RW | **Debug Mode Select Register (DEB_MODE_SEL):** Reserved.<br><br>**Power Well:** SUS |
| 3 | 0x0<br>RW | **Enable Auto Wakeup Non-IDLE (EN_AWAK_NIDLE):** When set to 1 enables the auto wakeup function when engine has identified non IDLE condition.<br><br>**Power Well:** SUS |
| 2 | 0x1<br>RW | **Enable PM Control P1 Exit P2 (EN_PMC_P1_EXIT_P2):** When set 1 enables the PM control module to transition to P1 instead of P0 when exit P2.<br><br>**Power Well:** SUS |
| 1 | 0x1<br>RW | **Enable PCIe PIPE CLK Isolation (EN_PP_CLK_ISOL):** When set to 1 enables the PCIe PIPE CLK to be isolated when main power is removed.<br><br>**Power Well:** SUS |
| 0 | 0x0<br>RW | **Enable P2 Overwrite P1 Allowed Detect (EN_P2OVRP1_ADET):** When set to 1 enables a function that can detect whether or not enable P2 overwrite P1 function. The condition to get to P2 overwrite is when engine is in idle conditions. This means that there is no ISO EP pending.<br><br>**Power Well:** SUS |

## 51.3.163 USB2 PHY Power Management Control (USB2_PHY_PMC)—Offset 8164h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 000000FCh

**BAR and Offset:** [MBAR] + 8164h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |

| 1 | 0x0<br>RW | **Enable Rx Bias ckt disable (EN_RXB_CD):** When set enables the Rx bias ckt to be disabled when conditions met (as described by the HS phy PM policy bits)<br><br>**Power Well:** Core |
| 0 | 0x0<br>RW | **Enable Tx Bias ckt disable (EN_TXB_CD):** When set enables the Tx bias ckt to be disabled when conditions met (as described by the HS phy PM policy bits)<br><br>**Power Well:** Core |

## 51.3.164 USB Power Gating Control (USB_PGC)—Offset 8168h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 000282EEh

**BAR and Offset:** [MBAR] + 8168h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:1 | 0x14177<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 0 | 0x0<br>RW | **USB SRAM power gating enable (USB_SRAM_PGE):** When set enables power gating on USB ports. Usage of this bit is further qualified with xHCI SRAM Dynamic Power Gating Disable fuse. If the fuse disables dynamic power gating, setting this bit to 1 shall not enable power gating feature. This bit always returns the value that was written to it irrespective of the setting of xHCI SRAM Dynamic Power Gating Disable fuse.<br><br>**Power Well:** Core |

## 51.3.165 xHCI Aux Clock Control Register (XHCI_AUX_CCR)—Offset 816Ch

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000400h

**BAR and Offset:** [MBAR] + 816Ch

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:20 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 19 | 0x0<br>RW | **USB3 Partition Engine/Link trunk gating Enable (PARUSB3_ENG_GEN):** When set to 1 enables gating of the SOSC trunk to the XHCI engine and link in the PARUSB3 partition.<br><br>**Power Well:** SUS |
| 18 | 0x0<br>RW | **USB3 Partition Frame Timer trunk gating Enable (PARUSB3_LINK_GEN):** When set to 1 enables gating of the SOSC trunk to the Frame timer in the PARUSB3 partition.<br><br>**Power Well:** SUS |
| 17 | 0x0<br>RW | **USB2 link partition clock gating enable (PARUSB2_CLK_GEN):** When set to 1 enables gating of the SOSC trunk to the USB2 link and Phy logic in the PARUSB2 partition.<br><br>**Power Well:** SUS |
| 16 | 0x0<br>RW | **USB2/USHIP 12.5 MHz partition clock gating enable (USHIP_PCGEN):** When set to 1 enables gating of the 12.5 MHz SOSC trunk to the USB2 and USHIP logic in the PARUSB2 partition.<br><br>**Power Well:** SUS |
| 15 | 0x0<br>RO | **Reserved1 (RSVD1):** Reserved |
| 14 | 0x0<br>RW | **USB3 Port Aux/Core clock gating enable (USB3_AC_CGE):** When set, allows the aux_cclk clock into the USB3 port to be gated when conditions are met. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.<br><br>**Power Well:** SUS |
| 13:12 | 0x0<br>RW | **Rx Detect Timer when port Aux Clock is Gated (RX_DT_ACG):** This field defines the value of the timer used to perform Rx Detect when port Aux Clock has been gated. 0x0: 100ms 0x1: 12ms Others: Reserved Note: This timer shall use the Fast Training Timer Tick (about 1us tick) for simulation purposes. For Fast Training mode, the above timeouts will become about 11us and about 100us, +/- implementation uncertainty, respectively.<br><br>**Power Well:** SUS |
| 11:8 | 0x4<br>RW | **U2 Residency Before ModPHY Clock Gating (U2R_BM_CG):** Before gating ModPHY Aux clock, Host Controller shall wait for this time in U2. This time is meant to ensure that the attached device has entered U2 as well. 0x0: 1us 0x1: 128us 0x2: 256us 0x3: 512us 0x4: 640us 0x5: 768us 0x6: 896us 0x7: 1024us Others: Reserved Note: This counter shall start counting once pipe has entered PS3 state in response to link in U2.<br><br>**Power Well:** SUS |
| 7 | 0x0<br>RW | **Frame Timer Clock Gating Ports in U2 Enable (FTCGPU2E):** This bit, when set, allows Host Controller to gate the clock to the Frame Timer when ports are in U2.<br><br>**Power Well:** SUS |
| 6 | 0x0<br>RW | **USB2 port clock throttle enable (USB2_PC_TE):** When set, allows the Aux clock into the USB2 ports to be throttled when conditions allow.<br><br>**Power Well:** SUS |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 5 | 0x0<br>RW | **XHCI Engine Aux clock gating enable (XHCI_AC_GE):** When set, allows the aux clock into the XHCI engine to be gated when idle. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.<br><br>**Power Well:** SUS |
| 4 | 0x0<br>RW | **XHCI Aux PM block clock gating enable (XHCI_APMB_CGE):** When set, allows the aux clock into the Aux PM block to be gated when idle. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.<br><br>**Power Well:** SUS |
| 3 | 0x0<br>RW | **USB3 Aux Clock Trunk Gating Enable (USB3_AC_TGE):** When set, allows Aux Clock Trunk feeding to USB3.0 ports to be gated when port Aux clock is gated at all USB3.0 ports and all USB3.0 modPHY instances. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.<br><br>**Power Well:** SUS |
| 2 | 0x0<br>RW | **USB3 Port Aux/Port clock gating enable (USB3_AP_CGE):** When set, allows the aux_pclk clock into the USB3 port to be gated when conditions are met. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.<br><br>**Power Well:** SUS |
| 1 | 0x0<br>RW | **ModPHY port Aux clock gating enable in U2 (MPP_AC_GEU2):** When set, allows the aux clock into the ModPhy to be gated when Link is in U2 and pipe has been in PS3 for at least the time defined by U2 Residency Before ModPHY Clock Gating field. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.<br><br>**Power Well:** SUS |
| 0 | 0x0<br>RW | **ModPHY port Aux clock gating enable in Disconnected, U3 or Disabled (MPP_AC_GE_DDU3):** When set, allows the aux clock into the ModPHY to be gated when Link is in Disconnected, U3 or Disabled state. Usage of this bit is further qualified with xHC Dynamic Clock Gating Disable fuse. If the fuse disables dynamic clock gating, Aux clock gating will not be enabled either. This bit always returns the value that was written to it irrespective of the setting of xHC Dynamic Clock Gating Disable fuse.<br><br>**Power Well:** SUS |

## 51.3.166 USB LPM Parameters (USB_LPM_PARAM)—Offset 8170h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 96090032h

**BAR and Offset:** [MBAR] + 8170h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:22 | 0x258<br>RW | **USB2_LPM_REG_RSM_U3_DET_NORM:** Reserved.<br><br>**Power Well:** Core |

## 51.3.176 reg_D0i2_CTRL_REG_type (D0i2_CTRL_REG)—Offset 81BCh

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 084204B0h

**BAR and Offset:** [MBAR] + 81BCh

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:30 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 29:26 | 0x2<br>RW | **D0i2 Minimum Residency (D0I2_MIN_RESIDENCY):** This field controls the minimum time that we must stay in D0i2 to ensure that the entry sequence has settled before we attempt to exit. 0h Disabled 1h 8 clocks 2h 16 clocks 3h 32 clocks 4h 128 clocks 5h 256 clocks 6h 512 clocks 7h 1024 clocks<br><br>**Power Well:** SUS |
| 25:22 | 0x1<br>RW | **D0i2 Entry Hysteresis Timer (D0I2_ENTRY_HYSTERESIS_TIMER):** This field allows for a hysteresis timer to be implemented specifically for D0i2. This will allow for D0i2 entry to be controlled independently from the timer used for D0i3 and D3. 0h Disabled 1h 8 clocks 2h 16 clocks 3h 32 clocks 4h 64 clocks 5h 128 clocks 6h 256 clocks 7h 512 clocks<br><br>**Power Well:** SUS |
| 21 | 0x0<br>RW | **Active Periodic EP Disable (ACTIVE_PERIODIC_EP_DISABLE):** This field allows the xHC to control how aggressive it enters D0i2 in the presence of active Periodic EPs. Setting this field will allow D0i2 only when there are no active Periodic EPs on the schedule. Either there are no active DB or any active Interrupt EP is flow controlled.<br><br>**Power Well:** SUS |
| 20:16 | 0x2<br>RW | **MSI D0i2 Pre Wake Time (MSID0I2PWT):** This is the latency that is expected to be incurred to exit the D0i2 state. This wake latency is the latency to be added to the tracked D0i2 wake by the MSI module. Example: If while allowing D0i2 there is an MSI generation that will trigger in 250 us from now ,the MSI module will trigger a D0i2 wake up 250 us MSI D0i2 Pre Wake Time. The D0I2WL is to ensure that the act of D0i2 exit does not impact the action(s) required by the alarm(s) that was enabled prior to D0i2. 3:0 250 ns ticks 0h 0 ns 1h 250 ns . 1Fh 3750 ns<br><br>**Power Well:** SUS |
| 15:4 | 0x4b<br>RW | **MSI Idle Threshold (MSI_IDLE_THRESHOLD):** This field allows the xHC to control how aggressive it enters D0i2 in the presence of pending MSI. This field is valid only if Pending MSI Disable is 0, allowing D0i2 in the presence of pending MSIs. D0i2 will be prevented if the amount of idle time between Event Ring being idle to the time an MSI will be generated does not exceed this time. Register Format: Bits [11:7] # of 125us uframes Bits [6:0] # of microseconds (0-124)<br><br>**Power Well:** SUS |
| 3 | 0x0<br>RW | **Pending MSI Disable (PENDING_MSI_DISABLE):** This field allows the xHC to disable D0i2 when there are pending MSIs in the event manager. Setting this field will require all IMOD counters to be 0h and all MSIs delivered. Clearing this field will allow for D0i2 power gating while there are 1 or more IMOD counters decrementing which implies that an MSI is pending and will be generated once the corresponding IMOD counter reaches 0h.<br><br>**Power Well:** SUS |
| 2 | 0x0<br>RW | **Frame Timer Run Disable (FRAME_TIMER_RUN_DISABLE):** This field allows the xHC to disable D0i2 when the frame timer is running. Clearing this field will allow D0i2 when the frame timer is required as defined in the XHCI Spec. Setting this field will not allow D0i2 when the frame timer is required and will limit D0i2 for the condition where the frame timer is not required.<br><br>**Power Well:** SUS |
| 1 | 0x0<br>RW | **USB2 L1 Disable (USB2_L1_DISABLE):** This field allows the xHC to disable D0i2 when USB2 ports are in L1. This implies that D0i2 will only be triggered when ports are in L2 or deeper.<br><br>**Power Well:** SUS |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 0 | 0x0<br>RW | **USB3 U2 Disable (USB3_U2_DISABLE):** This field allows the xHC to disable D0i2 when USB3 ports are in U2. This implies that D0i2 will only be triggered when ports are in U3 or deeper.<br><br>**Power Well:** SUS |

## 51.3.177 reg_D0i2_SCH_ALARM_CTRL_REG_type (D0i2_SCH_ALARM_CTRL_REG)—Offset 81C0h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MBAR] + 81C0h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:29 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** SUS |
| 28:16 | 0x0<br>RW | **D0i2 Idle Time (D0I2IT):** This is the minimum schedule idle time that must be available before D0i2 can allowed. 12:7 Time value in # of 125s Bus Intervals (0 8ms) 6:0 Fractional BI Time value in s ( 0 124s) This field controls how much scheduler idle time is required to trigger D0i2. The scheduler idle time is the same idle time that is used by other functions implementing alarm timers such as PLL shutdown, LTR and USB2 L1 override. If there is a need to require other alarm timers to have been set such as LTR has triggered a Low Idle time, then this field needs to be as aggressive as LTR Low Min Idle Time to ensure D0i2 is triggered once the scheduler has detected IDLE in the schedule. This is only to be used as alternate modes of operation or back up modes.<br><br>**Power Well:** SUS |
| 15:13 | 0x0<br>RO | **Reserved (RSVD1):** Reserved.<br><br>**Power Well:** SUS |
| 12:0 | 0x0<br>RW | **D0i2 Wake Latency (D0I2WL):** This is the latency that is expected to be incurred to exit the D0i2 state. This wake latency is the latency to be added to the tracked D0i2 wake by the scheduler. Example: If while allowing D0i2 there is an alarm that will trigger in 250 us from now , the scheduler will allow D0i2 and track this alarm with an adjustment to wake up 250ns D0I2WL) from. The D0I2WL is to ensure that the act of D0i2 exit does not impact the action(s) required by the alarm(s) that was enabled prior to D0i2. 12:7 Time value in # of 125s Bus Intervals (0 8ms) 6:0 Fractional BI Time value in s (0124s)<br><br>**Power Well:** SUS |

## 51.3.178 reg_USB2PMCTRL_REG_type (USB2PMCTRL_REG)—Offset 81C4h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MBAR] + 81C4h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:12 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** SUS |
| 11 | 0x0<br>RW | **USB2 PHY SUS Power Gate PORTSC Block Policy (U2PSPGPSCBP):** This controls the policy for blocking PORTSC Updates while the USB2 PHY SUS Well is power gated. When set, the controller will block any updates to the PORTSC caused by port status change if the USB2 PHY SUS is power gated. 0 Do not<br><br>**Power Well:** SUS |
| 10:8 | 0x0<br>RW | **USB2 PHY SUS Well Power Gate Entry Hysteresis Count (U2PSPGEHC):** This controls the amount of hysteresis time the controller will enforce after detecting the USB2 PHY SUS Power Gate entry condition. 0h 0 clocks 1h 32 clocks 2h 64 clocks 3h 128 clocks 4h 256 clocks 5h 512 clocks 6h 1024 clocks 7h 2048 clocks<br><br>**Power Well:** SUS |
| 7:4 | 0x0<br>RW | **USB2 PHY SUS Power Gate PORTSC Block Policy (U2CLPGLAT):** This field represents the worst case latency for the USB2 Common Lane to enter and exit its power gate state. This fields is required to be compared to a ports HIRD/HIRD value for the ports that have allowed L1 to L2 mapping to determine if the Common Lane can be allowed to power off. If the power gate entry/exit latency is greater than the HIRD/HIRDD then the common lane should not be allowed to power gate as this will result in a L1 exit violation. 0h 100 us 1h 200 us 2h 300 us Eh 1500us Fh 1600 us<br><br>**Power Well:** SUS |
| 3:2 | 0x0<br>RW | **USB2 PHY SUS Well Power Gate Policy (U2PSUSPGP):** This field controls when to enable the USB2 PHY SUS Well Power Gating when the proper conditions are met. 00 USB2 PHY SUS Power Gating is Disabled. 01 USB2 PHY SUS Power Gating is Enabled in Only D0 and D0i2 (Excludes D0i3 and D3) 10 USB2 PHY SUS Power Gating is Eanabled in only in D0, D0i2 and D0i3 (Excludes D3) 11 USB2 PHY SUS Power Gating is Eanabled in D0/D0i2/D0i3/D3<br><br>**Power Well:** SUS |
| 1 | 0x0<br>RW | **USB2 Common Lane Power Gating Enable During L1 to L2 Mapping for USB2 PHY Power Gating (U2CLPGEL1L2):** This field when set enables the controller to allow for the common lane power gating to be enabled when all ports are exposed as in L2 to the USB2 PHY while at least 1 port has been mapped to L2 from L1. This field alone does not guarantee power gating since the L1 HIRD/HIRDD Value must be compared with the PHYs power gate exit latency (U2CLPGLAT) held in this register to ensure that L1 exit is not violated. 0 USB2 Common Lane Power Gating is disabled when any port has been mapped from L1 to L2. 1 USB2 Common Lane Power Gating is allowed when any port has been mapped to L2 from L1 with the additional condition that the HIRD/HIRDD is greater than the PHYs Power Gate exit latency.<br><br>**Power Well:** SUS |
| 0 | 0x0<br>RW | **USB2 Data Lane L1 to L2 Mapping Enable for USB2 PHY Power Gating (U2DLL1L2ME):** This field when set enables the controller to map an L1 entry directly to L2 to allow the USB2 PHY to trigger its Autonomous Power Gating. The USB2 PHY will trigger PG only when in L2 since it does not fully understand the requirements for L1. 0 USB2 L1 to L2 mapping is disabled for all ports 1 USB2 L1 to L2 mapping is enabled for all ports<br><br>**Power Well:** SUS |

## 51.3.179 ECC_PARITY_ERROR_LOG_REG—Offset 83F8h

## 51.3.184 FUS2_REG—Offset 8414h

This register is NOT subject to HW save and restore.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MBAR] + 8414h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:12 | 0x0<br>RO | **RSVD:** Reserved.<br><br>**Power Well:** Core |
| 11:0 | 0x0<br>RO | **PORT_MAP_FUS1:** 1:0 Port 1 3:2 Port 2 5:4 Port 3 31:30 Port 16 Bit Description: 00: Port assgned to USB3 01: Port assigned to non-XHCI controller 10: Port assigned to Flex IO mapping. Mapping is based on Soft Straps. 11: Reserved.<br><br>**Power Well:** SUS |

## 51.3.185 STRAP1_REG—Offset 841Ch

This register is NOT subject to HW save and restore.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MBAR] + 841Ch

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:6 | 0x0<br>RO | **RSVD:** Reserved.<br><br>**Power Well:** Core |
| 5:0 | 0x0<br>RO | **FlexIO mapping (FLEX_IO_MAPPING):** Each bit corresponds to the appropriately numbered USB3 port (zero based) Bit 0 = port 1, bit 1 = port 2 etc. 0: Port is owned by XHCI 1: Port is not owned by XHCI<br><br>**Power Well:** Core |

## 51.3.186 STRAP2_REG—Offset 8420h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MBAR] + 8420h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:6 | 0x0<br>RO | **RSVD:** Reserved.<br><br>**Power Well:** Core |
| 5:0 | 0x0<br>RO | **USB3_SSIC_MODE:** Each bit corresponds to the appropriately numbered USB3 port (zero based) Bit 0 = port 1, bit 1 = port 2 etc. 0: Port is operated in USB3 mode 1: Port is operated in SSIC mode.<br><br>**Power Well:** Core |

## 51.3.187 STRAP3_REG—Offset 8424h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MBAR] + 8424h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:2 | 0x0<br>RO | **RSVD:** Reserved.<br><br>**Power Well:** Core |
| 1:0 | 0x0<br>RO | **XHCI_PRI_CLK_FREQ_SEL:** Specifies the frequency of the Primary clock (iosf_prim_mux_clk) used by XHCI 00 : 200 MHz (default) 01 : 125 MHz 10 : 250 MHz<br><br>**Power Well:** SUS |

## 51.3.188 DFT_REG1—Offset 8430h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MBAR] + 8430h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **SS/SSIC DFT CRC (SSDFTCRC):** These register bits contain the value of SS DFT CRC<br><br>**Power Well:** Core |
| 15:12 | 0x0<br>RO | **RSVD0:** RSVD0<br><br>**Power Well:** Core |
| 11 | 0x0<br>RW | **DFTLFPSSEL:** DFTLFPSSEL 0: Rxelecidle is driven from GPIO Pin 1: Rxelecidle is Driven as specified by Super Speed DFT LFPS Mode Select<br><br>**Power Well:** Core |
| 10 | 0x0<br>RW | **Super Speed DFT LFPS Mode Select (SSDFTLMSEL):** This bit selects the Super Speed DFT LFPS mode, and will only take effect when Super Speed HBP mode is enabled. 0b: HBP logic will internally loopback TX LFPS as RX LFPS and AFE RX LFPS path to the controller is disconnected. 1b: RX LFPS path works normally<br><br>**Power Well:** Core |
| 9:6 | 0x0<br>RW | **SS/SSIC DFT CRC Select (SSDFTCRCSEL):** These bits select which Super Speed DFT CRC value is reflected in SSDFTCRC bits. In addition, these bits also select which SuperSpeed DFT CRC MSB value is sent to GPIO monitor pin, i.e. sata3gp_gp37 to aid silicon debug. Live version of selected CRC's MSB will be- sent to GPIO monitor pin, i.e. sata3gp_gp37. 0h (default): No SuperSpeed DFT CRC is selected. 1h: Data Payload CRC 2h: Link Management Packet CRC 3h: Transaction Packet CRC 4h: Isochronous Timestamp Packet CRC 5h: Data Packet Header CRC 6h: Link Command Packet CRC 7h: RRAP Packet CRC 8h: Tx/Rx Cfg CRC Others: Reserved Note : CRC types 7 and 8 are onlyapplicable if Port is SSIC Port<br><br>**Power Well:** Core |
| 5 | 0x0<br>RO | **RSVD1:** RSVD1<br><br>**Power Well:** Core |
| 4:0 | 0x0<br>RW | **SS/SSIC DFT CRC Port Select (SSICDFTCPS):** One CRC per packet type is shared for all the Super Speed ports. These bits select the Super Speed port for which CRC data will be updated. 000b: (default) No SuperSpeed Port is selected 001b: SS/SSIC Port 0 010b: SS/SSIC Port 1 011b: SS/SSIC Port 2 100b: SS/SSIC Port 3 101b: SS/SSIC PORT4 110b :SS/SSIC Port 5 others : Rsvd<br><br>**Power Well:** Core |

## 51.3.189 DFT_REG2—Offset 8434h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MBAR] + 8434h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **HS/HSIC TX CRC (TXCRC):** These register bits contain the value of TX CRC. This TX CRC is placed right after the 480MHz XCLKQ.<br><br>**Power Well:** Core |
| 15:11 | 0x0<br>RW | **HSIC/UTMI+ DFT Port Select (UTMIDFTPS):** One CRC is shared for all the UTMI+ ports. These bits select the UTMI+ port for which CRC data will be updated and loopback status reflected in UTMILPBKSTS. 0h: (default) No UTMI+ Port is selected 1h: UTMI+ Port 0 2h: UTMI+ Port 1 3h: UTMI+ Port 2 4h: UTMI+ Port 3 5h: UTMI+ Port 4 6h: UTMI+ Port 5 7h: UTMI+ Port 6 8h: UTMI+ Port 7 9h: UTMI+ Port 8 Ah: UTMI+ Port 9 Bh: UTMI+ Port 10 Ch: UTMI+ Port 11 Dh: UTMI+ Port 12 Eh: UTMI+ Port 13 Others: Reserved<br><br>**Power Well:** Core |
| 10:7 | 0x0<br>RW | **Loop Number (UTMILPBKLOOPN_3_0):** Number of repeatable fixed pattern within a packet Note: Connect register bit 3 to counter bit 7, register bit 2 to counter bit 5, register bit 1 to counter bit 3, register bit 0 to counter bit 1. Counter bits 6, 4, 2 and 0 will be tied off to 0. Hence, the programmable loop number shall be: 0000b: 0 loop 0001b: 2 loops 0010b: 8 loops 0011b: 10 loops 1100b: 160 loops 1101b: 162 loops 1110b: 168 loops 1111b: 170 loops (max) +E27<br><br>**Power Well:** Core |
| 6:5 | 0x0<br>RW | **Operational Mode (UTMIOPMODE_1_0):** Operational Mode in test mode. These signals select between various operational modes: 00b: Normal Operation 01b: Non-Driving 10b: Disable Bit Stuffing and NRZI encoding 11b: Reserved<br><br>**Power Well:** Core |
| 4 | 0x0<br>RW | **Termination Select (UTMITERMSEL):** Termination Select in test mode. This signal selects between the FS and HS terminations: 0b: HS termination enabled 1b: FS termination enabled<br><br>**Power Well:** Core |
| 3:2 | 0x0<br>RW | **Transceiver Select (UTMIXCVRSELECT_1_0):** Transceiver Select in test mode. This signal selects between the LS, FS and HS transceivers: 00b: HS transceiver enabled 01b: FS transceiver enabled 10b: LS transceiver enabled 11b: Reserved<br><br>**Power Well:** Core |
| 1:0 | 0x0<br>RW | **UTMI+ Loopback Status (UTMILPBKSTS):** Loopback Status for port selected by UTMIDFTPS 00b: Reset condition 01b: Comparator has started receiving data and the received data matches with the TX pattern. 10b: Comparator has started receiving data the received data does not match with the TX pattern but there was no assertion of RC error from UTMI. 11b: Comparator has started receiving data and RX ERROR was asserted for at least one clock by UTMI. Note that this does not reflect the status of pattern comparison since RX error from UTMI is unexpected for loopback.<br><br>**Power Well:** Core |

## 51.3.190 DFT_REG3—Offset 8438h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MBAR] + 8438h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **Loopback Pattern (UTMILPBKPAT):** 2-byte pattern for loopback Note: This 2-byte pattern will be replicated to the upper 2-byte to form the DW pattern<br><br>**Power Well:** Core |
| 15:2 | 0x0<br>RW | **Loopback Lane Select (UTMILPBKSEL_13_0):** Port is selected if the corresponding bit is selected Note: MSB is for UTMI+ Port13, LSB is for UTMI+ Port0<br><br>**Power Well:** Core |
| 1 | 0x0<br>RW | **Loopback Pattern (UTMILPBKPATSEL):** Near end loopback pattern generation type: 0b: Fixed pattern 1b: USB2 test packet<br><br>**Power Well:** Core |
| 0 | 0x0<br>RW | **Loopback Type (UTMILPBKTYPE):** Loopback Type in test mode. This signal selects between DNELB and ANELB, and will only take effect if DTUTMILPBKEN is set. 0b: Digital Near-End Loopback (DNELB) 1b: Analog Near-End Loopback (ANELB) Note: Analog Far-End Loopback (AFELB) is not supported<br><br>**Power Well:** Core |

## 51.3.191 dft_reg4 (DFT_REG4)—Offset 843Ch

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MBAR] + 843Ch

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:11 | 0x0<br>RW | **RSVD:** Reserved.<br><br>**Power Well:** Core |
| 10:0 | 0x0<br>RW | **Loopback Pattern (UTMILPBKPATSEL):** Loopback Lane Select (UTMILPBKSEL): Port is selected if the corresponding bit (zero based) is selected Bit 0 = Port 1 Bit 1 = Port 2 Etc.<br><br>**Power Well:** Core |

## 51.3.192 dft_reg5 (DFT_REG5)—Offset 8440h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MBAR] + 8440h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0x0<br>RW/L | **High Speed Bypass Enable (HIGH_SPEED_BYPASS_ENABLE):** 0000 - Disable all HBP 0001 - Enable SS HBP 0010 - Enable HS HBP 0011 - Enable HSIC HBP 0100 - Enable SSIC HBP Others - Reserved<br><br>**Power Well:** Core |

| 3:0 | 0x0<br>WO | **Allow Software USB PHY RST (ALL_SW_UP_RST):** Allow a USB PHY reset being issued by software. Writing to this register with bit set to 1 will reset the USB PHY that is connected to the port. Bit3:0 indicates the port number of the USB PHY<br><br>**Power Well:** SUS |

## 51.3.197 Latency Tolerance Control 0 (HOST_IF_LAT_TOL_CTRL_REG0)—Offset 8464h

The Latency Tolerance Control Register is used by SW to control which BELT is returned when this register is read. SW shall write to this register to program a Slot-ID, Port-ID and BELT Select to determine which BELT is selected. When this register is read the selected BELT is returned.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 8464h

**Default:** 000D0000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:30 | 0x0<br>WO | **BELT Select (BELT_SEL):** This field determines what value will be selected to read back from SW when reading this register 0: Returns the SW programmed Latency Tolerance Value 1: Returns the Lowest BELT in the Host 2: Returns the BELT for the requested Slot-ID (Slot Select) 3: Returns the BELT for the requested Port-ID (Port Select)<br><br>**Power Well:** Core |
| 29:20 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 19:16 | 0xd<br>WO | **Port Select (PORT_SEL):** Used to select the BELT for a given Port # when the BELT Select is programmed to select the Port-ID (this field is 0 based)<br><br>**Power Well:** Core |
| 15:12 | 0x0<br>RO | **Rsvd:** Reserved.<br><br>**Power Well:** Core |
| 11:5 | 0x0<br>RO | **BELT Value (BELTV):** Value of selected BELT is return in this field<br><br>**Power Well:** Core |
| 4:0 | 0x0<br>RW | **Slot Select (SLOT_SEL):** Reads will return: BELT Value (BELTV) [4:0]: Value of selected BELT is return in this field Writes will control : Slot Select (): Used to select the BELT for a given Slot # when the BELT Select is programmed to select the Slot-ID (this field is zero based)<br><br>**Power Well:** Core |

## 51.3.198 USB Legacy Support Capability (USBLEGSUP)—Offset 846Ch

This register is modified and maintained by BIOS

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00002201h

**BAR and Offset:** [MBAR] + 846Ch

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:25 | 0x0<br>RO | Reserved. |
| 24 | 0x0<br>RW | **HC OS Owned Semaphore (HCOSOS):** Default = '0'. System software sets this bit to request ownership of the xHC. Ownership is obtained when this bit reads as '1' and the HC BIOS Owned Semaphore bit reads as '0'. |
| 23:17 | 0x0<br>RO | Reserved. |
| 16 | 0x0<br>RW | **HC BIOS Owned Semaphore (HCBIOSOS):** Default = '0'. The BIOS sets this bit to establish ownership of the xHC. System BIOS will set this bit to a '0' in response to a request for ownership of the xHC by system software. |
| 15:8 | 0x22<br>RW/S | **Next Capability Pointer (NextCP):** This field indicates the location of the next capability with respect to the effective address of this capacity. Refer to Table 145 for more information on this field. |
| 7:0 | 0x1<br>RW/L | **Capability ID (CID):** This field identifies the extended capability. Refer to Table 146 for the value that identifies the capability as Legacy Support. This extended capability requires one additional 32-bit register for control/status information (USBLEGCTLSTS), and this register is located at offset xECP+04h. |

## 51.3.199 USB2 Port Disable Override (USB2PDO)—Offset 84F8h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MBAR] + 84F8h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:14 | 0x0<br>RO | Reserved. |
| 13:0 | 0x0<br>RW/O | **USB2PDO (USB2PDO):** A '1' in a bit position prevents the corresponding USB 2 port from reporting a Device Connection to the xHC. This applies across all USB2 protocol ports<br>• 0 - Allows corresponding USB port to report a device connection to the xHC.<br>• 1 - Prevents the corresponding USB port from reporting a device Connection to the xHC.<br>Port to bit mapping is in one-hot encoding, this is bit 0 controls port 1 and so on.<br>• Bit 0 - USB 2.0 port 0<br>• ...<br>• Bit N - USB 2.0 port N |

## 51.3.200 USB3 Port Disable Override (USB3PDO)—Offset 84FCh

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MBAR] + 84FCh

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:10 | 0x0<br>RO | Reserved. |
| 9:0 | 0x0<br>RW/O | **USB3 Port Disable Override (USB3PDO):**<br>• 0 - Allows corresponding USB port to report a Device Connection to the xHC.<br>• 1 - Prevents the corresponding USB port from reporting a Device Connection to the xHC.<br>• Bit 0 - USB 3.0 Port 1<br>• ...<br>• Bit N - USB 3.0 Port N |

## 51.3.201 Command (CMD_MMIO)—Offset 8604h

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**Default:** 0000h

**BAR and Offset:** [MBAR] + 8604h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:11 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 10 | 0x0<br>RW | **Interrupt Disable (ID):** When cleared to 0, the function is capable of generating interrupts. When 1, the function can not generate its interrupt to the interrupt controller. Note that the corresponding Interrupt Status bit is not affected by the interrupt enable.<br><br>**Power Well:** Core |
| 9 | 0x0<br>RO | **Fast Back to Back Enable (FBE):** Reserved.<br><br>**Power Well:** Core |
| 8 | 0x0<br>RW | **SERR# Enable (SERR):** When set to 1, the XHC is capable of generating (internally) SERR#.<br><br>**Power Well:** Core |
| 7 | 0x0<br>RO | **Wait Cycle Control (WCC):** Reserved.<br><br>**Power Well:** Core |
| 6 | 0x0<br>RW | **Parity Error Response (PER):** When set to 1, the XHCI Host Controller will check for correct parity (on its internal interface) and halt operation when bad parity is detected during the data phase as recommended by the XHCI specification. Note that this applies to both requests and completions from the system interface. This bit must be set in order for the parity errors to generate SERR#.<br><br>**Power Well:** Core |
| 5 | 0x0<br>RO | **VGA Palette Snoop (VPS):** Reserved.<br><br>**Power Well:** Core |
| 4 | 0x0<br>RO | **Memory Write Invalidate (MWI):** Reserved.<br><br>**Power Well:** Core |
| 3 | 0x0<br>RO | **Special Cycle Enable (SCE):** Reserved.<br><br>**Power Well:** Core |
| 2 | 0x0<br>RW | **Bus Master Enable (BME):** When set, it allows XHC to act as a bus master. When cleared, it disable XHC from initiating transactions on the system bus.<br><br>**Power Well:** Core |
| 1 | 0x0<br>RW | **Memory Space Enable (MSE):** This bit controls access to the XHC Memory Space registers. If this bit is set, accesses to the XHC registers are enabled. The Base Address register for the XHC should be programmed before this bit is set.<br><br>**Power Well:** Core |
| 0 | 0x0<br>RO | **I/O Space Enable (IOSE):** Reserved as 0. Read-Only.<br><br>**Power Well:** Core |

## 51.3.202 Device Status (STS_MMIO)—Offset 8606h

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**Default:** 0290h

**BAR and Offset:** [MBAR] + 8606h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RW/1C | **Detected Parity Error (DPE):** This bit is set by the SoC whenever a parity error is seen on the internal interface to the XHC host controller, regardless of the setting of bit 6 or bit 8 in the Command register or any other conditions. Software clears this bit by writing a 1 to this bit location.<br><br>**Power Well:** Core |
| 14 | 0x0<br>RW/1C | **Signaled System Error (SSE):** This bit is set by the SoC whenever it signals SERR# (internally). The SERR_EN bit (bit 8 in the Command Register) must be 1 for this bit to be set.<br><br>**Power Well:** Core |
| 13 | 0x0<br>RW/1C | **Received Master-Abort Status (RMA):** This bit is set when XHC, as a master, receives a master-abort status on a memory access. This is treated as a Host Error and halts the DMA engines. Software clears this bit by writing a 1 to this bit location.<br><br>**Power Well:** Core |
| 12 | 0x0<br>RW/1C | **Received Target Abort Status (RTA):** This bit is set when XHC, as a master, receives a target abort status on a memory access. This is treated as a Host Error and halts the DMA engines. Software clears this bit by writing a 1 to this bit location.<br><br>**Power Well:** Core |
| 11 | 0x0<br>RW/1C | **Signaled Target-Abort Status (STA):** This bit is used to indicate when the XHC function responds to a cycle with a target abort.<br><br>**Power Well:** Core |
| 10:9 | 0x1<br>RO | **DEVSEL# Timing Status (DEVT):** This 2-bit field defines the timing for DEVSEL# assertion. Read-Only.<br><br>**Power Well:** Core |
| 8 | 0x0<br>RW/1C | **Master Data Parity Error Detected (MDPED):** This bit is set by the SoC whenever a data parity error is detected on a XHC read completion packet on the internal interface to the XHC host controller and bit 6 of the Command register is set to 1. Software clears this bit by writing a 1 to this bit location.<br><br>**Power Well:** Core |
| 7 | 0x1<br>RO | **Fast Back-to-Back Capable (FBBC):** Reserved as 1 Read-Only.<br><br>**Power Well:** Core |
| 6 | 0x0<br>RO | **User Definable Features (UDF):** Reserved as 0. Read-Only.<br><br>**Power Well:** Core |
| 5 | 0x0<br>RO | **66 MHz Capable (MC):** Reserved as 0. Read-Only.<br><br>**Power Well:** Core |
| 4 | 0x1<br>RO | **Capabilities List (CL):** Hardwired to 1 indicating that offset 34h contains a valid capabilities pointer.<br><br>**Power Well:** Core |
| 3 | 0x0<br>RO/V | **Interrupt Status (IS):** This read-only bit reflects the state of this function's interrupt at the input of the enable/disable logic. This bit is a 1 when the interrupt is asserted. This bit will be 0 when the interrupt is deasserted. The value reported in this bit is independent of the value in the Interrupt Enable bit.<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 2:0 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |

## 51.3.203 Revision ID (RID_MMIO)—Offset 8608h

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [MBAR] + 8608h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO/V | **Revision ID (RID):**<br><br>**Power Well:** Core |

## 51.3.204 Programming Interface (PI_MMIO)—Offset 8609h

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 30h

**BAR and Offset:** [MBAR] + 8609h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x30<br>RO | **Programming Interface (PI):** A value of 30h indicates that this USB Host Controller conforms to the XHCI specification.<br><br>**Power Well:** Core |

## 51.3.205 Sub Class Code (SCC_MMIO)—Offset 860Ah

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 03h

**BAR and Offset:** [MBAR] + 860Ah

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x3<br>RO | **Sub Class Code (SCC):** A value of 03h indicates that this is a Universal Serial Bus Host Controller.<br><br>**Power Well:** Core |

## 51.3.206 Base Class Code (BCC_MMIO)—Offset 860Bh

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 0Ch

**BAR and Offset:** [MBAR] + 860Bh

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0xc<br>RO | **Base Class Code (BCC):** A value of 0Ch indicates that this is a Serial Bus controller.<br><br>**Power Well:** Core |

## 51.3.207 Master Latency Timer (MLT_MMIO)—Offset 860Dh

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [MBAR] + 860Dh

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO | **Master Latency Timer (MLT):** Because the XHC controller is internally implemented with arbitration on an internal interface, it does not need a master latency timer. The bits will be fixed at 0.<br><br>**Power Well:** Core |

## 51.3.208 Header Type (HT_MMIO)—Offset 860Eh

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [MBAR] + 860Eh

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RO | **Multi-Function Bit (MFB):** Read only indicating single function device.<br><br>**Power Well:** Core |
| 6:0 | 0x0<br>RO | **Configuration layout (CL):** Hardwired to 0 to indicate a standard PCI configuration layout.<br><br>**Power Well:** Core |

## 51.3.209 Memory Base Address (MBAR_MMIO)—Offset 8610h

Value in this register will be different after the enumeration process.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**Default:** 0000000000000004h

**BAR and Offset:** [MBAR] + 8610h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:16 | 0x0<br>RW | **Base Address (BA):** Bits (63:16) correspond to memory address signals (63:16), respectively. This gives 64 KB of relocatable memory space aligned to 64 KB boundaries.<br><br>**Power Well:** Core |
| 15:4 | 0x0<br>RO | **Reserved (RSVD):** Reserved. Read-Only 0, this indicates that this function is requesting an 64KB block of memory.<br><br>**Power Well:** Core |
| 3 | 0x0<br>RO | **Prefetchable:** This bit is hardwired to 0 indicating that this range should not be prefetched.<br><br>**Power Well:** Core |
| 2:1 | 0x2<br>RO | **Type:** If this field is hardwired to 00 it indicates that this range can be mapped anywhere within 32-bit address space. If this field is hardwired to 10 it indicates that this range can be mapped anywhere within 64-bit address space.<br><br>**Power Well:** Core |
| 0 | 0x0<br>RO | **Resource Type Indicator (RTE):** This bit is hardwired to 0 indicating that the base address field in this register maps to memory space<br><br>**Power Well:** Core |

## 51.3.210 USB Subsystem Vendor ID (SSVID_MMIO)—Offset 862Ch

This register is modified and maintained by BIOS

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**Default:** 0000h

**BAR and Offset:** [MBAR] + 862Ch

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0x0<br>RW/L | **USB Subsystem Vendor ID (SSVID):** This register, in combination with the USB Subsystem ID register, enables the operating system to distinguish each subsystem from the others.<br><br>**Power Well:** Core |

## 51.3.211 USB Subsystem ID (SSID_MMIO)—Offset 862Eh

This register is modified and maintained by BIOS

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**Default:** 0000h

**BAR and Offset:** [MBAR] + 862Eh

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0x0<br>RW/L | **USB Subsystem ID (SSID):** BIOS sets the value in this register to identify the Subsystem ID. This register, in combination with the Subsystem Vendor ID register, enables the operating system to distinguish each subsystem from other(s).<br><br>**Power Well:** Core |

## 51.3.212 Capabilities Pointer (CAP_PTR_MMIO)—Offset 8634h

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 70h

**BAR and Offset:** [MBAR] + 8634h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x70<br>RO | **Capabilities Pointer (CAP_PTR):** This register points to the starting offset of the capabilities ranges.<br><br>**Power Well:** Core |

## 51.3.213 Interrupt Line (ILINE_MMIO)—Offset 863Ch

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [MBAR] + 863Ch

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Interrupt Line (ILINE):** This data is not used by the SoC. It is used as a scratchpad register to communicate to software the interrupt line that the interrupt pin is connected to.<br><br>**Power Well:** Core |

## 51.3.214 Interrupt Pin (IPIN_MMIO)—Offset 863Dh

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [MBAR] + 863Dh

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW/L | **Interrupt pin (IPIN):** Bits 7:0 reflect the Interrupt Pin assigned to the host controller by the platform (and are hardwired).<br><br>**Power Well:** Core |

## 51.3.215 XHC System Bus Configuration 1 (XHCC1_MMIO)—Offset 8640h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 000001FDh

**BAR and Offset:** [MBAR] + 8640h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW/O | **Access Control (ACCTRL):** This bit is used by BIOS to lock/unlock lockable bits. When set to '1' the write access to bits locked by this bit is disabled (locked state). When set to '0', the write access to bit locked by this bit is enabled (unlocked state). Writable once after platform reset.<br><br>**Power Well:** Core |
| 30:25 | 0x0<br>RW | **ECO1:**<br><br>**Power Well:** Core |
| 24 | 0x0<br>RW | **Master/Target Abort SERR (RMTASERR):** When set, it allows the out-of-band error reporting from the xHCI Controller to be reported as SERR# (if SERR# reporting is enabled) and thus set the STS.SSE bit.<br><br>**Power Well:** Core |
| 23 | 0x0<br>RW/C | **Unsupported Request Detected (URD):** Set the HW when xHCI Controller received an unsupported request posted cycle. Cleared by SW when the bit is written with value of '1'.<br><br>**Power Well:** Core |
| 22 | 0x0<br>RW | **Unsupported Request Report Enable (URRE):** When set this bit allows the URD bit to be reported as SERR# (if SERR# reporting is enabled) and thus set the STS.SSE bit.<br><br>**Power Well:** Core |
| 21:19 | 0x0<br>RW | **Inactivity Initiated L1 Enable (IIL1E):** If programmed to non-zero, it allows L1 power managed to be enabled after the time-out period specified. 000: Disabled 001: 32 bb_cclk 010: 64 bb_cclk 011: 128 bb_cclk 100: 256 bb_cclk 101: 512 bb_cclk 110: 1024 bb_cclk 111: 131072 bb_cclk<br><br>**Power Well:** Core |
| 18 | 0x0<br>RW | **XHC Initiated L1 Enable (XHCIL1E):** If set, allow the XHC initiated L1 power mangement to be enabled.<br><br>**Power Well:** Core |
| 17 | 0x0<br>RW | **D3 Initiated L1 Enable (D3IL1E):** If set, allow PCI device state D3 initiated L1 power managment to be enables. This bit can only be set if the XHCI L1 Override P2 chicken bit is set.<br><br>**Power Well:** Core |
| 16:12 | 0x0<br>RW | **Periodic Complete Pre Wake Time (PCPWT):** signal . This allows for platform wake time before the next scheduled periodic transaction. The value programmed in this field represents the # of bytes consumed in the current micro-frame which is required to allow for the periodic complete to de-assert. This allows for a programmable time to cause the periodic complete to de-assert prior to the start of the next micro-frame. Register Format: Bits (16:12) represnets the # of bytes remaining with a 256B granularity. Periodic Complete will de-assert if the bytes consumed in the current micro-frame is less<br><br>**Power Well:** Core |
| 11 | 0x0<br>RW | **SW Assisted xHC Idle (SWAXHCI):** This bit being set will indicate xHC idleness (through SW means), which must be a '1' to allow L1 entry, and subsequently allow backbone clock to be gated. This bit is to be set by Intel xHCI driver after checking that the xHCI Controller will stay in idle state for a significant period of time, e.g. all ports disconnected. This bit can be cleared under the following conditions (see SWAXHCI Policy bits in xHC System Bus Configuration 2 register): n SW: SW could write 0 to clear this bit. n HW: HW, under policy control, will clear this bit on an MMIO access to the Host Controller. n HW: HW, under policy control, will clear this bit when HW exits Idle state.<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 10:8 | 0x1<br>RW | **L23 to Host Reset Acknowledge Wait Count (L23HRAWC):** If programmed to non zero, it allows a wait period after the L23 PHY has shutdown before returning host reset acknowledge to PMC. 000: Disabled 001: 128 bb_cclk 010: 256 bb_cclk 011: 512 bb_cclk 100: 1024 bb_cclk 101: 2048 bb_cclk 110: 4096 bb_cclk 111: 131072 bb_cclk<br><br>**Power Well:** Core |
| 7:6 | 0x3<br>RW | **Upstream Type Arbiter Grant Count Posted (UTAGCP):** Grant count for IOSF upstream L2 request type arbiter for posted type<br><br>**Power Well:** Core |
| 5:4 | 0x3<br>RW | **Upstream Type Arbiter Grant Count Non Posted (UDAGCNP):** Grant count for IOSF upstream L2 type arbiter for non-posted type<br><br>**Power Well:** Core |
| 3:2 | 0x3<br>RW | **Upstream Type Arbiter Grant Count Completion (UDAGCCP) (UDAGCCP):** Grant count for IOSF upstream L2 type arbiter for completion type<br><br>**Power Well:** Core |
| 1:0 | 0x1<br>RW | **Upstream Device Arbiter Grant Count (UDAGC) (UDAGC):** Grant count for IOSF upstream L1 device arbiter<br><br>**Power Well:** Core |

## 51.3.216 XHC System Bus Configuration 2 (XHCC2_MMIO)—Offset 8644h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 0003C000h

**BAR and Offset:** [MBAR] + 8644h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **OC Configuration Done (OCCFGDONE):** This bit is used by BIOS to prevent spurious switching during OC configuration. It must be set by BIOS after configuration of the OC mapping bits is complete. Once this bit is set, OC mapping shall not be changed by SW.<br><br>**Power Well:** SUS |
| 30:26 | 0x0<br>RW | **ECO1:**<br><br>**Power Well:** Core |
| 25 | 0x0<br>RW | **DMA Request Boundary Crossing Control (DREQBCC):** This bit controls the boundary crossing limit of each Read/Write Request.<br>• 0: 4KB<br>• 1: 64B<br><br>**Power Well:** Core |

Note: if XHC Dynamic Clock Gating Disable Fuse is '1', hardware will always see '0' as an output from this register. BIOS reading this register should always return the correct value. BIOS need to query fuses to see if HW is enabled.<br><br>**Power Well:** Core |

## 51.3.218 Audio Time Synchronization (AUDSYNC_MMIO)—Offset 8658h

This 32 bit register is used for audio stream synchronization across different devices. Global signal sample_now captures a value in AUDSYNC register.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 8658h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:30 | 0x0<br>RO | **Rsvd2:** Reserved.<br><br>**Power Well:** Core |
| 29:16 | 0x0<br>RO/V | **Captured Frame List Current Index/Frame Number (CMFI):** The value in this register is updated in response to sample_now signal. Bits (29:16) reflect state of bits (13:0) of FRINDEX<br><br>**Power Well:** Core |
| 15:13 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 12:0 | 0x0<br>RO/V | **Captured Micro-frame BLIF (CMFB):** The value is updated in response to sample_now signal and provides information about offset within micro-frame. Captured value represents number of 8 high-speed bit time units from start of micro-frame. At the beginning of micro-frame captured value will be 0 and increase to maximum value at the end. Default maximum value is 7499 but it may be changed as result of adjustment done in FLA.<br><br>**Power Well:** Core |

## 51.3.219 Serial Bus Release Number (SBRN_MMIO)—Offset 8660h

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**BAR and Offset:** [MBAR] + 8660h

**Default:** 30h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x30<br>RO | **Serial Bus Release Number (SBRN):** A value of 30h indicates that this controller follows USB release 3.0.<br><br>**Power Well:** SUS |

## 51.3.220 Frame Length Adjustment (FLADJ_MMIO)—Offset 8661h

This feature is used to adjust any offset from the clock source that generates the clock that drives the SOF counter. When a new value is written into these six bits, the length of the frame is adjusted. Its initial programmed value is system dependent based on the accuracy of hardware USB clock and is initialized by system BIOS. This register should only be modified when the HChalted bit in the USBSTS register is a one. Changing value of this register while the host controller is operating yields undefined results.

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 60h

**BAR and Offset:** [MBAR] + 8661h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RO | **Reserved (RSVD):** .<br><br>**Power Well:** SUS |
| 6 | 0x1<br>RO | **No Frame Length Timing Capability (NO_FRAME_LENGTH_TIMING_CAP):** This flag is set to 1 to indicate that the host controller does not support a programmable Frame Length Timing Value field.<br><br>**Power Well:** Core |
| 5:0 | 0x20<br>RO | **Frame Length Timing Value (FLTV):** SOF micro-frame length) is equal to 59488 + value in this field. The default value is decimal 32 (20h), which gives a SOF cycle time of 60000. Frame Length (number of High Speed bit times) FLADJ Value (decimal) (decimal) 59488 0 (00h) 59504 1 (01h) 59520 2 (02h) ... 59984 31 (1Fh) 60000 32 (20h) ... 60480 62 (3Eh) 60496 63 (3Fh) Each decimal value change to this register corresponds to 16 high-speed bit times. The SOF cycle time (number of SOF counter clock periods to generate a SOF micro-frame length) is equal to 59488 + value in this field. The default value is decimal 32 (20h), which gives a SOF cycle time of 60000. Frame Length (# High Speed bit times) FLADJ Value<br><br>**Power Well:** SUS |

## 51.3.221 Best Effort Service Latency (BESL_MMIO)—Offset 8662h

Bset Effort Service Latency.

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [MBAR] + 8662h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:4 | 0x0<br>RW/L | **Default Best Effort Service Latency Deep (DBESLD):** Default Best Effort Service Latency (DBESLD) If the value of this field is non-zero, it defines the recommended value for programming the PORTPMSC register BESLD field. This is programmed by BIOS based on platform parameters.<br><br>**Power Well:** Core |
| 3:0 | 0x0<br>RW/L | **Default Best Effort Service Latency (DBESL):** If the value of this field is non-zero, it defines the recommended value for programming the PORTPMSC register BESL field. This is programmed by BIOS based on platform parameters.<br><br>**Power Well:** Core |

## 51.3.222 PCI Power Management Capability ID (PM_CID_MMIO)—Offset 8670h

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 01h

**BAR and Offset:** [MBAR] + 8670h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x1<br>RO | **PCI Power Management Capability ID (PM_CID):** A value of 01h indicates that this is a PCI Power Management capabilities field.<br><br>**Power Well:** Core |

## 51.3.223 Next Item Pointer #1 (PM_NEXT_MMIO)—Offset 8671h

This register is modified and maintained by BIOS

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 80h

**BAR and Offset:** [MBAR] + 8671h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x80<br>RW/L | **Next Item Pointer #1 (PM_NEXT):** This register defaults to 80h, which indicates that the next capability registers begin at configuration offset 80h. This register is writable when the Access Control bit is set to '0'. This allows BIOS to effectively hide the next capability registers, if necessary. This register should only be written during system initialization before the plug-and-play software has enabled any master-initiated traffic. Values of: 80h implies next capability is MSI 00h implies that MSI capability is hidden. Note: This value is never expected to be programmed.<br><br>**Power Well:** Core |

## 51.3.224 Power Management Capabilities (PM_CAP_MMIO)—Offset 8672h

Normally, this register is read-only to report capabilities to the power management software. In order to report different power management capabilities depending on the system in which the SoC is used, the write access to this register is controlled by the Access Control bit (ACCTRL). The value written to this register does not affect the hardware other than changing the value returned during a read. This register is modified and maintained by BIOS

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**BAR and Offset:** [MBAR] + 8672h

**Default:** C1C2h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:11 | 0x18<br>RW/L | **PME_Support:** This 5-bit field indicates the power states in which the function may assert PME#. The SoC XHC does not support the D1 or D2 states. For all other states, the SoC XHC is capable of generating PME#. Software should never need to modify this field.<br><br>**Power Well:** Core |
| 10 | 0x0<br>RW/L | **D2_Support:** The D2 state is not supported.<br><br>**Power Well:** Core |
| 9 | 0x0<br>RW/L | **D1_Support:** The D1 state is not supported.<br><br>**Power Well:** Core |
| 8:6 | 0x7<br>RW/L | **Aux_Current:** The SoC XHC reports 375mA maximum Suspend well current required when in the D3cold state. This value can be written by BIOS when a more accurate value is known.<br><br>**Power Well:** Core |
| 5 | 0x0<br>RW/L | **DSI:** The SoC reports 0, indicating that no device-specific initialization is required.<br><br>**Power Well:** Core |
| 4 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 3 | 0x0<br>RW/L | **PME Clock (PMEClock):** The SoC reports 0, indicating that no PCI clock is required to generate PME#.<br><br>**Power Well:** Core |
| 2:0 | 0x2<br>RW/L | **Version:** The SoC reports 010, indicating that it complies with Revision 1.1 of the PCI Power Management Specification.<br><br>**Power Well:** Core |

## 51.3.225 Power Management Control/Status (PM_CS_MMIO)—Offset 8674h

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**Default:** 0008h

**BAR and Offset:** [MBAR] + 8674h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RW/1C | **PME_Status:** This bit is set when the SoC XHC would normally assert the PME# signal independent of the state of the PME_En bit. Writing a 1 to this bit will clear it and cause the internal PME to deassert (if enabled). Writing a 0 has no effect. This bit must be explicitly cleared by the operating system each time the operating system is loaded.<br><br>**Power Well:** SUS |
| 14:13 | 0x0<br>RO | **Data_Scale:** The SoC hardwires these bits to 00 because it does not support the associated Data register.<br><br>**Power Well:** Core |
| 12:9 | 0x0<br>RO | **Data_Select:** The SoC hardwires these bits to 0000 because it does not support the associated Data register.<br><br>**Power Well:** Core |
| 8 | 0x0<br>RW | **PME_En:** A 1 enables the SoC XHC to generate an internal PME signal when PME_Status is 1. This bit must be explicitly cleared by the operating system each time it is initially loaded.<br><br>**Power Well:** SUS |
| 7:4 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 3 | 0x1<br>RO | **No Soft Reset (NSR):** ), this bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset. Configuration Context is preserved. Upon transition from the D3hot to the D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the PowerState bits. Transition from D3hot to D0 by a system or bus segment reset will return to the device state D0 Uninitialized with only PME context preserved if PME is supported and enabled.<br><br>**Power Well:** Core |
| 2 | 0x0<br>RO | **Reserved (RSVD2):** Reserved.<br><br>**Power Well:** Core |
| 1:0 | 0x0<br>RW | **PowerState:** This 2-bit field is used both to determine the current power state of XHC function and to set a new power state. The definition of the field values are: 00b - D0 state 11b - D3hot state If software attempts to write a value of 10b or 01b in to this field, the write operation must complete normally, however, the data is discarded and no state change occurs. When in the D3hot state, the SoC must not accept accesses to the XHC memory range, but the configuration space must still be accessible.<br><br>**Power Well:** Core |

## 51.3.226 Message Signaled Interrupt CID (MSI_CID_MMIO)—Offset 8680h

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 05h

**BAR and Offset:** [MBAR] + 8680h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x5<br>RO | **Capability ID (CID):** Indicates that this is an MSI capability<br><br>**Power Well:** Core |

## 51.3.227 Next item pointer (MSI_NEXT_MMIO)—Offset 8681h

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [MBAR] + 8681h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO | **Next Pointer (NEXT):** Indicates that this is the last item on the capability list<br><br>**Power Well:** Core |

## 51.3.228 Message Signaled Interrupt Message Control (MSI_MCTL_MMIO)—Offset 8682h

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**Default:** 0086h

**BAR and Offset:** [MBAR] + 8682h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:9 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 8 | 0x0<br>RO | **Per-Vector Masking Capable (PVM):** Specifies whether controller supports MSI per vector masking. Not supported<br><br>**Power Well:** Core |
| 7 | 0x1<br>RO | **64 Bit Address Capable (C64):** Specifies whether capable of generating 64-bit messages. This device is 64-bit capable.<br><br>**Power Well:** Core |
| 6:4 | 0x0<br>RW | **Multiple Message Enable (MME):** Indicates the number of messages the controller should assert. This device supports multiple message MSI.<br><br>**Power Well:** Core |
| 3:1 | 0x3<br>RO | **Multiple Message Capable (MMC):** Indicates the number of messages the controller wishes to assert. This field must be set by HW to reflect the number of Interrupters supported. Encoding number of Vectors requested (number of Interrupters) 000 1 001 2 010 4 011 8 100 16 101 32 110-111 Reserved<br><br>**Power Well:** Core |
| 0 | 0x0<br>RW | **MSI Enable (MSIE):** If set to 1, MSI is enabled and the traditional interrupt pins are not used to generate interrupts. If cleared to 0, MSI operation is disabled and the traditional interrupt pins are used.<br><br>**Power Well:** Core |

## 51.3.229 Message Signaled Interrupt Message Address (MSI_MAD_MMIO)—Offset 8684h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MBAR] + 8684h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:2 | 0x0<br>RW | **Addr:** Lower DW of system specified message address, always DWORD aligned<br><br>**Power Well:** Core |
| 1:0 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |

## 51.3.230 Message Signaled Interrupt Upper Address (MSI_MUAD_MMIO)—Offset 8688h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MBAR] + 8688h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Upper Addr (UpperAddr):** Upper DW of system specified message address.<br><br>**Power Well:** Core |

## 51.3.231 Message Signaled Interrupt Message Data (MSI_MD_MMIO)—Offset 868Ch

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**Default:** 0000h

**BAR and Offset:** [MBAR] + 868Ch

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0x0<br>RW | **Data:** This 16-bit field is programmed by system software if MSI is enabled. Its content is driven onto the lower word (PCI AD(15:0)) during the data phase of the MSI memory write transaction. The Multiple Message Enable field (bits 6-4 of the Message Control register) defines the number of low order message data bits the function is permitted to modify to generate its system software allocated vectors. For example, a Multiple Message Enable encoding of 010 indicates the function has been allocated four vectors and is permitted to modify message data bits 1 and 0 (a function modifies the lower message data bits to generate the allocated number of vectors). If the Multiple Message Enable field is 000, the function is not permitted to modify the message data.<br><br>**Power Well:** Core |

## 51.3.232 Device Idle Capability (DEVIDLE_MMIO)—Offset 8690h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** F0140009h

**BAR and Offset:** [MBAR] + 8690h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0xf<br>RO | **VID:** Reserved.<br><br>**Power Well:** Core |
| 27:24 | 0x0<br>RO | **REV:** Reserved.<br><br>**Power Well:** Core |
| 23:16 | 0x14<br>RO | **Length (LENGTH):** Indicates that this capability is 16 bytes long.<br><br>**Power Well:** Core |
| 15:8 | 0x0<br>RO | **Next Capability Pointer (NCP):** This field contains the offset to the next PCI Capability structure or 000h if no other items exist in the linked list of Capabilities.<br><br>**Power Well:** Core |
| 7:0 | 0x9<br>RO | **Capability ID (CID):** Reserved.<br><br>**Power Well:** Core |

## 51.3.233 Vendor Specific Header (VSHDR_MMIO)—Offset 8694h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 01400010h

**BAR and Offset:** [MBAR] + 8694h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:20 | 0x14<br>RO | **VSEC Length (VSEC_LENGTH):** This field indicates the number of bytes in the entire VSEC structure, including the PCI Extended Capability header, the Vendor- Specific header, and the Vendor-Specific register<br><br>**Power Well:** Core |
| 19:16 | 0x0<br>RO | **VSEC Rev (VSEC_REV):** This field is a vendor-defined version number that indicates the version of the VSEC structure. Software must qualify the Vendor ID and VSEC ID before interpreting this field.<br><br>**Power Well:** Core |
| 15:0 | 0x10<br>RO | **VSEC ID (VSEC_ID):** This field is a vendor-defined ID number that indicates the nature and format of the VSEC structure. Software must qualify the Vendor ID before interpreting this field.<br><br>**Power Well:** Core |

## 51.3.234 SW LTR POINTER (SWLTRPTR_MMIO)—Offset 8698h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MBAR] + 8698h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:4 | 0x0<br>RO | **SW LTR Update MMIO Offset Location (SW_LTR_UPDT_MMIO_OFFSET):** This register contains the location pointer to the SW LTR register in MMIO space, as an offset from the specified BAR. The value of this register is a dont care, if the Valid bit is not set.<br><br>**Power Well:** Core |
| 3:1 | 0x0<br>RO | **Base Address Register Number (BARNUM):** Contains the 0s based AR Number of the BAR which contains the location of the SW LTR MMIO register. When counting BAR Numbers, all BARs, regardless of size and type, consume one BAR Number. Bar 0 is the 1st BAR. The value of this register is a dont care, if the Valid bit is not set.<br><br>**Power Well:** Core |
| 0 | 0x0<br>RO | **Valid (VALID):** Set to 1 to indicate that the function has implemented a SW LTR register as specified in the DevIdle that can be located using the SWLTRLOC register and BARNUM. Set to 0 to indicate that the function has not implemented a SW LTR register that is compliant to the DevIdle definition. This could be because the function has not implemented SW LTR at all, or has a device specific version of SW LTR.<br><br>**Power Well:** Core |

## 51.3.235 Device Idle Pointer Register (DEVIDLEPTR_MMIO)—Offset 869Ch

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00080AC1h

**BAR and Offset:** [MBAR] + 869Ch

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:4 | 0x80ac<br>RW/L | **DevIdle MMIO Offset Location (DEVIDLELOC):** This register contains the location pointer to the DevIdle register in MMIO space, as an offset from the specified BAR. The value of this register is a dont care, if the Valid bit is not set.<br><br>**Power Well:** Core |
| 3:1 | 0x0<br>RO | **Base Address Register Number (BARNUM):** Contains the 0s based BAR Number of the BAR which contains the location of the DevIdle MMIO register. When counting BAR Numbers, all BARs, regardless of size and type, consume one BAR Number. Bar 0 is the 1st BAR. The value of this register is a dont care, if the Valid bit is not set.<br><br>**Power Well:** Core |
| 0 | 0x1<br>RW/L | **Valid (VALID):** Set to 1 to indicate that the function has implemented a DevIdle register as specified in the DevIdle that can be located using the DEVIDLELOC register and BARNUM. Set to 0 to indicate that the function has not implemented a DevIdle register that is compliant to the DevIdle definition. This could be because the function has not implemented DevIdle at all, or has a device specific version of DevIdle.<br><br>**Power Well:** Core |

## 51.3.236 Device Idle Power ON Latency (DEVIDLEPOL_MMIO)—Offset 86A0h

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**Default:** 0800h

**BAR and Offset:** [MBAR] + 86A0h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:13 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 12:10 | 0x2<br>RW/L | **Power On Latency Scale (POLS):** Latency Scale multiplier: 010: 1us 011: 32us All other settings are reserved. The value of this register is multiplied with the Power On Latency Value (POLV) to provide the DevIdle power on exit latency multiplier scale from 1us to 32ms. This register is defined to be RWO (read-write-once) to allow BIOS to set the initial value. This register is undefined if the DevIdle.Valid bit is 0.<br><br>**Power Well:** Core |
| 9:0 | 0x0<br>RW/L | **Power On Latency Value (POLV):** 10-bit value that is multiplied by the Power On Latency Scale. A value of 0 indicates a power on latency of less than 1us. This register is defined to be RWO (read-write-once) to allow BIOS to set the initial value. This register is undefined if the DevIdle.Valid bit is 0.<br><br>**Power Well:** Core |

## 51.3.237 High Speed Configuration 2 (HSCFG2_MMIO)—Offset 86A4h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00002000h

**BAR and Offset:** [MBAR] + 86A4h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:19 | 0x0<br>RO | **Rsvd1:** Reserved.<br><br>**Power Well:** Core |
| 18 | 0x0<br>RW | **PORT1_HOST_MODE_OVERRIDE:** When set, this bit causes the Host_Device mux on port 1 to be forced into the Host mode.<br><br>**Power Well:** Core |
| 17:16 | 0x0<br>RW | **eUSB2SEL:** The two bits are associate with USB2 ports 1 - bit 16 and 2 - bit 2 0: Port is mapped to USB2 1: Port is mapped to eUSB2<br><br>**Power Well:** Core |
| 15 | 0x0<br>RW | **HS ASYNC Active IN Mask (HSAAIM):** Determines if the Async Active will mask/ignore IN EP s. 0 HS ASYNC Active will include IN EP s. 1 HS ASYNC Active will mask/ignore IN EP s.<br><br>**Power Well:** Core |
| 14 | 0x0<br>RW | **HS OUT ASYNC Active Polling EP Mask (HSOAAPEPM):** Determines if the Async Active for OUT HS/FS/LS masks/ignores EP s that are polling/PINGing (HS) due to NAK. 0 HS OUT ASYNC Active will include EP s that are polling. 1 HS OUT ASYNC Active will mask/ignore EP s that are polling.<br><br>**Power Well:** Core |
| 13 | 0x1<br>RW | **HS IN ASYNC Active Polling EP Mask (HSIAAPEPM):** Determines if the Async Active for IN HS/FS/LS masks/ignores EP s that are polling due to NAK. 0 HS IN ASYNC Active will include EP s that are polling. 1 HS IN ASYNC Active will mask/ignore EP s that are polling.<br><br>**Power Well:** Core |
| 12:11 | 0x0<br>RW | **HS INTR IN Periodic Active Policy Control (HSIIPAPC):** Controls how the HS INTR IN periodic active is used to generate the global periodic active. This will determine how the smallest service interval among active EP s and number of active EP s are used. 0 HS INTR IN periodic active will be used to generate periodic active if Service Interval Threshold OR Numb of EP Threshold values meet the requirement. 1 HS INTR IN periodic active will be used to generate periodic active if Service Interval Threshold AND Numb of EP Threshold values meet the requirement. 2 Always allow HS INTR EP s to be used in the generation of the global Periodic Active indication. 3 Never allow HS INTR EP s to be used in the generation of the global Periodic Active indicaiton<br><br>**Power Well:** Core |
| 10:4 | 0x0<br>RW | **HS INTR IN Periodic Active Num of EP Threshold (HSIIPANEPT):** Defines the threshold used to determine if Periodic Acive may include HS/FS/LS INTR IN EP active indication. If there are more than NumEPThreshold active HS/FS/LS INTR EP s then they may be included as part of the periodic active generation.<br><br>**Power Well:** Core |
| 3:0 | 0x0<br>RW | **HS INTR IN Periodic Active Service Interval Threshold (HSIIPASIT):** Defines the Service Interval threshold used to determine if Periodic Acive will include HS/FS/LS INTR IN EP active indication. If there are any active HS/FS/LS INTR EP s with a service interval less than or equal to this threshold then they may be included as part of the periodic active generation.<br><br>**Power Well:** Core |

## 51.3.238 XHCI USB2 Overcurrent Pin Mapping 1 (U2OCM1_MMIO)—Offset 86B0h

The RW/L property of this register is controlled by OCCFDONE bit.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 86B0h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:4 | 0x0<br>RO | **Rsvd:** Reserved<br><br>**Power Well:** SUS |
| 3:0 | 0x0<br>RW/L | **OC Mapping (OCM):**<br>• 0 - port 0<br>• 1 - port 1<br>• 2 - port 2<br>• 3 - port 3<br>• Others: Reserved<br><br>**Power Well:** SUS |

## 51.3.239 XHCI USB3 Overcurrent Pin Mapping 1 (U3OCM1_MMIO)—Offset 86D0h

The RW/L property of this register is controlled by OCCFDONE bit.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 86D0h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:4 | 0x0<br>RO | **Rsvd:** Reserved.<br><br>**Power Well:** Core |

## 51.3.242 Debug Capability Doorbell Register (DCDB)—Offset 8704h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MBAR] + 8704h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 15:8 | 0x0<br>RW | **Doorbell Target (DBTGT):** This field defines the target of the doorbell reference. The table below defines the Debug Capability notification that is generated by ringing the doorbell. Value Definition 0 Data EP 1 OUT Enqueue Pointer Update 1 Data EP 1 IN Enqueue Pointer Update 2:255 Reserved This field returns '0' when read and the value should be treated as undefined by software.<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RW | **Reserved (RSVD_1):** Reserved.<br><br>**Power Well:** Core |

## 51.3.243 Debug Capability Event Ring Segment Table Size Register (DCERSTSZ)—Offset 8708h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MBAR] + 8708h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 15:0 | 0x0<br>RW | **Event Ring Segment Table Size (ERSTS):** This field identifies the number of valid Event Ring Segment Table entries in the Event Ring Segment Table pointed to by the Debug Capability Event Ring Segment Table Base Address register. The maximum value supported by an xHC implementation for this register is defined by the DCERST Max field in the DCID register Software shall initialize this register before setting the Debug Capability Enable field in the DCCTRL register to '1'.<br><br>**Power Well:** Core |

## 51.3.244 Debug Capability Event Ring Segment Table Base Address Register (DCERSTBA)—Offset 8710h

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**Default:** 0000000000000000h

**BAR and Offset:** [MBAR] + 8710h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:4 | 0x0<br>RW | **Event Ring Segment Table Base Address Register (ERSTBAR):** This field defines the high order bits of the start address of the Debug Capability Event Ring Segment Table. Software shall initialize this register before setting the Debug Capability Enable field in the DCCTRL register to '1'.<br><br>**Power Well:** Core |
| 3:0 | 0x0<br>RW | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |

## 51.3.245 Debug Capability Event Ring Dequeue Pointer Register (DCERDP)—Offset 8718h

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**Default:** 0000000000000000h

**BAR and Offset:** [MBAR] + 8718h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:4 | 0x0<br>RW | **Dequeue Pointer (DQP):** This field defines the high order bits of the 64-bit address of the current Debug Capability Event Ring Dequeue Pointer. Software shall initialize this register before setting the Debug Capability Enable field in the DCCTRL register to '1'.<br><br>**Power Well:** Core |
| 3 | 0x0<br>RW | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 2:0 | 0x0<br>RW | **Dequeue ERST Segment Index (DESI):** This field may be used by the xHC to accelerate checking the Event Ring full condition. This field is written with the low order 3 bits of the offset of the ERST entry which defines the Event Ring segment that the Event Ring Dequeue Pointer resides in.<br><br>**Power Well:** Core |

## 51.3.246 Debug Capability Control Register (DCCTRL)—Offset 8720h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MBAR] + 8720h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **Debug Capability Enable (DCE):** Reserved.<br><br>**Power Well:** Core |
| 30:24 | 0x0<br>RO | **Device Address (DADDR):** Reserved.<br><br>**Power Well:** Core |
| 23:16 | 0x0<br>RO | **Debug Max Burst Size (DMBS):** LPT-LP USB Debug Device does not support bursting.<br><br>**Power Well:** Core |

## 51.3.247 Debug Capability Status Register (DCST)—Offset 8724h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MBAR] + 8724h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RO | **Debug Port Number (DPNUM):** This field provides the ID of the Root Hub port that the Debug Capability has been automatically attached to. The value is '0' when the Debug Capability is not attached to a Root Hub port.<br><br>**Power Well:** Core |
| 23:1 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 0 | 0x0<br>RO | **Event Ring Not Empty (ERNE):** When '1', this field indicates that the Debug Capability Event Ring has a Transfer Event on it. It is automatically cleared to '0' by the xHC when the Debug Capability Event Ring is empty, i.e. the Debug Capability Enqueue Pointer is equal to the Debug Capability Event Ring Dequeue Pointer register.<br><br>**Power Well:** Core |

## 51.3.248 Debug Capability Port Status and Control Register (DCPORTSC)—Offset 8728h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000080h

**BAR and Offset:** [MBAR] + 8728h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 23 | 0x0<br>RW/C | **Port Config Error Change (CEC):** This flag indicates that the port failed to configure its link partner. 0 = No change. 1 = Port Config Error detected. Software shall clear this bit by writing a '1' to it.<br><br>**Power Well:** Core |
| 22 | 0x0<br>RW/C | **Port Link Status Change (PLC):** This flag is set to '1' due to the following PLS transitions: U0 -) U3 Suspend signaling detected from Debug Host U3 -) U0 Resume complete Polling -) Disabled Training Error Ux or Recovery -) Inactive Error Software shall clear this bit by writing a '1' to it. This field is '0' if DCE is '0'<br><br>**Power Well:** Core |
| 21 | 0x0<br>RW/C | **Port Reset Change (PRC):** This bit is set when reset processing on this port is complete (i.e. a '1' to '0' transition of PR). '0' = No change. '1' = Reset complete.Software shall clear this bit by writing a '1' to it. This field is '0' if DCE is '0'.<br><br>**Power Well:** Core |
| 20:18 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved.<br><br>**Power Well:** Core |
| 17 | 0x0<br>RW/C | **Connect Status Change (CSC):** an already-set bit (i.e., the bit will remain '1'). Software shall clear this bit by writing a '1' to it. This field is '0' if DCE is '0'.<br><br>**Power Well:** Core |
| 16:14 | 0x0<br>RO | **Reserved (RSVD_2):** Reserved.<br><br>**Power Well:** Core |
| 13:10 | 0x0<br>RO | **Port Speed (PSPD):** This field identifies the speed of the port. This field is only relevant when a Debug Host is attached (CCS = '1') in all other cases this field shall indicate Undefined Speed. 0 Undefined Speed 1-15 Protocol Speed ID (PSI) Note: The Debug Capability onlydoes not supports LS, FS, or HS operation.<br><br>**Power Well:** Core |
| 9 | 0x0<br>RO | **Reserved (RSVD_3):** Reserved.<br><br>**Power Well:** Core |
| 8:5 | 0x4<br>RO | **Port Link State (PLS):** This field reflects its current link state. This field is only relevant when a Debug Host is attached (Debug Port Number ) '0'). Value Meaning 0 Link is in the U0 State 1 Link is in the U1 State 2 Link is in the U2 State 3 Link is in the U3 State (Device Suspended) 4 Link is in the Disabled State 5 Link is in the RxDetect State 6 Link is in the Inactive State 7 Link is in the Polling State 8 Link is in the Recovery State 9 Link is in the Hot Reset State 15:10 Reserved Note: Transitions between different states are not reflected until the transition is complete.<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 4 | 0x0<br>RO | **Port Reset (PR):** '1' = Port is in Reset. '0' = Port is not in Reset. This bit is set to '1' when the bus reset sequence as defined in the USB Specification is detected on the Root Hub port assigned to the Debug capability. It is cleared when the bus reset sequence is completed by the Debug Host, and the DbC shall transition to the USB Default state. A '0' to '1' transition of this bit shall clear DCPORTSC PED ('0'). This field is '0' if DCE or CCS are '0'.<br><br>**Power Well:** Core |
| 3:2 | 0x0<br>RO | **Reserved (RSVD_4):** Reserved.<br><br>**Power Well:** Core |
| 1 | 0x0<br>RW | **Port Enabled/Disabled (PED):** Default = '0'. '1' = Enabled. '0' = Disabled. This flag shall be set to '1' by a '0' to '1' transition of CCS or a '1' to '0' transition of the PR. When PED transitions from '1' to '0' due to the assertion of PR, the port's link shall transition to the Rx.Detect state. This flag may be used by software to enable or disable the operation of the Root Hub port assigned to the Debug Capability. The Debug Capability Root Hub port operation may be disabled by a fault condition (disconnect event or other fault condition, e.g. a LTSSM Polling substate timeout, tPortConfiguration timeout error, etc.), the assertion of DCPORTSC PR, or by software. 0 = Debug Capability Root Hub port is disabled. 1 = Debug Capability Root Hub port is enabled. When the port is disabled (PED = '0') the port's link shall enter the SS.Disabled state and remain there until PED is reasserted ('1') or DCE is negated ('0'). Note that the Root Hub port is remains mapped to Debug Capability while PED = '0'. While PED = '0' the Debug Capability will appear to be disconnected to the Debug Host. Note, this bit is not affected by PORTSC PR bit transitions. This field is '0' if DCE or CCS are '0'.<br><br>**Power Well:** Core |
| 0 | 0x0<br>RO | **Current Connect Status (CCS):** '1' = A Root Hub port is connected to a Debug Host and assigned to the Debug Capability. '0' = No Debug Host is present. This value reflects the current state of the port, and may not correspond to the value reported by the Connect Status Change (CSC) field in the Port Status Change Event that was generated by a '0' to '1' transition of this bit. This flag is '0' if Debug Capability Enable (DCE) is '0'.<br><br>**Power Well:** Core |

## 51.3.249 Debug Capability Context Pointer Register (DCCP)—Offset 8730h

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**Default:** 0000000000000000h

**BAR and Offset:** [MBAR] + 8730h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:4 | 0x0<br>RW | **Debug Capability Context Pointer Register (DCCPR):** This field defines the high order bits of the start address of the Debug Capability Context data structure associated with the Debug Capability. Software shall initialize this register before setting the Debug Capability Enable bit in the Debug Capability Control Register to '1'.<br><br>**Power Well:** Core |
| 3:0 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |

## 51.3.250 Debug Capability Device Descriptor Info Register 1 (DCDDI1)—Offset 8738h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 80870000h

**BAR and Offset:** [MBAR] + 8738h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x8087<br>RW | **Vendor ID (VID):** This field is presented by the Debug Device in the USB Device Descriptor idVendor field.<br><br>**Power Well:** Core |
| 15:8 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RW | **DbC Protocol (DBCPR):** This field is presented by the Debug Device in the USB Interface Descriptor bInterfaceProtocol field. Value Function 0 Debug Target vendor defined. 1 GNU Remote Debug Command Set supported. 2-255 Reserved.<br><br>**Power Well:** Core |

## 51.3.251 Debug Capability Device Descriptor Info Register 2 (DCDDI2)—Offset 873Ch

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MBAR] + 873Ch

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **Device Revision (DREV):** This field is presented by the Debug Device in the USB Device Descriptor bcdDevice field.<br><br>**Power Well:** Core |
| 15:0 | 0x0<br>RW | **Product ID (PID):** This field is presented by the Debug Device in the USB Device Descriptor idProduct field.<br><br>**Power Well:** Core |

## 51.3.252 Debug Capability Descriptor Parameters (DCDP)—Offset 8740h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 000030C3h

**BAR and Offset:** [MBAR] + 8740h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 23:16 | 0x0<br>RW | **Max Power Field (MPF):** This field will be used by USB Debug Device to report maximum power consumption when the device is fully operational. This value is returned by bMaxPower field in response to Configuration Descriptor read from the debug device. Note: bU1DevExitLat and bU2DevExitLat fields returned in BOS Descriptor read will be taken from the corresponding fields from the Host Controller space.<br><br>**Power Well:** Core |
| 15:8 | 0x30<br>RW/S | **NEXT CAPABILITY POINTER (NCP):** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 0xc3<br>RW/S | **Capability ID (CID):** Reserved.<br><br>**Power Well:** Core |

## 51.3.253 Debug Device Control ODMA (DBGDEV_CTRL_ODMA_REG)—Offset 8748h

This register contains a number of fields that provide a specific level of configurability for the OUT DMA that is part of Debug Device logic. This configurability is above and beyond that defined in the xHCI specification.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MBAR] + 8748h

**Default:** 00000000h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:19 | 0x0<br>RW | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 18 | 0x0<br>RW | **Enable ACK FIFO credit accounting (EN_ACK_FCA):** Setting this field will enable ACK FIFO credit accounting. ODMA will ensure that ample room exists in the ACK FIFO for expected device responses prior to initiating a given DP<br><br>**Power Well:** Core |
| 17:14 | 0x0<br>RW | **Reserved (RSVD_1):** Reserved.<br><br>**Power Well:** Core |
| 13 | 0x0<br>RW | **Enable ACK FIFO ICA mechanisms (EN_ACK_FIFO_ICA):** Setting this field will enable ACK FIFO individual credit accounting mechanisms for Async vs. Periodic Endpoints. ODMA will ensure that ample room exists in the ACK FIFO for expected device responses prior to initiating a given DP<br><br>**Power Well:** Core |
| 12:9 | 0x0<br>RW | **Reserved (RSVD_2):** Reserved.<br><br>**Power Well:** Core |
| 8 | 0x0<br>RW | **Clear ownership of context semaphore (CL_OWN_CS):** Setting this field generates a pulse that clears the ownership of the context semaphore that is shared between the Out DMA Response and Completion Finite State Machines<br><br>**Power Well:** Core |
| 7 | 0x0<br>RW | **Return OD ACK credits (RET_OD_ACK_CR):** Setting this field generates a pulse that implicitly returns all of the Out DMA ACK credits on all ports<br><br>**Power Well:** Core |
| 6 | 0x0<br>RW | **Reserved (RSVD_3):** Reserved.<br><br>**Power Well:** Core |
| 5 | 0x0<br>RW | **Return ODCF SM to idle state (RET_ODCF_SM_IS):** Setting this field generates a pulse that returns the Out DMA Completion Finite State Machine into the IDLE state<br><br>**Power Well:** Core |
| 4 | 0x0<br>RW | **Return ODRF SM to idle state (RET_ODRF_SM_IS):** Setting this field generates a pulse that returns the Out DMA Response Finite State Machine into the IDLE state<br><br>**Power Well:** Core |
| 3 | 0x0<br>RW | **Return ODRDF SM to idle state (RET_ODRDF_SM_IS):** Setting this field generates a pulse that returns the Out DMA Read Finite State Machine into the IDLE state<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 2:0 | 0x0<br>RW | **Reserved (RSVD_4):** Reserved.<br><br>**Power Well:** Core |

## 51.3.254 DBC Control Register 1 (DBCCTL_REG)—Offset 8760h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MBAR] + 8760h

**MBAR Type:** PCI Configuration Register (Size: 64 bits)
**MBAR Reference:** [B:0, D:21, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0x0<br>RO | **Reserved (RSVD):** RSVD<br><br>**Power Well:** Core |
| 7 | 0x0<br>RW | **SW_DCE_SEL:** Reserved.<br><br>**Power Well:** Core |
| 6:3 | 0x0<br>RW | **DISC_RXD_CNT:** Reserved.<br><br>**Power Well:** Core |
| 2 | 0x0<br>RO | **RSVD0:** Reserved |
| 1 | 0x0<br>RW | **Force DCE Mode (FORCE_DCE_MODE):** 0: When DCE is set, the DbC switches to Mode 2 1: When DCE is set, the DbC switches to Mode 3<br><br>**Power Well:** Core |
| 0 | 0x0<br>RW | **Force Disconnect upon DCE (FORCE_DISCONNECT_ON_DCE):** If this bit is set by BIOS, the DbC will temporarily disconnect from the remote host if the DCE is set, and shortly thereafter re-connect. This allows the DbC to switch from Mode1 to Mode2 or Mode 3 operation upon DCE being set.<br><br>**Power Well:** Core |

# 52 System Management - B0, D24, F(0, 1, 3, 4)

## 52.1 Introduction and Index

The host-accessible registers for the System Management are described here.

To determine the number of devices/functions available refer to the following:

- Table 1-1, "Features by product SKU - Server and Cloud Storage SKUs 0 through 4"
- Table 1-2, "Features by Product SKU - Network and Enterprise Storage SKUs 5 through 10"
- Table 1-3, "Features by Product SKU - Extended Temperature SKUs 11 through 14".

The legend for the register access codes are described in Chapter 43, "Introduction."

### 52.1.1 Host Configuration Space—HECI1 (F:0)

These registers are discovered in Host Configuration Space starting at Bus 0, Device 24 (decimal), Function 0. The offset addresses are listed.

**Table 52-1. Summary of PCI Configuration Registers—0/24/0**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 0 | 4 | 19D38086 | "Identifiers (HECI1_ID)—Offset 0h" on page 2239 |
| 4 | 2 | 0000 | "Command (HECI1_CMD)—Offset 4h" on page 2240 |
| 6 | 2 | 0010 | "Status (HECI1_STS)—Offset 6h" on page 2241 |
| 8 | 4 | 07800000 | "Revision ID and Class Code (HECI1_RID_CC)—Offset 8h" on page 2242 |
| C | 1 | 00 | "Cache Line Size (HECI1_CLS)—Offset Ch" on page 2242 |
| D | 1 | 00 | "Master Latency Timer (HECI1_MLT)—Offset Dh" on page 2242 |
| E | 1 | 80 | "Header Type (HECI1_HTYPE)—Offset Eh" on page 2243 |
| F | 1 | 00 | "Built In Self-Test (HECI1_BIST)—Offset Fh" on page 2243 |
| 10 | 4 | 00000004 | "HECI MMIO Base Address Low (HECI1_MMIO_MBAR_LO)—Offset 10h" on page 2243 |
| 14 | 4 | 00000000 | "HECI MMIO Base Address High (HECI1_MMIO_MBAR_HI)—Offset 14h" on page 2244 |
| 2C | 4 | 00000000 | "Sub System Identifiers (HECI1_SS)—Offset 2Ch" on page 2244 |
| 34 | 1 | 50 | "Capabilities Pointer (HECI1_CAP)—Offset 34h" on page 2244 |
| 3C | 2 | 0100 | "Interrupt Information (HECI1_INTR)—Offset 3Ch" on page 2245 |
| 3E | 1 | 00 | "Minimum Grant (HECI1_MGNT)—Offset 3Eh" on page 2245 |
| 3F | 1 | 00 | "Maximum Latency (HECI1_MLAT)—Offset 3Fh" on page 2245 |
| 40 | 4 | 00000000 | "Host Firmware Status (HECI1_HFS)—Offset 40h" on page 2246 |
| 44 | 4 | 80000000 | "Miscellaneous Shadow (HECI1_MISC_SHDW)—Offset 44h" on page 2248 |
| 48 | 4 | 00000000 | "General Status Shadow 1 (HECI1_GS_SHDW1)—Offset 48h" on page 2249 |
| 4C | 4 | 00000000 | "Host General Status (HECI1_H_GS1)—Offset 4Ch" on page 2250 |
| 50 | 2 | 8C01 | "PCI Power Management Capability ID (HECI1_PID)—Offset 50h" on page 2250 |

| 8E | 2 | 0080 | "Message Signaled Interrupt Message Control (HECI2_MC)—Offset 8Eh" on page 2273 |
| 90 | 4 | 00000000 | "Message Signaled Interrupt Message Address (HECI2_MA)—Offset 90h" on page 2274 |
| 94 | 4 | 00000000 | "Message Signaled Interrupt Upper Address (HECI2_MUA)—Offset 94h" on page 2274 |
| 98 | 2 | 0000 | "Message Signaled Interrupt Message Data (HECI2_MD)—Offset 98h" on page 2274 |
| A0 | 1 | 00 | "HECI Interrupt Delivery Mode (HECI2_HIDM)—Offset A0h" on page 2275 |
| F8 | 4 | 00000000 | "Manufacturer's ID (HECI2_MANID)—Offset F8h" on page 2275 |

## 52.1.3 Host Configuration Space—HECI3 (F:4)

These registers are discovered in Host Configuration Space starting at Bus 0, Device 24 (decimal), Function 4. The offset addresses are listed.

**Table 52-3. Summary of PCI Configuration Registers—0/24/4**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 0 | 4 | 19D68086 | "Identifiers (HECI3_ID)—Offset 0h" on page 2276 |

### 52.1.4 Host Configuration Space—KT (F:3)

These registers are discovered in Host Configuration Space starting at Bus 0, Device 24 (decimal), Function 3. The offset addresses are listed.

**Table 52-4. Summary of PCI Configuration Registers—0/24/3**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 0 | 4 | 19D58086 | "Device ID and Vendor ID (KT_HOST_DID_VID)—Offset 0h" on page 2292 |
| 4 | 4 | 00B00000 | "Status and Command (KT_HOST_STS_CMD)—Offset 4h" on page 2293 |
| 8 | 4 | 07000200 | "Class Code and Revision ID (KT_HOST_CC_RID)—Offset 8h" on page 2295 |
| C | 4 | 00800000 | "BIST, Header Type, Latency Timer, and Cache Line Size (KT_HOST_BIST_HTYPE_LT_CLS)—Offset Ch" on page 2295 |
| 10 | 4 | 00000001 | "KT IO BAR (KT_HOST_IOBAR)—Offset 10h" on page 2296 |
| 14 | 4 | 00000000 | "KT Memory BAR (KT_HOST_MEMBAR)—Offset 14h" on page 2296 |
| 28 | 4 | 00000000 | "Cardbus CIS Pointer (KT_HOST_CCP)—Offset 28h" on page 2297 |

| 14 | 4 | 00000001 | "IDE Primary Control Block IO BAR (IDE_HOST_PCTLIOBAR)—Offset 14h" on page 2308 |
| 18 | 4 | 00000001 | "IDE Secondary Command Block IO BAR (IDE_HOST_SCMDIOBAR)—Offset 18h" on page 2309 |
| 1C | 4 | 00000001 | "IDE Secondary Control Block IO BAR (IDE_HOST_SCTLIOBAR)—Offset 1Ch" on page 2309 |
| 20 | 4 | 00000001 | "IDE Bus Master Block IO BAR (IDE_HOST_BMIOBAR)—Offset 20h" on page 2310 |
| 28 | 4 | 00000000 | "Cardbus CIS Pointer (IDE_HOST_CCP)—Offset 28h" on page 2310 |
| 2C | 4 | 00008086 | "Subsystem ID and Subsystem Vendor ID (IDE_HOST_SID_SVID)—Offset 2Ch" on page 2311 |
| 30 | 4 | 00000000 | "Expansion ROM Base Address (IDE_HOST_XRBAR)—Offset 30h" on page 2311 |
| 34 | 4 | 00000040 | "Capabilities List Pointer (IDE_HOST_CAPP)—Offset 34h" on page 2311 |
| 3C | 4 | 00000000 | "Maximum Latency, Minimum Grant, Interrupt Pin and Interrupt Line (IDE_HOST_MAXL_MING_INTP_INTL)—Offset 3Ch" on page 2312 |
| 40 | 4 | 00805005 | "MSI Message Control, Next Pointer and Capability ID (IDE_HOST_MSIMC_MSINP_MSICID)—Offset 40h" on page 2313 |
| 44 | 4 | 00000000 | "MSI Message Address (IDE_HOST_MSIMA)—Offset 44h" on page 2313 |
| 48 | 4 | 00000000 | "MSI Message Upper Address (IDE_HOST_MSIMUA)—Offset 48h" on page 2314 |
| 4C | 4 | 00000000 | "MSI Message Data (IDE_HOST_MSIMD)—Offset 4Ch" on page 2314 |
| 50 | 4 | 00230001 | "Power Management Capabilities, Next Pointer and Capability ID (IDE_HOST_PMCAP_PMNP_PMCID)—Offset 50h" on page 2315 |
| 54 | 4 | 00000008 | "Power Management Data, Control/Status Register Bridge Support Extensions, Control and Status (IDE_HOST_PMD_PMCSRBSE_PMCSR)—Offset 54h" on page 2316 |
| F8 | 4 | 00000000 | "Process Stepping Information (IDE_HOST_PSI)—Offset F8h" on page 2317 |

### 52.1.6 Host Memory Space—HECI1_MMIO_MBAR

An index of the registers that are accessible in Host Memory Space is shown here.

**Table 52-6. Summary of Memory Mapped I/O Registers—HECI1_MMIO_MBAR**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 0 | 4 | 00000000 | "Host CB Write Window (HECI1_H_CB_WW)—Offset 0h" on page 2318 |
| 4 | 4 | 80000000 | "Host Control and Status Register (HECI1_H_CSR)—Offset 4h" on page 2319 |
| 8 | 4 | FFFFFFFF | "CSE Circular Buffer Read Window (HECI1_CSE_CB_RW)—Offset 8h" on page 2320 |
| C | 4 | 80000000 | "CSE Control and Status Register Host Access (HECI1_CSE_CSR_HA)—Offset Ch" on page 2320 |
| 800 | 4 | 00000000 | "D0i3 Control (HECI1_D0I3C)—Offset 800h" on page 2321 |

### 52.1.7 Host Memory Space—HECI2_MMIO_MBAR

An index of the registers that are accessible in Host Memory Space is shown here.

**Table 52-7. Summary of Memory Mapped I/O Registers—HECI2_MMIO_MBAR**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 0 | 4 | 00000000 | "Host CB Write Window (HECI2_H_CB_WW)—Offset 0h" on page 2322 |
| 4 | 4 | 80000000 | "Host Control and Status Register (HECI2_H_CSR)—Offset 4h" on page 2323 |
| 8 | 4 | FFFFFFFF | "CSE Circular Buffer Read Window (HECI2_CSE_CB_RW)—Offset 8h" on page 2324 |
| C | 4 | 80000000 | "CSE Control and Status Register Host Access (HECI2_CSE_CSR_HA)—Offset Ch" on page 2324 |
| 800 | 4 | 00000000 | "D0i3 Control (HECI2_D0I3C)—Offset 800h" on page 2325 |

### 52.1.8 Host Memory Space—HECI3_MMIO_MBAR

An index of the registers that are accessible in Host Memory Space is shown here.

**Table 52-8. Summary of Memory Mapped I/O Registers—HECI3_MMIO_MBAR**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 0 | 4 | 00000000 | "Host CB Write Window (HECI3_H_CB_WW)—Offset 0h" on page 2326 |
| 4 | 4 | 80000000 | "Host Control and Status Register (HECI3_H_CSR)—Offset 4h" on page 2327 |
| 8 | 4 | FFFFFFFF | "CSE Circular Buffer Read Window (HECI3_CSE_CB_RW)—Offset 8h" on page 2328 |
| C | 4 | 80000000 | "CSE Control and Status Register Host Access (HECI3_CSE_CSR_HA)—Offset Ch" on page 2328 |
| 800 | 4 | 00000000 | "D0i3 Control (HECI3_D0I3C)—Offset 800h" on page 2329 |

### 52.1.9 Host Memory Space—KT_HOST_MEMBAR

An index of the registers that are accessible in Host Memory Space is shown here.

**Table 52-9. Summary of Memory Mapped I/O Registers—KT_HOST_MEMBAR**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 0 | 1 | 00 | "KT Receive Buffer Register (MEM_KTRBR)—Offset 0h" on page 2330 |
| 0 | 1 | 00 | "KT Transmitter Holding Register (MEM_KTTHR)—Offset 0h" on page 2330 |
| 0 | 1 | 00 | "KT Divisor Latch LSB Register (MEM_KTDLLR)—Offset 0h" on page 2331 |
| 1 | 1 | 00 | "KT Interrupt Enable register (MEM_KTIER)—Offset 1h" on page 2331 |
| 1 | 1 | 00 | "KT Divisor Latch MSB Register (MEM_KTDLMR)—Offset 1h" on page 2332 |
| 2 | 1 | 01 | "KT Interrupt Identification Register (MEM_KTIIR)—Offset 2h" on page 2333 |
| 2 | 1 | 00 | "KT FIFO Control register (MEM_KTFCR)—Offset 2h" on page 2334 |
| 3 | 1 | 03 | "KT Line Control register (MEM_KTLCR)—Offset 3h" on page 2335 |
| 4 | 1 | 00 | "KT Modem Control register (MEM_KTMCR)—Offset 4h" on page 2336 |
| 5 | 1 | 60 | "KT Line Status register (MEM_KTLSR)—Offset 5h" on page 2337 |
| 6 | 1 | 00 | "KT Modem Status register (MEM_KTMSR)—Offset 6h" on page 2338 |
| 7 | 1 | 00 | "KT Scratch register (MEM_KTSCR)—Offset 7h" on page 2338 |

## 52.1.10 Host Memory Space—Fixed Address

An index of the registers that are accessible in Host Memory Space is shown here.

**Table 52-10. Summary of Memory Mapped I/O Registers—Fixed Addresses**

| Memory Address (hex) | Bytes (decimal) | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| FED40000 | 4 | 00000000 | "FTPM Locality State (HOST_LOC_0_LOC_STATE_HROA)—Offset FED40000h" on page 2339 |
| FED40004 | 4 | 00000000 | "FTPM Locality Reserved (HOST_LOC_0_LOC_RSVD)—Offset FED40004h" on page 2340 |
| FED40008 | 4 | 00000000 | "FTPM Locality n Control Register (HOST_LOC_0_LOC_CTRL)—Offset FED40008h" on page 2340 |
| FED4000C | 4 | 00000000 | "FTPM Locality n Status Register Host Read Only Access. (HOST_LOC_0_LOC_STS_HROA)—Offset FED4000Ch" on page 2340 |
| FED40010 | 4 | 00000000 | "FTPM Locality Config Area Reserved Read Write[0-7] (HOST_LOC_0_RSVD_RW1[0-7])—Offset FED40010h, Count 8, Stride 4h" on page 2341 |
| FED40030 | 4 | 00000000 | "FTPM Interface ID Host Read Only Access 0 (HOST_LOC_0_INTF_ID_0)—Offset FED40030h" on page 2341 |
| FED40034 | 4 | 00000000 | "FTPM Interface ID Host Read Only Access 1 (HOST_LOC_0_INTF_ID_1)—Offset FED40034h" on page 2341 |
| FED40038 | 4 | 00000000 | "FTPM Locality Config Area Reserved Read Write[0-1] (HOST_LOC_0_RSVD_RW2[0-1])—Offset FED40038h, Count 2, Stride 4h" on page 2342 |
| FED40040 | 4 | 00000000 | "Control Area Request (HOST_LOC_0_CA_REQUEST)—Offset FED40040h" on page 2342 |
| FED40044 | 4 | 00000000 | "Control Area Status (HOST_LOC_0_CA_STATUS)—Offset FED40044h" on page 2342 |
| FED40048 | 4 | 00000000 | "Control Area Cancel (HOST_LOC_0_CA_CANCEL)—Offset FED40048h" on page 2343 |
| FED4004C | 4 | 00000000 | "Control Area Start (HOST_LOC_0_CA_START)—Offset FED4004Ch" on page 2343 |
| FED40050 | 4 | 00000000 | "Control Area Interrupt Reserved Part 1 (HOST_LOC_0_CA_INT_RSVD1)—Offset FED40050h" on page 2343 |
| FED40054 | 4 | 00000000 | "Control Area Interrupt Reserved Part 2 (HOST_LOC_0_CA_INT_RSVD2)—Offset FED40054h" on page 2344 |
| FED40058 | 4 | 00000000 | "Control Area Command Size (HOST_LOC_0_CA_CMD_SZ)—Offset FED40058h" on page 2344 |
| FED4005C | 4 | 00000000 | "Control Area Command Part 1 (HOST_LOC_0_CA_CMD1)—Offset FED4005Ch" on page 2344 |
| FED40060 | 4 | 00000000 | "Control Area Command Part 2 (HOST_LOC_0_CA_CMD2)—Offset FED40060h" on page 2345 |
| FED40064 | 4 | 00000000 | "Control Area Response Size (HOST_LOC_0_CA_RSP_SZ)—Offset FED40064h" on page 2345 |
| FED40068 | 4 | 00000000 | "Control Area Response Part 1 (HOST_LOC_0_CA_RSP1)—Offset FED40068h" on page 2345 |
| FED4006C | 4 | 00000000 | "Control Area Response Part 2 (HOST_LOC_0_CA_RSP2)—Offset FED4006Ch" on page 2346 |
| FED40070 | 4 x 4 | 00000000 | "FTPM Reserved Read Write[0-3] (HOST_LOC_0_RSVD_RW3[0-3])—Offset FED40070h, Count 4, Stride 4h" on page 2346 |
| FED40080 | 4 x 992 | 00000000 | "FTPM Command and Response Buffer[0-991] (HOST_LOC_0_FTPM_CRB[0-991])—Offset FED40080h, Count 992, Stride 4h" on page 2346 |

## 52.1.11 Host I/O Space—KT_HOST_IOBAR

An index of the registers that are accessible in Host I/O Space is shown here.

**Table 52-11. Summary of I/O Registers—KT_HOST_IOBAR**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 0 | 1 | 00 | "KT Receive Buffer Register (IO_KTRBR)—Offset 0h" on page 2347 |
| 0 | 1 | 00 | "KT Transmitter Holding Register (IO_KTTHR)—Offset 0h" on page 2347 |
| 0 | 1 | 00 | "KT Divisor Latch LSB Register (IO_KTDLLR)—Offset 0h" on page 2348 |
| 1 | 1 | 00 | "KT Interrupt Enable register (IO_KTIER)—Offset 1h" on page 2348 |
| 1 | 1 | 00 | "KT Divisor Latch MSB Register (IO_KTDLMR)—Offset 1h" on page 2349 |
| 2 | 1 | 01 | "KT Interrupt Identification Register (IO_KTIIR)—Offset 2h" on page 2349 |
| 2 | 1 | 00 | "KT FIFO Control register (IO_KTFCR)—Offset 2h" on page 2350 |
| 3 | 1 | 03 | "KT Line Control register (IO_KTLCR)—Offset 3h" on page 2351 |
| 4 | 1 | 00 | "KT Modem Control register (IO_KTMCR)—Offset 4h" on page 2352 |
| 5 | 1 | 60 | "KT Line Status register (IO_KTLSR)—Offset 5h" on page 2353 |
| 6 | 1 | 00 | "KT Modem Status register (IO_KTMSR)—Offset 6h" on page 2354 |
| 7 | 1 | 00 | "KT Scratch register (IO_KTSCR)—Offset 7h" on page 2355 |

### 52.1.12 Host I/O Space—IDE_HOST_PCMDIOBAR

An index of the registers that are accessible in Host I/O Space is shown here.

**Table 52-12. Summary of I/O Registers—IDE_HOST_PCMDIOBAR**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 0 | 1 | 0000 | "IDE Data Register (IDEDATA)—Offset 0h" on page 2356 |
| 1 | 1 | 00 | "IDE Features Register (IDEFR)—Offset 1h" on page 2356 |
| 1 | 1 | 00 | "IDE Error Register DEV0 (IDEERD0)—Offset 1h" on page 2357 |
| 1 | 1 | 00 | "IDE Error Register DEV1 (IDEERD1)—Offset 1h" on page 2357 |
| 2 | 1 | 00 | "IDE Sector Count In Register (IDESCIR)—Offset 2h" on page 2358 |
| 2 | 1 | 00 | "IDE Sector Count Out Register DEV0 (IDESCOR0)—Offset 2h" on page 2358 |
| 2 | 1 | 00 | "IDE Sector Count Out Register DEV1 (IDESCOR1)—Offset 2h" on page 2358 |
| 3 | 1 | 00 | "IDE Sector Number In Register (IDESNIR)—Offset 3h" on page 2359 |
| 3 | 1 | 00 | "IDE Sector Number Out Register DEV0 (IDESNOR0)—Offset 3h" on page 2359 |
| 3 | 1 | 00 | "IDE Sector Number Out Register DEV1 (IDESNOR1)—Offset 3h" on page 2360 |
| 4 | 1 | 00 | "IDE Cylinder Low In Register (IDECLIR)—Offset 4h" on page 2360 |
| 4 | 1 | 00 | "IDE Cylinder Low Out Register DEV0 (IDCLOR0)—Offset 4h" on page 2361 |
| 4 | 1 | 00 | "IDE Cylinder Low Out Register DEV1 (IDCLOR1)—Offset 4h" on page 2361 |
| 5 | 1 | 00 | "IDE Cylinder High In Register (IDECHIR)—Offset 5h" on page 2362 |
| 5 | 1 | 00 | "IDE Cylinder High Out Register DEV0 (IDCHOR0)—Offset 5h" on page 2362 |
| 5 | 1 | 00 | "IDE Cylinder High Out Register DEV1 (IDCHOR1)—Offset 5h" on page 2363 |
| 6 | 1 | 00 | "IDE Drive/Head In Register (IDEDHIR)—Offset 6h" on page 2363 |
| 6 | 1 | 00 | "IDE Drive/Head Out Register DEV0 (IDDHOR0)—Offset 6h" on page 2364 |
| 6 | 1 | 00 | "IDE Drive/Head Out Register DEV1 (IDDHOR1)—Offset 6h" on page 2364 |
| 7 | 1 | 00 | "IDE Command Register (IDECR)—Offset 7h" on page 2365 |
| 7 | 1 | 80 | "IDE Status Register DEV0 (IDESR0)—Offset 7h" on page 2366 |
| 7 | 1 | 80 | "IDE Status Register DEV1 (IDESR1)—Offset 7h" on page 2367 |

### 52.1.13 Host I/O Space—IDE_HOST_PCTLIOBAR

An index of the registers that are accessible in Host I/O Space is shown here.

**Table 52-13. Summary of I/O Registers—IDE_HOST_PCTLIOBAR**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 2 | 1 | 00 | "IDE Device Control Register (IDDCR)—Offset 2h" on page 2368 |
| 2 | 1 | 00 | "IDE Alternate Status Register (IDASR)—Offset 2h" on page 2368 |

### 52.1.14 Host I/O Space—IDE_HOST_BMIOBAR

An index of the registers that are accessible in Host I/O Space is shown here.

**Table 52-14. Summary of I/O Registers—IDE_HOST_BMIOBAR**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 0 | 1 | 00 | "IDE Primary Bus Master Command Register (IDEPBMCR)—Offset 0h" on page 2369 |
| 1 | 1 | 00 | "IDE Primary Bus Master Device Specific 0 Register (IDEPBMDS0R)—Offset 1h" on page 2370 |
| 2 | 1 | 80 | "IDE Primary Bus Master Status Register (IDEPBMSR)—Offset 2h" on page 2371 |
| 3 | 1 | 00 | "IDE Primary Bus Master Device Specific 1 Register (IDEPBMDS1R)—Offset 3h" on page 2373 |
| 4 | 1 | 00 | "IDE Primary Bus Master Descriptor Table Pointer Register Byte 0 (IDEPBMDTPR0)—Offset 4h" on page 2373 |
| 5 | 1 | 00 | "IDE Primary Bus Master Descriptor Table Pointer Register Byte 1 (IDEPBMDTPR1)—Offset 5h" on page 2373 |
| 6 | 1 | 00 | "IDE Primary Bus Master Descriptor Table Pointer Register Byte 2 (IDEPBMDTPR2)—Offset 6h" on page 2374 |
| 7 | 1 | 00 | "IDE Primary Bus Master Descriptor Table Pointer Register Byte 3 (IDEPBMDTPR3)—Offset 7h" on page 2374 |
| 8 | 1 | 00 | "IDE Secondary Bus Master Command Register (IDESBMCR)—Offset 8h" on page 2375 |
| 9 | 1 | 00 | "IDE Secondary Bus Master Device Specific 0 Register (IDESBMDS0R)—Offset 9h" on page 2375 |
| A | 1 | 80 | "IDE Secondary Bus Master Status Register (IDESBMSR)—Offset Ah" on page 2376 |
| B | 1 | 00 | "IDE Secondary Bus Master Device Specific 1 Register (IDESBMDS1R)—Offset Bh" on page 2377 |
| C | 1 | 00 | "IDE Secondary Bus Master Descriptor Table Pointer Register Byte 0 (IDESBMDTPR0)—Offset Ch" on page 2377 |
| D | 1 | 00 | "IDE Secondary Bus Master Descriptor Table Pointer Register Byte 1 (IDESBMDTPR1)—Offset Dh" on page 2378 |
| E | 1 | 00 | "IDE Secondary Bus Master Descriptor Table Pointer Register Byte 2 (IDESBMDTPR2)—Offset Eh" on page 2378 |
| F | 1 | 00 | "IDE Secondary Bus Master Descriptor Table Pointer Register Byte 3 (IDESBMDTPR3)—Offset Fh" on page 2379 |

### 52.1.15 Sideband Registers

An index of the Sideband registers that are accessible to the Host are listed here. Each is accessible in Host Memory Space using the Sideband Base Address Register (SBREG_BAR). See Section 3.4.1, "Using SBREG_BAR Method" on page 187.

**Table 52-15. Summary of Sideband Registers for KT (Host)—0xe4**

| Offset (hex) | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|
| 0 | 00000000 | "KT Host Interrupt Pin Register (KTHIPINR)—Offset 0h" on page 2380 |
| 4 | 00000000 | "BIOS KT Host PCI Function Disable Register (BKTHDISR)—Offset 4h" on page 2380 |

### Table 52-16. Summary of Sideband Registers for IDE (Host)—0xe4

| Offset (hex) | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|
| 0 | 00000000 | "IDE Host Interrupt Pin Register (IDEHIPINR)—Offset 0h" on page 2381 |
| 4 | 00000000 | "BIOS IDE Host PCI Function Disable Register (BIDEHDISR)—Offset 4h" on page 2381 |

## 52.2 Registers in Configuration Space—HECI1

### 52.2.1 Identifiers (HECI1_ID)—Offset 0h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:0] + 0h

**Default:** 19D38086h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x19d3 RO/V | **Device ID (DID):** Indicates what device number assigned by Intel. |
| 15:0 | 0x8086 RO | **Vendor ID (VID):** 16-bit field which indicates Intel is the vendor, assigned by the PCI SIG. |

## 52.2.2 Command (HECI1_CMD)—Offset 4h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:24, F:0] + 4h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:11 | 0x0<br>RO | **RSVD:** Reserved |
| 10 | 0x0<br>RW | **Interrupt Disable (ID):** Disables this device from generating PCI line based interrupts.<br>This bit does not have any effect on MSI operation. |
| 9 | 0x0<br>RO | **Fast Back-to-Back Enable (FBE):** Not implemented, hardwired to 0. |
| 8 | 0x0<br>RO | **SERR# Enable (SEE):** Not implemented, hardwired to 0. |
| 7 | 0x0<br>RO | **Wait Cycle Enable (WCC):** Not implemented, hardwired to 0. |
| 6 | 0x0<br>RO | **Parity Error Response Enable (PEE):** Not implemented, hardwired to 0. |
| 5 | 0x0<br>RO | **VGA Palette Snooping Enable (VAG):** Not implemented, hardwired to 0 |
| 4 | 0x0<br>RO | **Memory Write and Invalidate Enable (MWIE):** Not implemented, hardwired to 0. |
| 3 | 0x0<br>RO | **Special Cycle Enable (SCE):** Not implemented, hardwired to 0. |
| 2 | 0x0<br>RW | **Bus Master Enable (BME):** Controls the HECI host controller's abiity to act as a system memory master for data transfers.<br>When this bit is cleared, HECI bus master activity stops and any active DMA engines return to an idle condition.<br>This bit is made visible to firmware through the H_PCI_CSR register, and changes to this bit may be configured by the H_PCI_CSR register to generate an MSI to mIA.<br>When this bit is '0', HECI is blocked from generating MSI to the host CPU.<br>***Note:*** This bit does not block HECI accesses to CSE-UMA |
| 1 | 0x0<br>RW | **Memory Space Enable (MSE):** Controls access to the HECI host controllers memory mapped register space. |
| 0 | 0x0<br>RO | **I/O Space Enable (IOSE):** Not implemented, hardwired to 0. |

### 52.2.3 Status (HECI1_STS)—Offset 6h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:24, F:0] + 6h

**Default:** 0010h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RO | **Detected Parity Error (DPE):** Not implemented, hardwired to 0. |
| 14 | 0x0<br>RO | **Signaled System Error (SSE):** Not implemented, hardwired to 0. |
| 13 | 0x0<br>RO | **Received Master-Abort (RMA):** Not implemented, hardwired to 0. |
| 12 | 0x0<br>RO | **Received Target Abort (RTA):** Not implemented, hardwired to 0. |
| 11 | 0x0<br>RO | **Signaled Target-Abort (STA):** Not implemented, hardwired to 0. |
| 10:9 | 0x0<br>RO | **DEVSEL# Timing (DEVT):** These bits are hardwired to 00. |
| 8 | 0x0<br>RO | **Master Data Parity Error Detected (DPD):** Not implemented, hardwired to 0. |
| 7 | 0x0<br>RO | **Fast Back-to-Back Capable (FBC):** Not implemented, hardwired to 0. |
| 6 | 0x0<br>RO | **RSVD (RSVD_6_6):** Reserved. |
| 5 | 0x0<br>RO | **66 MHz Capable (C66):** Not implemented, hardwired to 0. |
| 4 | 0x1<br>RO | **Capabilities List (CL):** Indicates the presence of a capabilities list, hardwired to 1. |
| 3 | 0x0<br>RO/V | **Interrupt Status (IS):** Reflects the state of the INTx# signal at the input of the enable/disable circuit.<br>This bit is a 1 when the INTx# is asserted.<br>This bit is a 0 after the interrupt is cleared (independent of the state of the Interrupt Disable bit in the command register).<br>***Note:*** This bit is not set by an MSI. |
| 2:0 | 0x0<br>RO | **RSVD (RSVD_2_0):** Reserved |

## 52.2.4 Revision ID and Class Code (HECI1_RID_CC)—Offset 8h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:0] + 8h

**Default:** 07800000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x7<br>RO | **Base Class Code (BCC):** Indicates the base class code of the HECI host controller device. |
| 23:16 | 0x80<br>RO | **Sub Class Code (SCC):** Indicates the sub class code of the HECI host controller device. |
| 15:8 | 0x0<br>RO | **Programming Interface (PI):** Indicates the programming interface of the HECI host controller device. |
| 7:0 | 0x0<br>RO/V | **Revision ID (RID):** Indicates stepping of the HECI host controller. |

## 52.2.5 Cache Line Size (HECI1_CLS)—Offset Ch

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:24, F:0] + Ch

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO | **Cache Line Size (CLS):** Not implemented, hardwired to 0. |

## 52.2.6 Master Latency Timer (HECI1_MLT)—Offset Dh

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:24, F:0] + Dh

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO | **Master Latency Timer (MLT):** Not implemented, hardwired to 0. |

## 52.2.7 Header Type (HECI1_HTYPE)—Offset Eh

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:24, F:0] + Eh

**Default:** 80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x1<br>RO | **Multi-Function Device (MFD):** Indicates the HECI host controller is part of a multi- function device. |
| 6:0 | 0x0<br>RO | **Header Layout (HL):** Indicates that the HECI host controller uses a target device layout. |

## 52.2.8 Built In Self-Test (HECI1_BIST)—Offset Fh

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:24, F:0] + Fh

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RO | **BIST Capable (BC):** Not implemented, hardwired to 0. |
| 6:0 | 0x0<br>RO | **RSVD:** Reserved. |

## 52.2.9 HECI MMIO Base Address Low (HECI1_MMIO_MBAR_LO)—Offset 10h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:0] + 10h

**Default:** 00000004h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:12 | 0x0<br>RW | **Base Address Low (BA_LO):** Lower 32 bits of base address of register memory space. |
| 11:4 | 0x0<br>RO | **Memory Size (MS):** This field is hardwired to 0 to indicate that HECI device requests 4KB of memory space. |
| 3 | 0x0<br>RO | **Prefetchable (PF):** Indicates that this range is not pre-fetchable. |
| 2:1 | 0x2<br>RO | **Type (TP):** Indicates that this range can be mapped anywhere in 64-bit address space. |
| 0 | 0x0<br>RO | **Resource Type Indicator (RTE):** Indicates a request for register memory space. |

## 52.2.10 HECI MMIO Base Address High (HECI1_MMIO_MBAR_HI)—Offset 14h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:0] + 14h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Base Address High (BA_HI):** Upper 32 bits of base address of register memory space. |

## 52.2.11 Sub System Identifiers (HECI1_SS)—Offset 2Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:0] + 2Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW/O | **Subsystem ID (SSID):** Indicates the sub- system identifier.<br>This field should be programmed by BIOS during boot-up.<br>Once written, this register becomes Read Only. |
| 15:0 | 0x0<br>RW/O | **Subsystem Vendor ID (SSVID):** Indicates the sub-system vendor identifier.<br>This field should be programmed by BIOS during boot- up.<br>Once written, this register becomes Read Only. |

## 52.2.12 Capabilities Pointer (HECI1_CAP)—Offset 34h

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:24, F:0] + 34h

**Default:** 50h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x50<br>RO | **Capability Pointer (CP):** Indicates the first capability pointer offset.<br>It points to the PCI power management capability offset. |

## 52.2.13 Interrupt Information (HECI1_INTR)—Offset 3Ch

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:24, F:0] + 3Ch

**Default:** 0100h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x1<br>RO/V | **Interrupt Pin (IPIN):** This field indicates the virtual interrupt pin the HECI host controller uses.<br>A value of 0x1/0x2/0x3/0x4 indicates that this function implements legacy interrupt on INTA/INTB/INTC/INTD, respectively.<br>When legacy interrupt is not used this register should be set to 0x0. |
| 7:0 | 0x0<br>RW | **Interrupt Line (ILINE):** Software written value to indicate which interrupt line (vector) the interrupt is connected to.<br>No hardware action is taken on this field. |

## 52.2.14 Minimum Grant (HECI1_MGNT)—Offset 3Eh

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:24, F:0] + 3Eh

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO | **Grant (GNT):** Not implemented, hardwired to 0. |

## 52.2.15 Maximum Latency (HECI1_MLAT)—Offset 3Fh

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:24, F:0] + 3Fh

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO | **Latency (LAT):** Not implemented, hardwired to 0. |

## 52.2.16 Host Firmware Status (HECI1_HFS)—Offset 40h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:0] + 40h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0x0<br>RO | **BIOS MSG ACK:** Acknowledge for register based BIOS message in MEI 1 H_GS Register. |
| 27:25 | 0x0<br>RO | **BIOS MSG ACK Data:** Message specific data for acknowledged BIOS message. |
| 24:20 | 0x0<br>RO | Reserved |
| 19:16 | 0x0<br>RO | **Operating Mode:** This field describes the current operating mode of Intel® ME.<br>• 1:0 - Reserved<br>• 2 - Debug Mode<br>• 14:3 - Reserved<br>• 15 - Intel® SPS firmware is running in Intel® ME |
| 15:12 | 0x0<br>RO | **Error Code:** If set to nonzero value the Intel® ME firmware has encountered a fatal error and stopped normal operation.<br>• 0 - No Error<br>• 1 - Uncategorized Failure - The Intel® ME firmware has experienced an uncategorized error. Further details of the failure can be found in the Extended Status Data.<br>• 2 - Disabled - Firmware was disabled on this platform.<br>• 3 - Image Failure - The Intel® ME firmware stored in the system flash is not valid. |
| 11 | 0x0<br>RO | **Update in Progress:** The bit is set if any type of Intel® ME firmware update is in progress. |
| 10 | 0x0<br>RO | **Recovery BUP Load Fault:** This bit is set when firmware is not able to load recovery bring-up from the flash. It means that the recovery section in Intel® ME region on the SPI flash. |
| 9 | 0x0<br>RO | **Init Complete:** When this but is not set firmware is still in initialization phase. When firmware has fully entered a stable state, this but is set to 1 and "Current State" field of this register provides the steady state of the Intel® ME subsystem. |
| 8:6 | 0x0<br>RO | **Operating State:** This field describes the current operating state of Intel® ME.<br>• 000 - Preboot<br>• 001 - M0 with UMA<br>• 010 - Reserved<br>• 011 - Reserved<br>• 100 - M3 without UMA<br>• 101 - M0 without UMA - normal state for Intel® SPS firmware<br>• 110 - Bring up<br>• 111 - M0 without UMA but with error |
| 5 | 0x0<br>RO | **FPT or Factory Defaults Bad:** This bit is set when the firmware discovers a bad checksum of Intel® ME region Flash Partition Table (FPT) or Factory Defaults. When this bit set, it may or may not have the error code shown in bit [15:12]. The system can get this bit clear only by re-flashing the whole Intel® ME region in the SPI Flash. |
| 4 | 0x0<br>RO | **Manufacturing Mode:** When this bit is set, the platform is still in manufacturing mode. Host can use this bit to inform user that the platform is NOT READY for production yet. This but is set as long as Intel® ME Region access is not locked for flash masters other than Intel® ME. For shipping machine, this bit MUST be 0. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 3:0 | 0x0<br>RO | **Current State:** This field describes the current operation state of the firmware.<br>• 0 - Reset - Intel® ME is in reset state, will exit this state within 1 millisecond<br>• 1 - Initialization - Intel® ME is initializing, will exit this state within 2 seconds<br>• 2 - Recovery - Intel® ME is in recovery mode, check ME1.GMES register to determine cause<br>• 3 - Reserved<br>• 4 - Disabled - Intel® ME functionality has been disabled, it executes idle loop<br>• 5 - Operational - Intel® ME is in normal operational state<br>• 6 - Reserved<br>• 7 - State Transition - Intel® ME sets this state before starting a transition to a new Operating State.<br>It is a temporary state, may appear on transition between Initialization and Operational. |

## 52.2.17 Miscellaneous Shadow (HECI1_MISC_SHDW)—Offset 44h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:0] + 44h

**Default:** 80000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x1<br>RO | **Miscellaneous Shadow Valid (MSVLD):** This bit is hardwired to 1 to indicate that this HECI device implements the Miscellaneous Shadow register.<br>This bit can be used by host software that is bus/dev/function number agnostic (such as HECI operating system driver) to discover whether the Miscellaneous Shadow register is implemented or not. |
| 30:17 | 0x0<br>RO | **RSVD_30_17:** Reserved. |
| 16 | 0x0<br>RO/V | **CSE UMA Size Valid (CUSZV):** This bit indicates that FW has written the CUSZ field.<br>This field reflects the value of CSE CUBA.CUSZV. |
| 15:7 | 0x0<br>RO | **Reserved (RSVD_15_7):** Reserved. |
| 6:0 | 0x0<br>RO/V | **CSE UMA Size (CUSZ):** These bits reflect firmware's desired size of CSEUMA memory region.<br>It is configured by firmware prior to bring up core power and allowing BIOS to initialize memory.<br>The legal CSEUMA sizes and encodings for this field are:<br>• 0000000b (0MB, no CSEUMA region)<br>• 0000001b (1MB)<br>• 0000010b (2MB)<br>• 0000100b (4MB)<br>• 0001000b (8MB)<br>• 0010000b (16MB)<br>• 0100000b (32MB)<br>• 1000000b (64MB).<br>This field reflects the value of CSE CUBA.CUSZ. |

## 52.2.18 General Status Shadow 1 (HECI1_GS_SHDW1)—Offset 48h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:0] + 48h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **EOP Status:** This bit presents the Intel® ME notion of EOP status.<br>If BIOS encounters this bit set to '1' during POST it signals an error in platform power flow. |
| 30:28 | 0x0<br>RO | **Infrastructure Progress Code:** This field identifies the infrastructure progress code:<br>• 0 - ROM - Intel® ME is in ROM phase<br>• 1 - BUP - Intel® ME is in BRINGUP phase<br>• 2 - uKernel - Intel® ME is in Micro Kernel phase<br>• 3 - Policy Module - Intel® ME is in Policy Module phase<br>• 4 - Other Module - Intel® ME is loading modules in M0 or M3 Operating State |
| 27:16 | 0x0<br>RO | **Extended Status Data:** These bits provide extended status data for the current state of operating of the firmware. Or, if the firmware is in a fatal error state, these bits provide extended error code information. |
| 15:13 | 0x0<br>RO | **Firmware Heartbeat:** This number increments approximately every second if Intel® ME firmware is running. |
| 12 | 0x0<br>RO | Intel® ME Target Image Boot Fault<br>• 0 - Target image loaded successfully<br>• 1 - Target image boot failed, switched to backup image or recovery image |
| 11:8 | 0x0<br>RO | Reserved |
| 7 | 0x0<br>RO | **Warm Reset Request:** If this bit is set, Intel® ME informs BIOS that a warm reset is requested by Intel® ME. |
| 6 | 0x0<br>RO | **MFS Failure:** If this bit is set, Intel® ME informs BIOS that Intel® ME File System failure has been detected during recent Intel® ME boot. |
| 5:4 | 0x0<br>RO | Reserved |
| 3:1 | 0x0<br>RO | **Recovery Cause:** If ME1.HFS.Current State indicates that Intel® ME firmware is running in recovery mode these bits provide the cause of this mode:<br>• 0 - Intel® ME recovery jumper asserted<br>• 1 - Security strap override jumper asserted<br>• 2 - Recovery forced with IPMI command<br>• 3 - Invalid flash configuration, either:<br>  • flash master access permissions configuration is wrong<br>  • VSCC entry is missing or wrong<br>  • flash erase block size in Intel® ME region configuration<br>• 4 - Intel® ME internal error<br>  Intel® ME could not start in operational mode because of some firmware problems.<br>• 5..7 - Reserved for future extensions |
| 0 | 0x0<br>RO | **BIST in Progress:** If this bit is set Intel® ME Built In Self-Test is in Progress. |

## 52.2.19 Host General Status (HECI1_H_GS1)—Offset 4Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:0] + 4Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Host General Status (H_GS1):** General status of Host.<br>This field is not used by hardware. |

## 52.2.20 PCI Power Management Capability ID (HECI1_PID)—Offset 50h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:24, F:0] + 50h

**Default:** 8C01h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x8c<br>RO | **Next Capability (NEXT):** Indicates the location of the next capability item in the list.<br>This is the Message Signaled Interrupts capability. |
| 7:0 | 0x1<br>RO | **Cap ID (CID):** Indicates that this pointer is a PCI power management. |

## 52.2.21 PCI Power Management Capabilities (HECI1_PC)—Offset 52h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:24, F:0] + 52h

**Default:** 4003h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:11 | 0x8<br>RO | **PME Support (PSUP):** Indicates the states that can generate PME#.<br>HECI can assert PME# from D3hot only. |
| 10 | 0x0<br>RO | **D2 Support (D2S):** The D2 state is not supported for the HECI host controller. |
| 9 | 0x0<br>RO | **D _Support (D1S):** The D1 state is not supported for the HECI host controller. |
| 8:6 | 0x0<br>RO | **Aux_Current (AUXC):** Reports the maximum Suspend well current required when in the D3COLD state. Value of 0 is reported. |
| 5 | 0x0<br>RO | **Device Specific Initialization (DSI):** Indicates whether device-specific initialization is required. |
| 4 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 3 | 0x0<br>RO | **PME Clock (PMEC):** Indicates that PCI clock is not required to generate PME#. |
| 2:0 | 0x3<br>RO | **Version (VS):** Indicates support for Revision 1.2 of the PCI Power Management Specification. |

## 52.2.22 PCI Power Management Control and Status (HECI1_PMCS)—Offset 54h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:24, F:0] + 54h

**Default:** 0008h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RW/1C/V | **PME Status (PMES):** The PME Status bit in HECI space can be set to '1' by CSE FW performing a write into CSE side register to set PMES.<br>This bit is cleared by host CPU writing a '1' to it.<br>CSE cannot clear this bit.<br>Host CPU writes with value '0' have no effect on this bit. |
| 14:9 | 0x0<br>RO | **Reserved (RSVD_14_9):** Reserved. |
| 8 | 0x0<br>RW | **PME Enable (PMEE):** When set, PME_assert and PME_deassert messages are sent over Sideband to PMC based on the PMES bit.<br>When reset these messages may not be sent. |
| 7:4 | 0x0<br>RO | **Reserved (RSVD_7_4):** Reserved. |
| 3 | 0x1<br>RO | **No Soft Reset (NSR):** This bit indicates that when the HECI host controller is transitioning from D3hot to D0 due to power state command, it does not perform and internal reset. |
| 2 | 0x0<br>RO | **Reserved (RSVD_2_2):** Reserved. |
| 1:0 | 0x0<br>RW | **Power State (PS):** This field is used both to determine the current power state of the HECI host controller and to set a new power state. The values are:<br>• 00 - D0 state<br>• 11 - D3HOT state.<br>The D1 and D2 states are not supported for this HECI host controller.<br>If software attempts to write an unsupported, optional state to this field, the write operation must complete normally on the bus; however, the data is discarded and no state change occurs.<br>When in the D3HOT state, the HBA's configuration space is available, but the registers memory space is not.<br>Additionally, interrupts are blocked.<br>This field is visible to firmware through the H_PCI_CSR register, and changes to this field may be configured by the H_PCI_CSR register to generate an MSI to mIA. |

## 52.2.23 General Status Shadow 2 (HECI1_GS_SHDW2)—Offset 60h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:0] + 60h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **General Status Shadow 2 (GSS2):** This field is host side shadow of CSE General Status 2 (CSE_GS2). |

## 52.2.24 General Status Shadow 3 (HECI1_GS_SHDW3)—Offset 64h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:0] + 64h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **General Status Shadow 3 (GSS3):** This field is host side shadow of CSE General Status 3 (CSE_GS3). |

## 52.2.25 General Status Shadow 4 (HECI1_GS_SHDW4)—Offset 68h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:0] + 68h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **General Status Shadow 4 (GSS4):** This field is host side shadow of CSE General Status 4 (CSE_GS4). |

## 52.2.26 General Status Shadow 5 (HECI1_GS_SHDW5)—Offset 6Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:0] + 6Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **General Status Shadow 5 (GSS5):** This field is host side shadow of CSE General Status 5 (CSE_GS5). |

## 52.2.27 Host General Status 2 (HECI1_H_GS2)—Offset 70h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:0] + 70h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Host General Status 2 (H_GS2):** General status of Host.<br>This field is not used by hardware. |

## 52.2.28 Host General Status 3 (HECI1_H_GS3)—Offset 74h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:0] + 74h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Host General Status 3 (H_GS3):** General status of Host.<br>This field is not used by hardware. |

## 52.2.29 Message Signaled Interrupt Identifiers (HECI1_MID)—Offset 8Ch

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:24, F:0] + 8Ch

**Default:** 0005h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x0<br>RO | **Next Pointer (NEXT):** Indicates the next item in the list.<br>This can be other capability pointers (such as PCI-X or PCI- Express) or it can be the last item in the list. |
| 7:0 | 0x5<br>RO | **Capability ID (CID):** Indicates MSI. |

## 52.2.30 Message Signaled Interrupt Message Control (HECI1_MC)—Offset 8Eh

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:24, F:0] + 8Eh

**Default:** 0080h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 7 | 0x1<br>RO | **64 Bit Address Capable (C64):** Specifies whether capable of generating 64-bit messages. |
| 6:4 | 0x0<br>RO | **Multiple Message Enable (MME):** Not implemented, hardwired to 0. |
| 3:1 | 0x0<br>RO | **Multiple Message Capable (MMC):** Not implemented, hardwired to 0. |
| 0 | 0x0<br>RW | **MSI Enable (MSIE):** If set, MSI is enabled and INTx virtual wires are not used to generate interrupts. |

### 52.2.31 Message Signaled Interrupt Message Address (HECI1_MA)—Offset 90h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:0] + 90h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:2 | 0x0<br>RW | **Address (ADDR):** Lower 32 bits of the system specified message address, always DW aligned. |
| 1:0 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |

### 52.2.32 Message Signaled Interrupt Upper Address (HECI1_MUA)—Offset 94h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:0] + 94h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Upper Address (UADDR):** Upper 32 bits of the system specified message address.<br>This register is optional and only implemented if MC.C64=1. |

### 52.2.33 Message Signaled Interrupt Message Data (HECI1_MD)—Offset 98h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:24, F:0] + 98h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0x0<br>RW | **Data (DATA):** This 16-bit field is programmed by system software if MSI is enabled.<br>Its content is driven onto the FSB during the data phase of the MSI memory write transaction. |

## 52.2.34 HECI Interrupt Delivery Mode (HECI1_HIDM)—Offset A0h

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:24, F:0] + A0h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:3 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 2 | 0x0<br>RW/1S | **HIDM Lock (HIDM_L):** Writing 1 to this bit locks the HIDM field. |
| 1:0 | 0x0<br>RW/L | **HECI Interrupt Delivery Mode (HIDM):** These bits control what type of interrupt the HECI will send when CSE FW writes to set the CSE_IG bit.<br>They are interpreted as follows:<br>• 00 - Generate Legacy or MSI interrupt;<br>• 01 - Generate SCI;<br>• 10 - Generate SMI;<br>This field may be locked by writing 1 to HIDM_L bit. |

## 52.2.35 Host Extend Register Status (HECI1_HERS)—Offset BCh

This register is used to communicate the CSE FW measurement status information to host.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:0] + BCh

**Default:** 40000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO/V | **Extend Register Valid (ERV):** Set by FW after all FW has been loaded and the measurement data has been stored in HERx registers.<br>If ERA field is SHA-1, the result of the extend operation is in HER:5-1.<br>If ERA field is SHA-256, the result is in HER:8-1. |
| 30 | 0x1<br>RO | **Extend Feature Present (EFP):** This bit is hardwired to 1 to allow driver software to easily detect the chipset supports the Extend Registers FW measurement feature. |
| 29:4 | 0x0<br>RO | **Reserved (RSVD_29_4):** Reserved. |
| 3:0 | 0x0<br>RO/V | **Extend Register Algorithm (ERA):** This field indicates the hash algorithm used in the FW measurement Extend operation.<br>Encodings are:<br>0x0: SHA-1,<br>0x2: SHA-256.<br>Other values: reserved.<br>This field is set by FW with the used hash algorithm value when the ERV bit is set to 1.<br>This field is meaningless when the ERV bit is 0.<br>This field does NOT have any defined reset value. |

## 52.2.36 Host Extend Register DW1. (HECI1_HER1)—Offset C0h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:0] + C0h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **Host Extend Register DW1 (ERDW1):** Reserved. |

## 52.2.37 Host Extend Register DW2. (HECI1_HER2)—Offset C4h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:0] + C4h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **Host Extend Register DW2 (ERDW2):** Reserved. |

## 52.2.38 Host Extend Register DW3. (HECI1_HER3)—Offset C8h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:0] + C8h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **Host Extend Register DW3 (ERDW3):** Reserved. |

## 52.2.39 Host Extend Register DW4. (HECI1_HER4)—Offset CCh

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:0] + CCh

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **Host Extend Register DW4 (ERDW4):** Reserved. |

## 52.2.40 Host Extend Register DW5. (HECI1_HER5)—Offset D0h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:0] + D0h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **Host Extend Register DW5 (ERDW5):** Reserved. |

## 52.2.41 Host Extend Register DW6. (HECI1_HER6)—Offset D4h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:0] + D4h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **Host Extend Register DW6 (ERDW6):** Reserved. |

## 52.2.42 Host Extend Register DW7. (HECI1_HER7)—Offset D8h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:0] + D8h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **Host Extend Register DW7 (ERDW7):** Reserved. |

## 52.2.43 Host Extend Register DW8. (HECI1_HER8)—Offset DCh

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:0] + DCh

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **Host Extend Register DW8 (ERDW8):** Reserved. |

## 52.2.44 Manufacturer's ID (HECI1_MANID)—Offset F8h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:0] + F8h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0x0<br>RO | **Reserved (RSVD_31_28):** Reserved. |
| 27:24 | 0x0<br>RO/V | **Dot Portion of Process ID (DPOP):** Indicates the dot process. |
| 23:16 | 0x0<br>RO/V | **Manufacturing Stepping ID (MSID):** This field is incremented for each stepping of the part. Note that this field can be used by software to differentiate steppings when Revision ID may not change. |
| 15:8 | 0x0<br>RO/V | **Manufacturing ID (MID):** Set by Intel. |
| 7:0 | 0x0<br>RO/V | **Process Portion of Process ID (PPOP):** Indicates the process. The dot portion of the process is reflected in bits [27:24]. Note that this field can be used by software to differentiate steppings when Revision ID may not change. |

## 52.3 Registers in Configuration Space—HECI2

**AR Author and Tech Comm:** HIDE this sub-chapter if the device has no such registers.

### 52.3.1 Identifiers (HECI2_ID)—Offset 0h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:1] + 0h

**Default:** 19D48086h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x19d4<br>RO/V | **Device ID (DID):** Indicates what device number assigned by Intel. |
| 15:0 | 0x8086<br>RO | **Vendor ID (VID):** 16-bit field which indicates Intel is the vendor, assigned by the PCI SIG. |

### 52.3.2 Command (HECI2_CMD)—Offset 4h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:24, F:1] + 4h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:11 | 0x0<br>RO | **RSVD:** Reserved |
| 10 | 0x0<br>RW | **Interrupt Disable (ID):** Disables this device from generating PCI line based interrupts.<br>This bit does not have any effect on MSI operation. |
| 9 | 0x0<br>RO | **Fast Back-to-Back Enable (FBE):** Not implemented, hardwired to 0. |
| 8 | 0x0<br>RO | **SERR# Enable (SEE):** Not implemented, hardwired to 0. |
| 7 | 0x0<br>RO | **Wait Cycle Enable (WCC):** Not implemented, hardwired to 0. |
| 6 | 0x0<br>RO | **Parity Error Response Enable (PEE):** Not implemented, hardwired to 0. |
| 5 | 0x0<br>RO | **VGA Palette Snooping Enable (VAG):** Not implemented, hardwired to 0 |
| 4 | 0x0<br>RO | **Memory Write and Invalidate Enable (MWIE):** Not implemented, hardwired to 0. |
| 3 | 0x0<br>RO | **Special Cycle Enable (SCE):** Not implemented, hardwired to 0. |
| 2 | 0x0<br>RW | **Bus Master Enable (BME):** Controls the HECI host controller's ability to act as a system memory master for data transfers. When this bit is cleared, HECI bus master activity stops and any active DMA engines return to an idle condition.<br>This bit is made visible to firmware through the H_PCI_CSR register, and changes to this bit may be configured by the H_PCI_CSR register to generate an MSI to mIA.<br>When this bit is '0', HECI is blocked from generating MSI to the host CPU. Note that this bit does not block HECI accesses to CSE-UMA |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 1 | 0x0<br>RW | **Memory Space Enable (MSE):** Controls access to the HECI host controllers memory mapped register space. |
| 0 | 0x0<br>RO | **I/O Space Enable (IOSE):** Not implemented, hardwired to 0. |

### 52.3.3 Status (HECI2_STS)—Offset 6h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:24, F:1] + 6h

**Default:** 0010h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RO | **Detected Parity Error (DPE):** Not implemented, hardwired to 0. |
| 14 | 0x0<br>RO | **Signaled System Error (SSE):** Not implemented, hardwired to 0. |
| 13 | 0x0<br>RO | **Received Master-Abort (RMA):** Not implemented, hardwired to 0. |
| 12 | 0x0<br>RO | **Received Target Abort (RTA):** Not implemented, hardwired to 0. |
| 11 | 0x0<br>RO | **Signaled Target-Abort (STA):** Not implemented, hardwired to 0. |
| 10:9 | 0x0<br>RO | **DEVSEL# Timing (DEVT):** These bits are hardwired to 00. |
| 8 | 0x0<br>RO | **Master Data Pariy Error Detected (DPD):** Not implemented, hardwired to 0. |
| 7 | 0x0<br>RO | **Fast Back-to-Back Capable (FBC):** Not implemented, hardwired to 0. |
| 6 | 0x0<br>RO | **RSVD (RSVD_6_6):** Reserved |
| 5 | 0x0<br>RO | **66 MHz Capable (C66):** Not implemented, hardwired to 0. |
| 4 | 0x1<br>RO | **Capabilities List (CL):** Indicates the presence of a capabilities list, hardwired to 1. |
| 3 | 0x0<br>RO/V | **Interrupt Status (IS):** Reflects the state of the INTx# signal at the input of the enable/disable circuit.<br>This bit is a 1 when the INTx# is asserted.<br>This bit is a 0 after the interrupt is cleared (independent of the state of the Interrupt Disable bit in the command register).<br>***Note:*** This bit is not set by an MSI. |
| 2:0 | 0x0<br>RO | **RSVD (RSVD_2_0):** Reserved |

## 52.3.4 Revision ID and Class Code (HECI2_RID_CC)—Offset 8h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:1] + 8h

**Default:** 07800000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x7<br>RO | **Base Class Code (BCC):** Indicates the base class code of the HECI host controller device. |
| 23:16 | 0x80<br>RO | **Sub Class Code (SCC):** Indicates the sub class code of the HECI host controller device. |
| 15:8 | 0x0<br>RO | **Programming Interface (PI):** Indicates the programming interface of the HECI host controller device. |
| 7:0 | 0x0<br>RO/V | **Revision ID (RID):** Indicates stepping of the HECI host controller. |

## 52.3.5 Cache Line Size (HECI2_CLS)—Offset Ch

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:24, F:1] + Ch

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO | **Cache Line Size (CLS):** Not implemented, hardwired to 0. |

## 52.3.6 Master Latency Timer (HECI2_MLT)—Offset Dh

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:24, F:1] + Dh

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO | **Master Latency Timer (MLT):** Not implemented, hardwired to 0. |

## 52.3.7 Header Type (HECI2_HTYPE)—Offset Eh

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:24, F:1] + Eh

**Default:** 80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x1<br>RO | **Multi-Function Device (MFD):** Indicates the HECI host controller is part of a multi- function device. |
| 6:0 | 0x0<br>RO | **Header Layout (HL):** Indicates that the HECI host controller uses a target device layout. |

## 52.3.8 Built In Self-Test (HECI2_BIST)—Offset Fh

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:24, F:1] + Fh

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RO | **BIST Capable (BC):** Not implemented, hardwired to 0. |
| 6:0 | 0x0<br>RO | **RSVD:** Reserved |

## 52.3.9 HECI MMIO Base Address Low (HECI2_MMIO_MBAR_LO)—Offset 10h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:1] + 10h

**Default:** 00000004h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:12 | 0x0<br>RW | **Base Address Low (BA_LO):** Lower 32 bits of base address of register memory space. |
| 11:4 | 0x0<br>RO | **Memory Size (MS):** This field is hardwired to 0 to indicate that HECI device requests 4KB of memory space. |
| 3 | 0x0<br>RO | **Prefetchable (PF):** Indicates that this range is not pre-fetchable |
| 2:1 | 0x2<br>RO | **Type (TP):** Indicates that this range can be mapped anywhere in 64-bit address space. |
| 0 | 0x0<br>RO | **Resource Type Indicator (RTE):** Indicates a request for register memory space. |

## 52.3.10 HECI MMIO Base Address High (HECI2_MMIO_MBAR_HI)—Offset 14h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:1] + 14h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Base Address High (BA_HI):** Upper 32 bits of base address of register memory space. |

## 52.3.11 Sub System Identifiers (HECI2_SS)—Offset 2Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:1] + 2Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW/O | **Subsystem ID (SSID):** Indicates the sub- system identifier.<br>This field should be programmed by BIOS during boot-up.<br>Once written, this register becomes Read Only. |
| 15:0 | 0x0<br>RW/O | **Subsystem Vendor ID (SSVID):** Indicates the sub-system vendor identifier.<br>This field should be programmed by BIOS during boot- up.<br>Once written, this register becomes Read Only. |

## 52.3.12 Capabilities Pointer (HECI2_CAP)—Offset 34h

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:24, F:1] + 34h

**Default:** 50h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x50<br>RO | **Capability Pointer (CP):** Indicates the first capability pointer offset.<br>It points to the PCI power management capability offset. |

## 52.3.13 Interrupt Information (HECI2_INTR)—Offset 3Ch

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:24, F:1] + 3Ch

**Default:** 0100h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x1<br>RO/V | **Interrupt Pin (IPIN):** This field indicates the virtual interrupt pin the HECI host controller uses.<br>A value of 0x1/0x2/0x3/0x4 indicates that this function implements legacy interrupt on INTA/INTB/INTC/INTD, respectively.<br>When legacy interrupt is not used this register should be set to 0x0. |
| 7:0 | 0x0<br>RW | **Interrupt Line (ILINE):** Software written value to indicate which interrupt line (vector) the interrupt is connected to.<br>No hardware action is taken on this field. |

## 52.3.14 Minimum Grant (HECI2_MGNT)—Offset 3Eh

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:24, F:1] + 3Eh

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO | **Grant (GNT):** Not implemented, hardwired to 0. |

## 52.3.15 Maximum Latency (HECI2_MLAT)—Offset 3Fh

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:24, F:1] + 3Fh

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO | **Latency (LAT):** Not implemented, hardwired to 0. |

## 52.3.16 Host Firmware Status (HECI2_HFS)—Offset 40h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:1] + 40h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0x0<br>RO | **BIOS MSG ACK:** Acknowledge for register based BIOS message in MEI 1 H_GS Register. |
| 27:25 | 0x0<br>RO | **BIOS MSG ACK Data:** Message specific data for acknowledged BIOS message. |
| 24:20 | 0x0<br>RO | Reserved |
| 19:16 | 0x0<br>RO | **Operating Mode:** This field describes the current operating mode of Intel® ME.<br>• 1:0 - Reserved<br>• 2 - Debug Mode<br>• 14:3 - Reserved<br>• 15 - Intel® SPS firmware is running in Intel® ME |
| 15:12 | 0x0<br>RO | **Error Code:** If set to nonzero value the Intel® ME firmware has encountered a fatal error and stopped normal operation.<br>• 0 - No Error<br>• 1 - Uncategorized Failure - The Intel® ME firmware has experienced an uncategorized error. Further details of the failure can be found in the Extended Status Data.<br>• 2 - Disabled - Firmware was disabled on this platform.<br>• 3 - Image Failure - The Intel® ME firmware stored in the system flash is not valid. |
| 11 | 0x0<br>RO | **Update in Progress:** The bit is set if any type of Intel® ME firmware update is in progress. |
| 10 | 0x0<br>RO | **Recovery BUP Load Fault:** This bit is set when firmware is not able to load recovery bring-up from the flash. It means that the recovery section in Intel® ME region on the SPI flash. |
| 9 | 0x0<br>RO | **Init Complete:** When this but is not set firmware is still in initialization phase. When firmware has fully entered a stable state, this but is set to 1 and "Current State" field of this register provides the steady state of the Intel® ME subsystem. |
| 8:6 | 0x0<br>RO | **Operating State:** This field describes the current operating state of Intel® ME.<br>• 000 - Preboot<br>• 001 - M0 with UMA<br>• 010 - Reserved<br>• 011 - Reserved<br>• 100 - M3 without UMA<br>• 101 - M0 without UMA - normal state for Intel® SPS firmware<br>• 110 - Bring up<br>• 111 - M0 without UMA but with error |
| 5 | 0x0<br>RO | **FPT or Factory Defaults Bad:** This bit is set when the firmware discovers a bad checksum of Intel® ME region Flash Partition Table (FPT) or Factory Defaults. When this bit set, it may or may not have the error code shown in bit [15:12]. The system can get this bit clear only by re-flashing the whole Intel® ME region in the SPI Flash. |
| 4 | 0x0<br>RO | **Manufacturing Mode:** When this bit is set, the platform is still in manufacturing mode. Host can use this bit to inform user that the platform is NOT READY for production yet. This but is set as long as Intel® ME Region access is not locked for flash masters other than Intel® ME. For shipping machine, this bit MUST be 0. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 3:0 | 0x0<br>RO | **Current State:** This field describes the current operation state of the firmware.<br>• 0 - Reset - Intel® ME is in reset state, will exit this state within 1 millisecond<br>• 1 - Initialization - Intel® ME is initializing, will exit this state within 2 seconds<br>• 2 - Recovery - Intel® ME is in recovery mode, check ME1.GMES register to determine cause<br>• 3 - Reserved<br>• 4 - Disabled - Intel® ME functionality has been disabled, it executes idle loop<br>• 5 - Operational - Intel® ME is in normal operational state<br>• 6 - Reserved<br>• 7 - State Transition - Intel® ME sets this state before starting a transition to a new Operating State.<br>It is a temporary state, may appear on transition between Initialization and Operational. |

## 52.3.17 General Status Shadow 1 (HECI2_GS_SHDW1)—Offset 48h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:1] + 48h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **EOP Status:** This bit presents the Intel® ME notion of EOP status.<br>If BIOS encounters this bit set to '1' during POST it signals an error in platform power flow. |
| 30:28 | 0x0<br>RO | **Infrastructure Progress Code:** This field identifies the infrastructure progress code:<br>• 0 - ROM - Intel® ME is in ROM phase<br>• 1 - BUP - Intel® ME is in BRINGUP phase<br>• 2 - uKernel - Intel® ME is in Micro Kernel phase<br>• 3 - Policy Module - Intel® ME is in Policy Module phase<br>• 4 - Other Module - Intel® ME is loading modules in M0 or M3 Operating State |
| 27:16 | 0x0<br>RO | **Extended Status Data:** These bits provide extended status data for the current state of operating of the firmware. Or, if the firmware is in a fatal error state, these bits provide extended error code information. |
| 15:13 | 0x0<br>RO | **Firmware Heartbeat:** This number increments approximately every second if Intel® ME firmware is running. |
| 12 | 0x0<br>RO | Intel® ME Target Image Boot Fault<br>• 0 - Target image loaded successfully<br>• 1 - Target image boot failed, switched to backup image or recovery image |
| 11:8 | 0x0<br>RO | Reserved |
| 7 | 0x0<br>RO | **Warm Reset Request:** If this bit is set, Intel® ME informs BIOS that a warm reset is requested by Intel® ME. |
| 6 | 0x0<br>RO | **MFS Failure:** If this bit is set, Intel® ME informs BIOS that Intel® ME File System failure has been detected during recent Intel® ME boot. |
| 5:4 | 0x0<br>RO | Reserved |
| 3:1 | 0x0<br>RO | **Recovery Cause:** If ME1.HFS.Current State indicates that Intel® ME firmware is running in recovery mode these bits provide the cause of this mode:<br>• 0 - Intel® ME recovery jumper asserted<br>• 1 - Security strap override jumper asserted<br>• 2 - Recovery forced with IPMI command<br>• 3 - Invalid flash configuration, either:<br>  • flash master access permissions configuration is wrong<br>  • VSCC entry is missing or wrong<br>  • flash erase block size in Intel® ME region configuration<br>• 4 - Intel® ME internal error<br>  Intel® ME could not start in operational mode because of some firmware problems.<br>• 5..7 - Reserved for future extensions |
| 0 | 0x0<br>RO | **BIST in Progress:** If this bit is set Intel® ME Built In Self-Test is in Progress. |

## 52.3.18 Host General Status (HECI2_H_GS1)—Offset 4Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:1] + 4Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Host General Status (H_GS1):** General status of Host. This field is not used by hardware. |

## 52.3.19 PCI Power Management Capability ID (HECI2_PID)—Offset 50h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:24, F:1] + 50h

**Default:** 8C01h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x8c<br>RO | **Next Capability (NEXT):** Indicates the location of the next capability item in the list. This is the Message Signaled Interrupts capability. |
| 7:0 | 0x1<br>RO | **Cap ID (CID):** Indicates that this pointer is a PCI power management. |

## 52.3.20 PCI Power Management Capabilities (HECI2_PC)—Offset 52h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:24, F:1] + 52h

**Default:** 4003h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:11 | 0x8<br>RO | **PME Support (PSUP):** Indicates the states that can generate PME#.<br>HECI can assert PME# from D3hot only. |
| 10 | 0x0<br>RO | **D2 Support (D2S):** The D2 state is not supported for the HECI host controller. |
| 9 | 0x0<br>RO | **D _Support (D1S):** The D1 state is not supported for the HECI host controller. |
| 8:6 | 0x0<br>RO | **Aux_Current (AUXC):** Reports the maximum Suspend well current required when in the D3COLD state. Value of 0 is reported. |
| 5 | 0x0<br>RO | **Device Specific Initialization (DSI):** Indicates whether device-specific initialization is required. |
| 4 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 3 | 0x0<br>RO | **PME Clock (PMEC):** Indicates that PCI clock is not required to generate PME#. |
| 2:0 | 0x3<br>RO | **Version (VS):** Indicates support for Revision 1.2 of the PCI Power Management Specification. |

## 52.3.21 PCI Power Management Control and Status (HECI2_PMCS)—Offset 54h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:24, F:1] + 54h

**Default:** 0008h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RW/1C/V | **PME Status (PMES):** The PME Status bit in HECI space can be set to '1' by CSE FW performing a write into CSE side register to set PMES.<br>This bit is cleared by host CPU writing a '1' to it. CSE cannot clear this bit.<br>Host CPU writes with value '0' have no effect on this bit. |
| 14:9 | 0x0<br>RO | **Reserved (RSVD_14_9):** Reserved. |
| 8 | 0x0<br>RW | **PME Enable (PMEE):** When set, PME_assert and PME_deassert messages are sent over Sideband to PMC based on the PMES bit.<br>When reset these messages may not be sent. |
| 7:4 | 0x0<br>RO | **Reserved (RSVD_7_4):** Reserved. |
| 3 | 0x1<br>RO | **No Soft Reset (NSR):** This bit indicates that when the HECI host controller is transitioning from D3hot to D0 due to power state command, it does not perform and internal reset. |
| 2 | 0x0<br>RO | **Reserved (RSVD_2_2):** Reserved. |
| 1:0 | 0x0<br>RW | **Power State (PS):** This field is used both to determine the current power state of the HECI host controller and to set a new power state.<br>The values are:<br>• 00 - D0 state<br>• 11 - D3HOT state.<br>The D1 and D2 states are not supported for this HECI host controller. |

## 52.3.22 General Status Shadow 2 (HECI2_GS_SHDW2)—Offset 60h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:1] + 60h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **General Status Shadow 2 (GSS2):** This field is host side shadow of CSE General Status 2 (CSE_GS2). |

## 52.3.23 General Status Shadow 3 (HECI2_GS_SHDW3)—Offset 64h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:1] + 64h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **General Status Shadow 3 (GSS3):** This field is host side shadow of CSE General Status 3 (CSE_GS3). |

## 52.3.24 General Status Shadow 4 (HECI2_GS_SHDW4)—Offset 68h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:1] + 68h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **General Status Shadow 4 (GSS4):** This field is host side shadow of CSE General Status 4 (CSE_GS4). |

## 52.3.25 General Status Shadow 5 (HECI2_GS_SHDW5)—Offset 6Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:1] + 6Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **General Status Shadow 5 (GSS5):** This field is host side shadow of CSE General Status 5 (CSE_GS5). |

## 52.3.26 Host General Status 2 (HECI2_H_GS2)—Offset 70h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:1] + 70h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Host General Status 2 (H_GS2):** General status of Host.<br>This field is not used by hardware. |

## 52.3.27 Host General Status 3 (HECI2_H_GS3)—Offset 74h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:1] + 74h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Host General Status 3 (H_GS3):** General status of Host.<br>This field is not used by hardware. |

## 52.3.28 Message Signaled Interrupt Identifiers (HECI2_MID)—Offset 8Ch

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:24, F:1] + 8Ch

**Default:** 0005h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x0<br>RO | **Next Pointer (NEXT):** Indicates the next item in the list.<br>This can be other capability pointers (such as PCI-X or PCI- Express) or it can be the last item in the list. |
| 7:0 | 0x5<br>RO | **Capability ID (CID):** Indicates MSI. |

## 52.3.29 Message Signaled Interrupt Message Control (HECI2_MC)—Offset 8Eh

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:24, F:1] + 8Eh

**Default:** 0080h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 7 | 0x1<br>RO | **64 Bit Address Capable (C64):** Specifies whether capable of generating 64-bit messages. |
| 6:4 | 0x0<br>RO | **Multiple Message Enable (MME):** Not implemented, hardwired to 0. |
| 3:1 | 0x0<br>RO | **Multiple Message Capable (MMC):** Not implemented, hardwired to 0. |
| 0 | 0x0<br>RW | **MSI Enable (MSIE):** If set, MSI is enabled and INTx virtual wires are not used to generate interrupts. |

## 52.3.30 Message Signaled Interrupt Message Address (HECI2_MA)—Offset 90h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:1] + 90h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:2 | 0x0<br>RW | **Address (ADDR):** Lower 32 bits of the system specified message address, always DW aligned. |
| 1:0 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |

## 52.3.31 Message Signaled Interrupt Upper Address (HECI2_MUA)—Offset 94h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:1] + 94h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Upper Address (UADDR):** Upper 32 bits of the system specified message address.<br>This register is optional and only implemented if MC.C64=1. |

## 52.3.32 Message Signaled Interrupt Message Data (HECI2_MD)—Offset 98h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:24, F:1] + 98h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0x0<br>RW | **Data (DATA):** This 16-bit field is programmed by system software if MSI is enabled.<br>Its content is driven onto the FSB during the data phase of the MSI memory write transaction. |

## 52.3.33 HECI Interrupt Delivery Mode (HECI2_HIDM)—Offset A0h

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:24, F:1] + A0h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:3 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 2 | 0x0<br>RW/1S | **HIDM Lock (HIDM_L):** Writing 1 to this bit locks the HIDM field. |
| 1:0 | 0x0<br>RW/L | **HECI Interrupt Delivery Mode (HIDM):** These bits control what type of interrupt the HECI will send when CSE FW writes to set the CSE_IG bit.<br>They are interpreted as follows:<br>• 00 - Generate Legacy or MSI interrupt;<br>• 01 - Generate SCI;<br>• 10 - Generate SMI;<br>This field may be locked by writing 1 to HIDM_L bit. |

## 52.3.34 Manufacturer's ID (HECI2_MANID)—Offset F8h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:1] + F8h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0x0<br>RO | **Reserved (RSVD_31_28):** Reserved. |
| 27:24 | 0x0<br>RO/V | **Dot Portion of Process ID (DPOP):** Indicates the dot process. |
| 23:16 | 0x0<br>RO/V | **Manufacturing Stepping ID (MSID):** This field is incremented for each stepping of the part.<br>***Note:*** This field can be used by software to differentiate steppings when Revision ID may not change. |
| 15:8 | 0x0<br>RO/V | **Manufacturing ID (MID):** This field is set by Intel. |
| 7:0 | 0x0<br>RO/V | **Process Portion of Process ID (PPOP):** Indicates the process.<br>The dot portion of the process is reflected in bits [27:24].<br>***Note:*** This field can be used by software to differentiate steppings when Revision ID may not change. |

## 52.4 Registers in Configuration Space—HECI3

### 52.4.1 Identifiers (HECI3_ID)—Offset 0h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:4] + 0h

**Default:** 19D68086h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x19d6<br>RO/V | **Device ID (DID):** Indicates what device number assigned by Intel. |
| 15:0 | 0x8086<br>RO | **Vendor ID (VID):** 16-bit field which indicates Intel is the vendor, assigned by the PCI SIG. |

## 52.4.2 Command (HECI3_CMD)—Offset 4h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:24, F:4] + 4h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:11 | 0x0<br>RO | **RSVD:** Reserved |
| 10 | 0x0<br>RW | **Interrupt Disable (ID):** Disables this device from generating PCI line based interrupts.<br>This bit does not have any effect on MSI operation. |
| 9 | 0x0<br>RO | **Fast Back-to-Back Enable (FBE):** Not implemented, hardwired to 0. |
| 8 | 0x0<br>RO | **SERR# Enable (SEE):** Not implemented, hardwired to 0. |
| 7 | 0x0<br>RO | **Wait Cycle Enable (WCC):** Not implemented, hardwired to 0. |
| 6 | 0x0<br>RO | **Parity Error Response Enable (PEE):** Not implemented, hardwired to 0. |
| 5 | 0x0<br>RO | **VGA Palette Snooping Enable (VAG):** Not implemented, hardwired to 0 |
| 4 | 0x0<br>RO | **Memory Write and Invalidate Enable (MWIE):** Not implemented, hardwired to 0. |
| 3 | 0x0<br>RO | **Special Cycle Enable (SCE):** Not implemented, hardwired to 0. |
| 2 | 0x0<br>RW | **Bus Master Enable (BME):** Controls the HECI host controller's ability to act as a system memory master for data transfers.<br>When this bit is cleared, HECI bus master activity stops and any active DMA engines return to an idle condition.<br>This bit is made visible to firmware through the H_PCI_CSR register, and changes to this bit may be configured by the H_PCI_CSR register to generate an MSI to mIA.<br>When this bit is '0', HECI is blocked from generating MSI to the host CPU.<br>***Note:*** This bit does not block HECI accesses to CSE-UMA |
| 1 | 0x0<br>RW | **Memory Space Enable (MSE):** Controls access to the HECI host controllers memory mapped register space. |
| 0 | 0x0<br>RO | **I/O Space Enable (IOSE):** Not implemented, hardwired to 0. |

## 52.4.3 Status (HECI3_STS)—Offset 6h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:24, F:4] + 6h

**Default:** 0010h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RO | **Detected Parity Error (DPE):** Not implemented, hardwired to 0. |
| 14 | 0x0<br>RO | **Signaled System Error (SSE):** Not implemented, hardwired to 0. |
| 13 | 0x0<br>RO | **Received Master-Abort (RMA):** Not implemented, hardwired to 0. |
| 12 | 0x0<br>RO | **Received Target Abort (RTA):** Not implemented, hardwired to 0. |
| 11 | 0x0<br>RO | **Signaled Target-Abort (STA):** Not implemented, hardwired to 0. |
| 10:9 | 0x0<br>RO | **DEVSEL# Timing (DEVT):** These bits are hardwired to 00. |
| 8 | 0x0<br>RO | **Master Data Parity Error Detected (DPD):** Not implemented, hardwired to 0. |
| 7 | 0x0<br>RO | **Fast Back-to-Back Capable (FBC):** Not implemented, hardwired to 0. |
| 6 | 0x0<br>RO | **RSVD (RSVD_6_6):** Reserved |
| 5 | 0x0<br>RO | **66 MHz Capable (C66):** Not implemented, hardwired to 0. |
| 4 | 0x1<br>RO | **Capabilities List (CL):** Indicates the presence of a capabilities list, hardwired to 1. |
| 3 | 0x0<br>RO/V | **Interrupt Status (IS):** Reflects the state of the INTx# signal at the input of the enable/disable circuit.<br>This bit is a 1 when the INTx# is asserted.<br>This bit is a 0 after the interrupt is cleared (independent of the state of the Interrupt Disable bit in the command register).<br>***Note:*** This bit is not set by an MSI. |
| 2:0 | 0x0<br>RO | **RSVD (RSVD_2_0):** Reserved |

## 52.4.4 Revision ID and Class Code (HECI3_RID_CC)—Offset 8h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:4] + 8h

**Default:** 07800000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x7<br>RO | **Base Class Code (BCC):** Indicates the base class code of the HECI host controller device. |
| 23:16 | 0x80<br>RO | **Sub Class Code (SCC):** Indicates the sub class code of the HECI host controller device. |
| 15:8 | 0x0<br>RO | **Programming Interface (PI):** Indicates the programming interface of the HECI host controller device. |
| 7:0 | 0x0<br>RO/V | **Revision ID (RID):** Indicates stepping of the HECI host controller. |

## 52.4.5 Cache Line Size (HECI3_CLS)—Offset Ch

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:24, F:4] + Ch

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO | **Cache Line Size (CLS):** Not implemented, hardwired to 0. |

## 52.4.6 Master Latency Timer (HECI3_MLT)—Offset Dh

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:24, F:4] + Dh

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO | **Master Latency Timer (MLT):** Not implemented, hardwired to 0. |

## 52.4.7 Header Type (HECI3_HTYPE)—Offset Eh

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:24, F:4] + Eh

**Default:** 80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x1<br>RO | **Multi-Function Device (MFD):** Indicates the HECI host controller is part of a multi- function device. |
| 6:0 | 0x0<br>RO | **Header Layout (HL):** Indicates that the HECI host controller uses a target device layout. |

## 52.4.8 Built In Self-Test (HECI3_BIST)—Offset Fh

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:24, F:4] + Fh

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RO | **BIST Capable (BC):** Not implemented, hardwired to 0. |
| 6:0 | 0x0<br>RO | **RSVD:** Reserved |

## 52.4.9 HECI MMIO Base Address Low (HECI3_MMIO_MBAR_LO)—Offset 10h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:4] + 10h

**Default:** 00000004h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:12 | 0x0<br>RW | **Base Address Low (BA_LO):** Lower 32 bits of base address of register memory space. |
| 11:4 | 0x0<br>RO | **Memory Size (MS):** This field is hardwired to 0 to indicate that HECI device requests 4KB of memory space. |
| 3 | 0x0<br>RO | **Prefetchable (PF):** Indicates that this range is not pre-fetchable |
| 2:1 | 0x2<br>RO | **Type (TP):** Indicates that this range can be mapped anywhere in 64-bit address space. |
| 0 | 0x0<br>RO | **Resource Type Indicator (RTE):** Indicates a request for register memory space. |

## 52.4.10 HECI MMIO Base Address High (HECI3_MMIO_MBAR_HI)—Offset 14h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:4] + 14h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Base Address High (BA_HI):** Upper 32 bits of base address of register memory space. |

## 52.4.11 Sub System Identifiers (HECI3_SS)—Offset 2Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:4] + 2Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW/O | **Subsystem ID (SSID):** Indicates the sub- system identifier.<br>This field should be programmed by BIOS during boot-up.<br>Once written, this register becomes Read Only. |
| 15:0 | 0x0<br>RW/O | **Subsystem Vendor ID (SSVID):** Indicates the sub-system vendor identifier.<br>This field should be programmed by BIOS during boot- up.<br>Once written, this register becomes Read Only. |

## 52.4.12 Capabilities Pointer (HECI3_CAP)—Offset 34h

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:24, F:4] + 34h

**Default:** 50h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x50<br>RO | **Capability Pointer (CP):** Indicates the first capability pointer offset.<br>It points to the PCI power management capability offset. |

## 52.4.13 Interrupt Information (HECI3_INTR)—Offset 3Ch

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:24, F:4] + 3Ch

**Default:** 0100h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x1<br>RO/V | **Interrupt Pin (IPIN):** This field indicates the virtual interrupt pin the HECI host controller uses.<br>A value of 0x1/0x2/0x3/0x4 indicates that this function implements legacy interrupt on INTA/INTB/INTC/INTD, respectively.<br>When legacy interrupt is not used this register should be set to 0x0. |
| 7:0 | 0x0<br>RW | **Interrupt Line (ILINE):** Software written value to indicate which interrupt line (vector) the interrupt is connected to.<br>No hardware action is taken on this field. |

## 52.4.14 Minimum Grant (HECI3_MGNT)—Offset 3Eh

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:24, F:4] + 3Eh

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO | **Grant (GNT):** Not implemented, hardwired to 0. |

## 52.4.15 Maximum Latency (HECI3_MLAT)—Offset 3Fh

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:24, F:4] + 3Fh

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO | **Latency (LAT):** Not implemented, hardwired to 0. |

## 52.4.16 Host Firmware Status (HECI3_HFS)—Offset 40h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:4] + 40h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0x0<br>RO | **BIOS MSG ACK:** Acknowledge for register based BIOS message in MEI 1 H_GS Register. |
| 27:25 | 0x0<br>RO | **BIOS MSG ACK Data:** Message specific data for acknowledged BIOS message. |
| 24:20 | 0x0<br>RO | Reserved |
| 19:16 | 0x0<br>RO | **Operating Mode:** This field describes the current operating mode of Intel® ME.<br>• 1:0 - Reserved<br>• 2 - Debug Mode<br>• 14:3 - Reserved<br>• 15 - Intel® SPS firmware is running in Intel® ME |
| 15:12 | 0x0<br>RO | **Error Code:** If set to nonzero value the Intel® ME firmware has encountered a fatal error and stopped normal operation.<br>• 0 - No Error<br>• 1 - Uncategorized Failure - The Intel® ME firmware has experienced an uncategorized error. Further details of the failure can be found in the Extended Status Data.<br>• 2 - Disabled - Firmware was disabled on this platform.<br>• 3 - Image Failure - The Intel® ME firmware stored in the system flash is not valid. |
| 11 | 0x0<br>RO | **Update in Progress:** The bit is set if any type of Intel® ME firmware update is in progress. |
| 10 | 0x0<br>RO | **Recovery BUP Load Fault:** This bit is set when firmware is not able to load recovery bring-up from the flash. It means that the recovery section in Intel® ME region on the SPI flash. |
| 9 | 0x0<br>RO | **Init Complete:** When this but is not set firmware is still in initialization phase. When firmware has fully entered a stable state, this but is set to 1 and "Current State" field of this register provides the steady state of the Intel® ME subsystem. |
| 8:6 | 0x0<br>RO | **Operating State:** This field describes the current operating state of Intel® ME.<br>• 000 - Preboot<br>• 001 - M0 with UMA<br>• 010 - Reserved<br>• 011 - Reserved<br>• 100 - M3 without UMA<br>• 101 - M0 without UMA - normal state for Intel® SPS firmware<br>• 110 - Bring up<br>• 111 - M0 without UMA but with error |
| 5 | 0x0<br>RO | **FPT or Factory Defaults Bad:** This bit is set when the firmware discovers a bad checksum of Intel® ME region Flash Partition Table (FPT) or Factory Defaults. When this bit set, it may or may not have the error code shown in bit [15:12]. The system can get this bit clear only by re-flashing the whole Intel® ME region in the SPI Flash. |
| 4 | 0x0<br>RO | **Manufacturing Mode:** When this bit is set, the platform is still in manufacturing mode. Host can use this bit to inform user that the platform is NOT READY for production yet. This but is set as long as Intel® ME Region access is not locked for flash masters other than Intel® ME. For shipping machine, this bit MUST be 0. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 3:0 | 0x0<br>RO | **Current State:** This field describes the current operation state of the firmware.<br>• 0 - Reset - Intel® ME is in reset state, will exit this state within 1 millisecond<br>• 1 - Initialization - Intel® ME is initializing, will exit this state within 2 seconds<br>• 2 - Recovery - Intel® ME is in recovery mode, check ME1.GMES register to determine cause<br>• 3 - Reserved<br>• 4 - Disabled - Intel® ME functionality has been disabled, it executes idle loop<br>• 5 - Operational - Intel® ME is in normal operational state<br>• 6 - Reserved<br>• 7 - State Transition - Intel® ME sets this state before starting a transition to a new Operating State.<br>It is a temporary state, may appear on transition between Initialization and Operational. |

## 52.4.17 General Status Shadow 1 (HECI3_GS_SHDW1)—Offset 48h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:4] + 48h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **EOP Status:** This bit presents the Intel® ME notion of EOP status.<br>If BIOS encounters this bit set to '1' during POST it signals an error in platform power flow. |
| 30:28 | 0x0<br>RO | **Infrastructure Progress Code:** This field identifies the infrastructure progress code:<br>• 0 - ROM - Intel® ME is in ROM phase<br>• 1 - BUP - Intel® ME is in BRINGUP phase<br>• 2 - uKernel - Intel® ME is in Micro Kernel phase<br>• 3 - Policy Module - Intel® ME is in Policy Module phase<br>• 4 - Other Module - Intel® ME is loading modules in M0 or M3 Operating State |
| 27:16 | 0x0<br>RO | **Extended Status Data:** These bits provide extended status data for the current state of operating of the firmware. Or, if the firmware is in a fatal error state, these bits provide extended error code information. |
| 15:13 | 0x0<br>RO | **Firmware Heartbeat:** This number increments approximately every second if Intel® ME firmware is running. |
| 12 | 0x0<br>RO | Intel® ME Target Image Boot Fault<br>• 0 - Target image loaded successfully<br>• 1 - Target image boot failed, switched to backup image or recovery image |
| 11:8 | 0x0<br>RO | Reserved |
| 7 | 0x0<br>RO | **Warm Reset Request:** If this bit is set, Intel® ME informs BIOS that a warm reset is requested by Intel® ME. |
| 6 | 0x0<br>RO | **MFS Failure:** If this bit is set, Intel® ME informs BIOS that Intel® ME File System failure has been detected during recent Intel® ME boot. |
| 5:4 | 0x0<br>RO | Reserved |
| 3:1 | 0x0<br>RO | **Recovery Cause:** If ME1.HFS.Current State indicates that Intel® ME firmware is running in recovery mode these bits provide the cause of this mode:<br>• 0 - Intel® ME recovery jumper asserted<br>• 1 - Security strap override jumper asserted<br>• 2 - Recovery forced with IPMI command<br>• 3 - Invalid flash configuration, either:<br>  • flash master access permissions configuration is wrong<br>  • VSCC entry is missing or wrong<br>  • flash erase block size in Intel® ME region configuration<br>• 4 - Intel® ME internal error<br>  Intel® ME could not start in operational mode because of some firmware problems.<br>• 5..7 - Reserved for future extensions |
| 0 | 0x0<br>RO | **BIST in Progress:** If this bit is set Intel® ME Built In Self-Test is in Progress. |

## 52.4.18 Host General Status (HECI3_H_GS1)—Offset 4Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:4] + 4Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Host General Status (H_GS1):** General status of Host.<br>This field is not used by hardware. |

## 52.4.19 PCI Power Management Capability ID (HECI3_PID)—Offset 50h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:24, F:4] + 50h

**Default:** 8C01h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x8c<br>RO | **Next Capability (NEXT):** Indicates the location of the next capability item in the list.<br>This is the Message Signaled Interrupts capability. |
| 7:0 | 0x1<br>RO | **Cap ID (CID):** Indicates that this pointer is a PCI power management. |

## 52.4.20 PCI Power Management Capabilities (HECI3_PC)—Offset 52h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:24, F:4] + 52h

**Default:** 4003h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:11 | 0x8<br>RO | **PME Support (PSUP):** Indicates the states that can generate PME#.<br>HECI can assert PME# from D3hot only. |
| 10 | 0x0<br>RO | **D2 Support (D2S):** The D2 state is not supported for the HECI host controller. |
| 9 | 0x0<br>RO | **D _Support (D1S):** The D1 state is not supported for the HECI host controller. |
| 8:6 | 0x0<br>RO | **Aux_Current (AUXC):** Reports the maximum Suspend well current required when in the D3COLD state. Value of 0 is reported. |
| 5 | 0x0<br>RO | **Device Specific Initialization (DSI):** Indicates whether device-specific initialization is required. |
| 4 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 3 | 0x0<br>RO | **PME Clock (PMEC):** Indicates that PCI clock is not required to generate PME#. |
| 2:0 | 0x3<br>RO | **Version (VS):** Indicates support for Revision 1.2 of the PCI Power Management Specification. |

## 52.4.21 PCI Power Management Control and Status (HECI3_PMCS)—Offset 54h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:24, F:4] + 54h

**Default:** 0008h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RW/1C/V | **PME Status (PMES):** The PME Status bit in HECI space can be set to '1' by CSE FW performing a write into CSE side register to set PMES.<br>This bit is cleared by host CPU writing a '1' to it.<br>CSE cannot clear this bit.<br>Host CPU writes with value '0' have no effect on this bit. |
| 14:9 | 0x0<br>RO | **Reserved (RSVD_14_9):** Reserved. |
| 8 | 0x0<br>RW | **PME Enable (PMEE):** When set, PME_assert and PME_deassert messages are sent over Sideband to PMC based on the PMES bit.<br>When reset these messages may not be sent. |
| 7:4 | 0x0<br>RO | **Reserved (RSVD_7_4):** Reserved. |
| 3 | 0x1<br>RO | **No Soft Reset (NSR):** This bit indicates that when the HECI host controller is transitioning from D3hot to D0 due to power state command, it does not perform and internal reset. |
| 2 | 0x0<br>RO | **Reserved (RSVD_2_2):** Reserved. |
| 1:0 | 0x0<br>RW | **Power State (PS):** This field is used both to determine the current power state of the HECI host controller and to set a new power state.<br>The values are:<br>• 00 - D0 state<br>• 11 - D3HOT state.<br>The D1 and D2 states are not supported for this HECI host controller. |

## 52.4.22 General Status Shadow 2 (HECI3_GS_SHDW2)—Offset 60h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:4] + 60h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **General Status Shadow 2 (GSS2):** This field is host side shadow of CSE General Status 2 (CSE_GS2). |

## 52.4.23 General Status Shadow 3 (HECI3_GS_SHDW3)—Offset 64h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:4] + 64h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **General Status Shadow 3 (GSS3):** This field is host side shadow of CSE General Status 3 (CSE_GS3). |

## 52.4.24 General Status Shadow 4 (HECI3_GS_SHDW4)—Offset 68h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:4] + 68h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **General Status Shadow 4 (GSS4):** This field is host side shadow of CSE General Status 4 (CSE_GS4). |

## 52.4.25 General Status Shadow 5 (HECI3_GS_SHDW5)—Offset 6Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:4] + 6Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **General Status Shadow 5 (GSS5):** This field is host side shadow of CSE General Status 5 (CSE_GS5). |

## 52.4.26 Host General Status 2 (HECI3_H_GS2)—Offset 70h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:4] + 70h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Host General Status 2 (H_GS2):** General status of Host. This field is not used by hardware. |

## 52.4.27 Host General Status 3 (HECI3_H_GS3)—Offset 74h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:4] + 74h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Host General Status 3 (H_GS3):** General status of Host.<br>This field is not used by hardware. |

## 52.4.28 Message Signaled Interrupt Identifiers (HECI3_MID)—Offset 8Ch

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:24, F:4] + 8Ch

**Default:** 0005h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x0<br>RO | **Next Pointer (NEXT):** Indicates the next item in the list.<br>This can be other capability pointers (such as PCI-X or PCI- Express) or it can be the last item in the list. |
| 7:0 | 0x5<br>RO | **Capability ID (CID):** Indicates MSI. |

## 52.4.29 Message Signaled Interrupt Message Control (HECI3_MC)—Offset 8Eh

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:24, F:4] + 8Eh

**Default:** 0080h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 7 | 0x1<br>RO | **64 Bit Address Capable (C64):** Specifies whether capable of generating 64-bit messages. |
| 6:4 | 0x0<br>RO | **Multiple Message Enable (MME):** Not implemented, hardwired to 0. |
| 3:1 | 0x0<br>RO | **Multiple Message Capable (MMC):** Not implemented, hardwired to 0. |
| 0 | 0x0<br>RW | **MSI Enable (MSIE):** If set, MSI is enabled and INTx virtual wires are not used to generate interrupts. |

## 52.4.30 Message Signaled Interrupt Message Address (HECI3_MA)—Offset 90h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:4] + 90h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:2 | 0x0<br>RW | **Address (ADDR):** Lower 32 bits of the system specified message address, always DW aligned. |
| 1:0 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |

## 52.4.31 Message Signaled Interrupt Upper Address (HECI3_MUA)—Offset 94h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:4] + 94h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Upper Address (UADDR):** Upper 32 bits of the system specified message address.<br>This register is optional and only implemented if MC.C64=1. |

## 52.4.32 Message Signaled Interrupt Message Data (HECI3_MD)—Offset 98h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:24, F:4] + 98h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0x0<br>RW | **Data (DATA):** This 16-bit field is programmed by system software if MSI is enabled.<br>Its content is driven onto the FSB during the data phase of the MSI memory write transaction. |

## 52.4.33 HECI Interrupt Delivery Mode (HECI3_HIDM)—Offset A0h

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:24, F:4] + A0h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:3 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 2 | 0x0<br>RW/1S | **HIDM Lock (HIDM_L):** Writing 1 to this bit locks the HIDM field. |
| 1:0 | 0x0<br>RW/L | **HECI Interrupt Delivery Mode (HIDM):** These bits control what type of interrupt the HECI will send when CSE FW writes to set the CSE_IG bit.<br>They are interpreted as follows:<br>• 00 - Generate Legacy or MSI interrupt;<br>• 01 - Generate SCI;<br>• 10 - Generate SMI;<br>This field may be locked by writing 1 to HIDM_L bit. |

## 52.4.34 Manufacturer's ID (HECI3_MANID)—Offset F8h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:4] + F8h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0x0<br>RO | **Reserved (RSVD_31_28):** Reserved. |
| 27:24 | 0x0<br>RO/V | **Dot Portion of Process ID (DPOP):** Indicates the dot process. |
| 23:16 | 0x0<br>RO/V | **Manufacturing Stepping ID (MSID):** This field is incremented for each stepping of the part.<br>***Note:*** Note that this field can be used by software to differentiate steppings when Revision ID may not change. |
| 15:8 | 0x0<br>RO/V | **Manufacturing ID (MID):** This field is set by Intel. |
| 7:0 | 0x0<br>RO/V | **Process Portion of Process ID (PPOP):** Indicates the process.<br>The dot portion of the process is reflected in bits [27:24].<br>***Note:*** This field can be used by software to differentiate steppings when Revision ID may not change.<br>This field is set by a special IOSF SB message (SetIDValue). |

# 52.5 Registers in Configuration Space—KT (Host)

## 52.5.1 Device ID and Vendor ID (KT_HOST_DID_VID)—Offset 0h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:3] + 0h

**Default:** 19D58086h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x19d5<br>RO/V | **Device ID (DID):** This field identifies the particular device. |
| 15:0 | 0x8086<br>RO | **Vendor ID (VID):** This field identifies the manufacturer of the device.<br>Valid vendor identifiers are allocated by the PCI SIG to ensure uniqueness.<br>The value of 0x8086 indicates Intel |

## 52.5.2 Status and Command (KT_HOST_STS_CMD)—Offset 4h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:3] + 4h

**Default:** 00B00000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **Detected Parity Error (DPE):** Not implemented. Hardwired to 0. |
| 30 | 0x0<br>RO | **Signaled System Error (SSE):** Not implemented. Hardwired to 0. |
| 29 | 0x0<br>RW/1C/V | **Received Master Abort (RMA):** This bit must be set by a master device whenever its transaction (except for Special Cycle) is completed with Unsupported Request Completion Status (a.k.a. Master-Abort).<br>All master devices must implement this bit. |
| 28 | 0x0<br>RW/1C/V | **Received Target Abort (RTA):** This bit must be set by a master device whenever its transaction is completed with Completer Abort Completion Status (a.k.a. Target-Abort).<br>All master devices must implement this bit. |
| 27 | 0x0<br>RW/1C/V | **Signaled Target Abort (STA):** This bit must be set by a target device whenever it completes a Posted or Non-Posted transaction with a Completer Abort (a.k.a. Target-Abort) error.<br>Devices that will never signal Completer Abort (a.k.a. Target-Abort) do not need to implement this bit. |
| 26:25 | 0x0<br>RO | **Devsel Timing (DEVT):** These bits encode the timing of DEVSEL#.<br>There are three allowable timings for assertion of DEVSEL# as described below:<br>• 00b: fast<br>• 01b: medium<br>• 10b: slow<br>• 11b: reserved<br>These bits are read-only and must indicate the slowest time that a device asserts DEVSEL# for any bus command except Configuration Read and Configuration Write.<br>Hardwired to 00b. |
| 24 | 0x0<br>RO | **Master Data Parity Error (MDPE):** Not implemented. Hardwired to 0. |
| 23 | 0x1<br>RO | **Fast Back to Back Capable (FBTBC):** This bit indicates whether or not the target is capable of accepting fast back-to-back transactions when the transactions are not to the same agent.<br>This bit can be set to 1 if the device can accept these transactions and must be set to 0 otherwise.<br>Hardwired to 1. |
| 22 | 0x0<br>RO | **Reserved (RSVD3):** Reserved (RSVD) |
| 21 | 0x1<br>RO | **66 Mhz Capable (MCAP):** This bit indicates whether or not this device is capable of running at 66 MHz.<br>• A value of 0 indicates 33 MHz.<br>• A value of 1 indicates that the device is 66 MHz capable.<br>Hardwired to 1. |
| 20 | 0x1<br>RO | **Capabilities List (CAPL):** This optional read-only bit indicates whether or not this device implements the pointer for a New Capabilities linked list at offset 34h.<br>A value of zero indicates that no New Capabilities linked list is available.<br>A value of one indicates that the value read at offset 34h is a pointer in Configuration Space to a linked list of new capabilities. |
| 19 | 0x0<br>RO | **Interrupt Status (INTS):** This read-only bit reflects the state of the interrupt in the device/function. Only when the Interrupt Disable bit in the command register is a 0 and this Interrupt Status bit is a 1, will the device's/function's INTx# signal be asserted.<br>Setting the Interrupt Disable bit to a 1 has no effect on the state of this bit.<br>Read-only and hardwired to 0 for a device that does NOT support pin-based interrupt. |
| 18:16 | 0x0<br>RO | **Reserved (RSVD2):** |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:11 | 0x0<br>RO | **Reserved (RSVD1):** |
| 10 | 0x0<br>RW | **Interrupt Disable (INTD):** This bit disables the device/function from asserting INTx#.<br>A value of 0 enables the assertion of its INTx# signal.<br>A value of 1 disables the assertion of its INTx# signal.<br>This bit's state after RST# is 0. |
| 9 | 0x0<br>RO | **Fast Back to Back Enable (FBTBEN):** Not implemented.<br>Hardwired to 0. |
| 8 | 0x0<br>RO | **System Error Enable (SERREN):** Not implemented.<br>Hardwired to 0. |
| 7 | 0x0<br>RO | **Reserved (RSVD0):** |
| 6 | 0x0<br>RO | **Parity Error Response (PERRR):** Not implemented.<br>Hardwired to 0. |
| 5 | 0x0<br>RO | **VGA Palette Snoop (VGAPS):** Not implemented.<br>Hardwired to 0. |
| 4 | 0x0<br>RO | **Memory Write and Invalidate Enable (MWRIEN):** Not implemented.<br>Hardwired to 0. |
| 3 | 0x0<br>RO | **Special Cycles (SPCYC):** Not implemented.<br>Hardwired to 0. |
| 2 | 0x0<br>RW | **Bus Master Enable (BME):** Controls the ability of a PCI device to issue Memory and I/O Read/Write Requests, and the ability of a PCI bridge to forward Memory and I/O Read/Write Requests in the Upstream direction.<br>When this bit is Set, the PCI device function is allowed to issue Memory or I/O Requests.<br>When this bit is Clear, the PCI device function is not allowed to issue any Memory or I/O Requests.<br>***Note:*** As MSI/MSI-X interrupt Messages are in-band memory writes, setting the Bus Master Enable bit to 0b disables MSI/MSI-X interrupt Messages as well.<br>Requests other than Memory or I/O Requests are not controlled by this bit.<br>Default value of this bit is 0b.<br>This bit is hardwired to 0b if a PCI device function does not generate Memory or I/O Requests.<br>Default value of this bit is 0b. |
| 1 | 0x0<br>RW | **Memory Space Enable (MSE):** Controls a device's response to Memory Space accesses.<br>• A value of 0 disables the device response.<br>• A value of 1 allows the device to respond to Memory Space accesses. State after RST# is 0. |
| 0 | 0x0<br>RW | **IO Space Enable (IOSE):** Controls a device's response to I/O Space accesses. A value of 0 disables the device response. A value of 1 allows the device to respond to I/O Space accesses. State after RST# is 0. |

## 52.5.3 Class Code and Revision ID (KT_HOST_CC_RID)—Offset 8h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:3] + 8h

**Default:** 07000200h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x7<br>RO | **Base Class Code (BCC):** Identifies the Base Class Code of an external 16550-compatible serial controller device driver. |
| 23:16 | 0x0<br>RO | **Sub-Class Code (SCC):** Identifies the Sub-Class Code of an external 16550-compatible serial controller device driver. |
| 15:8 | 0x2<br>RO | **Programming Interface (PI):** Identifies the Programming Interface of an external 16550-compatible serial controller device driver. |
| 7:0 | 0x0<br>RO/V | **Revision ID (RID):** This register specifies a device specific revision identifier.<br>The value is chosen by the vendor.<br>Zero is an acceptable value.<br>This field should be viewed as a vendor defined extension to the Device ID. |

## 52.5.4 BIST, Header Type, Latency Timer, and Cache Line Size (KT_HOST_BIST_HTYPE_LT_CLS)—Offset Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:3] + Ch

**Default:** 00800000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RO | **Built In Self Test (BIST):** Not implemented.<br>Hardwired to 0. |
| 23 | 0x1<br>RO/V | **Header Type 1 (HTYPE1):** This bit identifies whether or not the device contains multiple functions.<br>• If the bit is 0, then the device is single function.<br>• If the bit is 1, then the device has multiple functions. |
| 22:16 | 0x0<br>RO | **Header Type 0 (HTYPE0):** This field identifies the layout of the second part of the predefined header (beginning at byte 10h in Configuration Space).<br>• The encoding 00h specifies the non-bridge Configuration Space Header.<br>• The encoding 01h specifies the PCI-to-PCI bridge Configuration Space Header.<br>• The encoding 02h specifies the CardBus bridge Configuration Space Header.<br>• All other encodings are reserved.<br>Hardwired to 0 to identify the non-bridge Configuration Space Header. |
| 15:8 | 0x0<br>RO | **Latency Timer (LT):** Not implemented.<br>Hardwired to 0. |
| 7:0 | 0x0<br>RO | **Cache Line Size (CLS):** Not implemented.<br>Hardwired to 0. |

## 52.5.5 KT IO BAR (KT_HOST_IOBAR)—Offset 10h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:3] + 10h

**Default:** 00000001h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:3 | 0x0<br>RW | **IO BAR (IOBAR):** Software programs this space with the base address of the device's IO region |
| 2 | 0x0<br>RO | **IO Size (IOSIZE):** Hardwired to 0 to indicate 8B of IO space |
| 1 | 0x0<br>RO | **Reserved (RSVD):** Hardwired to 0 for an IO BAR. |
| 0 | 0x1<br>RO | **IO Space Indicator (IOSPACE):** Hardwired to 1 to identify an IO BAR. |

## 52.5.6 KT Memory BAR (KT_HOST_MEMBAR)—Offset 14h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:3] + 14h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:12 | 0x0<br>RW | **Memory BAR (MEMBAR):** Software programs this register with the base address of the device's memory region |
| 11:4 | 0x0<br>RO | **Memory Size (MEMSIZE):** Hardwired to 0 to indicate 4KB of memory space |
| 3 | 0x0<br>RO | **Prefetchable (PREFETCH):** A device can mark a range as prefetchable if there are no side effects on reads, the device returns all bytes on reads regardless of the byte enables.<br>Hardwired to 0 to indicate the device's memory space as non-prefetchable. |
| 2:1 | 0x0<br>RO | **Type (TYP):** Hardwired to 0 to indicate that Base register is 32 bits wide and mapping can be done anywhere in the 32-bit Memory Space. |
| 0 | 0x0<br>RO | **Memory Space Indicator (MEMSPACE):** Hardwired to 0 to identify a Memory BAR. |

## 52.5.7 Cardbus CIS Pointer (KT_HOST_CCP)—Offset 28h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:3] + 28h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO | **Cardbus CIS Pointer (CCP):** Not implemented. Hardwired to 0. |

## 52.5.8 Subsystem ID and Subsystem Vendor ID (KT_HOST_SID_SVID)—Offset 2Ch

These registers are used to uniquely identify the add-in card or subsystem where the PCI device resides. They provide a mechanism for add-in card vendors to distinguish their add-in cards from one another even though the add-in cards may have the same PCI controller on them (and, therefore, the same Vendor ID and Device ID).

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:3] + 2Ch

**Default:** 00008086h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW/O | **Subsystem ID (SID):** Value of this field is vendor-specific.<br>This is written by BIOS. No hardware action will be taken on this value.<br><br>Implementation Note: The Write-Once lock must be implemented per field. SID should have its own lock. |
| 15:0 | 0x8086<br>RW/O | **Subsystem Vendor ID (SVID):** This field identifies the vendor of the add-in card or subsystem.<br>This is written by BIOS. No hardware action will be taken on this value.<br><br>Implementation Note: The Write-Once lock must be implemented per field. SVID should have its own lock. |

## 52.5.9 Expansion ROM Base Address (KT_HOST_XRBAR)—Offset 30h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:3] + 30h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO | **Expansion ROM Base Address (XRBAR):** Not implemented. Hardwired to 0. |

## 52.5.10 Capabilities List Pointer (KT_HOST_CAPP)—Offset 34h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:3] + 34h

**Default:** 00000040h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0x0<br>RO | **Reserved (RSVD):** |
| 7:0 | 0x40<br>RO | **Capabilities Pointer (CAPP):** Indicates the pointer for the first entry in the capabilities list which is the MSI Capability. |

## 52.5.11 Maximum Latency, Minimum Grant, Interrupt Pin and Interrupt Line (KT_HOST_MAXL_MING_INTP_INTL)—Offset 3Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:3] + 3Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RO | **Maximum Latency (MAXL):** Not implemented. Hardwired to 0. |
| 23:16 | 0x0<br>RO | **Minimum Grant (MING):** Not implemented. Hardwired to 0. |
| 15:8 | 0x0<br>RO/V | **Interrupt Pin (INTP):** This register specifies which interrupt pin KT uses in PCI interrupt mode.<br>Value Decoding<br>• 00h The function does NOT use an interrupt pin.<br>• 01h INTA<br>• 02h INTB<br>• 03h INTC<br>• 04h INTD<br>• 05h - FFh Reserved. |
| 7:0 | 0x0<br>RW | **Interrupt Line (INTL):** This register is used to communicate interrupt line routing information. POST software will write the routing information into this register as it initializes and configures the system.<br>The value in this register tells which input of the system interrupt controller(s) the device's interrupt pin is connected to.<br>The device itself does not use this value, rather it is used by device drivers and operating systems.<br>Device drivers and operating systems can use this information to determine priority and vector information.<br>Values in this register are system architecture specific. |

## 52.5.12 MSI Message Control, Next Pointer and Capability ID (KT_HOST_MSIMC_MSINP_MSICID)—Offset 40h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:3] + 40h

**Default:** 00805005h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:25 | 0x0<br>RO | **Reserved (RSVD):** |
| 24 | 0x0<br>RO | **Per Vector Masking Capable (PVMC):** Not implemented.<br>Hardwired to 0 to indicate the function does NOT support MSI per-vector masking. |
| 23 | 0x1<br>RO | **64 bit address capable (XAC):** Hardwired to 1 to indicate the function is capable of sending a 64-bit message address. |
| 22:20 | 0x0<br>RW | **Multiple Message Enable (MMEN):** Encoded number of interrupt vectors allocated by SW.<br>This field is RW for software compatibility, but only one interrupt vector is ever sent by the function. |
| 19:17 | 0x0<br>RO | **Multiple Message Capable (MMC):** Encoded number of interrupt vectors requested by a device.<br>Hardwired to 0 to indicate one requested interrupt vector. |
| 16 | 0x0<br>RW | **MSI Enable (MSIE):** If set, MSI interrupt delivery is enabled whereas pin-based interrupt delivery SHALL be disabled.<br>If cleared, prior to returning the configuration write (that clears this field) completion, the function must send any pending MSI(s). |
| 15:8 | 0x50<br>RO | **Next Item Pointer (NP):** Indicates the pointer for the next entry in the capabilities list.<br>Hardwired to 50h to point to the PM Capability list |
| 7:0 | 0x5<br>RO | **Capability ID (CID):** Hardwired to 05h to indicate the linked list item as the MSI Capability registers |

## 52.5.13 MSI Message Address (KT_HOST_MSIMA)—Offset 44h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:3] + 44h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:2 | 0x0<br>RW | **Message Address (MA):** 32-bit DW-aligned MSI message address. |
| 1:0 | 0x0<br>RO | **Reserved (RSVD):** |

## 52.5.14 MSI Message Upper Address (KT_HOST_MSIMUA)—Offset 48h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:3] + 48h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Message Upper Address (MUA):** Upper 32-bit of a 64-bit DW-aligned MSI message address. |

## 52.5.15 MSI Message Data (KT_HOST_MSIMD)—Offset 4Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:3] + 4Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **Reserved (RSVD):** |
| 15:0 | 0x0<br>RW | **Message Data (MD):** MSI Message Data |

## 52.5.16 Power Management Capabilities, Next Pointer and Capability ID (KT_HOST_PMCAP_PMNP_PMCID)—Offset 50h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:3] + 50h

**Default:** 00230001h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:27 | 0x0<br>RO | **PME Support (PMES):** This 5-bit field indicates the power states in which the function may assert PME#.<br>A value of 0b for any bit indicates that the function is not capable of asserting the PME# signal while in that power state.<br>• bit(27) X XXX1b - PME# can be asserted from D0<br>• bit(28) X XX1Xb - PME# can be asserted from D1<br>• bit(29) X X1XXb - PME# can be asserted from D2<br>• bit(30) X 1XXXb - PME# can be asserted from D3hot<br>• bit(31) 1 XXXXb - PME# can be asserted from D3cold |
| 26 | 0x0<br>RO | **D2 Support (D2S):** Hardwired to 0 to indicate that this device does not support D2 |
| 25 | 0x0<br>RO | **D1 Support (D1S):** Hardwired to 0 to indicate that this device does not support D1 |
| 24:22 | 0x0<br>RO | **Aux Current (AUXC):** Not implemented.<br>Hardwired to 0. |
| 21 | 0x1<br>RO | **Device Specific Initialization (DSI):** indicates whether special initialization of this function is required (beyond the standard PCI configuration header) before the generic class device driver is able to use it.<br>A 1 indicates that the function requires a device specific initialization sequence following transition to the D0 uninitialized state.<br>Hardwired to 1 to indicate Device Specific Initialization is required. |
| 20 | 0x0<br>RO | **Reserved (RSVD):** |
| 19 | 0x0<br>RO | **PME Clock (PMECLK):** Not implemented.<br>Hardwired to 0. |
| 18:16 | 0x3<br>RO | **Version (VER):** Hardwired to value of 011b indicates that this function complies with rev 1.2 of PCI Power Management Interface Spec |
| 15:8 | 0x0<br>RO | **Next Item Pointer (NP):** Indicates the pointer for the next entry in the capabilities list.<br>Hardwired to 0 to indicate no more linked list item. |
| 7:0 | 0x1<br>RO | **Capability ID (CID):** Hardwired to 01h to indicate the linked list item as the PCI Power Management registers |

## 52.5.17 Power Management Data, Control/Status Register Bridge Support Extensions, Control and Status (KT_HOST_PMD_PMCSRBSE_PMCSR)—Offset 54h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:3] + 54h

**Default:** 00000008h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RO | **Data:** Not implemented.<br>Hardwired to 0. |
| 23:16 | 0x0<br>RO | **Control/Status Register Bridge Support Extensions (CSRBSE):** Not implemented.<br>Hardwired to 0. |
| 15 | 0x0<br>RO | **PME Status (PMESTS):** This bit is set when the function would normally assert the PME signal independent of the state of the PME_En bit.<br>• Writing a 1 to this bit will clear it and cause the function to stop asserting a PME (if enabled).<br>• Writing a 0 has no effect.<br><br>If the function supports PME from D3cold, then this bit is sticky and must be explicitly cleared by the operating system each time the operating system is initially loaded.<br><br>Not implemented. Hardwired to 0. |
| 14:13 | 0x0<br>RO | **Data Scale (DS):** Not implemented.<br>Hardwired to 0. |
| 12:9 | 0x0<br>RO | **Data Select (DSEL):** Not implemented.<br>Hardwired to 0. |
| 8 | 0x0<br>RO | **PME Enable (PMEEN):** A 1 enables the function to assert PME. When 0, PME assertion is disabled.<br>This bit defaults to 0 if the function does not support PME generation from D3cold.<br>If the function supports PME from D3cold then this bit is sticky and must be explicitly cleared by the operating system each time it is initially loaded.<br><br>Not implemented. Hardwired to 0. |
| 7:4 | 0x0<br>RO | **Reserved (RSVD1):** |
| 3 | 0x1<br>RO | **No Soft Reset (NSR):** When set to 1, this bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset.<br>Configuration Context is preserved.<br>Upon transition from the D3hot to the D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the PowerState bits. |
| 2 | 0x0<br>RO | **Reserved (RSVD0):** |
| 1:0 | 0x0<br>RW | **Power State (PWRST):** This 2-bit field is used both to determine the current power state of a function and to set the function into a new power state.<br>The definition of the field values is given below:<br>• 00b - D0<br>• 01b - D1<br>• 10b - D2<br>• 11b - D3hot<br>If software attempts to write an unsupported, optional state to this field, the write operation must complete normally on the bus; however, the data is discarded and no state change occurs. |

## 52.5.18 Process Stepping Information (KT_HOST_PSI)—Offset F8h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:3] + F8h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0x0<br>RO | **Reserved (RSVD):** Not implemented.<br>Hardwired to 0. |
| 27:24 | 0x0<br>RO/V | **Dot Portion of Process ID (DPOP):** Reserved. |
| 23:16 | 0x0<br>RO/V | **Manufacturing Stepping (MSID):** Reserved. |
| 15:8 | 0x0<br>RO/V | **Manufacturing ID (MID):** Reserved. |
| 7:0 | 0x0<br>RO/V | **Process Portion of Process ID (PPOP):** Reserved. |

## 52.6 Registers in Configuration Space—IDE (Host)

**AR Author and Tech Comm:** HIDE this sub-chapter if the device has no such registers.

### 52.6.1 Device ID and Vendor ID (IDE_HOST_DID_VID)—Offset 0h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:2] + 0h

**Default:** 19EA8086h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x19ea<br>RO/V | **Device ID (DID):** This field identifies the particular device. |
| 15:0 | 0x8086<br>RO | **Vendor ID (VID):** This field identifies the manufacturer of the device.<br>Valid vendor identifiers are allocated by the PCI SIG to ensure uniqueness.<br>The value of 0x8086 indicates Intel |

## 52.6.2 Status and Command (IDE_HOST_STS_CMD)—Offset 4h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:2] + 4h

**Default:** 00B00000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **Detected Parity Error (DPE):** Not implemented.<br>Hardwired to 0. |
| 30 | 0x0<br>RO | **Signaled System Error (SSE):** Not implemented.<br>Hardwired to 0. |
| 29 | 0x0<br>RW/1C/V | **Received Master Abort (RMA):** This bit must be set by a master device whenever its transaction (except for Special Cycle) is completed with Unsupported Request Completion Status (a.k.a. Master-Abort).<br>All master devices must implement this bit. |
| 28 | 0x0<br>RW/1C/V | **Received Target Abort (RTA):** This bit must be set by a master device whenever its transaction is completed with Completer Abort Completion Status (a.k.a. Target-Abort).<br>All master devices must implement this bit. |
| 27 | 0x0<br>RW/1C/V | **Signaled Target Abort (STA):** This bit must be set by a target device whenever it completes a Posted or Non-Posted transaction with a Completer Abort (a.k.a. Target-Abort) error.<br>Devices that will never signal Completer Abort (a.k.a. Target-Abort) do not need to implement this bit. |
| 26:25 | 0x0<br>RO | **Devsel Timing (DEVT):** These bits encode the timing of DEVSEL#.<br>There are three allowable timings for assertion of DEVSEL# as described below:<br>• 00b: fast;<br>• 01b: medium;<br>• 10b: slow;<br>• 11b: reserved.<br>These bits are read-only and must indicate the slowest time that a device asserts DEVSEL# for any bus command except Configuration Read and Configuration Write.<br><br>Hardwired to 00b. |
| 24 | 0x0<br>RO | **Master Data Parity Error (MDPE):** Not implemented.<br>Hardwired to 0. |
| 23 | 0x1<br>RO | **Fast Back to Back Capable (FBTBC):** This bit indicates whether or not the target is capable of accepting fast back-to-back transactions when the transactions are not to the same agent.<br>This bit can be set to 1 if the device can accept these transactions and must be set to 0 otherwise.<br>Hardwired to 1. |
| 22 | 0x0<br>RO | **Reserved (RSVD3):** Reserved (RSVD) |
| 21 | 0x1<br>RO | **66 Mhz Capable (MCAP):** This bit indicates whether or not this device is capable of running at 66 MHz.<br>• A value of 0 indicates 33 MHz.<br>• A value of 1 indicates that the device is 66 MHz capable.<br><br>Hardwired to 1. |
| 20 | 0x1<br>RO | **Capabilities List (CAPL):** This optional read-only bit indicates whether or not this device implements the pointer for a New Capabilities linked list at offset 34h.<br>A value of zero indicates that no New Capabilities linked list is available.<br>A value of one indicates that the value read at offset 34h is a pointer in Configuration Space to a linked list of new capabilities. |
| 19 | 0x0<br>RO | **Interrupt Status (INTS):** This read-only bit reflects the state of the interrupt in the device/function. Only when the Interrupt Disable bit in the command register is a 0 and this Interrupt Status bit is a 1, will the device's/function's INTx# signal be asserted.<br>Setting the Interrupt Disable bit to a 1 has no effect on the state of this bit.<br>Read-only and hardwired to 0 for a device that does NOT support pin-based interrupt. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 18:16 | 0x0<br>RO | **Reserved (RSVD2):** |
| 15:11 | 0x0<br>RO | **Reserved (RSVD1):** |
| 10 | 0x0<br>RW | **Interrupt Disable (INTD):** This bit disables the device/function from asserting INTx#.<br>• A value of 0 enables the assertion of its INTx# signal.<br>• A value of 1 disables the assertion of its INTx# signal.<br>This bit's state after RST# is 0. |
| 9 | 0x0<br>RO | **Fast Back to Back Enable (FBTBEN):** Not implemented.<br>Hardwired to 0. |
| 8 | 0x0<br>RO | **System Error Enable (SERREN):** Not implemented.<br>Hardwired to 0. |
| 7 | 0x0<br>RO | **Reserved (RSVD0):** |
| 6 | 0x0<br>RO | **Parity Error Response (PERRR):** Not implemented.<br>Hardwired to 0. |
| 5 | 0x0<br>RO | **VGA Palette Snoop (VGAPS):** Not implemented.<br>Hardwired to 0. |
| 4 | 0x0<br>RO | **Memory Write and Invalidate Enable (MWRIEN):** Not implemented.<br>Hardwired to 0. |
| 3 | 0x0<br>RO | **Special Cycles (SPCYC):** Not implemented.<br>Hardwired to 0. |
| 2 | 0x0<br>RW | **Bus Master Enable (BME):** Controls the ability of a PCI device to issue Memory and I/O Read/Write Requests, and the ability of a PCI bridge to forward Memory and I/O Read/Write Requests in the Upstream direction.<br>When this bit is Set, the PCI device function is allowed to issue Memory or I/O Requests.<br>When this bit is Clear, the PCI device function is not allowed to issue any Memory or I/O Requests.<br>***Note:*** As MSI/MSI-X interrupt Messages are in-band memory writes, setting the Bus Master Enable bit to 0b disables MSI/MSI-X interrupt Messages as well.<br>Requests other than Memory or I/O Requests are not controlled by this bit.<br>Default value of this bit is 0b.<br>This bit is hardwired to 0b if a PCI device function does not generate Memory or I/O Requests.<br>Default value of this bit is 0b. |
| 1 | 0x0<br>RO | **Memory Space Enable (MSE):** Controls a device's response to Memory Space accesses.<br>• A value of 0 disables the device response.<br>• A value of 1 allows the device to respond to Memory Space accesses. State after RST# is 0.<br>Read-only and hardwired to 0 because IDE does NOT support Memory Space accesses. |
| 0 | 0x0<br>RW | **IO Space Enable (IOSE):** Controls a device's response to I/O Space accesses.<br>• A value of 0 disables the device response.<br>• A value of 1 allows the device to respond to I/O Space accesses.<br>State after RST# is 0. |

## 52.6.3 Class Code and Revision ID (IDE_HOST_CC_RID)—Offset 8h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:2] + 8h

**Default:** 01018500h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x1<br>RO | **Base Class Code (BCC):** Identifies the Base Class Code of an external IDE controller device driver. |
| 23:16 | 0x1<br>RO | **Sub-Class Code (SCC):** Identifies the Sub-Class Code of an external IDE controller device driver. |
| 15:8 | 0x85<br>RO | **Programming Interface (PI):** Identifies the Programming Interface of an IDE controller device driver. |
| 7:0 | 0x0<br>RO/V | **Revision ID (RID):** This register specifies a device specific revision identifier.<br>The value is chosen by the vendor.<br>Zero is an acceptable value.<br>This field should be viewed as a vendor defined extension to the Device ID. |

## 52.6.4 BIST, Header Type, Latency Timer, and Cache Line Size (IDE_HOST_BIST_HTYPE_LT_CLS)—Offset Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:2] + Ch

**Default:** 00800000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RO | **Built In Self Test (BIST):** Not implemented. Hardwired to 0. |
| 23 | 0x1<br>RO/V | **Header Type 1 (HTYPE1):** This bit identifies whether or not the device contains multiple functions.<br>• If the bit is 0, then the device is single function.<br>• If the bit is 1, then the device has multiple functions. |
| 22:16 | 0x0<br>RO | **Header Type 0 (HTYPE0):** This field identifies the layout of the second part of the predefined header (beginning at byte 10h in Configuration Space).<br>• The encoding 00h specifies the non-bridge Configuration Space Header.<br>• The encoding 01h specifies the PCI-to-PCI bridge Configuration Space Header.<br>• The encoding 02h specifies the CardBus bridge Configuration Space Header.<br>• All other encodings are reserved.<br><br>Hardwired to 0 to identify the non-bridge Configuration Space Header. |
| 15:8 | 0x0<br>RO | **Latency Timer (LT):** Not implemented. Hardwired to 0. |
| 7:0 | 0x0<br>RO | **Cache Line Size (CLS):** Not implemented. Hardwired to 0. |

## 52.6.5 IDE Primary Command Block IO BAR (IDE_HOST_PCMDIOBAR)—Offset 10h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:2] + 10h

**Default:** 00000001h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:3 | 0x0<br>RW | **IO BAR (IOBAR):** Software programs this space with the base address of the device's IO region |
| 2 | 0x0<br>RO | **IO Size (IOSIZE):** Hardwired to 0 to indicate 8B of IO space |
| 1 | 0x0<br>RO | **Reserved (RSVD):** Hardwired to 0 for an IO BAR. |
| 0 | 0x1<br>RO | **IO Space Indicator (IOSPACE):** Hardwired to 1 to identify an IO BAR. |

## 52.6.6 IDE Primary Control Block IO BAR (IDE_HOST_PCTLIOBAR)—Offset 14h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:2] + 14h

**Default:** 00000001h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:2 | 0x0<br>RW | **IO BAR (IOBAR):** Software programs this space with the base address of the device's IO region |
| 1 | 0x0<br>RO | **Reserved (RSVD):** Hardwired to 0 for an IO BAR. |
| 0 | 0x1<br>RO | **IO Space Indicator (IOSPACE):** Hardwired to 1 to identify an IO BAR. |

## 52.6.7 IDE Secondary Command Block IO BAR (IDE_HOST_SCMDIOBAR)—Offset 18h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:2] + 18h

**Default:** 00000001h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:3 | 0x0<br>RW | **IO BAR (IOBAR):** Software programs this space with the base address of the device's IO region |
| 2 | 0x0<br>RO | **IO Size (IOSIZE):** Hardwired to 0 to indicate 8B of IO space |
| 1 | 0x0<br>RO | **Reserved (RSVD):** Hardwired to 0 for an IO BAR. |
| 0 | 0x1<br>RO | **IO Space Indicator (IOSPACE):** Hardwired to 1 to identify an IO BAR. |

## 52.6.8 IDE Secondary Control Block IO BAR (IDE_HOST_SCTLIOBAR)—Offset 1Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:2] + 1Ch

**Default:** 00000001h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:2 | 0x0<br>RW | **IO BAR (IOBAR):** Software programs this space with the base address of the device's IO region. |
| 1 | 0x0<br>RO | **Reserved (RSVD):** Hardwired to 0 for an IO BAR. |
| 0 | 0x1<br>RO | **IO Space Indicator (IOSPACE):** Hardwired to 1 to identify an IO BAR. |

## 52.6.9 IDE Bus Master Block IO BAR (IDE_HOST_BMIOBAR)—Offset 20h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:2] + 20h

**Default:** 00000001h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:4 | 0x0<br>RW | **IO BAR (IOBAR):** Software programs this space with the base address of the device's IO region. |
| 3:2 | 0x0<br>RO | **IO Size (IOSIZE):** Hardwired to 0 to indicate 16B of IO space. |
| 1 | 0x0<br>RO | **Reserved (RSVD):** Hardwired to 0 for an IO BAR. |
| 0 | 0x1<br>RO | **IO Space Indicator (IOSPACE):** Hardwired to 1 to identify an IO BAR. |

## 52.6.10 Cardbus CIS Pointer (IDE_HOST_CCP)—Offset 28h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:2] + 28h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO | **Cardbus CIS Pointer (CCP):** Not implemented. Hardwired to 0. |

## 52.6.11 Subsystem ID and Subsystem Vendor ID (IDE_HOST_SID_SVID)—Offset 2Ch

These registers are used to uniquely identify the add-in card or subsystem where the PCI device resides. They provide a mechanism for add-in card vendors to distinguish their add-in cards from one another even though the add-in cards may have the same PCI controller on them (and, therefore, the same Vendor ID and Device ID).

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:2] + 2Ch

**Default:** 00008086h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW/O | **Subsystem ID (SID):** Value of this field is vendor-specific.<br>This is written by BIOS. No hardware action will be taken on this value.<br><br>Implementation Note: The Write-Once lock must be implemented per field. SID should have its own lock. |
| 15:0 | 0x8086<br>RW/O | **Subsystem Vendor ID (SVID):** This field identifies the vendor of the add-in card or subsystem.<br>This is written by BIOS. No hardware action will be taken on this value.<br><br>Implementation Note: The Write-Once lock must be implemented per field. SVID should have its own lock. |

## 52.6.12 Expansion ROM Base Address (IDE_HOST_XRBAR)—Offset 30h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:2] + 30h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO | **Expansion ROM Base Address (XRBAR):** Not implemented.<br>Hardwired to 0. |

## 52.6.13 Capabilities List Pointer (IDE_HOST_CAPP)—Offset 34h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:2] + 34h

**Default:** 00000040h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0x0<br>RO | **Reserved (RSVD):** |
| 7:0 | 0x40<br>RO | **Capabilities Pointer (CAPP):** Indicates the pointer for the first entry in the capabilities list which is the MSI Capability. |

## 52.6.14 Maximum Latency, Minimum Grant, Interrupt Pin and Interrupt Line (IDE_HOST_MAXL_MING_INTP_INTL)—Offset 3Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:2] + 3Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RO | **Maximum Latency (MAXL):** Not implemented.<br>Hardwired to 0. |
| 23:16 | 0x0<br>RO | **Minimum Grant (MING):** Not implemented.<br>Hardwired to 0. |
| 15:8 | 0x0<br>RO/V | **Interrupt Pin (INTP):** This register specifies which interrupt pin IDE uses in PCI interrupt mode.<br>Value Decoding<br>00h The function does NOT use an interrupt pin.<br>01h INTA<br>02h INTB<br>03h INTC<br>04h INTD<br>05h - FFh Reserved.<br><br>***Note:*** This field shadows the IDEHIPINR.IPIN field in the PTIO Host private CR space which is configured by BIOS over IOSF SB. |
| 7:0 | 0x0<br>RW | **Interrupt Line (INTL):** This register is used to communicate interrupt line routing information.<br>POST software will write the routing information into this register as it initializes and configures the system.<br>The value in this register tells which input of the system interrupt controller(s) the device's interrupt pin is connected to.<br>The device itself does not use this value, rather it is used by device drivers and operating systems.<br>Device drivers and operating systems can use this information to determine priority and vector information.<br>Values in this register are system architecture specific. |

## 52.6.15 MSI Message Control, Next Pointer and Capability ID (IDE_HOST_MSIMC_MSINP_MSICID)—Offset 40h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:2] + 40h

**Default:** 00805005h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:25 | 0x0<br>RO | **Reserved (RSVD):** |
| 24 | 0x0<br>RO | **Per Vector Masking Capable (PVMC):** Not implemented.<br>Hardwired to 0 to indicate the function does NOT support MSI per-vector masking. |
| 23 | 0x1<br>RO | **64 bit address capable (XAC):** Hardwired to 1 to indicate the function is capable of sending a 64-bit message address. |
| 22:20 | 0x0<br>RW | **Multiple Message Enable (MMEN):** Encoded number of interrupt vectors allocated by SW.<br>This field is RW for software compatibility, but only one interrupt vector is ever sent by the function. |
| 19:17 | 0x0<br>RO | **Multiple Message Capable (MMC):** Encoded number of interrupt vectors requested by a device.<br>Hardwired to 0 to indicate one requested interrupt vector. |
| 16 | 0x0<br>RW | **MSI Enable (MSIE):** If set, MSI interrupt delivery is enabled whereas pin-based interrupt delivery SHALL be disabled.<br>If cleared, prior to returning the configuration write (that clears this field) completion, the function must send any pending MSI(s). |
| 15:8 | 0x50<br>RO | **Next Item Pointer (NP):** Indicates the pointer for the next entry in the capabilities list.<br>Hardwired to 50h to point to the PM Capability list |
| 7:0 | 0x5<br>RO | **Capability ID (CID):** Hardwired to 05h to indicate the linked list item as the MSI Capability registers |

## 52.6.16 MSI Message Address (IDE_HOST_MSIMA)—Offset 44h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:2] + 44h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:2 | 0x0<br>RW | **Message Address (MA):** 32-bit DW-aligned MSI message address. |
| 1:0 | 0x0<br>RO | **Reserved (RSVD):** |

## 52.6.17 MSI Message Upper Address (IDE_HOST_MSIMUA)—Offset 48h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:2] + 48h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Message Upper Address (MUA):** Upper 32-bit of a 64-bit DW-aligned MSI message address. |

## 52.6.18 MSI Message Data (IDE_HOST_MSIMD)—Offset 4Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:2] + 4Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **Reserved (RSVD):** |
| 15:0 | 0x0<br>RW | **Message Data (MD):** MSI Message Data |

## 52.6.19 Power Management Capabilities, Next Pointer and Capability ID (IDE_HOST_PMCAP_PMNP_PMCID)—Offset 50h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:2] + 50h

**Default:** 00230001h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:27 | 0x0<br>RO | **PME Support (PMES):** This 5-bit field indicates the power states in which the function may assert PME#. A value of 0b for any bit indicates that the function is not capable of asserting the PME# signal while in that power state.<br>• bit(27) X XXX1b - PME# can be asserted from D0<br>• bit(28) X XX1Xb - PME# can be asserted from D1<br>• bit(29) X X1XXb - PME# can be asserted from D2<br>• bit(30) X 1XXXb - PME# can be asserted from D3hot<br>• bit(31) 1 XXXXb - PME# can be asserted from D3cold |
| 26 | 0x0<br>RO | **D2 Support (D2S):** Hardwired to 0 to indicate that this device does not support D2 |
| 25 | 0x0<br>RO | **D1 Support (D1S):** Hardwired to 0 to indicate that this device does not support D1 |
| 24:22 | 0x0<br>RO | **Aux Current (AUXC):** Not implemented.<br>Hardwired to 0. |
| 21 | 0x1<br>RO | **Device Specific Initialization (DSI):** indicates whether special initialization of this function is required (beyond the standard PCI configuration header) before the generic class device driver is able to use it.<br>A 1 indicates that the function requires a device specific initialization sequence following transition to the D0 uninitialized state.<br>Hardwired to 1 to indicate Device Specific Initialization is required. |
| 20 | 0x0<br>RO | **Reserved (RSVD):** |
| 19 | 0x0<br>RO | **PME Clock (PMECLK):** Not implemented.<br>Hardwired to 0. |
| 18:16 | 0x3<br>RO | **Version (VER):** Hardwired to value of 011b indicates that this function complies with rev 1.2 of PCI Power Management Interface Spec |
| 15:8 | 0x0<br>RO | **Next Item Pointer (NP):** Indicates the pointer for the next entry in the capabilities list.<br>Hardwired to 0 to indicate no more linked list item. |
| 7:0 | 0x1<br>RO | **Capability ID (CID):** Hardwired to 01h to indicate the linked list item as the PCI Power Management registers |

## 52.6.20 Power Management Data, Control/Status Register Bridge Support Extensions, Control and Status (IDE_HOST_PMD_PMCSRBSE_PMCSR)—Offset 54h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:2] + 54h

**Default:** 00000008h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RO | **Data:** Not implemented.<br>Hardwired to 0. |
| 23:16 | 0x0<br>RO | **Control/Status Register Bridge Support Extensions (CSRBSE):** Not implemented.<br>Hardwired to 0. |
| 15 | 0x0<br>RO | **PME Status (PMESTS):** This bit is set when the function would normally assert the PME signal independent of the state of the PME_En bit.<br>• Writing a 1 to this bit will clear it and cause the function to stop asserting a PME (if enabled).<br>• Writing a 0 has no effect.<br><br>If the function supports PME from D3cold, then this bit is sticky and must be explicitly cleared by the operating system each time the operating system is initially loaded.<br><br>Not implemented. Hardwired to 0. |
| 14:13 | 0x0<br>RO | **Data Scale (DS):** Not implemented.<br>Hardwired to 0. |
| 12:9 | 0x0<br>RO | **Data Select (DSEL):** Not implemented.<br>Hardwired to 0. |
| 8 | 0x0<br>RO | **PME Enable (PMEEN):** A 1 enables the function to assert PME.<br>When 0, PME assertion is disabled.<br>This bit defaults to 0 if the function does not support PME generation from D3cold.<br>If the function supports PME from D3cold then this bit is sticky and must be explicitly cleared by the operating system each time it is initially loaded.<br><br>Not implemented. Hardwired to 0. |
| 7:4 | 0x0<br>RO | **Reserved (RSVD1):** |
| 3 | 0x1<br>RO | **No Soft Reset (NSR):** When set to 1, this bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset.<br>Configuration Context is preserved.<br>Upon transition from the D3hot to the D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the PowerState bits. |
| 2 | 0x0<br>RO | **Reserved (RSVD0):** |
| 1:0 | 0x0<br>RW | **Power State (PWRST):** This 2-bit field is used both to determine the current power state of a function and to set the function into a new power state.<br>The definition of the field values is given below:<br>00b - D0<br>01b - D1<br>10b - D2<br>11b - D3hot<br><br>If software attempts to write an unsupported, optional state to this field, the write operation must complete normally on the bus; however, the data is discarded and no state change occurs. |

## 52.6.21 Process Stepping Information (IDE_HOST_PSI)—Offset F8h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:24, F:2] + F8h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0x0<br>RO | **Reserved (RSVD):** Not implemented.<br>Hardwired to 0. |
| 27:24 | 0x0<br>RO/V | **Dot Portion of Process ID (DPOP):** Reserved. |
| 23:16 | 0x0<br>RO/V | **Manufacturing Stepping (MSID):** Reserved. |
| 15:8 | 0x0<br>RO/V | **Manufacturing ID (MID):** Reserved. |
| 7:0 | 0x0<br>RO/V | **Process Portion of Process ID (PPOP):** Reserved. |

## 52.7 Registers in Memory Space—HECI1_MMIO_MBAR

These registers are accessed in Host Memory Space starting at the relocatable memory address defined by the Base Address Register (BAR) HECI1_MMIO_MBAR_LO described in Section 52.2.9, "HECI MMIO Base Address Low (HECI1_MMIO_MBAR_LO)—Offset 10h" on page 2243 and HECI1_MMIO_MBAR_HI described in Section 52.2.10, "HECI MMIO Base Address High (HECI1_MMIO_MBAR_HI)—Offset 14h" on page 2244.

### 52.7.1 Host CB Write Window (HECI1_H_CB_WW)—Offset 0h

This register is for host to write into its Circular Buffer.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [HECI1_MMIO_MBAR] + 0h

**HECI1_MMIO_MBAR Type:** PCI Configuration Register (Size: 64 bits)
**HECI1_MMIO_MBAR Reference:** [B:0, D:24, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>WO | **Host Circular Buffer Write Window Field (H_CB_WWF):** This field is for host to write into its circular buffer.<br>This field is write only, reads will return arbitrary data.<br>Writes to this register will increment the H_CBWP as long as CSE_RDY is 1.<br>When CSE_RDY is 0, writes to this register have no effect and are not delivered to the H_CB, nor is H_CBWP incremented. |

## 52.7.2 Host Control and Status Register (HECI1_H_CSR)—Offset 4h

This register reports status information about the host circular buffer (H_CB) and allows host software to control interrupt generation.

Note to software: reserved bits in this register must be set to 0 whenever this register is written.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [HECI1_MMIO_MBAR] + 4h

**Default:** 80000000h

**HECI1_MMIO_MBAR Type:** PCI Configuration Register (Size: 64 bits)
**HECI1_MMIO_MBAR Reference:** [B:0, D:24, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x80<br>RO | **Host Circular Buffer Depth (H_CBD):** This field indicates the maximum number of 32 bit entries available in the host circular buffer (H_CB).<br>Host software uses this field along with the H_CBRP and H_CBWP fields to calculate the number of valid entries in the H_CB to read or number of entries available for write.<br>Programmers note: This field is implemented with a '1-hot' scheme. Only one bit will be set to a '1' at a time. Each bit position represents the value n of a buffer depth of (2^n). For example, when bit# 1 is 1, the buffer depth is 2; when bit#2 is 1, the buffer depth is 4, etc.<br>**This field is hardwired to represent a depth of 128 entries.** |
| 23:16 | 0x0<br>RO/V | **Host CB Write Pointer (H_CBWP):** Points to next location in the H_CB for host to write the data.<br>Software uses this field along with H_CBRP and H_CBD fields to calculate the number of valid entries in the H_CB to read or number of entries available for write. |
| 15:8 | 0x0<br>RO/V | **Host CB Read Pointer (H_CBRP):** Points to next location in the H_CB where a valid data is available for embedded controller to read.<br>Software uses this field along with H_CBWR and H_CBD fields to calculate the number of valid entries in the host CB to read or number of entries available for write. |
| 7 | 0x0<br>RO | **Reserved (RSVD_7_7):** Reserved. |
| 6 | 0x0<br>RW/1C/V | **Host D0I3 Interrupt Status (H_D0I3C_IS):** HW sets this bit to 1 when D0I3C.H_D0I3_IR is set and D0I3C.H_D0I3_CIP transitions from 1 to 0.<br>Host clears this bit to 0 by writing a 1 to this bit position.<br>H_D0I3C_IE has no effect on this bit. |
| 5 | 0x0<br>RW | **Host D0I3 Interrupt Enable (H_D0I3C_IE):** Host sets this bit to 1 to enable the host interrupt (MSI, INTx, SMI or SCI) to be asserted when H_D0I3C_IS is set to 1. |
| 4 | 0x0<br>RW | **Host Reset (H_RST):** Setting this bit to 1 will initiate the HECI reset sequence to get the circular buffers into a known good state for host and CSE communication.<br>When this bit transitions from 0 to 1, hardware will clear the H_RDY and CSE_RDY bits. |
| 3 | 0x0<br>RW/V | **Host Ready (H_RDY):** This bit indicates that the host is ready to process messages. |
| 2 | 0x0<br>RW/V | **Host Interrupt Generate (H_IG):** Once message(s) are written into its CB, the host sets this bit to one for the HW to set the CSE_IS bit in the CSE_CSR and to generate an interrupt message to mIA. HW then clears this bit to 0. |
| 1 | 0x0<br>RW/1C/V | **Host Interrupt Status (H_IS):** HW sets this bit to 1 when CSE_IG bit is set to 1.<br>Host clears this bit to 0 by writing a 1 to this bit position.<br>H_IE has no effect on this bit. |
| 0 | 0x0<br>RW | **Host Interrupt Enable (H_IE):** Host sets this bit to 1 to enable the host interrupt (MSI, INTx, SMI or SCI) to be asserted when H_IS is set to 1. |

## 52.7.3 CSE Circular Buffer Read Window (HECI1_CSE_CB_RW)—Offset 8h

This register is for host to read from the CSE Circular Buffer (CSE_CB).

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [HECI1_MMIO_MBAR] + 8h

**Default:** FFFFFFFFh

**HECI1_MMIO_MBAR Type:** PCI Configuration Register (Size: 64 bits)
**HECI1_MMIO_MBAR Reference:** [B:0, D:24, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0xffffffff<br>RO | **CSE Circular Buffer Read Window Field (CSE_CB_RWF):** This bit field is for host to read from the CSE Circular Buffer.<br>This field is read only, writes have no effect.<br>Reads to this register will increment the CSE_CBRP as long as CSE_RDY is 1.<br>When CSE_RDY is 0, reads to this register have no effect, all 1s are returned, and CSE_CBRP is not incremented. |

## 52.7.4 CSE Control and Status Register Host Access (HECI1_CSE_CSR_HA)—Offset Ch

This register allows host software to read the CSE Control Status register (CSE_CSR).

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [HECI1_MMIO_MBAR] + Ch

**Default:** 80000000h

**HECI1_MMIO_MBAR Type:** PCI Configuration Register (Size: 64 bits)
**HECI1_MMIO_MBAR Reference:** [B:0, D:24, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x80<br>RO | **CSE Circular Buffer Depth Host Read Access (CSE_CBD_HRA):** Host read access to CSE_CBD. **This field is hardwired to represent a depth of 128 entries.** |
| 23:16 | 0x0<br>RO/V | **CSE CB Write Pointer Host Read Access (CSE_CBWP_HRA):** Host read only access to CSE_CBWP. |
| 15:8 | 0x0<br>RO/V | **CSE CB Read Pointer Host Read Access (CSE_CBRP_HRA):** Host read only access to CSE_CBRP. |
| 7 | 0x0<br>RO/V | **NMI Status Host Read Access (NMI_STS_HRA):** Host read access to NMI_STS. |
| 6 | 0x0<br>RO | **Reserved (RSVD_6_6):** Reserved. |
| 5 | 0x0<br>RO/V | **Pointer Reset Host Read Access (PTR_RST_HRA):** Host read access to PTR_RST. |
| 4 | 0x0<br>RO/V | **CSE Reset Host Read Access (CSE_RST_HRA):** Host read access to CSE_RST. |
| 3 | 0x0<br>RO/V | **CSE Ready Host Read Access (CSE_RDY_HRA):** Host read access to CSE_RDY. |
| 2 | 0x0<br>RO/V | **CSE Interrupt Generate Host Read Access (CSE_IG_HRA):** Host read only access to CSE_IG. |
| 1 | 0x0<br>RO/V | **CSE Interrupt Status Host Read Access (CSE_IS_HRA):** Host read only access to CSE_IS. |
| 0 | 0x0<br>RO/V | **CSE Interrupt Enable Host Read Access (CSE_IE_HRA):** Host read only access to CSE_IE. |

## 52.7.5 D0i3 Control (HECI1_D0I3C)—Offset 800h

This register allows host to configure the power mode using D0i0/D0i3 support.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [HECI1_MMIO_MBAR] + 800h

**Default:** 00000000h

**HECI1_MMIO_MBAR Type:** PCI Configuration Register (Size: 64 bits)
**HECI1_MMIO_MBAR Reference:** [B:0, D:24, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:4 | 0x0<br>RO | **Reserved (RSVD_31_4):** Reserved. |
| 3 | 0x0<br>RO | **Restore Required (H_D0I3C_RR):** When this bit is set (by HW), SW must restore the state of the IP. This bit is cleared by SW writing a 1.<br>**In CSE this bit is never set so it does not need to be cleared by SW.** |
| 2 | 0x0<br>RW | **D0i3 (H_D0I3C_I3):** SW sets this bit to 1 in order to move the IP into the D0i3 state.<br>Clearing this bit will return the IP into the fully active D0 state (D0i0).<br>When this bit changes state, mIA may be interrupted (see H_PCI_CSR.D0I3C_IS register's description) |
| 1 | 0x0<br>RW | **Interrupt Request (H_D0I3C_IR):** SW sets this bit to 1 to ask for an interrupt to be generated on completion of the command.<br>SW must clear or set this bit on each write to this register.<br>When this bit is set to 1, Command-in-Progress deassertion is captured in H_CSR.H_D0I3_IS.<br>If H_CSR.H_D0I3_IE is 1 as well, host interrupt will be initiated. |
| 0 | 0x0<br>RO/V | **Command-in-Progress (H_D0I3C_CIP):** HW sets this bit on a 0-)1 or 1-)0 transition of D0i3 bit (bit [2]).<br>While set, the other bits in this register are not valid and it is illegal for SW to write to any of them.<br>While clear, all other bits in this register are valid and SW may write to them.<br>If Interrupt Request (bit [1]) was set for the current command, HW may clear this bit before the interrupt has been made visible to SW, since when SW actually handles a particular interrupt is not visible to HW.<br>SW writes to this bit have no effect.<br>This bit is auto-cleared by HW one cycle after it is set. |

## 52.8 Registers in Memory Space—HECI2_MMIO_MBAR

These registers are accessed in Host Memory Space starting at the relocatable memory address defined by the Base Address Register (BAR) HECI2_MMIO_MBAR_LO described in Section 52.3.9, "HECI MMIO Base Address Low (HECI2_MMIO_MBAR_LO)—Offset 10h" on page 2263 and HECI2_MMIO_MBAR_HI described in Section 52.3.10, "HECI MMIO Base Address High (HECI2_MMIO_MBAR_HI)—Offset 14h" on page 2264.

### 52.8.1 Host CB Write Window (HECI2_H_CB_WW)—Offset 0h

This register is for host to write into its Circular Buffer.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [HECI2_MMIO_MBAR] + 0h

**HECI2_MMIO_MBAR Type:** PCI Configuration Register (Size: 64 bits)
**HECI2_MMIO_MBAR Reference:** [B:0, D:24, F:1] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>WO | **Host Circular Buffer Write Window Field (H_CB_WWF):** This field is for host to write into its circular buffer.<br>This field is write only, reads will return arbitrary data. Writes to this register will increment the H_CBWP as long as CSE_RDY is 1.<br>When CSE_RDY is 0, writes to this register have no effect and are not delivered to the H_CB, nor is H_CBWP incremented. |

## 52.8.2 Host Control and Status Register (HECI2_H_CSR)—Offset 4h

This register reports status information about the host circular buffer (H_CB) and allows host software to control interrupt generation.

Note to software: reserved bits in this register must be set to 0 whenever this register is written.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [HECI2_MMIO_MBAR] + 4h

**Default:** 80000000h

**HECI2_MMIO_MBAR Type:** PCI Configuration Register (Size: 64 bits)
**HECI2_MMIO_MBAR Reference:** [B:0, D:24, F:1] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x80<br>RO | **Host Circular Buffer Depth (H_CBD):** This field indicates the maximum number of 32 bit entries available in the host circular buffer (H_CB).<br>Host software uses this field along with the H_CBRP and H_CBWP fields to calculate the number of valid entries in the H_CB to read or number of entries available for write.<br><br>Programmers note: This field is implemented with a '1-hot' scheme. Only one bit will be set to a '1' at a time. Each bit position represents the value n of a buffer depth of (2^n). For example, when bit# 1 is 1, the buffer depth is 2; when bit#2 is 1, the buffer depth is 4, etc.<br>**This field is hardwired to represent a depth of 128 entries.** |
| 23:16 | 0x0<br>RO/V | **Host CB Write Pointer (H_CBWP):** Points to next location in the H_CB for host to write the data.<br>Software uses this field along with H_CBRP and H_CBD fields to calculate the number of valid entries in the H_CB to read or number of entries available for write. |
| 15:8 | 0x0<br>RO/V | **Host CB Read Pointer (H_CBRP):** Points to next location in the H_CB where a valid data is available for embedded controller to read.<br>Software uses this field along with H_CBWR and H_CBD fields to calculate the number of valid entries in the host CB to read or number of entries available for write. |
| 7 | 0x0<br>RO | **Reserved (RSVD_7_7):** Reserved. |
| 6 | 0x0<br>RW/1C/V | **Host D0I3 Interrupt Status (H_D0I3C_IS):** HW sets this bit to 1 when D0I3C.H_D0I3_IR is set and D0I3C.H_D0I3_CIP transitions from 1 to 0.<br>Host clears this bit to 0 by writing a 1 to this bit position.<br>H_D0I3C_IE has no effect on this bit. |
| 5 | 0x0<br>RW | **Host D0I3 Interrupt Enable (H_D0I3C_IE):** Host sets this bit to 1 to enable the host interrupt (MSI, INTx, SMI or SCI) to be asserted when H_D0I3C_IS is set to 1. |
| 4 | 0x0<br>RW | **Host Reset (H_RST):** Setting this bit to 1 will initiate the HECI reset sequence to get the circular buffers into a known good state for host and CSE communication.<br>When this bit transitions from 0 to 1, hardware will clear the H_RDY and CSE_RDY bits. |
| 3 | 0x0<br>RW/V | **Host Ready (H_RDY):** This bit indicates that the host is ready to process messages. |
| 2 | 0x0<br>RW/V | **Host Interrupt Generate (H_IG):** Once message(s) are written into its CB, the host sets this bit to one for the HW to set the CSE_IS bit in the CSE_CSR and to generate an interrupt message to mIA.<br>HW then clears this bit to 0. |
| 1 | 0x0<br>RW/1C/V | **Host Interrupt Status (H_IS):** HW sets this bit to 1 when CSE_IG bit is set to 1.<br>Host clears this bit to 0 by writing a 1 to this bit position.<br>H_IE has no effect on this bit. |
| 0 | 0x0<br>RW | **Host Interrupt Enable (H_IE):** Host sets this bit to 1 to enable the host interrupt (MSI, INTx, SMI or SCI) to be asserted when H_IS is set to 1. |

## 52.8.3 CSE Circular Buffer Read Window (HECI2_CSE_CB_RW)—Offset 8h

This register is for host to read from the CSE Circular Buffer (CSE_CB).

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [HECI2_MMIO_MBAR] + 8h

**Default:** FFFFFFFFh

**HECI2_MMIO_MBAR Type:** PCI Configuration Register (Size: 64 bits)
**HECI2_MMIO_MBAR Reference:** [B:0, D:24, F:1] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0xffffffff<br>RO | **CSE Circular Buffer Read Window Field (CSE_CB_RWF):** This bit field is for host to read from the CSE Circular Buffer.<br>This field is read only, writes have no effect.<br>Reads to this register will increment the CSE_CBRP as long as CSE_RDY is 1.<br>When CSE_RDY is 0, reads to this register have no effect, all 1s are returned, and CSE_CBRP is not incremented. |

## 52.8.4 CSE Control and Status Register Host Access (HECI2_CSE_CSR_HA)—Offset Ch

This register allows host software to read the CSE Control Status register (CSE_CSR).

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [HECI2_MMIO_MBAR] + Ch

**Default:** 80000000h

**HECI2_MMIO_MBAR Type:** PCI Configuration Register (Size: 64 bits)
**HECI2_MMIO_MBAR Reference:** [B:0, D:24, F:1] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x80<br>RO | **CSE Circular Buffer Depth Host Read Access (CSE_CBD_HRA):** Host read access to CSE_CBD. **This field is hardwired to represent a depth of 128 entries.** |
| 23:16 | 0x0<br>RO/V | **CSE CB Write Pointer Host Read Access (CSE_CBWP_HRA):** Host read only access to CSE_CBWP. |
| 15:8 | 0x0<br>RO/V | **CSE CB Read Pointer Host Read Access (CSE_CBRP_HRA):** Host read only access to CSE_CBRP. |
| 7 | 0x0<br>RO/V | **NMI Status Host Read Access (NMI_STS_HRA):** Host read access to NMI_STS. |
| 6 | 0x0<br>RO | **Reserved (RSVD_6_6):** Reserved. |
| 5 | 0x0<br>RO/V | **Pointer Reset Host Read Access (PTR_RST_HRA):** Host read access to PTR_RST. |
| 4 | 0x0<br>RO/V | **CSE Reset Host Read Access (CSE_RST_HRA):** Host read access to CSE_RST. |
| 3 | 0x0<br>RO/V | **CSE Ready Host Read Access (CSE_RDY_HRA):** Host read access to CSE_RDY. |
| 2 | 0x0<br>RO/V | **CSE Interrupt Generate Host Read Access (CSE_IG_HRA):** Host read only access to CSE_IG. |
| 1 | 0x0<br>RO/V | **CSE Interrupt Status Host Read Access (CSE_IS_HRA):** Host read only access to CSE_IS. |
| 0 | 0x0<br>RO/V | **CSE Interrupt Enable Host Read Access (CSE_IE_HRA):** Host read only access to CSE_IE. |

## 52.8.5 D0i3 Control (HECI2_D0I3C)—Offset 800h

This register allows host to configure the power mode using D0i0/D0i3 support.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [HECI2_MMIO_MBAR] + 800h

**HECI2_MMIO_MBAR Type:** PCI Configuration Register (Size: 64 bits)
**HECI2_MMIO_MBAR Reference:** [B:0, D:24, F:1] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:4 | 0x0<br>RO | **Reserved (RSVD_31_4):** Reserved. |
| 3 | 0x0<br>RO | **Restore Required (H_D0I3C_RR):** When this bit is set (by HW), SW must restore the state of the IP. This bit is cleared by SW writing a 1.<br>**In CSE this bit is never set so it does not need to be cleared by SW.** |
| 2 | 0x0<br>RW | **D0i3 (H_D0I3C_I3):** SW sets this bit to 1 in order to move the IP into the D0i3 state.<br>Clearing this bit will return the IP into the fully active D0 state (D0i0).<br>When this bit changes state, mIA may be interrupted (see H_PCI_CSR.D0I3C_IS register's description) |
| 1 | 0x0<br>RW | **Interrupt Request (H_D0I3C_IR):** SW sets this bit to 1 to ask for an interrupt to be generated on completion of the command.<br>SW must clear or set this bit on each write to this register.<br>When this bit is set to 1, Command-in-Progress deassertion is captured in H_CSR.H_D0I3_IS.<br>If H_CSR.H_D0I3_IE is 1 as well, host interrupt will be initiated. |
| 0 | 0x0<br>RO/V | **Command-in-Progress (H_D0I3C_CIP):** HW sets this bit on a 0-)1 or 1-)0 transition of D0i3 bit (bit [2]).<br>While set, the other bits in this register are not valid and it is illegal for SW to write to any of them.<br>While clear, all other bits in this register are valid and SW may write to them.<br>If Interrupt Request (bit [1]) was set for the current command, HW may clear this bit before the interrupt has been made visible to SW, since when SW actually handles a particular interrupt is not visible to HW.<br>SW writes to this bit have no effect.<br>This bit is auto-cleared by HW one cycle after it is set. |

## 52.9 Registers in Memory Space—HECI3_MMIO_MBAR

These registers are accessed in Host Memory Space starting at the relocatable memory address defined by the Base Address Register (BAR) HECI3_MMIO_MBAR_LO described in Section 52.4.9, "HECI MMIO Base Address Low (HECI3_MMIO_MBAR_LO)—Offset 10h" on page 2280 and HECI3_MMIO_MBAR_HI described in Section 52.4.10, "HECI MMIO Base Address High (HECI3_MMIO_MBAR_HI)—Offset 14h" on page 2281.

### 52.9.1 Host CB Write Window (HECI3_H_CB_WW)—Offset 0h

This register is for host to write into its Circular Buffer.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [HECI3_MMIO_MBAR] + 0h

**HECI3_MMIO_MBAR Type:** PCI Configuration Register (Size: 64 bits)
**HECI3_MMIO_MBAR Reference:** [B:0, D:24, F:4] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>WO | **Host Circular Buffer Write Window Field (H_CB_WWF):** This field is for host to write into its circular buffer.<br>This field is write only, reads will return arbitrary data.<br>Writes to this register will increment the H_CBWP as long as CSE_RDY is 1.<br>When CSE_RDY is 0, writes to this register have no effect and are not delivered to the H_CB, nor is H_CBWP incremented. |

## 52.9.2 Host Control and Status Register (HECI3_H_CSR)—Offset 4h

This register reports status information about the host circular buffer (H_CB) and allows host software to control interrupt generation.

Note to software: reserved bits in this register must be set to 0 whenever this register is written.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [HECI3_MMIO_MBAR] + 4h

**Default:** 80000000h

**HECI3_MMIO_MBAR Type:** PCI Configuration Register (Size: 64 bits)
**HECI3_MMIO_MBAR Reference:** [B:0, D:24, F:4] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x80<br>RO | **Host Circular Buffer Depth (H_CBD):** This field indicates the maximum number of 32 bit entries available in the host circular buffer (H_CB).<br>Host software uses this field along with the H_CBRP and H_CBWP fields to calculate the number of valid entries in the H_CB to read or number of entries available for write.<br>Programmers note: This field is implemented with a '1-hot' scheme. Only one bit will be set to a '1' at a time. Each bit position represents the value n of a buffer depth of (2^n). For example, when bit# 1 is 1, the buffer depth is 2; when bit#2 is 1, the buffer depth is 4, etc.<br>**This field is hardwired to represent a depth of 128 entries.** |
| 23:16 | 0x0<br>RO/V | **Host CB Write Pointer (H_CBWP):** Points to next location in the H_CB for host to write the data.<br>Software uses this field along with H_CBRP and H_CBD fields to calculate the number of valid entries in the H_CB to read or number of entries available for write. |
| 15:8 | 0x0<br>RO/V | **Host CB Read Pointer (H_CBRP):** Points to next location in the H_CB where a valid data is available for embedded controller to read.<br>Software uses this field along with H_CBWR and H_CBD fields to calculate the number of valid entries in the host CB to read or number of entries available for write. |
| 7 | 0x0<br>RO | **Reserved (RSVD_7_7):** Reserved. |
| 6 | 0x0<br>RW/1C/V | **Host D0I3 Interrupt Status (H_D0I3C_IS):** HW sets this bit to 1 when D0I3C.H_D0I3_IR is set and D0I3C.H_D0I3_CIP transitions from 1 to 0.<br>Host clears this bit to 0 by writing a 1 to this bit position. H_D0I3C_IE has no effect on this bit. |
| 5 | 0x0<br>RW | **Host D0I3 Interrupt Enable (H_D0I3C_IE):** Host sets this bit to 1 to enable the host interrupt (MSI, INTx, SMI or SCI) to be asserted when H_D0I3C_IS is set to 1. |
| 4 | 0x0<br>RW | **Host Reset (H_RST):** Setting this bit to 1 will initiate the HECI reset sequence to get the circular buffers into a known good state for host and CSE communication.<br>When this bit transitions from 0 to 1, hardware will clear the H_RDY and CSE_RDY bits. |
| 3 | 0x0<br>RW/V | **Host Ready (H_RDY):** This bit indicates that the host is ready to process messages. |
| 2 | 0x0<br>RW/V | **Host Interrupt Generate (H_IG):** Once message(s) are written into its CB, the host sets this bit to one for the HW to set the CSE_IS bit in the CSE_CSR and to generate an interrupt message to mIA. HW then clears this bit to 0. |
| 1 | 0x0<br>RW/1C/V | **Host Interrupt Status (H_IS):** HW sets this bit to 1 when CSE_IG bit is set to 1.<br>Host clears this bit to 0 by writing a 1 to this bit position. H_IE has no effect on this bit. |
| 0 | 0x0<br>RW | **Host Interrupt Enable (H_IE):** Host sets this bit to 1 to enable the host interrupt (MSI, INTx, SMI or SCI) to be asserted when H_IS is set to 1. |

## 52.9.3 CSE Circular Buffer Read Window (HECI3_CSE_CB_RW)—Offset 8h

This register is for host to read from the CSE Circular Buffer (CSE_CB).

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [HECI3_MMIO_MBAR] + 8h

**Default:** FFFFFFFFh

**HECI3_MMIO_MBAR Type:** PCI Configuration Register (Size: 64 bits)
**HECI3_MMIO_MBAR Reference:** [B:0, D:24, F:4] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0xffffffff<br>RO | **CSE Circular Buffer Read Window Field (CSE_CB_RWF):** This bit field is for host to read from the CSE Circular Buffer.<br>This field is read only, writes have no effect.<br>Reads to this register will increment the CSE_CBRP as long as CSE_RDY is 1.<br>When CSE_RDY is 0, reads to this register have no effect, all 1s are returned, and CSE_CBRP is not incremented. |

## 52.9.4 CSE Control and Status Register Host Access (HECI3_CSE_CSR_HA)—Offset Ch

This register allows host software to read the CSE Control Status register (CSE_CSR).

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [HECI3_MMIO_MBAR] + Ch

**Default:** 80000000h

**HECI3_MMIO_MBAR Type:** PCI Configuration Register (Size: 64 bits)
**HECI3_MMIO_MBAR Reference:** [B:0, D:24, F:4] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x80<br>RO | **CSE Circular Buffer Depth Host Read Access (CSE_CBD_HRA):** Host read access to CSE_CBD. **This field is hardwired to represent a depth of 128 entries.** |
| 23:16 | 0x0<br>RO/V | **CSE CB Write Pointer Host Read Access (CSE_CBWP_HRA):** Host read only access to CSE_CBWP. |

## 52.9.5 D0i3 Control (HECI3_D0I3C)—Offset 800h

This register allows host to configure the power mode using D0i0/D0i3 support.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [HECI3_MMIO_MBAR] + 800h

**HECI3_MMIO_MBAR Type:** PCI Configuration Register (Size: 64 bits)
**HECI3_MMIO_MBAR Reference:** [B:0, D:24, F:4] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:4 | 0x0<br>RO | **Reserved (RSVD_31_4):** Reserved. |
| 3 | 0x0<br>RO | **Restore Required (H_D0I3C_RR):** When this bit is set (by HW), SW must restore the state of the IP. This bit is cleared by SW writing a 1.<br>**In CSE this bit is never set so it does not need to be cleared by SW.** |
| 2 | 0x0<br>RW | **D0i3 (H_D0I3C_I3):** SW sets this bit to 1 in order to move the IP into the D0i3 state.<br>Clearing this bit will return the IP into the fully active D0 state (D0i0).<br>When this bit changes state, mIA may be interrupted (see H_PCI_CSR.D0I3C_IS register's description) |
| 1 | 0x0<br>RW | **Interrupt Request (H_D0I3C_IR):** SW sets this bit to 1 to ask for an interrupt to be generated on completion of the command.<br>SW must clear or set this bit on each write to this register.<br>When this bit is set to 1, Command-in-Progress deassertion is captured in H_CSR.H_D0I3_IS.<br>If H_CSR.H_D0I3_IE is 1 as well, host interrupt will be initiated. |
| 0 | 0x0<br>RO/V | **Command-in-Progress (H_D0I3C_CIP):** HW sets this bit on a 0-)1 or 1-)0 transition of D0i3 bit (bit [2]).<br>While set, the other bits in this register are not valid and it is illegal for SW to write to any of them.<br>While clear, all other bits in this register are valid and SW may write to them.<br>If Interrupt Request (bit [1]) was set for the current command, HW may clear this bit before the interrupt has been made visible to SW, since when SW actually handles a particular interrupt is not visible to HW.<br>SW writes to this bit have no effect.<br>This bit is auto-cleared by HW one cycle after it is set. |

## 52.10 Registers in Memory Space—KT_HOST_MEMBAR

These registers are accessed in Host Memory Space starting at the relocatable memory address defined by the Base Address Register (BAR) KT_HOST_MEMBAR described in Section 52.5.6, "KT Memory BAR (KT_HOST_MEMBAR)—Offset 14h" on page 2296.

### 52.10.1 KT Receive Buffer Register (MEM_KTRBR)—Offset 0h

This register implements the standard Receiver Buffer register in the KT Block. This is read-only. DLAB (i.e. KTLCR[7]) shall be 0. In non-FIFO mode, this register will be read when the receiver data is ready. In FIFO mode, a read from this register will be translated into a read from the RBR FIFO.

Reset condition: Host reset. Non-sticky.

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [KT_HOST_MEMBAR] + 0h

**KT_HOST_MEMBAR Type:** PCI Configuration Register (Size: 32 bits)
**KT_HOST_MEMBAR Reference:** [B:0, D:24, F:3] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO/V | **Receiver Buffer Register (RBR):** Implements the Receiver Buffer register of the Serial Interface. |

### 52.10.2 KT Transmitter Holding Register (MEM_KTTHR)—Offset 0h

This register implements the standard Transmitter Holding register in the KT Block. This is write-only. DLAB (i.e. KTLCR[7]) shall be 0. In non-FIFO mode, this register will be written when the Host needs to transmit data. In FIFO mode, a write to this register will be translated into a write to the THR FIFO.

Reset condition: Host reset. Non-sticky.

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [KT_HOST_MEMBAR] + 0h

**KT_HOST_MEMBAR Type:** PCI Configuration Register (Size: 32 bits)
**KT_HOST_MEMBAR Reference:** [B:0, D:24, F:3] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>WO | **Transmitter Holding Register (THR):** Implements the Transmit Data register of the Serial Interface. |

## 52.10.3 KT Divisor Latch LSB Register (MEM_KTDLLR)—Offset 0h

This register implements the standard DLL register in the KT Block. DLAB (i.e. KTLCR[7]) shall be 1 in order for this register to be accessed. this register is supported only for SW compatibility and has no impact on HW performance.

Reset condition: Host reset. Non-sticky.

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [KT_HOST_MEMBAR] + 0h

**KT_HOST_MEMBAR Type:** PCI Configuration Register (Size: 32 bits)
**KT_HOST_MEMBAR Reference:** [B:0, D:24, F:3] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW/V | **Divisor Latch LSB (DLL):** Implements the DLL register of the Serial Interface. |

## 52.10.4 KT Interrupt Enable register (MEM_KTIER)—Offset 1h

This register implements the standard Interrupt Enable register in the KT Block. The bits enable specific events to interrupt the Host. See bit specific definition below. DLAB (i.e. KTLCR[7]) shall is 0 in order for this register to be accessed.

Reset condition: Host reset. Non-sticky.

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [KT_HOST_MEMBAR] + 1h

**KT_HOST_MEMBAR Type:** PCI Configuration Register (Size: 32 bits)
**KT_HOST_MEMBAR Reference:** [B:0, D:24, F:3] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:4 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 3 | 0x0<br>RW | **MSR (IER3):** When set, enables bits in Modem Status register to cause an interrupt to the Host |
| 2 | 0x0<br>RW | **LSR (IER2):** When set, enables bits in Receiver Line Status Register to cause an interrupt to the Host |
| 1 | 0x0<br>RW | **THR (IER1):** When set, enables an interrupt to the Host when the Transmitter Holding register is empty |
| 0 | 0x0<br>RW | **DR (IER0):** When set, enables an interrupt to the Host when the Received Data is available OR Receiver FIFO timeout. |

## 52.10.5 KT Divisor Latch MSB Register (MEM_KTDLMR)—Offset 1h

This register implements the standard DLM register in the KT Block. DLAB (i.e. KTLCR[7]) shall be 1 in order for this register to be accessed. This register is supported only for SW compatibility and has no impact on HW performance.

Reset condition: Host reset. Non-sticky.

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**BAR and Offset:** [KT_HOST_MEMBAR] + 1h

**Default:** 00h

**KT_HOST_MEMBAR Type:** PCI Configuration Register (Size: 32 bits)
**KT_HOST_MEMBAR Reference:** [B:0, D:24, F:3] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW/V | **Divisor Latch MSB (DLM):** Implements the DLM register of the Serial Interface. |

## 52.10.6 KT Interrupt Identification Register (MEM_KTIIR)—Offset 2h

This register implements the standard Interrupt Identification register in the KT Block. This is read-only. This register is created to provide minimum software overhead during data character transfers. The register prioritizes KT interrupts into 4 levels and records them in the IIRSTS field of this register. The four levels of interrupt conditions in order of priority are: Receiver Line Status; Received Data Ready/Character Timeout Indication; Transmitter Holding Register Empty; MODEM Status. When the Host accesses the IIR, the HW freezes all interrupts and indicates the highest priority pending interrupt to the Host. While this Host access is occurring, the HW records new interrupts, but does not change its current indication until the access is complete. Table in the Host Interrupt Generation section shows the contents.

Reset condition: Host reset. Non-sticky.

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**BAR and Offset:** [KT_HOST_MEMBAR] + 2h

**Default:** 01h

**KT_HOST_MEMBAR Type:** PCI Configuration Register (Size: 32 bits)
**KT_HOST_MEMBAR Reference:** [B:0, D:24, F:3] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RO/V | **FIFO Enable (FIEN1):** This field is connected by HW to the FIFO Enable field of the FCR register. |
| 6 | 0x0<br>RO/V | **FIFO Enable (FIEN0):** This field is connected by HW to the FIFO Enable field of the FCR register. |
| 5:4 | 0x0<br>RO | **Reserved (RSVD):** Hardwired to 0. |
| 3:1 | 0x0<br>RO/V | **IIR Status (IIRSTS):** These bits are asserted by the HW according to the source of the interrupt and the priority level.<br>Refer to the section on Host Interrupt Generation for a table of values. |
| 0 | 0x1<br>RO/V | **Interrupt Status (INTSTS):** 0: indicates a pending Host interrupt and IIRSTS may be used as a pointer to the appropriate interrupt service routine. It reflects the logical-NOR of all UART interrupts. An individual UART interrupt will be identified as pending when the individual event status is asserted AND its corresponding event interrupt enable is asserted as well.<br>For example, the THR Empty interrupt will be identified as pending when both LSR[THRE] bit is 1 AND IER[IER1] is 1.<br>1: indicates no pending Host interrupt. |

## 52.10.7 KT FIFO Control register (MEM_KTFCR)—Offset 2h

This register implements the standard FIFO Control register in the KT Block. It is used to configure features pertinent to the FIFO mode of operation. This is write-only.

Reset condition: Host reset. Non-sticky.

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [KT_HOST_MEMBAR] + 2h

**KT_HOST_MEMBAR Type:** PCI Configuration Register (Size: 32 bits)
**KT_HOST_MEMBAR Reference:** [B:0, D:24, F:3] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:6 | 0x0<br>WO | **Receiver Trigger Level (RTL):** Trigger level in bytes for the Receiver FIFO.<br>Once the trigger level number of bytes is reached, an interrupt will be sent to the Host [7:6] RCVR FIFO Trigger Level (bytes)<br>• 00 -- 01<br>• 01 -- 04<br>• 10 -- 08<br>• 11 -- 14 |
| 5:4 | 0x0<br>WO | **Reserved (RSVD):** Writes to this field shall be dropped. |
| 3 | 0x0<br>WO | **RDY Mode (RDYM):** This bit has no effect on HW performance |
| 2 | 0x0<br>WO | **XMT FIFO Clear (XFIC):** When the Host writes one to this bit the HW will clear the XMT FIFO.<br>This bit is self-cleared by HW. |
| 1 | 0x0<br>WO | **RCV FIFO Clear (RFIC):** When the Host writes one to this bit the HW will clear the RCV FIFO.<br>This bit is self-cleared by HW. |
| 0 | 0x0<br>WO | **FIFO Enable (FIE):** When set indicates that the KT interface is working in FIFO node.<br>When this bit value is changed the RCV and XMT FIFO are cleared by HW.<br>This bit must be a 1 when other FCR bits are written to or they will NOT be programmed. |

## 52.10.8 KT Line Control register (MEM_KTLCR)—Offset 3h

This register implements the standard Line Control register in the KT Block. It specifies the format of the asynchronous data communications exchange and sets the DLAB bit. Most bits in this register have no effect on HW and are only used by the FW.

Reset condition: Host reset. Non-sticky.

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**BAR and Offset:** [KT_HOST_MEMBAR] + 3h

**Default:** 03h

**KT_HOST_MEMBAR Type:** PCI Configuration Register (Size: 32 bits)
**KT_HOST_MEMBAR Reference:** [B:0, D:24, F:3] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RW | **Divisor Latch Access Bit (DLAB):**<br>• 1: Allows access to the Divisor Latch Registers and reading of the FIFO Control Register.<br>• 0: Allows access to RBR, THR, IER and IIR registers. |
| 6 | 0x0<br>RW | **Break Control (BC):** This bit has no effect on HW |
| 5:4 | 0x0<br>RW | **Parity Bit Mode (PBM):** This bit has no effect on HW |
| 3 | 0x0<br>RW | **Parity Enable (PE):** This bit has no effect on HW |
| 2 | 0x0<br>RW | **Stop Bit Select (SBS):** This bit has no effect on HW |
| 1:0 | 0x3<br>RW | **Word Select Byte (WSB):** This bit has no effect on HW. |

## 52.10.9 KT Modem Control register (MEM_KTMCR)—Offset 4h

This register implements the standard Modem Control register in the KT Block. It controls the interface with the modem. Because the FW emulates the modem, the Host communicates with the FW via this register. This register has impact on the HW in the loopback mode.

Reset condition: Host reset. Non-sticky.

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**BAR and Offset:** [KT_HOST_MEMBAR] + 4h

**Default:** 00h

**KT_HOST_MEMBAR Type:** PCI Configuration Register (Size: 32 bits)
**KT_HOST_MEMBAR Reference:** [B:0, D:24, F:3] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:5 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 4 | 0x0<br>RW | **Loop Back Mode (LBM):** When set by Host indicates that the serial port is in loop Back mode. This means that the data that is transmitted by the host should be received. Helps in debug of the interface |
| 3 | 0x0<br>RW | **Output 2 (OUT2):** This bit has no effect on HW in normal mode.<br>In loop back mode the value of this bit is written by HW to Modem Status Register bit (7) |
| 2 | 0x0<br>RW | **Output 1 (OUT1):** This bit has no effect on HW in normal mode.<br>In loop back mode the value of this bit is written by HW to Modem Status Register bit(6) |
| 1 | 0x0<br>RW | **Request to Send Out (RTSO):** This bit has no effect on HW in normal mode.<br>In loopback mode, the value of this bit is written by HW to Modem Status Register bit(4) |
| 0 | 0x0<br>RW | **Data Terminal Ready Out (DRTO):** This bit has no effect on HW in normal mode.<br>In loopback mode, the value in this bit is written by HW to Modem Status Register Bit(5) |

## 52.10.10 KT Line Status register (MEM_KTLSR)—Offset 5h

This register implements the standard Line Status register in the KT Block. It provides status information of the data transfer to the Host. Error indication etc are provided by the HW/FW to the host via this register.

Reset condition: Host reset. Non-sticky.

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**BAR and Offset:** [KT_HOST_MEMBAR] + 5h

**Default:** 60h

**KT_HOST_MEMBAR Type:** PCI Configuration Register (Size: 32 bits)
**KT_HOST_MEMBAR Reference:** [B:0, D:24, F:3] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RO/C/V | **RCVR FIFO Error (RXFER):** This bit is cleared in non FIFO mode.<br>This bit is connected to UART LSR[BI] bit in FIFO mode. |
| 6 | 0x1<br>RO/V | **Transmitter Empty (TEMT):** In non-FIFO mode:<br>this bit will be set to 1 whenever the Transmitter Holding Register (THR) and the Transmitter Shift Register (TSR) are both empty, OR cleared to 0 whenever either THR or TSR contains a data byte.<br><br>In FIFO mode:<br>this bit will be set to 1 whenever XMIT FIFO and TSR are both empty, OR cleared to 0 whenever either XMIT FIFO or TSR contains a data byte.<br><br>Implementation note: This bit is connected by HW to THRE bit |
| 5 | 0x1<br>RO/V | **Transmitter Holding Register Empty (THRE):** The bit will always be set whenever Host changes UART FCR[FIE] bit.<br>This bit is controlled differently in FIFO vs non-FIFO modes:<br>Non-FIFO mode: This bit will be cleared by HW when Host writes to THR, and set by HW when FW reads from THR.<br>FIFO mode: This bit will be set by HW when XMIT FIFO is empty , and cleared by HW when XMIT FIFO is NOT empty. |
| 4 | 0x0<br>RO/C/V | **Break Interrupt (BI):** This bit will be cleared by HW when the UART LSR register is read by Host.<br>This bit will be set by HW in two cases:<br>In FIFO mode, when FW sets the KTRIVR[SBI] bit.<br>In non-FIFO mode, when FW sets the KTRBR[BIA] bit. |
| 3 | 0x0<br>RO | **Framing Error (FE):** This bit is NOT implemented and hardwired to 0. |
| 2 | 0x0<br>RO | **Parity Error (PE):** This bit is NOT implemented and hardwired to 0. |
| 1 | 0x0<br>RO/C/V | **Overrun Error (OE):** HW will clear this bit when Host reads from KTLSR register and this is source of interrupt.<br>HW will set this bit when overrun error is detected.<br>In non-FIFO mode, the character that triggers the overrun error shall overwrite the character in the RBR register.<br>In FIFO mode, the character that triggers the overrun error shall be dropped without corrupting the RCVR FIFO. |
| 0 | 0x0<br>RO/V | **Data Ready (DR):** Non-FIFO Mode: this bit will be set by HW when FW writes to RBR and cleared by HW when Host reads from RBR.<br>FIFO Mode: the bit will be set by HW when RCVR FIFO is not empty and cleared by HW when RCVR FIFO is empty. |

## 52.10.11 KT Modem Status register (MEM_KTMSR)—Offset 6h

This register implements the standard Modem Status register in the KT Block. It provides the current state of the control lines from the modem. The modem functionality is emulated by the FW.

Reset condition: Host reset. Non-sticky.

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**BAR and Offset:** [KT_HOST_MEMBAR] + 6h

**Default:** 00h

**KT_HOST_MEMBAR Type:** PCI Configuration Register (Size: 32 bits)
**KT_HOST_MEMBAR Reference:** [B:0, D:24, F:3] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RO | **Data Carrier Detect (DCD):** In Loop Back mode this bit is connected by HW to the value of MCR bit 3 |
| 6 | 0x0<br>RO | **Ring Indicator (RI):** In Loop Back mode this bit is connected by HW to the value of MCR bit 2. |
| 5 | 0x0<br>RO | **Data Set Ready (DSR):** In Loop Back mode this bit is connected by HW to the value of MCR bit 0. |
| 4 | 0x0<br>RO | **Clear To Send (CTS):** In Loop Back mode this bit is connected by HW to the value of MCR bit 1. |
| 3 | 0x0<br>RO/C/V | **Delta Data Carrier Detect (DDCD):** This bit is set when bit 7 is changed.<br>This bit is cleared by HW when the MSR register is being read by the HOST driver. |
| 2 | 0x0<br>RO/C/V | **Trailing Edge of Read Detector (TERI):** This bit is set when bit 6 is changed from 1 to 0.<br>This bit is cleared by HW when the MSR register is being read by the Host driver. |
| 1 | 0x0<br>RO/C/V | **Delta Data Set Ready (DDSR):** This bit is set when bit 5 is changed.<br>This bit is cleared by HW when the MSR register is being read by the Host driver |
| 0 | 0x0<br>RO/C/V | **Delta Clear To Send (DCTS):** This bit is set when bit 4 is changed.<br>This bit is cleared by HW when the MSR register is being read by the Host driver |

## 52.10.12 KT Scratch register (MEM_KTSCR)—Offset 7h

This register implements the standard Scratch register in the KT Block. It allows Host SW programmers to hold temporary data. It has NO effect on HW.

Reset condition: Host reset. Non-sticky.

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**BAR and Offset:** [KT_HOST_MEMBAR] + 7h

**Default:** 00h

**KT_HOST_MEMBAR Type:** PCI Configuration Register (Size: 32 bits)
**KT_HOST_MEMBAR Reference:** [B:0, D:24, F:3] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Scratch Register Data (SCRD):** Reserved. |

## 52.11 Registers in Memory Space—Fixed Address

These registers are accessed in Host Memory Space through fixed memory addresses.

### 52.11.1 FTPM Locality State (HOST_LOC_0_LOC_STATE_HROA)—Offset FED40000h

Reads by host SW from this register will reflect the value of FTPM_LOC_STATE register in mIA space. This register is aliased to the following addresses in the host address space: FED4_x000, x=0,1,2,3,4. This register is implemented in flip-flops.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [0x0] + FED40000h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0x0<br>RO/V | **Reserved (RSVD_31_8):** Opaque to HW. Defined by FW. |
| 7 | 0x0<br>RO/V | **Register Valid Status (FTPM_REG_VALID_STS):** Opaque to HW.<br>This bit is used by FW to signal to host SW when this register is valid. |
| 6:5 | 0x0<br>RO/V | **Reserved (RSVD_6_5):** Opaque to HW. Defined by FW. |
| 4:2 | 0x0<br>RO/V | **Active Locality (FTPM_ACTV_LOC):** The encodings are:<br>• 000 - Locality 0,<br>• 001 - Locality 1,<br>• 010 - Locality 2,<br>• 011 - Locality 3,<br>• 100 - Locality 4,<br>• 101 and 111 - reserved.<br>FW sets these bits to mux in the active locality.<br>Once set, the FTPM HCI will pass cycles from the active host locality to the FTPM shared SRAM.<br>Writes from in-active localities will be dropped and reads will return 0's. |
| 1 | 0x0<br>RO/V | **Locality Assigned (FTPM_LOC_ASSIGNED):** A value of 0 indicates to host SW that no locality is assigned, a value of 1 indicates a locality has been assigned. |
| 0 | 0x0<br>RO/V | **Establishment (FTPM_ESTABLISHMENT):** Opaque to HW.<br>This bit is set to 0 by FW when HASH_START occurs and set to 1 when the RESET_ESTABLISHMENT bit is set. |

### 52.11.2 FTPM Locality Reserved (HOST_LOC_0_LOC_RSVD)—Offset FED40004h

This register was added in order to support QW reads from Locality State register.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [0x0] + FED40004h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO | **Reserved (FTPM_LOC_RSVD_BITS):** Reserved. |

### 52.11.3 FTPM Locality n Control Register (HOST_LOC_0_LOC_CTRL)—Offset FED40008h

Writes by host SW to this register will update the value of the corresponding LOC_n_CTRL_CSEROA register in mIA space. Writes by host SW to this register may be configured by CSE FW to trigger an MSI/PME to mIA. This register is implemented in flip-flops.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [0x0] + FED40008h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>WO | **FTPM Locality n Control Bits (FTPM_LOC_CTRL_BITS):** Reserved. |

### 52.11.4 FTPM Locality n Status Register Host Read Only Access. (HOST_LOC_0_LOC_STS_HROA)—Offset FED4000Ch

Reads by host SW from this register will reflect the value of the corresponding LOC_n_STS register in mIA space. This register is opaque to HW. This register is implemented in flip-flops.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [0x0] + FED4000Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **FTPM Locality n Status Bits (FTPM_LOC_STS_BITS):** Reserved. |

### 52.11.5 FTPM Locality Config Area Reserved Read Write[0-7] (HOST_LOC_0_RSVD_RW1[0-7])—Offset FED40010h, Count 8, Stride 4h

This register represents a DW of RW memory in FTPM EBB which has no defined functionality. This DW is aliased to the same offset for each locality, and even inactive localities can access it.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset[0-7]:** [0x0] + FED40010h + [0-7]*4h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **FTPM Locality Config Area Reserved Read Write DW (RSVD_RW_31_0):** Reserved. |

### 52.11.6 FTPM Interface ID Host Read Only Access 0 (HOST_LOC_0_INTF_ID_0)—Offset FED40030h

This register is opaque to HW. This register is implemented in flip-flops.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [0x0] + FED40030h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **FTPM Interface ID Bits 0 (FTPM_INTF_ID_BITS_0):** These are the 32 LSbits used by FW to inform host SW as to the interface type of the TPM.<br>The exact usage is defined by TCG. |

### 52.11.7 FTPM Interface ID Host Read Only Access 1 (HOST_LOC_0_INTF_ID_1)—Offset FED40034h

This register is opaque to HW. This register is implemented in flip-flops.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [0x0] + FED40034h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **FTPM Interface ID Bits 1 (FTPM_INTF_ID_BITS_1):** These are the 32 MSbits used by FW to inform host SW as to the interface type of the TPM.<br>The exact usage is defined by TCG. |

## 52.11.8 FTPM Locality Config Area Reserved Read Write[0-1] (HOST_LOC_0_RSVD_RW2[0-1])—Offset FED40038h, Count 2, Stride 4h

This register represents a DW of RW memory in FTPM EBB which has no defined functionality. This DW is aliased to the same offset for each locality, and even inactive localities can access it.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset[0-1]:** [0x0] + FED40038h + [0-1]*4h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **FTPM Locality Config Area Reserved Read Write DW (RSVD_RW_31_0):** Reserved. |

## 52.11.9 Control Area Request (HOST_LOC_0_CA_REQUEST)—Offset FED40040h

This register is implemented in flip-flops. This register is implemented in retention flops to maintain state through PG.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [0x0] + FED40040h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **HOST_CA_REQUEST:** Host software sets this field to a CSxE firmware-defined value to indicate a state change request to the fTPM.<br>Any host write to this register shall result in an interrupt to the CSxE firmware, or wakeup the CSxE subsystem when it is in power-gated state. |

## 52.11.10 Control Area Status (HOST_LOC_0_CA_STATUS)—Offset FED40044h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [0x0] + FED40044h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **HOST_CA_STATUS:** Reserved. |

## 52.11.11 Control Area Cancel (HOST_LOC_0_CA_CANCEL)—Offset FED40048h

This register is implemented in flip-flops. This register is implemented in retention flops to maintain state through PG.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [0x0] + FED40048h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **HOST_CA_CANCEL:** Host software sets this field to a CSxE firmware-defined value to indicate that a command should be canceled.<br>Any host write to this register shall result in an interrupt to the CSxE firmware, or wakeup the CSxE subsystem when it is in power-gated state. |

## 52.11.12 Control Area Start (HOST_LOC_0_CA_START)—Offset FED4004Ch

This register is implemented in flip-flops. This register is implemented in retention flops to maintain state through PG.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [0x0] + FED4004Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Control Area Start (HOST_CA_START):** Host software sets this field to a CSxE firmware defined value to indicate that a command is available for processing.<br>The reset value indicates that a command is NOT available for processing.<br>Any host write to this register shall result in an interrupt to the CSE firmware or wakeup the CSE subsystem when it is in power-gated state. |

## 52.11.13 Control Area Interrupt Reserved Part 1 (HOST_LOC_0_CA_INT_RSVD1)—Offset FED40050h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [0x0] + FED40050h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **RSVD_31_0:** Reserved |

## 52.11.14 Control Area Interrupt Reserved Part 2 (HOST_LOC_0_CA_INT_RSVD2)—Offset FED40054h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [0x0] + FED40054h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **RSVD_31_0:** Reserved |

## 52.11.15 Control Area Command Size (HOST_LOC_0_CA_CMD_SZ)—Offset FED40058h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [0x0] + FED40058h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **HOST_CA_CMD_SZ:** Reserved. |

## 52.11.16 Control Area Command Part 1 (HOST_LOC_0_CA_CMD1)—Offset FED4005Ch

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [0x0] + FED4005Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **HOST_CA_CMD1:** Reserved. |

## 52.11.17 Control Area Command Part 2 (HOST_LOC_0_CA_CMD2)—Offset FED40060h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [0x0] + FED40060h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **HOST_CA_CMD2:** Reserved. |

## 52.11.18 Control Area Response Size (HOST_LOC_0_CA_RSP_SZ)—Offset FED40064h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [0x0] + FED40064h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **HOST_CA_RSP_SZ:** Reserved. |

## 52.11.19 Control Area Response Part 1 (HOST_LOC_0_CA_RSP1)—Offset FED40068h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [0x0] + FED40068h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **HOST_CA_RSP1:** Reserved. |

## 52.11.20 Control Area Response Part 2 (HOST_LOC_0_CA_RSP2)—Offset FED4006Ch

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [0x0] + FED4006Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **HOST_CA_RSP2:** Reserved. |

## 52.11.21 FTPM Reserved Read Write[0-3] (HOST_LOC_0_RSVD_RW3[0-3])—Offset FED40070h, Count 4, Stride 4h

This register represents a DW of RW memory in FTPM EBB which has no defined functionality. The access to this DW is allowed only to an active locality.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset[0-3]:** [0x0] + FED40070h + [0-3]*4h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **FTPM Reserved Read Write DW (RSVD_RW_31_0):** Reserved. |

## 52.11.22 FTPM Command and Response Buffer[0-991] (HOST_LOC_0_FTPM_CRB[0-991])—Offset FED40080h, Count 992, Stride 4h

This register represents a DW of RW memory in FTPM CRB (EBB).

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset[0-991]:** [0x0] + FED40080h + [0-991]*4h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **FTPM Command and Response Buffer DW (HOST_FTPM_CRB_DW):** Reserved. |

## 52.12 Registers in I/O Space—KT_HOST_IOBAR

These registers are accessed in Host I/O Space starting at the relocatable I/O address defined by the Base Address Register (BAR) KT_HOST_IOBAR described in Section 52.5.5, "KT IO BAR (KT_HOST_IOBAR)—Offset 10h" on page 2296.

### 52.12.1 KT Receive Buffer Register (IO_KTRBR)—Offset 0h

This register implements the standard Receiver Buffer register in the KT Block. This is read-only. DLAB (i.e. KTLCR[7]) shall be 0. In non-FIFO mode, this register will be read when the receiver data is ready. In FIFO mode, a read from this register will be translated into a read from the RBR FIFO.

Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [KT_HOST_IOBAR] + 0h

**KT_HOST_IOBAR Type:** PCI Configuration Register (Size: 32 bits)
**KT_HOST_IOBAR Reference:** [B:0, D:24, F:3] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO/V | **Receiver Buffer Register (RBR):** Implements the Receiver Buffer register of the Serial Interface. |

### 52.12.2 KT Transmitter Holding Register (IO_KTTHR)—Offset 0h

This register implements the standard Transmitter Holding register in the KT Block. This is write-only. DLAB (i.e. KTLCR[7]) shall be 0. In non-FIFO mode, this register will be written when the Host needs to transmit data. In FIFO mode, a write to this register will be translated into a write to the THR FIFO.

Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [KT_HOST_IOBAR] + 0h

**KT_HOST_IOBAR Type:** PCI Configuration Register (Size: 32 bits)
**KT_HOST_IOBAR Reference:** [B:0, D:24, F:3] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>WO | **Transmitter Holding Register (THR):** Implements the Transmit Data register of the Serial Interface. |

## 52.12.3 KT Divisor Latch LSB Register (IO_KTDLLR)—Offset 0h

This register implements the standard DLL register in the KT Block. DLAB (i.e. KTLCR[7]) shall be 1 in order for this register to be accessed. this register is supported only for SW compatibility and has no impact on HW performance.

Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [KT_HOST_IOBAR] + 0h

**Default:** 00h

**KT_HOST_IOBAR Type:** PCI Configuration Register (Size: 32 bits)
**KT_HOST_IOBAR Reference:** [B:0, D:24, F:3] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW/V | **Divisor Latch LSB (DLL):** Implements the DLL register of the Serial Interface. |

## 52.12.4 KT Interrupt Enable register (IO_KTIER)—Offset 1h

This register implements the standard Interrupt Enable register in the KT Block. The bits enable specific events to interrupt the Host. See bit specific definition below. DLAB (i.e. KTLCR[7]) shall is 0 in order for this register to be accessed.

Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [KT_HOST_IOBAR] + 1h

**Default:** 00h

**KT_HOST_IOBAR Type:** PCI Configuration Register (Size: 32 bits)
**KT_HOST_IOBAR Reference:** [B:0, D:24, F:3] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:4 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 3 | 0x0<br>RW | **MSR (IER3):** When set, enables bits in Modem Status register to cause an interrupt to the Host |
| 2 | 0x0<br>RW | **LSR (IER2):** When set, enables bits in Receiver Line Status Register to cause an interrupt to the Host |
| 1 | 0x0<br>RW | **THR (IER1):** When set, enables an interrupt to the Host when the Transmitter Holding register is empty |
| 0 | 0x0<br>RW | **DR (IER0):** When set, enables an interrupt to the Host when the Received Data is available OR Receiver FIFO timeout. |

## 52.12.5 KT Divisor Latch MSB Register (IO_KTDLMR)—Offset 1h

This register implements the standard DLM register in the KT Block. DLAB (i.e. KTLCR[7]) shall be 1 in order for this register to be accessed. This register is supported only for SW compatibility and has no impact on HW performance.

Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [KT_HOST_IOBAR] + 1h

**KT_HOST_IOBAR Type:** PCI Configuration Register (Size: 32 bits)
**KT_HOST_IOBAR Reference:** [B:0, D:24, F:3] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW/V | **Divisor Latch MSB (DLM):** Implements the DLM register of the Serial Interface. |

## 52.12.6 KT Interrupt Identification Register (IO_KTIIR)—Offset 2h

This register implements the standard Interrupt Identification register in the KT Block. This is read-only. This register is created to provide minimum software overhead during data character transfers. The register prioritizes KT interrupts into 4 levels and records them in the IIRSTS field of this register. The four levels of interrupt conditions in order of priority are: Receiver Line Status; Received Data Ready/Character Timeout Indication; Transmitter Holding Register Empty; MODEM Status. When the Host accesses the IIR, the HW freezes all interrupts and indicates the highest priority pending interrupt to the Host. While this Host access is occurring, the HW records new interrupts, but does not change its current indication until the access is complete. Table in the Host Interrupt Generation section shows the contents.

Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 01h

**BAR and Offset:** [KT_HOST_IOBAR] + 2h

**KT_HOST_IOBAR Type:** PCI Configuration Register (Size: 32 bits)
**KT_HOST_IOBAR Reference:** [B:0, D:24, F:3] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RO/V | **FIFO Enable (FIEN1):** This field is connected by HW to the FIFO Enable field of the FCR register. |
| 6 | 0x0<br>RO/V | **FIFO Enable (FIEN0):** This field is connected by HW to the FIFO Enable field of the FCR register. |
| 5:4 | 0x0<br>RO | **Reserved (RSVD):** Hardwired to 0. |
| 3:1 | 0x0<br>RO/V | **IIR Status (IIRSTS):** These bits are asserted by the HW according to the source of the interrupt and the priority level.<br>Refer to the section on Host Interrupt Generation for a table of values. |
| 0 | 0x1<br>RO/V | **Interrupt Status (INTSTS):** 0: indicates a pending Host interrupt and IIRSTS may be used as a pointer to the appropriate interrupt service routine. It reflects the logical-NOR of all UART interrupts. An individual UART interrupt will be identified as pending when the individual event status is asserted AND its corresponding event interrupt enable is asserted as well.<br>For example, the THR Empty interrupt will be identified as pending when both LSR[THRE] bit is 1 AND IER[IER1] is 1.<br>1: indicates no pending Host interrupt. |

## 52.12.7 KT FIFO Control register (IO_KTFCR)—Offset 2h

This register implements the standard FIFO Control register in the KT Block. It is used to configure features pertinent to the FIFO mode of operation. This is write-only.

Reset condition: Host reset. Non-sticky.

**Type:** I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [KT_HOST_IOBAR] + 2h

**KT_HOST_IOBAR Type:** PCI Configuration Register (Size: 32 bits)
**KT_HOST_IOBAR Reference:** [B:0, D:24, F:3] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:6 | 0x0<br>WO | **Receiver Trigger Level (RTL):** Trigger level in bytes for the Receiver FIFO. Once the trigger level number of bytes is reached, an interrupt will be sent to the Host [7:6] RCVR FIFO Trigger Level (bytes)<br>• 00 -- 01<br>• 01 -- 04<br>• 10 -- 08<br>• 11 -- 14 |
| 5:4 | 0x0<br>WO | **Reserved (RSVD):** Writes to this field shall be dropped. |
| 3 | 0x0<br>WO | **RDY Mode (RDYM):** This bit has no effect on HW performance. |
| 2 | 0x0<br>WO | **XMT FIFO Clear (XFIC):** When the Host writes one to this bit the HW will clear the XMT FIFO. This bit is self-cleared by HW. |
| 1 | 0x0<br>WO | **RCV FIFO Clear (RFIC):** When the Host writes one to this bit the HW will clear the RCV FIFO. This bit is self-cleared by HW. |
| 0 | 0x0<br>WO | **FIFO Enable (FIE):** When set indicates that the KT interface is working in FIFO node. When this bit value is changed the RCV and XMT FIFO are cleared by HW. This bit must be a 1 when other FCR bits are written to or they will NOT be programmed. |

## 52.12.8 KT Line Control register (IO_KTLCR)—Offset 3h

This register implements the standard Line Control register in the KT Block. It specifies the format of the asynchronous data communications exchange and sets the DLAB bit. Most bits in this register have no effect on HW and are only used by the FW.

Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 03h

**BAR and Offset:** [KT_HOST_IOBAR] + 3h

**KT_HOST_IOBAR Type:** PCI Configuration Register (Size: 32 bits)
**KT_HOST_IOBAR Reference:** [B:0, D:24, F:3] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RW | **Divisor Latch Access Bit (DLAB):**<br>• 1: Allows access to the Divisor Latch Registers and reading of the FIFO Control Register.<br>• 0: Allows access to RBR, THR, IER and IIR registers. |
| 6 | 0x0<br>RW | **Break Control (BC):** This bit has no effect on HW. |
| 5:4 | 0x0<br>RW | **Parity Bit Mode (PBM):** This bit has no effect on HW. |
| 3 | 0x0<br>RW | **Parity Enable (PE):** This bit has no effect on HW. |
| 2 | 0x0<br>RW | **Stop Bit Select (SBS):** This bit has no effect on HW. |
| 1:0 | 0x3<br>RW | **Word Select Byte (WSB):** This bit has no effect on HW. |

## 52.12.9 KT Modem Control register (IO_KTMCR)—Offset 4h

This register implements the standard Modem Control register in the KT Block. It controls the interface with the modem. Because the FW emulates the modem, the Host communicates with the FW via this register. This register has impact on the HW in the loopback mode.

Reset condition: Host reset. Non-sticky.

**Type:** I/O Register (Size: 8 bits)

**BAR and Offset:** [KT_HOST_IOBAR] + 4h

**Default:** 00h

**KT_HOST_IOBAR Type:** PCI Configuration Register (Size: 32 bits)
**KT_HOST_IOBAR Reference:** [B:0, D:24, F:3] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:5 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 4 | 0x0<br>RW | **Loop Back Mode (LBM):** When set by Host indicates that the serial port is in loop Back mode. This means that the data that is transmitted by the host should be received.<br>Helps in debug of the interface |
| 3 | 0x0<br>RW | **Output 2 (OUT2):** This bit has no effect on HW in normal mode.<br>In loop back mode the value of this bit is written by HW to Modem Status Register bit (7) |
| 2 | 0x0<br>RW | **Output 1 (OUT1):** This bit has no effect on HW in normal mode.<br>In loop back mode the value of this bit is written by HW to Modem Status Register bit(6) |
| 1 | 0x0<br>RW | **Request to Send Out (RTSO):** This bit has no effect on HW in normal mode.<br>In loopback mode, the value of this bit is written by HW to Modem Status Register bit(4) |
| 0 | 0x0<br>RW | **Data Terminal Ready Out (DRTO):** This bit has no effect on HW in normal mode.<br>In loopback mode, the value in this bit is written by HW to Modem Status Register Bit(5) |

## 52.12.10 KT Line Status register (IO_KTLSR)—Offset 5h

This register implements the standard Line Status register in the KT Block. It provides status information of the data transfer to the Host. Error indication etc are provided by the HW/FW to the host via this register.

Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [KT_HOST_IOBAR] + 5h

**Default:** 60h

**KT_HOST_IOBAR Type:** PCI Configuration Register (Size: 32 bits)
**KT_HOST_IOBAR Reference:** [B:0, D:24, F:3] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RO/C/V | **RCVR FIFO Error (RXFER):** This bit is cleared in non FIFO mode.<br>This bit is connected to UART LSR[BI] bit in FIFO mode. |
| 6 | 0x1<br>RO/C/V | **Transmitter Empty (TEMT):** In non-FIFO mode:<br>this bit will be set to 1 whenever the Transmitter Holding Register (THR) and the Transmitter Shift Register (TSR) are both empty, OR cleared to 0 whenever either THR or TSR contains a data byte.<br><br>In FIFO mode:<br>this bit will be set to 1 whenever XMIT FIFO and TSR are both empty, OR cleared to 0 whenever either XMIT FIFO or TSR contains a data byte.<br><br>Implementation note: This bit is connected by HW to THRE bit. |
| 5 | 0x1<br>RO/C/V | **Transmitter Holding Register Empty (THRE):** The bit will always be set whenever Host changes UART FCR[FIE] bit.<br>This bit is controlled differently in FIFO vs non-FIFO modes:<br>Non-FIFO mode: This bit will be cleared by HW when Host writes to THR, and set by HW when FW reads from THR.<br>FIFO mode: This bit will be set by HW when XMIT FIFO is empty, and cleared by HW when XMIT FIFO is NOT empty. |
| 4 | 0x0<br>RO/C/V | **Break Interrupt (BI):** This bit will be cleared by HW when the UART LSR register is read by Host.<br>This bit will be set by HW in two cases:<br>In FIFO mode, when FW sets the KTRIVR[SBI] bit.<br>In non-FIFO mode, when FW sets the KTRBR[BIA] bit. |
| 3 | 0x0<br>RO | **Framing Error (FE):** This bit is NOT implemented and hardwired to 0. |
| 2 | 0x0<br>RO | **Parity Error (PE):** This bit is NOT implemented and hardwired to 0. |
| 1 | 0x0<br>RO/C/V | **Overrun Error (OE):** HW will clear this bit when Host reads from KTLSR register and this is source of interrupt.<br>HW will set this bit when overrun error is detected.<br>In non-FIFO mode, the character that triggers the overrun error shall overwrite the character in the RBR register.<br>In FIFO mode, the character that triggers the overrun error shall be dropped without corrupting the RCVR FIFO. |
| 0 | 0x0<br>RO/V | **Data Ready (DR):** Non-FIFO Mode: this bit will be set by HW when FW writes to RBR and cleared by HW when Host reads from RBR.<br>FIFO Mode: the bit will be set by HW when RCVR FIFO is not empty and cleared by HW when RCVR FIFO is empty. |

## 52.12.11 KT Modem Status register (IO_KTMSR)—Offset 6h

This register implements the standard Modem Status register in the KT Block. It provides the current state of the control lines from the modem. The modem functionality is emulated by the FW.

Reset condition: Host reset. Non-sticky.

**Type:** I/O Register (Size: 8 bits)

**BAR and Offset:** [KT_HOST_IOBAR] + 6h

**Default:** 00h

**KT_HOST_IOBAR Type:** PCI Configuration Register (Size: 32 bits)
**KT_HOST_IOBAR Reference:** [B:0, D:24, F:3] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RO | **Data Carrier Detect (DCD):** In Loop Back mode this bit is connected by HW to the value of MCR bit 3 |
| 6 | 0x0<br>RO | **Ring Indicator (RI):** In Loop Back mode this bit is connected by HW to the value of MCR bit 2. |
| 5 | 0x0<br>RO | **Data Set Ready (DSR):** In Loop Back mode this bit is connected by HW to the value of MCR bit 0. |
| 4 | 0x0<br>RO | **Clear To Send (CTS):** In Loop Back mode this bit is connected by HW to the value of MCR bit 1. |
| 3 | 0x0<br>RO/C/V | **Delta Data Carrier Detect (DDCD):** This bit is set when bit 7 is changed.<br>This bit is cleared by HW when the MSR register is being read by the HOST driver. |
| 2 | 0x0<br>RO/C/V | **Trailing Edge of Read Detector (TERI):** This bit is set when bit 6 is changed from 1 to 0.<br>This bit is cleared by HW when the MSR register is being read by the Host driver. |
| 1 | 0x0<br>RO/C/V | **Delta Data Set Ready (DDSR):** This bit is set when bit 5 is changed.<br>This bit is cleared by HW when the MSR register is being read by the Host driver. |
| 0 | 0x0<br>RO/C/V | **Delta Clear To Send (DCTS):** This bit is set when bit 4 is changed.<br>This bit is cleared by HW when the MSR register is being read by the Host driver. |

## 52.12.12 KT Scratch register (IO_KTSCR)—Offset 7h

This register implements the standard Scratch register in the KT Block. It allows Host SW programmers to hold temporary data. It has NO effect on HW.

Reset condition: Host reset. Non-sticky.

**Type:** I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [KT_HOST_IOBAR] + 7h

**KT_HOST_IOBAR Type:** PCI Configuration Register (Size: 32 bits)
**KT_HOST_IOBAR Reference:** [B:0, D:24, F:3] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Scratch Register Data (SCRD):** Reserved. |

## 52.13 Registers in I/O Space—IDE_HOST_PCMDIOBAR

These registers are accessed in Host I/O Space starting at the relocatable I/O address defined by the Base Address Register (BAR) IDE_HOST_PCMDIOBAR described in Section 52.6.5, "IDE Primary Command Block IO BAR (IDE_HOST_PCMDIOBAR)—Offset 10h" on page 2308.

### 52.13.1 IDE Data Register (IDEDATA)—Offset 0h

This register serves as the data interface in IDE PIO modes. Unit of access is in WORD. Host writes to this register are converted into writes to the PIO buffer in CSxE memory at monotonically increasing WORD address. Host writes are dropped under any one of the following conditions: (1) PIO modes are disabled. (Cfg. IDEPBPR[EN] defined in CSxE memory space) (2) PIO buffer is full. Host reads from this register are converted into reads from the PIO buffer in CSxE memory at monotonically increasing WORD address. Host reads are dropped under any one of the following conditions: (1) PIO modes are disabled. (Cfg. IDEPBPR[EN] defined in CSxE memory space) (2) PIO buffer is empty.

Reset condition: no connection to any reset signal.

**Type:** I/O Register
(Size: 16 bits)

**BAR and Offset:** [IDE_HOST_PCMDIOBAR] + 0h

**Default:** 0000h

**IDE_HOST_PCMDIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_PCMDIOBAR Reference:** [B:0, D:24, F:2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0x0<br>RW/V | **IDE Data Register (IDEDR):** Data interface in IDE PIO modes. Host reads/writes from/to this register are converted into reads/writes from/to the PIO buffer in CSxE memory. |

### 52.13.2 IDE Features Register (IDEFR)—Offset 1h

This register implements the standard Features register in the Primary IDE Command Block. This is write-only. BE[0] shall be deasserted.

Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [IDE_HOST_PCMDIOBAR] + 1h

**Default:** 00h

**IDE_HOST_PCMDIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_PCMDIOBAR Reference:** [B:0, D:24, F:2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>WO | **IDE Features Data (IDEFD):** The IDE Features register is command specific and is used to enable and disable interface features. |

## 52.13.3 IDE Error Register DEV0 (IDEERD0)—Offset 1h

This register implements the standard Device 0 Error register in the Primary IDE Command Block. This is read-only. BE[0] shall be deasserted. DEV = 0 (i.e. IDEDHIR[4] = 0).

Reset condition: CSxE reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [IDE_HOST_PCMDIOBAR] + 1h

**Default:** 00h

**IDE_HOST_PCMDIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_PCMDIOBAR Reference:** [B:0, D:24, F:2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO/V | **IDE Error Data (IDEED):** Upon command completion of any command except EXECUTE DEVICE DIAGNOSTIC or DEVICE RESET, the content of this register is valid and contains error status when the ERR bit is set to 1 in the Status register (i.e. IDESR0[ERR] = 1).<br>Following a power-on, a hardware or software reset, or command completion of an EXECUTE DEVICE DIAGNOSTIC or DEVICE RESET command, this register contains a diagnostic code.<br><br>Bit 2 ABRT (command aborted) is set to 1 to indicate the requested command has been command aborted because the command code or a command parameter is invalid, the command is not supported, a pre-requisite for the command has not been met, or some other error has occurred. |

## 52.13.4 IDE Error Register DEV1 (IDEERD1)—Offset 1h

This register implements the standard Device 1 Error register in the Primary IDE Command Block. This is read-only. BE[0] shall be deasserted. DEV = 1 (i.e. IDEDHIR[4] = 1).

Reset condition: CSxE reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [IDE_HOST_PCMDIOBAR] + 1h

**Default:** 00h

**IDE_HOST_PCMDIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_PCMDIOBAR Reference:** [B:0, D:24, F:2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO/V | **IDE Error Data (IDEED):** Upon command completion of any command except EXECUTE DEVICE DIAGNOSTIC or DEVICE RESET, the content of this register is valid and contains error status when the ERR bit is set to 1 in the Status register (i.e. IDESR0[ERR] = 1).<br>Following a power-on, a hardware or software reset, or command completion of an EXECUTE DEVICE DIAGNOSTIC or DEVICE RESET command, this register contains a diagnostic code.<br><br>Bit 2 ABRT (command aborted) is set to 1 to indicate the requested command has been command aborted because the command code or a command parameter is invalid, the command is not supported, a pre-requisite for the command has not been met, or some other error has occurred. |

## 52.13.5 IDE Sector Count In Register (IDESCIR)—Offset 2h

This register implements the standard Sector Count In register in the Primary IDE Command Block. All 3 registers (IDESCIR, IDESCOR0, IDESCOR1) will be updated with the same write data when this register is write-accessed. This is write-only. This register is meaningful for an ATA command while unused for an ATAPI command.

Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [IDE_HOST_PCMDIOBAR] + 2h

**Default:** 00h

**IDE_HOST_PCMDIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_PCMDIOBAR Reference:** [B:0, D:24, F:2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>WO | **IDE Sector Count Data (IDESCD):** The Sector Count register specifies the sector count of the data for which an ATA transfer has been made. |

## 52.13.6 IDE Sector Count Out Register DEV0 (IDESCOR0)—Offset 2h

This register implements the standard Device 0 Sector Count Out register in the Primary IDE Command Block. This is read-only. DEV = 0 (i.e. IDEDHIR[4] = 0). CSxE FW writes to this register upon completion of an ATA/ATAPI command. This register is called IDE Interrupt Reason Register DEV0 for an ATAPI command.

Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [IDE_HOST_PCMDIOBAR] + 2h

**Default:** 00h

**IDE_HOST_PCMDIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_PCMDIOBAR Reference:** [B:0, D:24, F:2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO/V | **IDE Sector Count Out DEV0 (ISCOD0):** Sector Count Out register for Device 0 |

## 52.13.7 IDE Sector Count Out Register DEV1 (IDESCOR1)—Offset 2h

This register implements the standard Device 1 Sector Count Out register in the Primary IDE Command Block. This is read-only. DEV = 1 (i.e. IDEDHIR[4] = 1). CSxE FW writes to this register upon completion of an ATA/ATAPI command. This register is called IDE Interrupt Reason Register DEV1 for an ATAPI command.

Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [IDE_HOST_PCMDIOBAR] + 2h

**Default:** 00h

**IDE_HOST_PCMDIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_PCMDIOBAR Reference:** [B:0, D:24, F:2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO/V | **IDE Sector Count Out DEV1 (ISCOD1):** Sector Count Out register for Device 1 |

## 52.13.8 IDE Sector Number In Register (IDESNIR)—Offset 3h

This register implements the standard Sector Number In register in the Primary IDE Command Block in CHS addressing mode. All 3 registers (IDESNIR, IDESNOR0, IDESNOR1) will be updated with the same write data when this register is write-accessed. This is write-only. This register is called IDE LBA Low In Register in LBA addressing mode. This register is reserved for an ATAPI command.

Reset condition: Host reset. Non-sticky.

**Type:** I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [IDE_HOST_PCMDIOBAR] + 3h

**IDE_HOST_PCMDIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_PCMDIOBAR Reference:** [B:0, D:24, F:2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>WO | **IDE Sector Number Data (IDESND):** The Sector Number register is set by the host to specify the starting sector number associated with the next ATA command to be executed.<br>Following a qualified ATA command sequence the device will set the register value to the last sector read or written as a result of the previous ATA command. |

## 52.13.9 IDE Sector Number Out Register DEV0 (IDESNOR0)—Offset 3h

This register implements the standard Device 0 Sector Number Out register in the Primary IDE Command Block. This is read-only. DEV = 0 (i.e. IDEDHIR[4] = 0). CSxE FW writes to this register upon completion of an ATA command. This register is called IDE LBA Low Out Register DEV0 in LBA addressing mode. This register is reserved for an ATAPI command.

Reset condition: Host reset. Non-sticky.

**Type:** I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [IDE_HOST_PCMDIOBAR] + 3h

**IDE_HOST_PCMDIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_PCMDIOBAR Reference:** [B:0, D:24, F:2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO/V | **IDE Sector Number Out DEV0 (IDESNO0):** Sector Number Out register for Device 0 |

## 52.13.10 IDE Sector Number Out Register DEV1 (IDESNOR1)—Offset 3h

This register implements the standard Device 1 Sector Number Out register in the Primary IDE Command Block. This is read-only. DEV = 1 (i.e. IDEDHIR[4] = 1). CSxE FW writes to this register upon completion of an ATA command. This register is called IDE LBA Low Out Register DEV1 in LBA addressing mode. This register is reserved for an ATAPI command.

Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [IDE_HOST_PCMDIOBAR] + 3h

**Default:** 00h

**IDE_HOST_PCMDIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_PCMDIOBAR Reference:** [B:0, D:24, F:2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO/V | **IDE Sector Number Out DEV1 (IDESNO1):** Sector Number Out register for Device 1 |

## 52.13.11 IDE Cylinder Low In Register (IDECLIR)—Offset 4h

This register implements the standard Cylinder Low In register in the Primary IDE Command Block. All 3 registers (IDECLIR, IDCLOR0, IDCLOR1) will be updated with the same write data when this register is write-accessed. This is write-only. This register is called IDE LBA Mid In Register in LBA addressing mode. This register is called IDE Byte Count Low Limit Register for an ATAPI command.

Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [IDE_HOST_PCMDIOBAR] + 4h

**Default:** 00h

**IDE_HOST_PCMDIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_PCMDIOBAR Reference:** [B:0, D:24, F:2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>WO | **IDE Cylinder Low Data. (IDECLD):** The Cylinder Low register is set by the host to specify the cylinder number low byte.<br>Following an ATA command, the contents of this register is written by the device, identifying the cylinder number low byte. |

## 52.13.12 IDE Cylinder Low Out Register DEV0 (IDCLOR0)—Offset 4h

This register implements the standard Device 0 Cylinder Low Out register in the Primary IDE Command Block. This is read-only. DEV = 0 (i.e. IDEDHIR[4] = 0). CSxE FW writes to this register upon completion of an ATA command. This register is called IDE LBA Mid Out Register DEV0 in LBA addressing mode. This register is called IDE Byte Count Low Register DEV0 for an ATAPI command.

Reset condition: Host reset. Non-sticky.

**Type:** I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [IDE_HOST_PCMDIOBAR] + 4h

**IDE_HOST_PCMDIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_PCMDIOBAR Reference:** [B:0, D:24, F:2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO/V | **IDE Cylinder Low Out DEV0. (IDECLO0):** Cylinder Low Out Register for Device 0. |

## 52.13.13 IDE Cylinder Low Out Register DEV1 (IDCLOR1)—Offset 4h

This register implements the standard Device 1 Cylinder Low Out register in the Primary IDE Command Block. This is read-only. DEV = 1 (i.e. IDEDHIR[4] = 1). CSxE FW writes to this register upon completion of an ATA command. This register is called IDE LBA Mid Out Register DEV1 in LBA addressing mode. This register is called IDE Byte Count Low Register DEV1 for an ATAPI command.

Reset condition: Host reset. Non-sticky.

**Type:** I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [IDE_HOST_PCMDIOBAR] + 4h

**IDE_HOST_PCMDIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_PCMDIOBAR Reference:** [B:0, D:24, F:2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO/V | **IDE Cylinder Low Out DEV1. (IDECLO1):** Cylinder Low Out Register for Device 1. |

## 52.13.14 IDE Cylinder High In Register (IDECHIR)—Offset 5h

This register implements the standard Cylinder High In register in the Primary IDE Command Block. All 3 registers (IDECHIR, IDCHOR0, IDCHOR1) will be updated with the same write data when this register is write-accessed. This is write-only. This register is called IDE LBA High In Register in LBA addressing mode. This register is called IDE Byte Count High Limit Register for an ATAPI command.

Reset condition: Host reset. Non-sticky.

**Type:** I/O Register (Size: 8 bits)

**BAR and Offset:** [IDE_HOST_PCMDIOBAR] + 5h

**Default:** 00h

**IDE_HOST_PCMDIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_PCMDIOBAR Reference:** [B:0, D:24, F:2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>WO | **IDE Cylinder High Data (IDECHD):** The Cylinder High register is set by the host to specify the cylinder number high byte. Following an ATA command, the contents of this register is written by the device, identifying the cylinder number high byte. |

## 52.13.15 IDE Cylinder High Out Register DEV0 (IDCHOR0)—Offset 5h

This register implements the standard Device 0 Cylinder High Out register in the Primary IDE Command Block. This is read-only. DEV = 0 (i.e. IDEDHIR[4] = 0). CSxE FW writes to this register upon completion of an ATA command. This register is called IDE LBA High Out Register DEV0 in LBA addressing mode. This register is called IDE Byte Count High Register DEV0 for an ATAPI command.

Reset condition: Host reset. Non-sticky.

**Type:** I/O Register (Size: 8 bits)

**BAR and Offset:** [IDE_HOST_PCMDIOBAR] + 5h

**Default:** 00h

**IDE_HOST_PCMDIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_PCMDIOBAR Reference:** [B:0, D:24, F:2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO/V | **IDE Cylinder High Out DEV0 (IDECHO0):** Cylinder High Out register for Device 0 |

## 52.13.16 IDE Cylinder High Out Register DEV1 (IDCHOR1)—Offset 5h

This register implements the standard Device 1 Cylinder High Out register in the Primary IDE Command Block. This is read-only. DEV = 1 (i.e. IDEDHIR[4] = 1). CSxE FW writes to this register upon completion of an ATA command. This register is called IDE LBA High Out Register DEV1 in LBA addressing mode. This register is called IDE Byte Count High Register DEV1 for an ATAPI command.

Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [IDE_HOST_PCMDIOBAR] + 5h

**IDE_HOST_PCMDIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_PCMDIOBAR Reference:** [B:0, D:24, F:2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO/V | **IDE Cylinder High Out DEV1 (IDECHO1):** Cylinder High Out register for Device 1 |

## 52.13.17 IDE Drive/Head In Register (IDEDHIR)—Offset 6h

This register implements the standard Drive/Head In register in the Primary IDE Command Block. All 3 registers (IDEDHIR, IDDHOR0, IDDHOR1) will be updated with the same write data when this register is write-accessed. This is write-only. Bit 4 of this register is the DEV (master/slave) bit. This bit is cleared by hardware on IDE software reset (IDDCR[SRST] = 1) in addition to Host reset. This register is called IDE Device In Register in LBA addressing mode or for an ATAPI command.

Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [IDE_HOST_PCMDIOBAR] + 6h

**IDE_HOST_PCMDIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_PCMDIOBAR Reference:** [B:0, D:24, F:2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>WO | **IDE Drive/Head Data (IDEDHD):** The Drive/Head Register is used by the host and the device to select the type of addressing (CHS or LBA), the drive letter, and either bits 3 through 0 of the head number in CHS mode or in LBA mode, bits D3:D0 reflect the logical block number bits LBA27:LBA24. |

## 52.13.18 IDE Drive/Head Out Register DEV0 (IDDHOR0)—Offset 6h

This register implements the standard Device 0 Drive/Head Out register in the Primary IDE Command Block. This is read-only. DEV = 0 (i.e. IDEDHIR[4] = 0). CSxE FW writes to this register upon completion of an ATA command. This register is called IDE Device Out Register DEV0 in LBA addressing mode or for an ATAPI command.

Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [IDE_HOST_PCMDIOBAR] + 6h

**Default:** 00h

**IDE_HOST_PCMDIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_PCMDIOBAR Reference:** [B:0, D:24, F:2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO/V | **IDE Drive/Head Out DEV0 (IDEDHO0):** Drive/Head Out register of Device 0 |

## 52.13.19 IDE Drive/Head Out Register DEV1 (IDDHOR1)—Offset 6h

This register implements the standard Device 1 Drive/Head Out register in the Primary IDE Command Block. This is read-only. DEV = 1 (i.e. IDEDHIR[4] = 1). CSxE FW writes to this register upon completion of an ATA command. This register is called IDE Device Out Register DEV1 in LBA addressing mode or for an ATAPI command.

Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [IDE_HOST_PCMDIOBAR] + 6h

**Default:** 00h

**IDE_HOST_PCMDIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_PCMDIOBAR Reference:** [B:0, D:24, F:2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO/V | **IDE Drive/Head Out DEV1 (IDEDHO1):** Drive/Head Out register of Device 1 |

## 52.13.20 IDE Command Register (IDECR)—Offset 7h

This register implements the standard Command register in the Primary IDE Command Block. This is write-only.

Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [IDE_HOST_PCMDIOBAR] + 7h

**IDE_HOST_PCMDIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_PCMDIOBAR Reference:** [B:0, D:24, F:2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>WO | **IDE Command Data (IDECD):** The Command register specifies the ATA/ATAPI Command code being issued to the drive by the host.<br>Command processing begins when this register is written. The content of the Command Block registers becomes parameters of the command when this register is written.<br>Writing this register clears any pending interrupt condition.<br>Please refer to the description of the INTM and INTS bits in the IDGCR register in the CSxE memory space for detailed conditions under which interrupt condition shall be cleared. |

## 52.13.21 IDE Status Register DEV0 (IDESR0)—Offset 7h

This register implements the standard Device 0 Status register in the Primary IDE Command Block. This is read-only. DEV = 0 (i.e. IDEDHIR[4] = 0). CSxE FW writes to this register upon completion of an ATA/ATAPI command. Additionally upon completion of the last data phase of a PIO transfer, HW will load this register with value of the SRAFP field in the IDESRAP register in the CSxE memory space. Host read of this register clears Device 0's interrupt. Please refer to the description of the INTM bit in the IDGCR register in the CSxE memory space for detailed conditions under which interrupt condition shall be cleared. The bit description is for ATA mode. Different name in ATAPI mode, if applicable, is cited as well.

Reset condition: CSxE reset with the BSY bit as an exception. Please refer to description of the BSY bit below for a list of BSY bit reset conditions. Non-sticky.

**Type:** I/O Register (Size: 8 bits)

**BAR and Offset:** [IDE_HOST_PCMDIOBAR] + 7h

**Default:** 80h

**IDE_HOST_PCMDIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_PCMDIOBAR Reference:** [B:0, D:24, F:2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x1<br>RO/V | **Busy (BSY):** This bit is set by HW when the IDECR is being written and DEV=0, OR when IDDCR[SRST] bit is asserted by Host, OR host system reset, OR D3 to D0 transition of the IDE function.<br>This bit is cleared by FW write of 0.<br>Please refer to general register description above for special handling for a PIO transfer.<br>When this bit is 1, any other bit in this register is meaningless. |
| 6 | 0x0<br>RO/V | **Drive Ready (DRDY):** When set, indicates drive is ready for command.<br>Update of this bit is completely FW-assisted.<br>This bit is also called Device Ready.<br>Please refer to general register description above for special handling for a PIO transfer. |
| 5 | 0x0<br>RO/V | **Drive Fault (DF):** When set, indicates Error on the drive.<br>Update of this bit is completely FW-assisted.<br>This bit is called DMA Ready for a DMA ATAPI command.<br>Please refer to general register description above for special handling for a PIO transfer. |
| 4 | 0x0<br>RO/V | **Drive Seek Complete (DSC):** When set, indicates Heads are positioned over the desired cylinder.<br>Update of this bit is completely FW-assisted.<br>This bit is called Service for an ATAPI command.<br>Please refer to general register description above for special handling for a PIO transfer. |
| 3 | 0x0<br>RO/V | **Data Request (DRQ):** Set when the drive wants to exchange data with the Host via the data register.<br>Update of this bit is completely FW-assisted.<br>Please refer to general register description above for special handling for a PIO transfer. |
| 2 | 0x0<br>RO/V | **Corrected Data (CORR):** When set, indicates a correctable read error has occurred.<br>Update of this bit is completely FW-assisted.<br>Please refer to general register description above for special handling for a PIO transfer. |
| 1 | 0x0<br>RO/V | **Index (IDX):** This bit is set once per rotation of the medium when the index mark passes under the read/write head.<br>Update of this bit is completely FW-assisted.<br>Please refer to general register description above for special handling for a PIO transfer. |
| 0 | 0x0<br>RO/V | **Error (ERR):** When set, indicates an error occurred in the process of executing the current command. The Error Register of the selected device contains the error information.<br>Update of this bit is completely FW-assisted.<br>This bit is called Check for an ATAPI command.<br>Please refer to general register description above for special handling for a PIO transfer. |

## 52.13.22 IDE Status Register DEV1 (IDESR1)—Offset 7h

This register implements the standard Device 1 Status register in the Primary IDE Command Block. This is read-only. DEV = 1 (i.e. IDEDHIR[4] = 1). CSxE FW writes to this register upon completion of an ATA/ATAPI command. Additionally upon completion of the last data phase of a PIO transfer, HW will load this register with value of the SRAFP field in the IDESRAP register in the CSxE memory space. Host read of this register clears Device 1's interrupt. Please refer to the description of the INTM bit in the IDGCR register in the CSxE memory space for detailed conditions under which interrupt condition shall be cleared. The bit description is for ATA mode. Different name in ATAPI mode, if applicable, is cited as well.

Reset condition: CSxE reset with the BSY bit as an exception. Please refer to description of the BSY bit below for a list of BSY bit reset conditions. Non-sticky.

**Type:** I/O Register (Size: 8 bits)

**BAR and Offset:** [IDE_HOST_PCMDIOBAR] + 7h

**Default:** 80h

**IDE_HOST_PCMDIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_PCMDIOBAR Reference:** [B:0, D:24, F:2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x1<br>RO/V | **Busy (BSY):** This bit is set by HW when the IDECR is being written and DEV=1, OR when IDDCR[SRST] bit is asserted by Host, OR host system reset, OR D3 to D0 transition of the IDE function.<br>This bit is cleared by FW write of 0.<br>Please refer to general register description above for special handling for a PIO transfer.<br>When this bit is 1, any other bit in this register is meaningless. |
| 6 | 0x0<br>RO/V | **Drive Ready (DRDY):** When set, indicates drive is ready for command.<br>Update of this bit is completely FW-assisted.<br>This bit is also called Device Ready.<br>Please refer to general register description above for special handling for a PIO transfer. |
| 5 | 0x0<br>RO/V | **Drive Fault (DF):** When set, indicates Error on the drive.<br>Update of this bit is completely FW-assisted.<br>This bit is called DMA Ready for a DMA ATAPI command.<br>Please refer to general register description above for special handling for a PIO transfer. |
| 4 | 0x0<br>RO/V | **Drive Seek Complete (DSC):** When set, indicates Heads are positioned over the desired cylinder.<br>Update of this bit is completely FW-assisted.<br>This bit is called Service for an ATAPI command.<br>Please refer to general register description above for special handling for a PIO transfer. |
| 3 | 0x0<br>RO/V | **Data Request (DRQ):** Set when the drive wants to exchange data with the Host via the data register.<br>Update of this bit is completely FW-assisted.<br>Please refer to general register description above for special handling for a PIO transfer. |
| 2 | 0x0<br>RO/V | **Corrected Data (CORR):** When set, indicates a correctable read error has occurred.<br>Update of this bit is completely FW-assisted.<br>Please refer to general register description above for special handling for a PIO transfer. |
| 1 | 0x0<br>RO/V | **Index (IDX):** This bit is set once per rotation of the medium when the index mark passes under the read/write head.<br>Update of this bit is completely FW-assisted.<br>Please refer to general register description above for special handling for a PIO transfer. |
| 0 | 0x0<br>RO/V | **Error (ERR):** When set, indicates an error occurred in the process of executing the current command. The Error Register of the selected device contains the error information.<br>Update of this bit is completely FW-assisted.<br>This bit is called Check for an ATAPI command.<br>Please refer to general register description above for special handling for a PIO transfer. |

## 52.14 Registers in I/O Space—IDE_HOST_PCTLIOBAR

These registers are accessed in Host I/O Space starting at the relocatable I/O address defined by the Base Address Register (BAR) IDE_HOST_PCTLIOBAR described in described in Section 52.6.6, "IDE Primary Control Block IO BAR (IDE_HOST_PCTLIOBAR)—Offset 14h" on page 2308.

### 52.14.1 IDE Device Control Register (IDDCR)—Offset 2h

This register implements the standard Device Control register in the Primary IDE Control Block. This is write-only. BE[0] shall be deasserted.

Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [IDE_HOST_PCTLIOBAR] + 2h

**Default:** 00h

**IDE_HOST_PCTLIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_PCTLIOBAR Reference:** [B:0, D:24, F:2] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:3 | 0x0<br>WO | **Reserved (RSVD1):** Writable by Host, but NO HW effect due to writes. |
| 2 | 0x0<br>WO | **Software Reset (SRST):**<br>• 1: both devices shall perform the software reset protocol.<br>• 0: both devices shall exit software reset. |
| 1 | 0x0<br>WO | **Host Interrupt Disable (nIEN):**<br>• 1: disables HW from generating interrupt to the Host.<br>• 0: enables HW to generate interrupt to the Host. |
| 0 | 0x0<br>WO | **Reserved (RSVD0):** Writable by Host, but NO HW effect due to writes. |

### 52.14.2 IDE Alternate Status Register (IDASR)—Offset 2h

This register implements the standard Alternate Status register in the Primary IDE Control Block. This is read-only. It shadows the standard Status registers in the Primary IDE Command Block. Read of this register does NOT clear the interrupt status bits in the selected Status register. IDESR0 is shadowed when DEV = 0 (i.e. IDEDHIR[4] = 0). IDESR1 is shadowed when DEV = 1 (i.e. IDEDHIR[4] = 1).

Reset condition: There is no reset associated with this register because it is NOT a physical register.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [IDE_HOST_PCTLIOBAR] + 2h

**Default:** 00h

**IDE_HOST_PCTLIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_PCTLIOBAR Reference:** [B:0, D:24, F:2] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO/V | **IDE Alternate Status Register (IDEASR):** Shadows DEV0/DEV1 Status register on Host reads depending on IDEDHIR[4] setting. |

## 52.15 Registers in I/O Space—IDE_HOST_BMIOBAR

These registers are accessed in Host I/O Space starting at the relocatable I/O address defined by the Base Address Register (BAR) IDE_HOST_BMIOBAR described in described in Section 52.6.9, "IDE Bus Master Block IO BAR (IDE_HOST_BMIOBAR)—Offset 20h" on page 2310.

### 52.15.1 IDE Primary Bus Master Command Register (IDEPBMCR)—Offset 0h

This register implements the standard IDE Primary Bus Master Command register in the IDE Bus Master Block.

Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [IDE_HOST_BMIOBAR] + 0h

**IDE_HOST_BMIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_BMIOBAR Reference:** [B:0, D:24, F:2] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:4 | 0x0<br>RO | **Reserved (RSVD1):** Not implemented. Hardwired to 0. |
| 3 | 0x0<br>RW | **Read or Write Control (RWC):** This bit sets the direction of the bus master transfer.<br>• 0: reads are performed from Host system memory.<br>• 1: writes are performed to Host system memory.<br>This bit shall NOT be changed when the bus master function is active. |
| 2:1 | 0x0<br>RO | **Reserved (RSVD0):** Not implemented. Hardwired to 0. |
| 0 | 0x0<br>RW/V | **Start/Stop Bus Master (SSBM):** Host starts a bus master operation in the device by setting this bit to 1. The device shall only transfer data between the ATA device and Host memory in the bus master operation.<br>Host stops the bus master operation by clearing this bit to 0. All state information will be lost when 0 is written.<br><br>Host CANNOT stop and then resume the bus master operation.<br>When Host clears this bit to 0 while the bus master operation is still active, the bus master operation will be aborted and data transferred from the device may be discarded before being written to host memory.<br>In any event the device should terminate any DMA burst in progress compliant with the ATA protocol being used.<br>If the UDMA protocol is being used, there may be a CRC error report. The ATA device may be in an indeterminate state.<br><br>HW will clear this bit to 0 after the data transfer has been completed, as indicated by satisfaction of either of the following conditions:<br>(1) IDEPBMSR[BMIA] is cleared to 0. OR<br>(2) IDEPBMSR[INT] is set to 1. |

## 52.15.2 IDE Primary Bus Master Device Specific 0 Register (IDEPBMDS0R)—Offset 1h

This register implements the standard IDE Primary Bus Master Device Specific 0 register in the IDE Bus Master Block. This register is programmed by the Host for any device specific data.

Reset condition: CSxE reset. Non-sticky.

**Type:** I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [IDE_HOST_BMIOBAR] + 1h

**IDE_HOST_BMIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_BMIOBAR Reference:** [B:0, D:24, F:2] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW/V | **Device Specific Data0 (DSD0):** Device Specific |

## 52.15.3 IDE Primary Bus Master Status Register (IDEPBMSR)—Offset 2h

This register implements the standard IDE Primary Bus Master Status register in the IDE Bus Master Block.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [IDE_HOST_BMIOBAR] + 2h

**Default:** 80h

**IDE_HOST_BMIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_BMIOBAR Reference:** [B:0, D:24, F:2] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x1<br>RO/V | **Simplex Only (SO):** This bit indicates whether or not both bus master channels (primary and secondary) can be operated at the same time.<br>If the bit is 0, both channels operate independently and can be used at the same time.<br>If the bit is 1, only one channel may be used at a time.<br><br>Reset condition: CSxE reset.<br>Non-sticky. |
| 6 | 0x0<br>RW/V | **Device 1 DMA Capable (D1DC):** This read/write bit is set by device dependent code (BIOS or host software) to indicate that Device 1 for this channel is capable of DMA transfers, and that the device has been initialized for optimum performance.<br><br>Reset condition: Host reset.<br>Non-sticky. |
| 5 | 0x0<br>RW/V | **Device 0 DMA Capable (D0DC):** This read/write bit is set by device dependent code (BIOS or host software) to indicate that Device 0 for this channel is capable of DMA transfers, and that the device has been initialized for optimum performance.<br><br>Reset condition: Host reset.<br>Non-sticky. |
| 4:3 | 0x0<br>RO | **Reserved (RSVD):** Not implemented.<br>Hardwired to 0. |
| 2 | 0x0<br>RW/1C/V | **Interrupt (INT):** HW shall set this bit to 1 on rising edge detection of the ATA channels interrupt line (INTRQ).<br>Host SW writes 1 to clear this bit. Host SW can use this bit to determine if an ATA device has asserted its interrupt line (INTRQ) (see ATA standard).<br>When this bit is 1, all data MUST have been transferred to the Hosts system memory.<br>The adapter shall not set this bit to 1 until it has flushed all internal data buffers.<br><br>NOTE: When INTRQ is deasserted, HW won't clear this bit atomically.<br>When INTRQ is deasserted, this bit shall be cleared as well by Host SW writing 1 to this bit.<br><br>Reset condition: CSxE reset.<br>Non-sticky. |
| 1 | 0x0<br>RW/1C/V | **Error (ER):** FW will set this bit to 1 when the device encounters an error in transferring data to/from Host memory.<br>The exact error condition is bus specific and can be determined in a bus specific manner.<br>Host SW writes 1 to clear this bit.<br><br>Reset condition: CSxE reset.<br>Non-sticky. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 0 | 0x0<br>RO/V | **Bus Master IDE Active (BMIA):** HW shall set this bit when<br>(1) Host sets the IDEPBMCR[SSBM] bit.<br><br>FW shall clear this bit when<br>(1) The last transfer for a region is performed, where EOT for that region is set in the region descriptor. OR<br>(2) FW detects that Host cleared IDEPBMCR[SSBM] bit as indicated by a value of 1 in proxy bit IDEBMCR[SSBMC] in CSxE root space.<br><br>Before clearing this bit to 0, FW must satisfy the following conditions in addition:<br>(1) All data transferred from the device during the previous bus master command has been transferred to the Hosts system memory, unless the bus master command was aborted. OR<br>(2) All data has been written to the device.<br><br>Reset condition: CSxE reset.<br>Non-sticky. |

## 52.15.4 IDE Primary Bus Master Device Specific 1 Register (IDEPBMDS1R)—Offset 3h

This register implements the standard IDE Primary Bus Master Device Specific 1 register in the IDE Bus Master Block. This register is programmed by the Host for any device specific data.

Reset condition: CSxE reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [IDE_HOST_BMIOBAR] + 3h

**IDE_HOST_BMIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_BMIOBAR Reference:** [B:0, D:24, F:2] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW/V | **Device Specific Data1 (DSD1):** Device Specific Data |

## 52.15.5 IDE Primary Bus Master Descriptor Table Pointer Register Byte 0 (IDEPBMDTPR0)—Offset 4h

This register implements the Byte 0 of the standard IDE Primary Bus Master Descriptor Table Pointer register in the IDE Bus Master Block. The descriptor table pointer is used for bus master operation in the primary channel.

Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [IDE_HOST_BMIOBAR] + 4h

**IDE_HOST_BMIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_BMIOBAR Reference:** [B:0, D:24, F:2] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Descriptor Table Pointer Byte 0 (DTPB0):** Byte 0 of the Descriptor Table pointer.<br>The Descriptor Table shall be DW-aligned.<br>Hence bit[1:0] shall always be 0. |

## 52.15.6 IDE Primary Bus Master Descriptor Table Pointer Register Byte 1 (IDEPBMDTPR1)—Offset 5h

This register implements the Byte 1 of the standard IDE Primary Bus Master Descriptor Table Pointer register in the IDE Bus Master Block. The descriptor table pointer is used for bus master operation in the primary channel.

Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [IDE_HOST_BMIOBAR] + 5h

**IDE_HOST_BMIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_BMIOBAR Reference:** [B:0, D:24, F:2] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Descriptor Table Pointer Byte 1 (DTPB1):** Byte 1 of the Descriptor Table pointer. |

## 52.15.7 IDE Primary Bus Master Descriptor Table Pointer Register Byte 2 (IDEPBMDTPR2)—Offset 6h

This register implements the Byte 2 of the standard IDE Primary Bus Master Descriptor Table Pointer register in the IDE Bus Master Block. The descriptor table pointer is used for bus master operation in the primary channel.

Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [IDE_HOST_BMIOBAR] + 6h

**Default:** 00h

**IDE_HOST_BMIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_BMIOBAR Reference:** [B:0, D:24, F:2] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Descriptor Table Pointer Byte 2 (DTPB2):** Byte 2 of the Descriptor Table pointer. |

## 52.15.8 IDE Primary Bus Master Descriptor Table Pointer Register Byte 3 (IDEPBMDTPR3)—Offset 7h

This register implements the Byte 3 of the standard IDE Primary Bus Master Descriptor Table Pointer register in the IDE Bus Master Block. The descriptor table pointer is used for bus master operation in the primary channel.

Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [IDE_HOST_BMIOBAR] + 7h

**Default:** 00h

**IDE_HOST_BMIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_BMIOBAR Reference:** [B:0, D:24, F:2] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Descriptor Table Pointer Byte 3 (DTPB3):** Byte 3 of the Descriptor Table pointer. |

## 52.15.9 IDE Secondary Bus Master Command Register (IDESBMCR)—Offset 8h

This register implements the standard IDE Secondary Bus Master Command register in the IDE Bus Master Block. Usage notes: The Secondary IDE Channel is permanently disabled. Access attributes are maintained to satisfy test requirement. No bus master functionality is implemented behind the register.

Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [IDE_HOST_BMIOBAR] + 8h

**IDE_HOST_BMIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_BMIOBAR Reference:** [B:0, D:24, F:2] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:4 | 0x0<br>RO | **Reserved (RSVD1):** Not implemented.<br>Hardwired to 0. |
| 3 | 0x0<br>RW | **Read or Write Control (RWC):** This bit sets the direction of the bus master transfer.<br>• 0: reads are performed from Host system memory.<br>• 1: writes are performed to Host system memory.<br>This bit shall NOT be changed when the bus master function is active. |
| 2:1 | 0x0<br>RO | **Reserved (RSVD0):** Not implemented.<br>Hardwired to 0. |
| 0 | 0x0<br>RW | **Start/Stop Bus Master (SSBM):** Host starts a bus master operation in the device by setting this bit to 1.<br>The device shall only transfer data between the ATA device and Host memory in the bus master operation.<br>Host stops the bus master operation by clearing this bit to 0. All state information will be lost when 0 is written.<br><br>Host CANNOT stop and then resume the bus master operation. |

## 52.15.10 IDE Secondary Bus Master Device Specific 0 Register (IDESBMDS0R)—Offset 9h

This register implements the standard IDE Secondary Bus Master Device Specific 0 register in the IDE Bus Master Block. This register is programmed by the Host for any device specific data. Usage notes: The Secondary IDE Channel is permanently disabled. Access attributes are maintained to satisfy test requirement. No bus master functionality is implemented behind the register.

Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [IDE_HOST_BMIOBAR] + 9h

**IDE_HOST_BMIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_BMIOBAR Reference:** [B:0, D:24, F:2] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Device Specific Data0 (DSD0):** Device Specific |

## 52.15.11 IDE Secondary Bus Master Status Register (IDESBMSR)—Offset Ah

This register implements the standard IDE Secondary Bus Master Status register in the IDE Bus Master Block. Usage notes: The Secondary IDE Channel is permanently disabled. Access attributes are maintained to satisfy test requirement. No bus master functionality is implemented behind the register.

Reset condition: Host reset with the SO bit as an exception. Non-sticky.

**Type:** I/O Register (Size: 8 bits)

**BAR and Offset:** [IDE_HOST_BMIOBAR] + Ah

**Default:** 80h

**IDE_HOST_BMIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_BMIOBAR Reference:** [B:0, D:24, F:2] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x1<br>RO/V | **Simplex Only (SO):** Value indicates whether both Bus Master Channels can be operated at the same time or not.<br>• 0: Both can be operated independently<br>• 1: Only one can be operated at a time.<br><br>This bit shadows IDEPBMSR[SO].<br><br>Reset condition: CSxE reset.<br>Non-sticky. |
| 6 | 0x0<br>RW | **Device 1 DMA Capable (D1DC):** This read/write bit is set by device dependent code (BIOS or host software) to indicate that Device 1 for this channel is capable of DMA transfers, and that the device has been initialized for optimum performance. |
| 5 | 0x0<br>RW | **Device 0 DMA Capable (D0DC):** This read/write bit is set by device dependent code (BIOS or host software) to indicate that Device 0 for this channel is capable of DMA transfers, and that the device has been initialized for optimum performance. |
| 4:3 | 0x0<br>RO | **Reserved (RSVD):** Not implemented.<br>Hardwired to 0. |
| 2 | 0x0<br>RO | **Interrupt (INT):** No functionality implemented.<br>Hardwired to 0. |
| 1 | 0x0<br>RO | **Error (ER):** Not implemented.<br>Hardwired to 0. |
| 0 | 0x0<br>RO | **Bus Master IDE Active (BMIA):** Not implemented.<br>Hardwired to 0. |

## 52.15.12 IDE Secondary Bus Master Device Specific 1 Register (IDESBMDS1R)—Offset Bh

This register implements the standard IDE Secondary Bus Master Device Specific 1 register in the IDE Bus Master Block. This register is programmed by the Host for any device specific data. Usage notes: The Secondary IDE Channel is permanently disabled. Access attributes are maintained to satisfy test requirement. No bus master functionality is implemented behind the register.

Reset condition: Host reset. Non-sticky.

**Type:** I/O Register (Size: 8 bits)

**BAR and Offset:** [IDE_HOST_BMIOBAR] + Bh

**Default:** 00h

**IDE_HOST_BMIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_BMIOBAR Reference:** [B:0, D:24, F:2] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Device Specific Data1 (DSD1):** Device Specific Data |

## 52.15.13 IDE Secondary Bus Master Descriptor Table Pointer Register Byte 0 (IDESBMDTPR0)—Offset Ch

This register implements the Byte 0 of the standard IDE Secondary Bus Master Descriptor Table Pointer register in the IDE Bus Master Block. The descriptor table pointer is used for bus master operation in the secondary channel. Usage notes: The Secondary IDE Channel is permanently disabled. Access attributes are maintained to satisfy test requirement. No bus master functionality is implemented behind the register.

Reset condition: Host reset. Non-sticky.

**Type:** I/O Register (Size: 8 bits)

**BAR and Offset:** [IDE_HOST_BMIOBAR] + Ch

**Default:** 00h

**IDE_HOST_BMIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_BMIOBAR Reference:** [B:0, D:24, F:2] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Descriptor Table Pointer Byte 0 (DTPB0):** Byte 0 of the Descriptor Table pointer.<br>The Descriptor Table shall be DW-aligned. Hence bit[1:0] shall always be 0. |

## 52.15.14 IDE Secondary Bus Master Descriptor Table Pointer Register Byte 1 (IDESBMDTPR1)—Offset Dh

This register implements the Byte 1 of the standard IDE Secondary Bus Master Descriptor Table Pointer register in the IDE Bus Master Block. The descriptor table pointer is used for bus master operation in the secondary channel. Usage notes: The Secondary IDE Channel is permanently disabled. Access attributes are maintained to satisfy test requirement. No bus master functionality is implemented behind the register.

Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [IDE_HOST_BMIOBAR] + Dh

**Default:** 00h

**IDE_HOST_BMIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_BMIOBAR Reference:** [B:0, D:24, F:2] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Descriptor Table Pointer Byte 1 (DTPB1):** Byte 1 of the Descriptor Table pointer. |

## 52.15.15 IDE Secondary Bus Master Descriptor Table Pointer Register Byte 2 (IDESBMDTPR2)—Offset Eh

This register implements the Byte 2 of the standard IDE Secondary Bus Master Descriptor Table Pointer register in the IDE Bus Master Block. The descriptor table pointer is used for bus master operation in the secondary channel. Usage notes: The Secondary IDE Channel is permanently disabled. Access attributes are maintained to satisfy test requirement. No bus master functionality is implemented behind the register.

Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [IDE_HOST_BMIOBAR] + Eh

**Default:** 00h

**IDE_HOST_BMIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_BMIOBAR Reference:** [B:0, D:24, F:2] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Descriptor Table Pointer Byte 2 (DTPB2):** Byte 2 of the Descriptor Table pointer. |

## 52.15.16 IDE Secondary Bus Master Descriptor Table Pointer Register Byte 3 (IDESBMDTPR3)—Offset Fh

This register implements the Byte 3 of the standard IDE Secondary Bus Master Descriptor Table Pointer register in the IDE Bus Master Block. The descriptor table pointer is used for bus master operation in the secondary channel. Usage notes: The Secondary IDE Channel is permanently disabled. Access attributes are maintained to satisfy test requirement. No bus master functionality is implemented behind the register.

Reset condition: Host reset. Non-sticky.

**Type:** I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [IDE_HOST_BMIOBAR] + Fh

**IDE_HOST_BMIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_BMIOBAR Reference:** [B:0, D:24, F:2] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Descriptor Table Pointer Byte 3 (DTPB3):** Byte 3 of the Descriptor Table pointer. |

## 52.16 Sideband Registers—KT (Host)

The Sideband registers accessible to the Host are described here. They are accessible in Host Memory Space starting at the Sideband Base Address Register (SBREG_BAR). See Section 3.4.1, "Using SBREG_BAR Method" on page 187.

### 52.16.1 KT Host Interrupt Pin Register (KTHIPINR)—Offset 0h

This register provides for BIOS to specify which interrupt pin KT shall use in the Host root space when generating an interrupt in the PCI legacy mode.

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0xe4] + 0h
**Host Memory Space:** SBREG_BAR + 0xe40000 + 0h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0x0<br>RO | **Reserved (RSVD):** Not implemented.<br>Hardwired to 0. |
| 7:0 | 0x0<br>RW/O | **Interrupt Pin (IPIN):** BIOS writes to this field once to specify which interrupt pin KT shall use. After written once, this register will become read-only.<br>This field shall be shadowed into the Interrupt Pin register in the PCI header of the KT Host PCI function.<br><br>Value Decoding<br>• 00h The function does NOT use an interrupt pin.<br>• 01h INTA<br>• 02h INTB<br>• 03h INTC<br>• 04h INTD<br>• 05h - FFh Reserved<br><br>Reset condition: Host side reset.<br>Non-sticky. |

### 52.16.2 BIOS KT Host PCI Function Disable Register (BKTHDISR)—Offset 4h

This register provides for BIOS to enable or disable the KT Host PCI function.

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0xe4] + 4h
**Host Memory Space:** SBREG_BAR + 0xe40000 + 4h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:1 | 0x0<br>RO | **Reserved (RSVD):** Not implemented.<br>Hardwired to 0. |
| 0 | 0x0<br>RW | **Host PCI Function Disable (HDIS):** BIOS sets this bit to disable the KT Host PCI function.<br>BIOS clears this bit to enable the KT Host PCI function.<br><br>Reset condition: Host side reset.<br>Non-sticky. |

## 52.17 Sideband Registers—IDE (Host)

The Sideband registers accessible to the Host are described here. They are accessible in Host Memory Space starting at the Sideband Base Address Register (SBREG_BAR). See Section 3.4.1, "Using SBREG_BAR Method" on page 187.

### 52.17.1 IDE Host Interrupt Pin Register (IDEHIPINR)—Offset 0h

This register provides for BIOS to specify which interrupt pin IDE shall use in the Host root space when generating an interrupt in the PCI legacy mode.

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0xe4] + 0h
**Host Memory Space:** SBREG_BAR + 0xe40000 + 0h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0x0<br>RO | **Reserved (RSVD):** Not implemented. Hardwired to 0. |
| 7:0 | 0x0<br>RW/O | **Interrupt Pin (IPIN):** BIOS writes to this field once to specify which interrupt pin IDE shall use. After written once, this register will become read-only.<br>This field shall be shadowed into the Interrupt Pin register in the PCI header of the IDE Host PCI function.<br><br>Value Decoding<br>00h The function does NOT use an interrupt pin.<br>01h INTA<br>02h INTB<br>03h INTC<br>04h INTD<br>05h - FFh Reserved<br><br>Reset condition: Host side reset.<br>Non-sticky. |

### 52.17.2 BIOS IDE Host PCI Function Disable Register (BIDEHDISR)—Offset 4h

This register provides for BIOS to enable or disable the IDE Host PCI function.

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0xe4] + 4h
**Host Memory Space:** SBREG_BAR + 0xe40000 + 4h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:1 | 0x0<br>RO | **Reserved (RSVD):** Not implemented. Hardwired to 0. |
| 0 | 0x0<br>RW | **Host PCI Function Disable (HDIS):** BIOS sets this bit to disable the IDE Host PCI function. BIOS clears this bit to enable the IDE Host PCI function.<br><br>Reset condition: Host side reset.<br>Non-sticky. |

# 53 HSUART Controller - B0, D26, F(0, 1, 2)

## 53.1 Introduction and Index

The host-accessible registers for the HSUART Controller are described here.

To determine the number of devices/functions available refer to the following:

- Table 1-1, “Features by product SKU - Server and Cloud Storage SKUs 0 through 4”
- Table 1-2, “Features by Product SKU - Network and Enterprise Storage SKUs 5 through 10”
- Table 1-3, “Features by Product SKU - Extended Temperature SKUs 11 through 14”.

The legend for the register access codes are described in Chapter 43, “Introduction.”

### 53.1.1 Host Configuration Space

These registers are discovered in Host Configuration Space starting at Bus 0, Device 26 (decimal), Function (0, 1, 2). The offset addresses are listed.

**Table 53-1. Summary of PCI Configuration Registers—0/26/0,1,2**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 0 | 4 | 19D88086 | "VENDOR_DEVICE_ID—Offset 0h" on page 2387 |
| 4 | 4 | 00100000 | "CMD_STAT_REG—Offset 4h" on page 2388 |
| 8 | 4 | 07000200 | "REV_CLASS_CODE—Offset 8h" on page 2390 |
| C | 4 | 00800000 | "CACHE—Offset Ch" on page 2390 |
| 10 | 4 | 00000001 | "IOBA—Offset 10h" on page 2391 |
| 14 | 4 | 00000000 | "MEMBA—Offset 14h" on page 2391 |
| 2C | 4 | 00008086 | "SUBSYSTEM_VENDOR_ID—Offset 2Ch" on page 2392 |
| 34 | 4 | 00000040 | "CAP_PTR—Offset 34h" on page 2392 |
| 3C | 4 | 000001FF | "INTERRUPT—Offset 3Ch" on page 2392 |
| 40 | 4 | 00005005 | "MSIC—Offset 40h" on page 2393 |
| 44 | 4 | 00000000 | "MSIA—Offset 44h" on page 2394 |
| 48 | 4 | 00000000 | "MSID—Offset 48h" on page 2394 |
| 50 | 4 | 00030001 | "PMC—Offset 50h" on page 2395 |
| 54 | 4 | 00000008 | "PMCSR—Offset 54h" on page 2396 |
| 60 | 4 | 00000000h | "DSC—Offset 60h" on page 2397 |
| 74 | 4 | 00000000h | "FUNC_RDCFG_HIDE—Offset 74h" on page 2398 |

### 53.1.2 Host Memory Space—MEMBA

An index of the registers that are accessible in Host Memory Space is shown here. There is a set of these registers for each of the three HSUART Functions (F0, F1, and F2).

**Table 53-2. Summary of Memory Mapped I/O Registers—MEMBA**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 0 | 1 | 00 | "RBR_THR_DLL—Offset 0h" on page 2399 |
| 1 | 1 | 00 | "IER_DLH—Offset 1h" on page 2399 |
| 2 | 1 | 00 | "IIR_FCR—Offset 2h" on page 2400 |
| 3 | 1 | 00 | "LCR—Offset 3h" on page 2400 |
| 4 | 1 | 00 | "MCR—Offset 4h" on page 2402 |
| 5 | 1 | 60 | "LSR—Offset 5h" on page 2404 |
| 6 | 1 | 00 | "MSR—Offset 6h" on page 2406 |
| 7 | 1 | 00 | "SPR—Offset 7h" on page 2408 |
| 8 | 4 | 00000000 | "UART_FISR—Offset 8h" on page 2408 |
| 20 | 4 | 00000000 | "RFOR—Offset 20h" on page 2408 |
| 24 | 4 | 00000010 | "ABR—Offset 24h" on page 2409 |
| 28 | 4 | 00000000 | "ACR—Offset 28h" on page 2410 |
| 30 | 4 | 00000010 | "PSR—Offset 30h" on page 2410 |
| 34 | 4 | 000000D8 | "UCMR—Offset 34h" on page 2410 |
| 38 | 4 | 00003D09 | "UCDR—Offset 38h" on page 2411 |
| 80 | 4 | 000F0000 | "CH0SR—Offset 80h" on page 2412 |
| 84 | 4 | 00000000 | "CH0CR—Offset 84h" on page 2412 |
| 88 | 4 | 00008000 | "CH0DCR—Offset 88h" on page 2414 |
| 90 | 4 | 00000000 | "CH0BSR—Offset 90h" on page 2415 |
| 94 | 4 | 00000000 | "CH0MTSR—Offset 94h" on page 2415 |
| A0 | 4 | 00000000 | "CH0D0SAR—Offset A0h" on page 2415 |
| A4 | 4 | 00000000 | "CH0D0TSR—Offset A4h" on page 2416 |
| A8 | 4 | 00000000 | "CH0D1SAR—Offset A8h" on page 2416 |
| AC | 4 | 00000000 | "CH0D1TSR—Offset ACh" on page 2416 |
| B0 | 4 | 00000000 | "CH0D2SAR—Offset B0h" on page 2417 |
| B4 | 4 | 00000000 | "CH0D2TSR—Offset B4h" on page 2417 |
| B8 | 4 | 00000000 | "CH0D3SAR—Offset B8h" on page 2418 |
| BC | 4 | 00000000 | "CH0D3TSR—Offset BCh" on page 2418 |
| C0 | 4 | 000F0000 | "CH1SR—Offset C0h" on page 2419 |
| C4 | 4 | 00000000 | "CH1CR—Offset C4h" on page 2420 |
| C8 | 4 | 00008000 | "CH1DCR—Offset C8h" on page 2421 |
| D0 | 4 | 00000000 | "CH1BSR—Offset D0h" on page 2422 |
| D4 | 4 | 00000000 | "CH1MTSR—Offset D4h" on page 2422 |
| E0 | 4 | 00000000 | "CH1D0SAR—Offset E0h" on page 2422 |
| E4 | 4 | 00000000 | "CH1D0TSR—Offset E4h" on page 2423 |

## Table 53-2. Summary of Memory Mapped I/O Registers—MEMBA (Continued)

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| E8 | 4 | 00000000 | "CH1D1SAR—Offset E8h" on page 2423 |
| EC | 4 | 00000000 | "CH1D1TSR—Offset ECh" on page 2423 |
| F0 | 4 | 00000000 | "CH1D2SAR—Offset F0h" on page 2424 |
| F4 | 4 | 00000000 | "CH1D2TSR—Offset F4h" on page 2424 |
| F8 | 4 | 00000000 | "CH1D3SAR—Offset F8h" on page 2425 |
| FC | 4 | 00000000 | "CH1D3TSR—Offset FCh" on page 2425 |

### 53.1.3 Host I/O Space—IOBA

An index of the registers that are accessible in Host I/O Space is shown here. There is a set of these registers for each of the three HSUART Functions (F0, F1, and F2).

**Table 53-3. Summary of I/O Registers—IOBA**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 0 | 1 | 00 | "RBR_THR_DLL—Offset 0h" on page 2426 |
| 1 | 1 | 00 | "IER_DLH—Offset 1h" on page 2426 |
| 2 | 1 | 00 | "IIR_FCR—Offset 2h" on page 2427 |
| 3 | 1 | 00 | "LCR—Offset 3h" on page 2428 |
| 4 | 1 | 00 | "MCR—Offset 4h" on page 2430 |
| 5 | 1 | 00 | "LSR—Offset 5h" on page 2432 |
| 6 | 1 | 00 | "MSR—Offset 6h" on page 2434 |
| 7 | 1 | 00 | "SPR—Offset 7h" on page 2436 |

## 53.2 Registers in Configuration Space

### 53.2.1 VENDOR_DEVICE_ID—Offset 0h

*Note:* The default value of DEVICE_ID can be overwritten using the setidval sideband message.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:26, F:0] + 0h

**Default:** 19D88086h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x19d8<br>RO/V | **DEVICE_ID:** Device ID |
| 15:0 | 0x8086<br>RO | **VENDOR_ID:** Identifies uniquely Intel products. |

## 53.2.2 CMD_STAT_REG—Offset 4h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:26, F:0] + 4h

**Default:** 00100000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW/1C | **STATUS_DETECTED_PARITY_ERROR:** Detected Parity Error.<br>This bit is set when the device receives an uncorrectable data error or parity error regardless of the Parity Error Response bit (CMD_STAT_REG.COMMAND_PARITY_ERROR_RESPONSE_ENABLE). |
| 30 | 0x0<br>RW/1C | **STATUS_SIGNALED_SYSTEM_ERROR:** Signaled System Error.<br>Never expected to be asserted. This bit is set when the device has detected an uncorrectable error and reported it via SERR message over sideband.<br>This requires SERR Enable bit to be set in Command register. |
| 29 | 0x0<br>RW/1C | **STATUS_RECEIVED_MASTER_ABORT:** Received Master Abort.<br>This bit is set when device receives a Completion transaction with Unsupported Request completion status.<br>No error will be reported. |
| 28 | 0x0<br>RW/1C | **STATUS_RECEIVED_TARGET_ABORT:** Received Target Abort.<br>This bit is set when device receives a Completion transaction with Completer Abort completion status.<br>No error will be reported. |
| 27 | 0x0<br>RW/1C | **STATUS_SIGNALED_TARGET_ABORT:** Signaled Target Abort.<br>Set by the device when aborting a request that violates the device programming model.<br>When SERR Enable is set SERR message will be send over sideband. |
| 26:25 | 0x0<br>RSV | **STATUS_RESERVED_25:** Reserved. |
| 24 | 0x0<br>RW/1C | **STATUS_MASTER_DATA_PARITY_ERROR:** Master Data Parity Error.<br>This bit is set if the Parity Error Response bit (CMD_STAT_REG.COMMAND_PARITY_ERROR_RESPONSE_ENABLE) is set and it receives a completion with poisoned data from IOSF. |
| 23:21 | 0x0<br>RSV | **STATUS_RESERVED_21:** Reserved. |
| 20 | 0x1<br>RO | **STATUS_NEW_CAP:** New Capabilities.<br>Indicates that a device implements extended capabilities.<br>The Controller sets this bit, and implements a capabilities list. |
| 19 | 0x0<br>RO/V | **STATUS_INTERRUPT_STATUS:** Interrupt Status.<br>The Interrupt Status field is a RO field that indicates that an interrupt message is pending internally to the device. |
| 18:16 | 0x0<br>RSV | **STATUS_RESERVED_16:** Reserved. |
| 15:11 | 0x0<br>RSV | **COMMAND_RESERVED_11:** Reserved. |
| 10 | 0x0<br>RW | **COMMAND_INTERRUPT_DISABLE:** Interrupt Disable.<br>Controls the ability of a device to generate a legacy interrupt message.<br>When set, the device cannot generate legacy interrupt messages. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 9 | 0x0<br>RSV | **COMMAND_RESERVED_9:** Reserved. |
| 8 | 0x0<br>RW | **COMMAND_SERR_ENABLE:** SERR# Enable |
| 7 | 0x0<br>RSV | **COMMAND_RESERVED_7:** Reserved. |
| 6 | 0x0<br>RW | **COMMAND_PARITY_ERROR_RESPONSE_ENABLE:** Parity Error Response.<br>This bit controls the setting of STATUS_MASTER_DATA_PARITY_ERROR.<br>0 = Parity errors can be ignored by the device.<br>1 = Device can report parity errors. |
| 5:3 | 0x0<br>RSV | **COMMAND_RESERVED_3:** Reserved. |
| 2 | 0x0<br>RW | **COMMAND_BUS_ACCESS_ENABLE:** Must be set to 1 for the device to initiate memory read and write requests as a master.<br>This bit does not affect a device's ability to generate MSI message, Error Message, or completion cycles as a target. |
| 1 | 0x0<br>RW | **COMMAND_MEM_ACCESS_ENABLE:** Memory Access Enable |
| 0 | 0x0<br>RW | **COMMAND_IO_ACCESS_ENABLE:** When set, IO Space Decoding is enabled and IO transactions targeting the device are accepted. |

## 53.2.3 REV_CLASS_CODE—Offset 8h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:26, F:0] + 8h

**Default:** 07000200h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0x70002<br>RO | **CLASS_CODE:** The class code is a RO hard-coded value that identifies its functionality.<br>***Note:*** This field (Programming Interface, Sub Class Code, Base Class Code) is RO from Primary and RW from Sideband. |
| 7:0 | 0x0<br>RO/V | **REVISION_ID:** The default revision ID is 0x0. |

## 53.2.4 CACHE—Offset Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:26, F:0] + Ch

**Default:** 00800000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RSV | **BIST:** Reserved. |
| 23:16 | 0x80<br>RO | **HEADER_TYPE:** This indicates if a device is single-function or multifunction.<br>If a single function is the only active one then this field has a value of 0x00 to indicate a single-function device.<br>If other functions are enabled then this field has a value of 0x80 to indicate a multi-function device. |
| 15:8 | 0x0<br>RSV | **RESERVED_1:** Reserved. |
| 7:0 | 0x0<br>RSV | **RESERVED_0:** Reserved. |

## 53.2.5 IOBA—Offset 10h

The Base Address registers (BARs) are used to map register space of the various functions. It has a memory BAR, IO BAR.

The internal registers memories are accessed as direct memory mapped offsets from the Base Address register. Software can access a Dword or 64 bits.

*Note:* If this is a Dummy function the register is RO as 0.

**Type:** PCI Configuration Register (Size: 32 bits) **Offset:** [B:0, D:26, F:0] + 10h

**Default:** 00000001h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:3 | 0x0<br>RW | **BASE_ADDR:** Reserved. |
| 2:1 | 0x0<br>RO | **MEMORY_TYPE:** Hardwired to 0 for 8 byte access. |
| 0 | 0x1<br>RO | **MEMORY_IO_SPACE:** Reserved. |

## 53.2.6 MEMBA—Offset 14h

The Base Address registers (BARs) are used to map register space of the various functions.

The internal registers memories are accessed as direct memory mapped offsets from the Base Address register. Software can access a Dword or 64 bits.

**Type:** PCI Configuration Register (Size: 32 bits) **Offset:** [B:0, D:26, F:0] + 14h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0x0<br>RW | **BASE_ADDR:** Reserved. |
| 7:4 | 0x0<br>RO | **MEM_SIZE:** Set to 0 to indicate 256 byte memory Space. |
| 3 | 0x0<br>RO | **PREFETCHABLE:** Set to 0 to indicate MEMBA is not prefetchable. |
| 2:1 | 0x0<br>RO | **MEMORY_TYPE:** Set to 0 to indicate the BAR is located in lower 4G space. |
| 0 | 0x0<br>RO | **MEMORY_IO_SPACE:** Reserved. |

## 53.2.7 SUBSYSTEM_VENDOR_ID—Offset 2Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:26, F:0] + 2Ch

**Default:** 00008086h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW/O/P | **SUBSYSTEM_ID:**<br>***Note:*** This field is RO from Sideband and RW/O from Primary. |
| 15:0 | 0x8086<br>RW/O/P | **SUBSYSTEM_VENDOR_ID:**<br>***Note:*** This field is RO from Sideband and RW/O from Primary. |

## 53.2.8 CAP_PTR—Offset 34h

The Capabilities Pointer field is an 8 bit field that provides an offset in the device's PCI configuration space for the location of the first item in the Capabilities Linked List (CLL).

Controller sets this bit and implements a capabilities list to indicate that it supports PCI power management, Message Signaled Interrupts (MSIs), and PCIe extended capabilities. Its value is 0x40, which is the address of the first entry: MSI cap.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:26, F:0] + 34h

**Default:** 00000040h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0x0<br>RSV | **RESERVED:** Reserved. |
| 7:0 | 0x40<br>RO | **CAP_PTR:** |

## 53.2.9 INTERRUPT—Offset 3Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:26, F:0] + 3Ch

**Default:** 000001FFh

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RSV | **RESERVED:** Reserved. |
| 15:8 | 0x1<br>RW/P/L | **INTERRUPT_PIN:** A value of 0x1, 0x2, 0x3, or 0x4 indicates that this function implements legacy interrupt on INTA#, INTB#, INTC#, or INTD#, respectively.<br>This bit is locked by PLKCTL.CL. |
| 7:0 | 0xff<br>RW | **INTERRUPT_LINE:** Read/write register programmed by software to indicate which of the system interrupt request lines this controller's interrupt pin is bound to.<br>See the PCIe definition for more details. Each of the PCIe functions has its own register.<br>***Note:*** For Dummy functions this register is RO as zero. |

## 53.2.10 MSIC—Offset 40h

MSI Capability Register.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:26, F:0] + 40h

**Default:** 00005005h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RSV | **RESERVED:** Reserved. |
| 23 | 0x0<br>RO | **AD64C:** 64-bit capable.<br>A value of 1 indicates it is capable of generating 64-bit message addresses. |
| 22:20 | 0x0<br>RW | **MMEN:** Multiple Message Enable.<br>Indicates it supports a single message per function. |
| 19:17 | 0x0<br>RO | **MMC:** Multiple Message Capable.<br>Indicates a single requested message per each function. |
| 16 | 0x0<br>RW | **MSI_EN:** If set to 1, equals MSI.<br>In this case, controller generates an MSI for interrupt assertion instead of INTx signaling. |
| 15:8 | 0x50<br>RO | **NEXT_POINTER:** Next cap Pointer.<br>This field provides an offset to the next capability item in the capability list.<br>Its value of 0x50 points to the PM capability structure. |
| 7:0 | 0x5<br>RO | **CAP_ID:** This field equals 0x05 indicating the linked list item as being the MSI registers. |

## 53.2.11 MSIA—Offset 44h

Written by the system to indicate 32 bits of the address to use for the MSI memory write transaction.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:26, F:0] + 44h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:2 | 0x0<br>RW | **MSIAddr:** Reserved. |
| 1:0 | 0x0<br>RO | **MSI_DW:** Value of 0 indicates memory address is always DW aligned. |

## 53.2.12 MSID—Offset 48h

Written by the system to indicate the lower 16 bits of the data written in the MSI memory write Dword transaction. The upper 16 bits of the transaction are written as 0b.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:26, F:0] + 48h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RSV | **RESERVED:** Reserved. |
| 15:0 | 0x0<br>RW | **MSID:** |

## 53.2.13 PMC—Offset 50h

All fields are reset on full power-up. All of the fields except PME_En and PME_Status are reset on exit from D3cold state. If aux power is not supplied, the PME_En and PME_Status fields also reset on exit from D3cold state.

*Note:* See the detailed description for registers loaded from the EEPROM at initialization time. Behavior of some fields depend on the Power Management bit in EEPROM word 0x0A.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:26, F:0] + 50h

**Default:** 00030001h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:27 | 0x0<br>RO | **PME_SUPPORT:** This 5-bit field indicates the power states in which the function may assert PME#. A value of 0b for any bit indicates that the function is not capable of asserting the PME# signal while in that power state. |
| 26 | 0x0<br>RO | **D2_SUPPORT:** Does not support D2 state. |
| 25 | 0x0<br>RO | **D1_SUPPORT:** Does not support D1 state. |
| 24:22 | 0x0<br>RO | **AUX_CURRENT:** Required current defined in the Data Register. |
| 21 | 0x0<br>RO | **DSI:** Controller requires its device driver to be executed following transition to the D0 uninitialized state. |
| 20 | 0x0<br>RSV | **RESERVED:** Reserved. |
| 19 | 0x0<br>RO | **PME_CLOCK:** Disabled; Hardwired to 0. |
| 18:16 | 0x3<br>RO | **VERSION:** Complies with the PCI PM specification, revision 1.2 |
| 15:8 | 0x0<br>RO | **NEXT_POINTER:** This field provides an offset to the next capability item in the capability list. Value of 0xA0 points to the PCI Express capability. |
| 7:0 | 0x1<br>RO | **CAP_ID:** This fields equals 0x01 indicating the linked list item as being the PCI Power Management registers. |

## 53.2.14 PMCSR—Offset 54h

All fields are reset on full power-up. All of the fields except PME_En and PME_Status are reset on exit from D3cold state. If aux power is not supplied, the PME_En and PME_Status fields also reset on exit from D3cold state. Each device function has its own PMCSR register.

*Note:* See the detailed description for registers loaded from the EEPROM at initialization time. Behavior of some fields depend on the Power Management bit in EEPROM word 0x0A.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:26, F:0] + 54h

**Default:** 00000008h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RO | **DATA:** No Data. |
| 23:16 | 0x0<br>RSV | **RESERVED16:** Reserved. |
| 15 | 0x0<br>RO | **PME_STATUS:** |
| 14:9 | 0x0<br>RSV | **RESERVED:** Reserved. |
| 8 | 0x0<br>RO | **PME_EN:** Hardwired to 0, indicate not support PME. |
| 7:4 | 0x0<br>RSV | **RESERVED4:** Reserved. |
| 3 | 0x1<br>RO | **NO_SOFT_RESET:**<br>• When set (1) this bit indicates that when controller transitions from D3hot to D0 because of modifying Power State bits in the PMCSR register, no internal reset is issued and Configuration Context is preserved. Upon transition from the D3hot to the D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the Power State bits.<br>• When clear (0) controller performs an internal reset upon transitioning from D3hot to D0 via software control of the Power State bits in the PMCSR register. Configuration Context is lost when performing the soft reset. Upon transition from the D3hot to the D0 state, full re-initialization sequence is needed to return the device to D0 Initialized.<br>Regardless of this bit, devices that transition from D3hot to D0 by a system or bus segment reset will return to the device state D0 Uninitialized with only PME context preserved if PME is supported and enabled. |
| 2 | 0x0<br>RSV | **RESERVED2:** Reserved. |
| 1:0 | 0x0<br>RW/V | **POWER_STATE:** This field is used to set and report the power state of a function as follows:<br>• 00b = D0<br>• 01b = D1 (cycle ignored if written with this value)<br>• 10b = D2 (cycle ignored if written with this value)<br>• 11b = D3 hot |

## 53.2.15 DSC—Offset 60h

Device Specific control and Status Register.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:26, F:0] + 60h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:20 | 0x0<br>RSV | **RESERVED_3:** Reserved. |
| 19 | 0x0<br>RW/1C | **URD:** Unsupported Request Detect:<br>When set, this bit is set when unsupported request is detected. |
| 18:16 | 0x0<br>RSV | **RESERVED_2:** Reserved. |
| 15:4 | 0x0<br>RSV | **RESERVED_1:** Reserved. |
| 3 | 0x0<br>RW | **URRE:** Unsupported Request Reporting Enable:<br>When set, this bit enables the reporting of Non-fatal error. |
| 2:0 | 0x0<br>RSV | **RESERVED_0:** Reserved. |

## 53.2.16 FUNC_RDCFG_HIDE—Offset 74h

Function-Hide Register. Hiding is programmable per-function. Since hiding affects reads to FUNC_RDCFG_HIDE itself, this register is not shared in order to avoid read-modify-write errors.

*Note:* If function 0 is hidden, O/S will not discover function 1 and function 2.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:26, F:0] + 74h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:1 | 0x0<br>RSV | **RESERVED_0:** Reserved. |
| 0 | 0x0<br>RW | **HIDE:** HIDE:<br>• 0 - HSUART Not Hidden<br>• 1 - HSUART Hidden |

## 53.3 Registers in Memory Space—MEMBA

These registers are accessed in Host Memory Space starting at the relocatable memory address defined by the Base Address Register (BAR) MEMBA. There is a set of these registers for each of the three HSUART Functions (F0, F1, and F2).

### 53.3.1 RBR_THR_DLL—Offset 0h

RBR = Receive buffer register THR = Transmit hold register DLL = Divisor Latch low.

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [MEMBA] + 0h

**MEMBA Type:** PCI Configuration Register (Size: 32 bits)
**MEMBA Reference:** [B:0, D:26, F:0,1,2] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW/V | **RBR_THR_DLL:** When DLAB =0, this 8 bit is used as Received Buffer Register as Read, and is used as Transmit Holding Register as Write.<br>When DLAB is 1, this register is used as DLL (Divisor Latch Low Byte Register). |

### 53.3.2 IER_DLH—Offset 1h

IER = Interrupt Enable Register DLH = Divisor Latch High.

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [MEMBA] + 1h

**MEMBA Type:** PCI Configuration Register (Size: 32 bits)
**MEMBA Reference:** [B:0, D:26, F:0,1,2] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW/V | **IER_DLH:** When DLAB =0, this 8 bit is used as Interrupt Enable Register.<br>When DLAB =1, this 8 bit is used as DLH (Divisor Latch High Byte Register). |

## 53.3.3 IIR_FCR—Offset 2h

IIR = Interrupt Identification Register FCR = FIFO control register.

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [MEMBA] + 2h

**MEMBA Type:** PCI Configuration Register (Size: 32 bits)
**MEMBA Reference:** [B:0, D:26, F:0,1,2] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW/V | **IIR_FCR:** When this 8 bit is read, it is serving as Interrupt Identification Registers.<br>When this 8 bit is written, it is serving as FCR (FIFO control register.). |

## 53.3.4 LCR—Offset 3h

Line Control Register.

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [MEMBA] + 3h

**MEMBA Type:** PCI Configuration Register (Size: 32 bits)
**MEMBA Reference:** [B:0, D:26, F:0,1,2] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RW | **LCR_DLAB:** Divisor Latch Register Access Bit:<br>The divisor-latch access bit must be set high (logic 1) to access the divisor latches of the baud rate generator during a read or write operation. It must be set low (logic 0) to access the receiver buffer, the Transmit Holding register, or the Interrupt Enable register.<br>This bit does not need to be set when using auto-baud.<br>• 0: Access Transmit Holding register (THR), Receive Buffer register (RBR) and Interrupt Enable register.<br>• 1: Access Divisor Latch registers (DLL and DLH). |
| 6 | 0x0<br>RW | **LCR_SB:** Set Break:<br>The set-break control bit transmits a Break condition to the receiving UART.<br>When SB is set to logic 1, the serial output (TXD) is forced to the Spacing (logic 0) state and remains there until SB is set to logic 0. This bit acts only on the TXD pin and has no effect on the transmitter logic.<br>• 0: No effect on TXD output.<br>• 1: Forces TXD output to 0 (space).<br>This feature enables the processor to alert a terminal in a computer communications system.<br>If the following sequence is executed, no erroneous characters will be transmitted because of the break:<br>Load 0x00 in the Transmit Holding register in response to a TDRQ Interrupt.<br>After TDRQ goes high (indicating that 0x00 is being shifted out), set the break bit before the parity or stop bits reach the TXD pin.<br>Wait for the transmitter to be idle (TEMT = 1), and clear the break bit when normal transmission has to be restored.<br>During the Break, the transmitter can be used as a character timer to accurately establish the Break duration.<br>In FIFO mode, wait for the transmitter to be idle (TEMT=1) to set and clear the break bit. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 5 | 0x0<br>RW | **LCR_STKYP:** Sticky Parity:<br>This bit is the sticky-parity bit, which can be used in multiprocessor communications.<br>• 0: No effect on parity bit.<br>• 1: Forces parity bit to be opposite of EPS bit value.<br>When PEN and STKYP are logic 1, the bit that is transmitted in the parity-bit location (the bit just before the stop bit) is the complement of the EPS bit. If EPS is 0, then the bit at the parity-bit location will be transmitted as a 1.<br>In the receiver, if STKYP and PEN are 1, then the receiver compares the bit that is received in the parity-bit location with the complement of the EPS bit.<br>If the values being compared are not equal, the receiver sets the parity-error bit in LSR, and causes an Error Interrupt if Line-Status Interrupts were enabled.<br>For example, if EPS is 0, the receiver expects the bit received at the parity-bit location to be 1.<br>If it is not, then the parity-error bit is set.<br>By forcing the bit value at the parity-bit location, rather than calculating a parity value, a system with a master transmitter and multiple receivers can identify some transmitted characters as receiver addresses and the rest of the characters as data.<br>If PEN = 0, STKYP is ignored. |
| 4 | 0x0<br>RW | **LCR_EPS:** Even Parity Select:<br>EPS is only valid when the parity is enabled (PEN = 1).<br>• 0: Sends and checks for odd parity.<br>• 1: Sends and checks for even parity. |
| 3 | 0x0<br>RW | **LCR_PEN:** Parity Enable (PEN): When PEN is logic 1, a parity bit is generated (transmit data) or checked (receive data) between the last data-word bit and stop bit of the serial data.<br>• 0: No parity function.<br>• 1: Allows parity generation and checking. |
| 2 | 0x0<br>RW | **LCR_STB:** Stop Bits:<br>This bit specifies the number of stop bits transmitted and received in each serial character.<br>• 0: 1 stop bit.<br>• 1: 2 stop bits; except for 5-bit character, then 1 bits The receiver checks the first stop bit only, regardless of the number of stop bits selected. |
| 1:0 | 0x0<br>RW | **LCR_WLS:** Word Length Select:<br>The word length select bits specify the number of data bits (five to eight bits are allowed) in each transmitted or received serial character.<br>• 00: 5-bit character (default).<br>• 01: 6-bit character 10: 7-bit character 11: 8-bit character. |

## 53.3.5 MCR—Offset 4h

Modem Control Register.

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**BAR and Offset:** [MEMBA] + 4h

**Default:** 00h

**MEMBA Type:** PCI Configuration Register (Size: 32 bits)
**MEMBA Reference:** [B:0, D:26, F:0,1,2] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:6 | 0x0<br>RSV | **MCR_RESERVED:** Reserved. |
| 5 | 0x0<br>RW | **MCR_AFE:** MCR-Auto Flow Enable:<br>This is a reserved bit in 16550 spec.<br>• 0: Auto-RTS and Auto-CTS are disabled.<br>• 1: Auto-CTS is enabled. If MCR[RTS] is also set, both Auto-CTS and Auto-RTS is enabled.<br>Auto-RTS is not enabled if AFE is not set regardless of the state of MCR[RTS].<br>Autoflow automates the flow of data between the UART and the remote device. |
| 4 | 0x0<br>RW | **MCR_LOOP:** Modem Control Register-Loop back test mode.<br>This bit provides a local loopback feature for diagnostic testing of the UART.<br>This feature allows the processor to verify the UART transmit and receive data paths.<br>The Transmit, Receive, and Modem Control interrupts are operational in this mode.<br>• 0: Normal UART operation.<br>• 1: Loopback Test mode operation Serial output uart_txd pin is set to logic 1.<br>Serial input uart_rxd pin is disconnected from external input line.<br>The output of the Transmitter Shift register is looped back into the Receiver Shift register.<br>The modem-control inputs (uart_cts, uart_dsr, uart_dcd, and uart_ri) are activated by MCR bits 0-3 instead of the modem-control inputs.<br><br>A Break signal can also be transferred from the transmitter section to the receiver section in Loopback mode. When LOOP is set to logic 1, the following will occur:<br>The TXD (transmitter output) pin is set to a logic-1 state.<br>The RXD (receiver input) pin is disconnected.<br>The output of the Transmitter Shift register is looped back into the Receiver-Shift register input.<br>The four modem-control inputs (uart_cts, uart_dsr, uart_dcd, and uart_ri) are disconnected from the pins and the modem-control output pins (uart_rts and uart_dtr) are forced to their inactive state.<br>The lower four bits of the Modem Control register (MCR) are connected to the upper four modem status register (MSR) bits.<br>Flow control can be tested; if autoflow is enabled, the MCR[RTS] bit has no effect on the nCTS input as nRTS is asserted by the autoflow logic.<br>• DTR = 1 forces DSR to a 1<br>• RTS = 1 forces CTS to a 1<br>• OUT1 = 1 forces RI to a 1<br>• OUT2= 1 forces DCD to a 1<br>Coming out of the Loopback Test mode may result in unpredictable activation of the delta bits (bits 3:0) in the Modem Status register (MSR).<br>It is recommended that MSR is read once to clear the delta bits in the MSR. |
| 3 | 0x0<br>RW | **MCR_OUT2:** Output2:<br>The function of the auxiliary output OUT2 bit differs depending on the mode of the UART.<br>• 0: uart_dcd UART pin input set low when in Loop-back mode.<br>• 1: uart_dcd UART pin input set high when in Loop-back mode. |
| 2 | 0x0<br>RW | **MCR_OUT1:** Modem Control Register-output1:<br>The auxiliary output OUT1 bit is only used in Loopback Test mode.<br>• 0: uart_ri UART pin input set low when in Loop-back mode.<br>• 1: uart_ri UART pin input set high when in Loop-back mode. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 1 | 0x0<br>RW | **MCR_RTS:** When Auto Flow is disabled: MCR[AFE] = 0:<br>• 0: Primary output uart_rts pin is forced to logic 1.<br>• 1: Primary output uart_rts pin is forced to logic 0.<br>When Auto Flow is enabled: MCR[AFE] = 1:<br>• 0: Auto-RTS is disabled.<br>• 1: Auto-RTS is enabled. |
| 0 | 0x0<br>RW | **MCR_DTR:** Modem Control Register-Data Terminal Ready.<br>This bit controls the Data Terminal Ready output.<br>• 0: Primary output uart_dtr pin is forced to logic 1.<br>• 1: Primary output uart_dtr pin is forced to logic 0.<br>The uart_dtr output of the UART may be applied to an EIA inverting line driver (such as the DS1488) to obtain the proper polarity input at the succeeding modem or data set. |

## 53.3.6 LSR—Offset 5h

Line Status Register.

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 60h

**BAR and Offset:** [MEMBA] + 5h

**MEMBA Type:** PCI Configuration Register (Size: 32 bits)
**MEMBA Reference:** [B:0, D:26, F:0,1,2] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RO/V | **LSR_FIFOE:** Line Status Register - FIFO Error Status:<br>• 0: No character has error inside the Receive FIFO.<br>• 1: At least one character in Receiver FIFO has errors.<br>In non-FIFO mode, this bit is always set to 0. In FIFO mode, FIFOE is set to 1 when there is at least one parity error, framing error, or break indication for any of the characters in the FIFO.<br>A processor read to the Line Status register does not reset this bit.<br>FIFOE is reset when all error bytes have been read from the FIFO.<br>If DMA requests are enabled and FIFOE is set to 1, the Error Interrupt is generated and no Receive DMA request is generated even if the Receive FIFO reaches the trigger level.<br>If DMA requests are not enabled setting FIFOE to 1 does not generate an interrupt. |
| 6 | 0x1<br>RO/V | **LSR_TEMT:** Line Status Register - Transmitter Empty:<br>• 0: There is data in the Transmit Shift register, the Transmit Holding register, or the FIFO (in FIFO mode).<br>• 1: All the data in the transmitter has been shifted out. |
| 5 | 0x1<br>RO/V | **LSR_TDRQ:** Line Status Register - Transmit data Request:<br>• 0: The UART is NOT ready to receive data for transmission.<br>• 1: The UART is ready to receive data for transmission.<br>The assertion of TDRQ causes the UART to interrupt the processor when the Transmit Data Request Interrupt Enable IER[TIE] is set high, and generates a DMA request to the DMA controller if DMA Request is enabled.<br>TDRQ is set to 1 when the new symbol is copied from Transmit Holding register into the Transmit Shift register.<br>The bit is reset to logic 0 concurrently with the loading of the Transmit Holding register by the processor.<br>In FIFO mode, TDRQ is set to logic 1 when the FIFO is less than half full.<br>It is cleared when the FIFO is more than half full.<br>If more than 64 characters are loaded into the FIFO, the excess characters are lost. |
| 4 | 0x0<br>RO/C/V | **LSR_BI:** Line Status Register - Break Interrupt:<br>• 0: No break signal has been received.<br>• 1: Break signal has been received.<br>BI is set to logic 1 when the received data input is held in the Spacing (logic 0) state for longer than a full character transmission time (that is, the total time of start bit + data bits + parity bit + stop bits).<br>The Break Indicator is reset when the processor reads the Line Status register. In FIFO mode, only one Break character (equal to 0x00) is loaded into the FIFO regardless of the length of the Break condition.<br>BI shows the Break condition for the character at the bottom of the FIFO, not the most recent character received. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 3 | 0x0<br>RO/C/V | **LSR_FE:** Line Status Register - frame error:<br>• 0: No Framing error.<br>• 1: Framing error has occurred.<br>FE indicates that the received character did not have a valid stop bit. FE is set to logic 1 when the bit following the last data bit or parity bit is detected as logic 0 bit (spacing level).<br>If the Line Control register had been set for two stop bits, the receiver does not check for a valid second stop bit.<br>The FE indicator is reset when the processor reads the Line Status register.<br>The UART will resynchronize after a framing error by assuming that the framing error was due to the next start bit.<br>Therefore it samples this start bit twice and then takes in the data. In FIFO mode, FE shows a framing error for the character at the bottom of the FIFO, not for the most recent character received. |
| 2 | 0x0<br>RO/C/V | **LSR_PE:** Line Status Register - Parity Enable:<br>• 0: No Parity error.<br>• 1: Parity error has occurred.<br>PE indicates that the received character does not have the correct even or odd parity, as selected by the Even Parity Select bit.<br>The PE is set to logic 1 upon detection of a parity error and is reset to logic 0 when the processor reads the Line Status register.<br>In FIFO mode, PE shows a parity error for the character at the bottom of the FIFO, not the most recent character received. |
| 1 | 0x0<br>RO/C/V | **LSR_OE:** Line Status Register - Overflow Error:<br>• 0: No overflow error. Data has not been lost.<br>• 1: Overflow error. Receive data has been lost.<br>In non-FIFO mode, OE indicates that data in the Receiver Buffer register was not read by the processor before the next character was received; the new character is lost.<br>In FIFO mode, OE indicates that all 64 bytes of the FIFO are full and the most recently received byte has been discarded.<br>The OE indicator is set to logic 1 upon detection of an overflow condition and reset when the processor reads the Line Status register. |
| 0 | 0x0<br>RO/V | **LSR_DR:** Line Status Register - Data Ready:<br>• 0: No data has been received.<br>• 1: Data is available in RBR or the FIFO.<br>DR is set to logic 1 when a complete incoming character has been received and transferred into the Receiver Buffer register or the FIFO. In non-FIFO mode, DR is reset to 0 when the receive buffer is read.<br>In FIFO mode, DR is reset to logic 0 if the FIFO is empty (last character has been read from RBR) or the RESETRF bit is set in FCR. |

## 53.3.7 MSR—Offset 6h

Modem Status Register.

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [MEMBA] + 6h

**MEMBA Type:** PCI Configuration Register (Size: 32 bits)
**MEMBA Reference:** [B:0, D:26, F:0,1,2] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RO/V | **MSR_DCD:** Modem Status Register - data Carrier Detect:<br>Loopback is disabled, MCR[LOOP] = 0.<br>• 0: Primary input uart_dcd is logic 1.<br>• 1: Primary input uart_dcd is logic 0.<br>Loopback is enabled, MCR[LOOP] = 1.<br>• 0: MCR[OUT2] is logic 0.<br>• 1: MCR[OUT2] is logic 1. |
| 6 | 0x0<br>RO/V | **MSR_RI:** Modem Status Register - Ring Indicator:<br>Loopback is disabled, MCR[LOOP] = 0.<br>• 0: Primary input uart_ri is logic 1.<br>• 1: Primary input uart_ri is logic 0.<br>Loopback is enabled, MCR[LOOP] = 1.<br>• 0: MCR[OUT1] is logic 0.<br>• 1: MCR[OUT1] is logic 1. |
| 5 | 0x0<br>RO/V | **MSR_DSR:** Modem Status Register - Data Set Ready:<br>Loopback is disabled, MCR[LOOP] = 0.<br>• 0: Primary input uart_dsr is logic 1.<br>• 1: Primary input uart_dsr is logic 0.<br>Loopback is enabled, MCR[LOOP] = 1.<br>• 0: MCR[DTR] is logic 0.<br>• 1: MCR[DTR] is logic 1. |
| 4 | 0x0<br>RO/V | **MSR_CTS:** Modem Status Register - Clear to Send:<br>Loopback is disabled, MCR[LOOP] = 0.<br>• 0: Primary input uart_cts is logic 1.<br>• 1: Primary input uart_cts is logic 0.<br>Loopback is enabled, MCR[LOOP] = 1.<br>• 0: MCR[RTS] is logic 0.<br>• 1: MCR[RTS] is logic 1. |
| 3 | 0x0<br>RO/C/V | **MSR_DDCR:** Modem Status Register - Delta Data Carrier Ready:<br>• 0: No change in uart_dcr pin since last read of MSR.<br>• 1: uart_dcr pin has changed state.<br>When DDCR is set the modem status interrupt will be generated if enabled in IER. |
| 2 | 0x0<br>RO/C/V | **MSR_TERI:** Modem Status Register - Trailing Edge Ring Indicator:<br>• 0: uart_ri pin has not changed from 0 to 1 since last read of MSR.<br>• 1: uart_ri pin has changed from 0 to 1.<br>When TERI is set the modem status interrupt will be generated if enabled in IER. |
| 1 | 0x0<br>RO/C/V | **MSR_DDSR:** Modem Status Register - Delta Data Set Ready:<br>• 0: No change in uart_dsr pin since last read of MSR.<br>• 1: uart_dsr pin has changed state.<br>When DDSR is set the modem status interrupt will be generated if enabled in IER. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 0 | 0x0<br>RO/V | **MSR_DCTS:** Modem Status Register - Delta Clear to Send:<br>• 0: No change in uart_cts pin since last read of MSR.<br>• 1: uart_cts pin has change state.<br>When DCTS is set the modem status interrupt will be generated if enabled in IER. |

## 53.3.8 SPR—Offset 7h

Scratch Pad Status Register.

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [MEMBA] + 7h

**MEMBA Type:** PCI Configuration Register (Size: 32 bits)
**MEMBA Reference:** [B:0, D:26, F:0,1,2] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **SPR:** Scratch Pad Register (SCRATCH):<br>Writing to this field does not affect the operation of the UART in any way. |

## 53.3.9 UART_FISR—Offset 8h

UART Functional Interrupt Status Register.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MEMBA] + 8h

**MEMBA Type:** PCI Configuration Register (Size: 32 bits)
**MEMBA Reference:** [B:0, D:26, F:0,1,2] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:3 | 0x0<br>RSV | **RESERVED:** Reserved. |
| 2 | 0x0<br>RO/V | **DWCIS:** DMA Write Channel Interrupt Status (DWCIS):<br>Set when Functions DMA write channel interrupt line is asserted. |
| 1 | 0x0<br>RO/V | **DRCIS:** DMA Read Channel Interrupt Status (DRCIS):<br>Set when Functions DMA read channel interrupt line is asserted. |
| 0 | 0x0<br>RO/V | **UIS:** UART Interrupt Status (UIS):<br>Set when Functions UART interrupt line is asserted. |

## 53.3.10 RFOR—Offset 20h

Receiver FIFO Occupancy Register.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MEMBA] + 20h

**MEMBA Type:** PCI Configuration Register (Size: 32 bits)
**MEMBA Reference:** [B:0, D:26, F:0,1,2] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:7 | 0x0<br>RSV | **RESERVED:** Reserved. |
| 6:0 | 0x0<br>RO | **RFBC:** Receive FIFO Byte Count (RFBC):<br>Number of bytes (0-64) present in the receive FIFO. |

## 53.3.11 ABR—Offset 24h

Auto BAUD Control Register.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000010h

**BAR and Offset:** [MEMBA] + 24h

**MEMBA Type:** PCI Configuration Register (Size: 32 bits)
**MEMBA Reference:** [B:0, D:26, F:0,1,2] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:5 | 0x0<br>RSV | **RESERVED:** Reserved. |
| 4 | 0x1<br>RW | **UUE:** UART Unit Enable (UUE):<br>• 0: UART transceiver is disabled.<br>• 1: UART transceiver is enabled.<br>Transceiver is also disabled by hardware whenever the function is D3-hot PM state. |
| 3 | 0x0<br>RW | **ABT:** Auto-baud Table (ABT):<br>• 0: Formula used to calculate baud rates allowing all possible baud rates.<br>• 1: Standard baud rates to be chosen by UART.<br>When set to 1, UART will round the calculated baud rate to nearest standard baud rate. |
| 2 | 0x0<br>RW | **ABUP:** Auto-Baud UART Program (ABUP):<br>• 0: Processor Programs Divisor Latch registers.<br>• 1: UART Programs Divisor Latch registers Setting ABUP allows the UART to automatically program the Divisor Latch registers (DLL and DLH) when the auto-baud circuit has detected the baud rate, regardless of the state of the Divisor-Latch Access bit (LCR[DLAB]). For this to occur, the Auto-Baud Enable (ABE) bit must be set.<br>Clearing this bit allows the processor to read the Auto-Baud Count register (ACR) and determine the baud rate using its own algorithm rather than using the UARTs. |
| 1 | 0x0<br>RW | **ABLIE:** Auto-Baud Lock Interrupt Enable (ABLIE):<br>• 0: Auto Baud Lock Interrupt disabled (Source IIR[ABL]).<br>• 1: Auto Baud Lock Interrupt enabled (Source IIR[ABL]).<br>Setting ABLIE enables the IIR[ABL] Interrupt, which occurs when the auto-baud circuit has detected the baud rate and written the value into the Auto-Baud Count register (ACR).<br>The Divisor Latch registers can then be programmed by the processor or auto-baud circuitry as dictated by the state of the ABUP. |
| 0 | 0x0<br>RW | **ABE:** Auto-Baud Enable (ABE):<br>• 0: Auto Baud disabled.<br>• 1: Auto Baud enabled.<br>Setting ABE enables the auto-baud circuitry within the UART. The circuitry counts the number of clocks in the start bit and writes this count into the Auto-Baud Count register (ACR).<br>It will then interrupt the processor if the Auto Baud Lock Interrupt Enable (ABLIE) bit is set.<br>It will also automatically program the Divisor Latch registers (DLL and DLH) if the Auto-Baud UART Program (ABUP) bit is set. |

## 53.3.12 ACR—Offset 28h

Auto Baud Count Register.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MEMBA] + 28h

**Default:** 00000000h

**MEMBA Type:** PCI Configuration Register (Size: 32 bits)
**MEMBA Reference:** [B:0, D:26, F:0,1,2] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RSV | **RESERVED:** Reserved. |
| 15:0 | 0x0<br>RO/V | **ABC:** Auto-Baud Count (ABC):<br>Auto-baud count is the number of FUART clock cycles within a start bit pulse. |

## 53.3.13 PSR—Offset 30h

Pre-Scaler Register.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MEMBA] + 30h

**Default:** 00000010h

**MEMBA Type:** PCI Configuration Register (Size: 32 bits)
**MEMBA Reference:** [B:0, D:26, F:0,1,2] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RSV | **RESERVED:** Reserved. |
| 15:0 | 0x10<br>RW | **PS:** Pre-Scalar (PS):<br># of samples per character bit. |

## 53.3.14 UCMR—Offset 34h

UART CLOCK GEN Multiplier Register.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MEMBA] + 34h

**Default:** 000000D8h

**MEMBA Type:** PCI Configuration Register (Size: 32 bits)
**MEMBA Reference:** [B:0, D:26, F:0,1,2] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RSV | **RESERVED:** Reserved. |
| 23:0 | 0xd8<br>RW | **UCMUL:** UART Clock Gen Multiplier (UCMUL):<br>UART Clock Gen Multiplier to derive the UART transceiver clock. |

## 53.3.15 UCDR—Offset 38h

UART CLOCK GEN Divisor Register.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MEMBA] + 38h

**Default:** 00003D09h

**MEMBA Type:** PCI Configuration Register (Size: 32 bits)
**MEMBA Reference:** [B:0, D:26, F:0,1,2] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RSV | **RESERVED:** Reserved. |
| 23:0 | 0x3d09<br>RW | **UCDIV:** UART Clock Gen Divisor (UCDIV):<br>UART Clock Gen Divisor to derive the UART transceiver clock. |

## 53.3.16 CH0SR—Offset 80h

Channel Status Register.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 000F0000h

**BAR and Offset:** [MEMBA] + 80h

**MEMBA Type:** PCI Configuration Register (Size: 32 bits)
**MEMBA Reference:** [B:0, D:26, F:0,1,2] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:30 | 0x0<br>RO/V | **CDESC:** Current Descriptor (CDESC):<br>• 00: Descriptor 0<br>• 01: Descriptor 1<br>• 10: Descriptor 2<br>• 11: Descriptor 3<br>The current descriptor will points to the descriptor to be served at any moment.<br>While none of the descriptor is valid the current descriptor will point to the descriptor 0. |
| 29:20 | 0x0<br>RSV | **RESERVED_2:** Reserved 2. |
| 19:16 | 0xf<br>RO/V | **DESCE:** Descriptor Empty (DESCE):<br>One bit per descriptor, value of 1 indicates the descriptor transfer size is not 0. |
| 15 | 0x0<br>RO/C/V | **CHE:** Channel Error (CHE):<br>When set this bit indicates the following error condition. write channel:<br>RX FIFO error status transitioned from 1 to 0.<br>Once read this bit will only get set again when the RX FIFO Error status transition from 1 to 0.<br>Error status is assumed 1 when FIFO contains erroneous data. read channel:<br>The last read request is returned with malformed completion. In this case the UART TX FIFO will not be updated. |
| 14:12 | 0x0<br>RSV | **RESERVED_1:** Reserved 1. |
| 11:8 | 0x0<br>RO/C/V | **DESCTO:** Descriptor Time Out (DESCTO):<br>One bit per descriptor, value of 1 indicates the descriptor has timed out.<br>This only valid for write channel. In the event of descriptor timeout the available data in the buffer will be written to the memory and channel timeout interrupt will be asserted if enabled through descriptor control register.<br>If the timeout condition will occur at the descriptor done boundary only descriptor done status is updated. |
| 7:4 | 0x0<br>RSV | **RESERVED_0:** Reserved 0. |
| 3:0 | 0x0<br>RO/C/V | **DESCD:** Descriptor Done (DESCD):<br>One bit per descriptor, value of 1 indicates the descriptor request has been completed. |

## 53.3.17 CH0CR—Offset 84h

Channel Control Register.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MEMBA] + 84h

**MEMBA Type:** PCI Configuration Register (Size: 32 bits)
**MEMBA Reference:** [B:0, D:26, F:0,1,2] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:2 | 0x0<br>RSV | **RESERVED_0:** Reserved 0. |
| 1 | 0x0<br>WO | **CHD:** Channel Direction (CHD):<br>• 0: Read Channel (UART TX).<br>• 1: Write Channel (UART RX). |
| 0 | 0x0<br>WO | **CHA:** Channel Active (CHA):<br>• 0: Channel is disabled.<br>• 1: Channel is enabled.<br>Whenever channel stops the hardware will clear this bit. Channel can be stopped by HW on descriptor done, timeout or error condition. |

## 53.3.18 CH0DCR—Offset 88h

Channel 0 Descriptor Control Register.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MEMBA] + 88h

**Default:** 00008000h

**MEMBA Type:** PCI Configuration Register (Size: 32 bits)
**MEMBA Reference:** [B:0, D:26, F:0,1,2] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0x0<br>RSV | **RESERVED_3:** Reserved 3. |
| 27:24 | 0x0<br>RW | **CHTOI:** Channel Time Out Interrupt (CHTOI):<br>One bit per descriptor, value of 1 indicates the channel should generate interrupt once timeout is detected. This is only applicable to write channel. |
| 23 | 0x0<br>RW | **CHEI:** Channel Error Interrupt (CHEI):<br>Value of 1 indicates the channel should generate interrupt if the channel error condition has occurred. |
| 22:20 | 0x0<br>RSV | **RESERVED_2:** Reserved 2. |
| 19:16 | 0x0<br>RW | **CHDI:** Channel Done Interrupt (CHDI):<br>One bit per descriptor, value of 1 indicates the channel should generate interrupt once descriptor is done. |
| 15 | 0x1<br>RW | **CHSOE:** Channel Stop on Error (CHSOTO):<br>Value of 1 indicates the channel should stop on error condition while any serving descriptor. |
| 14 | 0x0<br>RW | **CHSOTO:** Channel Stop on Timeout (CHSOTO):<br>Value of 1 indicates the channel should stop on timeout condition while any serving descriptor. |
| 13:12 | 0x0<br>RSV | **RESERVED_1:** Reserved 1. |
| 11:8 | 0x0<br>RW | **CHSOD:** Channel Stop on Done (CHSOD):<br>One bit per descriptor, value of 1 indicates the channel should stop once the descriptor request has been completed. |
| 7:4 | 0x0<br>RSV | **RESERVED_0:** Reserved 0. |
| 3:0 | 0x0<br>RW/V | **DESCA:** Descriptor Active (DESCA):<br>One bit per descriptor, value of 1 indicates the descriptor is active.<br>Whenever the descriptor is done or timed out the corresponding descriptor active bit will be cleared. |

## 53.3.19 CH0BSR—Offset 90h

Channel Buffer Size.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MEMBA] + 90h

**MEMBA Type:** PCI Configuration Register (Size: 32 bits)
**MEMBA Reference:** [B:0, D:26, F:0,1,2] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RSV | **RESERVED_0:** Reserved 0. |
| 15:0 | 0x0<br>RW | **CHBS:** Channel Buffer Size (CHBS):<br>Indicates the size of UART FIFO connected to the channel. |

## 53.3.20 CH0MTSR—Offset 94h

Channel Minimum Transfer Size Register.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MEMBA] + 94h

**MEMBA Type:** PCI Configuration Register (Size: 32 bits)
**MEMBA Reference:** [B:0, D:26, F:0,1,2] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RSV | **RESERVED_0:** Reserved 0. |
| 15:0 | 0x0<br>RW | **CHMTSR:** Channel Minimum Transfer Size (CHMTSR):<br>Indicates the minimum number of bytes required to make the DMA request. |

## 53.3.21 CH0D0SAR—Offset A0h

Channel Descriptor 0 Start Address Register.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MEMBA] + A0h

**MEMBA Type:** PCI Configuration Register (Size: 32 bits)
**MEMBA Reference:** [B:0, D:26, F:0,1,2] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW/V | **CHD0SAR:** Channel Descriptor 0 Start Address (CHD0SAR): |

## 53.3.22 CH0D0TSR—Offset A4h

Channel Descriptor 0 Transfer Size Register.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MEMBA] + A4h

**Default:** 00000000h

**MEMBA Type:** PCI Configuration Register (Size: 32 bits)
**MEMBA Reference:** [B:0, D:26, F:0,1,2] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RSV | **RESERVED_0:** Reserved 0. |
| 15:0 | 0x0<br>RW/V | **CHD0TS:** Channel Descriptor 0 Transfer Size (CHD0TS): |

## 53.3.23 CH0D1SAR—Offset A8h

Channel Descriptor 1 Start Address Register.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MEMBA] + A8h

**Default:** 00000000h

**MEMBA Type:** PCI Configuration Register (Size: 32 bits)
**MEMBA Reference:** [B:0, D:26, F:0,1,2] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW/V | **CHD1SAR:** Channel Descriptor 1 Start Address (CHD1SAR): |

## 53.3.24 CH0D1TSR—Offset ACh

Channel Descriptor 1 Transfer Size Register.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MEMBA] + ACh

**Default:** 00000000h

**MEMBA Type:** PCI Configuration Register (Size: 32 bits)
**MEMBA Reference:** [B:0, D:26, F:0,1,2] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RSV | **RESERVED_0:** Reserved 0. |
| 15:0 | 0x0<br>RW/V | **CHD1TS:** Channel Descriptor 1 Transfer Size (CHD1TS): |

## 53.3.25 CH0D2SAR—Offset B0h

Channel Descriptor 2 Start Address Register.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MEMBA] + B0h

**MEMBA Type:** PCI Configuration Register (Size: 32 bits)
**MEMBA Reference:** [B:0, D:26, F:0,1,2] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW/V | **CHD2SAR:** Channel Descriptor 2 Start Address (CHD2SAR): |

## 53.3.26 CH0D2TSR—Offset B4h

Channel Descriptor 2 Transfer Size Register.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MEMBA] + B4h

**MEMBA Type:** PCI Configuration Register (Size: 32 bits)

| 15:0 | 0x0<br>RW/V | **CHD0TS:** Channel Descriptor 0 Transfer Size (CHD0TS): |

## 53.3.36 CH1D1SAR—Offset E8h

Channel Descriptor 1 Start Address Register.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MEMBA] + E8h

**MEMBA Type:** PCI Configuration Register (Size: 32 bits)
**MEMBA Reference:** [B:0, D:26, F:0,1,2] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW/V | **CHD1SAR:** Channel Descriptor 1 Start Address (CHD1SAR): |

## 53.3.37 CH1D1TSR—Offset ECh

Channel Descriptor 1 Transfer Size Register.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MEMBA] + ECh

**MEMBA Type:** PCI Configuration Register (Size: 32 bits)
**MEMBA Reference:** [B:0, D:26, F:0,1,2] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RSV | **RESERVED_0:** Reserved 0. |
| 15:0 | 0x0<br>RW/V | **CHD1TS:** Channel Descriptor 1 Transfer Size (CHD1TS): |

## 53.3.38 CH1D2SAR—Offset F0h

Channel Descriptor 2 Start Address Register.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MEMBA] + F0h

**MEMBA Type:** PCI Configuration Register (Size: 32 bits)
**MEMBA Reference:** [B:0, D:26, F:0,1,2] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW/V | **CHD2SAR:** Channel Descriptor 2 Start Address (CHD2SAR): |

## 53.3.39 CH1D2TSR—Offset F4h

Channel Descriptor 2 Transfer Size Register.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [MEMBA] + F4h

**MEMBA Type:** PCI Configuration Register (Size: 32 bits)
**MEMBA Reference:** [B:0, D:26, F:0,1,2] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RSV | **RESERVED_0:** Reserved 0. |
| 15:0 | 0x0<br>RW/V | **CHD2TS:** Channel Descriptor 2 Transfer Size (CHD2TS): |

## 53.3.40 CH1D3SAR—Offset F8h

Channel Descriptor 3 Start Address Register.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MEMBA] + F8h

**Default:** 00000000h

**MEMBA Type:** PCI Configuration Register (Size: 32 bits)
**MEMBA Reference:** [B:0, D:26, F:0,1,2] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW/V | **CHD3SAR:** Channel Descriptor 3 Start Address (CHD3SAR): |

## 53.3.41 CH1D3TSR—Offset FCh

Channel Descriptor 3 Transfer Size Register.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [MEMBA] + FCh

**Default:** 00000000h

**MEMBA Type:** PCI Configuration Register (Size: 32 bits)
**MEMBA Reference:** [B:0, D:26, F:0,1,2] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RSV | **RESERVED_0:** Reserved 0. |
| 15:0 | 0x0<br>RW/V | **CHD3TS:** Channel Descriptor 3 Transfer Size (CHD3TS): |

## 53.4 Registers in I/O Space—IOBA

These registers are accessed in Host I/O Space starting at the relocatable I/O address defined by the Base Address Register (BAR) IOBA described in Section 53.2.5, "IOBA—Offset 10h" on page 2391. There is a set of these registers for each of the three HSUART Functions (F0, F1, and F2).

### 53.4.1 RBR_THR_DLL—Offset 0h

RBR = Receive buffer register THR = Transmit hold register DLL = Divisor Latch low.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [IOBA] + 0h

**Default:** 00h

**IOBA Type:** PCI Configuration Register (Size: 32 bits)
**IOBA Reference:** [B:0, D:26, F:0,1,2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW/V | **RBR_THR_DLL:**<br>When DLAB =0, this 8 bit is used as Received Buffer Register as Read, and is used as Transmit Holding Register as Write.<br>When DLAB is 1, this register is used as DLL (Divisor Latch Low Byte Register). |

### 53.4.2 IER_DLH—Offset 1h

IER = Interrupt Enable Register DLH = Divisor Latch High.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [IOBA] + 1h

**Default:** 00h

**IOBA Type:** PCI Configuration Register (Size: 32 bits)
**IOBA Reference:** [B:0, D:26, F:0,1,2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW/V | **IER_DLH:**<br>When DLAB =0, this 8 bit is used as Interrupt Enable Register.<br>When DLAB =1, this 8 bit is used as DLH (Divisor Latch High Byte Register). |

## 53.4.3 IIR_FCR—Offset 2h

IIR = Interrupt Identification Register FCR = FIFO control register.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [IOBA] + 2h

**IOBA Type:** PCI Configuration Register (Size: 32 bits)
**IOBA Reference:** [B:0, D:26, F:0,1,2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW/V | **IIR_FCR:**<br>When this 8 bit is read, it is serving as Interrupt Identification Registers.<br>When this 8 bit is written, it is serving as FCR (FIFO control register.). |

## 53.4.4 LCR—Offset 3h

Line Control Register.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [IOBA] + 3h

**IOBA Type:** PCI Configuration Register (Size: 32 bits)
**IOBA Reference:** [B:0, D:26, F:0,1,2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RW | **LCR_DLAB:** Divisor Latch Register Access Bit (DLAB):<br>The divisor-latch access bit must be set high (logic 1) to access the divisor latches of the baud rate generator during a read or write operation.<br>It must be set low (logic 0) to access the receiver buffer, the Transmit Holding register, or the Interrupt Enable register.<br>This bit does not need to be set when using auto-baud.<br>• 0: Access Transmit Holding register (THR), Receive Buffer register (RBR) and Interrupt Enable register.<br>• 1: Access Divisor Latch registers (DLL and DLH) |
| 6 | 0x0<br>RW | **LCR_SB:** Set Break (SB):<br>The set-break control bit transmits a Break condition to the receiving UART. When SB is set to logic 1, the serial output (TXD) is forced to the Spacing (logic 0) state and remains there until SB is set to logic 0.<br>This bit acts only on the TXD pin and has no effect on the transmitter logic.<br>• 0: No effect on TXD output.<br>• 1: Forces TXD output to 0 (space).<br>This feature enables the processor to alert a terminal in a computer communications system.<br>If the following sequence is executed, no erroneous characters will be transmitted because of the break:<br>Load 0x00 in the Transmit Holding register in response to a TDRQ Interrupt.<br>After TDRQ goes high (indicating that 0x00 is being shifted out), set the break bit before the parity or stop bits reach the TXD pin.<br>Wait for the transmitter to be idle (TEMT = 1), and clear the break bit when normal transmission has to be restored.<br>During the Break, the transmitter can be used as a character timer to accurately establish the Break duration.<br>In FIFO mode, wait for the transmitter to be idle (TEMT=1) to set and clear the break bit. |
| 5 | 0x0<br>RW | **LCR_STKYP:** Sticky Parity (STKYP):<br>This bit is the sticky-parity bit, which can be used in multiprocessor communications.<br>• 0: No effect on parity bit.<br>• 1: Forces parity bit to be opposite of EPS bit value.<br>When PEN and STKYP are logic 1, the bit that is transmitted in the parity-bit location (the bit just before the stop bit) is the complement of the EPS bit.<br>If EPS is 0, then the bit at the parity-bit location will be transmitted as a 1.<br>In the receiver, if STKYP and PEN are 1, then the receiver compares the bit that is received in the parity-bit location with the complement of the EPS bit.<br>If the values being compared are not equal, the receiver sets the parity-error bit in LSR, and causes an Error Interrupt if Line-Status Interrupts were enabled.<br>For example, if EPS is 0, the receiver expects the bit received at the parity-bit location to be 1.<br>If it is not, then the parity-error bit is set. By forcing the bit value at the parity-bit location, rather than calculating a parity value, a system with a master transmitter and multiple receivers can identify some transmitted characters as receiver addresses and the rest of the characters as data.<br>If PEN = 0, STKYP is ignored. |
| 4 | 0x0<br>RW | **LCR_EPS:** Even Parity Select (EPS):<br>EPS is only valid when the parity is enabled (PEN = 1).<br>• 0: Sends and checks for odd parity.<br>• 1: Sends and checks for even parity. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 3 | 0x0<br>RW | **LCR_PEN:** Parity Enable (PEN):<br>When PEN is logic 1, a parity bit is generated (transmit data) or checked (receive data) between the last data-word bit and stop bit of the serial data.<br>• 0: No parity function.<br>• 1: Allows parity generation and checking. |
| 2 | 0x0<br>RW | **LCR_STB:** Stop Bits (STB):<br>This bit specifies the number of stop bits transmitted and received in each serial character.<br>• 0: 1 stop bit<br>• 1: 2 stop bits; except for 5-bit character, then 1 bits The receiver checks the first stop bit only, regardless of the number of stop bits selected. |
| 1:0 | 0x0<br>RW | **LCR_WLS:** Word Length Select (WLS):<br>The word length select bits specify the number of data bits (five to eight bits are allowed) in each transmitted or received serial character.<br>• 00: 5-bit character (default)<br>• 01: 6-bit character<br>• 10: 7-bit character<br>• 11: 8-bit character |

## 53.4.5 MCR—Offset 4h

Modem Control Register.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [IOBA] + 4h

**IOBA Type:** PCI Configuration Register (Size: 32 bits)
**IOBA Reference:** [B:0, D:26, F:0,1,2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:6 | 0x0<br>RSV | **MCR_RESERVED:** Reserved. |
| 5 | 0x0<br>RW | **MCR_AFE:** MCR-Auto Flow Enable (AFE):<br>This is a reserved bit in 16550 spec.<br>• 0: Auto-RTS and Auto-CTS are disabled.<br>• 1: Auto-CTS is enabled.<br>If MCR[RTS] is also set, both Auto-CTS and Auto-RTS is enabled.<br>Auto-RTS is not enabled if AFE is not set regardless of the state of MCR[RTS].<br>Autoflow automates the flow of data between the UART and the remote device. |
| 4 | 0x0<br>RW | **MCR_LOOP:** Modem Control Register-Loop back test mode (LOOP):<br>This bit provides a local loopback feature for diagnostic testing of the UART. This feature allows the processor to verify the UART transmit and receive data paths.<br>The Transmit, Receive, and Modem Control interrupts are operational in this mode.<br>• 0: Normal UART operation.<br>• 1: Loopback Test mode operation.<br>Serial output uart_txd pin is set to logic 1. Serial input uart_rxd pin is disconnected from external input line.<br>The output of the Transmitter Shift register is looped back into the Receiver Shift register.<br>The modem-control inputs (uart_cts, uart_dsr, uart_dcd, and uart_ri) are activated by MCR bits 0-3 instead of the modem-control inputs.<br>A Break signal can also be transferred from the transmitter section to the receiver section in Loopback mode. When LOOP is set to logic 1, the following will occur:<br>The TXD (transmitter output) pin is set to a logic-1 state.<br>The RXD (receiver input) pin is disconnected.<br>The output of the Transmitter Shift register is looped back into the Receiver-Shift register input.<br>The four modem-control inputs (uart_cts, uart_dsr, uart_dcd, and uart_ri) are disconnected from the pins and the modem-control output pins (uart_rts and uart_dtr) are forced to their inactive state.<br>The lower four bits of the Modem Control register (MCR) are connected to the upper four modem status register (MSR) bits.<br>Flow control can be tested; if autoflow is enabled, the MCR[RTS] bit has no effect on the nCTS input as nRTS is asserted by the autoflow logic.<br>• DTR = 1 forces DSR to a 1<br>• RTS = 1 forces CTS to a 1<br>• OUT1 = 1 forces RI to a 1<br>• OUT2= 1 forces DCD to a 1<br>Coming out of the Loopback Test mode may result in unpredictable activation of the delta bits (bits 3:0) in the Modem Status register (MSR).<br>It is recommended that MSR is read once to clear the delta bits in the MSR. |
| 3 | 0x0<br>RW | **MCR_OUT2:** Output2 (OUT2):<br>The function of the auxiliary output OUT2 bit differs depending on the mode of the UART.<br>• 0: uart_dcd UART pin input set low when in Loop-back mode<br>• 1: uart_dcd UART pin input set high when in Loop-back mode. |
| 2 | 0x0<br>RW | **MCR_OUT1:** Modem Control Register-output1 (OUT1):<br>The auxiliary output OUT1 bit is only used in Loopback Test mode.<br>• 0: uart_ri UART pin input set low when in Loop-back mode<br>• 1: uart_ri UART pin input set high when in Loop-back mode |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 1 | 0x0<br>RW | **MCR_RTS:**<br>When Auto Flow is disabled MCR[AFE] = 0:<br>• 0: Primary output uart_rts pin is forced to logic 1.<br>• 1: Primary output uart_rts pin is forced to logic 0.<br>When Auto Flow is enabled: MCR[AFE] = 1:<br>• 0: Auto-RTS is disabled.<br>• 1: Auto-RTS is enabled. |
| 0 | 0x0<br>RW | **MCR_DTR:** Modem Control Register-Data Terminal Ready (DTR):<br>This bit controls the Data Terminal Ready output.<br>• 0: Primary output uart_dtr pin is forced to logic 1.<br>• 1: Primary output uart_dtr pin is forced to logic 0.<br>The uart_dtr output of the UART may be applied to an EIA inverting line driver (such as the DS1488) to obtain the proper polarity input at the succeeding modem or data set. |

## 53.4.6 LSR—Offset 5h

Line Status Register.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [IOBA] + 5h

**IOBA Type:** PCI Configuration Register (Size: 32 bits)
**IOBA Reference:** [B:0, D:26, F:0,1,2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RO/V | **LSR_FIFOE:** Line Status Register - FIFO Error Status (FIFOE):<br>• 0: No character has error inside the Receive FIFO.<br>• 1: At least one character in Receiver FIFO has errors.<br>In non-FIFO mode, this bit is always set to 0. In FIFO mode, FIFOE is set to 1 when there is at least one parity error, framing error, or break indication for any of the characters in the FIFO.<br>A processor read to the Line Status register does not reset this bit.<br>FIFOE is reset when all error bytes have been read from the FIFO.<br>If DMA requests are enabled and FIFOE is set to 1, the Error Interrupt is generated and no Receive DMA request is generated even if the Receive FIFO reaches the trigger level.<br>If DMA requests are not enabled setting FIFOE to 1 does not generate an interrupt. |
| 6 | 0x0<br>RO/V | **LSR_TEMT:** Line Status Register - Transmitter Empty (TEMT):<br>• 0: There is data in the Transmit Shift register, the Transmit Holding register, or the FIFO (in FIFO mode).<br>• 1: All the data in the transmitter has been shifted out. |
| 5 | 0x0<br>RO/V | **LSR_TDRQ:** Line Status Register - Transmit data Request (TDRQ)<br>• 0: The UART is NOT ready to receive data for transmission.<br>• 1: The UART is ready to receive data for transmission.<br>The assertion of TDRQ causes the UART to interrupt the processor when the Transmit Data Request Interrupt Enable IER[TIE] is set high, and generates a DMA request to the DMA controller if DMA Request is enabled.<br>TDRQ is set to 1 when the new symbol is copied from Transmit Holding register into the Transmit Shift register.<br>The bit is reset to logic 0 concurrently with the loading of the Transmit Holding register by the processor.<br>In FIFO mode, TDRQ is set to logic 1 when the FIFO is less than half full.<br>It is cleared when the FIFO is more than half full. If more than 64 characters are loaded into the FIFO, the excess characters are lost. |
| 4 | 0x0<br>RO/C/V | **LSR_BI:** Line Status Register - Break Interrupt (BI):<br>• 0: No break signal has been received.<br>• 1: Break signal has been received.<br>BI is set to logic 1 when the received data input is held in the Spacing (logic 0) state for longer than a full character transmission time (that is, the total time of start bit + data bits + parity bit + stop bits).<br>The Break Indicator is reset when the processor reads the Line Status register.<br>In FIFO mode, only one Break character (equal to 0x00) is loaded into the FIFO regardless of the length of the Break condition.<br>BI shows the Break condition for the character at the bottom of the FIFO, not the most recent character received. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 3 | 0x0<br>RO/C/V | **LSR_FE:** Line Status Register - frame error (FE):<br>• 0: No Framing error.<br>• 1: Framing error has occurred.<br>FE indicates that the received character did not have a valid stop bit. FE is set to logic 1 when the bit following the last data bit or parity bit is detected as logic 0 bit (spacing level).<br>If the Line Control register had been set for two stop bits, the receiver does not check for a valid second stop bit.<br>The FE indicator is reset when the processor reads the Line Status register.<br>The UART will resynchronize after a framing error by assuming that the framing error was due to the next start bit. Therefore it samples this start bit twice and then takes in the data.<br>In FIFO mode, FE shows a framing error for the character at the bottom of the FIFO, not for the most recent character received. |
| 2 | 0x0<br>RO/C/V | **LSR_PE:** Line Status Register - Parity Enable (PE):<br>• 0: No Parity error.<br>• 1: Parity error has occurred.<br>PE indicates that the received character does not have the correct even or odd parity, as selected by the Even Parity Select bit.<br>The PE is set to logic 1 upon detection of a parity error and is reset to logic 0 when the processor reads the Line Status register.<br>In FIFO mode, PE shows a parity error for the character at the bottom of the FIFO, not the most recent character received. |
| 1 | 0x0<br>RO/C/V | **LSR_OE:** Line Status Register - Overflow Error (OE):<br>• 0: No overflow error. Data has not been lost.<br>• 1: Overflow error. Receive data has been lost.<br>In non-FIFO mode, OE indicates that data in the Receiver Buffer register was not read by the processor before the next character was received; the new character is lost.<br>In FIFO mode, OE indicates that all 64 bytes of the FIFO are full and the most recently received byte has been discarded.<br>The OE indicator is set to logic 1 upon detection of an overflow condition and reset when the processor reads the Line Status register. |
| 0 | 0x0<br>RO/V | **LSR_DR:** Line Status Register - Data Ready (DR):<br>• 0: No data has been received.<br>• 1: Data is available in RBR or the FIFO.<br>DR is set to logic 1 when a complete incoming character has been received and transferred into the Receiver Buffer register or the FIFO.<br>In non-FIFO mode, DR is reset to 0 when the receive buffer is read.<br>In FIFO mode, DR is reset to logic 0 if the FIFO is empty (last character has been read from RBR) or the RESETRF bit is set in FCR. |

## 53.4.7 MSR—Offset 6h

Modem Status Register

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [IOBA] + 6h

**IOBA Type:** PCI Configuration Register (Size: 32 bits)
**IOBA Reference:** [B:0, D:26, F:0,1,2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RO/V | **MSR_DCD:** Modem Status Register - data Carrier Detect (DCD):<br>Loopback is disabled, MCR[LOOP] = 0<br>• 0: Primary input uart_dcd is logic 1.<br>• 1: Primary input uart_dcd is logic 0.<br>Loopback is enabled, MCR[LOOP] = 1<br>• 0: MCR[OUT2] is logic 0.<br>• 1: MCR[OUT2] is logic 1. |
| 6 | 0x0<br>RO/V | **MSR_RI:** Modem Status Register - Ring Indicator (RI):<br>Loopback is disabled, MCR[LOOP] = 0<br>• 0: Primary input uart_ri is logic 1.<br>• 1: Primary input uart_ri is logic 0.<br>Loopback is enabled, MCR[LOOP] = 1<br>• 0: MCR[OUT1] is logic 0.<br>• 1: MCR[OUT1] is logic 1. |
| 5 | 0x0<br>RO/V | **MSR_DSR:** Modem Status Register - Data Set Ready (DSR):<br>Loopback is disabled, MCR[LOOP] = 0<br>• 0: Primary input uart_dsr is logic 1.<br>• 1: Primary input uart_dsr is logic 0.<br>Loopback is enabled, MCR[LOOP] = 1<br>• 0: MCR[DTR] is logic 0.<br>• 1: MCR[DTR] is logic 1. |
| 4 | 0x0<br>RO/V | **MSR_CTS:** Modem Status Register - Clear to Send (CTS):<br>Loopback is disabled, MCR[LOOP] = 0<br>• 0: Primary input uart_cts is logic 1.<br>• 1: Primary input uart_cts is logic 0.<br>Loopback is enabled, MCR[LOOP] = 1<br>• 0: MCR[RTS] is logic 0.<br>• 1: MCR[RTS] is logic 1. |
| 3 | 0x0<br>RO/C/V | **MSR_DDCR:** Modem Status Register - Delta Data Carrier Ready (DDCR):<br>• 0: No change in uart_dcr pin since last read of MSR<br>• 1: uart_dcr pin has changed state.<br>When DDCR is set the modem status interrupt will be generated if enabled in IER. |
| 2 | 0x0<br>RO/C/V | **MSR_TERI:** Modem Status Register - Trailing Edge Ring Indicator (TERI):<br>• 0: uart_ri pin has not changed from 0 to 1 since last read of MSR.<br>• 1: uart_ri pin has changed from 0 to 1.<br>When TERI is set the modem status interrupt will be generated if enabled in IER. |
| 1 | 0x0<br>RO/C/V | **MSR_DDSR:** Modem Status Register - Delta Data Set Ready (DDSR):<br>• 0: No change in uart_dsr pin since last read of MSR.<br>• 1: uart_dsr pin has changed state.<br>When DDSR is set the modem status interrupt will be generated if enabled in IER. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 0 | 0x0<br>RO/V | **MSR_DCTS:** Modem Status Register - Delta Clear to Send (DCTS):<br>• 0: No change in uart_cts pin since last read of MSR.<br>• 1: uart_cts pin has change state.<br>When DCTS is set the modem status interrupt will be generated if enabled in IER. |

## 53.4.8 SPR—Offset 7h

Scratch Pad Status Register.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [IOBA] + 7h

**IOBA Type:** PCI Configuration Register (Size: 32 bits)
**IOBA Reference:** [B:0, D:26, F:0,1,2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **SPR:** Scratch Pad Register (SCRATCH):<br>Writing to this field does not affect the operation of the UART in any way. |

§ §

# 54 Innovation Engine - B0, D27, F(0, 1, 3, 4)

## 54.1 Introduction and Index

The host-accessible registers for the Innovation Engine are described here.

To determine the number of devices/functions available refer to the following:

- Table 1-1, "Features by product SKU - Server and Cloud Storage SKUs 0 through 4"
- Table 1-2, "Features by Product SKU - Network and Enterprise Storage SKUs 5 through 10"
- Table 1-3, "Features by Product SKU - Extended Temperature SKUs 11 through 14".

The legend for the register access codes are described in Chapter 43, "Introduction."

### 54.1.1 Host Configuration Space—HECI1 (F:0)

These registers are discovered in Host Configuration Space starting at Bus 0, Device 27 (decimal), Function 0. The offset addresses are listed.

**Table 54-1. Summary of PCI Configuration Registers HECI1—0/27/0**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 0 | 4 | 19E58086 | "Identifiers (HECI1_ID)—Offset 0h" on page 2454 |
| 4 | 2 | 0000 | "Command (HECI1_CMD)—Offset 4h" on page 2455 |
| 6 | 2 | 0010 | "Status (HECI1_STS)—Offset 6h" on page 2456 |
| 8 | 4 | 07800000 | "Revision ID and Class Code (HECI1_RID_CC)—Offset 8h" on page 2457 |
| C | 1 | 00 | "Cache Line Size (HECI1_CLS)—Offset Ch" on page 2457 |
| D | 1 | 00 | "Master Latency Timer (HECI1_MLT)—Offset Dh" on page 2457 |
| E | 1 | 80 | "Header Type (HECI1_HTYPE)—Offset Eh" on page 2458 |
| F | 1 | 00 | "Built In Self-Test (HECI1_BIST)—Offset Fh" on page 2458 |
| 10 | 4 | 00000004 | "HECI MMIO Base Address Low (HECI1_MMIO_MBAR_LO)—Offset 10h" on page 2458 |
| 14 | 4 | 00000000 | "HECI MMIO Base Address High (HECI1_MMIO_MBAR_HI)—Offset 14h" on page 2459 |
| 2C | 4 | 00000000 | "Sub System Identifiers (HECI1_SS)—Offset 2Ch" on page 2459 |
| 34 | 1 | 50 | "Capabilities Pointer (HECI1_CAP)—Offset 34h" on page 2459 |
| 3C | 2 | 0100 | "Interrupt Information (HECI1_INTR)—Offset 3Ch" on page 2460 |
| 3E | 1 | 00 | "Minimum Grant (HECI1_MGNT)—Offset 3Eh" on page 2460 |
| 3F | 1 | 00 | "Maximum Latency (HECI1_MLAT)—Offset 3Fh" on page 2460 |
| 40 | 4 | 00000000 | "Host Firmware Status (HECI1_HFS)—Offset 40h" on page 2461 |
| 44 | 4 | 80000000 | "Miscellaneous Shadow (HECI1_MISC_SHDW)—Offset 44h" on page 2463 |

| F8 | 4 | 00000000 | "Process Stepping Information (IDE_HOST_PSI)—Offset F8h" on page 2534 |

### 54.1.6 Host Memory Space—HECI1_MMIO_MBAR

An index of the registers that are accessible in Host Memory Space is shown here.

**Table 54-6. Summary of Memory Mapped I/O Registers—HECI1_MMIO_MBAR**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 0 | 4 | 00000000 | "Host CB Write Window (HECI1_H_CB_WW)—Offset 0h" on page 2535 |
| 4 | 4 | 80000000 | "Host Control and Status Register (HECI1_H_CSR)—Offset 4h" on page 2536 |
| 8 | 4 | FFFFFFFF | "CSE Circular Buffer Read Window (HECI1_CSE_CB_RW)—Offset 8h" on page 2537 |
| C | 4 | 80000000 | "CSE Control and Status Register Host Access (HECI1_CSE_CSR_HA)—Offset Ch" on page 2537 |
| 800 | 4 | 00000000 | "D0i3 Control (HECI1_D0I3C)—Offset 800h" on page 2538 |

### 54.1.7 Host Memory Space—HECI2_MMIO_MBAR

An index of the registers that are accessible in Host Memory Space is shown here.

**Table 54-7. Summary of Memory Mapped I/O Registers—HECI2_MMIO_MBAR**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 0 | 4 | 00000000 | "Host CB Write Window (HECI2_H_CB_WW)—Offset 0h" on page 2539 |
| 4 | 4 | 80000000 | "Host Control and Status Register (HECI2_H_CSR)—Offset 4h" on page 2540 |
| 8 | 4 | FFFFFFFF | "CSE Circular Buffer Read Window (HECI2_CSE_CB_RW)—Offset 8h" on page 2541 |
| C | 4 | 80000000 | "CSE Control and Status Register Host Access (HECI2_CSE_CSR_HA)—Offset Ch" on page 2541 |
| 800 | 4 | 00000000 | "D0i3 Control (HECI2_D0I3C)—Offset 800h" on page 2542 |

### 54.1.8 Host Memory Space—HECI3_MMIO_MBAR

An index of the registers that are accessible in Host Memory Space is shown here.

**Table 54-8. Summary of Memory Mapped I/O Registers—HECI3_MMIO_MBAR**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 0 | 4 | 00000000 | "Host CB Write Window (HECI3_H_CB_WW)—Offset 0h" on page 2543 |
| 4 | 4 | 80000000 | "Host Control and Status Register (HECI3_H_CSR)—Offset 4h" on page 2544 |
| 8 | 4 | FFFFFFFF | "CSE Circular Buffer Read Window (HECI3_CSE_CB_RW)—Offset 8h" on page 2545 |
| C | 4 | 80000000 | "CSE Control and Status Register Host Access (HECI3_CSE_CSR_HA)—Offset Ch" on page 2545 |
| 800 | 4 | 00000000 | "D0i3 Control (HECI3_D0I3C)—Offset 800h" on page 2546 |

### 54.1.9 Host Memory Space—KT_HOST_MEMBAR

An index of the registers that are accessible in Host Memory Space is shown here.

**Table 54-9. Summary of Memory Mapped I/O Registers—KT_HOST_MEMBAR**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 0 | 1 | 00 | "KT Receive Buffer Register (MEM_KTRBR)—Offset 0h" on page 2547 |
| 0 | 1 | 00 | "KT Transmitter Holding Register (MEM_KTTHR)—Offset 0h" on page 2547 |
| 0 | 1 | 00 | "KT Divisor Latch LSB Register (MEM_KTDLLR)—Offset 0h" on page 2547 |
| 1 | 1 | 00 | "KT Interrupt Enable register (MEM_KTIER)—Offset 1h" on page 2548 |
| 1 | 1 | 00 | "KT Divisor Latch MSB Register (MEM_KTDLMR)—Offset 1h" on page 2548 |
| 2 | 1 | 01 | "KT Interrupt Identification Register (MEM_KTIIR)—Offset 2h" on page 2549 |
| 2 | 1 | 00 | "KT FIFO Control register (MEM_KTFCR)—Offset 2h" on page 2550 |
| 3 | 1 | 03 | "KT Line Control register (MEM_KTLCR)—Offset 3h" on page 2551 |
| 4 | 1 | 00 | "KT Modem Control register (MEM_KTMCR)—Offset 4h" on page 2552 |
| 5 | 1 | 60 | "KT Line Status register (MEM_KTLSR)—Offset 5h" on page 2553 |
| 6 | 1 | 00 | "KT Modem Status register (MEM_KTMSR)—Offset 6h" on page 2554 |
| 7 | 1 | 00 | "KT Scratch register (MEM_KTSCR)—Offset 7h" on page 2554 |

### 54.1.10 Host Memory Space—Fixed Address

An index of the registers that are accessible in Host Memory Space is shown here.

**Table 54-10. Summary of Memory Mapped I/O Registers—Fix Addresses**

| Memory Address (hex) | Bytes (decimal) | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| FED40000 | 4 | 00000000 | "FTPM Locality State (HOST_LOC_0_LOC_STATE_HROA)—Offset FED40000h" on page 2555 |
| FED40004 | 4 | 00000000 | "FTPM Locality Reserved (HOST_LOC_0_LOC_RSVD)—Offset FED40004h" on page 2555 |
| FED40008 | 4 | 00000000 | "FTPM Locality n Control Register (HOST_LOC_0_LOC_CTRL)—Offset FED40008h" on page 2556 |
| FED4000C | 4 | 00000000 | "FTPM Locality n Status Register Host Read Only Access. (HOST_LOC_0_LOC_STS_HROA)—Offset FED4000Ch" on page 2556 |
| FED40010 | 4 | 00000000 | "FTPM Locality Config Area Reserved Read Write[0-7] (HOST_LOC_0_RSVD_RW1[0-7])—Offset FED40010h, Count 8, Stride 4h" on page 2556 |
| FED40030 | 4 | 00000000 | "FTPM Interface ID Host Read Only Access 0 (HOST_LOC_0_INTF_ID_0)—Offset FED40030h" on page 2557 |
| FED40034 | 4 | 00000000 | "FTPM Interface ID Host Read Only Access 1 (HOST_LOC_0_INTF_ID_1)—Offset FED40034h" on page 2557 |
| FED40038 | 4 | 00000000 | "FTPM Locality Config Area Reserved Read Write[0-1] (HOST_LOC_0_RSVD_RW2[0-1])—Offset FED40038h, Count 2, Stride 4h" on page 2557 |
| FED40040 | 4 | 00000000 | "Control Area Request (HOST_LOC_0_CA_REQUEST)—Offset FED40040h" on page 2558 |
| FED40044 | 4 | 00000000 | "Control Area Status (HOST_LOC_0_CA_STATUS)—Offset FED40044h" on page 2558 |
| FED40048 | 4 | 00000000 | "Control Area Cancel (HOST_LOC_0_CA_CANCEL)—Offset FED40048h" on page 2558 |
| FED4004C | 4 | 00000000 | "Control Area Start (HOST_LOC_0_CA_START)—Offset FED4004Ch" on page 2559 |
| FED40050 | 4 | 00000000 | "Control Area Interrupt Reserved Part 1 (HOST_LOC_0_CA_INT_RSVD1)—Offset FED40050h" on page 2559 |
| FED40054 | 4 | 00000000 | "Control Area Interrupt Reserved Part 2 (HOST_LOC_0_CA_INT_RSVD2)—Offset FED40054h" on page 2559 |
| FED40058 | 4 | 00000000 | "Control Area Command Size (HOST_LOC_0_CA_CMD_SZ)—Offset FED40058h" on page 2560 |
| FED4005C | 4 | 00000000 | "Control Area Command Part 1 (HOST_LOC_0_CA_CMD1)—Offset FED4005Ch" on page 2560 |
| FED40060 | 4 | 00000000 | "Control Area Command Part 2 (HOST_LOC_0_CA_CMD2)—Offset FED40060h" on page 2560 |
| FED40064 | 4 | 00000000 | "Control Area Response Size (HOST_LOC_0_CA_RSP_SZ)—Offset FED40064h" on page 2560 |
| FED40068 | 4 | 00000000 | "Control Area Response Part 1 (HOST_LOC_0_CA_RSP1)—Offset FED40068h" on page 2561 |
| FED4006C | 4 | 00000000 | "Control Area Response Part 2 (HOST_LOC_0_CA_RSP2)—Offset FED4006Ch" on page 2561 |
| FED40070 | 4 x 4 | 00000000 | "FTPM Reserved Read Write[0-3] (HOST_LOC_0_RSVD_RW3[0-3])—Offset FED40070h, Count 4, Stride 4h" on page 2561 |
| FED40080 | 4 x 992 | 00000000 | "FTPM Command and Response Buffer[0-991] (HOST_LOC_0_FTPM_CRB[0-991])—Offset FED40080h, Count 992, Stride 4h" on page 2561 |

### 54.1.11 Host I/O Space—KT_HOST_IOBAR

An index of the registers that are accessible in Host I/O Space is shown here.

**Table 54-11. Summary of I/O Registers—KT_HOST_IOBAR**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 0 | 1 | 00 | "KT Receive Buffer Register (IO_KTRBR)—Offset 0h" on page 2562 |
| 0 | 1 | 00 | "KT Transmitter Holding Register (IO_KTTHR)—Offset 0h" on page 2562 |
| 0 | 1 | 00 | "KT Divisor Latch LSB Register (IO_KTDLLR)—Offset 0h" on page 2563 |
| 1 | 1 | 00 | "KT Interrupt Enable register (IO_KTIER)—Offset 1h" on page 2563 |
| 1 | 1 | 00 | "KT Divisor Latch MSB Register (IO_KTDLMR)—Offset 1h" on page 2564 |
| 2 | 1 | 01 | "KT Interrupt Identification Register (IO_KTIIR)—Offset 2h" on page 2564 |
| 2 | 1 | 00 | "KT FIFO Control register (IO_KTFCR)—Offset 2h" on page 2565 |
| 3 | 1 | 03 | "KT Line Control register (IO_KTLCR)—Offset 3h" on page 2566 |
| 4 | 1 | 00 | "KT Modem Control register (IO_KTMCR)—Offset 4h" on page 2567 |
| 5 | 1 | 60 | "KT Line Status register (IO_KTLSR)—Offset 5h" on page 2568 |
| 6 | 1 | 00 | "KT Modem Status register (IO_KTMSR)—Offset 6h" on page 2569 |
| 7 | 1 | 00 | "KT Scratch register (IO_KTSCR)—Offset 7h" on page 2569 |

### 54.1.12 Host I/O Space—IDE_HOST_PCMDIOBAR

An index of the registers that are accessible in Host I/O Space is shown here.

**Table 54-12. Summary of I/O Registers—IDE_HOST_PCMDIOBAR**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 0 | 1 | 0000 | "IDE Data Register (IDEDATA)—Offset 0h" on page 2570 |
| 1 | 1 | 00 | "IDE Features Register (IDEFR)—Offset 1h" on page 2570 |
| 1 | 1 | 00 | "IDE Error Register DEV0 (IDEERD0)—Offset 1h" on page 2571 |
| 1 | 1 | 00 | "IDE Error Register DEV1 (IDEERD1)—Offset 1h" on page 2571 |
| 2 | 1 | 00 | "IDE Sector Count In Register (IDESCIR)—Offset 2h" on page 2572 |
| 2 | 1 | 00 | "IDE Sector Count Out Register DEV0 (IDESCOR0)—Offset 2h" on page 2572 |
| 2 | 1 | 00 | "IDE Sector Count Out Register DEV1 (IDESCOR1)—Offset 2h" on page 2572 |
| 3 | 1 | 00 | "IDE Sector Number In Register (IDESNIR)—Offset 3h" on page 2573 |
| 3 | 1 | 00 | "IDE Sector Number Out Register DEV0 (IDESNOR0)—Offset 3h" on page 2573 |
| 3 | 1 | 00 | "IDE Sector Number Out Register DEV1 (IDESNOR1)—Offset 3h" on page 2573 |
| 4 | 1 | 00 | "IDE Cylinder Low In Register (IDECLIR)—Offset 4h" on page 2574 |
| 4 | 1 | 00 | "IDE Cylinder Low Out Register DEV0 (IDCLOR0)—Offset 4h" on page 2574 |
| 4 | 1 | 00 | "IDE Cylinder Low Out Register DEV1 (IDCLOR1)—Offset 4h" on page 2575 |
| 5 | 1 | 00 | "IDE Cylinder High In Register (IDECHIR)—Offset 5h" on page 2575 |
| 5 | 1 | 00 | "IDE Cylinder High Out Register DEV0 (IDCHOR0)—Offset 5h" on page 2576 |
| 5 | 1 | 00 | "IDE Cylinder High Out Register DEV1 (IDCHOR1)—Offset 5h" on page 2576 |
| 6 | 1 | 00 | "IDE Drive/Head In Register (IDEDHIR)—Offset 6h" on page 2577 |
| 6 | 1 | 00 | "IDE Drive/Head Out Register DEV0 (IDDHOR0)—Offset 6h" on page 2577 |
| 6 | 1 | 00 | "IDE Drive/Head Out Register DEV1 (IDDHOR1)—Offset 6h" on page 2578 |
| 7 | 1 | 00 | "IDE Command Register (IDECR)—Offset 7h" on page 2578 |
| 7 | 1 | 80 | "IDE Status Register DEV0 (IDESR0)—Offset 7h" on page 2579 |
| 7 | 1 | 80 | "IDE Status Register DEV1 (IDESR1)—Offset 7h" on page 2580 |

### 54.1.13 Host I/O Space—IDE_HOST_PCTLIOBAR

An index of the registers that are accessible in Host I/O Space is shown here.

**Table 54-13. Summary of I/O Registers—IDE_HOST_PCTLIOBAR**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 2 | 1 | 00 | "IDE Device Control Register (IDDCR)—Offset 2h" on page 2581 |
| 2 | 1 | 00 | "IDE Alternate Status Register (IDASR)—Offset 2h" on page 2581 |

### 54.1.14 Host I/O Space—IDE_HOST_BMIOBAR

An index of the registers that are accessible in Host I/O Space is shown here.

**Table 54-14. Summary of I/O Registers—IDE_HOST_BMIOBAR**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 0 | 1 | 00 | "IDE Primary Bus Master Command Register (IDEPBMCR)—Offset 0h" on page 2582 |
| 1 | 1 | 00 | "IDE Primary Bus Master Device Specific 0 Register (IDEPBMDS0R)—Offset 1h" on page 2583 |
| 2 | 1 | 80 | "IDE Primary Bus Master Status Register (IDEPBMSR)—Offset 2h" on page 2584 |
| 3 | 1 | 00 | "IDE Primary Bus Master Device Specific 1 Register (IDEPBMDS1R)—Offset 3h" on page 2586 |
| 4 | 1 | 00 | "IDE Primary Bus Master Descriptor Table Pointer Register Byte 0 (IDEPBMDTPR0)—Offset 4h" on page 2586 |
| 5 | 1 | 00 | "IDE Primary Bus Master Descriptor Table Pointer Register Byte 1 (IDEPBMDTPR1)—Offset 5h" on page 2586 |
| 6 | 1 | 00 | "IDE Primary Bus Master Descriptor Table Pointer Register Byte 2 (IDEPBMDTPR2)—Offset 6h" on page 2587 |
| 7 | 1 | 00 | "IDE Primary Bus Master Descriptor Table Pointer Register Byte 3 (IDEPBMDTPR3)—Offset 7h" on page 2587 |
| 8 | 1 | 00 | "IDE Secondary Bus Master Command Register (IDESBMCR)—Offset 8h" on page 2588 |
| 9 | 1 | 00 | "IDE Secondary Bus Master Device Specific 0 Register (IDESBMDS0R)—Offset 9h" on page 2588 |
| A | 1 | 80 | "IDE Secondary Bus Master Status Register (IDESBMSR)—Offset Ah" on page 2589 |
| B | 1 | 00 | "IDE Secondary Bus Master Device Specific 1 Register (IDESBMDS1R)—Offset Bh" on page 2590 |
| C | 1 | 00 | "IDE Secondary Bus Master Descriptor Table Pointer Register Byte 0 (IDESBMDTPR0)—Offset Ch" on page 2590 |
| D | 1 | 00 | "IDE Secondary Bus Master Descriptor Table Pointer Register Byte 1 (IDESBMDTPR1)—Offset Dh" on page 2591 |
| E | 1 | 00 | "IDE Secondary Bus Master Descriptor Table Pointer Register Byte 2 (IDESBMDTPR2)—Offset Eh" on page 2591 |
| F | 1 | 00 | "IDE Secondary Bus Master Descriptor Table Pointer Register Byte 3 (IDESBMDTPR3)—Offset Fh" on page 2592 |

### 54.1.15 Sideband Registers

An index of the Sideband registers that are accessible to the Host are listed here. Each is accessible in Host Memory Space using the Sideband Base Address Register (SBREG_BAR). See Section 3.4.1, "Using SBREG_BAR Method" on page 187.

**Table 54-15. Summary of Sideband Registers for KT (Host)—0xf4**

| Offset (hex) | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|
| 0 | 00000000 | "KT Host Interrupt Pin Register (KTHIPINR)—Offset 0h" on page 2593 |
| 4 | 00000000 | "BIOS KT Host PCI Function Disable Register (BKTHDISR)—Offset 4h" on page 2593 |

**Table 54-16. Summary of Sideband Registers IDE (Host)—0xf4**

| Offset (hex) | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|
| 0 | 00000000 | "IDE Host Interrupt Pin Register (IDEHIPINR)—Offset 0h" on page 2594 |
| 4 | 00000000 | "BIOS IDE Host PCI Function Disable Register (BIDEHDISR)—Offset 4h" on page 2594 |

## 54.2 Registers in Configuration Space—HECI1

### 54.2.1 Identifiers (HECI1_ID)—Offset 0h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:0] + 0h

**Default:** 19E58086h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x19E5<br>RO/V | **Device ID (DID):** Indicates what device number assigned by Intel. |
| 15:0 | 0x8086<br>RO | **Vendor ID (VID):** 16-bit field which indicates that Intel is the vendor, assigned by the PCI SIG. |

## 54.2.2 Command (HECI1_CMD)—Offset 4h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:27, F:0] + 4h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:11 | 0x0<br>RO | **RSVD:** Reserved |
| 10 | 0x0<br>RW | **Interrupt Disable (ID):** Disables this device from generating PCI line based interrupts.<br>This bit does not have any effect on MSI operations. |
| 9 | 0x0<br>RO | **Fast Back-to-Back Enable (FBE):** Not implemented, hardwired to 0. |
| 8 | 0x0<br>RO | **SERR# Enable (SEE):** Not implemented, hardwired to 0. |
| 7 | 0x0<br>RO | **Wait Cycle Enable (WCC):** Not implemented, hardwired to 0. |
| 6 | 0x0<br>RO | **Parity Error Response Enable (PEE):** Not implemented, hardwired to 0. |
| 5 | 0x0<br>RO | **VGA Palette Snooping Enable (VAG):** Not implemented, hardwired to 0 |
| 4 | 0x0<br>RO | **Memory Write and Invalidate Enable (MWIE):** Not implemented, hardwired to 0. |
| 3 | 0x0<br>RO | **Special Cycle Enable (SCE):** Not implemented, hardwired to 0. |
| 2 | 0x0<br>RW | **Bus Master Enable (BME):** Controls the HECI host controller's ability to act as a system memory master for data transfers.<br>When this bit is cleared, HECI bus master activity stops and any active DMA engines return to an idle condition.<br>This bit is made visible to firmware through the H_PCI_CSR register, and changes to this bit may be configured by the H_PCI_CSR register to generate an MSI to mIA.<br>When this bit is '0', HECI is blocked from generating MSI to the host CPU.<br>***Note:*** This bit does not block HECI accesses to CSE-UMA. |
| 1 | 0x0<br>RW | **Memory Space Enable (MSE):** Controls access to the HECI host controller’s memory-mapped register space. |
| 0 | 0x0<br>RO | **I/O Space Enable (IOSE):** Not implemented, hardwired to 0. |

### 54.2.3 Status (HECI1_STS)—Offset 6h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:27, F:0] + 6h

**Default:** 0010h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RO | **Detected Parity Error (DPE):** Not implemented, hardwired to 0. |
| 14 | 0x0<br>RO | **Signaled System Error (SSE):** Not implemented, hardwired to 0. |
| 13 | 0x0<br>RO | **Received Master-Abort (RMA):** Not implemented, hardwired to 0. |
| 12 | 0x0<br>RO | **Received Target Abort (RTA):** Not implemented, hardwired to 0. |
| 11 | 0x0<br>RO | **Signaled Target-Abort (STA):** Not implemented, hardwired to 0. |
| 10:9 | 0x0<br>RO | **DEVSEL# Timing (DEVT):** These bits are hardwired to 00. |
| 8 | 0x0<br>RO | **Master Data Pariy Error Detected (DPD):** Not implemented, hardwired to 0. |
| 7 | 0x0<br>RO | **Fast Back-to-Back Capable (FBC):** Not implemented, hardwired to 0. |
| 6 | 0x0<br>RO | **RSVD (RSVD_6_6):** Reserved |
| 5 | 0x0<br>RO | **66 MHz Capable (C66):** Not implemented, hardwired to 0. |
| 4 | 0x1<br>RO | **Capabilities List (CL):** Indicates the presence of a capabilities list, hardwired to 1. |
| 3 | 0x0<br>RO/V | **Interrupt Status (IS):** Reflects the state of the INTx# signal at the input of the enable/disable circuit.<br>• This bit is a 1 when the INTx# is asserted.<br>• This bit is a 0 after the interrupt is cleared (independent of the state of the Interrupt Disable bit in the command register).<br>***Note:*** This bit is not set by an MSI. |
| 2:0 | 0x0<br>RO | **RSVD (RSVD_2_0):** Reserved |

## 54.2.4 Revision ID and Class Code (HECI1_RID_CC)—Offset 8h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:0] + 8h

**Default:** 07800000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x7<br>RO | **Base Class Code (BCC):** Indicates the base class code of the HECI host controller device. |
| 23:16 | 0x80<br>RO | **Sub Class Code (SCC):** Indicates the sub class code of the HECI host controller device. |
| 15:8 | 0x0<br>RO | **Programming Interface (PI):** Indicates the programming interface of the HECI host controller device. |
| 7:0 | 0x0<br>RO/V | **Revision ID (RID):** Indicates stepping of the HECI host controller. |

## 54.2.5 Cache Line Size (HECI1_CLS)—Offset Ch

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:27, F:0] + Ch

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO | **Cache Line Size (CLS):** Not implemented, hardwired to 0. |

## 54.2.6 Master Latency Timer (HECI1_MLT)—Offset Dh

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:27, F:0] + Dh

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO | **Master Latency Timer (MLT):** Not implemented, hardwired to 0. |

### 54.2.7 Header Type (HECI1_HTYPE)—Offset Eh

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:27, F:0] + Eh

**Default:** 80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x1<br>RO | **Multi-Function Device (MFD):** Indicates the HECI host controller is part of a multi-function device. |
| 6:0 | 0x0<br>RO | **Header Layout (HL):** Indicates that the HECI host controller uses a target device layout. |

### 54.2.8 Built In Self-Test (HECI1_BIST)—Offset Fh

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:27, F:0] + Fh

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RO | **BIST Capable (BC):** Not implemented, hardwired to 0. |
| 6:0 | 0x0<br>RO | **RSVD:** Reserved |

### 54.2.9 HECI MMIO Base Address Low (HECI1_MMIO_MBAR_LO)—Offset 10h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:0] + 10h

**Default:** 00000004h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:12 | 0x0<br>RW | **Base Address Low (BA_LO):** Lower 32 bits of base address of register memory space. |
| 11:4 | 0x0<br>RO | **Memory Size (MS):** This field is hardwired to 0 to indicate that HECI device requests 4KB of memory space. |
| 3 | 0x0<br>RO | **Prefetchable (PF):** Indicates that this range is not pre-fetchable |
| 2:1 | 0x2<br>RO | **Type (TP):** Indicates that this range can be mapped anywhere in 64-bit address space. |
| 0 | 0x0<br>RO | **Resource Type Indicator (RTE):** Indicates a request for register memory space. |

### 54.2.10 HECI MMIO Base Address High (HECI1_MMIO_MBAR_HI)—Offset 14h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:0] + 14h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Base Address High (BA_HI):** Upper 32 bits of base address of register memory space. |

### 54.2.11 Sub System Identifiers (HECI1_SS)—Offset 2Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:0] + 2Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW/O | **Subsystem ID (SSID):** Indicates the sub- system identifier.<br>This field should be programmed by BIOS during boot-up.<br>Once written, this register becomes Read Only. |
| 15:0 | 0x0<br>RW/O | **Subsystem Vendor ID (SSVID):** Indicates the sub-system vendor identifier.<br>This field should be programmed by BIOS during boot- up.<br>Once written, this register becomes Read Only. |

### 54.2.12 Capabilities Pointer (HECI1_CAP)—Offset 34h

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:27, F:0] + 34h

**Default:** 50h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x50<br>RO | **Capability Pointer (CP):** Indicates the first capability pointer offset.<br>It points to the PCI power management capability offset. |

## 54.2.13 Interrupt Information (HECI1_INTR)—Offset 3Ch

**Type:** PCI Configuration Register
(Size: 16 bits)

**Offset:** [B:0, D:27, F:0] + 3Ch

**Default:** 0100h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x1<br>RO/V | **Interrupt Pin (IPIN):** This field indicates the virtual interrupt pin the HECI host controller uses.<br>A value of 0x1/0x2/0x3/0x4 indicates that this function implements legacy interrupt on INTA/INTB/INTC/INTD, respectively.<br>When legacy interrupt is not used this register should be set to 0x0.<br>Programmed by BIOS over IOSF SB through corresponding Private CR register. |
| 7:0 | 0x0<br>RW | **Interrupt Line (ILINE):** Software written value to indicate which interrupt line (vector) the interrupt is connected to.<br>No hardware action is taken on this field. |

## 54.2.14 Minimum Grant (HECI1_MGNT)—Offset 3Eh

**Type:** PCI Configuration Register
(Size: 8 bits)

**Offset:** [B:0, D:27, F:0] + 3Eh

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO | **Grant (GNT):** Not implemented, hardwired to 0. |

## 54.2.15 Maximum Latency (HECI1_MLAT)—Offset 3Fh

**Type:** PCI Configuration Register
(Size: 8 bits)

**Offset:** [B:0, D:27, F:0] + 3Fh

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO | **Latency (LAT):** Not implemented, hardwired to 0. |

## 54.2.16 Host Firmware Status (HECI1_HFS)—Offset 40h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:0] + 40h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0x0<br>RO | **BIOS MSG ACK:** Acknowledge for register based BIOS message in MEI 1 H_GS Register. |
| 27:25 | 0x0<br>RO | **BIOS MSG ACK Data:** Message specific data for acknowledged BIOS message. |
| 24:20 | 0x0<br>RO | Reserved |
| 19:16 | 0x0<br>RO | **Operating Mode:** This field describes the current operating mode of Intel® ME.<br>• 1:0 - Reserved<br>• 2 - Debug Mode<br>• 14:3 - Reserved<br>• 15 - Intel® SPS firmware is running in Intel® ME |
| 15:12 | 0x0<br>RO | **Error Code:** If set to nonzero value the Intel® ME firmware has encountered a fatal error and stopped normal operation.<br>• 0 - No Error<br>• 1 - Uncategorized Failure - The Intel® ME firmware has experienced an uncategorized error. Further details of the failure can be found in the Extended Status Data.<br>• 2 - Disabled - Firmware was disabled on this platform.<br>• 3 - Image Failure - The Intel® ME firmware stored in the system flash is not valid. |
| 11 | 0x0<br>RO | **Update in Progress:** The bit is set if any type of Intel® ME firmware update is in progress. |
| 10 | 0x0<br>RO | **Recovery BUP Load Fault:** This bit is set when firmware is not able to load recovery bring-up from the flash. It means that the recovery section in Intel® ME region on the SPI flash. |
| 9 | 0x0<br>RO | **Init Complete:** When this but is not set firmware is still in initialization phase. When firmware has fully entered a stable state, this but is set to 1 and "Current State" field of this register provides the steady state of the Intel® ME subsystem. |
| 8:6 | 0x0<br>RO | **Operating State:** This field describes the current operating state of Intel® ME.<br>• 000 - Preboot<br>• 001 - M0 with UMA<br>• 010 - Reserved<br>• 011 - Reserved<br>• 100 - M3 without UMA<br>• 101 - M0 without UMA - normal state for Intel® SPS firmware<br>• 110 - Bring up<br>• 111 - M0 without UMA but with error |
| 5 | 0x0<br>RO | **FPT or Factory Defaults Bad:** This bit is set when the firmware discovers a bad checksum of Intel® ME region Flash Partition Table (FPT) or Factory Defaults. When this bit set, it may or may not have the error code shown in bit [15:12]. The system can get this bit clear only by re-flashing the whole Intel® ME region in the SPI Flash. |
| 4 | 0x0<br>RO | **Manufacturing Mode:** When this bit is set, the platform is still in manufacturing mode. Host can use this bit to inform user that the platform is NOT READY for production yet. This but is set as long as Intel® ME Region access is not locked for flash masters other than Intel® ME. For shipping machine, this bit MUST be 0. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 3:0 | 0x0<br>RO | **Current State:** This field describes the current operation state of the firmware.<br>• 0 - Reset - Intel® ME is in reset state, will exit this state within 1 millisecond<br>• 1 - Initialization - Intel® ME is initializing, will exit this state within 2 seconds<br>• 2 - Recovery - Intel® ME is in recovery mode, check ME1.GMES register to determine cause<br>• 3 - Reserved<br>• 4 - Disabled - Intel® ME functionality has been disabled, it executes idle loop<br>• 5 - Operational - Intel® ME is in normal operational state<br>• 6 - Reserved<br>• 7 - State Transition - Intel® ME sets this state before starting a transition to a new Operating State.<br>It is a temporary state, may appear on transition between Initialization and Operational. |

## 54.2.17 Miscellaneous Shadow (HECI1_MISC_SHDW)—Offset 44h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:0] + 44h

**Default:** 80000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x1<br>RO | **Miscellaneous Shadow Valid (MSVLD):** This bit is hardwired to 1 to indicate that this HECI device implements the Miscellaneous Shadow register.<br>This bit can be used by host software that is bus/dev/function number agnostic (such as HECI operating system driver) to discover whether the Miscellaneous Shadow register is implemented or not. |
| 30:17 | 0x0<br>RO | **RSVD_30_17:** Reserved |
| 16 | 0x0<br>RO/V | **CSE UMA Size Valid (CUSZV):** This bit indicates that firmware has written the CUSZ field.<br>This field reflects the value of CSE CUBA.CUSZV. |
| 15:7 | 0x0<br>RO | **Reserved (RSVD_15_7):** Reserved. |
| 6:0 | 0x0<br>RO/V | **CSE UMA Size (CUSZ):** These bits reflect firmware's desired size of CSEUMA memory region.<br>It is configured by firmware prior to bring up core power and allowing BIOS to initialize memory.<br>The legal CSEUMA sizes and encodings for this field are:<br>• 0000000b (0MB, no CSEUMA region)<br>• 0000001b (1MB)<br>• 0000010b (2MB)<br>• 0000100b (4MB)<br>• 0001000b (8MB)<br>• 0010000b (16MB)<br>• 0100000b (32MB)<br>• 1000000b (64MB)<br>This field reflects the value of CSE CUBA.CUSZ. |

## 54.2.18 General Status Shadow 1 (HECI1_GS_SHDW1)—Offset 48h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:0] + 48h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **EOP Status:** This bit presents the Intel® ME notion of EOP status.<br>If BIOS encounters this bit set to '1' during POST it signals an error in platform power flow. |
| 30:28 | 0x0<br>RO | **Infrastructure Progress Code:** This field identifies the infrastructure progress code:<br>• 0 - ROM - Intel® ME is in ROM phase<br>• 1 - BUP - Intel® ME is in BRINGUP phase<br>• 2 - uKernel - Intel® ME is in Micro Kernel phase<br>• 3 - Policy Module - Intel® ME is in Policy Module phase<br>• 4 - Other Module - Intel® ME is loading modules in M0 or M3 Operating State |
| 27:16 | 0x0<br>RO | **Extended Status Data:** These bits provide extended status data for the current state of operating of the firmware. Or, if the firmware is in a fatal error state, these bits provide extended error code information. |
| 15:13 | 0x0<br>RO | **Firmware Heartbeat:** This number increments approximately every second if Intel® ME firmware is running. |
| 12 | 0x0<br>RO | Intel® ME Target Image Boot Fault<br>• 0 - Target image loaded successfully<br>• 1 - Target image boot failed, switched to backup image or recovery image |
| 11:8 | 0x0<br>RO | Reserved |
| 7 | 0x0<br>RO | **Warm Reset Request:** If this bit is set, Intel® ME informs BIOS that a warm reset is requested by Intel® ME. |
| 6 | 0x0<br>RO | **MFS Failure:** If this bit is set, Intel® ME informs BIOS that Intel® ME File System failure has been detected during recent Intel® ME boot. |
| 5:4 | 0x0<br>RO | Reserved |
| 3:1 | 0x0<br>RO | **Recovery Cause:** If ME1.HFS.Current State indicates that Intel® ME firmware is running in recovery mode these bits provide the cause of this mode:<br>• 0 - Intel® ME recovery jumper asserted<br>• 1 - Security strap override jumper asserted<br>• 2 - Recovery forced with IPMI command<br>• 3 - Invalid flash configuration, either:<br>  • flash master access permissions configuration is wrong<br>  • VSCC entry is missing or wrong<br>  • flash erase block size in Intel® ME region configuration<br>• 4 - Intel® ME internal error<br>  Intel® ME could not start in operational mode because of some firmware problems.<br>• 5..7 - Reserved for future extensions |
| 0 | 0x0<br>RO | **BIST in Progress:** If this bit is set Intel® ME Built In Self-Test is in Progress. |

## 54.2.19 Host General Status (HECI1_H_GS1)—Offset 4Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:0] + 4Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Host General Status (H_GS1):** General status of Host.<br>This field is not used by hardware. |

## 54.2.20 PCI Power Management Capability ID (HECI1_PID)—Offset 50h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:27, F:0] + 50h

**Default:** 8C01h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x8c<br>RO | **Next Capability (NEXT):** Indicates the location of the next capability item in the list.<br>This is the Message Signaled Interrupts capability. |
| 7:0 | 0x1<br>RO | **Cap ID (CID):** Indicates that this pointer is a PCI power management. |

## 54.2.21 PCI Power Management Capabilities (HECI1_PC)—Offset 52h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:27, F:0] + 52h

**Default:** 4003h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:11 | 0x8<br>RO | **PME Support (PSUP):** Indicates the states that can generate PME#.<br>HECI can assert PME# from D3hot only. |
| 10 | 0x0<br>RO | **D2 Support (D2S):** The D2 state is not supported for the HECI host controller. |
| 9 | 0x0<br>RO | **D _Support (D1S):** The D1 state is not supported for the HECI host controller. |
| 8:6 | 0x0<br>RO | **Aux_Current (AUXC):** Reports the maximum Suspend well current required when in the D3COLD state. Value of 0 is reported. |
| 5 | 0x0<br>RO | **Device Specific Initialization (DSI):** Indicates whether device-specific initialization is required. |
| 4 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 3 | 0x0<br>RO | **PME Clock (PMEC):** Indicates that PCI clock is not required to generate PME#. |
| 2:0 | 0x3<br>RO | **Version (VS):** Indicates support for Revision 1.2 of the PCI Power Management Specification. |

## 54.2.22 PCI Power Management Control and Status (HECI1_PMCS)—Offset 54h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:27, F:0] + 54h

**Default:** 0008h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RW/1C/V | **PME Status (PMES):** The PME Status bit in HECI space can be set to '1' by CSE FW performing a write into CSE side register to set PMES.<br>This bit is cleared by host CPU writing a '1' to it.<br>CSE cannot clear this bit. Host CPU writes with value '0' have no effect on this bit. |
| 14:9 | 0x0<br>RO | **Reserved (RSVD_14_9):** Reserved. |
| 8 | 0x0<br>RW | **PME Enable (PMEE):** When set, PME_assert and PME_deassert messages are sent over the SoC Sideband to the SoC PMC based on the PMES bit.<br>When reset these messages are not sent to the PMC. |
| 7:4 | 0x0<br>RO | **Reserved (RSVD_7_4):** Reserved. |
| 3 | 0x1<br>RO | **No Soft Reset (NSR):** This bit indicates that when the HECI host controller is transitioning from D3hot to D0 due to power state command, it does not perform and internal reset. |
| 2 | 0x0<br>RO | **Reserved (RSVD_2_2):** Reserved. |
| 1:0 | 0x0<br>RW | **Power State (PS):** This field is used both to determine the current power state of the HECI host controller and to set a new power state. The values are:<br>• 00 - D0 state<br>• 11 - D3HOT state<br>The D1 and D2 states are not supported for this HECI host controller. |

## 54.2.23 General Status Shadow 2 (HECI1_GS_SHDW2)—Offset 60h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:0] + 60h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **General Status Shadow 2 (GSS2):** This field is host side shadow of CSE General Status 2 (CSE_GS2). |

## 54.2.24 General Status Shadow 3 (HECI1_GS_SHDW3)—Offset 64h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:0] + 64h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **General Status Shadow 3 (GSS3):** This field is host side shadow of CSE General Status 3 (CSE_GS3). |

## 54.2.25 General Status Shadow 4 (HECI1_GS_SHDW4)—Offset 68h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:0] + 68h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **General Status Shadow 4 (GSS4):** This field is host side shadow of CSE General Status 4 (CSE_GS4). |

## 54.2.26 General Status Shadow 5 (HECI1_GS_SHDW5)—Offset 6Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:0] + 6Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **General Status Shadow 5 (GSS5):** This field is host side shadow of CSE General Status 5 (CSE_GS5). |

## 54.2.27 Host General Status 2 (HECI1_H_GS2)—Offset 70h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:0] + 70h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Host General Status 2 (H_GS2):** General status of Host. This field is not used by hardware. |

## 54.2.28 Host General Status 3 (HECI1_H_GS3)—Offset 74h

**Type:** PCI Configuration Register
(Size: 32 bits)

**Offset:** [B:0, D:27, F:0] + 74h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Host General Status 3 (H_GS3):** General status of Host.<br>This field is not used by hardware. |

## 54.2.29 Message Signaled Interrupt Identifiers (HECI1_MID)—Offset 8Ch

**Type:** PCI Configuration Register
(Size: 16 bits)

**Offset:** [B:0, D:27, F:0] + 8Ch

**Default:** 0005h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x0<br>RO | **Next Pointer (NEXT):** Indicates the next item in the list.<br>This can be additional capability pointers or, if zero, indicates that this is the last item in the list. |
| 7:0 | 0x5<br>RO | **Capability ID (CID):** Indicates Message Signaled Interrupts (MSI). |

## 54.2.30 Message Signaled Interrupt Message Control (HECI1_MC)—Offset 8Eh

**Type:** PCI Configuration Register
(Size: 16 bits)

**Offset:** [B:0, D:27, F:0] + 8Eh

**Default:** 0080h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 7 | 0x1<br>RO | **64 Bit Address Capable (C64):** Specifies whether capable of generating 64-bit messages. |
| 6:4 | 0x0<br>RO | **Multiple Message Enable (MME):** Not implemented, hardwired to 0. |
| 3:1 | 0x0<br>RO | **Multiple Message Capable (MMC):** Not implemented, hardwired to 0. |
| 0 | 0x0<br>RW | **MSI Enable (MSIE):** If set, MSI is enabled and INTx virtual wires are not used to generate interrupts. |

### 54.2.31 Message Signaled Interrupt Message Address (HECI1_MA)—Offset 90h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:0] + 90h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:2 | 0x0<br>RW | **Address (ADDR):** Lower 32 bits of the system specified message address, always DW aligned. |
| 1:0 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |

### 54.2.32 Message Signaled Interrupt Upper Address (HECI1_MUA)—Offset 94h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:0] + 94h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Upper Address (UADDR):** Upper 32 bits of the system specified message address.<br>This register is optional and only implemented if MC.C64=1. |

### 54.2.33 Message Signaled Interrupt Message Data (HECI1_MD)—Offset 98h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:27, F:0] + 98h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0x0<br>RW | **Data (DATA):** This 16-bit field is programmed by system software if MSI is enabled.<br>Its content is driven onto the FSB during the data phase of the MSI memory write transaction. |

## 54.2.34 HECI Interrupt Delivery Mode (HECI1_HIDM)—Offset A0h

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:27, F:0] + A0h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:3 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 2 | 0x0<br>RW/1S | **HIDM Lock (HIDM_L):** Writing 1 to this bit locks the HIDM field. |
| 1:0 | 0x0<br>RW/L | **HECI Interrupt Delivery Mode (HIDM):** These bits control what type of interrupt the HECI will send when CSE FW writes to set the CSE_IG bit.<br>They are interpreted as follows:<br>• 00 - Generate Legacy or MSI interrupt<br>• 01 - Generate SCI<br>• 10 - Generate SMI<br>This field may be locked by writing 1 to HIDM_L bit. |

## 54.2.35 Host Extend Register Status (HECI1_HERS)—Offset BCh

This register is used to communicate the CSE FW measurement status information to host.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:0] + BCh

**Default:** 40000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO/V | **Extend Register Valid (ERV):** Set by FW after all FW has been loaded and the measurement data has been stored in HERx registers.<br>• If ERA field is SHA-1, the result of the extend operation is in HER:5-1.<br>• If ERA field is SHA-256, the result is in HER:8-1. |
| 30 | 0x1<br>RO | **Extend Feature Present (EFP):** This bit is hardwired to 1 to allow driver software to easily detect the chipset supports the Extend Registers FW measurement feature. |
| 29:4 | 0x0<br>RO | **Reserved (RSVD_29_4):** Reserved. |
| 3:0 | 0x0<br>RO/V | **Extend Register Algorithm (ERA):** This field indicates the hash algorithm used in the FW measurement Extend operation.<br>Encodings are:<br>• 0x0: SHA-1<br>• 0x2: SHA-256<br>• Other values: reserved.<br>This field is set by FW with the used hash algorithm value when the ERV bit is set to 1.<br>This field is meaningless when the ERV bit is 0.<br>This field does NOT have any defined reset value. |

## 54.2.36 Host Extend Register DW1. (HECI1_HER1)—Offset C0h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:0] + C0h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **Host Extend Register DW1 (ERDW1):** 1st DWORD result of the extend operation.<br>***Note:*** Note: Extend Operation is HER[5:1] if using SHA-1. If using SHA-256 then Extend Operation is HER[8:1]. |

## 54.2.37 Host Extend Register DW2. (HECI1_HER2)—Offset C4h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:0] + C4h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **Host Extend Register DW2 (ERDW2):** 2nd DWORD result of the extend operation.<br>***Note:*** Extend Operation is HER[5:1] if using SHA-1. If using SHA-256 then Extend Operation is HER[8:1]. |

## 54.2.38 Host Extend Register DW3. (HECI1_HER3)—Offset C8h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:0] + C8h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **Host Extend Register DW3 (ERDW3):** 3rd DWORD result of the extend operation.<br>***Note:*** Extend Operation is HER[5:1] if using SHA-1. If using SHA-256 then Extend Operation is HER[8:1]. |

## 54.2.39 Host Extend Register DW4. (HECI1_HER4)—Offset CCh

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:0] + CCh

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **Host Extend Register DW4 (ERDW4):** 4th DWORD result of the extend operation.<br>***Note:*** Extend Operation is HER[5:1] if using SHA-1. If using SHA-256 then Extend Operation is HER[8:1]. |

## 54.2.40 Host Extend Register DW5. (HECI1_HER5)—Offset D0h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:0] + D0h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **Host Extend Register DW5 (ERDW5):** 5th DWORD result of the extend operation.<br>***Note:*** Extend Operation is HER[5:1] if using SHA-1. If using SHA-256 then Extend Operation is HER[8:1]. |

## 54.2.41 Host Extend Register DW6. (HECI1_HER6)—Offset D4h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:0] + D4h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **Host Extend Register DW6 (ERDW6):** 6th DWORD result of the extend operation.<br>***Note:*** Extend Operation is HER[5:1] if using SHA-1. If using SHA-256 then Extend Operation is HER[8:1]. |

## 54.2.42 Host Extend Register DW7. (HECI1_HER7)—Offset D8h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:0] + D8h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **Host Extend Register DW7 (ERDW7):** 7th DWORD result of the extend operation.<br>***Note:*** Extend Operation is HER[5:1] if using SHA-1. If using SHA-256 then Extend Operation is HER[8:1]. |

## 54.2.43 Host Extend Register DW8. (HECI1_HER8)—Offset DCh

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:0] + DCh

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **Host Extend Register DW8 (ERDW8):** 8th DWORD result of the extend operation.<br>***Note:*** Extend Operation is HER[5:1] if using SHA-1. If using SHA-256 then Extend Operation is HER[8:1]. |

## 54.2.44 Manufacturer's ID (HECI1_MANID)—Offset F8h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:0] + F8h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0x0<br>RO | **Reserved (RSVD_31_28):** Reserved. |
| 27:24 | 0x0<br>RO/V | **Dot Portion of Process ID (DPOP):** Indicates the dot process. |
| 23:16 | 0x0<br>RO/V | **Manufacturing Stepping ID (MSID):** This field is incremented for each stepping of the part.<br>This field can be used by software to differentiate steppings when Revision ID may not change. |
| 15:8 | 0x0<br>RO/V | **Manufacturing ID (MID):** This field is set by the SoC. |
| 7:0 | 0x0<br>RO/V | **Process Portion of Process ID (PPOP):** Indicates the process.<br>The dot portion of the process is reflected in bits [27:24].<br>This field can be used by software to differentiate steppings when Revision ID may not change. |

## 54.3 Registers in Configuration Space—HECI2

### 54.3.1 Identifiers (HECI2_ID)—Offset 0h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:1] + 0h

**Default:** 19E68086h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x19E6<br>RO/V | **Device ID (DID):** Indicates what device number assigned by Intel. |
| 15:0 | 0x8086<br>RO | **Vendor ID (VID):** 16-bit field which indicates that Intel is the vendor, assigned by the PCI SIG. |

## 54.3.2 Command (HECI2_CMD)—Offset 4h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:27, F:1] + 4h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:11 | 0x0<br>RO | **RSVD:** Reserved |
| 10 | 0x0<br>RW | **Interrupt Disable (ID):** Disables this device from generating PCI line based interrupts.<br>This bit does not have any effect on MSI operations. |
| 9 | 0x0<br>RO | **Fast Back-to-Back Enable (FBE):** Not implemented, hardwired to 0. |
| 8 | 0x0<br>RO | **SERR# Enable (SEE):** Not implemented, hardwired to 0. |
| 7 | 0x0<br>RO | **Wait Cycle Enable (WCC):** Not implemented, hardwired to 0. |
| 6 | 0x0<br>RO | **Parity Error Response Enable (PEE):** Not implemented, hardwired to 0. |
| 5 | 0x0<br>RO | **VGA Palette Snooping Enable (VAG):** Not implemented, hardwired to 0 |
| 4 | 0x0<br>RO | **Memory Write and Invalidate Enable (MWIE):** Not implemented, hardwired to 0. |
| 3 | 0x0<br>RO | **Special Cycle Enable (SCE):** Not implemented, hardwired to 0. |
| 2 | 0x0<br>RW | **Bus Master Enable (BME):** Controls the HECI host controller's ability to act as a system memory master for data transfers.<br>When this bit is cleared, HECI bus master activity stops and any active DMA engines return to an idle condition.<br>This bit is made visible to firmware through the H_PCI_CSR register, and changes to this bit may be configured by the H_PCI_CSR register to generate an MSI to mIA.<br>When this bit is '0', HECI is blocked from generating MSI to the host CPU.<br>***Note:*** This bit does not block HECI accesses to CSE-UMA |
| 1 | 0x0<br>RW | **Memory Space Enable (MSE):** Controls access to the HECI host controllers memory-mapped register space. |
| 0 | 0x0<br>RO | **I/O Space Enable (IOSE):** Not implemented, hardwired to 0. |

### 54.3.3 Status (HECI2_STS)—Offset 6h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:27, F:1] + 6h

**Default:** 0010h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RO | **Detected Parity Error (DPE):** Not implemented, hardwired to 0. |
| 14 | 0x0<br>RO | **Signaled System Error (SSE):** Not implemented, hardwired to 0. |
| 13 | 0x0<br>RO | **Received Master-Abort (RMA):** Not implemented, hardwired to 0. |
| 12 | 0x0<br>RO | **Received Target Abort (RTA):** Not implemented, hardwired to 0. |
| 11 | 0x0<br>RO | **Signaled Target-Abort (STA):** Not implemented, hardwired to 0. |
| 10:9 | 0x0<br>RO | **DEVSEL# Timing (DEVT):** These bits are hardwired to 00. |
| 8 | 0x0<br>RO | **Master Data Pariy Error Detected (DPD):** Not implemented, hardwired to 0. |
| 7 | 0x0<br>RO | **Fast Back-to-Back Capable (FBC):** Not implemented, hardwired to 0. |
| 6 | 0x0<br>RO | **RSVD (RSVD_6_6):** Reserved |
| 5 | 0x0<br>RO | **66 MHz Capable (C66):** Not implemented, hardwired to 0. |
| 4 | 0x1<br>RO | **Capabilities List (CL):** Indicates the presence of a capabilities list, hardwired to 1. |
| 3 | 0x0<br>RO/V | **Interrupt Status (IS):** Reflects the state of the INTx# signal at the input of the enable/disable circuit.<br>This bit is a 1 when the INTx# is asserted.<br>This bit is a 0 after the interrupt is cleared (independent of the state of the Interrupt Disable bit in the command register).<br>***Note:*** This bit is not set by an MSI. |
| 2:0 | 0x0<br>RO | **RSVD (RSVD_2_0):** Reserved |

### 54.3.4 Revision ID and Class Code (HECI2_RID_CC)—Offset 8h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:1] + 8h

**Default:** 07800000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x7<br>RO | **Base Class Code (BCC):** Indicates the base class code of the HECI host controller device. |
| 23:16 | 0x80<br>RO | **Sub Class Code (SCC):** Indicates the sub class code of the HECI host controller device. |
| 15:8 | 0x0<br>RO | **Programming Interface (PI):** Indicates the programming interface of the HECI host controller device. |
| 7:0 | 0x0<br>RO/V | **Revision ID (RID):** Indicates stepping of the HECI host controller. |

### 54.3.5 Cache Line Size (HECI2_CLS)—Offset Ch

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:27, F:1] + Ch

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO | **Cache Line Size (CLS):** Not implemented, hardwired to 0. |

### 54.3.6 Master Latency Timer (HECI2_MLT)—Offset Dh

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:27, F:1] + Dh

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO | **Master Latency Timer (MLT):** Not implemented, hardwired to 0. |

## 54.3.7 Header Type (HECI2_HTYPE)—Offset Eh

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:27, F:1] + Eh

**Default:** 80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x1<br>RO | **Multi-Function Device (MFD):** Indicates the HECI host controller is part of a multi-function device. |
| 6:0 | 0x0<br>RO | **Header Layout (HL):** Indicates that the HECI host controller uses a target device layout. |

## 54.3.8 Built In Self-Test (HECI2_BIST)—Offset Fh

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:27, F:1] + Fh

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RO | **BIST Capable (BC):** Not implemented, hardwired to 0. |
| 6:0 | 0x0<br>RO | **RSVD:** Reserved |

## 54.3.9 HECI MMIO Base Address Low (HECI2_MMIO_MBAR_LO)—Offset 10h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:1] + 10h

**Default:** 00000004h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:12 | 0x0<br>RW | **Base Address Low (BA_LO):** Lower 32 bits of base address of register memory space. |
| 11:4 | 0x0<br>RO | **Memory Size (MS):** This field is hardwired to 0 to indicate that HECI device requests 4KB of memory space. |
| 3 | 0x0<br>RO | **Prefetchable (PF):** Indicates that this range is not pre-fetchable |
| 2:1 | 0x2<br>RO | **Type (TP):** Indicates that this range can be mapped anywhere in 64-bit address space. |
| 0 | 0x0<br>RO | **Resource Type Indicator (RTE):** Indicates a request for register memory space. |

### 54.3.10 HECI MMIO Base Address High (HECI2_MMIO_MBAR_HI)—Offset 14h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:1] + 14h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Base Address High (BA_HI):** Upper 32 bits of base address of register memory space. |

### 54.3.11 Sub System Identifiers (HECI2_SS)—Offset 2Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:1] + 2Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW/O | **Subsystem ID (SSID):** Indicates the sub- system identifier.<br>This field should be programmed by BIOS during boot-up.<br>Once written, this register becomes Read Only. |
| 15:0 | 0x0<br>RW/O | **Subsystem Vendor ID (SSVID):** Indicates the sub-system vendor identifier.<br>This field should be programmed by BIOS during boot- up.<br>Once written, this register becomes Read Only. |

### 54.3.12 Capabilities Pointer (HECI2_CAP)—Offset 34h

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:27, F:1] + 34h

**Default:** 50h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x50<br>RO | **Capability Pointer (CP):** Indicates the first capability pointer offset.<br>It points to the PCI power management capability offset. |

## 54.3.13 Interrupt Information (HECI2_INTR)—Offset 3Ch

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:27, F:1] + 3Ch

**Default:** 0100h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x1<br>RO/V | **Interrupt Pin (IPIN):** This field indicates the virtual interrupt pin the HECI host controller uses.<br>A value of 0x1/0x2/0x3/0x4 indicates that this function implements legacy interrupt on INTA/INTB/INTC/INTD, respectively.<br>When legacy interrupt is not used this register should be set to 0x0. |
| 7:0 | 0x0<br>RW | **Interrupt Line (ILINE):** Software written value to indicate which interrupt line (vector) the interrupt is connected to.<br>No hardware action is taken on this field. |

## 54.3.14 Minimum Grant (HECI2_MGNT)—Offset 3Eh

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:27, F:1] + 3Eh

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO | **Grant (GNT):** Not implemented, hardwired to 0. |

## 54.3.15 Maximum Latency (HECI2_MLAT)—Offset 3Fh

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:27, F:1] + 3Fh

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO | **Latency (LAT):** Not implemented, hardwired to 0. |

## 54.3.16 Host Firmware Status (HECI2_HFS)—Offset 40h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:1] + 40h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0x0<br>RO | **BIOS MSG ACK:** Acknowledge for register based BIOS message in MEI 1 H_GS Register. |
| 27:25 | 0x0<br>RO | **BIOS MSG ACK Data:** Message specific data for acknowledged BIOS message. |
| 24:20 | 0x0<br>RO | Reserved |
| 19:16 | 0x0<br>RO | **Operating Mode:** This field describes the current operating mode of Intel® ME.<br>• 1:0 - Reserved<br>• 2 - Debug Mode<br>• 14:3 - Reserved<br>• 15 - Intel® SPS firmware is running in Intel® ME |
| 15:12 | 0x0<br>RO | **Error Code:** If set to nonzero value the Intel® ME firmware has encountered a fatal error and stopped normal operation.<br>• 0 - No Error<br>• 1 - Uncategorized Failure - The Intel® ME firmware has experienced an uncategorized error. Further details of the failure can be found in the Extended Status Data.<br>• 2 - Disabled - Firmware was disabled on this platform.<br>• 3 - Image Failure - The Intel® ME firmware stored in the system flash is not valid. |
| 11 | 0x0<br>RO | **Update in Progress:** The bit is set if any type of Intel® ME firmware update is in progress. |
| 10 | 0x0<br>RO | **Recovery BUP Load Fault:** This bit is set when firmware is not able to load recovery bring-up from the flash. It means that the recovery section in Intel® ME region on the SPI flash. |
| 9 | 0x0<br>RO | **Init Complete:** When this but is not set firmware is still in initialization phase. When firmware has fully entered a stable state, this but is set to 1 and "Current State" field of this register provides the steady state of the Intel® ME subsystem. |
| 8:6 | 0x0<br>RO | **Operating State:** This field describes the current operating state of Intel® ME.<br>• 000 - Preboot<br>• 001 - M0 with UMA<br>• 010 - Reserved<br>• 011 - Reserved<br>• 100 - M3 without UMA<br>• 101 - M0 without UMA - normal state for Intel® SPS firmware<br>• 110 - Bring up<br>• 111 - M0 without UMA but with error |
| 5 | 0x0<br>RO | **FPT or Factory Defaults Bad:** This bit is set when the firmware discovers a bad checksum of Intel® ME region Flash Partition Table (FPT) or Factory Defaults. When this bit set, it may or may not have the error code shown in bit [15:12]. The system can get this bit clear only by re-flashing the whole Intel® ME region in the SPI Flash. |
| 4 | 0x0<br>RO | **Manufacturing Mode:** When this bit is set, the platform is still in manufacturing mode. Host can use this bit to inform user that the platform is NOT READY for production yet. This but is set as long as Intel® ME Region access is not locked for flash masters other than Intel® ME. For shipping machine, this bit MUST be 0. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 3:0 | 0x0<br>RO | **Current State:** This field describes the current operation state of the firmware.<br>• 0 - Reset - Intel® ME is in reset state, will exit this state within 1 millisecond<br>• 1 - Initialization - Intel® ME is initializing, will exit this state within 2 seconds<br>• 2 - Recovery - Intel® ME is in recovery mode, check ME1.GMES register to determine cause<br>• 3 - Reserved<br>• 4 - Disabled - Intel® ME functionality has been disabled, it executes idle loop<br>• 5 - Operational - Intel® ME is in normal operational state<br>• 6 - Reserved<br>• 7 - State Transition - Intel® ME sets this state before starting a transition to a new Operating State.<br>It is a temporary state, may appear on transition between Initialization and Operational. |

## 54.3.17 General Status Shadow 1 (HECI2_GS_SHDW1)—Offset 48h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:1] + 48h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **EOP Status:** This bit presents the Intel® ME notion of EOP status.<br>If BIOS encounters this bit set to '1' during POST it signals an error in platform power flow. |
| 30:28 | 0x0<br>RO | **Infrastructure Progress Code:** This field identifies the infrastructure progress code:<br>• 0 - ROM - Intel® ME is in ROM phase<br>• 1 - BUP - Intel® ME is in BRINGUP phase<br>• 2 - uKernel - Intel® ME is in Micro Kernel phase<br>• 3 - Policy Module - Intel® ME is in Policy Module phase<br>• 4 - Other Module - Intel® ME is loading modules in M0 or M3 Operating State |
| 27:16 | 0x0<br>RO | **Extended Status Data:** These bits provide extended status data for the current state of operating of the firmware. Or, if the firmware is in a fatal error state, these bits provide extended error code information. |
| 15:13 | 0x0<br>RO | **Firmware Heartbeat:** This number increments approximately every second if Intel® ME firmware is running. |
| 12 | 0x0<br>RO | Intel® ME Target Image Boot Fault<br>• 0 - Target image loaded successfully<br>• 1 - Target image boot failed, switched to backup image or recovery image |
| 11:8 | 0x0<br>RO | Reserved |
| 7 | 0x0<br>RO | **Warm Reset Request:** If this bit is set, Intel® ME informs BIOS that a warm reset is requested by Intel® ME. |
| 6 | 0x0<br>RO | **MFS Failure:** If this bit is set, Intel® ME informs BIOS that Intel® ME File System failure has been detected during recent Intel® ME boot. |
| 5:4 | 0x0<br>RO | Reserved |
| 3:1 | 0x0<br>RO | **Recovery Cause:** If ME1.HFS.Current State indicates that Intel® ME firmware is running in recovery mode these bits provide the cause of this mode:<br>• 0 - Intel® ME recovery jumper asserted<br>• 1 - Security strap override jumper asserted<br>• 2 - Recovery forced with IPMI command<br>• 3 - Invalid flash configuration, either:<br>  • flash master access permissions configuration is wrong<br>  • VSCC entry is missing or wrong<br>  • flash erase block size in Intel® ME region configuration<br>• 4 - Intel® ME internal error<br>  Intel® ME could not start in operational mode because of some firmware problems.<br>• 5..7 - Reserved for future extensions |
| 0 | 0x0<br>RO | **BIST in Progress:** If this bit is set Intel® ME Built In Self-Test is in Progress. |

## 54.3.18 Host General Status (HECI2_H_GS1)—Offset 4Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:1] + 4Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Host General Status (H_GS1):** General status of Host.<br>This field is not used by hardware. |

## 54.3.19 PCI Power Management Capability ID (HECI2_PID)—Offset 50h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:27, F:1] + 50h

**Default:** 8C01h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x8c<br>RO | **Next Capability (NEXT):** Indicates the location of the next capability item in the list.<br>This is the Message Signaled Interrupts capability. |
| 7:0 | 0x1<br>RO | **Cap ID (CID):** Indicates that this pointer is a PCI power management. |

## 54.3.20 PCI Power Management Capabilities (HECI2_PC)—Offset 52h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:27, F:1] + 52h

**Default:** 4003h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:11 | 0x8<br>RO | **PME Support (PSUP):** Indicates the states that can generate PME#.<br>HECI can assert PME# from D3hot only. |
| 10 | 0x0<br>RO | **D2 Support (D2S):** The D2 state is not supported for the HECI host controller. |
| 9 | 0x0<br>RO | **D _Support (D1S):** The D1 state is not supported for the HECI host controller. |
| 8:6 | 0x0<br>RO | **Aux_Current (AUXC):** Reports the maximum Suspend well current required when in the D3COLD state. Value of 0 is reported. |
| 5 | 0x0<br>RO | **Device Specific Initialization (DSI):** Indicates whether device-specific initialization is required. |
| 4 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 3 | 0x0<br>RO | **PME Clock (PMEC):** Indicates that PCI clock is not required to generate PME#. |
| 2:0 | 0x3<br>RO | **Version (VS):** Indicates support for Revision 1.2 of the PCI Power Management Specification. |

## 54.3.21 PCI Power Management Control and Status (HECI2_PMCS)—Offset 54h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:27, F:1] + 54h

**Default:** 0008h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RW/1C/V | **PME Status (PMES):** The PME Status bit in HECI space can be set to '1' by CSE FW performing a write into CSE side register to set PMES.<br>This bit is cleared by host CPU writing a '1' to it.<br>CSE cannot clear this bit.<br>Host CPU writes with value '0' have no effect on this bit. |
| 14:9 | 0x0<br>RO | **Reserved (RSVD_14_9):** Reserved. |
| 8 | 0x0<br>RW | **PME Enable (PMEE):** When set, PME_assert and PME_deassert messages are sent over the Soc Sideband to the SoC PMC based on the PMES bit.<br>When reset these messages are not sent to the PMC. |
| 7:4 | 0x0<br>RO | **Reserved (RSVD_7_4):** Reserved. |
| 3 | 0x1<br>RO | **No Soft Reset (NSR):** This bit indicates that when the HECI host controller is transitioning from D3hot to D0 due to power state command, it does not perform and internal reset. |
| 2 | 0x0<br>RO | **Reserved (RSVD_2_2):** Reserved. |
| 1:0 | 0x0<br>RW | **Power State (PS):** This field is used both to determine the current power state of the HECI host controller and to set a new power state. The values are:<br>• 00 - D0 state<br>• 11 - D3HOT state<br>The D1 and D2 states are not supported for this HECI host controller. |

## 54.3.22 General Status Shadow 2 (HECI2_GS_SHDW2)—Offset 60h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:1] + 60h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **General Status Shadow 2 (GSS2):** This field is host side shadow of CSE General Status 2 (CSE_GS2). |

## 54.3.23 General Status Shadow 3 (HECI2_GS_SHDW3)—Offset 64h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:1] + 64h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **General Status Shadow 3 (GSS3):** This field is host side shadow of CSE General Status 3 (CSE_GS3). |

## 54.3.24 General Status Shadow 4 (HECI2_GS_SHDW4)—Offset 68h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:1] + 68h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **General Status Shadow 4 (GSS4):** This field is host side shadow of CSE General Status 4 (CSE_GS4). |

## 54.3.25 General Status Shadow 5 (HECI2_GS_SHDW5)—Offset 6Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:1] + 6Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **General Status Shadow 5 (GSS5):** This field is host side shadow of CSE General Status 5 (CSE_GS5). |

## 54.3.26 Host General Status 2 (HECI2_H_GS2)—Offset 70h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:1] + 70h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Host General Status 2 (H_GS2):** General status of Host.<br>This field is not used by hardware. |

## 54.3.27 Host General Status 3 (HECI2_H_GS3)—Offset 74h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:1] + 74h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Host General Status 3 (H_GS3):** General status of Host.<br>This field is not used by hardware. |

## 54.3.28 Message Signaled Interrupt Identifiers (HECI2_MID)—Offset 8Ch

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:27, F:1] + 8Ch

**Default:** 0005h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x0<br>RO | **Next Pointer (NEXT):** Indicates the next item in the list.<br>This can be additional capability pointers or, if zero, indicates that this is the last item in the list. |
| 7:0 | 0x5<br>RO | **Capability ID (CID):** Indicates Message Signaled Interrupts (MSI). |

## 54.3.29 Message Signaled Interrupt Message Control (HECI2_MC)—Offset 8Eh

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:27, F:1] + 8Eh

**Default:** 0080h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 7 | 0x1<br>RO | **64 Bit Address Capable (C64):** Specifies whether capable of generating 64-bit messages. |
| 6:4 | 0x0<br>RO | **Multiple Message Enable (MME):** Not implemented, hardwired to 0. |
| 3:1 | 0x0<br>RO | **Multiple Message Capable (MMC):** Not implemented, hardwired to 0. |
| 0 | 0x0<br>RW | **MSI Enable (MSIE):** If set, MSI is enabled and INTx virtual wires are not used to generate interrupts. |

## 54.3.30 Message Signaled Interrupt Message Address (HECI2_MA)—Offset 90h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:1] + 90h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:2 | 0x0<br>RW | **Address (ADDR):** Lower 32 bits of the system specified message address, always DW aligned. |
| 1:0 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |

## 54.3.31 Message Signaled Interrupt Upper Address (HECI2_MUA)—Offset 94h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:1] + 94h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Upper Address (UADDR):** Upper 32 bits of the system specified message address.<br>This register is optional and only implemented if MC.C64=1. |

## 54.3.32 Message Signaled Interrupt Message Data (HECI2_MD)—Offset 98h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:27, F:1] + 98h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0x0<br>RW | **Data (DATA):** This 16-bit field is programmed by system software if MSI is enabled.<br>Its content is driven onto the FSB during the data phase of the MSI memory write transaction. |

## 54.3.33 HECI Interrupt Delivery Mode (HECI2_HIDM)—Offset A0h

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:27, F:1] + A0h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:3 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 2 | 0x0<br>RW/1S | **HIDM Lock (HIDM_L):** Writing 1 to this bit locks the HIDM field. |
| 1:0 | 0x0<br>RW/L | **HECI Interrupt Delivery Mode (HIDM):** These bits control what type of interrupt the HECI will send when CSE FW writes to set the CSE_IG bit.<br>They are interpreted as follows:<br>• 00 - Generate Legacy or MSI interrupt<br>• 01 - Generate SCI<br>• 10 - Generate SMI<br>This field may be locked by writing 1 to HIDM_L bit. |

## 54.3.34 Manufacturer's ID (HECI2_MANID)—Offset F8h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:1] + F8h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0x0<br>RO | **Reserved (RSVD_31_28):** Reserved. |
| 27:24 | 0x0<br>RO/V | **Dot Portion of Process ID (DPOP):** Indicates the dot process. |
| 23:16 | 0x0<br>RO/V | **Manufacturing Stepping ID (MSID):** This field is incremented for each stepping of the part.<br>***Note:*** This field can be used by software to differentiate steppings when Revision ID may not change. |
| 15:8 | 0x0<br>RO/V | **Manufacturing ID (MID):** This field is set by the SoC. |
| 7:0 | 0x0<br>RO/V | **Process Portion of Process ID (PPOP):** Indicates the process.<br>The dot portion of the process is reflected in bits [27:24].<br>This field can be used by software to differentiate steppings when Revision ID may not change. |

## 54.4 Registers in Configuration Space—HECI3

### 54.4.1 Identifiers (HECI3_ID)—Offset 0h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:4] + 0h

**Default:** 19E98086h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x19E9<br>RO/V | **Device ID (DID):** Indicates what device number assigned by Intel. |
| 15:0 | 0x8086<br>RO | **Vendor ID (VID):** 16-bit field which indicates that Intel is the vendor, assigned by the PCI SIG. |

## 54.4.2 Command (HECI3_CMD)—Offset 4h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:27, F:4] + 4h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:11 | 0x0<br>RO | **RSVD:** Reserved |
| 10 | 0x0<br>RW | **Interrupt Disable (ID):** Disables this device from generating PCI line based interrupts.<br>This bit does not have any effect on MSI operations. |
| 9 | 0x0<br>RO | **Fast Back-to-Back Enable (FBE):** Not implemented, hardwired to 0. |
| 8 | 0x0<br>RO | **SERR# Enable (SEE):** Not implemented, hardwired to 0. |
| 7 | 0x0<br>RO | **Wait Cycle Enable (WCC):** Not implemented, hardwired to 0. |
| 6 | 0x0<br>RO | **Parity Error Response Enable (PEE):** Not implemented, hardwired to 0. |
| 5 | 0x0<br>RO | **VGA Palette Snooping Enable (VAG):** Not implemented, hardwired to 0 |
| 4 | 0x0<br>RO | **Memory Write and Invalidate Enable (MWIE):** Not implemented, hardwired to 0. |
| 3 | 0x0<br>RO | **Special Cycle Enable (SCE):** Not implemented, hardwired to 0. |
| 2 | 0x0<br>RW | **Bus Master Enable (BME):** Controls the HECI host controller's ability to act as a system memory master for data transfers.<br>When this bit is cleared, HECI bus master activity stops and any active DMA engines return to an idle condition.<br>This bit is made visible to firmware through the H_PCI_CSR register, and changes to this bit may be configured by the H_PCI_CSR register to generate an MSI to mIA.<br>When this bit is '0', HECI is blocked from generating MSI to the host CPU.<br>***Note:*** This bit does not block HECI accesses to CSE-UMA |
| 1 | 0x0<br>RW | **Memory Space Enable (MSE):** Controls access to the HECI host controllers memory-mapped register space. |
| 0 | 0x0<br>RO | **I/O Space Enable (IOSE):** Not implemented, hardwired to 0. |

## 54.4.3 Status (HECI3_STS)—Offset 6h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:27, F:4] + 6h

**Default:** 0010h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RO | **Detected Parity Error (DPE):** Not implemented, hardwired to 0. |
| 14 | 0x0<br>RO | **Signaled System Error (SSE):** Not implemented, hardwired to 0. |
| 13 | 0x0<br>RO | **Received Master-Abort (RMA):** Not implemented, hardwired to 0. |
| 12 | 0x0<br>RO | **Received Target Abort (RTA):** Not implemented, hardwired to 0. |
| 11 | 0x0<br>RO | **Signaled Target-Abort (STA):** Not implemented, hardwired to 0. |
| 10:9 | 0x0<br>RO | **DEVSEL# Timing (DEVT):** These bits are hardwired to 00. |
| 8 | 0x0<br>RO | **Master Data Pariy Error Detected (DPD):** Not implemented, hardwired to 0. |
| 7 | 0x0<br>RO | **Fast Back-to-Back Capable (FBC):** Not implemented, hardwired to 0. |
| 6 | 0x0<br>RO | **RSVD (RSVD_6_6):** Reserved |
| 5 | 0x0<br>RO | **66 MHz Capable (C66):** Not implemented, hardwired to 0. |
| 4 | 0x1<br>RO | **Capabilities List (CL):** Indicates the presence of a capabilities list, hardwired to 1. |
| 3 | 0x0<br>RO/V | **Interrupt Status (IS):** Reflects the state of the INTx# signal at the input of the enable/disable circuit.<br>This bit is a 1 when the INTx# is asserted.<br>This bit is a 0 after the interrupt is cleared (independent of the state of the Interrupt Disable bit in the command register).<br>***Note:*** This bit is not set by an MSI. |
| 2:0 | 0x0<br>RO | **RSVD (RSVD_2_0):** Reserved |

## 54.4.4 Revision ID and Class Code (HECI3_RID_CC)—Offset 8h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:4] + 8h

**Default:** 07800000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x7<br>RO | **Base Class Code (BCC):** Indicates the base class code of the HECI host controller device. |
| 23:16 | 0x80<br>RO | **Sub Class Code (SCC):** Indicates the sub class code of the HECI host controller device. |
| 15:8 | 0x0<br>RO | **Programming Interface (PI):** Indicates the programming interface of the HECI host controller device. |
| 7:0 | 0x0<br>RO/V | **Revision ID (RID):** Indicates stepping of the HECI host controller. |

## 54.4.5 Cache Line Size (HECI3_CLS)—Offset Ch

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:27, F:4] + Ch

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO | **Cache Line Size (CLS):** Not implemented, hardwired to 0. |

## 54.4.6 Master Latency Timer (HECI3_MLT)—Offset Dh

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:27, F:4] + Dh

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO | **Master Latency Timer (MLT):** Not implemented, hardwired to 0. |

## 54.4.7 Header Type (HECI3_HTYPE)—Offset Eh

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:27, F:4] + Eh

**Default:** 80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x1<br>RO | **Multi-Function Device (MFD):** Indicates the HECI host controller is part of a multi-function device. |
| 6:0 | 0x0<br>RO | **Header Layout (HL):** Indicates that the HECI host controller uses a target device layout. |

## 54.4.8 Built In Self-Test (HECI3_BIST)—Offset Fh

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:27, F:4] + Fh

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RO | **BIST Capable (BC):** Not implemented, hardwired to 0. |
| 6:0 | 0x0<br>RO | **RSVD:** Reserved |

## 54.4.9 HECI MMIO Base Address Low (HECI3_MMIO_MBAR_LO)—Offset 10h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:4] + 10h

**Default:** 00000004h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:12 | 0x0<br>RW | **Base Address Low (BA_LO):** Lower 32 bits of base address of register memory space. |
| 11:4 | 0x0<br>RO | **Memory Size (MS):** This field is hardwired to 0 to indicate that HECI device requests 4KB of memory space. |
| 3 | 0x0<br>RO | **Prefetchable (PF):** Indicates that this range is not pre-fetchable. |
| 2:1 | 0x2<br>RO | **Type (TP):** Indicates that this range can be mapped anywhere in 64-bit address space. |
| 0 | 0x0<br>RO | **Resource Type Indicator (RTE):** Indicates a request for register memory space. |

## 54.4.10 HECI MMIO Base Address High (HECI3_MMIO_MBAR_HI)—Offset 14h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:4] + 14h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Base Address High (BA_HI):** Upper 32 bits of base address of register memory space. |

## 54.4.11 Sub System Identifiers (HECI3_SS)—Offset 2Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:4] + 2Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW/O | **Subsystem ID (SSID):** Indicates the sub- system identifier.<br>This field should be programmed by BIOS during boot-up.<br>Once written, this register becomes Read Only. |
| 15:0 | 0x0<br>RW/O | **Subsystem Vendor ID (SSVID):** Indicates the sub-system vendor identifier.<br>This field should be programmed by BIOS during boot- up.<br>Once written, this register becomes Read Only. |

## 54.4.12 Capabilities Pointer (HECI3_CAP)—Offset 34h

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:27, F:4] + 34h

**Default:** 50h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x50<br>RO | **Capability Pointer (CP):** Indicates the first capability pointer offset.<br>It points to the PCI power management capability offset. |

## 54.4.13 Interrupt Information (HECI3_INTR)—Offset 3Ch

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:27, F:4] + 3Ch

**Default:** 0100h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x1<br>RO/V | **Interrupt Pin (IPIN):** This field indicates the virtual interrupt pin the HECI host controller uses.<br>A value of 0x1/0x2/0x3/0x4 indicates that this function implements legacy interrupt on INTA/INTB/INTC/INTD, respectively.<br>When legacy interrupt is not used this register should be set to 0x0. |
| 7:0 | 0x0<br>RW | **Interrupt Line (ILINE):** Software written value to indicate which interrupt line (vector) the interrupt is connected to.<br>No hardware action is taken on this field. |

## 54.4.14 Minimum Grant (HECI3_MGNT)—Offset 3Eh

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:27, F:4] + 3Eh

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO | **Grant (GNT):** Not implemented, hardwired to 0. |

## 54.4.15 Maximum Latency (HECI3_MLAT)—Offset 3Fh

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:27, F:4] + 3Fh

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO | **Latency (LAT):** Not implemented, hardwired to 0. |

## 54.4.16 Host Firmware Status (HECI3_HFS)—Offset 40h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:4] + 40h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0x0<br>RO | **BIOS MSG ACK:** Acknowledge for register based BIOS message in MEI 1 H_GS Register. |
| 27:25 | 0x0<br>RO | **BIOS MSG ACK Data:** Message specific data for acknowledged BIOS message. |
| 24:20 | 0x0<br>RO | Reserved |
| 19:16 | 0x0<br>RO | **Operating Mode:** This field describes the current operating mode of Intel® ME.<br>• 1:0 - Reserved<br>• 2 - Debug Mode<br>• 14:3 - Reserved<br>• 15 - Intel® SPS firmware is running in Intel® ME |
| 15:12 | 0x0<br>RO | **Error Code:** If set to nonzero value the Intel® ME firmware has encountered a fatal error and stopped normal operation.<br>• 0 - No Error<br>• 1 - Uncategorized Failure - The Intel® ME firmware has experienced an uncategorized error. Further details of the failure can be found in the Extended Status Data.<br>• 2 - Disabled - Firmware was disabled on this platform.<br>• 3 - Image Failure - The Intel® ME firmware stored in the system flash is not valid. |
| 11 | 0x0<br>RO | **Update in Progress:** The bit is set if any type of Intel® ME firmware update is in progress. |
| 10 | 0x0<br>RO | **Recovery BUP Load Fault:** This bit is set when firmware is not able to load recovery bring-up from the flash. It means that the recovery section in Intel® ME region on the SPI flash. |
| 9 | 0x0<br>RO | **Init Complete:** When this but is not set firmware is still in initialization phase. When firmware has fully entered a stable state, this but is set to 1 and "Current State" field of this register provides the steady state of the Intel® ME subsystem. |
| 8:6 | 0x0<br>RO | **Operating State:** This field describes the current operating state of Intel® ME.<br>• 000 - Preboot<br>• 001 - M0 with UMA<br>• 010 - Reserved<br>• 011 - Reserved<br>• 100 - M3 without UMA<br>• 101 - M0 without UMA - normal state for Intel® SPS firmware<br>• 110 - Bring up<br>• 111 - M0 without UMA but with error |
| 5 | 0x0<br>RO | **FPT or Factory Defaults Bad:** This bit is set when the firmware discovers a bad checksum of Intel® ME region Flash Partition Table (FPT) or Factory Defaults. When this bit set, it may or may not have the error code shown in bit [15:12]. The system can get this bit clear only by re-flashing the whole Intel® ME region in the SPI Flash. |
| 4 | 0x0<br>RO | **Manufacturing Mode:** When this bit is set, the platform is still in manufacturing mode. Host can use this bit to inform user that the platform is NOT READY for production yet. This but is set as long as Intel® ME Region access is not locked for flash masters other than Intel® ME. For shipping machine, this bit MUST be 0. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 3:0 | 0x0<br>RO | **Current State:** This field describes the current operation state of the firmware.<br>• 0 - Reset - Intel® ME is in reset state, will exit this state within 1 millisecond<br>• 1 - Initialization - Intel® ME is initializing, will exit this state within 2 seconds<br>• 2 - Recovery - Intel® ME is in recovery mode, check ME1.GMES register to determine cause<br>• 3 - Reserved<br>• 4 - Disabled - Intel® ME functionality has been disabled, it executes idle loop<br>• 5 - Operational - Intel® ME is in normal operational state<br>• 6 - Reserved<br>• 7 - State Transition - Intel® ME sets this state before starting a transition to a new Operating State.<br>It is a temporary state, may appear on transition between Initialization and Operational. |

## 54.4.17 General Status Shadow 1 (HECI3_GS_SHDW1)—Offset 48h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:4] + 48h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **EOP Status:** This bit presents the Intel® ME notion of EOP status.<br>If BIOS encounters this bit set to '1' during POST it signals an error in platform power flow. |
| 30:28 | 0x0<br>RO | **Infrastructure Progress Code:** This field identifies the infrastructure progress code:<br>• 0 - ROM - Intel® ME is in ROM phase<br>• 1 - BUP - Intel® ME is in BRINGUP phase<br>• 2 - uKernel - Intel® ME is in Micro Kernel phase<br>• 3 - Policy Module - Intel® ME is in Policy Module phase<br>• 4 - Other Module - Intel® ME is loading modules in M0 or M3 Operating State |
| 27:16 | 0x0<br>RO | **Extended Status Data:** These bits provide extended status data for the current state of operating of the firmware. Or, if the firmware is in a fatal error state, these bits provide extended error code information. |
| 15:13 | 0x0<br>RO | **Firmware Heartbeat:** This number increments approximately every second if Intel® ME firmware is running. |
| 12 | 0x0<br>RO | Intel® ME Target Image Boot Fault<br>• 0 - Target image loaded successfully<br>• 1 - Target image boot failed, switched to backup image or recovery image |
| 11:8 | 0x0<br>RO | Reserved |
| 7 | 0x0<br>RO | **Warm Reset Request:** If this bit is set, Intel® ME informs BIOS that a warm reset is requested by Intel® ME. |
| 6 | 0x0<br>RO | **MFS Failure:** If this bit is set, Intel® ME informs BIOS that Intel® ME File System failure has been detected during recent Intel® ME boot. |
| 5:4 | 0x0<br>RO | Reserved |
| 3:1 | 0x0<br>RO | **Recovery Cause:** If ME1.HFS.Current State indicates that Intel® ME firmware is running in recovery mode these bits provide the cause of this mode:<br>• 0 - Intel® ME recovery jumper asserted<br>• 1 - Security strap override jumper asserted<br>• 2 - Recovery forced with IPMI command<br>• 3 - Invalid flash configuration, either:<br>  • flash master access permissions configuration is wrong<br>  • VSCC entry is missing or wrong<br>  • flash erase block size in Intel® ME region configuration<br>• 4 - Intel® ME internal error<br>  Intel® ME could not start in operational mode because of some firmware problems.<br>• 5..7 - Reserved for future extensions |
| 0 | 0x0<br>RO | **BIST in Progress:** If this bit is set Intel® ME Built In Self-Test is in Progress. |

## 54.4.18 Host General Status (HECI3_H_GS1)—Offset 4Ch

**Type:** PCI Configuration Register
(Size: 32 bits)

**Offset:** [B:0, D:27, F:4] + 4Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Host General Status (H_GS1):** General status of Host.<br>This field is not used by hardware. |

## 54.4.19 PCI Power Management Capability ID (HECI3_PID)—Offset 50h

**Type:** PCI Configuration Register
(Size: 16 bits)

**Offset:** [B:0, D:27, F:4] + 50h

**Default:** 8C01h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x8c<br>RO | **Next Capability (NEXT):** Indicates the location of the next capability item in the list.<br>This is the Message Signaled Interrupts capability. |
| 7:0 | 0x1<br>RO | **Cap ID (CID):** Indicates that this pointer is a PCI power management. |

## 54.4.20 PCI Power Management Capabilities (HECI3_PC)—Offset 52h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:27, F:4] + 52h

**Default:** 4003h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:11 | 0x8<br>RO | **PME Support (PSUP):** Indicates the states that can generate PME#.<br>HECI can assert PME# from D3hot only. |
| 10 | 0x0<br>RO | **D2 Support (D2S):** The D2 state is not supported for the HECI host controller. |
| 9 | 0x0<br>RO | **D _Support (D1S):** The D1 state is not supported for the HECI host controller. |
| 8:6 | 0x0<br>RO | **Aux_Current (AUXC):** Reports the maximum Suspend well current required when in the D3COLD state. Value of 0 is reported. |
| 5 | 0x0<br>RO | **Device Specific Initialization (DSI):** Indicates whether device-specific initialization is required. |
| 4 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 3 | 0x0<br>RO | **PME Clock (PMEC):** Indicates that PCI clock is not required to generate PME#. |
| 2:0 | 0x3<br>RO | **Version (VS):** Indicates support for Revision 1.2 of the PCI Power Management Specification. |

## 54.4.21 PCI Power Management Control and Status (HECI3_PMCS)—Offset 54h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:27, F:4] + 54h

**Default:** 0008h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RW/1C/V | **PME Status (PMES):** The PME Status bit in HECI space can be set to '1' by CSE FW performing a write into CSE side register to set PMES.<br>This bit is cleared by host CPU writing a '1' to it.<br>CSE cannot clear this bit.<br>Host CPU writes with value '0' have no effect on this bit. |
| 14:9 | 0x0<br>RO | **Reserved (RSVD_14_9):** Reserved. |
| 8 | 0x0<br>RW | **PME Enable (PMEE):** When set, PME_assert and PME_deassert messages are sent over the SoC Sideband to the SoC PMC based on the PMES bit.<br>When reset these messages may not be sent. |
| 7:4 | 0x0<br>RO | **Reserved (RSVD_7_4):** Reserved. |
| 3 | 0x1<br>RO | **No Soft Reset (NSR):** This bit indicates that when the HECI host controller is transitioning from D3hot to D0 due to power state command, it does not perform and internal reset. |
| 2 | 0x0<br>RO | **Reserved (RSVD_2_2):** Reserved. |
| 1:0 | 0x0<br>RW | **Power State (PS):** This field is used both to determine the current power state of the HECI host controller and to set a new power state. The values are:<br>• 00 - D0 state<br>• 11 - D3HOT state<br>The D1 and D2 states are not supported for this HECI host controller. |

## 54.4.22 General Status Shadow 2 (HECI3_GS_SHDW2)—Offset 60h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:4] + 60h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **General Status Shadow 2 (GSS2):** This field is host side shadow of CSE General Status 2 (CSE_GS2). |

## 54.4.23 General Status Shadow 3 (HECI3_GS_SHDW3)—Offset 64h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:4] + 64h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **General Status Shadow 3 (GSS3):** This field is host side shadow of CSE General Status 3 (CSE_GS3). |

## 54.4.24 General Status Shadow 4 (HECI3_GS_SHDW4)—Offset 68h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:4] + 68h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **General Status Shadow 4 (GSS4):** This field is host side shadow of CSE General Status 4 (CSE_GS4). |

## 54.4.25 General Status Shadow 5 (HECI3_GS_SHDW5)—Offset 6Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:4] + 6Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **General Status Shadow 5 (GSS5):** This field is host side shadow of CSE General Status 5 (CSE_GS5). |

## 54.4.26 Host General Status 2 (HECI3_H_GS2)—Offset 70h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:4] + 70h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Host General Status 2 (H_GS2):** General status of Host. This field is not used by hardware. |

## 54.4.27 Host General Status 3 (HECI3_H_GS3)—Offset 74h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:4] + 74h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Host General Status 3 (H_GS3):** General status of Host.<br>This field is not used by hardware. |

## 54.4.28 Message Signaled Interrupt Identifiers (HECI3_MID)—Offset 8Ch

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:27, F:4] + 8Ch

**Default:** 0005h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x0<br>RO | **Next Pointer (NEXT):** Indicates the next item in the list.<br>This can be additional capability pointers or, if zero, indicates that this is the last item in the list. |
| 7:0 | 0x5<br>RO | **Capability ID (CID):** Indicates a Message Signaled Interrupt (MSI). |

## 54.4.29 Message Signaled Interrupt Message Control (HECI3_MC)—Offset 8Eh

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:27, F:4] + 8Eh

**Default:** 0080h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 7 | 0x1<br>RO | **64 Bit Address Capable (C64):** Specifies whether capable of generating 64-bit messages. |
| 6:4 | 0x0<br>RO | **Multiple Message Enable (MME):** Not implemented, hardwired to 0. |
| 3:1 | 0x0<br>RO | **Multiple Message Capable (MMC):** Not implemented, hardwired to 0. |
| 0 | 0x0<br>RW | **MSI Enable (MSIE):** If set, MSI is enabled and INTx virtual wires are not used to generate interrupts. |

## 54.4.30 Message Signaled Interrupt Message Address (HECI3_MA)—Offset 90h

**Type:** PCI Configuration Register
(Size: 32 bits)

**Offset:** [B:0, D:27, F:4] + 90h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:2 | 0x0<br>RW | **Address (ADDR):** Lower 32 bits of the system specified message address, always DW aligned. |
| 1:0 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |

## 54.4.31 Message Signaled Interrupt Upper Address (HECI3_MUA)—Offset 94h

**Type:** PCI Configuration Register
(Size: 32 bits)

**Offset:** [B:0, D:27, F:4] + 94h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Upper Address (UADDR):** Upper 32 bits of the system specified message address.<br>This register is optional and only implemented if MC.C64=1. |

## 54.4.32 Message Signaled Interrupt Message Data (HECI3_MD)—Offset 98h

**Type:** PCI Configuration Register
(Size: 16 bits)

**Offset:** [B:0, D:27, F:4] + 98h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0x0<br>RW | **Data (DATA):** This 16-bit field is programmed by system software if MSI is enabled.<br>Its content is driven onto the FSB during the data phase of the MSI memory write transaction. |

## 54.4.33 HECI Interrupt Delivery Mode (HECI3_HIDM)—Offset A0h

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:27, F:4] + A0h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:3 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 2 | 0x0<br>RW/1S | **HIDM Lock (HIDM_L):** Writing 1 to this bit locks the HIDM field. |
| 1:0 | 0x0<br>RW/L | **HECI Interrupt Delivery Mode (HIDM):** These bits control what type of interrupt the HECI will send when CSE FW writes to set the CSE_IG bit.<br>They are interpreted as follows:<br>• 00 - Generate Legacy or MSI interrupt<br>• 01 - Generate SCI<br>• 10 - Generate SMI<br>This field may be locked by writing 1 to HIDM_L bit. |

## 54.4.34 Manufacturer's ID (HECI3_MANID)—Offset F8h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:4] + F8h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0x0<br>RO | **Reserved (RSVD_31_28):** Reserved. |
| 27:24 | 0x0<br>RO/V | **Dot Portion of Process ID (DPOP):** Indicates the dot process. |
| 23:16 | 0x0<br>RO/V | **Manufacturing Stepping ID (MSID):** This field is incremented for each stepping of the part.<br>This field can be used by software to differentiate steppings when Revision ID may not change. |
| 15:8 | 0x0<br>RO/V | **Manufacturing ID (MID):** This field is set by the SoC. |
| 7:0 | 0x0<br>RO/V | **Process Portion of Process ID (PPOP):** Indicates the process.<br>The dot portion of the process is reflected in bits [27:24].<br>This field can be used by software to differentiate steppings when Revision ID may not change. |

## 54.5 Registers in Configuration Space—KT (Host)

### 54.5.1 Device ID and Vendor ID (KT_HOST_DID_VID)—Offset 0h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:3] + 0h

**Default:** 19E88086h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x19E8<br>RO/V | **Device ID (DID):** This field identifies the particular device. |
| 15:0 | 0x8086<br>RO | **Vendor ID (VID):** This field identifies the manufacturer of the device.<br>The value of 0x8086 indicates Intel. |

## 54.5.2 Status and Command (KT_HOST_STS_CMD)—Offset 4h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:3] + 4h

**Default:** 00B00000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **Detected Parity Error (DPE):** Not implemented.<br>Hardwired to 0. |
| 30 | 0x0<br>RO | **Signaled System Error (SSE):** Not implemented.<br>Hardwired to 0. |
| 29 | 0x0<br>RW/1C/V | **Received Master Abort (RMA):** This bit must be set by a master device whenever its transaction (except for Special Cycle) is completed with Unsupported Request Completion Status (a.k.a. Master-Abort).<br>All master devices must implement this bit. |
| 28 | 0x0<br>RW/1C/V | **Received Target Abort (RTA):** This bit must be set by a master device whenever its transaction is completed with Completer Abort Completion Status (a.k.a. Target-Abort).<br>All master devices must implement this bit. |
| 27 | 0x0<br>RW/1C/V | **Signaled Target Abort (STA):** This bit must be set by a target device whenever it completes a Posted or Non-Posted transaction with a Completer Abort (a.k.a. Target-Abort) error.<br>Devices that will never signal Completer Abort (a.k.a. Target-Abort) do not need to implement this bit. |
| 26:25 | 0x0<br>RO | **Devsel Timing (DEVT):** These bits encode the timing of DEVSEL#.<br>There are three allowable timings for assertion of DEVSEL# as described below:<br>• 00b: fast<br>• 01b: medium<br>• 10b: slow<br>• 11b: reserved<br>These bits are read-only and must indicate the slowest time that a device asserts DEVSEL# for any bus command except Configuration Read and Configuration Write.<br>Hardwired to 00b. |
| 24 | 0x0<br>RO | **Master Data Parity Error (MDPE):** Not implemented.<br>Hardwired to 0. |
| 23 | 0x1<br>RO | **Fast Back to Back Capable (FBTBC):** This bit indicates whether or not the target is capable of accepting fast back-to-back transactions when the transactions are not to the same agent.<br>This bit can be set to 1 if the device can accept these transactions and must be set to 0 otherwise.<br>Hardwired to 1. |
| 22 | 0x0<br>RO | **Reserved (RSVD3):** Reserved (RSVD) |
| 21 | 0x1<br>RO | **66 Mhz Capable (MCAP):** This bit indicates whether or not this device is capable of running at 66 MHz.<br>A value of 0 indicates 33 MHz.<br>A value of 1 indicates that the device is 66 MHz capable.<br>Hardwired to 1. |
| 20 | 0x1<br>RO | **Capabilities List (CAPL):** This optional read-only bit indicates whether or not this device implements the pointer for a New Capabilities linked list at offset 34h.<br>A value of zero indicates that no New Capabilities linked list is available.<br>A value of one indicates that the value read at offset 34h is a pointer in Configuration Space to a linked list of new capabilities. |
| 19 | 0x0<br>RO | **Interrupt Status (INTS):** This read-only bit reflects the state of the interrupt in the device/function. Only when the Interrupt Disable bit in the command register is a 0 and this Interrupt Status bit is a 1, will the device's/function's INTx# signal be asserted.<br>Setting the Interrupt Disable bit to a 1 has no effect on the state of this bit.<br>Read-only and hardwired to 0 for a device that does NOT support pin-based interrupt. |
| 18:16 | 0x0<br>RO | **Reserved (RSVD2):** |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:11 | 0x0<br>RO | **Reserved (RSVD1):** |
| 10 | 0x0<br>RW | **Interrupt Disable (INTD):** This bit disables the device/function from asserting INTx#.<br>A value of 0 enables the assertion of its INTx# signal.<br>A value of 1 disables the assertion of its INTx# signal.<br>This bit's state after RST# is 0. |
| 9 | 0x0<br>RO | **Fast Back to Back Enable (FBTBEN):** Not implemented.<br>Hardwired to 0. |
| 8 | 0x0<br>RO | **System Error Enable (SERREN):** Not implemented.<br>Hardwired to 0. |
| 7 | 0x0<br>RO | **Reserved (RSVD0):** |
| 6 | 0x0<br>RO | **Parity Error Response (PERRR):** Not implemented.<br>Hardwired to 0. |
| 5 | 0x0<br>RO | **VGA Palette Snoop (VGAPS):** Not implemented.<br>Hardwired to 0. |
| 4 | 0x0<br>RO | **Memory Write and Invalidate Enable (MWRIEN):** Not implemented.<br>Hardwired to 0. |
| 3 | 0x0<br>RO | **Special Cycles (SPCYC):** Not implemented.<br>Hardwired to 0. |
| 2 | 0x0<br>RW | **Bus Master Enable (BME):** Controls the ability of a PCI device to issue Memory and I/O Read/Write Requests.<br>When this bit is Set, the PCI device function is allowed to issue Memory or I/O Requests.<br>When this bit is Clear, the PCI device function is not allowed to issue any Memory or I/O Requests.<br>***Note:*** As MSI/MSI-X interrupt Messages are in-band memory writes, setting the Bus Master Enable bit to 0b disables MSI/MSI-X interrupt Messages as well.<br>Requests other than Memory or I/O Requests are not controlled by this bit.<br>Default value of this bit is 0b.<br>This bit is hardwired to 0b if a PCI device function does not generate Memory or I/O Requests. |
| 1 | 0x0<br>RW | **Memory Space Enable (MSE):** Controls a device's response to Memory Space accesses.<br>• A value of 0 disables the device response.<br>• A value of 1 allows the device to respond to Memory Space accesses.<br>State after RST# is 0. |
| 0 | 0x0<br>RW | **IO Space Enable (IOSE):** Controls a device's response to I/O Space accesses.<br>• A value of 0 disables the device response.<br>• A value of 1 allows the device to respond to I/O Space accesses.<br>State after RST# is 0. |

### 54.5.3 Class Code and Revision ID (KT_HOST_CC_RID)—Offset 8h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:3] + 8h

**Default:** 07000200h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x7<br>RO | **Base Class Code (BCC):** Identifies the Base Class Code of an external 16550-compatible serial controller device driver. |
| 23:16 | 0x0<br>RO | **Sub-Class Code (SCC):** Identifies the Sub-Class Code of an external 16550-compatible serial controller device driver. |
| 15:8 | 0x2<br>RO | **Programming Interface (PI):** Identifies the Programming Interface of an external 16550-compatible serial controller device driver. |
| 7:0 | 0x0<br>RO/V | **Revision ID (RID):** This register specifies a device specific revision identifier.<br>The value is chosen by the vendor.<br>Zero is an acceptable value.<br>This field should be viewed as a vendor defined extension to the Device ID. |

## 54.5.4 BIST, Header Type, Latency Timer, and Cache Line Size (KT_HOST_BIST_HTYPE_LT_CLS)—Offset Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:3] + Ch

**Default:** 00800000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RO | **Built In Self Test (BIST):** Not implemented. Hardwired to 0. |
| 23 | 0x1<br>RO/V | **Header Type 1 (HTYPE1):** This bit identifies whether or not the device contains multiple functions.<br>• If the bit is 0, then the device is single function.<br>• If the bit is 1, then the device has multiple functions. |
| 22:16 | 0x0<br>RO | **Header Type 0 (HTYPE0):** This field identifies the layout of the second part of the predefined header (beginning at byte 10h in Configuration Space).<br>• The encoding 00h specifies the non-bridge Configuration Space Header.<br>• The encoding 01h specifies the PCI-to-PCI bridge Configuration Space Header.<br>• The encoding 02h specifies the CardBus bridge Configuration Space Header.<br>• All other encodings are reserved.<br>Hardwired to 0 to identify the non-bridge Configuration Space Header. |
| 15:8 | 0x0<br>RO | **Latency Timer (LT):** Not implemented.<br>Hardwired to 0. |
| 7:0 | 0x0<br>RO | **Cache Line Size (CLS):** Not implemented.<br>Hardwired to 0. |

## 54.5.5 KT IO BAR (KT_HOST_IOBAR)—Offset 10h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:3] + 10h

**Default:** 00000001h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:3 | 0x0<br>RW | **IO BAR (IOBAR):** Software programs this space with the base address of the device's IO region. |
| 2 | 0x0<br>RO | **IO Size (IOSIZE):** Hardwired to 0 to indicate 8B of IO space. |
| 1 | 0x0<br>RO | **Reserved (RSVD):** Hardwired to 0 for an IO BAR. |
| 0 | 0x1<br>RO | **IO Space Indicator (IOSPACE):** Hardwired to 1 to identify an IO BAR. |

## 54.5.6 KT Memory BAR (KT_HOST_MEMBAR)—Offset 14h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:3] + 14h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:12 | 0x0<br>RW | **Memory BAR (MEMBAR):** Software programs this register with the base address of the device's memory region. |
| 11:4 | 0x0<br>RO | **Memory Size (MEMSIZE):** Hardwired to 0 to indicate 4KB of memory space. |
| 3 | 0x0<br>RO | **Prefetchable (PREFETCH):** A device can mark a range as prefetchable if there are no side effects on reads, the device returns all bytes on reads regardless of the byte enables.<br>Hardwired to 0 to indicate the device's memory space as non-prefetchable. |
| 2:1 | 0x0<br>RO | **Type (TYP):** Hardwired to 0 to indicate that Base register is 32 bits wide and mapping can be done anywhere in the 32-bit Memory Space. |
| 0 | 0x0<br>RO | **Memory Space Indicator (MEMSPACE):** Hardwired to 0 to identify a Memory BAR. |

## 54.5.7 Cardbus CIS Pointer (KT_HOST_CCP)—Offset 28h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:3] + 28h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO | **Cardbus CIS Pointer (CCP):** Not implemented.<br>Hardwired to 0. |

### 54.5.8 Subsystem ID and Subsystem Vendor ID (KT_HOST_SID_SVID)—Offset 2Ch

These registers are used to uniquely identify the add-in card or subsystem where the PCI device resides. They provide a mechanism for add-in card vendors to distinguish their add-in cards from one another even though the add-in cards may have the same PCI controller on them (and, therefore, the same Vendor ID and Device ID).

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:3] + 2Ch

**Default:** 00008086h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW/O | **Subsystem ID (SID):** Value of this field is vendor-specific.<br>This is written by BIOS. No hardware action will be taken on this value.<br>Implementation Note: The Write-Once lock must be implemented per field. SID should have its own lock. |
| 15:0 | 0x8086<br>RW/O | **Subsystem Vendor ID (SVID):** This field identifies the vendor of the add-in card or subsystem.<br>This is written by BIOS. No hardware action will be taken on this value.<br>Implementation Note: The Write-Once lock must be implemented per field. SVID should have its own lock. |

### 54.5.9 Expansion ROM Base Address (KT_HOST_XRBAR)—Offset 30h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:3] + 30h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO | **Expansion ROM Base Address (XRBAR):** Not implemented.<br>Hardwired to 0. |

### 54.5.10 Capabilities List Pointer (KT_HOST_CAPP)—Offset 34h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:3] + 34h

**Default:** 00000040h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0x0<br>RO | **Reserved (RSVD):** |
| 7:0 | 0x40<br>RO | **Capabilities Pointer (CAPP):** Indicates the pointer for the first entry in the capabilities list which is the MSI Capability. |

## 54.5.11 Maximum Latency, Minimum Grant, Interrupt Pin and Interrupt Line (KT_HOST_MAXL_MING_INTP_INTL)—Offset 3Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:3] + 3Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RO | **Maximum Latency (MAXL):** Not implemented.<br>Hardwired to 0. |
| 23:16 | 0x0<br>RO | **Minimum Grant (MING):** Not implemented.<br>Hardwired to 0. |
| 15:8 | 0x0<br>RO/V | **Interrupt Pin (INTP):** This register specifies which interrupt pin KT uses in PCI interrupt mode.<br><br>Value Decoding<br>• 00h The function does NOT use an interrupt pin.<br>• 01h INTA<br>• 02h INTB<br>• 03h INTC<br>• 04h INTD<br>• 05h - FFh Reserved.<br>***Note:*** This field shadows the KTHIPINR.IPIN field in the PTIO Host private CR space which is configured by BIOS over IOSF SB. |
| 7:0 | 0x0<br>RW | **Interrupt Line (INTL):** This register is used to communicate interrupt line routing information. POST software will write the routing information into this register as it initializes and configures the system. |

## 54.5.12 MSI Message Control, Next Pointer and Capability ID (KT_HOST_MSIMC_MSINP_MSICID)—Offset 40h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:3] + 40h

**Default:** 00805005h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:25 | 0x0<br>RO | **Reserved (RSVD):** |
| 24 | 0x0<br>RO | **Per Vector Masking Capable (PVMC):** Not implemented.<br>Hardwired to 0 to indicate the function does NOT support MSI per-vector masking. |
| 23 | 0x1<br>RO | **64 bit address capable (XAC):** Hardwired to 1 to indicate the function is capable of sending a 64-bit message address. |
| 22:20 | 0x0<br>RW | **Multiple Message Enable (MMEN):** Encoded number of interrupt vectors allocated by SW.<br>This field is RW for software compatibility, but only one interrupt vector is ever sent by the function. |
| 19:17 | 0x0<br>RO | **Multiple Message Capable (MMC):** Encoded number of interrupt vectors requested by a device.<br>Hardwired to 0 to indicate one requested interrupt vector. |
| 16 | 0x0<br>RW | **MSI Enable (MSIE):** If set, MSI interrupt delivery is enabled whereas pin-based interrupt delivery SHALL be disabled.<br>If cleared, prior to returning the configuration write (that clears this field) completion, the function must send any pending MSI(s). |
| 15:8 | 0x50<br>RO | **Next Item Pointer (NP):** Indicates the pointer for the next entry in the capabilities list.<br>Hardwired to 50h to point to the PM Capability list. |
| 7:0 | 0x5<br>RO | **Capability ID (CID):** Hardwired to 05h to indicate the linked list item as the MSI Capability registers. |

## 54.5.13 MSI Message Address (KT_HOST_MSIMA)—Offset 44h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:3] + 44h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:2 | 0x0<br>RW | **Message Address (MA):** 32-bit DW-aligned MSI message address. |
| 1:0 | 0x0<br>RO | **Reserved (RSVD):** |

## 54.5.14 MSI Message Upper Address (KT_HOST_MSIMUA)—Offset 48h

**Type:** PCI Configuration Register
(Size: 32 bits)

**Offset:** [B:0, D:27, F:3] + 48h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Message Upper Address (MUA):** Upper 32-bit of a 64-bit DW-aligned MSI message address. |

## 54.5.15 MSI Message Data (KT_HOST_MSIMD)—Offset 4Ch

**Type:** PCI Configuration Register
(Size: 32 bits)

**Offset:** [B:0, D:27, F:3] + 4Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **Reserved (RSVD):** |
| 15:0 | 0x0<br>RW | **Message Data (MD):** MSI Message Data |

## 54.5.16 Power Management Capabilities, Next Pointer and Capability ID (KT_HOST_PMCAP_PMNP_PMCID)—Offset 50h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:3] + 50h

**Default:** 00230001h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:27 | 0x0<br>RO | **PME Support (PMES):** This 5-bit field indicates the power states in which the function may assert PME#.<br>A value of 0b for any bit indicates that the function is not capable of asserting the PME# signal while in that power state.<br>• bit(27) X XXX1b - PME# can be asserted from D0<br>• bit(28) X XX1Xb - PME# can be asserted from D1<br>• bit(29) X X1XXb - PME# can be asserted from D2<br>• bit(30) X 1XXXb - PME# can be asserted from D3hot<br>• bit(31) 1 XXXXb - PME# can be asserted from D3cold |
| 26 | 0x0<br>RO | **D2 Support (D2S):** Hardwired to 0 to indicate that this device does not support D2. |
| 25 | 0x0<br>RO | **D1 Support (D1S):** Hardwired to 0 to indicate that this device does not support D1. |
| 24:22 | 0x0<br>RO | **Aux Current (AUXC):** Not implemented.<br>Hardwired to 0. |
| 21 | 0x1<br>RO | **Device Specific Initialization (DSI):** indicates whether special initialization of this function is required (beyond the standard PCI configuration header) before the generic class device driver is able to use it.<br>A 1 indicates that the function requires a device specific initialization sequence following transition to the D0 uninitialized state.<br>Hardwired to 1 to indicate Device Specific Initialization is required. |
| 20 | 0x0<br>RO | **Reserved (RSVD):** |
| 19 | 0x0<br>RO | **PME Clock (PMECLK):** Not implemented.<br>Hardwired to 0. |
| 18:16 | 0x3<br>RO | **Version (VER):** Hardwired to value of 011b indicates that this function complies with rev 1.2 of PCI Power Management Interface Spec. |
| 15:8 | 0x0<br>RO | **Next Item Pointer (NP):** Indicates the pointer for the next entry in the capabilities list.<br>Hardwired to 0 to indicate no more linked list item. |
| 7:0 | 0x1<br>RO | **Capability ID (CID):** Hardwired to 01h to indicate the linked list item as the PCI Power Management registers. |

## 54.5.17 Power Management Data, Control/Status Register Bridge Support Extensions, Control and Status (KT_HOST_PMD_PMCSRBSE_PMCSR)—Offset 54h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:3] + 54h

**Default:** 00000008h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RO | **Data:** Not implemented. Hardwired to 0. |
| 23:16 | 0x0<br>RO | **Control/Status Register Bridge Support Extensions (CSRBSE):** Not implemented. Hardwired to 0. |
| 15 | 0x0<br>RO | **PME Status (PMESTS):** This bit is set when the function would normally assert the PME signal independent of the state of the PME_En bit.<br>• Writing a 1 to this bit will clear it and cause the function to stop asserting a PME (if enabled).<br>• Writing a 0 has no effect.<br>If the function supports PME from D3cold, then this bit is sticky and must be explicitly cleared by the operating system each time the operating system is initially loaded.<br>Not implemented. Hardwired to 0. |
| 14:13 | 0x0<br>RO | **Data Scale (DS):** Not implemented. Hardwired to 0. |
| 12:9 | 0x0<br>RO | **Data Select (DSEL):** Not implemented. Hardwired to 0. |
| 8 | 0x0<br>RO | **PME Enable (PMEEN):** A 1 enables the function to assert PME. When 0, PME assertion is disabled. This bit defaults to 0 if the function does not support PME generation from D3cold.<br>If the function supports PME from D3cold then this bit is sticky and must be explicitly cleared by the operating system each time it is initially loaded.<br>Not implemented. Hardwired to 0. |
| 7:4 | 0x0<br>RO | **Reserved (RSVD1):** |
| 3 | 0x1<br>RO | **No Soft Reset (NSR):** When set to 1, this bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset.<br>Configuration Context is preserved.<br>Upon transition from the D3hot to the D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the PowerState bits. |
| 2 | 0x0<br>RO | **Reserved (RSVD0):** |
| 1:0 | 0x0<br>RW | **Power State (PWRST):** This 2-bit field is used both to determine the current power state of a function and to set the function into a new power state.<br>The definition of the field values is given below:<br>• 00b - D0<br>• 01b - D1<br>• 10b - D2<br>• 11b - D3hot<br>If software attempts to write an unsupported, optional state to this field, the write operation must complete normally on the bus; however, the data is discarded and no state change occurs. |

## 54.5.18 Process Stepping Information (KT_HOST_PSI)—Offset F8h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:3] + F8h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0x0<br>RO | **Reserved (RSVD):** Not implemented. Hardwired to 0. |
| 27:24 | 0x0<br>RO/V | **Dot Portion of Process ID (DPOP):** Reserved. |
| 23:16 | 0x0<br>RO/V | **Manufacturing Stepping (MSID):** Reserved. |
| 15:8 | 0x0<br>RO/V | **Manufacturing ID (MID):** Reserved. |
| 7:0 | 0x0<br>RO/V | **Process Portion of Process ID (PPOP):** Reserved. |

## 54.6 Registers in Configuration Space—IDE (Host)

### 54.6.1 Device ID and Vendor ID (IDE_HOST_DID_VID)—Offset 0h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:2] + 0h

**Default:** 19E78086h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x19e7<br>RO/V | **Device ID (DID):** This field identifies the particular device.<br>This identifier is allocated by the vendor. |
| 15:0 | 0x8086<br>RO | **Vendor ID (VID):** This field identifies the manufacturer of the device. The value of 0x8086 indicates Intel. |

## 54.6.2 Status and Command (IDE_HOST_STS_CMD)—Offset 4h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:2] + 4h

**Default:** 00B00000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **Detected Parity Error (DPE):** Not implemented. Hardwired to 0. |
| 30 | 0x0<br>RO | **Signaled System Error (SSE):** Not implemented. Hardwired to 0. |
| 29 | 0x0<br>RW/1C/V | **Received Master Abort (RMA):** This bit must be set by a master device whenever its transaction (except for Special Cycle) is completed with Unsupported Request Completion Status (a.k.a. Master-Abort).<br>All master devices must implement this bit. |
| 28 | 0x0<br>RW/1C/V | **Received Target Abort (RTA):** This bit must be set by a master device whenever its transaction is completed with Completer Abort Completion Status (a.k.a. Target-Abort).<br>All master devices must implement this bit. |
| 27 | 0x0<br>RW/1C/V | **Signaled Target Abort (STA):** This bit must be set by a target device whenever it completes a Posted or Non-Posted transaction with a Completer Abort (a.k.a. Target-Abort) error.<br>Devices that will never signal Completer Abort (a.k.a. Target-Abort) do not need to implement this bit. |
| 26:25 | 0x0<br>RO | **Devsel Timing (DEVT):** These bits encode the timing of DEVSEL#.<br>There are three allowable timings for assertion of DEVSEL# as described below:<br>• 00b: fast<br>• 01b: medium<br>• 10b: slow<br>• 11b: reserved<br>These bits are read-only and must indicate the slowest time that a device asserts DEVSEL# for any bus command except Configuration Read and Configuration Write.<br>Hardwired to 00b. |
| 24 | 0x0<br>RO | **Master Data Parity Error (MDPE):** Not implemented. Hardwired to 0. |
| 23 | 0x1<br>RO | **Fast Back to Back Capable (FBTBC):** This bit indicates whether or not the target is capable of accepting fast back-to-back transactions when the transactions are not to the same agent.<br>This bit can be set to 1 if the device can accept these transactions and must be set to 0 otherwise.<br>Hardwired to 1. |
| 22 | 0x0<br>RO | **Reserved (RSVD3):** Reserved (RSVD |
| 21 | 0x1<br>RO | **66 Mhz Capable (MCAP):** This bit indicates whether or not this device is capable of running at 66 MHz.<br>• A value of 0 indicates 33 MHz<br>• A value of 1 indicates that the device is 66 MHz capable<br>Hardwired to 1. |
| 20 | 0x1<br>RO | **Capabilities List (CAPL):** This optional read-only bit indicates whether or not this device implements the pointer for a New Capabilities linked list at offset 34h.<br>• A value of zero indicates that no New Capabilities linked list is available.<br>• A value of one indicates that the value read at offset 34h is a pointer in Configuration Space to a linked list of new capabilities. |
| 19 | 0x0<br>RO | **Interrupt Status (INTS):** This read-only bit reflects the state of the interrupt in the device/function.<br>Only when the Interrupt Disable bit in the command register is a 0 and this Interrupt Status bit is a 1, will the device's/function's INTx# signal be asserted.<br>Setting the Interrupt Disable bit to a 1 has no effect on the state of this bit.<br>Read-only and hardwired to 0 for a device that does NOT support pin-based interrupt. |
| 18:16 | 0x0<br>RO | **Reserved (RSVD2):** |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:11 | 0x0<br>RO | **Reserved (RSVD1):** |
| 10 | 0x0<br>RW | **Interrupt Disable (INTD):** This bit disables the device/function from asserting INTx#.<br>• A value of 0 enables the assertion of its INTx# signal<br>• A value of 1 disables the assertion of its INTx# signal<br>This bit's state after RST# is 0. |
| 9 | 0x0<br>RO | **Fast Back to Back Enable (FBTBEN):** Not implemented. Hardwired to 0. |
| 8 | 0x0<br>RO | **System Error Enable (SERREN):** Not implemented. Hardwired to 0. |
| 7 | 0x0<br>RO | **Reserved (RSVD0):** |
| 6 | 0x0<br>RO | **Parity Error Response (PERRR):** Not implemented. Hardwired to 0. |
| 5 | 0x0<br>RO | **VGA Palette Snoop (VGAPS):** Not implemented. Hardwired to 0. |
| 4 | 0x0<br>RO | **Memory Write and Invalidate Enable (MWRIEN):** Not implemented. Hardwired to 0. |
| 3 | 0x0<br>RO | **Special Cycles (SPCYC):** Not implemented. Hardwired to 0. |
| 2 | 0x0<br>RW | **Bus Master Enable (BME):** Controls the ability of a PCI device to issue Memory and I/O Read/Write Requests.<br>When this bit is Set, the PCI device function is allowed to issue Memory or I/O Requests.<br>When this bit is Clear, the PCI device function is not allowed to issue any Memory or I/O Requests.<br>***Note:*** As MSI/MSI-X interrupt Messages are in-band memory writes, setting the Bus Master Enable bit to 0b disables MSI/MSI-X interrupt Messages as well.<br>Requests other than Memory or I/O Requests are not controlled by this bit.<br>Default value of this bit is 0b.<br>This bit is hardwired to 0b if a PCI device function does not generate Memory or I/O Requests. |
| 1 | 0x0<br>RO | **Memory Space Enable (MSE):** Controls a device's response to Memory Space accesses.<br>• A value of 0 disables the device response.<br>• A value of 1 allows the device to respond to Memory Space accesses.<br>State after RST# is 0.<br>Read-only and hardwired to 0 because IDE does NOT support Memory Space accesses. |
| 0 | 0x0<br>RW | **IO Space Enable (IOSE):** Controls a device's response to I/O Space accesses.<br>• A value of 0 disables the device response.<br>• A value of 1 allows the device to respond to I/O Space accesses.<br>State after RST# is 0. |

### 54.6.3 Class Code and Revision ID (IDE_HOST_CC_RID)—Offset 8h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:2] + 8h

**Default:** 01018500h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x1<br>RO | **Base Class Code (BCC):** Identifies the Base Class Code of an external IDE controller device driver. |
| 23:16 | 0x1<br>RO | **Sub-Class Code (SCC):** Identifies the Sub-Class Code of an external IDE controller device driver. |
| 15:8 | 0x85<br>RO | **Programming Interface (PI):** Identifies the Programming Interface of an IDE controller device driver. |
| 7:0 | 0x0<br>RO/V | **Revision ID (RID):** This register specifies a device specific revision identifier.<br>The value is chosen by the vendor. Zero is an acceptable value.<br>This field should be viewed as a vendor defined extension to the Device ID. |

## 54.6.4 BIST, Header Type, Latency Timer, and Cache Line Size (IDE_HOST_BIST_HTYPE_LT_CLS)—Offset Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:2] + Ch

**Default:** 00800000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RO | **Built In Self Test (BIST):** Not implemented. Hardwired to 0. |
| 23 | 0x1<br>RO/V | **Header Type 1 (HTYPE1):** This bit identifies whether or not the device contains multiple functions.<br>• If the bit is 0, then the device is single function<br>• If the bit is 1, then the device has multiple functions |
| 22:16 | 0x0<br>RO | **Header Type 0 (HTYPE0):** This field identifies the layout of the second part of the predefined header (beginning at byte 10h in Configuration Space).<br>• The encoding 00h specifies the non-bridge Configuration Space Header.<br>• The encoding 01h specifies the PCI-to-PCI bridge Configuration Space Header.<br>• The encoding 02h specifies the CardBus bridge Configuration Space Header.<br>• All other encodings are reserved.<br>Hardwired to 0 to identify the non-bridge Configuration Space Header. |
| 15:8 | 0x0<br>RO | **Latency Timer (LT):** Not implemented. Hardwired to 0. |
| 7:0 | 0x0<br>RO | **Cache Line Size (CLS):** Not implemented. Hardwired to 0. |

## 54.6.5 IDE Primary Command Block IO BAR (IDE_HOST_PCMDIOBAR)—Offset 10h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:2] + 10h

**Default:** 00000001h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:3 | 0x0<br>RW | **IO BAR (IOBAR):** Software programs this space with the base address of the device's IO region. |
| 2 | 0x0<br>RO | **IO Size (IOSIZE):** Hardwired to 0 to indicate 8B of IO space. |
| 1 | 0x0<br>RO | **Reserved (RSVD):** Hardwired to 0 for an IO BAR. |
| 0 | 0x1<br>RO | **IO Space Indicator (IOSPACE):** Hardwired to 1 to identify an IO BAR. |

## 54.6.6 IDE Primary Control Block IO BAR (IDE_HOST_PCTLIOBAR)—Offset 14h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:2] + 14h

**Default:** 00000001h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:2 | 0x0 RW | **IO BAR (IOBAR):** Software programs this space with the base address of the device's IO region. |
| 1 | 0x0 RO | **Reserved (RSVD):** Hardwired to 0 for an IO BAR. |
| 0 | 0x1 RO | **IO Space Indicator (IOSPACE):** Hardwired to 1 to identify an IO BAR. |

## 54.6.7 IDE Secondary Command Block IO BAR (IDE_HOST_SCMDIOBAR)—Offset 18h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:2] + 18h

**Default:** 00000001h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:3 | 0x0 RW | **IO BAR (IOBAR):** Software programs this space with the base address of the device's IO region. |
| 2 | 0x0 RO | **IO Size (IOSIZE):** Hardwired to 0 to indicate 8B of IO space. |
| 1 | 0x0 RO | **Reserved (RSVD):** Hardwired to 0 for an IO BAR. |
| 0 | 0x1 RO | **IO Space Indicator (IOSPACE):** Hardwired to 1 to identify an IO BAR. |

## 54.6.8 IDE Secondary Control Block IO BAR (IDE_HOST_SCTLIOBAR)—Offset 1Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:2] + 1Ch

**Default:** 00000001h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:2 | 0x0 RW | **IO BAR (IOBAR):** Software programs this space with the base address of the device's IO region. |
| 1 | 0x0 RO | **Reserved (RSVD):** Hardwired to 0 for an IO BAR. |
| 0 | 0x1 RO | **IO Space Indicator (IOSPACE):** Hardwired to 1 to identify an IO BAR. |

## 54.6.9 IDE Bus Master Block IO BAR (IDE_HOST_BMIOBAR)—Offset 20h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:2] + 20h

**Default:** 00000001h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:4 | 0x0<br>RW | **IO BAR (IOBAR):** Software programs this space with the base address of the device's IO region. |
| 3:2 | 0x0<br>RO | **IO Size (IOSIZE):** Hardwired to 0 to indicate 16B of IO space. |
| 1 | 0x0<br>RO | **Reserved (RSVD):** Hardwired to 0 for an IO BAR. |
| 0 | 0x1<br>RO | **IO Space Indicator (IOSPACE):** Hardwired to 1 to identify an IO BAR. |

## 54.6.10 Cardbus CIS Pointer (IDE_HOST_CCP)—Offset 28h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:2] + 28h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO | **Cardbus CIS Pointer (CCP):** Not implemented.<br>Hardwired to 0. |

## 54.6.11 Subsystem ID and Subsystem Vendor ID (IDE_HOST_SID_SVID)—Offset 2Ch

These registers are used to uniquely identify the add-in card or subsystem where the PCI device resides. They provide a mechanism for add-in card vendors to distinguish their add-in cards from one another even though the add-in cards may have the same PCI controller on them (and, therefore, the same Vendor ID and Device ID).

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:2] + 2Ch

**Default:** 00008086h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW/O | **Subsystem ID (SID):** Value of this field is vendor-specific.<br>This is written by BIOS. No hardware action will be taken on this value.<br>Implementation Note: The Write-Once lock must be implemented per field. SID should have its own lock. |
| 15:0 | 0x8086<br>RW/O | **Subsystem Vendor ID (SVID):** This field identifies the vendor of the add-in card or subsystem.<br>This is written by BIOS. No hardware action will be taken on this value.<br>Implementation Note: The Write-Once lock must be implemented per field. SVID should have its own lock. |

## 54.6.12 Expansion ROM Base Address (IDE_HOST_XRBAR)—Offset 30h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:2] + 30h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO | **Expansion ROM Base Address (XRBAR):** Not implemented. Hardwired to 0. |

## 54.6.13 Capabilities List Pointer (IDE_HOST_CAPP)—Offset 34h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:2] + 34h

**Default:** 00000040h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0x0<br>RO | **Reserved (RSVD):** |
| 7:0 | 0x40<br>RO | **Capabilities Pointer (CAPP):** Indicates the pointer for the first entry in the capabilities list which is the MSI Capability. |

## 54.6.14 Maximum Latency, Minimum Grant, Interrupt Pin and Interrupt Line (IDE_HOST_MAXL_MING_INTP_INTL)—Offset 3Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:2] + 3Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RO | **Maximum Latency (MAXL):** Not implemented. Hardwired to 0. |
| 23:16 | 0x0<br>RO | **Minimum Grant (MING):** Not implemented. Hardwired to 0. |
| 15:8 | 0x0<br>RO/V | **Interrupt Pin (INTP):** This register specifies which interrupt pin IDE uses in PCI interrupt mode.<br>Value Decoding<br>• 00h The function does NOT use an interrupt pin.<br>• 01h INTA<br>• 02h INTB<br>• 03h INTC<br>• 04h INTD<br>• 05h - FFh Reserved. |
| 7:0 | 0x0<br>RW | **Interrupt Line (INTL):** This register is used to communicate interrupt line routing information. POST software will write the routing information into this register as it initializes and configures the system. |

## 54.6.15 MSI Message Control, Next Pointer and Capability ID (IDE_HOST_MSIMC_MSINP_MSICID)—Offset 40h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:2] + 40h

**Default:** 00805005h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:25 | 0x0<br>RO | **Reserved (RSVD):** |
| 24 | 0x0<br>RO | **Per Vector Masking Capable (PVMC):** Not implemented. Hardwired to 0 to indicate the function does NOT support MSI per-vector masking. |
| 23 | 0x1<br>RO | **64 bit address capable (XAC):** Hardwired to 1 to indicate the function is capable of sending a 64-bit message address. |
| 22:20 | 0x0<br>RW | **Multiple Message Enable (MMEN):** Encoded number of interrupt vectors allocated by SW.<br>This field is RW for software compatibility, but only one interrupt vector is ever sent by the function. |
| 19:17 | 0x0<br>RO | **Multiple Message Capable (MMC):** Encoded number of interrupt vectors requested by a device.<br>Hardwired to 0 to indicate one requested interrupt vector. |
| 16 | 0x0<br>RW | **MSI Enable (MSIE):** If set, MSI interrupt delivery is enabled whereas pin-based interrupt delivery SHALL be disabled.<br>If cleared, prior to returning the configuration write (that clears this field) completion, the function must send any pending MSI(s). |
| 15:8 | 0x50<br>RO | **Next Item Pointer (NP):** Indicates the pointer for the next entry in the capabilities list.<br>Hardwired to 50h to point to the PM Capability list. |
| 7:0 | 0x5<br>RO | **Capability ID (CID):** Hardwired to 05h to indicate the linked list item as the MSI Capability registers. |

## 54.6.16 MSI Message Address (IDE_HOST_MSIMA)—Offset 44h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:2] + 44h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:2 | 0x0<br>RW | **Message Address (MA):** 32-bit DW-aligned MSI message address. |
| 1:0 | 0x0<br>RO | **Reserved (RSVD):** |

## 54.6.17 MSI Message Upper Address (IDE_HOST_MSIMUA)—Offset 48h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:2] + 48h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Message Upper Address (MUA):** Upper 32-bit of a 64-bit DW-aligned MSI message address. |

## 54.6.18 MSI Message Data (IDE_HOST_MSIMD)—Offset 4Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:2] + 4Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **Reserved (RSVD):** |
| 15:0 | 0x0<br>RW | **Message Data (MD):** MSI Message Data |

## 54.6.19 Power Management Capabilities, Next Pointer and Capability ID (IDE_HOST_PMCAP_PMNP_PMCID)—Offset 50h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:2] + 50h

**Default:** 00230001h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:27 | 0x0<br>RO | **PME Support (PMES):** This 5-bit field indicates the power states in which the function may assert PME#.<br>A value of 0b for any bit indicates that the function is not capable of asserting the PME# signal while in that power state.<br>• bit(27) X XXX1b - PME# can be asserted from D0<br>• bit(28) X XX1Xb - PME# can be asserted from D1<br>• bit(29) X X1XXb - PME# can be asserted from D2<br>• bit(30) X 1XXXb - PME# can be asserted from D3hot<br>• bit(31) 1 XXXXb - PME# can be asserted from D3cold |
| 26 | 0x0<br>RO | **D2 Support (D2S):** Hardwired to 0 to indicate that this device does not support D2. |
| 25 | 0x0<br>RO | **D1 Support (D1S):** Hardwired to 0 to indicate that this device does not support D1. |
| 24:22 | 0x0<br>RO | **Aux Current (AUXC):** Not implemented.Hardwired to 0. |
| 21 | 0x1<br>RO | **Device Specific Initialization (DSI):** indicates whether special initialization of this function is required (beyond the standard PCI configuration header) before the generic class device driver is able to use it.<br>A 1 indicates that the function requires a device specific initialization sequence following transition to the D0 uninitialized state.<br>Hardwired to 1 to indicate Device Specific Initialization is required. |
| 20 | 0x0<br>RO | **Reserved (RSVD):** |
| 19 | 0x0<br>RO | **PME Clock (PMECLK):** Not implemented.Hardwired to 0. |
| 18:16 | 0x3<br>RO | **Version (VER):** Hardwired to value of 011b indicates that this function complies with rev 1.2 of PCI Power Management Interface Spec. |
| 15:8 | 0x0<br>RO | **Next Item Pointer (NP):** Indicates the pointer for the next entry in the capabilities list.<br>Hardwired to 0 to indicate no more linked list item. |
| 7:0 | 0x1<br>RO | **Capability ID (CID):** Hardwired to 01h to indicate the linked list item as the PCI Power Management registers. |

## 54.6.20 Power Management Data, Control/Status Register Bridge Support Extensions, Control and Status (IDE_HOST_PMD_PMCSRBSE_PMCSR)—Offset 54h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:2] + 54h

**Default:** 00000008h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RO | **Data:** Not implemented. Hardwired to 0. |
| 23:16 | 0x0<br>RO | **Control/Status Register Bridge Support Extensions (CSRBSE):** Not implemented. Hardwired to 0. |
| 15 | 0x0<br>RO | **PME Status (PMESTS):** This bit is set when the function would normally assert the PME signal independent of the state of the PME_En bit.<br>• Writing a 1 to this bit will clear it and cause the function to stop asserting a PME (if enabled).<br>• Writing a 0 has no effect.<br>If the function supports PME from D3cold, then this bit is sticky and must be explicitly cleared by the operating system each time the operating system is initially loaded.<br>Not implemented. Hardwired to 0. |
| 14:13 | 0x0<br>RO | **Data Scale (DS):** Not implemented. Hardwired to 0. |
| 12:9 | 0x0<br>RO | **Data Select (DSEL):** Not implemented. Hardwired to 0. |
| 8 | 0x0<br>RO | **PME Enable (PMEEN):** A 1 enables the function to assert PME.<br>When 0, PME assertion is disabled.<br>This bit defaults to 0 if the function does not support PME generation from D3cold.<br>If the function supports PME from D3cold then this bit is sticky and must be explicitly cleared by the operating system each time it is initially loaded.<br>Not implemented. Hardwired to 0. |
| 7:4 | 0x0<br>RO | **Reserved (RSVD1):** |
| 3 | 0x1<br>RO | **No Soft Reset (NSR):** When set to 1, this bit indicates that devices transitioning from D3hot to D0 because of PowerState commands do not perform an internal reset.<br>Configuration Context is preserved.<br>Upon transition from the D3hot to the D0 Initialized state, no additional operating system intervention is required to preserve Configuration Context beyond writing the PowerState bits. |
| 2 | 0x0<br>RO | **Reserved (RSVD0):** |
| 1:0 | 0x0<br>RW | **Power State (PWRST):** This 2-bit field is used both to determine the current power state of a function and to set the function into a new power state.<br>The definition of the field values is given below:<br>• 00b - D0<br>• 01b - D1<br>• 10b - D2<br>• 11b - D3hot<br>If software attempts to write an unsupported, optional state to this field, the write operation must complete normally on the bus; however, the data is discarded and no state change occurs. |

## 54.6.21 Process Stepping Information (IDE_HOST_PSI)—Offset F8h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:27, F:2] + F8h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0x0<br>RO | **Reserved (RSVD):** Not implemented. Hardwired to 0. |
| 27:24 | 0x0<br>RO/V | **Dot Portion of Process ID (DPOP):** Reserved. |
| 23:16 | 0x0<br>RO/V | **Manufacturing Stepping (MSID):** Reserved. |
| 15:8 | 0x0<br>RO/V | **Manufacturing ID (MID):** Reserved. |
| 7:0 | 0x0<br>RO/V | **Process Portion of Process ID (PPOP):** Reserved. |

## 54.7 Registers in Memory Space—HECI1_MMIO_MBAR

These registers are accessed in Host Memory Space starting at the relocatable memory address defined by the Base Address Register (BAR) HECI1_MMIO_MBAR_LO described in Section 54.2.9, "HECI MMIO Base Address Low (HECI1_MMIO_MBAR_LO)—Offset 10h" on page 2458 and HECI1_MMIO_MBAR_HI described in Section 54.2.10, "HECI MMIO Base Address High (HECI1_MMIO_MBAR_HI)—Offset 14h" on page 2459.

### 54.7.1 Host CB Write Window (HECI1_H_CB_WW)—Offset 0h

This register is for host to write into its Circular Buffer.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [HECI1_MMIO_MBAR] + 0h

**HECI1_MMIO_MBAR Type:** PCI Configuration Register (Size: 64 bits)
**HECI1_MMIO_MBAR Reference:** [B:0, D:27, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>WO | **Host Circular Buffer Write Window Field (H_CB_WWF):** This field is for host to write into its circular buffer.<br>This field is write only, reads will return arbitrary data.<br>Writes to this register will increment the H_CBWP as long as CSE_RDY is 1.<br>When CSE_RDY is 0, writes to this register have no effect and are not delivered to the H_CB, nor is H_CBWP incremented. |

## 54.7.2 Host Control and Status Register (HECI1_H_CSR)—Offset 4h

This register reports status information about the host circular buffer (H_CB) and allows host software to control interrupt generation.

Note to software: reserved bits in this register must be set to 0 whenever this register is written.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [HECI1_MMIO_MBAR] + 4h

**Default:** 80000000h

**HECI1_MMIO_MBAR Type:** PCI Configuration Register (Size: 64 bits)
**HECI1_MMIO_MBAR Reference:** [B:0, D:27, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x80<br>RO | **Host Circular Buffer Depth (H_CBD):** This field indicates the maximum number of 32 bit entries available in the host circular buffer (H_CB).<br>Host software uses this field along with the H_CBRP and H_CBWP fields to calculate the number of valid entries in the H_CB to read or number of entries available for write.<br>Programmers note: This field is implemented with a '1-hot' scheme. Only one bit will be set to a '1' at a time.<br>Each bit position represents the value n of a buffer depth of (2^n). For example, when bit# 1 is 1, the buffer depth is 2; when bit#2 is 1, the buffer depth is 4, etc.<br>**This field is hardwired to represent a depth of 128 entries.** |
| 23:16 | 0x0<br>RO/V | **Host CB Write Pointer (H_CBWP):** Points to next location in the H_CB for host to write the data.<br>Software uses this field along with H_CBRP and H_CBD fields to calculate the number of valid entries in the H_CB to read or number of entries available for write. |
| 15:8 | 0x0<br>RO/V | **Host CB Read Pointer (H_CBRP):** Points to next location in the H_CB where a valid data is available for embedded controller to read.<br>Software uses this field along with H_CBWR and H_CBD fields to calculate the number of valid entries in the host CB to read or number of entries available for write. |
| 7 | 0x0<br>RO | **Reserved (RSVD_7_7):** Reserved. |
| 6 | 0x0<br>RW/1C/V | **Host D0I3 Interrupt Status (H_D0I3C_IS):** HW sets this bit to 1 when D0I3C.H_D0I3_IR is set and D0I3C.H_D0I3_CIP transitions from 1 to 0.<br>Host clears this bit to 0 by writing a 1 to this bit position.<br>H_D0I3C_IE has no effect on this bit. |
| 5 | 0x0<br>RW | **Host D0I3 Interrupt Enable (H_D0I3C_IE):** Host sets this bit to 1 to enable the host interrupt (MSI, INTx, SMI or SCI) to be asserted when H_D0I3C_IS is set to 1. |
| 4 | 0x0<br>RW | **Host Reset (H_RST):** Setting this bit to 1 will initiate the HECI reset sequence to get the circular buffers into a known good state for host and CSE communication.<br>When this bit transitions from 0 to 1, hardware will clear the H_RDY and CSE_RDY bits. |
| 3 | 0x0<br>RW/V | **Host Ready (H_RDY):** This bit indicates that the host is ready to process messages. |
| 2 | 0x0<br>RW/V | **Host Interrupt Generate (H_IG):** Once message(s) are written into its CB, the host sets this bit to one for the HW to set the CSE_IS bit in the CSE_CSR and to generate an interrupt message to mIA. HW then clears this bit to 0. |
| 1 | 0x0<br>RW/1C/V | **Host Interrupt Status (H_IS):** HW sets this bit to 1 when CSE_IG bit is set to 1.<br>Host clears this bit to 0 by writing a 1 to this bit position.<br>H_IE has no effect on this bit. |
| 0 | 0x0<br>RW | **Host Interrupt Enable (H_IE):** Host sets this bit to 1 to enable the host interrupt (MSI, INTx, SMI or SCI) to be asserted when H_IS is set to 1. |

## 54.7.3 CSE Circular Buffer Read Window (HECI1_CSE_CB_RW)—Offset 8h

This register is for host to read from the CSE Circular Buffer (CSE_CB).

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [HECI1_MMIO_MBAR] + 8h

**Default:** FFFFFFFFh

**HECI1_MMIO_MBAR Type:** PCI Configuration Register (Size: 64 bits)
**HECI1_MMIO_MBAR Reference:** [B:0, D:27, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0xffffffff<br>RO | **CSE Circular Buffer Read Window Field (CSE_CB_RWF):** This bit field is for host to read from the CSE Circular Buffer.<br>This field is read only, writes have no effect.<br>Reads to this register will increment the CSE_CBRP as long as CSE_RDY is 1.<br>When CSE_RDY is 0, reads to this register have no effect, all 1s are returned, and CSE_CBRP is not incremented. |

## 54.7.4 CSE Control and Status Register Host Access (HECI1_CSE_CSR_HA)—Offset Ch

This register allows host software to read the CSE Control Status register (CSE_CSR).

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [HECI1_MMIO_MBAR] + Ch

**Default:** 80000000h

**HECI1_MMIO_MBAR Type:** PCI Configuration Register (Size: 64 bits)
**HECI1_MMIO_MBAR Reference:** [B:0, D:27, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x80<br>RO | **CSE Circular Buffer Depth Host Read Access (CSE_CBD_HRA):** Host read access to CSE_CBD.<br>**This field is hardwired to represent a depth of 128 entries.** |
| 23:16 | 0x0<br>RO/V | **CSE CB Write Pointer Host Read Access (CSE_CBWP_HRA):** Host read only access to CSE_CBWP. |
| 15:8 | 0x0<br>RO/V | **CSE CB Read Pointer Host Read Access (CSE_CBRP_HRA):** Host read only access to CSE_CBRP. |
| 7 | 0x0<br>RO/V | **NMI Status Host Read Access (NMI_STS_HRA):** Host read access to NMI_STS. |
| 6 | 0x0<br>RO | **Reserved (RSVD_6_6):** Reserved. |
| 5 | 0x0<br>RO/V | **Pointer Reset Host Read Access (PTR_RST_HRA):** Host read access to PTR_RST. |
| 4 | 0x0<br>RO/V | **CSE Reset Host Read Access (CSE_RST_HRA):** Host read access to CSE_RST. |
| 3 | 0x0<br>RO/V | **CSE Ready Host Read Access (CSE_RDY_HRA):** Host read access to CSE_RDY. |
| 2 | 0x0<br>RO/V | **CSE Interrupt Generate Host Read Access (CSE_IG_HRA):** Host read only access to CSE_IG. |
| 1 | 0x0<br>RO/V | **CSE Interrupt Status Host Read Access (CSE_IS_HRA):** Host read only access to CSE_IS. |
| 0 | 0x0<br>RO/V | **CSE Interrupt Enable Host Read Access (CSE_IE_HRA):** Host read only access to CSE_IE. |

## 54.7.5 D0i3 Control (HECI1_D0I3C)—Offset 800h

This register allows host to configure the power mode using D0i0/D0i3 support.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [HECI1_MMIO_MBAR] + 800h

**Default:** 00000000h

**HECI1_MMIO_MBAR Type:** PCI Configuration Register (Size: 64 bits)
**HECI1_MMIO_MBAR Reference:** [B:0, D:27, F:0] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:4 | 0x0<br>RO | **Reserved (RSVD_31_4):** Reserved. |
| 3 | 0x0<br>RO | **Restore Required (H_D0I3C_RR):** When this bit is set (by HW), SW must restore the state of the IP. This bit is cleared by SW writing a 1.<br>**In CSE this bit is never set so it does not need to be cleared by SW.** |
| 2 | 0x0<br>RW | **D0i3 (H_D0I3C_I3):** SW sets this bit to 1 in order to move the IP into the D0i3 state.<br>Clearing this bit will return the IP into the fully active D0 state (D0i0).<br>When this bit changes state, mIA may be interrupted (see H_PCI_CSR.D0I3C_IS register's description) |
| 1 | 0x0<br>RW | **Interrupt Request (H_D0I3C_IR):** SW sets this bit to 1 to ask for an interrupt to be generated on completion of the command.<br>SW must clear or set this bit on each write to this register.<br>When this bit is set to 1, Command-in-Progress deassertion is captured in H_CSR.H_D0I3_IS.<br>If H_CSR.H_D0I3_IE is 1 as well, host interrupt will be initiated. |
| 0 | 0x0<br>RO/V | **Command-in-Progress (H_D0I3C_CIP):** HW sets this bit on a 0-)1 or 1-)0 transition of D0i3 bit (bit [2]).<br>While set, the other bits in this register are not valid and it is illegal for SW to write to any of them.<br>While clear, all other bits in this register are valid and SW may write to them.<br>If Interrupt Request (bit [1]) was set for the current command, HW may clear this bit before the interrupt has been made visible to SW, since when SW actually handles a particular interrupt is not visible to HW.<br>SW writes to this bit have no effect.<br>This bit is auto-cleared by HW one cycle after it is set. |

## 54.8 Registers in Memory Space—HECI2_MMIO_MBAR

These registers are accessed in Host Memory Space starting at the relocatable memory address defined by the Base Address Register (BAR) HECI2_MMIO_MBAR_LO described in Section 54.3.9, "HECI MMIO Base Address Low (HECI2_MMIO_MBAR_LO)—Offset 10h" on page 2478 and HECI2_MMIO_MBAR_HI described in Section 54.3.10, "HECI MMIO Base Address High (HECI2_MMIO_MBAR_HI)—Offset 14h" on page 2479.

### 54.8.1 Host CB Write Window (HECI2_H_CB_WW)—Offset 0h

This register is for host to write into its Circular Buffer.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [HECI2_MMIO_MBAR] + 0h

**HECI2_MMIO_MBAR Type:** PCI Configuration Register (Size: 64 bits)
**HECI2_MMIO_MBAR Reference:** [B:0, D:27, F:1] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>WO | **Host Circular Buffer Write Window Field (H_CB_WWF):** This field is for host to write into its circular buffer.<br>This field is write only, reads will return arbitrary data. Writes to this register will increment the H_CBWP as long as CSE_RDY is 1.<br>When CSE_RDY is 0, writes to this register have no effect and are not delivered to the H_CB, nor is H_CBWP incremented. |

## 54.8.2 Host Control and Status Register (HECI2_H_CSR)—Offset 4h

This register reports status information about the host circular buffer (H_CB) and allows host software to control interrupt generation.

Note to software: reserved bits in this register must be set to 0 whenever this register is written.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [HECI2_MMIO_MBAR] + 4h

**Default:** 80000000h

**HECI2_MMIO_MBAR Type:** PCI Configuration Register (Size: 64 bits)
**HECI2_MMIO_MBAR Reference:** [B:0, D:27, F:1] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x80<br>RO | **Host Circular Buffer Depth (H_CBD):** This field indicates the maximum number of 32 bit entries available in the host circular buffer (H_CB).<br>Host software uses this field along with the H_CBRP and H_CBWP fields to calculate the number of valid entries in the H_CB to read or number of entries available for write.<br><br>Programmers note: This field is implemented with a '1-hot' scheme. Only one bit will be set to a '1' at a time.<br>Each bit position represents the value n of a buffer depth of (2^n).<br>For example, when bit# 1 is 1, the buffer depth is 2; when bit#2 is 1, the buffer depth is 4, etc.<br>**This field is hardwired to represent a depth of 128 entries.** |
| 23:16 | 0x0<br>RO/V | **Host CB Write Pointer (H_CBWP):** Points to next location in the H_CB for host to write the data.<br>Software uses this field along with H_CBRP and H_CBD fields to calculate the number of valid entries in the H_CB to read or number of entries available for write. |
| 15:8 | 0x0<br>RO/V | **Host CB Read Pointer (H_CBRP):** Points to next location in the H_CB where a valid data is available for embedded controller to read.<br>Software uses this field along with H_CBWR and H_CBD fields to calculate the number of valid entries in the host CB to read or number of entries available for write. |
| 7 | 0x0<br>RO | **Reserved (RSVD_7_7):** Reserved. |
| 6 | 0x0<br>RW/1C/V | **Host D0I3 Interrupt Status (H_D0I3C_IS):** HW sets this bit to 1 when D0I3C.H_D0I3_IR is set and D0I3C.H_D0I3_CIP transitions from 1 to 0.<br>Host clears this bit to 0 by writing a 1 to this bit position.<br>H_D0I3C_IE has no effect on this bit. |
| 5 | 0x0<br>RW | **Host D0I3 Interrupt Enable (H_D0I3C_IE):** Host sets this bit to 1 to enable the host interrupt (MSI, INTx, SMI or SCI) to be asserted when H_D0I3C_IS is set to 1. |
| 4 | 0x0<br>RW | **Host Reset (H_RST):** Setting this bit to 1 will initiate the HECI reset sequence to get the circular buffers into a known good state for host and CSE communication.<br>When this bit transitions from 0 to 1, hardware will clear the H_RDY and CSE_RDY bits. |
| 3 | 0x0<br>RW/V | **Host Ready (H_RDY):** This bit indicates that the host is ready to process messages. |
| 2 | 0x0<br>RW/V | **Host Interrupt Generate (H_IG):** Once message(s) are written into its CB, the host sets this bit to one for the HW to set the CSE_IS bit in the CSE_CSR and to generate an interrupt message to mIA. HW then clears this bit to 0. |
| 1 | 0x0<br>RW/1C/V | **Host Interrupt Status (H_IS):** HW sets this bit to 1 when CSE_IG bit is set to 1.<br>Host clears this bit to 0 by writing a 1 to this bit position.<br>H_IE has no effect on this bit. |
| 0 | 0x0<br>RW | **Host Interrupt Enable (H_IE):** Host sets this bit to 1 to enable the host interrupt (MSI, INTx, SMI or SCI) to be asserted when H_IS is set to 1. |

## 54.8.3 CSE Circular Buffer Read Window (HECI2_CSE_CB_RW)—Offset 8h

This register is for host to read from the CSE Circular Buffer (CSE_CB).

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [HECI2_MMIO_MBAR] + 8h

**Default:** FFFFFFFFh

**HECI2_MMIO_MBAR Type:** PCI Configuration Register (Size: 64 bits)
**HECI2_MMIO_MBAR Reference:** [B:0, D:27, F:1] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0xffffffff<br>RO | **CSE Circular Buffer Read Window Field (CSE_CB_RWF):** This bit field is for host to read from the CSE Circular Buffer.<br>This field is read only, writes have no effect.<br>Reads to this register will increment the CSE_CBRP as long as CSE_RDY is 1. When CSE_RDY is 0, reads to this register have no effect, all 1s are returned, and CSE_CBRP is not incremented. |

## 54.8.4 CSE Control and Status Register Host Access (HECI2_CSE_CSR_HA)—Offset Ch

This register allows host software to read the CSE Control Status register (CSE_CSR).

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [HECI2_MMIO_MBAR] + Ch

**Default:** 80000000h

**HECI2_MMIO_MBAR Type:** PCI Configuration Register (Size: 64 bits)
**HECI2_MMIO_MBAR Reference:** [B:0, D:27, F:1] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x80<br>RO | **CSE Circular Buffer Depth Host Read Access (CSE_CBD_HRA):** Host read access to CSE_CBD.<br>**This field is hardwired to represent a depth of 128 entries.** |
| 23:16 | 0x0<br>RO/V | **CSE CB Write Pointer Host Read Access (CSE_CBWP_HRA):** Host read only access to CSE_CBWP. |
| 15:8 | 0x0<br>RO/V | **CSE CB Read Pointer Host Read Access (CSE_CBRP_HRA):** Host read only access to CSE_CBRP. |
| 7 | 0x0<br>RO/V | **NMI Status Host Read Access (NMI_STS_HRA):** Host read access to NMI_STS. |
| 6 | 0x0<br>RO | **Reserved (RSVD_6_6):** Reserved. |
| 5 | 0x0<br>RO/V | **Pointer Reset Host Read Access (PTR_RST_HRA):** Host read access to PTR_RST. |
| 4 | 0x0<br>RO/V | **CSE Reset Host Read Access (CSE_RST_HRA):** Host read access to CSE_RST. |
| 3 | 0x0<br>RO/V | **CSE Ready Host Read Access (CSE_RDY_HRA):** Host read access to CSE_RDY. |
| 2 | 0x0<br>RO/V | **CSE Interrupt Generate Host Read Access (CSE_IG_HRA):** Host read only access to CSE_IG. |
| 1 | 0x0<br>RO/V | **CSE Interrupt Status Host Read Access (CSE_IS_HRA):** Host read only access to CSE_IS. |
| 0 | 0x0<br>RO/V | **CSE Interrupt Enable Host Read Access (CSE_IE_HRA):** Host read only access to CSE_IE. |

## 54.8.5 D0i3 Control (HECI2_D0I3C)—Offset 800h

This register allows host to configure the power mode using D0i0/D0i3 support.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [HECI2_MMIO_MBAR] + 800h

**HECI2_MMIO_MBAR Type:** PCI Configuration Register (Size: 64 bits)
**HECI2_MMIO_MBAR Reference:** [B:0, D:27, F:1] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:4 | 0x0<br>RO | **Reserved (RSVD_31_4):** Reserved. |
| 3 | 0x0<br>RO | **Restore Required (H_D0I3C_RR):** When this bit is set (by HW), SW must restore the state of the IP. This bit is cleared by SW writing a 1.<br>**In CSE this bit is never set so it does not need to be cleared by SW.** |
| 2 | 0x0<br>RW | **D0i3 (H_D0I3C_I3):** SW sets this bit to 1 in order to move the IP into the D0i3 state.<br>Clearing this bit will return the IP into the fully active D0 state (D0i0).<br>When this bit changes state, mIA may be interrupted (see H_PCI_CSR.D0I3C_IS register's description) |
| 1 | 0x0<br>RW | **Interrupt Request (H_D0I3C_IR):** SW sets this bit to 1 to ask for an interrupt to be generated on completion of the command.<br>SW must clear or set this bit on each write to this register.<br>When this bit is set to 1, Command-in-Progress deassertion is captured in H_CSR.H_D0I3_IS.<br>If H_CSR.H_D0I3_IE is 1 as well, host interrupt will be initiated. |
| 0 | 0x0<br>RO/V | **Command-in-Progress (H_D0I3C_CIP):** HW sets this bit on a 0-)1 or 1-)0 transition of D0i3 bit (bit [2]).<br>While set, the other bits in this register are not valid and it is illegal for SW to write to any of them.<br>While clear, all other bits in this register are valid and SW may write to them.<br>If Interrupt Request (bit [1]) was set for the current command, HW may clear this bit before the interrupt has been made visible to SW, since when SW actually handles a particular interrupt is not visible to HW.<br>SW writes to this bit have no effect.<br>This bit is auto-cleared by HW one cycle after it is set. |

## 54.9 Registers in Memory Space—HECI3_MMIO_MBAR

These registers are accessed in Host Memory Space starting at the relocatable memory address defined by the Base Address Register (BAR) HECI3_MMIO_MBAR_LO described in Section 54.4.9, "HECI MMIO Base Address Low (HECI3_MMIO_MBAR_LO)—Offset 10h" on page 2495 and HECI3_MMIO_MBAR_HI described in Section 54.4.10, "HECI MMIO Base Address High (HECI3_MMIO_MBAR_HI)—Offset 14h" on page 2496.

### 54.9.1 Host CB Write Window (HECI3_H_CB_WW)—Offset 0h

This register is for host to write into its Circular Buffer.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [HECI3_MMIO_MBAR] + 0h

**HECI3_MMIO_MBAR Type:** PCI Configuration Register (Size: 64 bits)
**HECI3_MMIO_MBAR Reference:** [B:0, D:27, F:4] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>WO | **Host Circular Buffer Write Window Field (H_CB_WWF):** This field is for host to write into its circular buffer.<br>This field is write only, reads will return arbitrary data.<br>Writes to this register will increment the H_CBWP as long as CSE_RDY is 1.<br>When CSE_RDY is 0, writes to this register have no effect and are not delivered to the H_CB, nor is H_CBWP incremented. |

## 54.9.2 Host Control and Status Register (HECI3_H_CSR)—Offset 4h

This register reports status information about the host circular buffer (H_CB) and allows host software to control interrupt generation.

Note to software: reserved bits in this register must be set to 0 whenever this register is written.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [HECI3_MMIO_MBAR] + 4h

**Default:** 80000000h

**HECI3_MMIO_MBAR Type:** PCI Configuration Register (Size: 64 bits)
**HECI3_MMIO_MBAR Reference:** [B:0, D:27, F:4] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x80<br>RO | **Host Circular Buffer Depth (H_CBD):** This field indicates the maximum number of 32 bit entries available in the host circular buffer (H_CB).<br>Host software uses this field along with the H_CBRP and H_CBWP fields to calculate the number of valid entries in the H_CB to read or number of entries available for write.<br><br>Programmers note: This field is implemented with a '1-hot' scheme.<br>Only one bit will be set to a '1' at a time.<br>Each bit position represents the value n of a buffer depth of (2^n).<br>For example, when bit# 1 is 1, the buffer depth is 2; when bit#2 is 1, the buffer depth is 4, etc.<br>**This field is hardwired to represent a depth of 128 entries.** |
| 23:16 | 0x0<br>RO/V | **Host CB Write Pointer (H_CBWP):** Points to next location in the H_CB for host to write the data.<br>Software uses this field along with H_CBRP and H_CBD fields to calculate the number of valid entries in the H_CB to read or number of entries available for write. |
| 15:8 | 0x0<br>RO/V | **Host CB Read Pointer (H_CBRP):** Points to next location in the H_CB where a valid data is available for embedded controller to read.<br>Software uses this field along with H_CBWR and H_CBD fields to calculate the number of valid entries in the host CB to read or number of entries available for write. |
| 7 | 0x0<br>RO | **Reserved (RSVD_7_7):** Reserved. |
| 6 | 0x0<br>RW/1C/V | **Host D0I3 Interrupt Status (H_D0I3C_IS):** HW sets this bit to 1 when D0I3C.H_D0I3_IR is set and D0I3C.H_D0I3_CIP transitions from 1 to 0.<br>Host clears this bit to 0 by writing a 1 to this bit position.<br>H_D0I3C_IE has no effect on this bit. |
| 5 | 0x0<br>RW | **Host D0I3 Interrupt Enable (H_D0I3C_IE):** Host sets this bit to 1 to enable the host interrupt (MSI, INTx, SMI or SCI) to be asserted when H_D0I3C_IS is set to 1. |
| 4 | 0x0<br>RW | **Host Reset (H_RST):** Setting this bit to 1 will initiate the HECI reset sequence to get the circular buffers into a known good state for host and CSE communication.<br>When this bit transitions from 0 to 1, hardware will clear the H_RDY and CSE_RDY bits. |
| 3 | 0x0<br>RW/V | **Host Ready (H_RDY):** This bit indicates that the host is ready to process messages. |
| 2 | 0x0<br>RW/V | **Host Interrupt Generate (H_IG):** Once message(s) are written into its CB, the host sets this bit to one for the HW to set the CSE_IS bit in the CSE_CSR and to generate an interrupt message to mIA. HW then clears this bit to 0. |
| 1 | 0x0<br>RW/1C/V | **Host Interrupt Status (H_IS):** HW sets this bit to 1 when CSE_IG bit is set to 1.<br>Host clears this bit to 0 by writing a 1 to this bit position.<br>H_IE has no effect on this bit. |
| 0 | 0x0<br>RW | **Host Interrupt Enable (H_IE):** Host sets this bit to 1 to enable the host interrupt (MSI, INTx, SMI or SCI) to be asserted when H_IS is set to 1. |

## 54.9.3 CSE Circular Buffer Read Window (HECI3_CSE_CB_RW)—Offset 8h

This register is for host to read from the CSE Circular Buffer (CSE_CB).

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [HECI3_MMIO_MBAR] + 8h

**Default:** FFFFFFFFh

**HECI3_MMIO_MBAR Type:** PCI Configuration Register (Size: 64 bits)
**HECI3_MMIO_MBAR Reference:** [B:0, D:27, F:4] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0xffffffff<br>RO | **CSE Circular Buffer Read Window Field (CSE_CB_RWF):** This bit field is for host to read from the CSE Circular Buffer.<br>This field is read only, writes have no effect.<br>Reads to this register will increment the CSE_CBRP as long as CSE_RDY is 1.<br>When CSE_RDY is 0, reads to this register have no effect, all 1s are returned, and CSE_CBRP is not incremented. |

## 54.9.4 CSE Control and Status Register Host Access (HECI3_CSE_CSR_HA)—Offset Ch

This register allows host software to read the CSE Control Status register (CSE_CSR).

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [HECI3_MMIO_MBAR] + Ch

**Default:** 80000000h

**HECI3_MMIO_MBAR Type:** PCI Configuration Register (Size: 64 bits)
**HECI3_MMIO_MBAR Reference:** [B:0, D:27, F:4] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x80<br>RO | **CSE Circular Buffer Depth Host Read Access (CSE_CBD_HRA):** Host read access to CSE_CBD.<br>**This field is hardwired to represent a depth of 128 entries.** |
| 23:16 | 0x0<br>RO/V | **CSE CB Write Pointer Host Read Access (CSE_CBWP_HRA):** Host read only access to CSE_CBWP. |
| 15:8 | 0x0<br>RO/V | **CSE CB Read Pointer Host Read Access (CSE_CBRP_HRA):** Host read only access to CSE_CBRP. |
| 7 | 0x0<br>RO/V | **NMI Status Host Read Access (NMI_STS_HRA):** Host read access to NMI_STS. |
| 6 | 0x0<br>RO | **Reserved (RSVD_6_6):** Reserved. |
| 5 | 0x0<br>RO/V | **Pointer Reset Host Read Access (PTR_RST_HRA):** Host read access to PTR_RST. |
| 4 | 0x0<br>RO/V | **CSE Reset Host Read Access (CSE_RST_HRA):** Host read access to CSE_RST. |
| 3 | 0x0<br>RO/V | **CSE Ready Host Read Access (CSE_RDY_HRA):** Host read access to CSE_RDY. |
| 2 | 0x0<br>RO/V | **CSE Interrupt Generate Host Read Access (CSE_IG_HRA):** Host read only access to CSE_IG. |
| 1 | 0x0<br>RO/V | **CSE Interrupt Status Host Read Access (CSE_IS_HRA):** Host read only access to CSE_IS. |
| 0 | 0x0<br>RO/V | **CSE Interrupt Enable Host Read Access (CSE_IE_HRA):** Host read only access to CSE_IE. |

## 54.9.5 D0i3 Control (HECI3_D0I3C)—Offset 800h

This register allows host to configure the power mode using D0i0/D0i3 support.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [HECI3_MMIO_MBAR] + 800h

**HECI3_MMIO_MBAR Type:** PCI Configuration Register (Size: 64 bits)
**HECI3_MMIO_MBAR Reference:** [B:0, D:27, F:4] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:4 | 0x0<br>RO | **Reserved (RSVD_31_4):** Reserved. |
| 3 | 0x0<br>RO | **Restore Required (H_D0I3C_RR):** When this bit is set (by HW), SW must restore the state of the IP. This bit is cleared by SW writing a 1.<br>**In CSE this bit is never set so it does not need to be cleared by SW.** |
| 2 | 0x0<br>RW | **D0i3 (H_D0I3C_I3):** SW sets this bit to 1 in order to move the IP into the D0i3 state.<br>Clearing this bit will return the IP into the fully active D0 state (D0i0).<br>When this bit changes state, mIA may be interrupted (see H_PCI_CSR.D0I3C_IS register's description) |
| 1 | 0x0<br>RW | **Interrupt Request (H_D0I3C_IR):** SW sets this bit to 1 to ask for an interrupt to be generated on completion of the command.<br>SW must clear or set this bit on each write to this register.<br>When this bit is set to 1, Command-in-Progress deassertion is captured in H_CSR.H_D0I3_IS.<br>If H_CSR.H_D0I3_IE is 1 as well, host interrupt will be initiated. |
| 0 | 0x0<br>RO/V | **Command-in-Progress (H_D0I3C_CIP):** HW sets this bit on a 0-)1 or 1-)0 transition of D0i3 bit (bit [2]).<br>While set, the other bits in this register are not valid and it is illegal for SW to write to any of them.<br>While clear, all other bits in this register are valid and SW may write to them.<br>If Interrupt Request (bit [1]) was set for the current command, HW may clear this bit before the interrupt has been made visible to SW, since when SW actually handles a particular interrupt is not visible to HW.<br>SW writes to this bit have no effect.<br>This bit is auto-cleared by HW one cycle after it is set. |

## 54.10 Registers in Memory Space—KT_HOST_MEMBAR

These registers are accessed in Host Memory Space starting at the relocatable memory address defined by the Base Address Register (BAR) KT_HOST_MEMBAR described in Section 54.5.6, "KT Memory BAR (KT_HOST_MEMBAR)—Offset 14h" on page 2513.

### 54.10.1 KT Receive Buffer Register (MEM_KTRBR)—Offset 0h

This register implements the standard Receiver Buffer register in the KT Block. This is read-only. DLAB(i.e. KTLCR[7]) shall be 0. In non-FIFO mode, this register will be read when the receiver data is ready. In FIFO mode, a read from this register will be translated into a read from the RBR FIFO. Reset condition: Host reset. Non-sticky.

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [KT_HOST_MEMBAR] + 0h

**KT_HOST_MEMBAR Type:** PCI Configuration Register (Size: 32 bits)
**KT_HOST_MEMBAR Reference:** [B:0, D:27, F:3] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO/V | **Receiver Buffer Register (RBR):** Implements the Receiver Buffer register of the Serial Interface. |

### 54.10.2 KT Transmitter Holding Register (MEM_KTTHR)—Offset 0h

This register implements the standard Transmitter Holding register in the KT Block. This is write-only. DLAB(i.e. KTLCR[7]) shall be 0. In non-FIFO mode, this register will be written when the Host needs to transmit data. In FIFO mode, a write to this register will be translated into a write to the THR FIFO. Reset condition: Host reset. Non-sticky.

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [KT_HOST_MEMBAR] + 0h

**KT_HOST_MEMBAR Type:** PCI Configuration Register (Size: 32 bits)
**KT_HOST_MEMBAR Reference:** [B:0, D:27, F:3] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>WO | **Transmitter Holding Register (THR):** Implements the Transmit Data register of the Serial Interface. |

### 54.10.3 KT Divisor Latch LSB Register (MEM_KTDLLR)—Offset 0h

This register implements the standard DLL register in the KT Block. DLAB(i.e. KTLCR[7]) shall be 1 in order for this register to be accessed. this register is supported only for SW compatibility and has no impact on HW performance. Reset condition: Host reset. Non-sticky.

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [KT_HOST_MEMBAR] + 0h

**KT_HOST_MEMBAR Type:** PCI Configuration Register (Size: 32 bits)
**KT_HOST_MEMBAR Reference:** [B:0, D:27, F:3] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW/V | **Divisor Latch LSB (DLL):** Implements the DLL register of the Serial Interface. |

## 54.10.4 KT Interrupt Enable register (MEM_KTIER)—Offset 1h

This register implements the standard Interrupt Enable register in the KT Block. The bits enable specific events to interrupt the Host. See bit specific definition below. DLAB(i.e. KTLCR[7]) shall is 0 in order for this register to be accessed. Reset condition: Host reset. Non-sticky.

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**BAR and Offset:** [KT_HOST_MEMBAR] + 1h

**Default:** 00h

**KT_HOST_MEMBAR Type:** PCI Configuration Register (Size: 32 bits)
**KT_HOST_MEMBAR Reference:** [B:0, D:27, F:3] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:4 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 3 | 0x0<br>RW | **MSR (IER3):** When set, enables bits in Modem Status register to cause an interrupt to the Host |
| 2 | 0x0<br>RW | **LSR (IER2):** When set, enables bits in Receiver Line Status Register to cause an interrupt to the Host |
| 1 | 0x0<br>RW | **THR (IER1):** When set, enables an interrupt to the Host when the Transmitter Holding register is empty. |
| 0 | 0x0<br>RW | **DR (IER0):** When set, enables an interrupt to the Host when the Received Data is available OR Receiver FIFO timeout. |

## 54.10.5 KT Divisor Latch MSB Register (MEM_KTDLMR)—Offset 1h

This register implements the standard DLM register in the KT Block. DLAB(i.e. KTLCR[7]) shall be 1 in order for this register to be accessed. This register is supported only for SW compatibility and has no impact on HW performance. Reset condition: Host reset. Non-sticky.

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**BAR and Offset:** [KT_HOST_MEMBAR] + 1h

**Default:** 00h

**KT_HOST_MEMBAR Type:** PCI Configuration Register (Size: 32 bits)
**KT_HOST_MEMBAR Reference:** [B:0, D:27, F:3] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW/V | **Divisor Latch MSB (DLM):** Implements the DLM register of the Serial Interface. |

## 54.10.6 KT Interrupt Identification Register (MEM_KTIIR)—Offset 2h

This register implements the standard Interrupt Identification register in the KT Block. This is read-only. This register is created to provide minimum software overhead during data character transfers. The register prioritizes KT interrupts into 4 levels and records them in the IIRSTS field of this register. The four levels of interrupt conditions in order of priority are: Receiver Line Status; Received Data Ready/Character Timeout Indication; Transmitter Holding Register Empty; MODEM Status. When the Host accesses the IIR, the HW freezes all interrupts and indicates the highest priority pending interrupt to the Host. While this Host access is occurring, the HW records new interrupts, but does not change its current indication until the access is complete. Table in the Host Interrupt Generation section shows the contents. Reset condition: Host reset. Non-sticky.

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**BAR and Offset:** [KT_HOST_MEMBAR] + 2h

**Default:** 01h

**KT_HOST_MEMBAR Type:** PCI Configuration Register (Size: 32 bits)
**KT_HOST_MEMBAR Reference:** [B:0, D:27, F:3] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RO/V | **FIFO Enable (FIEN1):** This field is connected by HW to the FIFO Enable field of the FCR register. |
| 6 | 0x0<br>RO/V | **FIFO Enable (FIEN0):** This field is connected by HW to the FIFO Enable field of the FCR register. |
| 5:4 | 0x0<br>RO | **Reserved (RSVD):** Hardwired to 0. |
| 3:1 | 0x0<br>RO/V | **IIR Status (IIRSTS):** These bits are asserted by the HW according to the source of the interrupt and the priority level.<br>Refer to the section on Host Interrupt Generation for a table of values. |
| 0 | 0x1<br>RO/V | **Interrupt Status (INTSTS):**<br>• 0: indicates a pending Host interrupt and IIRSTS may be used as a pointer to the appropriate interrupt service routine.<br>It reflects the logical-NOR of all UART interrupts.<br>An individual UART interrupt will be identified as pending when the individual event status is asserted AND its corresponding event interrupt enable is asserted as well.<br>For example, the THR Empty interrupt will be identified as pending when both LSR[THRE] bit is 1 AND IER[IER1] is 1.<br>• 1: indicates no pending Host interrupt. |

## 54.10.7 KT FIFO Control register (MEM_KTFCR)—Offset 2h

This register implements the standard FIFO Control register in the KT Block. It is used to configure features pertinent to the FIFO mode of operation. This is write-only. Reset condition: Host reset. Non-sticky.

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**BAR and Offset:** [KT_HOST_MEMBAR] + 2h

**Default:** 00h

**KT_HOST_MEMBAR Type:** PCI Configuration Register (Size: 32 bits)
**KT_HOST_MEMBAR Reference:** [B:0, D:27, F:3] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:6 | 0x0<br>WO | **Receiver Trigger Level (RTL):** Trigger level in bytes for the Receiver FIFO.<br>Once the trigger level number of bytes is reached, an interrupt will be sent to the Host [7:6] RCVR FIFO Trigger Level (bytes)<br>• 00 -- 01<br>• 01 -- 04<br>• 10 -- 08<br>• 11 -- 14 |
| 5:4 | 0x0<br>WO | **Reserved (RSVD):** Writes to this field shall be dropped. |
| 3 | 0x0<br>WO | **RDY Mode (RDYM):** This bit has no effect on HW performance. |
| 2 | 0x0<br>WO | **XMT FIFO Clear (XFIC):** When the Host writes one to this bit the HW will clear the XMT FIFO.<br>This bit is self-cleared by HW. |
| 1 | 0x0<br>WO | **RCV FIFO Clear (RFIC):** When the Host writes one to this bit the HW will clear the RCV FIFO.<br>This bit is self-cleared by HW. |
| 0 | 0x0<br>WO | **FIFO Enable (FIE):** When set indicates that the KT interface is working in FIFO node.<br>When this bit value is changed the RCV and XMT FIFO are cleared by HW.<br>This bit must be a 1 when other FCR bits are written to or they will NOT be programmed. |

## 54.10.8 KT Line Control register (MEM_KTLCR)—Offset 3h

This register implements the standard Line Control register in the KT Block. It specifies the format of the asynchronous data communications exchange and sets the DLAB bit. Most bits in this register have no effect on HW and are only used by the FW. Reset condition: Host reset. Non-sticky.

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**BAR and Offset:** [KT_HOST_MEMBAR] + 3h

**Default:** 03h

**KT_HOST_MEMBAR Type:** PCI Configuration Register (Size: 32 bits)
**KT_HOST_MEMBAR Reference:** [B:0, D:27, F:3] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RW | **Divisor Latch Access Bit (DLAB):**<br>• 1: Allows access to the Divisor Latch Registers and reading of the FIFO Control Register.<br>• 0: Allows access to RBR, THR, IER and IIR registers. |
| 6 | 0x0<br>RW | **Break Control (BC):** This bit has no effect on HW. |
| 5:4 | 0x0<br>RW | **Parity Bit Mode (PBM):** This bit has no effect on HW. |
| 3 | 0x0<br>RW | **Parity Enable (PE):** This bit has no effect on HW. |
| 2 | 0x0<br>RW | **Stop Bit Select (SBS):** This bit has no effect on HW. |
| 1:0 | 0x3<br>RW | **Word Select Byte (WSB):** This bit has no effect on HW. |

## 54.10.9 KT Modem Control register (MEM_KTMCR)—Offset 4h

This register implements the standard Modem Control register in the KT Block. It controls the interface with the modem. Because the FW emulates the modem, the Host communicates with the FW via this register. This register has impact on the HW in the loopback mode. Reset condition: Host reset. Non-sticky.

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [KT_HOST_MEMBAR] + 4h

**KT_HOST_MEMBAR Type:** PCI Configuration Register (Size: 32 bits)
**KT_HOST_MEMBAR Reference:** [B:0, D:27, F:3] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:5 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 4 | 0x0<br>RW | **Loop Back Mode (LBM):** When set by Host indicates that the serial port is in loop Back mode. This means that the data that is transmitted by the host should be received.<br>Helps in debug of the interface |
| 3 | 0x0<br>RW | **Output 2 (OUT2):** This bit has no effect on HW in normal mode.<br>In loop back mode the value of this bit is written by HW to Modem Status Register bit (7). |
| 2 | 0x0<br>RW | **Output 1 (OUT1):** This bit has no effect on HW in normal mode.<br>In loop back mode the value of this bit is written by HW to Modem Status Register bit(6). |
| 1 | 0x0<br>RW | **Request to Send Out (RTSO):** This bit has no effect on HW in normal mode.<br>In loopback mode, the value of this bit is written by HW to Modem Status Register bit(4). |
| 0 | 0x0<br>RW | **Data Terminal Ready Out (DRTO):** This bit has no effect on HW in normal mode.<br>In loopback mode, the value in this bit is written by HW to Modem Status Register Bit(5). |

## 54.10.10 KT Line Status register (MEM_KTLSR)—Offset 5h

This register implements the standard Line Status register in the KT Block. It provides status information of the data transfer to the Host. Error indication etc are provided by the HW/FW to the host via this register. Reset condition: Host reset. Non-sticky.

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**BAR and Offset:** [KT_HOST_MEMBAR] + 5h

**Default:** 60h

**KT_HOST_MEMBAR Type:** PCI Configuration Register (Size: 32 bits)
**KT_HOST_MEMBAR Reference:** [B:0, D:27, F:3] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RO/C/V | **RCVR FIFO Error (RXFER):** This bit is cleared in non FIFO mode.<br>This bit is connected to UART LSR[BI] bit in FIFO mode. |
| 6 | 0x1<br>RO/V | **Transmitter Empty (TEMT):**<br>In non-FIFO mode:<br>This bit will be set to 1 whenever the Transmitter Holding Register (THR) and the Transmitter Shift Register (TSR) are both empty, OR cleared to 0 whenever either THR or TSR contains a data byte.<br><br>In FIFO mode:<br>This bit will be set to 1 whenever XMIT FIFO and TSR are both empty, OR cleared to 0 whenever either XMIT FIFO or TSR contains a data byte.<br><br>Implementation note: This bit is connected by HW to THRE bit |

## 54.10.11 KT Modem Status register (MEM_KTMSR)—Offset 6h

This register implements the standard Modem Status register in the KT Block. It provides the current state of the control lines from the modem. The modem functionality is emulated by the FW. Reset condition: Host reset. Non-sticky.

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [KT_HOST_MEMBAR] + 6h

**KT_HOST_MEMBAR Type:** PCI Configuration Register (Size: 32 bits)
**KT_HOST_MEMBAR Reference:** [B:0, D:27, F:3] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RO | **Data Carrier Detect (DCD):** In Loop Back mode this bit is connected by HW to the value of MCR bit 3 |
| 6 | 0x0<br>RO | **Ring Indicator (RI):** In Loop Back mode this bit is connected by HW to the value of MCR bit 2. |
| 5 | 0x0<br>RO | **Data Set Ready (DSR):** In Loop Back mode this bit is connected by HW to the value of MCR bit 0. |
| 4 | 0x0<br>RO | **Clear To Send (CTS):** In Loop Back mode this bit is connected by HW to the value of MCR bit 1. |
| 3 | 0x0<br>RO/C/V | **Delta Data Carrier Detect (DDCD):** This bit is set when bit 7 is changed.<br>This bit is cleared by HW when the MSR register is being read by the HOST driver. |
| 2 | 0x0<br>RO/C/V | **Trailing Edge of Read Detector (TERI):** This bit is set when bit 6 is changed from 1 to 0.<br>This bit is cleared by HW when the MSR register is being read by the Host driver. |
| 1 | 0x0<br>RO/C/V | **Delta Data Set Ready (DDSR):** This bit is set when bit 5 is changed.<br>This bit is cleared by HW when the MSR register is being read by the Host driver. |
| 0 | 0x0<br>RO/C/V | **Delta Clear To Send (DCTS):** This bit is set when bit 4 is changed.<br>This bit is cleared by HW when the MSR register is being read by the Host driver. |

## 54.10.12 KT Scratch register (MEM_KTSCR)—Offset 7h

This register implements the standard Scratch register in the KT Block. It allows Host SW programmers to hold temporary data. It has NO effect on HW. Reset condition: Host reset. Non-sticky.

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [KT_HOST_MEMBAR] + 7h

**KT_HOST_MEMBAR Type:** PCI Configuration Register (Size: 32 bits)
**KT_HOST_MEMBAR Reference:** [B:0, D:27, F:3] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Scratch Register Data (SCRD):** Reserved. |

## 54.11 Registers in Memory Space—Fixed Address

These registers are accessed in Host Memory Space through fixed memory addresses.

### 54.11.1 FTPM Locality State (HOST_LOC_0_LOC_STATE_HROA)—Offset FED40000h

Reads by host SW from this register will reflect the value of FTPM_LOC_STATE register in mIA space. This register is aliased to the following addresses in the host address space: FED4_x000, x=0,1,2,3,4. This register is implemented in flip-flops.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [0x0] + FED40000h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0x0<br>RO/V | **Reserved (RSVD_31_8):** Opaque to HW. Defined by FW. |
| 7 | 0x0<br>RO/V | **Register Valid Status (FTPM_REG_VALID_STS):** Opaque to HW.<br>This bit is used by FW to signal to host SW when this register is valid. |
| 6:5 | 0x0<br>RO/V | **Reserved (RSVD_6_5):** Opaque to HW. Defined by FW. |
| 4:2 | 0x0<br>RO/V | **Active Locality (FTPM_ACTV_LOC):** The encodings are:<br>• 000 - Locality 0,<br>• 001 - Locality 1,<br>• 010 - Locality 2,<br>• 011 - Locality 3,<br>• 100 - Locality 4,<br>• 101 and 111 - reserved.<br>FW sets these bits to mux in the active locality.<br>Once set, the FTPM HCI will pass cycles from the active host locality to the FTPM shared SRAM.<br>Writes from in-active localities will be dropped and reads will return 0's. |
| 1 | 0x0<br>RO/V | **Locality Assigned (FTPM_LOC_ASSIGNED):** A value of 0 indicates to host SW that no locality is assigned, a value of 1 indicates a locality has been assigned. |
| 0 | 0x0<br>RO/V | **Establishment (FTPM_ESTABLISHMENT):**<br>Opaque to HW.<br>This bit is set to 0 by FW when HASH_START occurs and set to 1 when the RESET_ESTABLISHMENT bit is set. |

### 54.11.2 FTPM Locality Reserved (HOST_LOC_0_LOC_RSVD)—Offset FED40004h

This register was added in order to support QW reads from Locality State register.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [0x0] + FED40004h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO | **Reserved (FTPM_LOC_RSVD_BITS):** Reserved. |

### 54.11.3 FTPM Locality n Control Register (HOST_LOC_0_LOC_CTRL)—Offset FED40008h

Writes by host SW to this register will update the value of the corresponding LOC_n_CTRL_CSEROA register in mIA space. Writes by host SW to this register may be configured by CSE FW to trigger an MSI/PME to mIA. This register is implemented in flip-flops.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [0x0] + FED40008h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>WO | **FTPM Locality n Control Bits (FTPM_LOC_CTRL_BITS):** Reserved. |

### 54.11.4 FTPM Locality n Status Register Host Read Only Access. (HOST_LOC_0_LOC_STS_HROA)—Offset FED4000Ch

Reads by host SW from this register will reflect the value of the corresponding LOC_n_STS register in mIA space. This register is opaque to HW. This register is implemented in flip-flops.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [0x0] + FED4000Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **FTPM Locality n Status Bits (FTPM_LOC_STS_BITS):** Reserved. |

### 54.11.5 FTPM Locality Config Area Reserved Read Write[0-7] (HOST_LOC_0_RSVD_RW1[0-7])—Offset FED40010h, Count 8, Stride 4h

This register represents a DW of RW memory in FTPM EBB which has no defined functionality. This DW is aliased to the same offset for each locality, and even inactive localities can access it.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset[0-7]:** [0x0] + FED40010h + [0-7]*4h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **FTPM Locality Config Area Reserved Read Write DW (RSVD_RW_31_0):** Reserved. |

### 54.11.6 FTPM Interface ID Host Read Only Access 0 (HOST_LOC_0_INTF_ID_0)—Offset FED40030h

This register is opaque to HW. This register is implemented in flip-flops.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [0x0] + FED40030h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **FTPM Interface ID Bits 0 (FTPM_INTF_ID_BITS_0):** These are the 32 LSbits used by FW to inform host SW as to the interface type of the TPM.<br>The exact usage is defined by TCG. |

### 54.11.7 FTPM Interface ID Host Read Only Access 1 (HOST_LOC_0_INTF_ID_1)—Offset FED40034h

This register is opaque to HW. This register is implemented in flip-flops.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [0x0] + FED40034h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **FTPM Interface ID Bits 1 (FTPM_INTF_ID_BITS_1):** These are the 32 MSbits used by FW to inform host SW as to the interface type of the TPM.<br>The exact usage is defined by TCG. |

### 54.11.8 FTPM Locality Config Area Reserved Read Write[0-1] (HOST_LOC_0_RSVD_RW2[0-1])—Offset FED40038h, Count 2, Stride 4h

This register represents a DW of RW memory in FTPM EBB which has no defined functionality. This DW is aliased to the same offset for each locality, and even inactive localities can access it.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset[0-1]:** [0x0] + FED40038h + [0-1]*4h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **FTPM Locality Config Area Reserved Read Write DW (RSVD_RW_31_0):** Reserved. |

## 54.11.9 Control Area Request (HOST_LOC_0_CA_REQUEST)—Offset FED40040h

This register is implemented in flip-flops. This register is implemented in retention flops to maintain state through PG.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [0x0] + FED40040h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **HOST_CA_REQUEST:** Host software sets this field to a CSxE firmware-defined value to indicate a state change request to the fTPM.<br>Any host write to this register shall result in an interrupt to the CSxE firmware, or wakeup the CSxE subsystem when it is in power-gated state. |

## 54.11.10 Control Area Status (HOST_LOC_0_CA_STATUS)—Offset FED40044h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [0x0] + FED40044h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **HOST_CA_STATUS:** Reserved. |

## 54.11.11 Control Area Cancel (HOST_LOC_0_CA_CANCEL)—Offset FED40048h

This register is implemented in flip-flops. This register is implemented in retention flops to maintain state through PG.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [0x0] + FED40048h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **HOST_CA_CANCEL:** Host software sets this field to a CSxE firmware-defined value to indicate that a command should be canceled.<br>Any host write to this register shall result in an interrupt to the CSxE firmware, or wakeup the CSxE subsystem when it is in power-gated state. |

## 54.11.12 Control Area Start (HOST_LOC_0_CA_START)—Offset FED4004Ch

This register is implemented in flip-flops. This register is implemented in retention flops to maintain state through PG.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [0x0] + FED4004Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Control Area Start (HOST_CA_START):** Host software sets this field to a CSxE firmware defined value to indicate that a command is available for processing.<br>The reset value indicates that a command is NOT available for processing.<br>Any host write to this register shall result in an interrupt to the CSE firmware or wakeup the CSE subsystem when it is in power-gated state. |

## 54.11.13 Control Area Interrupt Reserved Part 1 (HOST_LOC_0_CA_INT_RSVD1)—Offset FED40050h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [0x0] + FED40050h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **RSVD_31_0:** Reserved. |

## 54.11.14 Control Area Interrupt Reserved Part 2 (HOST_LOC_0_CA_INT_RSVD2)—Offset FED40054h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [0x0] + FED40054h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **RSVD_31_0:** Reserved. |

## 54.11.15 Control Area Command Size (HOST_LOC_0_CA_CMD_SZ)—Offset FED40058h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [0x0] + FED40058h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **HOST_CA_CMD_SZ:** Reserved. |

## 54.11.16 Control Area Command Part 1 (HOST_LOC_0_CA_CMD1)—Offset FED4005Ch

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [0x0] + FED4005Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **HOST_CA_CMD1:** Reserved. |

## 54.11.17 Control Area Command Part 2 (HOST_LOC_0_CA_CMD2)—Offset FED40060h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [0x0] + FED40060h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **HOST_CA_CMD2:** Reserved. |

## 54.11.18 Control Area Response Size (HOST_LOC_0_CA_RSP_SZ)—Offset FED40064h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [0x0] + FED40064h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **HOST_CA_RSP_SZ:** Reserved. |

## 54.11.19 Control Area Response Part 1 (HOST_LOC_0_CA_RSP1)—Offset FED40068h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [0x0] + FED40068h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **HOST_CA_RSP1:** Reserved. |

## 54.11.20 Control Area Response Part 2 (HOST_LOC_0_CA_RSP2)—Offset FED4006Ch

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [0x0] + FED4006Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **HOST_CA_RSP2:** Reserved. |

## 54.11.21 FTPM Reserved Read Write[0-3] (HOST_LOC_0_RSVD_RW3[0-3])—Offset FED40070h, Count 4, Stride 4h

This register represents a DW of RW memory in FTPM EBB which has no defined functionality. The access to this DW is allowed only to an active locality.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset[0-3]:** [0x0] + FED40070h + [0-3]*4h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **FTPM Reserved Read Write DW (RSVD_RW_31_0):** Reserved. |

## 54.11.22 FTPM Command and Response Buffer[0-991] (HOST_LOC_0_FTPM_CRB[0-991])—Offset FED40080h, Count 992, Stride 4h

This register represents a DW of RW memory in FTPM CRB (EBB)

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset[0-991]:** [0x0] + FED40080h + [0-991]*4h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **FTPM Command and Response Buffer DW (HOST_FTPM_CRB_DW):** Reserved. |

## 54.12 Registers in I/O Space—KT_HOST_IOBAR

These registers are accessed in Host I/O Space starting at the relocatable I/O address defined by the Base Address Register (BAR) KT_HOST_IOBAR described in Section 54.5.5, "KT IO BAR (KT_HOST_IOBAR)—Offset 10h" on page 2512.

### 54.12.1 KT Receive Buffer Register (IO_KTRBR)—Offset 0h

This register implements the standard Receiver Buffer register in the KT Block. This is read-only. DLAB(i.e. KTLCR[7]) shall be 0. In non-FIFO mode, this register will be read when the receiver data is ready. In FIFO mode, a read from this register will be translated into a read from the RBR FIFO. Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [KT_HOST_IOBAR] + 0h

**KT_HOST_IOBAR Type:** PCI Configuration Register (Size: 32 bits)
**KT_HOST_IOBAR Reference:** [B:0, D:27, F:3] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO/V | **Receiver Buffer Register (RBR):** Implements the Receiver Buffer register of the Serial Interface. |

### 54.12.2 KT Transmitter Holding Register (IO_KTTHR)—Offset 0h

This register implements the standard Transmitter Holding register in the KT Block. This is write-only. DLAB(i.e. KTLCR[7]) shall be 0. In non-FIFO mode, this register will be written when the Host needs to transmit data. In FIFO mode, a write to this register will be translated into a write to the THR FIFO. Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [KT_HOST_IOBAR] + 0h

**KT_HOST_IOBAR Type:** PCI Configuration Register (Size: 32 bits)
**KT_HOST_IOBAR Reference:** [B:0, D:27, F:3] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>WO | **Transmitter Holding Register (THR):** Implements the Transmit Data register of the Serial Interface. |

### 54.12.3 KT Divisor Latch LSB Register (IO_KTDLLR)—Offset 0h

This register implements the standard DLL register in the KT Block. DLAB(i.e. KTLCR[7]) shall be 1 in order for this register to be accessed. this register is supported only for SW compatibility and has no impact on HW performance. Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [KT_HOST_IOBAR] + 0h

**KT_HOST_IOBAR Type:** PCI Configuration Register (Size: 32 bits)
**KT_HOST_IOBAR Reference:** [B:0, D:27, F:3] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW/V | **Divisor Latch LSB (DLL):** Implements the DLL register of the Serial Interface. |

### 54.12.4 KT Interrupt Enable register (IO_KTIER)—Offset 1h

This register implements the standard Interrupt Enable register in the KT Block. The bits enable specific events to interrupt the Host. See bit specific definition below. DLAB(i.e. KTLCR[7]) shall is 0 in order for this register to be accessed. Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [KT_HOST_IOBAR] + 1h

**KT_HOST_IOBAR Type:** PCI Configuration Register (Size: 32 bits)
**KT_HOST_IOBAR Reference:** [B:0, D:27, F:3] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:4 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 3 | 0x0<br>RW | **MSR (IER3):** When set, enables bits in Modem Status register to cause an interrupt to the Host. |
| 2 | 0x0<br>RW | **LSR (IER2):** When set, enables bits in Receiver Line Status Register to cause an interrupt to the Host. |
| 1 | 0x0<br>RW | **THR (IER1):** When set, enables an interrupt to the Host when the Transmitter Holding register is empty. |
| 0 | 0x0<br>RW | **DR (IER0):** When set, enables an interrupt to the Host when the Received Data is available OR Receiver FIFO timeout. |

## 54.12.5 KT Divisor Latch MSB Register (IO_KTDLMR)—Offset 1h

This register implements the standard DLM register in the KT Block. DLAB(i.e. KTLCR[7]) shall be 1 in order for this register to be accessed. This register is supported only for SW compatibility and has no impact on HW performance. Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [KT_HOST_IOBAR] + 1h

**Default:** 00h

**KT_HOST_IOBAR Type:** PCI Configuration Register (Size: 32 bits)
**KT_HOST_IOBAR Reference:** [B:0, D:27, F:3] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW/V | **Divisor Latch MSB (DLM):** Implements the DLM register of the Serial Interface. |

## 54.12.6 KT Interrupt Identification Register (IO_KTIIR)—Offset 2h

This register implements the standard Interrupt Identification register in the KT Block. This is read-only. This register is created to provide minimum software overhead during data character transfers. The register prioritizes KT interrupts into 4 levels and records them in the IIRSTS field of this register. The four levels of interrupt conditions in order of priority are: Receiver Line Status; Received Data Ready/Character Timeout Indication; Transmitter Holding Register Empty; MODEM Status. When the Host accesses the IIR, the HW freezes all interrupts and indicates the highest priority pending interrupt to the Host. While this Host access is occurring, the HW records new interrupts, but does not change its current indication until the access is complete. Table in the Host Interrupt Generation section shows the contents. Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [KT_HOST_IOBAR] + 2h

**Default:** 01h

**KT_HOST_IOBAR Type:** PCI Configuration Register (Size: 32 bits)
**KT_HOST_IOBAR Reference:** [B:0, D:27, F:3] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RO/V | **FIFO Enable (FIEN1):** This field is connected by HW to the FIFO Enable field of the FCR register. |
| 6 | 0x0<br>RO/V | **FIFO Enable (FIEN0):** This field is connected by HW to the FIFO Enable field of the FCR register. |
| 5:4 | 0x0<br>RO | **Reserved (RSVD):** Hardwired to 0. |
| 3:1 | 0x0<br>RO/V | **IIR Status (IIRSTS):** These bits are asserted by the HW according to the source of the interrupt and the priority level.<br>Refer to the section on Host Interrupt Generation for a table of values. |
| 0 | 0x1<br>RO/V | **Interrupt Status (INTSTS):**<br>• 0: indicates a pending Host interrupt and IIRSTS may be used as a pointer to the appropriate interrupt service routine.<br>It reflects the logical-NOR of all UART interrupts.<br>An individual UART interrupt will be identified as pending when the individual event status is asserted AND its corresponding event interrupt enable is asserted as well.<br>For example, the THR Empty interrupt will be identified as pending when both LSR[THRE] bit is 1 AND IER[IER1] is 1.<br>• 1: indicates no pending Host interrupt. |

## 54.12.7 KT FIFO Control register (IO_KTFCR)—Offset 2h

This register implements the standard FIFO Control register in the KT Block. It is used to configure features pertinent to the FIFO mode of operation. This is write-only. Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [KT_HOST_IOBAR] + 2h

**KT_HOST_IOBAR Type:** PCI Configuration Register (Size: 32 bits)
**KT_HOST_IOBAR Reference:** [B:0, D:27, F:3] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:6 | 0x0<br>WO | **Receiver Trigger Level (RTL):** Trigger level in bytes for the Receiver FIFO.<br>Once the trigger level number of bytes is reached, an interrupt will be sent to the Host [7:6] RCVR FIFO Trigger Level (bytes)<br>• 00 -- 01<br>• 01 -- 04<br>• 10 -- 08<br>• 11 -- 14 |
| 5:4 | 0x0<br>WO | **Reserved (RSVD):** Writes to this field shall be dropped. |
| 3 | 0x0<br>WO | **RDY Mode (RDYM):** This bit has no effect on HW performance. |
| 2 | 0x0<br>WO | **XMT FIFO Clear (XFIC):** When the Host writes one to this bit the HW will clear the XMT FIFO.<br>This bit is self-cleared by HW. |
| 1 | 0x0<br>WO | **RCV FIFO Clear (RFIC):** When the Host writes one to this bit the HW will clear the RCV FIFO.<br>This bit is self-cleared by HW. |
| 0 | 0x0<br>WO | **FIFO Enable (FIE):** When set indicates that the KT interface is working in FIFO node.<br>When this bit value is changed the RCV and XMT FIFO are cleared by HW.<br>This bit must be a 1 when other FCR bits are written to or they will NOT be programmed. |

## 54.12.8 KT Line Control register (IO_KTLCR)—Offset 3h

This register implements the standard Line Control register in the KT Block. It specifies the format of the asynchronous data communications exchange and sets the DLAB bit. Most bits in this register have no effect on HW and are only used by the FW. Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [KT_HOST_IOBAR] + 3h

**Default:** 03h

**KT_HOST_IOBAR Type:** PCI Configuration Register (Size: 32 bits)
**KT_HOST_IOBAR Reference:** [B:0, D:27, F:3] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RW | **Divisor Latch Access Bit (DLAB):**<br>• 1: Allows access to the Divisor Latch Registers and reading of the FIFO Control Register.<br>• 0: Allows access to RBR, THR, IER and IIR registers. |
| 6 | 0x0<br>RW | **Break Control (BC):** This bit has no effect on HW. |
| 5:4 | 0x0<br>RW | **Parity Bit Mode (PBM):** This bit has no effect on HW. |
| 3 | 0x0<br>RW | **Parity Enable (PE):** This bit has no effect on HW. |
| 2 | 0x0<br>RW | **Stop Bit Select (SBS):** This bit has no effect on HW. |
| 1:0 | 0x3<br>RW | **Word Select Byte (WSB):** This bit has no effect on HW. |

## 54.12.9 KT Modem Control register (IO_KTMCR)—Offset 4h

This register implements the standard Modem Control register in the KT Block. It controls the interface with the modem. Because the FW emulates the modem, the Host communicates with the FW via this register. This register has impact on the HW in the loopback mode. Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [KT_HOST_IOBAR] + 4h

**Default:** 00h

**KT_HOST_IOBAR Type:** PCI Configuration Register (Size: 32 bits)
**KT_HOST_IOBAR Reference:** [B:0, D:27, F:3] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:5 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 4 | 0x0<br>RW | **Loop Back Mode (LBM):** When set by Host indicates that the serial port is in loop Back mode.<br>This means that the data that is transmitted by the host should be received.<br>Helps in debug of the interface. |
| 3 | 0x0<br>RW | **Output 2 (OUT2):** This bit has no effect on HW in normal mode.<br>In loop back mode the value of this bit is written by HW to Modem Status Register bit (7). |
| 2 | 0x0<br>RW | **Output 1 (OUT1):** This bit has no effect on HW in normal mode.<br>In loop back mode the value of this bit is written by HW to Modem Status Register bit(6). |
| 1 | 0x0<br>RW | **Request to Send Out (RTSO):** This bit has no effect on HW in normal mode.<br>In loopback mode, the value of this bit is written by HW to Modem Status Register bit(4). |
| 0 | 0x0<br>RW | **Data Terminal Ready Out (DRTO):** This bit has no effect on HW in normal mode.<br>In loopback mode, the value in this bit is written by HW to Modem Status Register Bit(5). |

## 54.12.10 KT Line Status register (IO_KTLSR)—Offset 5h

This register implements the standard Line Status register in the KT Block. It provides status information of the data transfer to the Host. Error indication etc are provided by the HW/FW to the host via this register. Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [KT_HOST_IOBAR] + 5h

**Default:** 60h

**KT_HOST_IOBAR Type:** PCI Configuration Register (Size: 32 bits)
**KT_HOST_IOBAR Reference:** [B:0, D:27, F:3] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RO/C/V | **RCVR FIFO Error (RXFER):** This bit is cleared in non FIFO mode.<br>This bit is connected to UART LSR[BI] bit in FIFO mode. |
| 6 | 0x1<br>RO/C/V | **Transmitter Empty (TEMT):**<br>In non-FIFO mode:<br>This bit will be set to 1 whenever the Transmitter Holding Register (THR) and the Transmitter Shift Register (TSR) are both empty, OR cleared to 0 whenever either THR or TSR contains a data byte.<br><br>In FIFO mode:<br>This bit will be set to 1 whenever XMIT FIFO and TSR are both empty, OR cleared to 0 whenever either XMIT FIFO or TSR contains a data byte.<br><br>Implementation note: This bit is connected by HW to THRE bit |
| 5 | 0x1<br>RO/C/V | **Transmitter Holding Register Empty (THRE):** The bit will always be set whenever Host changes UART FCR[FIE] bit.<br>This bit is controlled differently in FIFO vs non-FIFO modes:<br>Non-FIFO mode:<br>This bit will be cleared by HW when Host writes to THR, and set by HW when FW reads from THR.<br><br>FIFO mode:<br>This bit will be set by HW when XMIT FIFO is empty , and cleared by HW when XMIT FIFO is NOT empty. |
| 4 | 0x0<br>RO/C/V | **Break Interrupt (BI):** This bit will be cleared by HW when the UART LSR register is read by Host.<br>This bit will be set by HW in two cases:<br>In FIFO mode, when FW sets the KTRIVR[SBI] bit.<br>In non-FIFO mode, when FW sets the KTRBR[BIA] bit. |
| 3 | 0x0<br>RO | **Framing Error (FE):** This bit is NOT implemented and hardwired to 0. |
| 2 | 0x0<br>RO | **Parity Error (PE):** This bit is NOT implemented and hardwired to 0. |
| 1 | 0x0<br>RO/C/V | **Overrun Error (OE):** HW will clear this bit when Host reads from KTLSR register and this is source of interrupt.<br>HW will set this bit when overrun error is detected.<br>In non-FIFO mode, the character that triggers the overrun error shall overwrite the character in the RBR register.<br>In FIFO mode, the character that triggers the overrun error shall be dropped without corrupting the RCVR FIFO. |
| 0 | 0x0<br>RO/V | **Data Ready (DR):**<br>Non-FIFO Mode:<br>This bit will be set by HW when FW writes to RBR and cleared by HW when Host reads from RBR.<br><br>FIFO Mode:<br>The bit will be set by HW when RCVR FIFO is not empty and cleared by HW when RCVR FIFO is empty. |

## 54.12.11 KT Modem Status register (IO_KTMSR)—Offset 6h

This register implements the standard Modem Status register in the KT Block. It provides the current state of the control lines from the modem. The modem functionality is emulated by the FW. Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [KT_HOST_IOBAR] + 6h

**KT_HOST_IOBAR Type:** PCI Configuration Register (Size: 32 bits)
**KT_HOST_IOBAR Reference:** [B:0, D:27, F:3] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RO | **Data Carrier Detect (DCD):** In Loop Back mode this bit is connected by HW to the value of MCR bit 3. |
| 6 | 0x0<br>RO | **Ring Indicator (RI):** In Loop Back mode this bit is connected by HW to the value of MCR bit 2. |
| 5 | 0x0<br>RO | **Data Set Ready (DSR):** In Loop Back mode this bit is connected by HW to the value of MCR bit 0. |
| 4 | 0x0<br>RO | **Clear To Send (CTS):** In Loop Back mode this bit is connected by HW to the value of MCR bit 1. |
| 3 | 0x0<br>RO/C/V | **Delta Data Carrier Detect (DDCD):** This bit is set when bit 7 is changed.<br>This bit is cleared by HW when the MSR register is being read by the HOST driver. |
| 2 | 0x0<br>RO/C/V | **Trailing Edge of Read Detector (TERI):** This bit is set when bit 6 is changed from 1 to 0.<br>This bit is cleared by HW when the MSR register is being read by the Host driver. |
| 1 | 0x0<br>RO/C/V | **Delta Data Set Ready (DDSR):** This bit is set when bit 5 is changed.<br>This bit is cleared by HW when the MSR register is being read by the Host driver. |
| 0 | 0x0<br>RO/C/V | **Delta Clear To Send (DCTS):** This bit is set when bit 4 is changed.<br>This bit is cleared by HW when the MSR register is being read by the Host driver. |

## 54.12.12 KT Scratch register (IO_KTSCR)—Offset 7h

This register implements the standard Scratch register in the KT Block. It allows Host SW programmers to hold temporary data. It has NO effect on HW. Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [KT_HOST_IOBAR] + 7h

**KT_HOST_IOBAR Type:** PCI Configuration Register (Size: 32 bits)
**KT_HOST_IOBAR Reference:** [B:0, D:27, F:3] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Scratch Register Data (SCRD):** Reserved. |

## 54.13 Registers in I/O Space—IDE_HOST_PCMDIOBAR

These registers are accessed in Host I/O Space starting at the relocatable I/O address defined by the Base Address Register (BAR) IDE_HOST_PCMDIOBAR described in Section 54.6.5, "IDE Primary Command Block IO BAR (IDE_HOST_PCMDIOBAR)—Offset 10h" on page 2525.

### 54.13.1 IDE Data Register (IDEDATA)—Offset 0h

This register serves as the data interface in IDE PIO modes. Unit of access is in WORD. Host writes to this register are converted into writes to the PIO buffer in CSxE memory at monotonically increasing WORD address. Host writes are dropped under any one of the following conditions: (1) PIO modes are disabled. (Cfg. IDEPBPR[EN] defined in CSxE memory space) (2) PIO buffer is full. Host reads from this register are converted into reads from the PIO buffer in CSxE memory at monotonically increasing WORD address. Host reads are dropped under any one of the following conditions: (1) PIO modes are disabled. (Cfg. IDEPBPR[EN] defined in CSxE memory space) (2) PIO buffer is empty. Reset condition: no connection to any reset signal.

**Type:** I/O Register
(Size: 16 bits)

**Default:** 0000h

**BAR and Offset:** [IDE_HOST_PCMDIOBAR] + 0h

**IDE_HOST_PCMDIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_PCMDIOBAR Reference:** [B:0, D:27, F:2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0x0<br>RW/V | **IDE Data Register (IDEDR):** Data interface in IDE PIO modes.<br>Host reads/writes from/to this register are converted into reads/writes from/to the PIO buffer in CSxE memory. |

### 54.13.2 IDE Features Register (IDEFR)—Offset 1h

This register implements the standard Features register in the Primary IDE Command Block. This is write-only. BE[0] shall be deasserted. Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [IDE_HOST_PCMDIOBAR] + 1h

**IDE_HOST_PCMDIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_PCMDIOBAR Reference:** [B:0, D:27, F:2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>WO | **IDE Features Data (IDEFD):** The IDE Features register is command specific and is used to enable and disable interface features. |

## 54.13.3 IDE Error Register DEV0 (IDEERD0)—Offset 1h

This register implements the standard Device 0 Error register in the Primary IDE Command Block. This is read-only. BE[0] shall be deasserted. DEV = 0 (i.e. IDEDHIR[4] = 0). Reset condition: CSxE reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [IDE_HOST_PCMDIOBAR] + 1h

**Default:** 00h

**IDE_HOST_PCMDIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_PCMDIOBAR Reference:** [B:0, D:27, F:2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO/V | **IDE Error Data (IDEED):** Upon command completion of any command except EXECUTE DEVICE DIAGNOSTIC or DEVICE RESET, the content of this register is valid and contains error status when the ERR bit is set to 1 in the Status register (i.e. IDESR0[ERR] = 1).<br>Following a power-on, a hardware or software reset, or command completion of an EXECUTE DEVICE DIAGNOSTIC or DEVICE RESET command, this register contains a diagnostic code.<br>Bit 2 ABRT (command aborted) is set to 1 to indicate the requested command has been command aborted because the command code or a command parameter is invalid, the command is not supported, a pre-requisite for the command has not been met, or some other error has occurred. |

## 54.13.4 IDE Error Register DEV1 (IDEERD1)—Offset 1h

This register implements the standard Device 1 Error register in the Primary IDE Command Block. This is read-only. BE[0] shall be deasserted. DEV = 1 (i.e. IDEDHIR[4] = 1). Reset condition: CSxE reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [IDE_HOST_PCMDIOBAR] + 1h

**Default:** 00h

**IDE_HOST_PCMDIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_PCMDIOBAR Reference:** [B:0, D:27, F:2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO/V | **IDE Error Data (IDEED):** Upon command completion of any command except EXECUTE DEVICE DIAGNOSTIC or DEVICE RESET, the content of this register is valid and contains error status when the ERR bit is set to 1 in the Status register (i.e. IDESR0[ERR] = 1).<br>Following a power-on, a hardware or software reset, or command completion of an EXECUTE DEVICE DIAGNOSTIC or DEVICE RESET command, this register contains a diagnostic code.<br>Bit 2 ABRT (command aborted) is set to 1 to indicate the requested command has been command aborted because the command code or a command parameter is invalid, the command is not supported, a pre-requisite for the command has not been met, or some other error has occurred. |

## 54.13.5 IDE Sector Count In Register (IDESCIR)—Offset 2h

This register implements the standard Sector Count In register in the Primary IDE Command Block. All 3 registers (IDESCIR, IDESCOR0, IDESCOR1) will be updated with the same write data when this register is write-accessed. This is write-only. This register is meaningful for an ATA command while unused for an ATAPI command. Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [IDE_HOST_PCMDIOBAR] + 2h

**Default:** 00h

**IDE_HOST_PCMDIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_PCMDIOBAR Reference:** [B:0, D:27, F:2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>WO | **IDE Sector Count Data (IDESCD):** The Sector Count register specifies the sector count of the data for which an ATA transfer has been made. |

## 54.13.6 IDE Sector Count Out Register DEV0 (IDESCOR0)—Offset 2h

This register implements the standard Device 0 Sector Count Out register in the Primary IDE Command Block. This is read-only. DEV = 0 (i.e. IDEDHIR[4] = 0). CSxE FW writes to this register upon completion of an ATA/ATAPI command. This register is called IDE Interrupt Reason Register DEV0 for an ATAPI command. Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [IDE_HOST_PCMDIOBAR] + 2h

**Default:** 00h

**IDE_HOST_PCMDIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_PCMDIOBAR Reference:** [B:0, D:27, F:2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO/V | **IDE Sector Count Out DEV0 (ISCOD0):** Sector Count Out register for Device 0. |

## 54.13.7 IDE Sector Count Out Register DEV1 (IDESCOR1)—Offset 2h

This register implements the standard Device 1 Sector Count Out register in the Primary IDE Command Block. This is read-only. DEV = 1 (i.e. IDEDHIR[4] = 1). CSxE FW writes to this register upon completion of an ATA/ATAPI command. This register is called IDE Interrupt Reason Register DEV1 for an ATAPI command. Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [IDE_HOST_PCMDIOBAR] + 2h

**Default:** 00h

**IDE_HOST_PCMDIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_PCMDIOBAR Reference:** [B:0, D:27, F:2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO/V | **IDE Sector Count Out DEV1 (ISCOD1):** Sector Count Out register for Device 1. |

## 54.13.8 IDE Sector Number In Register (IDESNIR)—Offset 3h

This register implements the standard Sector Number In register in the Primary IDE Command Block in CHS addressing mode. All 3 registers (IDESNIR, IDESNOR0, IDESNOR1) will be updated with the same write data when this register is write-accessed. This is write-only. This register is called IDE LBA Low In Register in LBA addressing mode. This register is reserved for an ATAPI command. Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [IDE_HOST_PCMDIOBAR] + 3h

**Default:** 00h

**IDE_HOST_PCMDIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_PCMDIOBAR Reference:** [B:0, D:27, F:2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>WO | **IDE Sector Number Data (IDESND):** The Sector Number register is set by the host to specify the starting sector number associated with the next ATA command to be executed.<br>Following a qualified ATA command sequence the device will set the register value to the last sector read or written as a result of the previous ATA command. |

## 54.13.9 IDE Sector Number Out Register DEV0 (IDESNOR0)—Offset 3h

This register implements the standard Device 0 Sector Number Out register in the Primary IDE Command Block. This is read-only. DEV = 0 (i.e. IDEDHIR[4] = 0). CSxE FW writes to this register upon completion of an ATA command. This register is called IDE LBA Low Out Register DEV0 in LBA addressing mode. This register is reserved for an ATAPI command. Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [IDE_HOST_PCMDIOBAR] + 3h

**Default:** 00h

**IDE_HOST_PCMDIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_PCMDIOBAR Reference:** [B:0, D:27, F:2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO/V | **IDE Sector Number Out DEV0 (IDESNO0):** Sector Number Out register for Device 0. |

## 54.13.10 IDE Sector Number Out Register DEV1 (IDESNOR1)—Offset 3h

This register implements the standard Device 1 Sector Number Out register in the Primary IDE Command Block. This is read-only. DEV = 1 (i.e. IDEDHIR[4] = 1). CSxE FW writes to this register upon completion of an ATA command. This register is called IDE LBA Low Out Register DEV1 in LBA addressing mode. This register is reserved for an ATAPI command. Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [IDE_HOST_PCMDIOBAR] + 3h

**Default:** 00h

**IDE_HOST_PCMDIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_PCMDIOBAR Reference:** [B:0, D:27, F:2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO/V | **IDE Sector Number Out DEV1 (IDESNO1):** Sector Number Out register for Device 1. |

## 54.13.11 IDE Cylinder Low In Register (IDECLIR)—Offset 4h

This register implements the standard Cylinder Low In register in the Primary IDE Command Block. All 3 registers (IDECLIR, IDCLOR0, IDCLOR1) will be updated with the same write data when this register is write-accessed. This is write-only. This register is called IDE LBA Mid In Register in LBA addressing mode. This register is called IDE Byte Count Low Limit Register for an ATAPI command. Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [IDE_HOST_PCMDIOBAR] + 4h

**Default:** 00h

**IDE_HOST_PCMDIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_PCMDIOBAR Reference:** [B:0, D:27, F:2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>WO | **IDE Cylinder Low Data. (IDECLD):** The Cylinder Low register is set by the host to specify the cylinder number low byte.<br>Following an ATA command, the contents of this register is written by the device, identifying the cylinder number low byte. |

## 54.13.12 IDE Cylinder Low Out Register DEV0 (IDCLOR0)—Offset 4h

This register implements the standard Device 0 Cylinder Low Out register in the Primary IDE Command Block. This is read-only. DEV = 0 (i.e. IDEDHIR[4] = 0). CSxE FW writes to this register upon completion of an ATA command. This register is called IDE LBA Mid Out Register DEV0 in LBA addressing mode. This register is called IDE Byte Count Low Register DEV0 for an ATAPI command. Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [IDE_HOST_PCMDIOBAR] + 4h

**Default:** 00h

**IDE_HOST_PCMDIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_PCMDIOBAR Reference:** [B:0, D:27, F:2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO/V | **IDE Cylinder Low Out DEV0. (IDECLO0):** Cylinder Low Out Register for Device 0. |

## 54.13.13 IDE Cylinder Low Out Register DEV1 (IDCLOR1)—Offset 4h

This register implements the standard Device 1 Cylinder Low Out register in the Primary IDE Command Block. This is read-only. DEV = 1 (i.e. IDEDHIR[4] = 1). CSxE FW writes to this register upon completion of an ATA command. This register is called IDE LBA Mid Out Register DEV1 in LBA addressing mode. This register is called IDE Byte Count Low Register DEV1 for an ATAPI command. Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [IDE_HOST_PCMDIOBAR] + 4h

**Default:** 00h

**IDE_HOST_PCMDIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_PCMDIOBAR Reference:** [B:0, D:27, F:2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO/V | **IDE Cylinder Low Out DEV1. (IDECLO1):** Cylinder Low Out Register for Device 1. |

## 54.13.14 IDE Cylinder High In Register (IDECHIR)—Offset 5h

This register implements the standard Cylinder High In register in the Primary IDE Command Block. All 3 registers (IDECHIR, IDCHOR0, IDCHOR1) will be updated with the same write data when this register is write-accessed. This is write-only. This register is called IDE LBA High In Register in LBA addressing mode. This register is called IDE Byte Count High Limit Register for an ATAPI command. Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [IDE_HOST_PCMDIOBAR] + 5h

**Default:** 00h

**IDE_HOST_PCMDIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_PCMDIOBAR Reference:** [B:0, D:27, F:2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>WO | **IDE Cylinder High Data (IDECHD):** The Cylinder High register is set by the host to specify the cylinder number high byte.<br>Following an ATA command, the contents of this register is written by the device, identifying the cylinder number high byte. |

## 54.13.15 IDE Cylinder High Out Register DEV0 (IDCHOR0)—Offset 5h

This register implements the standard Device 0 Cylinder High Out register in the Primary IDE Command Block. This is read-only. DEV = 0 (i.e. IDEDHIR[4] = 0). CSxE FW writes to this register upon completion of an ATA command. This register is called IDE LBA High Out Register DEV0 in LBA addressing mode. This register is called IDE Byte Count High Register DEV0 for an ATAPI command. Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [IDE_HOST_PCMDIOBAR] + 5h

**Default:** 00h

**IDE_HOST_PCMDIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_PCMDIOBAR Reference:** [B:0, D:27, F:2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO/V | **IDE Cylinder High Out DEV0 (IDECHO0):** Cylinder High Out register for Device 0. |

## 54.13.16 IDE Cylinder High Out Register DEV1 (IDCHOR1)—Offset 5h

This register implements the standard Device 1 Cylinder High Out register in the Primary IDE Command Block. This is read-only. DEV = 1 (i.e. IDEDHIR[4] = 1). CSxE FW writes to this register upon completion of an ATA command. This register is called IDE LBA High Out Register DEV1 in LBA addressing mode. This register is called IDE Byte Count High Register DEV1 for an ATAPI command. Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [IDE_HOST_PCMDIOBAR] + 5h

**Default:** 00h

**IDE_HOST_PCMDIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_PCMDIOBAR Reference:** [B:0, D:27, F:2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO/V | **IDE Cylinder High Out DEV1 (IDECHO1):** Cylinder High Out register for Device 1. |

## 54.13.17 IDE Drive/Head In Register (IDEDHIR)—Offset 6h

This register implements the standard Drive/Head In register in the Primary IDE Command Block. All 3 registers (IDEDHIR, IDDHOR0, IDDHOR1) will be updated with the same write data when this register is write-accessed. This is write-only. Bit 4 of this register is the DEV (master/slave) bit. This bit is cleared by hardware on IDE software reset (IDDCR[SRST] = 1) in addition to Host reset. This register is called IDE Device In Register in LBA addressing mode or for an ATAPI command. Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [IDE_HOST_PCMDIOBAR] + 6h

**IDE_HOST_PCMDIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_PCMDIOBAR Reference:** [B:0, D:27, F:2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>WO | **IDE Drive/Head Data (IDEDHD):** The Drive/Head Register is used by the host and the device to select the type of addressing (CHS or LBA), the drive letter, and either bits 3 through 0 of the head number in CHS mode or in LBA mode, bits D3:D0 reflect the logical block number bits LBA27:LBA24. |

## 54.13.18 IDE Drive/Head Out Register DEV0 (IDDHOR0)—Offset 6h

This register implements the standard Device 0 Drive/Head Out register in the Primary IDE Command Block. This is read-only. DEV = 0 (i.e. IDEDHIR[4] = 0). CSxE FW writes to this register upon completion of an ATA command. This register is called IDE Device Out Register DEV0 in LBA addressing mode or for an ATAPI command. Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [IDE_HOST_PCMDIOBAR] + 6h

**IDE_HOST_PCMDIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_PCMDIOBAR Reference:** [B:0, D:27, F:2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO/V | **IDE Drive/Head Out DEV0 (IDEDHO0):** Drive/Head Out register of Device 0. |

## 54.13.19 IDE Drive/Head Out Register DEV1 (IDDHOR1)—Offset 6h

This register implements the standard Device 1 Drive/Head Out register in the Primary IDE Command Block. This is read-only. DEV = 1 (i.e. IDEDHIR[4] = 1). CSxE FW writes to this register upon completion of an ATA command. This register is called IDE Device Out Register DEV1 in LBA addressing mode or for an ATAPI command. Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [IDE_HOST_PCMDIOBAR] + 6h

**Default:** 00h

**IDE_HOST_PCMDIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_PCMDIOBAR Reference:** [B:0, D:27, F:2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO/V | **IDE Drive/Head Out DEV1 (IDEDHO1):** Drive/Head Out register of Device 1. |

## 54.13.20 IDE Command Register (IDECR)—Offset 7h

This register implements the standard Command register in the Primary IDE Command Block. This is write-only. Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [IDE_HOST_PCMDIOBAR] + 7h

**Default:** 00h

**IDE_HOST_PCMDIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_PCMDIOBAR Reference:** [B:0, D:27, F:2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>WO | **IDE Command Data (IDECD):** The Command register specifies the ATA/ATAPI Command code being issued to the drive by the host. Command processing begins when this register is written.<br>The content of the Command Block registers becomes parameters of the command when this register is written.<br>Writing this register clears any pending interrupt condition.<br>Please refer to the description of the INTM and INTS bits in the IDGCR register in the CSxE memory space for detailed conditions under which interrupt condition shall be cleared. |

## 54.13.21 IDE Status Register DEV0 (IDESR0)—Offset 7h

This register implements the standard Device 0 Status register in the Primary IDE Command Block. This is read-only. DEV = 0 (i.e. IDEDHIR[4] = 0). CSxE FW writes to this register upon completion of an ATA/ATAPI command. Additionally upon completion of the last data phase of a PIO transfer, HW will load this register with value of the SRAFP field in the IDESRAP register in the CSxE memory space. Host read of this register clears Device 0's interrupt. Please refer to the description of the INTM bit in the IDGCR register in the CSxE memory space for detailed conditions under which interrupt condition shall be cleared. The bit description is for ATA mode. Different name in ATAPI mode, if applicable, is cited as well. Reset condition: CSxE reset with the BSY bit as an exception. Please refer to description of the BSY bit below for a list of BSY bit reset conditions. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [IDE_HOST_PCMDIOBAR] + 7h

**Default:** 80h

**IDE_HOST_PCMDIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_PCMDIOBAR Reference:** [B:0, D:27, F:2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x1<br>RO/V | **Busy (BSY):** This bit is set by HW when the IDECR is being written and DEV=0, OR when IDDCR[SRST] bit is asserted by Host, OR host system reset, OR D3 to D0 transition of the IDE function.<br>This bit is cleared by FW write of 0.<br>Please refer to general register description above for special handling for a PIO transfer.<br>When this bit is 1, any other bit in this register is meaningless. |
| 6 | 0x0<br>RO/V | **Drive Ready (DRDY):** When set, indicates drive is ready for command.<br>Update of this bit is completely FW-assisted.<br>This bit is also called Device Ready.<br>Please refer to general register description above for special handling for a PIO transfer. |
| 5 | 0x0<br>RO/V | **Drive Fault (DF):** When set, indicates Error on the drive.<br>Update of this bit is completely FW-assisted.<br>This bit is called DMA Ready for a DMA ATAPI command.<br>Please refer to general register description above for special handling for a PIO transfer. |
| 4 | 0x0<br>RO/V | **Drive Seek Complete (DSC):** When set, indicates Heads are positioned over the desired cylinder.<br>Update of this bit is completely FW-assisted.<br>This bit is called Service for an ATAPI command.<br>Please refer to general register description above for special handling for a PIO transfer. |
| 3 | 0x0<br>RO/V | **Data Request (DRQ):** Set when the drive wants to exchange data with the Host via the data register.<br>Update of this bit is completely FW-assisted.<br>Please refer to general register description above for special handling for a PIO transfer. |
| 2 | 0x0<br>RO/V | **Corrected Data (CORR):** When set, indicates a correctable read error has occurred.<br>Update of this bit is completely FW-assisted.<br>Please refer to general register description above for special handling for a PIO transfer. |
| 1 | 0x0<br>RO/V | **Index (IDX):** This bit is set once per rotation of the medium when the index mark passes under the read/write head.<br>Update of this bit is completely FW-assisted.<br>Please refer to general register description above for special handling for a PIO transfer. |
| 0 | 0x0<br>RO/V | **Error (ERR):** When set, indicates an error occurred in the process of executing the current command.<br>The Error Register of the selected device contains the error information.<br>Update of this bit is completely FW-assisted.<br>This bit is called Check for an ATAPI command.<br>Please refer to general register description above for special handling for a PIO transfer. |

## 54.13.22 IDE Status Register DEV1 (IDESR1)—Offset 7h

This register implements the standard Device 1 Status register in the Primary IDE Command Block. This is read-only. DEV = 1 (i.e. IDEDHIR[4] = 1). CSxE FW writes to this register upon completion of an ATA/ATAPI command. Additionally upon completion of the last data phase of a PIO transfer, HW will load this register with value of the SRAFP field in the IDESRAP register in the CSxE memory space. Host read of this register clears Device 1's interrupt. Please refer to the description of the INTM bit in the IDGCR register in the CSxE memory space for detailed conditions under which interrupt condition shall be cleared. The bit description is for ATA mode. Different name in ATAPI mode, if applicable, is cited as well. Reset condition: CSxE reset with the BSY bit as an exception. Please refer to description of the BSY bit below for a list of BSY bit reset conditions. Non-sticky.

**Type:** I/O Register (Size: 8 bits)

**BAR and Offset:** [IDE_HOST_PCMDIOBAR] + 7h

**Default:** 80h

**IDE_HOST_PCMDIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_PCMDIOBAR Reference:** [B:0, D:27, F:2] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x1<br>RO/V | **Busy (BSY):** This bit is set by HW when the IDECR is being written and DEV=1, OR when IDDCR[SRST] bit is asserted by Host, OR host system reset, OR D3 to D0 transition of the IDE function.<br>This bit is cleared by FW write of 0.<br>Please refer to general register description above for special handling for a PIO transfer.<br>When this bit is 1, any other bit in this register is meaningless. |
| 6 | 0x0<br>RO/V | **Drive Ready (DRDY):** When set, indicates drive is ready for command.<br>Update of this bit is completely FW-assisted.<br>This bit is also called Device Ready.<br>Please refer to general register description above for special handling for a PIO transfer. |
| 5 | 0x0<br>RO/V | **Drive Fault (DF):** When set, indicates Error on the drive.<br>Update of this bit is completely FW-assisted.<br>This bit is called DMA Ready for a DMA ATAPI command.<br>Please refer to general register description above for special handling for a PIO transfer. |
| 4 | 0x0<br>RO/V | **Drive Seek Complete (DSC):** When set, indicates Heads are positioned over the desired cylinder.<br>Update of this bit is completely FW-assisted.<br>This bit is called Service for an ATAPI command.<br>Please refer to general register description above for special handling for a PIO transfer. |
| 3 | 0x0<br>RO/V | **Data Request (DRQ):** Set when the drive wants to exchange data with the Host via the data register.<br>Update of this bit is completely FW-assisted.<br>Please refer to general register description above for special handling for a PIO transfer. |
| 2 | 0x0<br>RO/V | **Corrected Data (CORR):** When set, indicates a correctable read error has occurred.<br>Update of this bit is completely FW-assisted.<br>Please refer to general register description above for special handling for a PIO transfer. |
| 1 | 0x0<br>RO/V | **Index (IDX):** This bit is set once per rotation of the medium when the index mark passes under the read/write head.<br>Update of this bit is completely FW-assisted.<br>Please refer to general register description above for special handling for a PIO transfer. |
| 0 | 0x0<br>RO/V | **Error (ERR):** When set, indicates an error occurred in the process of executing the current command. The Error Register of the selected device contains the error information.<br>Update of this bit is completely FW-assisted.<br>This bit is called Check for an ATAPI command.<br>Please refer to general register description above for special handling for a PIO transfer. |

## 54.14 Registers in I/O Space—IDE_HOST_PCTLIOBAR

These registers are accessed in Host I/O Space starting at the relocatable I/O address defined by the Base Address Register (BAR) IDE_HOST_PCTLIOBAR described in Section 54.6.6, "IDE Primary Control Block IO BAR (IDE_HOST_PCTLIOBAR)—Offset 14h" on page 2526.

### 54.14.1 IDE Device Control Register (IDDCR)—Offset 2h

This register implements the standard Device Control register in the Primary IDE Control Block. This is write-only. BE[0] shall be deasserted. Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [IDE_HOST_PCTLIOBAR] + 2h

**IDE_HOST_PCTLIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_PCTLIOBAR Reference:** [B:0, D:27, F:2] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:3 | 0x0<br>WO | **Reserved (RSVD1):** Writable by Host, but NO HW effect due to writes. |
| 2 | 0x0<br>WO | **Software Reset (SRST):** 1: both devices shall perform the software reset protocol.<br>0: both devices shall exit software reset. |
| 1 | 0x0<br>WO | **Host Interrupt Disable (nIEN):** 1: disables HW from generating interrupt to the Host.<br>0: enables HW to generate interrupt to the Host. |
| 0 | 0x0<br>WO | **Reserved (RSVD0):** Writable by Host, but NO HW effect due to writes. |

### 54.14.2 IDE Alternate Status Register (IDASR)—Offset 2h

This register implements the standard Alternate Status register in the Primary IDE Control Block. This is read-only. It shadows the standard Status registers in the Primary IDE Command Block. Read of this register does NOT clear the interrupt status bits in the selected Status register. IDESR0 is shadowed when DEV = 0 (i.e. IDEDHIR[4] = 0). IDESR1 is shadowed when DEV = 1 (i.e. IDEDHIR[4] = 1). Reset condition: There is no reset associated with this register because it is NOT a physical register.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [IDE_HOST_PCTLIOBAR] + 2h

**IDE_HOST_PCTLIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_PCTLIOBAR Reference:** [B:0, D:27, F:2] + 14h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO/V | **IDE Alternate Status Register (IDEASR):** Shadows DEV0/DEV1 Status register on Host reads depending on IDEDHIR[4] setting. |

## 54.15 Registers in I/O Space—IDE_HOST_BMIOBAR

These registers are accessed in Host I/O Space starting at the relocatable I/O address defined by the Base Address Register (BAR) IDE_HOST_BMIOBAR described in Section 54.6.9, "IDE Bus Master Block IO BAR (IDE_HOST_BMIOBAR)—Offset 20h" on page 2527.

### 54.15.1 IDE Primary Bus Master Command Register (IDEPBMCR)—Offset 0h

This register implements the standard IDE Primary Bus Master Command register in the IDE Bus Master Block. Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [IDE_HOST_BMIOBAR] + 0h

**IDE_HOST_BMIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_BMIOBAR Reference:** [B:0, D:27, F:2] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:4 | 0x0<br>RO | **Reserved (RSVD1):** Not implemented. Hardwired to 0. |
| 3 | 0x0<br>RW | **Read or Write Control (RWC):** This bit sets the direction of the bus master transfer.<br>• 0: reads are performed from Host system memory.<br>• 1: writes are performed to Host system memory.<br>This bit shall NOT be changed when the bus master function is active. |
| 2:1 | 0x0<br>RO | **Reserved (RSVD0):** Not implemented. Hardwired to 0. |
| 0 | 0x0<br>RW/V | **Start/Stop Bus Master (SSBM):** Host starts a bus master operation in the device by setting this bit to 1.<br>The device shall only transfer data between the ATA device and Host memory in the bus master operation.<br>Host stops the bus master operation by clearing this bit to 0. All state information will be lost when 0 is written.<br><br>Host CANNOT stop and then resume the bus master operation.<br>When Host clears this bit to 0 while the bus master operation is still active, the bus master operation will be aborted and data transferred from the device may be discarded before being written to host memory.<br>In any event the device should terminate any DMA burst in progress compliant with the ATA protocol being used.<br>If the UDMA protocol is being used, there may be a CRC error report. The ATA device may be in an indeterminate state.<br><br>HW will clear this bit to 0 after the data transfer has been completed, as indicated by satisfaction of either of the following conditions:<br>(1) IDEPBMSR[BMIA] is cleared to 0. OR<br>(2) IDEPBMSR[INT] is set to 1. |

## 54.15.2 IDE Primary Bus Master Device Specific 0 Register (IDEPBMDS0R)—Offset 1h

This register implements the standard IDE Primary Bus Master Device Specific 0 register in the IDE Bus Master Block. This register is programmed by the Host for any device specific data. Reset condition: CSxE reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [IDE_HOST_BMIOBAR] + 1h

**IDE_HOST_BMIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_BMIOBAR Reference:** [B:0, D:27, F:2] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW/V | **Device Specific Data0 (DSD0):** Device Specific. |

## 54.15.3 IDE Primary Bus Master Status Register (IDEPBMSR)—Offset 2h

This register implements the standard IDE Primary Bus Master Status register in the IDE Bus Master Block.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [IDE_HOST_BMIOBAR] + 2h

**Default:** 80h

**IDE_HOST_BMIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_BMIOBAR Reference:** [B:0, D:27, F:2] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x1<br>RO/V | **Simplex Only (SO):** This bit indicates whether or not both bus master channels (primary and secondary) can be operated at the same time.<br>• If the bit is 0, both channels operate independently and can be used at the same time.<br>• If the bit is 1, only one channel may be used at a time.<br><br>Reset condition: CSxE reset.<br>Non-sticky. |
| 6 | 0x0<br>RW/V | **Device 1 DMA Capable (D1DC):** This read/write bit is set by device dependent code (BIOS or host software) to indicate that Device 1 for this channel is capable of DMA transfers, and that the device has been initialized for optimum performance.<br><br>Reset condition: Host reset.<br>Non-sticky. |
| 5 | 0x0<br>RW/V | **Device 0 DMA Capable (D0DC):** This read/write bit is set by device dependent code (BIOS or host software) to indicate that Device 0 for this channel is capable of DMA transfers, and that the device has been initialized for optimum performance.<br><br>Reset condition: Host reset.<br>Non-sticky. |
| 4:3 | 0x0<br>RO | **Reserved (RSVD):** Not implemented. Hardwired to 0. |
| 2 | 0x0<br>RW/1C/V | **Interrupt (INT):** HW shall set this bit to 1 on rising edge detection of the ATA channels interrupt line (INTRQ).<br>Host SW writes 1 to clear this bit. Host SW can use this bit to determine if an ATA device has asserted its interrupt line (INTRQ) (see ATA standard).<br>When this bit is 1, all data MUST have been transferred to the Hosts system memory.<br>The adapter shall not set this bit to 1 until it has flushed all internal data buffers.<br><br>NOTE:<br>When INTRQ is deasserted, HW won't clear this bit atomically.<br>When INTRQ is deasserted, this bit shall be cleared as well by Host SW writing 1 to this bit.<br><br>Reset condition: CSxE reset.<br>Non-sticky. |
| 1 | 0x0<br>RW/1C/V | **Error (ER):** FW will set this bit to 1 when the device encounters an error in transferring data to/from Host memory.<br>The exact error condition is bus specific and can be determined in a bus specific manner.<br>Host SW writes 1 to clear this bit.<br><br>Reset condition: CSxE reset.<br>Non-sticky. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 0 | 0x0<br>RO/V | **Bus Master IDE Active (BMIA):** HW shall set this bit when (1) Host sets the IDEPBMCR[SSBM] bit.<br><br>FW shall clear this bit when<br>(1) The last transfer for a region is performed, where EOT for that region is set in the region descriptor. OR<br>(2) FW detects that Host cleared IDEPBMCR[SSBM] bit as indicated by a value of 1 in proxy bit IDEBMCR[SSBMC] in CSxE root space.<br><br>Before clearing this bit to 0, FW must satisfy the following conditions in addition:<br>(1) All data transferred from the device during the previous bus master command has been transferred to the Hosts system memory, unless the bus master command was aborted. OR<br>(2) All data has been written to the device.<br><br>Reset condition: CSxE reset.<br>Non-sticky. |

## 54.15.4 IDE Primary Bus Master Device Specific 1 Register (IDEPBMDS1R)—Offset 3h

This register implements the standard IDE Primary Bus Master Device Specific 1 register in the IDE Bus Master Block. This register is programmed by the Host for any device specific data. Reset condition: CSxE reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [IDE_HOST_BMIOBAR] + 3h

**IDE_HOST_BMIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_BMIOBAR Reference:** [B:0, D:27, F:2] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW/V | **Device Specific Data1 (DSD1):** Device Specific Data. |

## 54.15.5 IDE Primary Bus Master Descriptor Table Pointer Register Byte 0 (IDEPBMDTPR0)—Offset 4h

This register implements the Byte 0 of the standard IDE Primary Bus Master Descriptor Table Pointer register in the IDE Bus Master Block. The descriptor table pointer is used for bus master operation in the primary channel. Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [IDE_HOST_BMIOBAR] + 4h

**IDE_HOST_BMIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_BMIOBAR Reference:** [B:0, D:27, F:2] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Descriptor Table Pointer Byte 0 (DTPB0):** Byte 0 of the Descriptor Table pointer.<br>The Descriptor Table shall be DW-aligned.<br>Hence bit[1:0] shall always be 0. |

## 54.15.6 IDE Primary Bus Master Descriptor Table Pointer Register Byte 1 (IDEPBMDTPR1)—Offset 5h

This register implements the Byte 1 of the standard IDE Primary Bus Master Descriptor Table Pointer register in the IDE Bus Master Block. The descriptor table pointer is used for bus master operation in the primary channel. Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [IDE_HOST_BMIOBAR] + 5h

**IDE_HOST_BMIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_BMIOBAR Reference:** [B:0, D:27, F:2] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Descriptor Table Pointer Byte 1 (DTPB1):** Byte 1 of the Descriptor Table pointer. |

## 54.15.7 IDE Primary Bus Master Descriptor Table Pointer Register Byte 2 (IDEPBMDTPR2)—Offset 6h

This register implements the Byte 2 of the standard IDE Primary Bus Master Descriptor Table Pointer register in the IDE Bus Master Block. The descriptor table pointer is used for bus master operation in the primary channel. Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [IDE_HOST_BMIOBAR] + 6h

**IDE_HOST_BMIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_BMIOBAR Reference:** [B:0, D:27, F:2] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Descriptor Table Pointer Byte 2 (DTPB2):** Byte 2 of the Descriptor Table pointer. |

## 54.15.8 IDE Primary Bus Master Descriptor Table Pointer Register Byte 3 (IDEPBMDTPR3)—Offset 7h

This register implements the Byte 3 of the standard IDE Primary Bus Master Descriptor Table Pointer register in the IDE Bus Master Block. The descriptor table pointer is used for bus master operation in the primary channel. Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [IDE_HOST_BMIOBAR] + 7h

**IDE_HOST_BMIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_BMIOBAR Reference:** [B:0, D:27, F:2] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Descriptor Table Pointer Byte 3 (DTPB3):** Byte 3 of the Descriptor Table pointer. |

## 54.15.9 IDE Secondary Bus Master Command Register (IDESBMCR)—Offset 8h

This register implements the standard IDE Secondary Bus Master Command register in the IDE Bus Master Block. Usage notes: The Secondary IDE Channel is permanently disabled. Access attributes are maintained to satisfy test requirement. No bus master functionality is implemented behind the register. Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [IDE_HOST_BMIOBAR] + 8h

**Default:** 00h

**IDE_HOST_BMIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_BMIOBAR Reference:** [B:0, D:27, F:2] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:4 | 0x0<br>RO | **Reserved (RSVD1):** Not implemented.<br>Hardwired to 0. |
| 3 | 0x0<br>RW | **Read or Write Control (RWC):** This bit sets the direction of the bus master transfer.<br>• 0: reads are performed from Host system memory.<br>• 1: writes are performed to Host system memory.<br>This bit shall NOT be changed when the bus master function is active. |
| 2:1 | 0x0<br>RO | **Reserved (RSVD0):** Not implemented. Hardwired to 0. |
| 0 | 0x0<br>RW | **Start/Stop Bus Master (SSBM):** Host starts a bus master operation in the device by setting this bit to 1.<br>The device shall only transfer data between the ATA device and Host memory in the bus master operation.<br>Host stops the bus master operation by clearing this bit to 0.<br>All state information will be lost when 0 is written.<br><br>Host CANNOT stop and then resume the bus master operation. |

## 54.15.10 IDE Secondary Bus Master Device Specific 0 Register (IDESBMDS0R)—Offset 9h

This register implements the standard IDE Secondary Bus Master Device Specific 0 register in the IDE Bus Master Block. This register is programmed by the Host for any device specific data. Usage notes: The Secondary IDE Channel is permanently disabled. Access attributes are maintained to satisfy test requirement. No bus master functionality is implemented behind the register. Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [IDE_HOST_BMIOBAR] + 9h

**Default:** 00h

**IDE_HOST_BMIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_BMIOBAR Reference:** [B:0, D:27, F:2] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Device Specific Data0 (DSD0):** Device Specific. |

## 54.15.11 IDE Secondary Bus Master Status Register (IDESBMSR)—Offset Ah

This register implements the standard IDE Secondary Bus Master Status register in the IDE Bus Master Block. Usage notes: The Secondary IDE Channel is permanently disabled. Access attributes are maintained to satisfy test requirement. No bus master functionality is implemented behind the register. Reset condition: Host reset with the SO bit as an exception. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 80h

**BAR and Offset:** [IDE_HOST_BMIOBAR] + Ah

**IDE_HOST_BMIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_BMIOBAR Reference:** [B:0, D:27, F:2] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x1<br>RO/V | **Simplex Only (SO):** Value indicates whether both Bus Master Channels can be operated at the same time or not.<br>• 0: Both can be operated independently<br>• 1: Only one can be operated at a time.<br><br>This bit shadows IDEPBMSR[SO].<br><br>Reset condition: CSxE reset.<br>Non-sticky. |
| 6 | 0x0<br>RW | **Device 1 DMA Capable (D1DC):** This read/write bit is set by device dependent code (BIOS or host software) to indicate that Device 1 for this channel is capable of DMA transfers, and that the device has been initialized for optimum performance. |
| 5 | 0x0<br>RW | **Device 0 DMA Capable (D0DC):** This read/write bit is set by device dependent code (BIOS or host software) to indicate that Device 0 for this channel is capable of DMA transfers, and that the device has been initialized for optimum performance. |
| 4:3 | 0x0<br>RO | **Reserved (RSVD):** Not implemented.<br>Hardwired to 0. |
| 2 | 0x0<br>RO | **Interrupt (INT):** No functionality implemented.<br>Hardwired to 0. |
| 1 | 0x0<br>RO | **Error (ER):** Not implemented.<br>Hardwired to 0. |
| 0 | 0x0<br>RO | **Bus Master IDE Active (BMIA):** Not implemented.<br>Hardwired to 0. |

## 54.15.12 IDE Secondary Bus Master Device Specific 1 Register (IDESBMDS1R)—Offset Bh

This register implements the standard IDE Secondary Bus Master Device Specific 1 register in the IDE Bus Master Block. This register is programmed by the Host for any device specific data. Usage notes: The Secondary IDE Channel is permanently disabled. Access attributes are maintained to satisfy test requirement. No bus master functionality is implemented behind the register. Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [IDE_HOST_BMIOBAR] + Bh

**Default:** 00h

**IDE_HOST_BMIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_BMIOBAR Reference:** [B:0, D:27, F:2] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Device Specific Data1 (DSD1):** Device Specific Data. |

## 54.15.13 IDE Secondary Bus Master Descriptor Table Pointer Register Byte 0 (IDESBMDTPR0)—Offset Ch

This register implements the Byte 0 of the standard IDE Secondary Bus Master Descriptor Table Pointer register in the IDE Bus Master Block. The descriptor table pointer is used for bus master operation in the secondary channel. Usage notes: The Secondary IDE Channel is permanently disabled. Access attributes are maintained to satisfy test requirement. No bus master functionality is implemented behind the register. Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [IDE_HOST_BMIOBAR] + Ch

**Default:** 00h

**IDE_HOST_BMIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_BMIOBAR Reference:** [B:0, D:27, F:2] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Descriptor Table Pointer Byte 0 (DTPB0):** Byte 0 of the Descriptor Table pointer.<br>The Descriptor Table shall be DW-aligned.<br>Hence bit[1:0] shall always be 0. |

## 54.15.14 IDE Secondary Bus Master Descriptor Table Pointer Register Byte 1 (IDESBMDTPR1)—Offset Dh

This register implements the Byte 1 of the standard IDE Secondary Bus Master Descriptor Table Pointer register in the IDE Bus Master Block. The descriptor table pointer is used for bus master operation in the secondary channel. Usage notes: The Secondary IDE Channel is permanently disabled. Access attributes are maintained to satisfy test requirement. No bus master functionality is implemented behind the register. Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [IDE_HOST_BMIOBAR] + Dh

**IDE_HOST_BMIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_BMIOBAR Reference:** [B:0, D:27, F:2] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Descriptor Table Pointer Byte 1 (DTPB1):** Byte 1 of the Descriptor Table pointer. |

## 54.15.15 IDE Secondary Bus Master Descriptor Table Pointer Register Byte 2 (IDESBMDTPR2)—Offset Eh

This register implements the Byte 2 of the standard IDE Secondary Bus Master Descriptor Table Pointer register in the IDE Bus Master Block. The descriptor table pointer is used for bus master operation in the secondary channel. Usage notes: The Secondary IDE Channel is permanently disabled. Access attributes are maintained to satisfy test requirement. No bus master functionality is implemented behind the register. Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [IDE_HOST_BMIOBAR] + Eh

**IDE_HOST_BMIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_BMIOBAR Reference:** [B:0, D:27, F:2] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Descriptor Table Pointer Byte 2 (DTPB2):** Byte 2 of the Descriptor Table pointer. |

## 54.15.16 IDE Secondary Bus Master Descriptor Table Pointer Register Byte 3 (IDESBMDTPR3)—Offset Fh

This register implements the Byte 3 of the standard IDE Secondary Bus Master Descriptor Table Pointer register in the IDE Bus Master Block. The descriptor table pointer is used for bus master operation in the secondary channel. Usage notes: The Secondary IDE Channel is permanently disabled. Access attributes are maintained to satisfy test requirement. No bus master functionality is implemented behind the register. Reset condition: Host reset. Non-sticky.

**Type:** I/O Register
(Size: 8 bits)

**BAR and Offset:** [IDE_HOST_BMIOBAR] + Fh

**Default:** 00h

**IDE_HOST_BMIOBAR Type:** PCI Configuration Register (Size: 32 bits)
**IDE_HOST_BMIOBAR Reference:** [B:0, D:27, F:2] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Descriptor Table Pointer Byte 3 (DTPB3):** Byte 3 of the Descriptor Table pointer. |

## 54.16 Sideband Registers—KT (Host)

The Sideband registers accessible to the Host are described here. They are accessible in Host Memory Space starting at the Sideband Base Address Register (SBREG_BAR). See Section 3.4.1, "Using SBREG_BAR Method" on page 187.

### 54.16.1 KT Host Interrupt Pin Register (KTHIPINR)—Offset 0h

This register provides for BIOS to specify which interrupt pin KT shall use in the Host root space when generating an interrupt in the PCI legacy mode.

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0xf4] + 0h
**Host Memory Space:** SBREG_BAR + 0xf40000 + 0h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0x0<br>RO | **Reserved (RSVD):** Not implemented.<br>Hardwired to 0. |
| 7:0 | 0x0<br>RW/O | **Interrupt Pin (IPIN):** BIOS writes to this field once to specify which interrupt pin KT shall use. After written once, this register will become read-only.<br>This field shall be shadowed into the Interrupt Pin register in the PCI header of the KT Host PCI function.<br><br>Value Decoding<br>• 00h The function does NOT use an interrupt pin.<br>• 01h INTA<br>• 02h INTB<br>• 03h INTC<br>• 04h INTD<br>• 05h - FFh Reserved<br><br>Reset condition: Host side reset.<br>Non-sticky. |

### 54.16.2 BIOS KT Host PCI Function Disable Register (BKTHDISR)—Offset 4h

This register provides for BIOS to enable or disable the KT Host PCI function.

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0xf4] + 4h
**Host Memory Space:** SBREG_BAR + 0xf40000 + 4h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:1 | 0x0<br>RO | **Reserved (RSVD):** Not implemented.<br>Hardwired to 0. |
| 0 | 0x0<br>RW | **Host PCI Function Disable (HDIS):** BIOS sets this bit to disable the KT Host PCI function. BIOS clears this bit to enable the KT Host PCI function.<br><br>Reset condition: Host side reset.<br>Non-sticky. |

## 54.17 Sideband Registers—IDE (Host)

The Sideband registers accessible to the Host are described here. They are accessible in Host Memory Space starting at the Sideband Base Address Register (SBREG_BAR). See Section 3.4.1, "Using SBREG_BAR Method" on page 187.

### 54.17.1 IDE Host Interrupt Pin Register (IDEHIPINR)—Offset 0h

This register provides for BIOS to specify which interrupt pin IDE shall use in the Host root space when generating an interrupt in the PCI legacy mode.

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0xf4] + 0h
**Host Memory Space:** SBREG_BAR + 0xf40000 + 0h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0x0<br>RO | **Reserved (RSVD):** Not implemented.<br>Hardwired to 0. |
| 7:0 | 0x0<br>RW/O | **Interrupt Pin (IPIN):** BIOS writes to this field once to specify which interrupt pin IDE shall use. After written once, this register will become read-only.<br>This field shall be shadowed into the Interrupt Pin register in the PCI header of the IDE Host PCI function.<br><br>Value Decoding<br>• 00h The function does NOT use an interrupt pin.<br>• 01h INTA<br>• 02h INTB<br>• 03h INTC<br>• 04h INTD<br>• 05h - FFh Reserved<br><br>Reset condition: Host side reset.<br>Non-sticky. |

### 54.17.2 BIOS IDE Host PCI Function Disable Register (BIDEHDISR)—Offset 4h

This register provides for BIOS to enable or disable the IDE Host PCI function.

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0xf4] + 4h
**Host Memory Space:** SBREG_BAR + 0xf40000 + 4h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:1 | 0x0<br>RO | **Reserved (RSVD):** Not implemented.<br>Hardwired to 0. |
| 0 | 0x0<br>RW | **Host PCI Function Disable (HDIS):** BIOS sets this bit to disable the IDE Host PCI function. BIOS clears this bit to enable the IDE Host PCI function.<br><br>Reset condition: Host side reset.<br>Non-sticky. |

# 55 eMMC Controller - B0, D28, F0

## 55.1 Introduction and Index

The host-accessible registers for the eMMC Controller are described here.

To determine the number of devices/functions available refer to the following:

- Table 1-1, "Features by product SKU - Server and Cloud Storage SKUs 0 through 4"
- Table 1-2, "Features by Product SKU - Network and Enterprise Storage SKUs 5 through 10"
- Table 1-3, "Features by Product SKU - Extended Temperature SKUs 11 through 14".

The legend for the register access codes are described in Chapter 43, "Introduction."

### 55.1.1 Host Memory Space—BAR or BAR1

An index of the registers that are accessible in Host Memory Space is shown here.

**Table 55-1. Summary of Memory Mapped I/O Registers—BAR or BAR1 (Sheet 1 of 3)**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| **eMMC Registers** | | | |
| 0 | 4 | 00000000 | "SDMA System Address Register/Argument2 Register (SDMASYSADDR)—Offset 0h" on page 2599 |
| 4 | 2 | 0000 | "BlockSize Register (BLOCKSIZE)—Offset 4h" on page 2599 |
| 6 | 2 | 0000 | "BlockCount Register (BLOCKCOUNT)—Offset 6h" on page 2599 |
| 8 | 4 | 00000000 | "Argument1 Register (ARGUMENT1)—Offset 8h" on page 2600 |
| C | 2 | 0000 | "TransferMode Register (TRANSFERMODE)—Offset Ch" on page 2600 |
| E | 2 | 0000 | "Command Register (COMMAND)—Offset Eh" on page 2600 |
| 10 | 4 | 00000000 | "Response Register (RESPONSE1)—Offset 10h" on page 2601 |
| 14 | 2 | 0000 | "Response Register (RESPONSE2)—Offset 14h" on page 2602 |
| 16 | 2 | 0000 | "Response Register (RESPONSE3)—Offset 16h" on page 2602 |
| 18 | 2 | 0000 | "Response Register (RESPONSE4)—Offset 18h" on page 2602 |
| 1A | 2 | 0000 | "Response Register (RESPONSE5)—Offset 1Ah" on page 2602 |
| 1C | 2 | 0000 | "Response Register (RESPONSE6)—Offset 1Ch" on page 2603 |
| 1E | 2 | 0000 | "Response Register (RESPONSE7)—Offset 1Eh" on page 2603 |
| 20 | 4 | 00000000 | "Buffer DataPort Register (DATAPORT)—Offset 20h" on page 2603 |
| 24 | 4 | 00000000 | "PresentState Register (PRESENTSTATE)—Offset 24h" on page 2604 |
| 28 | 1 | 00 | "HostControl1 Register (HOSTCONTROL1)—Offset 28h" on page 2606 |
| 29 | 1 | 00 | "PowerControl Register (POWERCONTROL)—Offset 29h" on page 2607 |
| 2A | 1 | 80 | "BlockGapControl Register (BLOCKGAPCONTROL)—Offset 2Ah" on page 2607 |
| 2B | 1 | 00 | "Wakeup Control Register (WAKEUPCONTROL)—Offset 2Bh" on page 2608 |
| 2C | 2 | 0000 | "Clock Control Register (CLOCKCONTROL)—Offset 2Ch" on page 2609 |
| 2E | 1 | 00 | "Timeout Control Register (TIMEOUTCONTROL)—Offset 2Eh" on page 2610 |
| 2F | 1 | 00 | "Software Reset Register (SOFTWARERESET)—Offset 2Fh" on page 2610 |
| 30 | 2 | 0000 | "Normal Interrupt Status Register (NORMALINTRSTS)—Offset 30h" on page 2611 |
| 32 | 2 | 0000 | "ErrorInterruptStatus Register (ERRORINTRSTS)—Offset 32h" on page 2612 |
| 34 | 2 | 0000 | "Normal Interrupt Status Enable Register (NORMALINTRSTSENA)—Offset 34h" on page 2613 |
| 36 | 2 | 0000 | "Error Interrupt Status Enable Register (ERRORINTRSTSENA)—Offset 36h" on page 2614 |
| 38 | 2 | 0000 | "Normal Interrupt Signal Enable Register (NORMALINTRSIGENA)—Offset 38h" on page 2615 |
| 3A | 2 | 0000 | "Error Interrupt Signal Enable Register (ERRORINTRSIGENA)—Offset 3Ah" on page 2616 |
| 3C | 2 | 0000 | "Auto CMD12 Error Status Register (AUTOCMDERRSTS)—Offset 3Ch" on page 2617 |
| 3E | 2 | 0000 | "Host Control2 Register (HOSTCONTROL2)—Offset 3Eh" on page 2618 |
| 40 | 8 | 80000007F76F64B2 | "Capabilities Register (CAPABILITIES)—Offset 40h" on page 2619 |

## Table 55-1. Summary of Memory Mapped I/O Registers—BAR or BAR1 (Sheet 2 of 3)

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 48 | 8 | 0000000000000000 | "Maximum Current Capabilities Register (MAXCURRENTCAP)—Offset 48h" on page 2621 |
| 50 | 2 | 0000 | "Force Event REGISTER for AUTO CMD Error Status (FORCEEVENTFORAUTOCMDERRORSTATUS)—Offset 50h" on page 2621 |
| 52 | 2 | 0000 | "Force Event Register for Error Interrupt Status (FORCEEVENTFORERRINTSTS)—Offset 52h" on page 2622 |
| 54 | 1 | 00 | "ADMA Error Status Register (ADMAERRSTS)—Offset 54h" on page 2623 |
| 58 | 4 | 00000000 | "ADMA System Address Register0&1 (ADMASYSADDR01)—Offset 58h" on page 2623 |
| 5C | 2 | 0000 | "ADMA System Address Register1 (ADMASYSADDR2)—Offset 5Ch" on page 2623 |
| 5E | 2 | 0000 | "ADMA System Address Register1 (ADMASYSADDR3)—Offset 5Eh" on page 2624 |
| 60 | 2 | 0003 | "Preset Value Register for Initialization (PRESETVALUE0)—Offset 60h" on page 2624 |
| 62 | 2 | 0003 | "Preset Value Register for Default Speed (PRESETVALUE1)—Offset 62h" on page 2625 |
| 64 | 2 | 0003 | "Preset Value Register for High Speed (PRESETVALUE2)—Offset 64h" on page 2625 |
| 66 | 2 | 0003 | "Preset Value Register for SDR12 (PRESETVALUE3)—Offset 66h" on page 2626 |
| 68 | 2 | 0002 | "Preset Value Register for SDR25 (PRESETVALUE4)—Offset 68h" on page 2626 |
| 6A | 2 | 0001 | "Preset Value Register for SDR50 (PRESETVALUE5)—Offset 6Ah" on page 2627 |
| 6C | 2 | 0000 | "Preset Value Register for SDR104 (PRESETVALUE6)—Offset 6Ch" on page 2627 |
| 6E | 2 | 0002 | "Preset Value Register for DDR50 (PRESETVALUE7)—Offset 6Eh" on page 2628 |
| 70 | 4 | 00000000 | "Boot Timeout Control Register (BOOTTIMEOUTCNT)—Offset 70h" on page 2628 |
| 74 | 2 | 0000 | "Preset Value Register for DDR50 (PRESETVALUE8)—Offset 74h" on page 2629 |
| FC | 2 | 0000 | "Slot Interrupt Status Register (SLOTINTRSTS)—Offset FCh" on page 2629 |
| FE | 2 | 1002 | "Host Controller Version Register (HOSTCONTROLLERVER)—Offset FEh" on page 2629 |
| **Extended eMMC Registers (Convergence Layer)** | | | |
| 804 | 4 | 00000800 | "Software Latency Tolerance Reporting (SW_LTR_VAL)—Offset 804h" on page 2630 |
| 808 | 4 | 00000800 | "Auto Latency Tolerance Reporting (AUTO_LTR_VAL)—Offset 808h" on page 2630 |
| 810 | 4 | 00000000 | "Capabilities Bypass Control Register (CAP_BYPS)—Offset 810h" on page 2631 |
| 814 | 4 | 3001EF3C | "eMMC Capabilities Bypass Register1 (CAP_BYPS_REG1)—Offset 814h" on page 2632 |
| 818 | 4 | 04004000 | "eMMC Capabilities Bypass Register2 (CAP_BYPS_REG2)—Offset 818h" on page 2634 |
| 81C | 4 | 00000008 | "D0i3 Control Register (REG_D0i3)—Offset 81Ch" on page 2635 |
| 820 | 4 | 00000400 | "Front End Module Tx Command Path Delay Register (Tx_CMD_DLY)—Offset 820h" on page 2635 |
| 824 | 4 | 00000A18 | "Front End Module Tx Data Path Delay Register1 (Tx_DATA_DLY_1)—Offset 824h" on page 2636 |
| 828 | 4 | 1C1C1C00 | "Front End Module Tx Data Path Delay Register2 (Tx_DATA_DLY_2)—Offset 828h" on page 2637 |

**Table 55-1. Summary of Memory Mapped I/O Registers—BAR or BAR1 (Sheet 3 of 3)**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 82C | 4 | 00000000 | "Front End Module Rx Data Path Delay Register1 (Rx_CMD_DATA_DLY_1)—Offset 82Ch" on page 2638 |
| 830 | 4 | 00000000 | "Front End Module Rx Strobe Path Delay Register (Rx_STROBE_CTRL_PATH)—Offset 830h" on page 2639 |
| 834 | 4 | 00000000 | "Front End Module Rx Data Path Delay Register2 (Rx_CMD_DATA_DLY_2)—Offset 834h" on page 2640 |
| 838 | 4 | 00000001 | "Master DLL Software Control Register (MASTER_DLL)—Offset 838h" on page 2641 |
| 840 | 4 | 00000000 | "Auto Tuning Value (AUTO_TUNING)—Offset 840h" on page 2641 |
| 900 | 4 | 00000000 | "Root Space Select (eMMC_ROOT_SPACE)—Offset 900h" on page 2642 |

## 55.2 Registers in Memory Space—BAR or BAR1

The eMMC operates in either PCI Mode or ACPI Mode. By default all the devices are defined as PCI devices (PCI Mode).

To change a device to an ACPI device (ACPI Mode), it first needs to be enumerated and assigned a BAR. Once this is done, it is possible to configure the device to be an ACPI device. Its address shall be the configured BAR address.

### 55.2.1 SDMA System Address Register/Argument2 Register (SDMASYSADDR)—Offset 0h

This register contains concatenates reg_sdmasysaddrlo and reg_sdmasysaddrhi

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [BAR or BAR1] + 0h

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **sdma_sysaddress:** Refer to reg_sdmasysaddrlo and reg_sdmasysaddrhi |

### 55.2.2 BlockSize Register (BLOCKSIZE)—Offset 4h

This register is used to configure the number of bytes in a data block

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**Default:** 0000h

**BAR and Offset:** [BAR or BAR1] + 4h

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RO | **RSVD0:** Reserved |
| 14:12 | 0x0<br>RW | **sdma_bufboundary:** This Field specifies DMA Buffer Boundary |
| 11:0 | 0x0<br>RW | **xfer_blocksize:** This Field specifies Block Size for Data Transfers |

### 55.2.3 BlockCount Register (BLOCKCOUNT)—Offset 6h

This register is used to configure the number of data blocks

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**Default:** 0000h

**BAR and Offset:** [BAR or BAR1] + 6h

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0x0<br>RW | **xfer_blockcount:** This Register specifies Block Size for Data Transfers |

## 55.2.4 Argument1 Register (ARGUMENT1)—Offset 8h

This register contains concatenates argument1lo and argument1hi registers to result SD Command Argument

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [BAR or BAR1] + 8h

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **command_argument1:** refer t oreg_argument1lo and reg_argument1hi. |

## 55.2.5 TransferMode Register (TRANSFERMODE)—Offset Ch

This register is used to control the operations of data transfers

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**Default:** 0000h

**BAR and Offset:** [BAR or BAR1] + Ch

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:6 | 0x0<br>RO | **RSVD0:** Reserved |
| 5 | 0x0<br>RW | **xfermode_multiblksel:** This bit enables multiple block data transfers. |
| 4 | 0x0<br>RW | **xfermode_dataxferdir:** This bit defines the direction of data transfers. |
| 3:2 | 0x0<br>RW | **xfermode_autocmdena:** This field determines use of auto command functions. |
| 1 | 0x0<br>RW | **xfermode_blkcntena:** This bit is used to enable the Block count register, which is only relevant for multiple block transfers |
| 0 | 0x0<br>RW | **xfermode_dmaenable:** '1' to enable DMA, |

## 55.2.6 Command Register (COMMAND)—Offset Eh

This register is used to program the Command for host controller

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**Default:** 0000h

**BAR and Offset:** [BAR or BAR1] + Eh

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:14 | 0x0<br>RO | **RSVD0:** Reserved |
| 13:8 | 0x0<br>RW | **command_cmdindex:** This bit shall be set to the command number (CMD0-63, ACMD0-63). |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:6 | 0x0<br>RW | **command_cmdtype:** This bit is used for select different command types. |
| 5 | 0x0<br>RW | **command_datapresent:** This bit is used to checking whether data present or not. |
| 4 | 0x0<br>RW | **command_indexchkena:** This bit is used to enable/disable Command Index checking. |
| 3 | 0x0<br>RW | **command_crcchkena:** This bit is used to enable/disable CRC checking. |
| 2 | 0x0<br>RO | **RSVD1:** Reserved |
| 1:0 | 0x0<br>RW | **command_responsetype:** Response Type Select. |

## 55.2.7 Response Register (RESPONSE1)—Offset 10h

This register is used to store responses from SD Cards (concatinates response0 and response1 registers)

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [BAR or BAR1] + 10h

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO | **command_response:** R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit |

## 55.2.8 Response Register (RESPONSE2)—Offset 14h

This register is used to store responses from SD Cards

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**BAR and Offset:** [BAR or BAR1] + 14h

**Default:** 0000h

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0x0<br>RO | **command_response:** R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit |

## 55.2.9 Response Register (RESPONSE3)—Offset 16h

This register is used to store responses from SD Cards

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**BAR and Offset:** [BAR or BAR1] + 16h

**Default:** 0000h

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0x0<br>RO | **command_response:** R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit |

## 55.2.10 Response Register (RESPONSE4)—Offset 18h

This register is used to store responses from SD Cards

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**BAR and Offset:** [BAR or BAR1] + 18h

**Default:** 0000h

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0x0<br>RO | **command_response:** R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit |

## 55.2.11 Response Register (RESPONSE5)—Offset 1Ah

This register is used to store responses from SD Cards

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**BAR and Offset:** [BAR or BAR1] + 1Ah

**Default:** 0000h

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0x0<br>RO | **command_response:** R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit |

## 55.2.12 Response Register (RESPONSE6)—Offset 1Ch

This register is used to store responses from SD Cards

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**Default:** 0000h

**BAR and Offset:** [BAR or BAR1] + 1Ch

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0x0<br>RO | **command_response:** R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit |

## 55.2.13 Response Register (RESPONSE7)—Offset 1Eh

This register is used to store responses from SD Cards

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**Default:** 0000h

**BAR and Offset:** [BAR or BAR1] + 1Eh

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0x0<br>RO | **command_response:** R[] refers to a bit range within the response data as transmitted on the SD Bus, REP[] refers to a bit |

## 55.2.14 Buffer DataPort Register (DATAPORT)—Offset 20h

This register is used to access internal buffer

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [BAR or BAR1] + 20h

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **sdhcdmactrl_piobufrddata:** The Host Controller Buffer can be accessed through this 32-bit Data Port Register. |

## 55.2.15 PresentState Register (PRESENTSTATE)—Offset 24h

The Host Driver can get status of the Host Controller from this 32-bit read-only register

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [BAR or BAR1] + 24h

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:29 | 0x0<br>RO | **RSVD0:** Reserved |
| 28 | 0x0<br>RO | **sdif_dat7in_dsync:** This status is used to check DAT line level to recover from errors, and for debugging. |
| 27 | 0x0<br>RO | **sdif_dat6in_dsync:** This status is used to check DAT line level to recover from errors, and for debugging. |
| 26 | 0x0<br>RO | **sdif_dat5in_dsync:** This status is used to check DAT line level to recover from errors, and for debugging. |
| 25 | 0x0<br>RO | **sdif_dat4in_dsync:** This status is used to check DAT line level to recover from errors, and for debugging. |
| 24 | 0x0<br>RO | **sdif_cmdin_dsync:** This status is used to check DAT line level to recover from errors, and for debugging. |
| 23 | 0x0<br>RO | **sdif_dat3in_dsync:** This status is used to check DAT line level to recover from errors, and for debugging. |
| 22 | 0x0<br>RO | **sdif_dat2in_dsync:** This status is used to check DAT line level to recover from errors, and for debugging. |
| 21 | 0x0<br>RO | **sdif_dat1in_dsync:** This status is used to check DAT line level to recover from errors, and for debugging. |
| 20 | 0x0<br>RO | **sdif_dat0in_dsync:** This status is used to check DAT line level to recover from errors, and for debugging. |
| 19 | 0x0<br>RO | **sdif_wp_dsync:** The Write Protect Switch is supported for memory and combo cards. |
| 18 | 0x0<br>RO | **sdif_cd_n_dsync:** This bit reflects the inverse value of the SDCD# pin. |
| 17 | 0x0<br>RO | **sdhccarddet_statestable_dsync:** This bit is used for testing. |
| 16 | 0x0<br>RO | **sdhccarddet_inserted_dsync:** This bit indicates whether a card has been inserted. |
| 15:12 | 0x0<br>RO | **RSVD1:** Reserved |
| 11 | 0x0<br>RO | **sdhcdmactrl_piobufrdena:** This status is used for non-DMA read transfers.<br>This read only flag indicates that valid data exists in the host side buffer status. |
| 10 | 0x0<br>RO | **sdhcdmactrl_piobufwrena:** This status is used for non-DMA write transfers.<br>This read only flag indicates if space is available for write data. |
| 9 | 0x0<br>RO | **sdhcdmactrl_rdxferactive:** This status is used for detecting completion of a read transfer. |
| 8 | 0x0<br>RO | **sdhcdmactrl_wrxferactive:** This status indicates a write transfer is active. |
| 7:4 | 0x0<br>RO | **RSVD2:** Reserved |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 3 | 0x0<br>RO | **sdhcsdctrl_retuningreq_dsync:** Host Controller may request Host Driver to execute re-tuning sequence by setting this bit. |
| 2 | 0x0<br>RO | **sdhcdmactrl_datalineactive:** This bit indicates whether one of the DAT line on SD bus is in use. |
| 1 | 0x0<br>RO | **presentstate_inhibitdat:** This status bit is generated if either the DAT Line Active or the Read transfer Active is set to 1. |
| 0 | 0x0<br>RO | **presentstate_inhibitcmd:** If this bit is 0, it indicates the CMD line is not in use and the HC can issue a SD command using the CMD line.<br>This bit is set immediately after the Command register (00Fh) is written.<br>This bit is cleared when the command response is received. |

## 55.2.16 HostControl1 Register (HOSTCONTROL1)—Offset 28h

This register is used to program DMA modes, LED Control, Data Transfer Width, High Speed Enable, Card detect test level and signal selection.

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [BAR or BAR1] + 28h

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RW | **hostctrl1_cdsigselect:** This bit selects source for card detection. |
| 6 | 0x0<br>RW | **hostctrl1_cdtestlevel:** This bit is used for indicating whether card is inserted or not. |
| 5 | 0x0<br>RW | **hostctrl1_extdatawidth:** This bit controls 8-bit bus width mode for embedded device. |
| 4:3 | 0x0<br>RW | **hostctrl1_dmaselect:** One of supported DMA modes can be selected. |
| 2 | 0x0<br>RW | **hostctrl1_highspeedena:** This bit is used for setting speed mode. |
| 1 | 0x0<br>RW | **hostctrl1_datawidth:** This bit selects the data width of the HC. |
| 0 | 0x0<br>RW | **hostctrl1_ledcontrol:** This bit is used to caution the user not to remove the card while the SD card is being accessed. |

## 55.2.17 PowerControl Register (POWERCONTROL)—Offset 29h

This register is used to program the SD Bus power and voltage level

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [BAR or BAR1] + 29h

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:5 | 0x0<br>RO | **RSVD0:** Reserved |
| 4 | 0x0<br>RW | **emmc_hwreset:** Hardware reset signal is generated for eMMC card. |
| 3:1 | 0x0<br>RW | **pwrctrl_sdbusvoltage:** By setting these bits, the HD selects the voltage level for the SD card. |
| 0 | 0x0<br>RW | **pwrctrl_sdbuspower:** This bit is used detect whether power is on or off. |

## 55.2.18 BlockGapControl Register (BLOCKGAPCONTROL)—Offset 2Ah

This register is used to program the block gap request, read wait control and interrupt at block gap

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 80h

**BAR and Offset:** [BAR or BAR1] + 2Ah

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x1<br>RW | **blkgapctrl_bootackena:** To check for the boot acknowledge in boot operation. |
| 6 | 0x0<br>RW | **blkgapctrl_altbootmode:** To start boot code access in alternative mode. |
| 5 | 0x0<br>RW | **blkgapctrl_bootenable:** To start boot code access.<br>• '0' To stop boot code access<br>• '1' To start boot code access |
| 4 | 0x0<br>RW | **blkgapctrl_spimode:** SPI mode enable bit.<br>• '0' SD Mode<br>• '1' SPI Mode |
| 3 | 0x0<br>RW | **blkgapctrl_interrupt:** This bit is valid only in 4-bit mode of the SDIO card and selects a sample point in the interrupt cycle. |
| 2 | 0x0<br>RW | **blkgapctrl_rdwaitctrl:** The read wait function is optional for SDIO cards. |
| 1 | 0x0<br>RW | **blkgapctrl_continue:** This bit is used to restart a transaction which was stopped using the Stop At Block Gap Request. |
| 0 | 0x0<br>RW | **blkgapctrl_stopatblkgap:** This bit is used to stop executing a transaction at the next block gap for non- DMA,SDMA and ADMA transfers. |

## 55.2.19 Wakeup Control Register (WAKEUPCONTROL)—Offset 2Bh

This register is used to program the wakeup functionality

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [BAR or BAR1] + 2Bh

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:3 | 0x0<br>RO | **RSVD0:** Reserved |
| 2 | 0x0<br>RW | **wkupctrl_cardremoval:** This bit enables wakeup event via Card Insertion assertion in the Normal Interrupt Status register. |
| 1 | 0x0<br>RW | **wkupctrl_cardinsertion:** This bit enables wakeup event via Card Insertion assertion in the Normal Interrupt Status register. |
| 0 | 0x0<br>RW | **wkupctrl_cardinterrupt:** This bit enables wakeup event via Card Interrupt assertion in the Normal Interrupt Status register. |

## 55.2.20 Clock Control Register (CLOCKCONTROL)—Offset 2Ch

This register is used to program the Clock frequency select, generator select, Clock enable, Internal Clock state fields

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**BAR and Offset:** [BAR or BAR1] + 2Ch

**Default:** 0000h

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x0<br>RW | **clkctrl_sdclkfreqsel:** This register is used to select the frequency of the SDCLK pin. |
| 7:6 | 0x0<br>RW | **clkctrl_sdclkfreqsel_upperbits:** Bit 07-06 is assigned to bit 09-08 of clock divider in SDCLK Frequency Select |
| 5 | 0x0<br>RW | **clkctrl_clkgensel:** This bit is used to select the clock generator mode in SDCLK Frequency Select. |
| 4:3 | 0x0<br>RO | **RSVD0:** Reserved |
| 2 | 0x0<br>RW | **clkctrl_sdclkena:** This bit enables/disables SD Clock.<br>• '0' Disable<br>• '1' Enable |
| 1 | 0x0<br>RO | **sdhcclkgen_intclkstable_dsync:** This bit is set to 1 when SD clock is stable after writing to Internal Clock Enable in this register to 1. |
| 0 | 0x0<br>RW | **clkctrl_intclkena:** This bit enables setting of internal clock.<br>• '0' Stop<br>• '1' Oscillate |

## 55.2.21 Timeout Control Register (TIMEOUTCONTROL)—Offset 2Eh

The register sets the Data Timeout counter value

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [BAR or BAR1] + 2Eh

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:4 | 0x0<br>RO | **RSVD0:** Reserved |
| 3:0 | 0x0<br>RW | **timeout_ctrvalue:** This value determines the interval by which DAT line time-outs are detected. |

## 55.2.22 Software Reset Register (SOFTWARERESET)—Offset 2Fh

This register is used to program the software reset for data, command and for all.

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [BAR or BAR1] + 2Fh

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:3 | 0x0<br>RO | **RSVD0:** Reserved |
| 2 | 0x0<br>RW | **swreset_for_dat:** Only part of data circuit is reset.<br>• '0' Work<br>• '1' Reset |
| 1 | 0x0<br>RW | **swreset_for_cmd:** Only part of command circuit is reset.<br>• '0' Work<br>• '1' reset. |
| 0 | 0x0<br>RW | **swreset_for_all:** If this bit is set to 1, the SD card shall reset itself and must be re initialized by the HD. |

## 55.2.23 Normal Interrupt Status Register (NORMALINTRSTS)—Offset 30h

This register gives the status of all the interrupts.

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**Default:** 0000h

**BAR and Offset:** [BAR or BAR1] + 30h

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RO | **reg_errorintrsts:** This bit is set If any of the bits in the Error Interrupt Status Register are set. |
| 14 | 0x0<br>RW | **normalintrsts_bootcomplete:** This status is set if the boot operation gets terminated. |
| 13 | 0x0<br>RW | **normalintrsts_rcvbootack:** This status is set if the boot acknowledge is received from device. |
| 12 | 0x0<br>RO | **normalintrsts_retuningevent:** This status is set if Re-Tuning Request in the Present State register changes from 0 to 1. |
| 11 | 0x0<br>RO | **normalintrsts_intc:** This status is set if INT_C is enabled and INT_C# pin is in low level.<br>It is cleared by resetting the INT_C interrupt factor. |
| 10 | 0x0<br>RO | **normalintrsts_intb:** This status is set if INT_B is enabled and INT_B# pin is in low level.<br>It is cleared by resetting |
| 9 | 0x0<br>RO | **normalintrsts_inta:** This status is set if INT_A is enabled and INT_A# pin is in low level.<br>It is cleared by resetting |
| 8 | 0x0<br>RO | **normalintrsts_cardintsts:** This status is set to generate Card Interrupt.<br>• '0' No Card Interrupt<br>• '1' Generate Card Interrupt |
| 7 | 0x0<br>RW | **normalintrsts_cardremsts:** This status is set if the Card Inserted in the Present State register changes from 1 to 0. |
| 6 | 0x0<br>RW | **normalintrsts_cardinssts:** This status is set if the Card Inserted in the Present State register changes from 0 to 1. |
| 5 | 0x0<br>RW | **normalintrsts_bufrdready:** This status is set if the Buffer Read Enable changes from 0 to 1. |
| 4 | 0x0<br>RW | **normalintrsts_bufwrready:** This status is set if the Buffer Write Enable changes from 0 to 1. |
| 3 | 0x0<br>RW | **normalintrsts_dmainterrupt:** This status is set if the HC detects the Host DMA Buffer Boundary in the Block Size register. |
| 2 | 0x0<br>RW | **normalintrsts_blkgapevent:** If the Stop At Block Gap Request in the BlockGap Control Register is set, this bit is set. |
| 1 | 0x0<br>RW | **normalintrsts_xfercomplete:** This bit is set when a read / write transaction is completed. |
| 0 | 0x0<br>RW | **normalintrsts_cmdcomplete:** This bit is set when we get the end bit of the command response. |

## 55.2.24 ErrorInterruptStatus Register (ERRORINTRSTS)—Offset 32h

This register gives the status of the error interrupts.

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**Default:** 0000h

**BAR and Offset:** [BAR or BAR1] + 32h

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:13 | 0x0<br>RO | **RSVD0:** Reserved |
| 12 | 0x0<br>RW | **errorintrsts_hosterror:** Occurs when detecting Host ERROR |
| 11:10 | 0x0<br>RO | **RSVD1:** Reserved |
| 9 | 0x0<br>RW | **errorintrsts_admaerror:** This bit is set when the Host Controller detects errors during ADMA based data transfer. |
| 8 | 0x0<br>RW | **errorintrsts_autocmderror:** This bit is set when detecting that one of the bits D00-D04 in Auto CMD Error Status register has changed from 0 to 1. |
| 7 | 0x0<br>RW | **errorintrsts_currlimiterror:** If this bit is 1, it means that the HC is not supplying power to SD card due to some failure.<br>Reading 0 means that the HC is supplying power and no error has occurred. |
| 6 | 0x0<br>RW | **errorintrsts_dataendbiterror:** Occurs when detecting 0 at the end bit position of read data which uses the DAT line or the end bit position of the CRC status. |
| 5 | 0x0<br>RW | **errorintrsts_datacrcerror:** Occurs when detecting CRC error when transferring read data which uses the DAT line or when detecting the Write CRC Status having a value of other than 010. |
| 4 | 0x0<br>RW | **errorintrsts_datatimeouterror:** This status is set if Data Timeout error occurs. |
| 3 | 0x0<br>RW | **errorintrsts_cmdindexerror:** Occurs if a Command Index error occurs in the Command Response. |
| 2 | 0x0<br>RW | **errorintrsts_cmdendbiterror:** Occurs when detecting that the end bit of a command response is 0. |
| 1 | 0x0<br>RW | **errorintrsts_cmdcrcerror:** This bit is set when Command CRC Error is generated.<br>• '0' No Error<br>• '1' CRC Error |
| 0 | 0x0<br>RW | **errorintrsts_cmdtimeouterror:** This bit is set if no response is returned within 64 SDCLK cycles from the end bit of the command. |

## 55.2.25 Normal Interrupt Status Enable Register (NORMALINTRSTSENA)—Offset 34h

This register is used to enable the normal interrupt status register fields.

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**Default:** 0000h

**BAR and Offset:** [BAR or BAR1] + 34h

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RO | **normalintrsts_enableregbit15:** The HC shall control error Interrupts using the Error Interrupt Status Enable register. |
| 14 | 0x0<br>RW | **normalintrsts_enableregbit14:** This status is set if the boot operation gets terminated. |
| 13 | 0x0<br>RW | **normalintrsts_enableregbit13:** This status is set if the boot acknowledge is received from device. |
| 12 | 0x0<br>RW | **normalintrsts_enableregbit12:** This status is set if Re-Tuning Request in the Present State register changes from 0 to 1. |
| 11 | 0x0<br>RW | **normalintrsts_enableregbit11:** If this bit is set to 0, the Host Controller shall clear the interrupt request to the System. |
| 10 | 0x0<br>RW | **normalintrsts_enableregbit10:** If this bit is set to 0, the Host Controller shall clear the interrupt request to the System. |
| 9 | 0x0<br>RW | **normalintrsts_enableregbit9:** If this bit is set to 0, the Host Controller shall clear the interrupt request to the System. |
| 8 | 0x0<br>RW | **sdhcregset_cardintstsena:** If this bit is set to 0, the HC shall clear Interrupt request to the System. The Card Interrupt detection is stopped when this bit is cleared and restarted when this bit is set to 1. |
| 7 | 0x0<br>RW | **sdhcregset_cardremstsena:** This status is set if the Card Inserted in the Present State register changes from 1 to 0. |
| 6 | 0x0<br>RW | **sdhcregset_cardinsstsena:** This status is set if the Card Inserted in the Present State register changes from 0 to 1. |
| 5 | 0x0<br>RW | **normalintrsts_enableregbit5:** This status is set if the Buffer Read Enable changes from 0 to 1. |
| 4 | 0x0<br>RW | **normalintrsts_enableregbit4:** This status is set if the Buffer Write Enable changes from 0 to 1. |
| 3 | 0x0<br>RW | **normalintrsts_enableregbit3:** This status is set if the HC detects the Host DMA Buffer Boundary in the Block Size regiser. |
| 2 | 0x0<br>RW | **normalintrsts_enableregbit2:** If the Stop At Block Gap Request in the BlockGap Control Register is set, this bit is set. |
| 1 | 0x0<br>RW | **normalintrsts_enableregbit1:** This bit is set when a read / write transaction is completed. |
| 0 | 0x0<br>RW | **normalintrsts_enableregbit0:** This bit is set when we get the end bit of the command response. |

## 55.2.26 Error Interrupt Status Enable Register (ERRORINTRSTSENA)—Offset 36h

This register is used to enable the Error Interrupt Status register fields

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**Default:** 0000h

**BAR and Offset:** [BAR or BAR1] + 36h

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:13 | 0x0<br>RO | **RSVD0:** Reserved |
| 12 | 0x0<br>RO | **errorintrsts_enableregbit12:** Occurs when detecting ERROR in m_hresp(dma transaction) |
| 11 | 0x0<br>RO | **RSVD1:** Reserved |
| 10 | 0x0<br>RW | **errorintrsts_enableregbit10:** This status is set if INT_B is enabled and INT_B# pin is in low level. It is cleared by resetting |
| 9 | 0x0<br>RW | **errorintrsts_enableregbit9:** This bit is set when the Host Controller detects errors during ADMA based data transfer. |
| 8 | 0x0<br>RW | **errorintrsts_enableregbit8:** This bit is set when detecting that one of the bits D00-D04 in Auto CMD Error Status register has changed from 0 to 1. |
| 7 | 0x0<br>RW | **errorintrsts_enableregbit7:** If this bit is 1, it means that the HC is not supplying power to SD card due to some failure.<br>Reading 0 means that the HC is supplying power and no error has occurred. |
| 6 | 0x0<br>RW | **errorintrsts_enableregbit6:** Occurs when detecting 0 at the end bit position of read data which uses the DAT line or the end bit position of the CRC status. |
| 5 | 0x0<br>RW | **errorintrsts_enableregbit5:** Occurs when detecting CRC error when transferring read data which uses the DAT line or when detecting the Write CRC Status having a value of other than 010. |
| 4 | 0x0<br>RW | **errorintrsts_enableregbit4:** This status is set if Data Timeout error occurs. |
| 3 | 0x0<br>RW | **errorintrsts_enableregbit3:** Occurs if a Command Index error occurs in the Command Response. |
| 2 | 0x0<br>RW | **errorintrsts_enableregbit2:** Occurs when detecting that the end bit of a command response is 0. |
| 1 | 0x0<br>RW | **errorintrsts_enableregbit1:** This bit is set when Command CRC Error is generated. |
| 0 | 0x0<br>RW | **errorintrsts_enableregbit0:** This bit is set if no response is returned within 64 SDCLK cycles from the end bit of the command. |

## 55.2.27 Normal Interrupt Signal Enable Register (NORMALINTRSIGENA)—Offset 38h

This register is used to enable the Normal Interrupt Signal register.

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**Default:** 0000h

**BAR and Offset:** [BAR or BAR1] + 38h

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RO | **normalintrsts_enableregbit15:** The HD shall control error Interrupts using the Error Interrupt Signal Enable register. |
| 14 | 0x0<br>RW | **normalintrsts_enableregbit14:** Boot Terminate Interrupt Signal Enable |
| 13 | 0x0<br>RW | **normalintrsts_enableregbit13:** Boot ack rcv Signal Enable |
| 12 | 0x0<br>RW | **normalintrsts_enableregbit12:** Re-Tuning Event Signal Enable |
| 11 | 0x0<br>RW | **normalintrsts_enableregbit11:** INT_C Signal Enable |
| 10 | 0x0<br>RW | **normalintrsts_enableregbit10:** INT_B Signal Enable |
| 9 | 0x0<br>RW | **normalintrsts_enableregbit9:** INT_A Signal Enable |
| 8 | 0x0<br>RW | **sdhcregset_cardintstsena:** Card Interrupt Signal Enable |
| 7 | 0x0<br>RW | **sdhcregset_cardremstsena:** Card Removal Signal Enable |
| 6 | 0x0<br>RW | **sdhcregset_cardinsstsena:** Card Insertion Signal Enable |
| 5 | 0x0<br>RW | **normalintrsts_enableregbit5:** Buffer Read Ready Signal Enable |
| 4 | 0x0<br>RW | **normalintrsts_enableregbit4:** Buffer Write Ready Signal Enable |
| 3 | 0x0<br>RW | **normalintrsts_enableregbit3:** DMA Interrupt Signal Enable |
| 2 | 0x0<br>RW | **normalintrsts_enableregbit2:** Block Gap Event Signal Enable |
| 1 | 0x0<br>RW | **normalintrsts_enableregbit1:** Transfer Complete Signal Enable |
| 0 | 0x0<br>RW | **normalintrsts_enableregbit0:** Command Complete Signal Enable |

## 55.2.28 Error Interrupt Signal Enable Register (ERRORINTRSIGENA)—Offset 3Ah

This register is used to enable Error Interrupt Signal register.

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**Default:** 0000h

**BAR and Offset:** [BAR or BAR1] + 3Ah

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:13 | 0x0<br>RO | **RSVD0:** Reserved |
| 12 | 0x0<br>RO | **errorintrsig_enableregbit12:** Target Response Error Signal Enable |
| 11 | 0x0<br>RO | **RSVD1:** Reserved |
| 10 | 0x0<br>RW | **errorintrsig_enableregbit10:** Tuning Error Signal Enable |
| 9 | 0x0<br>RW | **errorintrsig_enableregbit9:** ADMA Error Signal Enable |
| 8 | 0x0<br>RW | **errorintrsig_enableregbit8:** Auto CMD Error Signal Enable |
| 7 | 0x0<br>RW | **errorintrsig_enableregbit7:** Current Limit Error Signal Enable |
| 6 | 0x0<br>RW | **errorintrsig_enableregbit6:** Data End Bit Error Signal Enable |
| 5 | 0x0<br>RW | **errorintrsig_enableregbit5:** Data CRC Error Signal Enable |
| 4 | 0x0<br>RW | **errorintrsig_enableregbit4:** Data Timeout Error Signal Enable |
| 3 | 0x0<br>RW | **errorintrsig_enableregbit3:** Command Index Error Signal Enable |
| 2 | 0x0<br>RW | **errorintrsig_enableregbit2:** Command End Bit Error Signal Enable |
| 1 | 0x0<br>RW | **errorintrsig_enableregbit1:** Command CRC Error Signal Enable |
| 0 | 0x0<br>RW | **errorintrsig_enableregbit0:** Command Timeout Error Signal Enable |

## 55.2.29 Auto CMD12 Error Status Register (AUTOCMDERRSTS)—Offset 3Ch

This register is used to indicate CMD12 response error of Auto CMD12 and CMD23 response error of Auto CMD 23.

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**Default:** 0000h

**BAR and Offset:** [BAR or BAR1] + 3Ch

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x0<br>RO | **RSVD0:** Reserved |
| 7 | 0x0<br>RO | **autocmderrsts_nexterror:** Setting this bit to 1 means CMD_wo_DAT is not executed due to an Auto CMD12 error(D04- D01) in this register.<br>This bit is set to 0 when Auto CMD Error is generated by Auto CMD23 |
| 6:5 | 0x0<br>RO | **RSVD1:** Reserved |
| 4 | 0x0<br>RO | **autocmderrsts_indexerror:** Occurs if the Command Index error occurs in response to a command. |
| 3 | 0x0<br>RO | **autocmderrsts_endbiterror:** Occurs when detecting that the end bit of command response is 0. |
| 2 | 0x0<br>RO | **autocmderrsts_crcerror:** Occurs when detecting a CRC error in the command response. |
| 1 | 0x0<br>RO | **autocmderrsts_timeouterror:** Occurs if the no response is returned within 64 SDCLK cycles from the end bit of the command. |
| 0 | 0x0<br>RO | **autocmderrsts_notexecerror:** Setting this bit to 1 means the HC cannot issue Auto CMD12 to stop memory multiple block transfer due to some error. |

## 55.2.30 Host Control2 Register (HOSTCONTROL2)—Offset 3Eh

This register is used to program UHS Select Mode, UHS Select Mode, Driver Strength Select, Execute Tuning, Sampling Clock Select, Asynchronous Interrupt Enable and Preset value enable.

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**Default:** 0000h

**BAR and Offset:** [BAR or BAR1] + 3Eh

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RW | **hostctrl2_presetvalueenable:** This bit enables the functions defined in the Preset Value registers. |
| 14 | 0x0<br>RW | **hostctrl2_asynchintrenable:** This bit can be set to 1 if a card support asynchronous interrupt and Asynchronous Interrupt Support is set to 1 in the Capabilities register. |
| 13:10 | 0x0<br>RO | **RSVD0:** Reserved |
| 9 | 0x0<br>RW | **hostctrl2_driverstrength_bit2:** This is the programmed Drive Strength output and Bit[2] of the sdhccore_drivestrength value. |
| 8 | 0x0<br>RO | **RSVD1:** Reserved |
| 7 | 0x0<br>RW | **hostctrl2_samplingclkselect:** This bit is set by tuning procedure when Execute Tuning is cleared. |
| 6 | 0x0<br>RW | **hostctrl2_executetuning:** This bit is set to 1 to start tuning procedure and automatically cleared when tuning procedure is completed. |
| 5:4 | 0x0<br>RW | **hostctrl2_driverstrength:** Host Controller output driver in 1.8V signaling is selected by this bit. |
| 3 | 0x0<br>RW | **hostctrl2_1p8vsignallingena:** This bit controls voltage regulator for I/O cell. |
| 2:0 | 0x0<br>RW | **hostctrl2_uhsmodeselect:** This field is used to select one of UHS-I modes and effective when 1.8V Signaling Enable is set to 1. |

## 55.2.31 Capabilities Register (CAPABILITIES)—Offset 40h

This register provides the host driver with information specific to the host controller implementation.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**Default:** 80000007F76F64B2h

**BAR and Offset:** [BAR or BAR1] + 40h

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63 | 0x1<br>RO | **corecfg_hs400support:** This field indicates whether HS400 is supported or not. |
| 62:58 | 0x0<br>RO | **rsvd0:** Reserved Field |
| 57 | 0x0<br>RO | **corecfg_spiblkmode:** This field indicates whether SPI Block Mode is supported or not. |
| 56 | 0x0<br>RO | **corecfg_spisupport:** This field indicates whether SPI Mode is supported or not. |
| 55:48 | 0x0<br>RO | **corecfg_clockmultiplier:** This field indicates clock multiplier value of programmable clock generator. |
| 47:46 | 0x0<br>RO | **corecfg_retuningmodes:** This field defines the re-tuning capability of a Host Controller. |
| 45 | 0x0<br>RO | **corecfg_tuningforsdr50:** If this bit is set to 1, this Host Controller requires tuning to operate SDR50. |
| 44 | 0x0<br>RO | **rsvd1:** Reserved Field |
| 43:40 | 0x0<br>RO | **corecfg_retuningtimercnt:** This field indicates an initial value of the Re-Tuning Timer for Re-Tuning Mode 1 to 3. |
| 39 | 0x0<br>RO | **corecfg_type4support:** This bit indicates support of Type 4 Driver. |
| 38 | 0x0<br>RO | **corecfg_ddriversupport:** This bit indicates support of Driver Type D for 1.8 Signaling. |
| 37 | 0x0<br>RO | **corecfg_cdriversupport:** This bit indicates support of Driver Type C for 1.8 Signaling. |
| 36 | 0x0<br>RO | **corecfg_adriversupport:** This bit indicates support of Driver Type A for 1.8 Signaling. |
| 35 | 0x0<br>RO | **rsvd2:** Reserved Field |
| 34 | 0x1<br>RO | **corecfg_ddr50support:** This bit indicates whether DDR50 is supported. |
| 33 | 0x1<br>RO | **corecfg_sdr104support:** This bit indicates whether SDR104 is supported.SDR104 requires tuning. |
| 32 | 0x1<br>RO | **corecfg_sdr50support:** This bit indicates whether SDR50 is supported. |
| 31:30 | 0x3<br>RO | **corecfg_slottype:** This field indicates usage of a slot by a specific Host System |
| 29 | 0x1<br>RO | **corecfg_asynchintrsupport:** Asynchronous Interrupt Support |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 28 | 0x1<br>RO | **corecfg_64bitsupport:** This bit indicates whether the HC supports 64bit System Bus |
| 27 | 0x0<br>RO | **rsvd3:** Reserved Field |
| 26 | 0x1<br>RO | **corecfg_1p8voltsupport:** This bit indicates whether the HC supports 1.8V. |
| 25 | 0x1<br>RO | **corecfg_3p0voltsupport:** This bit indicates whether the HC supports 3.0V. |
| 24 | 0x1<br>RO | **corecfg_3p3voltsupport:** This bit indicates whether the HC supports 3.3V. |
| 23 | 0x0<br>RO | **corecfg_suspressupport:** This bit indicates whether the HC supports Suspend/Resume functionality. |
| 22 | 0x1<br>RO | **corecfg_sdmasupport:** This bit indicates whether the HC is capable of using DMA to transfer data between system memory and the HC directly. |
| 21 | 0x1<br>RO | **corecfg_highspeedsupport:** This bit indicates whether the HC and the Host System support High Speed mode. |
| 20 | 0x0<br>RO | **rsvd4:** Reserved Field |
| 19 | 0x1<br>RO | **corecfg_adma2support:** '0'ADMA2 Not Supported |
| 18 | 0x1<br>RO | **corecfg_8bitsupport:** This bit indicates whether the Host Controller is capable of using 8-bit bus width mode. |
| 17:16 | 0x3<br>RO | **corecfg_maxblklength:** This value indicates the maximum block size that the HD can read and write to the buffer in the HC. |
| 15:8 | 0x64<br>RO | **corecfg_baseclkfreq:** 6-bit Base Clock Frequency |
| 7 | 0x1<br>RO | **corecfg_timeoutclkunit:** This bit shows the unit of base clock frequency used to detect Data Timeout Error. |
| 6 | 0x0<br>RO | **rsvd5:** Reserved Field |
| 5:0 | 0x32<br>RO | **corecfg_timeoutclkfreq:** This bit shows the base clock frequency used to detect Data Timeout Error. |

## 55.2.32 Maximum Current Capabilities Register (MAXCURRENTCAP)—Offset 48h

This register indicates maximum current capability for each voltage.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**Default:** 0000000000000000h

**BAR and Offset:** [BAR or BAR1] + 48h

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:24 | 0x0<br>RO | **RSVD0:** Reserved |
| 23:16 | 0x0<br>RO | **corecfg_maxcurrent1p8v:** Maximum Current for 1.8V |
| 15:8 | 0x0<br>RO | **corecfg_maxcurrent3p0v:** Maximum Current for 3.0V |
| 7:0 | 0x0<br>RO | **corecfg_maxcurrent3p3v:** Maximum Current for 3.3V |

## 55.2.33 Force Event REGISTER for AUTO CMD Error Status (FORCEEVENTFORAUTOCMDERRORSTATUS)—Offset 50h

This register is not physically implemented, rather it is an address where Auto CMD Error Status register can be written.

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**Default:** 0000h

**BAR and Offset:** [BAR or BAR1] + 50h

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x0<br>RO | **RSVD0:** Reserved |
| 7 | 0x0<br>RO | **forcecmdnotissuedbyautocmd12err:** Force Event for Command Not Issued by AUTO CMD12 Error |
| 6:5 | 0x0<br>RO | **RSVD1:** Reserved |
| 4 | 0x0<br>RO | **forceautocmdindexerr:** Force Event for AUTO CMD Index Error |
| 3 | 0x0<br>RO | **forceautocmdendbiterr:** Force Event for AUTO CMD End Bit Error |
| 2 | 0x0<br>RO | **forceautocmdcrcerr:** Force Event for AUTO CMD Timeout Error |
| 1 | 0x0<br>RO | **forceautocmdtimeouterr:** Force Event for AUTO CMD Timeout Error |
| 0 | 0x0<br>RO | **forceautocmdnotexec:** Force Event for AUTO CMD12 Not Executed |

## 55.2.34 Force Event Register for Error Interrupt Status (FORCEEVENTFORERRINTSTS)—Offset 52h

This register is not physically implemented, rather it is an address where Error Interrupt Status register can be written.

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**Default:** 0000h

**BAR and Offset:** [BAR or BAR1] + 52h

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:11 | 0x0<br>RO | **RSVD0:** Reserved |
| 10 | 0x0<br>RO | **forcetuningerr:** Force Event for Tuning Error |
| 9 | 0x0<br>RO | **forceadmaerr:** Force Event for ADMA Error<br>• '0' no interrupt<br>• '1' interrupt generated |
| 8 | 0x0<br>RO | **forceautocmderr:** Force Event for Auto CMD Error<br>• '0' no interrupt<br>• '1' interrupt generated |
| 7 | 0x0<br>RO | **forcecurrlimerr:** Force Event for Current Limit Error<br>• '0' no interrupt<br>• '1' interrupt generated |
| 6 | 0x0<br>RO | **forcedatendbiterr:** Force Event for Data End Bit Error.<br>• '0' no interrupt<br>• '1' interrupt generated |
| 5 | 0x0<br>RO | **forcedatcrcerr:** Force Event for Data CRC Error |
| 4 | 0x0<br>RO | **forcedattimeouterr:** Force Event for Data Timeout Error<br>• '0' no interrupt<br>• '1' interrupt generated |
| 3 | 0x0<br>RO | **forcecmdindexerr:** Force Event for Command Index Error |
| 2 | 0x0<br>RO | **forcecmdendbiterr:** Force Event for Command End Bit Error<br>• '0' no interrupt<br>• '1' interrupt generated |
| 1 | 0x0<br>RO | **forcecmdcrcerr:** Force Event for Command CRC Error |
| 0 | 0x0<br>RO | **forcecmdtimeouterr:** Force Event for CMD Timeout Error<br>• '0' No interrupt<br>• '1' interrupt generated |

## 55.2.35 ADMA Error Status Register (ADMAERRSTS)—Offset 54h

When the ADMA Error interrupt occurs, this register holds the ADMA State in ADMA Error States field and ADMA System Address holds address around the error descriptor.

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [BAR or BAR1] + 54h

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:3 | 0x0<br>RO | **RSVD0:** Reserved |
| 2 | 0x0<br>RO | **admaerrsts_admalenmismatcherr:** ADMA Length Mismatch Error |
| 1:0 | 0x0<br>RO | **admaerrsts_admaerrorstate:** This field indicates the state of ADMA when error is occurred during ADMA data transfer. |

## 55.2.36 ADMA System Address Register0&1 (ADMASYSADDR01)—Offset 58h

This register contains the physical address used for ADMA data transfer.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [BAR or BAR1] + 58h

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **adma_sysaddress0:** This register holds byte address of executing command of the Descriptor table. |

## 55.2.37 ADMA System Address Register1 (ADMASYSADDR2)—Offset 5Ch

This register contains the physical address used for ADMA data transfer.

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**Default:** 0000h

**BAR and Offset:** [BAR or BAR1] + 5Ch

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0x0<br>RW | **adma_sysaddress2:** This register holds byte address of executing command of the Descriptor table. |

## 55.2.38 ADMA System Address Register1 (ADMASYSADDR3)—Offset 5Eh

This register contains the physical address used for ADMA data transfer.

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**Default:** 0000h

**BAR and Offset:** [BAR or BAR1] + 5Eh

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0x0<br>RW | **adma_sysaddress3:** This register holds byte address of executing command of the Descriptor table. |

## 55.2.39 Preset Value Register for Initialization (PRESETVALUE0)—Offset 60h

This register is used to read the SDCLK Frequency Select Value, Clock Generator Select Value, and Driver Strength Select Value.

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**Default:** 0003h

**BAR and Offset:** [BAR or BAR1] + 60h

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:14 | 0x0<br>RO | **DriverStrengthSelectValue:** Driver Strength Select Value |
| 13:11 | 0x0<br>RO | **RSVD0:** Reserved |
| 10 | 0x0<br>RO | **ClockGeneratorSelectValue:** This bit is effective when Host Controller supports programmable clock |
| 9:0 | 0x3<br>RO | **SDCLKFrequencySelectValue:** 10-bit preset value to set SDCLK Frequency Select in the Clock Control Register is described by a host system. |

## 55.2.40 Preset Value Register for Default Speed (PRESETVALUE1)—Offset 62h

This register is used to read the SDCLK Frequency Select Value, Clock Generator Select Value, and Driver Strength Select Value for Default Speed.

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**Default:** 0003h

**BAR and Offset:** [BAR or BAR1] + 62h

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:14 | 0x0<br>RO | **DriverStrengthSelectValue:** Driver Strength Select Value |
| 13:11 | 0x0<br>RO | **RSVD0:** Reserved |
| 10 | 0x0<br>RO | **ClockGeneratorSelectValue:** This bit is effective when Host Controller supports programmable clock |
| 9:0 | 0x3<br>RO | **SDCLKFrequencySelectValue:** 10-bit preset value to set SDCLK Frequency Select in the Clock Control Register is described by a host system. |

## 55.2.41 Preset Value Register for High Speed (PRESETVALUE2)—Offset 64h

This register is used to read the SDCLK Frequency Select Value, Clock Generator Select Value, and Driver Strength Select Value for High Speed.

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**Default:** 0003h

**BAR and Offset:** [BAR or BAR1] + 64h

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:14 | 0x0<br>RO | **DriverStrengthSelectValue:** Driver Strength Select Value |
| 13:11 | 0x0<br>RO | **RSVD0:** Reserved |
| 10 | 0x0<br>RO | **ClockGeneratorSelectValue:** This bit is effective when Host Controller supports programmable clock |
| 9:0 | 0x3<br>RO | **SDCLKFrequencySelectValue:** 10-bit preset value to set SDCLK Frequency Select in the Clock Control Register is described by a host system. |

## 55.2.42 Preset Value Register for SDR12 (PRESETVALUE3)—Offset 66h

This register is used to read the SDCLK Frequency Select Value, Clock Generator Select Value, and Driver Strength Select Value for SDR12.

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**Default:** 0003h

**BAR and Offset:** [BAR or BAR1] + 66h

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:14 | 0x0<br>RO | **DriverStrengthSelectValue:** Driver Strength Select Value |
| 13:11 | 0x0<br>RO | **RSVD0:** Reserved |
| 10 | 0x0<br>RO | **ClockGeneratorSelectValue:** This bit is effective when Host Controller supports programmable clock |
| 9:0 | 0x3<br>RO | **SDCLKFrequencySelectValue:** 10-bit preset value to set SDCLK Frequency Select in the Clock Control Register is described by a host system. |

## 55.2.43 Preset Value Register for SDR25 (PRESETVALUE4)—Offset 68h

This register is used to read the SDCLK Frequency Select Value, Clock Generator Select Value, and Driver Strength Select Value SDR25.

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**Default:** 0002h

**BAR and Offset:** [BAR or BAR1] + 68h

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:14 | 0x0<br>RO | **DriverStrengthSelectValue:** Driver Strength Select Value |
| 13:11 | 0x0<br>RO | **RSVD0:** Reserved |
| 10 | 0x0<br>RO | **ClockGeneratorSelectValue:** This bit is effective when Host Controller supports programmable clock |
| 9:0 | 0x2<br>RO | **SDCLKFrequencySelectValue:** 10-bit preset value to set SDCLK Frequency Select in the Clock Control Register is described by a host system. |

## 55.2.44 Preset Value Register for SDR50 (PRESETVALUE5)—Offset 6Ah

This register is used to read the SDCLK Frequency Select Value, Clock Generator Select Value, and Driver Strength Select Value for SDR50.

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**Default:** 0001h

**BAR and Offset:** [BAR or BAR1] + 6Ah

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:14 | 0x0<br>RO | **DriverStrengthSelectValue:** Driver Strength Select Value |
| 13:11 | 0x0<br>RO | **RSVD0:** Reserved |
| 10 | 0x0<br>RO | **ClockGeneratorSelectValue:** This bit is effective when Host Controller supports programmable clock |
| 9:0 | 0x1<br>RO | **SDCLKFrequencySelectValue:** 10-bit preset value to set SDCLK Frequency Select in the Clock Control Register is described by a host system. |

## 55.2.45 Preset Value Register for SDR104 (PRESETVALUE6)—Offset 6Ch

This register is used to read the SDCLK Frequency Select Value, Clock Generator Select Value, and Driver Strength Select Value for SDR 104.

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**Default:** 0000h

**BAR and Offset:** [BAR or BAR1] + 6Ch

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:14 | 0x0<br>RO | **DriverStrengthSelectValue:** Driver Strength Select Value |
| 13:11 | 0x0<br>RO | **RSVD0:** Reserved |
| 10 | 0x0<br>RO | **ClockGeneratorSelectValue:** This bit is effective when Host Controller supports programmable clock |
| 9:0 | 0x0<br>RO | **SDCLKFrequencySelectValue:** 10-bit preset value to set SDCLK Frequency Select in the Clock Control Register is described by a host system. |

## 55.2.46 Preset Value Register for DDR50 (PRESETVALUE7)—Offset 6Eh

This register is used to read the SDCLK Frequency Select Value, Clock Generator Select Value, and Driver Strength Select Value for DDR50.

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**Default:** 0002h

**BAR and Offset:** [BAR or BAR1] + 6Eh

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:14 | 0x0<br>RO | **DriverStrengthSelectValue:** Driver Strength Select Value |
| 13:11 | 0x0<br>RO | **RSVD0:** Reserved |
| 10 | 0x0<br>RO | **ClockGeneratorSelectValue:** This bit is effective when Host Controller supports programmable clock |
| 9:0 | 0x2<br>RO | **SDCLKFrequencySelectValue:** 10-bit preset value to set SDCLK Frequency Select in the Clock Control Register is described by a host system. |

## 55.2.47 Boot Timeout Control Register (BOOTTIMEOUTCNT)—Offset 70h

This is used to program the boot timeout value counter.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [BAR or BAR1] + 70h

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **boot_timeoutcnt:** This value determines the interval by which DAT line time-outs are detected during boot operation for eMMC4.4 card. |

## 55.2.48 Preset Value Register for DDR50 (PRESETVALUE8)—Offset 74h

This register is used to read the SDCLK Frequency Select Value, Clock Generator Select Value, and Driver Strength Select Value for DDR50.

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**Default:** 0000h

**BAR and Offset:** [BAR or BAR1] + 74h

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:14 | 0x0<br>RO | **DriverStrengthSelectValue:** Driver Strength Select Value |
| 13:11 | 0x0<br>RO | **RSVD0:** Reserved |
| 10 | 0x0<br>RO | **ClockGeneratorSelectValue:** This bit is effective when Host Controller supports programmable clock |
| 9:0 | 0x0<br>RO | **SDCLKFrequencySelectValue:** 10-bit preset value to set SDCLK Frequency Select in the Clock Control Register is described by a host system. |

## 55.2.49 Slot Interrupt Status Register (SLOTINTRSTS)—Offset FCh

This register is used to read the interrupt signal for each slot.

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**Default:** 0000h

**BAR and Offset:** [BAR or BAR1] + FCh

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x0<br>RO | **RSVD0:** Reserved |
| 7:0 | 0x0<br>RO | **sdhchostif_slotintrsts:** These status bits indicate the logical OR of Interrupt signal and Wakeup signal for each slot. |

## 55.2.50 Host Controller Version Register (HOSTCONTROLLERVER)—Offset FEh

This register is used to read the vendor version number and specification version number.

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**Default:** 1002h

**BAR and Offset:** [BAR or BAR1] + FEh

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x10<br>RO | **SDHC_VENVERNUM:** This status is reserved for the vendor version number. |
| 7:0 | 0x2<br>RO | **SpecificationVersionNumber:** This status indicates the Host Controller Spec. Version.<br>The upper and lower 4-bits indicate the version. |

## 55.2.51 Software Latency Tolerance Reporting (SW_LTR_VAL)—Offset 804h

Sets the Software Latency Tolerance Reporting fields.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000800h

**BAR and Offset:** [BAR or BAR1] + 804h

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 15 | 0x0<br>RW | **Snoop_Requirment:** If the Requirement (bit 15) is clear, that indicates that the device has no LTR requirement for this type of traffic (i.e. it can wait for service indefinitely).<br>If the 10-bit latency value is zero it indicates that the device cannot tolerate any delay and needs the best possible service/response time. |
| 14:13 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 12:10 | 0x2<br>RW | **Snoop_latency_scale:** Support for codes 010 (1us) or 011 (32us) for Snoop Latency Scale (1us -) 32ms total span) only.<br>Writes to this CSR which don't match those values will be dropped completely, next read will return previous value. |
| 9:0 | 0x0<br>RW | **Snoop_value:** 10-bit latency value |

## 55.2.52 Auto Latency Tolerance Reporting (AUTO_LTR_VAL)—Offset 808h

Sets the Auto Latency Tolerance Reporting fields.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000800h

**BAR and Offset:** [BAR or BAR1] + 808h

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 15 | 0x0<br>RW | **Snoop_Requirment:** If the Requirement (bit 15) is clear, that indicates that the device has no LTR requirement for this type of traffic (i.e. it can wait for service indefinitely).<br>If the 10-bit latency value is zero it indicates that the device cannot tolerate any delay and needs the best possible service/response time. |
| 14:13 | 0x0<br>RO | **Reserved_low:** Reserved_low |
| 12:10 | 0x2<br>RW | **Snoop_latency_scale:** Support for codes 010 (1us) or 011 (32us) for Snoop Latency Scale (1us -) 32ms total span) only.<br>Writes to this CSR which don't match those values will be dropped completely, next read will return previous value. |
| 9:0 | 0x0<br>RW | **Snoop_value:** 10-bit latency value |

## 55.2.53 Capabilities Bypass Control Register (CAP_BYPS)—Offset 810h

Capabilities Bypass Control register.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [BAR or BAR1] + 810h

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 7:0 | 0x0<br>RW | **Enable_Cap_Bypass:** 8h5A Enable Capabilities Bypass.<br>All other Capabilities Bypass Disable (using default values). |

## 55.2.54 eMMC Capabilities Bypass Register1 (CAP_BYPS_REG1)—Offset 814h

eMMC Capabilities Bypass register 1

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 3001EF3Ch

**BAR and Offset:** [BAR or BAR1] + 814h

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:30 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 29 | 0x1<br>RW | **hs400_support:**<br>• 1: HS400 Mode Supported.<br>• 0: HS400 Mode NOT Supported |
| 28 | 0x1<br>RW | **timeout_clock_unit:**<br>• 1b1 - to Select MHz Clock<br>• 1b0 - to Select KHz Clock |
| 27:22 | 0x200<br>RW | **timeout_clock_freq:** Timeout clock frequency |
| 21 | 0x0<br>RW | **SPI_mode_support:** SPI Mode Support<br>• 1b1 SPI Mode Supported<br>• 1b0 SPI Mode Not Supported |
| 20:17 | 0x0<br>RW | **timer_count:** Timer Count for Re-Tuning This is the Timer Count for Re-Tuning Timer for Re-Tuning Mode 1 to 3. Setting to 4b0 disables Re-Tuning Timer |
| 16 | 0x1<br>RW | **tuning_for_SDR50:** Use Tuning for SDR50<br>• 1b1 Use Tuning<br>• 1b0 Don’t use Tuning |
| 15 | 0x1<br>RW | **ddr50_support:**<br>• 1: DDR50 Mode Supported.<br>• 0: DDR50 Mode NOT Supported |
| 14 | 0x1<br>RW | **sdr104_support:**<br>• 1: SDR104 Mode Supported.<br>• 0: SDR104 Mode NOT Supported |
| 13 | 0x1<br>RW | **sdr50_support:**<br>• 1: SDR50 Mode Supported.<br>• 0: SDR50 Mode NOT Supported |
| 12:11 | 0x1<br>RW | **Slot_Type:**<br>• 00 - Removable SD Card Slot.<br>• 01 - Embedded Slot for One Device.<br>• 10 - Shared Bus Slot.<br>• 11 - Reserved |
| 10 | 0x1<br>RW | **Async_Interrupt_Support:**<br>• 1: Asynchronous Interrupt Supported.<br>• 0: Asynchronous Interrupt NOT Supported |
| 9 | 0x1<br>RW | **Sys_Addr_64bit_Support:**<br>• 1 - Core supports 64-bit System Address Bus.<br>• 0 - Core supports only 32-bit System Address Bus |
| 8 | 0x1<br>RW | **Voltage_Support_1_8V:**<br>• 1: 1.8V Supported.<br>• 0: 1.8V NOT Supported |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RW | **Voltage_Support_3V:**<br>• 1: 3.0V Supported.<br>• 0: 3.0V NOT Supported |
| 6 | 0x0<br>RW | **Voltage_Support_3_3V:**<br>• 1: 3.3V Supported.<br>• 0: 3.3V NOT Supported |

## 55.2.55 eMMC Capabilities Bypass Register2 (CAP_BYPS_REG2)—Offset 818h

eMMC Capabilities Bypass register 2

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 04004000h

**BAR and Offset:** [BAR or BAR1] + 818h

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:27 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 26:21 | 0x20<br>RW | **tuning_count_val:** Tuning Count Value Configures the Number of Taps (Phases) of the rxclk_in that is supported.<br>The Tuning State machine uses this information to select one of the Taps (Phases) of the rxclk_in during the Tuning Procedure. |
| 20 | 0x0<br>RW | **tuning_dis:** Disable the 1.5x Tuning count when calculating total tuning count.<br>The internal tuning count will be set to the corecfg_Tuningcount when this signal is asserted |
| 19 | 0x0<br>RW | **driver_type_4:** Driver Type 4 Support<br>• 1b1 Supported<br>• 1b0 NOT Supported |
| 18 | 0x0<br>RW | **driver_type_D:** Driver Type D Support<br>• 1b1 Supported<br>• 1b0 NOT Supported |
| 17 | 0x0<br>RW | **driver_type_C:** Driver Type C Support<br>• 1b1 Supported<br>• 1b0 NOT Supported |
| 16 | 0x0<br>RW | **driver_type_A:** Driver Type A Support<br>• 1b1 Supported<br>• 1b0 NOT Supported |
| 15 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 14 | 0x1<br>RW | **support_8_bit_embedded:** 8-bit Support for Embedded Device<br>• 1b1 Supported<br>• 1b0 NOT Supported |
| 13:8 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 7:0 | 0x0<br>RW | **base_sd_clock:** Base Clock Frequency for SD Clock |

## 55.2.56 D0i3 Control Register (REG_D0i3)—Offset 81Ch

D0i3 Control register

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000008h

**BAR and Offset:** [BAR or BAR1] + 81Ch

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:5 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 4 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 3 | 0x1<br>RW/1C | **RestoreRequired:** When set (by HW), SW must restore state to the IP. The state may have been lost due to a reset or full power lost.<br>SW clears the bit by writing a 1. This bit will be set on initial power up. |
| 2 | 0x0<br>RW | **D0i3:** SW sets this bit to 1 to move the IP into the D0i3 state.<br>Writing this bit to 0 will return the IP to the fully active D0 state (D0i0). |
| 1 | 0x0<br>RO | **Interrupt_Request:** SW sets this bit to 1 to ask for an interrupt to be generated on completion of the command.<br>SW must clear or set this on each write to this register. Not supported in SCS! |
| 0 | 0x0<br>RO | **Cmd_In_Progress:** HW sets this bit on a 1-)0 or 0-)1 transition of bit [2].<br>While set, the other bits in this register are not valid and it is illegal for SW to write to any bit in this register.<br>When clear all the other bits in the register are valid and SW may write to any bit.<br>If Interrupt Request bit [1] was set for the current command, HW may clear this bit before the interrupt has been made visible to SW, since when SW actually handles |

## 55.2.57 Front End Module Tx Command Path Delay Register (Tx_CMD_DLY)—Offset 820h

Front end module Tx Command Path Delay register

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000400h

**BAR and Offset:** [BAR or BAR1] + 820h

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:15 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 14:8 | 0x4<br>RW | **ddr_mode:** Tx CMD Delay (DDR Mode). 0 39 Select number of active delay elements.<br>Each = 125pSec. 40 127 Reserved |
| 7 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 6:0 | 0x0<br>RW | **sdr_mode:** Tx CMD Delay (SDR Mode). 0 39 Select number of active delay elements.<br>Each = 125pSec. 40 127 - Reserved |

## 55.2.58 Front End Module Tx Data Path Delay Register1 (Tx_DATA_DLY_1)—Offset 824h

Front end module Tx data Path Delay register 1

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000A18h

**BAR and Offset:** [BAR or BAR1] + 824h

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:15 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 14:8 | 0xa<br>RW | **hs400_mode:** Tx Data Delay (HS400 Mode).<br>• 0-78 - Select number of active delay elements. Each = 125pSec.<br>• 79-127 - Reserved |
| 7 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 6:0 | 0x18<br>RW | **sdr104_hs200:** Tx Data Delay (SDR104/HS200 Mode)<br>• 0-79 - Select the required delay, as a multiple of 125pSec.<br>• 80-127 - Reserved |

## 55.2.59 Front End Module Tx Data Path Delay Register2 (Tx_DATA_DLY_2)—Offset 828h

Front end module Tx data Path Delay register 2

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 1C1C1C00h

**BAR and Offset:** [BAR or BAR1] + 828h

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 30:24 | 0x1c<br>RW | **sdr50_mode:** Tx Data Delay (SDR50 Mode)<br>• 0-79 - Select the required delay, as a multiple of 125pSec.<br>• 80-127 - Reserved |
| 23 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 22:16 | 0x1c<br>RW | **ddr50_mode:** Tx Data Delay (DDR50 Mode).<br>• 0-78 - Select number of active delay elements. Each = 125pSec.<br>• 79-127 - Reserved |

## 55.2.60 Front End Module Rx Data Path Delay Register1 (Rx_CMD_DATA_DLY_1)—Offset 82Ch

Front end module Rx data Path Delay register 1

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [BAR or BAR1] + 82Ch

**Default:** 00000000h

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 30:24 | 0x0<br>RW | **sdr50_mode:** Rx CMD + Data Delay (SDR50 Mode).<br>• 0-79 - Select the required delay, as a multiple of 125pSec.<br>• 80-127 - Reserved |

## 55.2.61 Front End Module Rx Strobe Path Delay Register (Rx_STROBE_CTRL_PATH)—Offset 830h

Front end module Rx strobe Path Delay register

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [BAR or BAR1] + 830h

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:17 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 16 | 0x0<br>RW | **auto_tuning:** Enable Auto Tuning for HS400 Strobe Path<br>• 0 Auto Tuning Disabled<br>• 1 Auto Tuning Enabled |

| 7 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 6:0 | 0x0<br>RW | **hs400_mode2:** Rx Strobe Delay DLL 2(HS400 Mode)<br>• 0-39 - Select number of active delay elements. Each = 125pSec<br>• 40-63 - Reserved |

## 55.2.62 Front End Module Rx Data Path Delay Register2 (Rx_CMD_DATA_DLY_2)—Offset 834h

Front end module Rx data Path Delay register 2

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [BAR or BAR1] + 834h

**Default:** 00000000h

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:18 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 17:16 | 0x0<br>RW | **clk_source:** Clock Source for Rx Path<br>• 00 - Rx Clock after Output Buffer<br>• 01 - Rx Clock before Output Buffer<br>• 10 - Automatic Selection based on Working mode (HS 200 before buffer, all others after buffer)<br>• 11 - Reserved |
| 15:14 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 13:8 | 0x0<br>RW | **path_pll:** Rx Path PLL #3 Delay value For Auto Tuning Mode<br>• 0-39 - Select the required delay, as a multiple of 125pSec.<br>• 40-63 - Reserved |
| 7 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |

## 55.2.63 Master DLL Software Control Register (MASTER_DLL)—Offset 838h

Master DLL Software control register

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000001h

**BAR and Offset:** [BAR or BAR1] + 838h

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:25 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 24 | 0x0<br>RW | **SW_reset_dll:** SW reset for Master DLL<br>• 0 No SW Reset for Master DLL<br>• 1 Force Reset for Master DLL |
| 23 | 0x0<br>RO/V | **DLL_lock:** Master DLL Lock Indication |
| 22:8 | 0x0<br>RW | **coarse_code:** Set coarse code to DLL. (only valid when Software control is Enabled) |
| 7:4 | 0x0<br>RW | **fine_code:** Set fine code to DLL. (only valid when Software control is Enabled) |
| 3 | 0x0<br>RO/V | **less:** Phase Detection Less Indication |
| 2 | 0x0<br>RO/V | **more:** Phase Detector More Indication |
| 1 | 0x0<br>RW | **Master_DLL_Software_Ctrl:** Master DLL Software Ctrl.<br>• 0 Master DLL Automatic Control (SW Control Disabled).<br>• 1 Master DLL Software Control Enabled |
| 0 | 0x1<br>RW | **Ctrl_of_Mst_DLL_Ref_Clk:** Ctrl of Master DLL Ref Clock.<br>• 0 - Clock is Disabled.<br>• 1 - Clock is Enabled |

## 55.2.64 Auto Tuning Value (AUTO_TUNING)—Offset 840h

Auto Tuning Value

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [BAR or BAR1] + 840h

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:5 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 4:0 | 0x0<br>RO/V | **Auto_tuning_val:** Reserved. |

## 55.2.65 Root Space Select (eMMC_ROOT_SPACE)—Offset 900h

Root space select to indicate which root space the IP will output its upstream accesses

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [BAR or BAR1] + 900h

**BAR or BAR1 Type:** PCI Configuration Register (Size: 64 bits)
**BAR or BAR1 Reference:** [B:0, D:28, F:0] + 10h or 18h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:1 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 0 | 0x0<br>RO | **root_space:** Root Space Select Selects the Root Space in which the IP output its upstream accesses<br>• 0 Root Space 0<br>• 1 Root Space 1 |

§ §

# 56 LPC Controller - B0, D31, F0

## 56.1 Introduction and Index

The host-accessible registers for the LPC Controller are described here.

To determine the number of devices/functions available refer to the following:

- Table 1-1, "Features by product SKU - Server and Cloud Storage SKUs 0 through 4"
- Table 1-2, "Features by Product SKU - Network and Enterprise Storage SKUs 5 through 10"
- Table 1-3, "Features by Product SKU - Extended Temperature SKUs 11 through 14".

The legend for the register access codes are described in Chapter 43, "Introduction."

### 56.1.1 Host Configuration Space

These registers are discovered in Host Configuration Space starting at Bus 0, Device 31 (decimal), Function 0. The offset addresses are listed.

**Table 56-1. Summary of PCI Configuration Registers—0/31/0**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 80 | 2 | 0000 | "I/O Decode Ranges (IOD)—Offset 80h" on page 2645 |
| 82 | 2 | 0000 | "I/O Enables (IOE)—Offset 82h" on page 2646 |
| 84 | 4 | 00000000 | "LPC Generic I/O Range #1 (LGIR1)—Offset 84h" on page 2647 |
| 88 | 4 | 00000000 | "LPC Generic I/O Range #2 (LGIR2)—Offset 88h" on page 2648 |
| 8C | 4 | 00000000 | "LPC Generic I/O Range #3 (LGIR3)—Offset 8Ch" on page 2649 |
| 90 | 4 | 00000000 | "LPC Generic I/O Range #4 (LGIR4)—Offset 90h" on page 2650 |
| 94 | 4 | 00000000 | "USB Legacy Keyboard/Mouse Control (ULKMC)—Offset 94h" on page 2651 |
| 98 | 4 | 00000000 | "LPC Generic Memory Range (LGMR)—Offset 98h" on page 2653 |
| D0 | 4 | 00112233 | "FWH ID Select #1 (FS1)—Offset D0h" on page 2653 |
| D4 | 2 | 4567 | "FWH ID Select #2 (FS2)—Offset D4h" on page 2654 |
| D8 | 2 | FFCF | "BIOS Decode Enable (BDE)—Offset D8h" on page 2655 |
| DC | 1 | 20 | "BIOS Control (BC)—Offset DCh" on page 2657 |
| E0 | 4 | 00000000 | "PCI Clock Control (PCCTL)—Offset E0h" on page 2659 |

## 56.2 Registers in Configuration Space

### 56.2.1 I/O Decode Ranges (IOD)—Offset 80h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:31, F:0] + 80h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:13 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 12 | 0x0<br>RW | **FDD Range (FDD):** The following table describes which range to decode for the FDD Port:<br>Bits Decode Range<br>• 0 3F0h - 3F5h, 3F7h (Primary).<br>• 1 370h - 375h, 377h (Secondary). |
| 11:10 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved. |
| 9:8 | 0x0<br>RW | **LPT Range (LPT):** The following table describes which range to decode for the LPT Port:<br>Bits Decode Range<br>• 00 378h - 37Fh and 778h - 77Fh.<br>• 01 278h - 27Fh (port 279h is read only) and 678h - 67Fh.<br>• 10 3BCh - 3BEh and 7BCh - 7BEh.<br>• 11 Reserved. |
| 7 | 0x0<br>RO | **Reserved (RSVD_2):** Reserved. |
| 6:4 | 0x0<br>RW | **ComB Range (CB):** The following table describes which range to decode for the COMB Port:<br>Bits Decode Range<br>• 000 3F8h - 3FFh (COM 1)<br>• 001 2F8h - 2FFh (COM 2)<br>• 010 220h - 227h<br>• 011 228h - 22Fh<br>• 100 238h - 23Fh<br>• 101 2E8h - 2EFh (COM 4)<br>• 110 338h - 33Fh<br>• 111 3E8h - 3EFh (COM 3) |
| 3 | 0x0<br>RO | **Reserved (RSVD_3):** Reserved. |
| 2:0 | 0x0<br>RW | **ComA Range (CA):** The following table describes which range to decode for the COMA Port:<br>Bits Decode Range<br>• 000 3F8h - 3FFh (COM 1)<br>• 001 2F8h - 2FFh (COM 2)<br>• 010 220h - 227h<br>• 011 228h - 22Fh<br>• 100 238h - 23Fh<br>• 101 2E8h - 2EFh (COM 4)<br>• 110 338h - 33Fh<br>• 111 3E8h - 3EFh (COM 3) |

## 56.2.2 I/O Enables (IOE)—Offset 82h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:31, F:0] + 82h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:14 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 13 | 0x0<br>RW | **Microcontroller Enable #2 (ME2):** Enables decoding of I/O locations 4Eh and 4Fh to LPC. |
| 12 | 0x0<br>RW | **SuperI/O Enable (SE):** Enables decoding of I/O locations 2Eh and 2Fh to LPC. |
| 11 | 0x0<br>RW | **Microcontroller Enable #1 (ME1):** Enables decoding of I/O locations 62h and 66h to LPC. |
| 10 | 0x0<br>RW | **Keyboard Enable (KE):** Enables decoding of the keyboard I/O locations 60h and 64h to LPC. |
| 9 | 0x0<br>RW | **High Gameport Enable (HGE):** Enables decoding of the I/O locations 208h to 20Fh to LPC. |
| 8 | 0x0<br>RW | **Low Gameport Enable (LGE):** Enables decoding of the I/O locations 200h to 207h to LPC.<br><br>**Power Well:** Core |
| 7:4 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved. |
| 3 | 0x0<br>RW | **Floppy Drive Enable (FDE):** Enables decoding of the FDD range to LPC.<br>Range is selected by IOD.FDE |
| 2 | 0x0<br>RW | **Parallel Port Enable (PPE):** Enables decoding of the LPT range to LPC.<br>Range is selected by IOD.LPT. |
| 1 | 0x0<br>RW | **Com Port B Enable (CBE):** Enables decoding of the COMB range to LPC.<br>Range is selected IOD.CB. |
| 0 | 0x0<br>RW | **Com Port A Enable (CAE):** Enables decoding of the COMA range to LPC.<br>Range is selected IOD.CA. |

### 56.2.3 LPC Generic I/O Range #1 (LGIR1)—Offset 84h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:0] + 84h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 23:18 | 0x0<br>RW | **Address [7:2] Mask (Address_7_2_Mask):** A 1 in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match.<br>The corresponding bit in the Address field, below, is ignored.<br>The mask is only provided for the lower 6 bits of the DWord address, allowing for decoding blocks up to 256 bytes in size. |
| 17:16 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved. |
| 15:2 | 0x0<br>RW | **Address [15:2] (Address_15_2):** DWord-aligned address.<br><br>***Note:*** The SoC does not provide decode down to the word or byte level. |
| 1 | 0x0<br>RO | **Reserved (RSVD_2):** Reserved. |
| 0 | 0x0<br>RW | **LPC Decode Enable (LPC_Decode_Enable):** When this bit is set to 1, then the range specified in this register is enabled for decoding to LPC. |

## 56.2.4 LPC Generic I/O Range #2 (LGIR2)—Offset 88h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:0] + 88h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 23:18 | 0x0<br>RW | **Address [7:2] Mask (Address_7_2_Mask):** A 1 in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match.<br>The corresponding bit in the Address field, below, is ignored.<br>The mask is only provided for the lower 6 bits of the DWord address, allowing for decoding blocks up to 256 bytes in size. |
| 17:16 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved. |
| 15:2 | 0x0<br>RW | **Address [15:2] (Address_15_2):** DWord-aligned address.<br><br>***Note:*** The SoC does not provide decode down to the word or byte level. |
| 1 | 0x0<br>RO | **Reserved (RSVD_2):** Reserved. |
| 0 | 0x0<br>RW | **LPC Decode Enable (LPC_Decode_Enable):** When this bit is set to 1, then the range specified in this register is enabled for decoding to LPC. |

## 56.2.5 LPC Generic I/O Range #3 (LGIR3)—Offset 8Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:0] + 8Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 23:18 | 0x0<br>RW | **Address [7:2] Mask (Address_7_2_Mask):** A 1 in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match.<br>The corresponding bit in the Address field, below, is ignored.<br>The mask is only provided for the lower 6 bits of the DWord address, allowing for decoding blocks up to 256 bytes in size. |
| 17:16 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved.<br><br>**Power Well:** Core |
| 15:2 | 0x0<br>RW | **Address [15:2] (Address_15_2):** DWord-aligned address.<br><br>***Note:*** The SoC does not provide decode down to the word or byte level. |
| 1 | 0x0<br>RO | **Reserved (RSVD_2):** Reserved. |
| 0 | 0x0<br>RW | **LPC Decode Enable (LPC_Decode_Enable):** When this bit is set to 1, then the range specified in this register is enabled for decoding to LPC. |

## 56.2.6 LPC Generic I/O Range #4 (LGIR4)—Offset 90h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:0] + 90h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 23:18 | 0x0<br>RW | **Address [7:2] Mask (Address_7_2_Mask):** A 1 in any bit position indicates that any value in the corresponding address bit in a received cycle will be treated as a match.<br>The corresponding bit in the Address field, below, is ignored.<br>The mask is only provided for the lower 6 bits of the DWord address, allowing for decoding blocks up to 256 bytes in size. |
| 17:16 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved. |
| 15:2 | 0x0<br>RW | **Address [15:2] (Address_15_2):** DWord-aligned address.<br><br>***Note:*** The SoC does not provide decode down to the word or byte level. |
| 1 | 0x0<br>RO | **Reserved (RSVD_2):** Reserved. |
| 0 | 0x0<br>RW | **LPC Decode Enable (LPC_Decode_Enable):** When this bit is set to 1, then the range specified in this register is enabled for decoding to LPC. |

## 56.2.7 USB Legacy Keyboard/Mouse Control (ULKMC)—Offset 94h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:0] + 94h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 15 | 0x0<br>RW/1C | **SMI Caused by End of Pass-through (SMIBYENDPS):** Indicates if the event occurred.<br><br>***Note:*** Even if the corresponding enable bit is not set in the Bit 7, then this bit will still be active.<br><br>It is up to the SMM code to use the enable bit to determine the exact cause of the SMI#.<br>Writing a 1 to this bit will clear the latch. |
| 14 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved. |
| 13 | 0x0<br>RW | **Reserved (RSVD_2):** Reserved. |
| 12 | 0x0<br>RO | **Reserved (RSVD_3):** Reserved. |
| 11 | 0x0<br>RW/1C | **SMI Caused by Port 64 Write (TRAPBY64W):** Indicates if the event occurred.<br>***Note:*** Even if the corresponding enable bit is not set in the Bit 3, then this bit will still be active.<br>It is up to the SMM code to use the enable bit to determine the exact cause of the SMI#.<br>Writing a 1 to this bit will clear the latch.<br><br>***Note:*** The A20Gate Pass-Through Logic allows specific port 64h Writes to complete without setting this bit. |
| 10 | 0x0<br>RW/1C | **SMI Caused by Port 64 Read (TRAPBY64R):** Indicates if the event occurred.<br>***Note:*** Even if the corresponding enable bit is not set in the Bit 2, then this bit will still be active.<br>It is up to the SMM code to use the enable bit to determine the exact cause of the SMI#.<br>Writing a 1 to this bit will clear the latch. |
| 9 | 0x0<br>RW/1C | **SMI Caused by Port 60 Write (TRAPBY60W):** Indicates if the event occurred.<br><br>***Note:*** Even if the corresponding enable bit is not set in the Bit 1, then this bit will still be active.<br><br>It is up to the SMM code to use the enable bit to determine the exact cause of the SMI#.<br>Writing a 1 to this bit will clear the latch.<br><br>***Note:*** The A20Gate Pass-Through Logic allows specific port 60h Writes to complete without setting this bit. |
| 8 | 0x0<br>RW/1C | **SMI Caused by Port 60 Read (TRAPBY60R):** Indicates if the event occurred.<br><br>***Note:*** Even if the corresponding enable bit is not set in the Bit 0, then this bit will still be active.<br><br>It is up to the SMM code to use the enable bit to determine the exact cause of the SMI#.<br>Writing a 1 to this bit will clear the latch. |
| 7 | 0x0<br>RW | **SMI at End of Pass-through Enable (SMIATENDPS):** May need to cause SMI at the end of a pass-through.<br>Can occur if an SMI is generated in the middle of a pass through, and needs to be serviced later. |
| 6 | 0x0<br>RO | **Pass Through State (PSTATE):** This read-only bit indicates that the state machine is in the middle of an A20GATE pass-through sequence.<br>If software needs to reset this bit, it should set Bit 5 0. |
| 5 | 0x0<br>RW | **A20Gate Pass-Through Enable (A20PASSEN):** When enabled, allows A20GATE sequence Pass-Through function (see details below in Section 20.14). When enabled, a specific cycle sequence involving writes to port 60h and port 64h does not result in the setting of the SMI status bits.SMI# will not be generated, even if the various enable bits are set. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 4 | 0x0<br>RW | **Reserved (RSVD_4):** Reserved. |
| 3 | 0x0<br>RW | **SMI on Port 64 Writes Enable (s64WEN):** When set, a 1 in bit 11 will cause an SMI event. |
| 2 | 0x0<br>RW | **SMI on Port 64 Reads Enable (s64REN):** When set, a 1 in bit 10 will cause an SMI event. |
| 1 | 0x0<br>RW | **SMI on Port 60 Writes Enable (s60WEN):** When set, a 1 in bit 9 will cause an SMI event. |
| 0 | 0x0<br>RW | **SMI on Port 60 Reads Enable (s60REN):** When set, a 1 in bit 8 will cause an SMI event. |

## 56.2.8 LPC Generic Memory Range (LGMR)—Offset 98h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:0] + 98h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **Memory Address [31:16] (MA_31_16):** This field specifies a 64KB memory block anywhere in the 4GB memory space that will be decoded to LPC as standard LPC Memory Cycle if enabled. |
| 15:1 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 0 | 0x0<br>RW | **LPC Memory Range Decode Enable (LMRD_En):** When this bit is set to 1, then the range specified in this register is enabled for decoding to LPC. |

## 56.2.9 FWH ID Select #1 (FS1)—Offset D0h

This register contains the IDSEL fields the LPC Bridge uses for memory cycles going to the FWH.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:0] + D0h

**Default:** 00112233h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0x0<br>RO | **F8-FF IDSEL (IF8):** IDSEL to use in FWH cycle for range enabled by BDE.EF8. |
| 27:24 | 0x0<br>RW | **F0-F7 IDSEL (IF0):** IDSEL to use in FWH cycle for range enabled by BDE.EF0. |
| 23:20 | 0x1<br>RW | **E8-EF IDSEL (IE8):** IDSEL to use in FWH cycle for range enabled by BDE.EE8. |
| 19:16 | 0x1<br>RW | **E0-E7 IDSEL (IE0):** IDSEL to use in FWH cycle for range enabled by BDE.EE0. |
| 15:12 | 0x2<br>RW | **D8-DF IDSEL (ID8):** IDSEL to use in FWH cycle for range enabled by BDE.ED8. |
| 11:8 | 0x2<br>RW | **D0-D7 IDSEL (ID0):** IDSEL to use in FWH cycle for range enabled by BDE.ED0. |
| 7:4 | 0x3<br>RW | **C8-CF IDSEL (IC8):** IDSEL to use in FWH cycle for range enabled by BDE.EC8. |
| 3:0 | 0x3<br>RW | **C0-C7 IDSEL (IC0):** IDSEL to use in FWH cycle for range enabled by BDE.EC0. |

## 56.2.10 FWH ID Select #2 (FS2)—Offset D4h

This register contains the additional IDSEL fields the LPC Bridge uses for memory cycles going to the FWH.

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:31, F:0] + D4h

**Default:** 4567h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:12 | 0x4<br>RW | **70-7F IDSEL (I70):** IDSEL to use in FWH cycle for range enabled by BDE.E70. |
| 11:8 | 0x5<br>RW | **60-6F IDSEL (I60):** IDSEL to use in FWH cycle for range enabled by BDE.E60. |
| 7:4 | 0x6<br>RW | **50-5F IDSEL (I50):** IDSEL to use in FWH cycle for range enabled by BDE.E50. |
| 3:0 | 0x7<br>RW | **40-4F IDSEL (I40):** IDSEL to use in FWH cycle for range enabled by BDE.E40. |

## 56.2.11 BIOS Decode Enable (BDE)—Offset D8h

Note that this register effects the BIOS decode regardless of whether the BIOS is resident on LPC or SPI. The concept of Feature Space does not apply to SPI-based flash. The SoC simply decodes these ranges as memory accesses when enabled for the SPI flash interface.

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:31, F:0] + D8h

**Default:** FFCFh

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x1<br>RO | **F8-FF Enable (EF8):** Enables decoding of 512K of the following BIOS range:<br>• Data space: FFF80000h - FFFFFFFFh.<br>• Feature space: FFB80000h - FFBFFFFFh. |
| 14 | 0x1<br>RW | **F0-F8 Enable (EF0):** Enables decoding of 512K of the following BIOS range:<br>• Data space: FFF00000h - FFF7FFFFh.<br>• Feature space: FFB00000h - FFB7FFFFh. |
| 13 | 0x1<br>RW | **E8-EF Enable (EE8):** Enables decoding of 512K of the following BIOS range:<br>• Data space: FFE80000h - FFEFFFFFh.<br>• Feature space: FFA80000h - FFAFFFFFh. |
| 12 | 0x1<br>RW | **E0-E8 Enable (EE0):** Enables decoding of 512K of the following BIOS range:<br>• Data space: FFE00000h - FFE7FFFFh.<br>• Feature Space: FFA00000h - FFA7FFFFh. |
| 11 | 0x1<br>RW | **D8-DF Enable (ED8):** Enables decoding of 512K of the following BIOS range:<br>• Data space: FFD80000h - FFDFFFFFh.<br>• Feature space: FF980000h - FF9FFFFFh. |
| 10 | 0x1<br>RW | **D0-D7 Enable (ED0):** Enables decoding of 512K of the following BIOS range:<br>• Data space: FFD00000h - FFD7FFFFh.<br>• Feature space: FF900000h - FF97FFFFh. |
| 9 | 0x1<br>RW | **C8-CF Enable (EC8):** Enables decoding of 512K of the following BIOS range:<br>• Data space: FFC80000h - FFCFFFFFh.<br>• Feature space: FF880000h - FF8FFFFFh. |
| 8 | 0x1<br>RW | **C0-C7 Enable (EC0):** Enables decoding of 512K of the following BIOS range:<br>• Data space: FFC00000h - FFC7FFFFh.<br>• Feature space: FF800000h - FF87FFFFh. |
| 7 | 0x1<br>RW | **Legacy F Segment Enable (LFE):** This enables the decoding of the legacy 64KB range at F0000h - FFFFFh.<br>***Note:*** Decode for the BIOS legacy F segment is enabled by the LFE bit only, it is not affected by the GEN_PMCON_1.iA64_EN bit. |
| 6 | 0x1<br>RW | **Legacy E Segment Enable (LEE):** This enables the decoding of the legacy 64KB range at E0000h - EFFFFh.<br>***Note:*** Decode for the BIOS legacy E segment is enabled by the LEE bit only, it is not affected by the GEN_PMCON_1.iA64_EN bit. |
| 5:4 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 3 | 0x1<br>RW | **70-7F Enable (E70):** Enables decoding of 1MB of the following BIOS range:<br>• Data space: FF700000h - FF7FFFFFh.<br>• Feature space: FF300000h - FF3FFFFFh. |
| 2 | 0x1<br>RW | **60-6F Enable (E60):** Enables decoding of 1MB of the following BIOS range:<br>• Data space: FF600000h - FF6FFFFFh.<br>• Feature Space: FF200000h - FF2FFFFFh. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 1 | 0x1<br>RW | **50-5F Enable (E50):** Enables decoding of 1MB of the following BIOS range:<br>• Data space: FF500000h - FF5FFFFFh.<br>• Feature space: FF100000h - FF1FFFFFh. |
| 0 | 0x1<br>RW | **40-4F Enable (E40):** Enables decoding of 1MB of the following BIOS range:<br>• Data space: FF400000h - FF4FFFFFh.<br>• Feature space: FF000000h - FF0FFFFFh. |

## 56.2.12 BIOS Control (BC)—Offset DCh

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:31, F:0] + DCh

**Default:** 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RW/1L | **BIOS Interface Lock-Down (BILD):** When set, prevents BC.TS and BC.BBS from being changed. This bit can only be written from 0 to 1 once.<br>***Note:*** BIOS: This bit is not backed up in the RTC well. This bit should also be set in the BUC register in the RTC device to record the last state of this value following a cold reset. |
| 6 | 0x0<br>RW/L | **Boot BIOS Strap (BBS):** This field determines the destination of accesses to the BIOS memory range. For the default, Functional Strap section of Signal Description chapter for details.<br>Bits Description<br>• 0 SPI.<br>• 1 LPC.<br>When SPI or LPC is selected, the range that is decoded is further qualified by other configuration bits described in the respective sections.<br>The value in this field can be overwritten by software as long as the BIOS Interface Lock-Down is not set.<br>***Note:*** Software must not change this bit since the SoC does not support dynamic switching between the SPI and LPC interface it is chosen at boot time by a strap. |
| 5 | 0x1<br>RW/L | **Enable InSMM.STS (EISS):** When this bit is set, the BIOS region is not writable until SMM sets the InSMM.STS bit.<br>If this bit [5] is set, then WPD must be a 1 and InSMM.STS must be 1 also.<br>If this bit [5] is clear, then BIOS is writable based only on WPD = 1 and the InSMM.STS is a don't care. |
| 4 | 0x0<br>RO | **Top Swap (TS):** When set, the SoC will invert either A16, A17, or A18 for cycles going to the BIOS space (but not the feature space). When cleared, the SoC will not invert A16.<br>If booting from SPI, then the BOOT_BLOCK_SIZE soft strap determines if A16, A17, or A18 should be inverted if Top Swap is enabled.<br>*If the SoC is strapped for to enable Top-Swap Override (GPIO[3] is sampled as height (1) within 400 ns of the rising edge (0 -> 1) of the active-low resume reset signal RSMRST_N), then this bit cannot be cleared by software. The strap jumper should be removed (GPIO[3] set to low(0)) and the system rebooted.<br>BIOS Note:<br>1. This bit provides a read-only path to view the state of the Top Swap strap. It is backed up and driven from the RTC well. BIOS will need to program the corresponding register in the RTC Controller (in RTC well), which will be reflected in this register.<br>2. The Register portion of the Top Swap is lockable by the BIOS Interface Lockdown Bit (BC.BILD) but unlockable by SPI Flash Protected Range and Top Swap Override (uCode.PRR_TS_OVR). |
| 3:2 | 0x0<br>RW | **SPI Read Configuration (SRC):** This 2-bit field controls two policies related to BIOS reads on the SPI interface:<br>Bit 3- Prefetch Enable<br>Bit 2- Cache Disable<br>Settings are summarized below:<br>Bits 3:2 Description<br>• 00 - No prefetching, but caching enabled. Direct Memory reads load the read buffer cache with valid data, allowing repeated reads to the same range to complete quickly<br>• 01 - No prefetching and no caching. One-to-one correspondence of host BIOS reads to SPI cycles. This value can be used to invalidate the cache.<br>• 10 - Prefetching and Caching enabled. This mode is used for long sequences of short reads to consecutive addresses (i.e. shadowing)<br>• 11 - Illegal. Caching must be enabled when Prefetching is enabled. This eliminates the need for a complex prefetch-flushing mechanism. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 1 | 0x0<br>RW/1L | **Lock Enable (LE):** When set, setting the WP bit will cause SMI.<br>When cleared, setting the WP bit will not cause SMI. Once set, this bit can only be cleared by a PLTRST#.<br>When this bit is set, EISS - bit [5] of this register is locked down. |
| 0 | 0x0<br>RW | **Write Protect Disable (WPD):** When set, access to the BIOS space is enabled for both read and write cycles to BIOS.<br>When cleared, only read cycles are permitted to the FWH or SPI flash.<br>When this bit is written from a 0 to a 1 and the LE bit is also set, an SMI# is generated.<br>This ensures that only SMM code can update BIOS. |

## 56.2.13 PCI Clock Control (PCCTL)—Offset E0h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:0] + E0h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:10 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 9 | 0x0<br>RO/V | **CLKRUN# Buffer Enable Override (CLKRUN_EN_OVR):** When set to '1', SW is in control of the CLKRUN# buffer enable and the value in CLKRUN_EN_VAL will be propagated to the output buffer enable.<br>When this bit is '0', HW will determine the value of the buffer enable. |
| 8 | 0x0<br>RO/V | **CLKRUN# Override (CLKRUN_OVR):** When set to '1', SW is in control of the CLKRUN# pin and the value in CLKRUN_VAL will be propagated to the output pin.<br>When this bit is '0', HW will determine the value of the pin. |
| 7 | 0x0<br>RO/V | **CLKRUN# Buffer Enable Value (CLKRUN_EN_VAL):** Either HW or SW may own control of the CLKRUN# pin.<br>This bit provides the value to drive on the active low CLKRUN# buffer enable if CLKRUN_EN_OVR is set to '1'. |
| 6 | 0x0<br>RO/V | **CLKRUN# Pin Output Value (CLKRUN_VAL):** Either HW or SW may own control of the CLKRUN# pin.<br>This bit provides the value to drive on the pin if CLKRUN_OVR is set to '1'. |
| 5 | 0x0<br>RO/V | **Stop PCI# Value (STP_PCI_VAL):** Either Hardware or Software may own control of the internal STP_PCI#.<br>This bit provides the value to drive on the STP_PCI# if STP_PCI_OVR is set to 1.<br>***Note:***<br>1. SW cannot control the STP_PCI# pin while PLTRST# is asserted (the pin will be at its reset default value). |
| 4 | 0x0<br>RO/V | **Stop PCI# Override (STP_PCI_OVR):** When set to 1, Firmware is in control of the STP_PCI# and the value in STP_PCI_VAL will be propagated to the internal STP_PCI#.<br>When this bit is '0', HW will determine the value of the pin.<br>***Note:***<br>1. BIOS cannot control the STP_PCI# pin while PLTRST# is asserted (the pin will be at its reset default value). |
| 3:2 | 0x0<br>RW | **Reserved (RSVD_1):** Reserved |
| 1 | 0x0<br>RW | **Reserved (RSVD_1):** Reserved. |
| 0 | 0x0<br>RW | **Clock Run Enable (CLKRUN_EN):** Enables the CLKRUN# logic to stop the PCI clocks.<br>If the SLP_EN bit is set, then the SoC will drive CLKRUN# low.<br>This will keep the PCI and LPC clocks running on the way to the sleeping state.<br>This is required to meet an LPC specification.<br>This does not necessarily mean that the CLKRUN_EN bit is forced low when SLP_EN is set.<br>Even though the CLKRUN# signal will be low when SLP_EN is set, the state of the CLKRUN_EN bit is ignored when SLP_EN bit is set.<br>This gives flexibility in the implementation. |

# 57 Primary to Side Band Bridge - B0, D31, F1

## 57.1 Introduction and Index

The host-accessible registers for the Primary to Side Band (P2SB) Bridge are described here.

The legend for the register access codes are described in Chapter 43, “Introduction.”

### 57.1.1 Host Configuration Space

These registers are discovered in Host Configuration Space starting at Bus 0, Device 31 (decimal), Function 1. The offset addresses are listed.

**Table 57-1. Summary of PCI Configuration Registers—0/31/1**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 0 | 4 | 19DD8086 | "PCI Identifier (PCIID)—Offset 0h" on page 2663 |
| 4 | 2 | 0004 | "PCI Command (PCICMD)—Offset 4h" on page 2664 |
| 6 | 2 | 0000 | "PCI Status (PCISTS)—Offset 6h" on page 2665 |
| 8 | 1 | 00 | "Revision ID (PCIRID)—Offset 8h" on page 2665 |
| 9 | 4 | 00058000 | "Class Code (PCICC)—Offset 9h" on page 2666 |
| D | 1 | 00 | "PCI Master Latency Timer (PCIMLT)—Offset Dh" on page 2666 |
| E | 2 | 00 | "PCI Header Type (PCIHTYPE)—Offset Eh" on page 2666 |
| 10 | 4 | 00000004 | "Sideband Register Access BAR (SBREG_BAR)—Offset 10h" on page 2667 |
| 14 | 4 | 00000000 | "Sideband Register BAR High DWORD (SBREG_BARH)—Offset 14h" on page 2667 |
| 2C | 4 | 00000000 | "PCI Subsystem Identifiers (PCIHSS)—Offset 2Ch" on page 2668 |
| 50 | 2 | 00F8 | "VLW Bus:Device:Function (VBDF)—Offset 50h" on page 2668 |
| 52 | 2 | 00F8 | "ERROR Bus:Device:Function (EBDF)—Offset 52h" on page 2669 |
| 54 | 4 | 0000C700 | "Routing Configuration (RCFG)—Offset 54h" on page 2670 |
| 60 | 1 | 00 | "High Performance Event Timer Configuration (HPTC)—Offset 60h" on page 2670 |
| 64 | 2 | 0000 | "IOxAPIC Configuration (IOAC)—Offset 64h" on page 2671 |
| 6C | 2 | 00F8 | "IOxAPIC Bus:Device:Function (IBDF)—Offset 6Ch" on page 2671 |

| CC | 4 | 00000000 | "Endpoint Mask 7 (EPMASK7)—Offset CCh" on page 2677 |
| D0 | 4 | 00000000 | "SBI Address (SBIADDR)—Offset D0h" on page 2677 |

## Table 57-1. Summary of PCI Configuration Registers—0/31/1 (Continued)

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| D4 | 4 | 00000000 | "SBI Data (SBIDATA)—Offset D4h" on page 2678 |
| D8 | 2 | 0000 | "SBI Status (SBISTAT)—Offset D8h" on page 2678 |
| DA | 2 | 0000 | "SBI Routing Identification (SBIRID)—Offset DAh" on page 2679 |
| DC | 4 | 00000000 | "SBI Extended Address (SBIEXTADDR)—Offset DCh" on page 2679 |
| E0 | 4 | 00000007 | "P2SB Control (P2SBC)—Offset E0h" on page 2680 |
| F0 | 4 | 00000000 | "Unsupported Request Error Status (URES)—Offset F0h" on page 2681 |
| F4 | 4 | 00000000 | "Unsupported Request Error Control (UREC)—Offset F4h" on page 2681 |
| F8 | 4 | 00000F00 | "Manufacturer's ID (MANID)—Offset F8h" on page 2682 |

## 57.2 Registers in Configuration Space

### 57.2.1 PCI Identifier (PCIID)—Offset 0h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:1] + 0h

**Default:** 19DD8086h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x19dd<br>RO/V | **Device Identification (DID):** The upper 8-bits of this field can be overridden by the SoC.<br><br>**Power Well:** Core |
| 15:0 | 0x8086<br>RO | **Vendor Identification (VID):** Indicates Intel<br><br>**Power Well:** Core |

## 57.2.2 PCI Command (PCICMD)—Offset 4h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:31, F:1] + 4h

**Default:** 0004h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:11 | 0x0<br>RO | **Reserved (RSVD):** Reserved<br><br>**Power Well:** Core |
| 10 | 0x0<br>RO | **Interrupt Disable (INTD):** P2SB does not issue any interrupts on its own behalf<br><br>**Power Well:** Core |
| 9 | 0x0<br>RO | **Fast Back to Back Enable (FB2BE):** Not applicable<br><br>**Power Well:** Core |
| 8 | 0x0<br>RW | **SERR# Enable (SEE):** This bit enables parity error reporting to the SoC Interrupt Error Handler (IEH)<br><br>**Power Well:** Core |
| 7 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved<br><br>**Power Well:** Core |
| 6 | 0x0<br>RW | **Parity Error Response Enable (PEE):** This bit controls the device's response to parity error.<br><br>**Power Well:** Core |
| 5 | 0x0<br>RO | **VGA Palette Snoop (VGA):** Not applicable.<br><br>**Power Well:** Core |
| 4 | 0x0<br>RO | **Memory Write & Invalidate Enable (MWIE):** Not applicable.<br><br>**Power Well:** Core |
| 3 | 0x0<br>RO | **Special Cycle Enable (SCE):** Not applicable.<br><br>**Power Well:** Core |
| 2 | 0x1<br>RO | **Bus Master Enable (BME):** Bus mastering cannot be disabled as this device acts as a proxy for non-PCI devices.<br><br>**Power Well:** Core |
| 1 | 0x0<br>RW | **Memory Space Enable (MSE):** This bit controls the P2SB acceptance of PCI MMIO BARs only. Other legacy regions are unaffected by this bit.<br><br>**Power Well:** Core |
| 0 | 0x0<br>RW | **I/O Space Enable (IOSE):** Legacy regions are unaffected by this bit.<br><br>**Power Well:** Core |

## 57.2.3 PCI Status (PCISTS)—Offset 6h

The P2SB does not issue any interrupts, signal any errors, or provide any additional capability structures. This register has no functionality.

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:31, F:1] + 6h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RW/1C | **Detected Parity Error (DPE):** This register bit is set when parity error is detected.<br><br>**Power Well:** Core |
| 14 | 0x0<br>RW/1C | **Signaled System Error (SSE):** This register sets when PCICMD.SE bit and PCISTS.DPE bit is set<br><br>**Power Well:** Core |
| 13:0 | 0x0<br>RO | **Reserved (RSVD):** Reserved<br><br>**Power Well:** Core |

## 57.2.4 Revision ID (PCIRID)—Offset 8h

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:31, F:1] + 8h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO/V | **Revision ID (RID):** Indicates the part revision. This field resets to 0 and can be overridden by the SoC circuitry during the SoC power-up sequence<br><br>**Power Well:** Core |

## 57.2.5 Class Code (PCICC)—Offset 9h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:1] + 9h

**Default:** 00058000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RO | **RSVD0:** Reserved |
| 23:16 | 0x5<br>RO | **Base Class Code (BCC):** Indicates a Memory Controller device class.<br><br>**Power Well:** Core |
| 15:8 | 0x80<br>RO | **Sub-Class Code (SCC):** Indicates an unspecified sub-class other Memory Controller.<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RO | **Programming Interface (PI):** No programming interface.<br><br>**Power Well:** Core |

## 57.2.6 PCI Master Latency Timer (PCIMLT)—Offset Dh

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:31, F:1] + Dh

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO | **Reserved (RSVD):** Reserved<br><br>**Power Well:** Core |

## 57.2.7 PCI Header Type (PCIHTYPE)—Offset Eh

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:31, F:1] + Eh

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RO | **Multi-Function Device (MFD):** Indicates that this is part of a multi-function device.<br><br>**Power Well:** Core |
| 6:0 | 0x0<br>RO | **Header Type (HTYPE):** Indicates a generic Type 0 PCI device header.<br><br>**Power Well:** Core |

## 57.2.8 Sideband Register Access BAR (SBREG_BAR)—Offset 10h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:1] + 10h

**Default:** 00000004h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RW | **Register Base Address (RBA):** Lower DWORD of the base address for the sideband register access BAR.<br><br>**Power Well:** Core |
| 23:4 | 0x0<br>RO | **Hardwired to 0 to request a BAR of 16MB (HW202RB16MB):** Hardwired to 0 to request a BAR of 16MB<br><br>**Power Well:** Core |
| 3 | 0x0<br>RO | **Prefetchable (PREF):** Indicates this is not prefetchable.<br><br>**Power Well:** Core |
| 2:1 | 0x2<br>RO | **Address Type (ATYPE):** Indicates that the BAR can be defined to be located anywhere in 64-bit Host Root Memory Space.<br><br>**Power Well:** Core |
| 0 | 0x0<br>RO | **Space Type (STYPE):** Indicates Memory Space<br><br>**Power Well:** Core |

## 57.2.9 Sideband Register BAR High DWORD (SBREG_BARH)—Offset 14h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:1] + 14h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Register Base Address (RBAH):** Upper DWORD of the base address for the sideband register access BAR.<br><br>**Power Well:** Core |

## 57.2.10 PCI Subsystem Identifiers (PCIHSS)—Offset 2Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:1] + 2Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW/O | **Subsystem ID (SSID):** Written by BIOS. Not used by hardware.<br><br>**Power Well:** Core |
| 15:0 | 0x0<br>RW/O | **Subsystem Vendor ID (SSVID):** Written by BIOS. Not used by hardware.<br><br>**Power Well:** Core |

## 57.2.11 VLW Bus:Device:Function (VBDF)—Offset 50h

This register specifies the bus:device:function ID that the VLW VDM will use for its Requester ID. This field is default to Bus 0: Device 31: Function 0 after reset. BIOS shall program this field accordingly if unique bus:device:function number is required for the VLW message.

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:31, F:1] + 50h

**Default:** 00F8h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x0<br>RW | **Bus Number (BUS):** Reserved.<br><br>**Power Well:** Core |
| 7:3 | 0x1f<br>RW | **Device Number (DEV):** Reserved.<br><br>**Power Well:** Core |
| 2:0 | 0x0<br>RW | **Function Number (FUNC):** Reserved.<br><br>**Power Well:** Core |

## 57.2.12 ERROR Bus:Device:Function (EBDF)—Offset 52h

This register specifies the bus:device:function ID that the Error Signaling messages VDM will use for its Requester ID. This field is default to Bus 0: Device 31: Function 0 after reset. BIOS shall program this field accordingly if unique bus:device:function number is required for the VLW message.

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:31, F:1] + 52h

**Default:** 00F8h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x0<br>RW | **Bus Number (BUS):** Reserved.<br><br>**Power Well:** Core |
| 7:3 | 0x1f<br>RW | **Device Number (DEV):** Reserved.<br><br>**Power Well:** Core |
| 2:0 | 0x0<br>RW | **Function Number (FUNC):** Reserved.<br><br>**Power Well:** Core |

## 57.2.13 Routing Configuration (RCFG)—Offset 54h

This register contains information used for routing transactions between primary and sideband interfaces.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:1] + 54h

**Default:** 0000C700h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 15:8 | 0xc7<br>RW | **Reserved Page Register Destination ID (RPRID):** Specifies the IOSF-SB destination ID for sending Reserved Page Register cycles (e.g. Port 80h). By default this will load to the ID of the LPC device depending on which has been strapped active in the system.<br><br>**Power Well:** Core |
| 7:1 | 0x0<br>RW | **Reserved (RSVD_1):** Reserved.<br><br>**Power Well:** Core |
| 0 | 0x0<br>RW | **RTC Shadow Enable (RSE):** When set, all IO writes to the RTC will be also sent to the PMC. This allows cases where the battery-backed storage is in an external PMIC device.<br><br>**Power Well:** Core |

## 57.2.14 High Performance Event Timer Configuration (HPTC)—Offset 60h

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:31, F:1] + 60h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RW | **Address Enable (AE):** When set, the P2SB will decode the High Performance Event Timer (HPET) Host Root memory-address range selected by bits 1:0 below.<br><br>**Power Well:** Core |
| 6:2 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 1:0 | 0x0<br>RW | **Address Select (AS):** This 2-bit field selects 1 of 4 possible memory address ranges for the High-Performance Event Timer (HPET) functionality. The encodings are:<br>• 00: FED0_0000h - FED0_03FFFh<br>• 01: FED0_1000h - FED0_13FFFh<br>• 10: FED0_2000h - FED0_23FFFh<br>• 11: FED0_3000h - FED0_33FFFh<br><br>**Power Well:** Core |

## 57.2.15 IOxAPIC Configuration (IOAC)—Offset 64h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:31, F:1] + 64h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:9 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 8 | 0x0<br>RW | **Address Enable (AE):** When set, the P2SB will decode the IOxAPIC Host Root memory-address range selected by bits 7:0 below.<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RW | **APIC Range Select (ASEL):** These eight bits define the eight address bits 19:12 for the IOxAPIC range. The default value of 00h enables compatibility with prior Intel products as an initial value. This value must not be changed by software unless the IOxAPIC Address Enable (AE) bit is cleared.<br><br>**Power Well:** Core |

## 57.2.16 IOxAPIC Bus:Device:Function (IBDF)—Offset 6Ch

This register specifies the PCI Bus:Device:Function ID that the IOxAPIC will use in the following:

- As the Requester ID when initiating Interrupt Messages to the CPU.
- As the Completer ID when responding to the reads targeting the IOxAPIC Memory-Mapped I/O (MMIO) registers.

This field is default to Bus 0: Device 31: Function 0 after reset. BIOS shall program this field accordingly if a unique Bus:Device:Function number is required for the internal IOxAPIC.

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:31, F:1] + 6Ch

**Default:** 00F8h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x0<br>RW | **Bus Number (BUS):** Reserved.<br><br>**Power Well:** Core |
| 7:3 | 0x1f<br>RW | **Device Number (DEV):** Reserved.<br><br>**Power Well:** Core |
| 2:0 | 0x0<br>RW | **Function Number (FUNC):** Reserved.<br><br>**Power Well:** Core |

## 57.2.17 HPET Bus:Device:Function (HBDF)—Offset 70h

This register specifies the PCI Bus:Device:Function ID that the integrated High-Performance Event Timer (HPET) device will use in the following:

- As the Requester ID when initiating Interrupt Messages to the CPU.
- As the Completer ID when responding to the reads targeting the corresponding HPET Memory-Mapped I/O (MMIO) registers.

This field is default to Bus 0: Device 31: Function 0 after reset. BIOS shall program this field accordingly if unique Bus:Device:Function number is required for the corresponding HPET.

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:31, F:1] + 70h

**Default:** 00F8h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x0<br>RW | **Bus Number (BUS):** Reserved.<br><br>**Power Well:** Core |
| 7:3 | 0x1f<br>RW | **Device Number (DEV):** Reserved.<br><br>**Power Well:** Core |
| 2:0 | 0x0<br>RW | **Function Number (FUNC):** Reserved.<br><br>**Power Well:** Core |

## 57.2.18 Sideband Register posted 0 (SBREGPOSTED0)—Offset 80h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:1] + 80h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Sideband Register posted 0 (SBREGPOSTED0):** One hot masks for setting SBREG to posted posted for IOSF-SB endpoint IDs 31-0.<br><br>**Power Well:** Core |

## 57.2.19 Sideband Register posted 1 (SBREGPOSTED1)—Offset 84h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:1] + 84h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Sideband Register posted 1 (SBREGPOSTED1):** One hot masks for setting SBREG to posted for IOSF-SB endpoint IDs 63-32.<br><br>**Power Well:** Core |

## 57.2.20 Sideband Register posted 2 (SBREGPOSTED2)—Offset 88h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:1] + 88h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Sideband Register posted 0 (SBREGPOSTED2):** One hot masks for setting SBREG to posted for IOSF-SB endpoint IDs 95-64.<br><br>**Power Well:** Core |

## 57.2.21 Sideband Register posted 3 (SBREGPOSTED3)—Offset 8Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:1] + 8Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Sideband Register posted 3 (SBREGPOSTED3):** One hot masks for setting SBREG to posted for IOSF-SB endpoint IDs 127-96.<br><br>**Power Well:** Core |

## 57.2.22 Sideband Register posted 4 (SBREGPOSTED4)—Offset 90h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:1] + 90h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Sideband Register posted 4 (SBREGPOSTED4):** One hot masks for setting SBREG to posted for IOSF-SB endpoint IDs 159-128.<br><br>**Power Well:** Core |

## 57.2.23 Sideband Register posted 5 (SBREGPOSTED5)—Offset 94h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:1] + 94h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Sideband Register posted 5 (SBREGPOSTED5):** One hot masks for setting SBREG to posted for IOSF-SB endpoint IDs 191-160.<br><br>**Power Well:** Core |

## 57.2.24 Sideband Register posted 6 (SBREGPOSTED6)—Offset 98h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:1] + 98h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Sideband Register posted 6 (SBREGPOSTED6):** One hot masks for setting SBREG to posted for IOSF-SB endpoint IDs 223-192.<br><br>**Power Well:** Core |

## 57.2.25 Sideband Register posted 7 (SBREGPOSTED7)—Offset 9Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:1] + 9Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Sideband Register posted 7 (SBREGPOSTED7):** One hot masks for setting SBREG to posted for IOSF-SB endpoint IDs 255-224.<br><br>**Power Well:** Core |

## 57.2.26 Display Bus:Device:Function (DISPBDF)—Offset A0h

This register specifies the PCI Bus:Device:Function ID that the Display initiated upstream RAVDMs will use for its Requester ID. This will also be used for the claiming these Route-by-ID RAVDMs downstream.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:1] + A0h

**Default:** 00060010h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:19 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 18:16 | 0x6<br>RW | **Display Target Block (DTBLK):** This register contains the Target BLK field that will be used when sending RAVDM messages to the CPU Complex North Display.<br><br>**Power Well:** Core |
| 15:8 | 0x0<br>RW | **Bus Number (BUS):** The bus number of the Display in the CPU Complex.<br><br>**Power Well:** Core |
| 7:3 | 0x2<br>RW | **Device Number (DEV):** The bus number of the Display in the CPU Complex.<br><br>**Power Well:** Core |
| 2:0 | 0x0<br>RW | **Function Number (FUNC):** The function number of the Display in the CPU Complex<br><br>**Power Well:** Core |

## 57.2.27 ICC Register Offsets (ICCOS)—Offset A4h

This register contains the offsets to be used when sending RAVDMs to the Integrated Clock Controller. Each of the two spaces decoded for the ICC have a separate base address that will be used when sending those transactions on IOSF-SB to the ICC.

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:31, F:1] + A4h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x0<br>RW | **Modulator Control Address Offset (MODBASE):** This specifies the upper 8b for the 16b address that will be used for sending RAVDM access that target the Modulator Control range of the ICC (FFF00h - FFFFFh).<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RW | **Buffer Address Offset (BUFBASE):** This specifies the upper 8b for the 16b address that will be used for sending RAVDM access that target the Buffer range of the ICC (FFE00h - FFEFFh).<br><br>**Power Well:** Core |

## 57.2.28 Endpoint Mask 0 (EPMASK0)—Offset B0h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:1] + B0h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW/V/L | **Endpoint Mask 0 (EPMASK0):** One hot masks for disabling IOSF-SB endpoint IDs 31-0.<br><br>**Power Well:** Core |

## 57.2.29 Endpoint Mask 1 (EPMASK1)—Offset B4h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:1] + B4h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW/V/L | **Endpoint Mask 1 (EPMASK1):** One hot masks for disabling IOSF-SB endpoint IDs 63-32.<br><br>**Power Well:** Core |

## 57.2.30 Endpoint Mask 2 (EPMASK2)—Offset B8h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:1] + B8h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0 RW/V/L | **Endpoint Mask 2 (EPMASK2):** One hot masks for disabling IOSF-SB endpoint IDs 95-64.<br>**Power Well:** Core |

## 57.2.31 Endpoint Mask 3 (EPMASK3)—Offset BCh

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:1] + BCh

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0 RW/V/L | **Endpoint Mask 3 (EPMASK3):** One hot masks for disabling IOSF-SB endpoint IDs 127-96.<br>**Power Well:** Core |

## 57.2.32 Endpoint Mask 4 (EPMASK4)—Offset C0h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:1] + C0h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0 RW/V/L | **Endpoint Mask 4 (EPMASK4):** One hot masks for disabling IOSF-SB endpoint IDs 128-159.<br>**Power Well:** Core |

## 57.2.33 Endpoint Mask 5 (EPMASK5)—Offset C4h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:1] + C4h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0 RW/V/L | **Endpoint Mask 5 (EPMASK5):** One hot masks for disabling IOSF-SB endpoint IDs 191-160.<br>**Power Well:** Core |

## 57.2.34 Endpoint Mask 6 (EPMASK6)—Offset C8h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:1] + C8h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW/V/L | **Endpoint Mask 6 (EPMASK6):** One hot masks for disabling IOSF-SB endpoint IDs 223-192.<br><br>**Power Well:** Core |

## 57.2.35 Endpoint Mask 7 (EPMASK7)—Offset CCh

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:1] + CCh

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW/V/L | **Endpoint Mask 7 (EPMASK7):** One hot masks for disabling IOSF-SB endpoint IDs 255-224.<br><br>**Power Well:** Core |

## 57.2.36 SBI Address (SBIADDR)—Offset D0h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:1] + D0h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RW | **Destination Port ID (DESTID):** The content of this register field is sent in the IOSF Sideband Message Register Access dest field.<br><br>**Power Well:** Core |
| 23:20 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 19:16 | 0x0<br>RW | **Root Space (RS):** Destination IOSF-SB Root Space.<br>***Note:*** This register may only be written during manufacturing test. P2SB will only accept writes to this register from transactions with a SAI equal to the SBI_RS_ACCESS_SAI parameter. This should be assigned to the SAI used by the functional test module (typically TAM) that will perform this register write on IOSF-P.<br><br>**Power Well:** Core |
| 15:0 | 0x0<br>RW | **Address Offset (OFFSET):** Register address offset.<br>The content of this register field is sent in the IOSF Sideband Message Register Access address(15:0) field.<br><br>**Power Well:** Core |

## 57.2.37 SBI Data (SBIDATA)—Offset D4h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:1] + D4h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW/V | **Data (DATA):** The content of this register field is sent on the IOSF sideband Message Register Access data(31:0) field.<br><br>**Power Well:** Core |

## 57.2.38 SBI Status (SBISTAT)—Offset D8h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:31, F:1] + D8h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:8 | 0x0<br>RW | **Opcode (OPCODE):** This is the Opcode sent in the IOSF sideband message.<br><br>**Power Well:** Core |
| 7 | 0x0<br>RW | **Posted (POSTED):** When set to 1, the message will be send as a posted message instead of non-posted.<br>This should only be used if the receiver is known to support posted operations for the specified operation.<br><br>**Power Well:** Core |
| 6:3 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 2:1 | 0x0<br>RW/V | **Response Status (RESPONSE):**<br>• 00 - Successful<br>• 01 - Unsuccessful / Not Supported<br>• 10 - Powered Down<br>• 11 - Multi-cast Mixed<br>This register reflects the response status for the previously completed transaction.<br>The value of this register is only meaningful if SBISTAT.INITRDY is zero.<br><br>**Power Well:** Core |
| 0 | 0x0<br>RW/1S | **Initiate/ Ready# (INITRDY):**<br>• 0: The IOSF sideband interface is ready for a new transaction<br>• 1: The IOSF sideband interface is busy with the previous transaction.<br>A write to set this register bit to 1 will trigger an IOSF sideband message on the private IOSF sideband interface.<br>The message will be formed based on the values programmed in the Sideband Message Interface Register Access registers.<br>Software needs to ensure that the interface is not busy (SBISTAT.INITRDY is clear) before writing to this register.<br><br>**Power Well:** Core |

## 57.2.39 SBI Routing Identification (SBIRID)—Offset DAh

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:31, F:1] + DAh

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:12 | 0x0<br>RW | **First Byte Enable (FBE):** The content of this field is sent in the IOSF Sideband Register Access FBE field.<br><br>**Power Well:** Core |
| 11 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 10:8 | 0x0<br>RW | **Base Address Register (BAR):** The contents of this field are sent in the IOSF Sideband Register Access BAR field.<br>This should be zero performing a Memory Mapped operation to a PCI compliant device.<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RW | **Function ID (FID):** The contents of this field are sent in the IOSF Sideband Register access FID field. This field should generally remain at zero unless specifically required by a particular application.<br><br>**Power Well:** Core |

## 57.2.40 SBI Extended Address (SBIEXTADDR)—Offset DCh

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:1] + DCh

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Extended Address (ADDR):** The content of this register field is sent on the IOSF sideband Message Register Access address(48:32) field.<br>This must be set to all 0 if 16b addressing is desired.<br><br>**Power Well:** Core |

## 57.2.41 P2SB Control (P2SBC)—Offset E0h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:1] + E0h

**Default:** 00000007h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:27 | 0x0<br>RW | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 26 | 0x0<br>RW | **Data Parity Error Enable (DPEE):** IOSFP data parity error handling (EP bit) enabling bit<br><br>**Power Well:** Core |
| 25 | 0x0<br>RW | **Command Parity Error Enable (CPEE):** IOSFP command parity error handling enabling bit<br><br>**Power Well:** Core |
| 24 | 0x0<br>RW | **Data Phase Parity Error Enable (DPPEE):** IOSFP data phase parity error handling enabling bit<br><br>**Power Well:** Core |
| 23:18 | 0x0<br>RW | **Reserved (RSVD_3):** Reserved.<br><br>**Power Well:** Core |
| 17 | 0x0<br>RW/O | **Endpoint Mask Lock (MASKLOCK):** Locks the value of the eight Endpoint Mask (EPMASK[0-7]) registers.<br>Once this value is written to a one it may only be cleared by a reset.<br><br>**Power Well:** Core |
| 16 | 0x0<br>RW | **PGCB Clock Gating Enable (PGCBCGE):** When asserted, the P2SB can de-assert the clock request to disable the PGCB clock dynamically when it reaches the power-down idle state.<br><br>**Power Well:** Core |
| 15:9 | 0x0<br>RW | **Reserved: (RSVD_1):** Hardware will not allocate these bits for any purpose in the future so that BIOS can always write to the HIDE field with this byte enabled without having to remember any other field values since it will not be possible to do a read-modify-write when the device is hidden.<br><br>**Power Well:** Core |
| 8 | 0x0<br>RW | **Hide Device (HIDE):** When this bit is set, the P2SB will return 1s on any PCI Configuration Read on IOSF-P. All other transactions including PCI Configuration Writes are unaffected by this.<br>This does not affect reads performed on the IOSF-SB interface.<br><br>**Power Well:** Core |
| 7:3 | 0x0<br>RW | **Reserved (RSVD_2):** Reserved.<br><br>**Power Well:** Core |
| 2:0 | 0x7<br>RW | **Max Writes Pending (MAXW):** This controls the maximum number of outstanding writes on IOSF-SB initiated by MMIO writes to the SBREG_BAR.<br>Once the number of SBREG_BAR writes that are issued, but not completed, on IOSF-SB is equal to this value, no new requests will be forwarded until the completions are received.<br>A value of zero will have the same behavior as the value of one (single write outstanding).<br><br>**Power Well:** Core |

## 57.2.42 Unsupported Request Error Status (URES)—Offset F0h

This register is only reset by a loss of core power

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:1] + F0h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:9 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 8 | 0x0<br>RW/1C | **Unsupported Request Detected (URD):** Set to 1 by hardware upon detecting an Unsupported Request on IOSF Primary interface that is not considered Advisory Non-Fatal<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved.<br><br>**Power Well:** Core |

## 57.2.43 Unsupported Request Error Control (UREC)—Offset F4h

This register is only reset by a loss of core power.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:1] + F4h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:9 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 8 | 0x0<br>RW | **Unsupported Request Reporting Enable (URRE):** If set to 1 by software, it allows reporting of an Unsupported Request as a system error.<br><br>**Power Well:** SUS |
| 7:0 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved.<br><br>**Power Well:** Core |

## 57.2.44 Manufacturer's ID (MANID)—Offset F8h

This register is assigned during the boot flow using the SetID message based on values found in the fuse block. All fields except MID will be reset by hardware to zero and set only by the SetID message.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:1] + F8h

**Default:** 00000F00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 27:24 | 0x0<br>RO/V | **Dot portion of Process ID (DOT):** Indicates the dot process<br><br>**Power Well:** Core |
| 23:16 | 0x0<br>RO/V | **Manufacturing Stepping Identifier (MSID):** This field is incremented for each stepping of the part.<br>***Note:*** This field can be used by software to differentiate steppings when the Stepping Revision ID may not change.<br><br>**Power Well:** Core |
| 15:8 | 0xf<br>RO | **Manufacturing Identifier (MID):** 0Fh = Intel<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RO/V | **Process portion of process ID (PROC):** Indicates the process.<br>The dot portion of the process is reflected in bits (27:24)<br><br>**Power Well:** Core |

§ §

# 58 Power Management Controller - B0, D31, F2

## 58.1 Introduction and Index

The host-accessible registers for the Power Management Controller (PMC) are described here.

To determine the number of devices/functions available refer to the following:

- Table 1-1, "Features by product SKU - Server and Cloud Storage SKUs 0 through 4"
- Table 1-2, "Features by Product SKU - Network and Enterprise Storage SKUs 5 through 10"
- Table 1-3, "Features by Product SKU - Extended Temperature SKUs 11 through 14".

The legend for the register access codes are described in Chapter 43, "Introduction."

### 58.1.1 Host Configuration Space

These registers are discovered in Host Configuration Space starting at Bus 0, Device 31 (decimal), Function 2. The offset addresses are listed.

**Table 58-1. Summary of PCI Configuration Registers—0/31/2**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 0 | 4 | 19DE8086 | "PCI Identifier (PCIID)—Offset 0h" on page 2689 |
| 40 | 4 | 00000001 | "ACPI Base Address (ABASE)—Offset 40h" on page 2689 |
| 44 | 4 | 00000000 | "ACPI Control (ACTL)—Offset 44h" on page 2690 |
| A0 | 4 | A0000000 | "General PM Configuration A (GEN_PMCON_A)—Offset A0h" on page 2691 |
| A4 | 4 | 00004007 | "General PM Configuration B (GEN_PMCON_B)—Offset A4h" on page 2693 |
| AC | 4 | 00000000 | "Extended Test Mode Register 3 (ETR3)—Offset ACh" on page 2695 |

## 58.1.2 Host Memory Space—PWRMBASE

### Table 58-2. Summary of Memory Mapped I/O Registers—PWRMBASE

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 0 | 4 | FFFFFFFF | "Wake Alarm Device Timer: AC (WADT_AC)—Offset 0h" on page 2696 |
| 4 | 4 | FFFFFFFF | "Wake Alarm Device Timer: DC (WADT_DC)—Offset 4h" on page 2697 |
| 8 | 4 | FFFFFFFF | "Wake Alarm Device Expired Timer: AC (WADT_EXP_AC)—Offset 8h" on page 2698 |
| C | 4 | FFFFFFFF | "Wake Alarm Device Expired Timer: DC (WADT_EXP_DC)—Offset Ch" on page 2698 |
| 10 | 4 | 05000000 | "Power and Reset Status (PRSTS)—Offset 10h" on page 2699 |
| 18 | 4 | 00000020 | "Power Management Configuration Reg 1 (PM_CFG)—Offset 18h" on page 2700 |
| 1C | 4 | 00000000 | "PCH Power Management Status (PCH_PM_STS)—Offset 1Ch" on page 2704 |
| 24 | 4 | 00000000 | "PCH Power Management Status (PCH_PM_STS2)—Offset 24h" on page 2705 |
| F0 | 4 | 200F0DE4 | "ADR Enable (ADR_EN)—Offset F0h" on page 2707 |
| F8 | 4 | 00000000 | "System Time Capture Trigger (SYSTIMCT)—Offset F8h" on page 2709 |
| FC | 4 | 00000000 | "ACPI Timer Control (ACPI_TMR_CTL)—Offset FCh" on page 2709 |
| 120 | 4 | 00000432 | "GPIO Configuration (GPIO_CFG)—Offset 120h" on page 2710 |
| 124 | 4 | 00000000 | "Global Reset Causes (GBLRST_CAUSE0)—Offset 124h" on page 2711 |
| 128 | 4 | 00000000 | "Global Reset Causes (GBLRST_CAUSE1)—Offset 128h" on page 2713 |
| 12C | 4 | 00000000 | "Host Partition Reset Causes (HPR_CAUSE0)—Offset 12Ch" on page 2714 |
| 200 | 4 | 0000FFFF | "modPHY Power Management Configuration Reg 1 (MODPHY_PM_CFG1)—Offset 200h" on page 2715 |
| 204 | 4 | 05000000 | "modPHY Power Management Configuration Reg 2 (MODPHY_PM_CFG2)—Offset 204h" on page 2716 |
| 208 | 4 | 00000000 | "modPHY Power Management Configuration Reg 3 (MODPHY_PM_CFG3)—Offset 208h" on page 2718 |
| 20C | 4 | 00000000 | "modPHY Power Management Configuration Reg 4 (MODPHY_PM_CFG4)—Offset 20Ch" on page 2719 |
| 3F0 | 4 | 00000000 | "IE_STS (IE_STS)—Offset 3F0h" on page 2720 |
| 3F4 | 4 | 00000000 | "ME_STS (ME_STS)—Offset 3F4h" on page 2722 |
| 620 | 4 | 00000000 | "Static PG Related Function Disable Register 1 (ST_PG_FDIS_PMC_1)—Offset 620h" on page 2723 |
| 628 | 4 | 00000000 | "Non-Static PG Related Function Disable Register 1 (NST_PG_FDIS_1)—Offset 628h" on page 2724 |
| 640 | 4 | 00000000 | "Non-Static PG Fuse Disable Read 1 Register (N_STPG_FUSE_SS_DIS_RD_1)—Offset 640h" on page 2724 |
| 644 | 4 | 00000000 | "Static PG Fuse and Soft Strap Disable Read Register 2 (STPG_FUSE_SS_DIS_RD_2)—Offset 644h" on page 2725 |

### 58.1.3 Host I/O Space—ABASE

An index of the registers that are accessible in Host I/O Space is shown here.

**Table 58-3. Summary of I/O Registers—ABASE**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 0 | 4 | 00000000 | "Power Management 1 Enables and Status (PM1_EN_STS)—Offset 0h" on page 2726 |
| 4 | 4 | 00000000 | "Power Management 1 Control —Offset 4h" on page 2728 |
| 8 | 4 | 00000000 | "Power Management 1 Timer (PM1_TMR)—Offset 8h" on page 2729 |
| 30 | 4 | 00000002 | "SMI Control and Enable (SMI_EN)—Offset 30h" on page 2730 |
| 34 | 4 | 00000000 | "SMI Status Register (SMI_STS)—Offset 34h" on page 2732 |
| 40 | 4 | 00000000 | "General Purpose Event Control (GPE_CTRL)—Offset 40h" on page 2735 |
| 44 | 4 | 00000000 | "Device Trap Status Register (DEVTRAP_STS)—Offset 44h" on page 2736 |
| 50 | 4 | 00000000 | "PM2a Control Block (PM2A_CNT_BLK)—Offset 50h" on page 2737 |
| 54 | 4 | 00002000 | "Over-Clocking WDT Control (OC_WDT_CTL)—Offset 54h" on page 2737 |
| 80 | 4 | 00000000 | "General Purpose Event 0 Status [31:0] (GPE0_STS_31_0)—Offset 80h" on page 2738 |
| 84 | 4 | 00000000 | "General Purpose Event 0 Status [63:32] (GPE0_STS_63_32)—Offset 84h" on page 2739 |
| 88 | 4 | 00000000 | "General Purpose Event 0 Status [95:64] (GPE0_STS_95_64)—Offset 88h" on page 2739 |
| 8C | 4 | 00000000 | "General Purpose Event 0 Status [127:96] (GPE0_STS_127_96)—Offset 8Ch" on page 2740 |
| 90 | 4 | 00000000 | "General Purpose Event 0 Enable [31:0] (GPE0_EN_31_0)—Offset 90h" on page 2742 |
| 94 | 4 | 00000000 | "General Purpose Event 0 Enable [63:32] (GPE0_EN_63_32)—Offset 94h" on page 2742 |
| 98 | 4 | 00000000 | "General Purpose Event 0 Enable [95:64] (GPE0_EN_95_64)—Offset 98h" on page 2742 |
| 9C | 4 | 00000000 | "General Purpose Event 0 Enable [127:96] (GPE0_EN_127_96)—Offset 9Ch" on page 2743 |

### 58.1.4 Host I/O Space—Fixed Address

An index of the registers that are accessible in Host I/O Space is shown here.

**Table 58-4. Summary of I/O Registers—Fixed Addresses**

| Address (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| CF9 | 1 | 0 | "Reset Control Register (RST_CNT)" on page 2745 |

### 58.1.5 Sideband Registers

An index of the Sideband registers that are accessible to the Host are listed here. Each is accessible in Host Memory Space using the Sideband Base Address Register (SBREG_BAR). See Section 3.4.1, "Using SBREG_BAR Method" on page 187.

**Table 58-5. Summary of Sideband Registers—0x82**

| Offset (hex) | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|
| B0 | 00000000 | "Advanced Power Management Status and Control Port (APM_STS_CNT)—Offset B0h" on page 2746 |
| B4 | 00000000 | "Misc SB Reg0 (MISC_SBR0)—Offset B4h" on page 2746 |

## 58.2 Registers in Configuration Space

### 58.2.1 PCI Identifier (PCIID)—Offset 0h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:2] + 0h

**Default:** 19DE8086h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x19DE<br>RO/V | **Device Identification (DID):** These bits are assigned by Intel. |
| 15:0 | 0x8086<br>RO | **Vendor Identification (VID):** Indicates Intel |

### 58.2.2 ACPI Base Address (ABASE)—Offset 40h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:2] + 40h

**Default:** 00000001h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0x0<br>RW/L | **Base Address (BA):** Provides the 256 bytes of I/O space for ACPI logic.<br>This field is locked by GEN_PMCON_B.ACPI_BASE_LOCK. |
| 7:1 | 0x0<br>RO | **Reserved (RSVD_7_1):** Always 0. |
| 0 | 0x1<br>RO | **Space Type (STYPE):** Always 1 to indicate I/O space. |

## 58.2.3 ACPI Control (ACTL)—Offset 44h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:2] + 44h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:9 | 0x0<br>RO | **Reserved (RSVD_31_9):** Reserved. |
| 8 | 0x0<br>RW | **PWRM Enable (PWRM_EN):** When set, decode of the Host Memory Space range pointed by PWRMBASE is enabled. |
| 7 | 0x0<br>RW | **ACPI Enable (EN):** When set, decode of the I/O range pointed to by the ACPI base register is enabled and the ACPI power management function is enabled. |
| 6:3 | 0x0<br>RO | **Reserved (RSVD_6_3):** Reserved. |
| 2:0 | 0x0<br>RW | **SCI IRQ Select (SCIS):** Specifies on which IRQ the SCI will internally appear.<br>If not using the APIC, the SCI must be routed to IRQ[9-11], and that interrupt is not sharable with the SERIRQ stream, but is shareable with other PCI interrupts.<br>If using the APIC, the SCI can also be mapped to IRQ20-23, and can be shared with other interrupts.<br>Bits - SCI Map<br>---- - -------<br>• 000 - IRQ9<br>• 001 - IRQ10<br>• 010 - IRQ11<br>• 011 - Reserved<br>• 100 - IRQ20 (only if APIC is enabled)<br>• 101 - IRQ21 (only if APIC is enabled)<br>• 110 - IRQ22 (only if APIC is enabled)<br>• 111 - IRQ23 (only if APIC is enabled)<br>When the interrupt is mapped to APIC interrupts 9, 10 or 11, the APIC should be programmed for active-high reception.<br>When the interrupt is mapped to APIC interrupts 20 through 23, the APIC should be programmed for active-low reception. |

## 58.2.4 General PM Configuration A (GEN_PMCON_A)—Offset A0h

Usage: ACPI and Legacy.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:2] + A0h

**Default:** A0000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x1<br>RW | **GBE Prep Non-fatal Timeout Enable (GBE_PREP_NFTO_EN):** When cleared, this bit causes the PMC to disable the GBE Prep non-fatal timeout, causing the PMC to wait indefinitely for the ACK STS (response) for Reset/Boot Prep message from the GBe MAC.<br>When set, a non-fatal timeout will apply to the Reset/Boot Prep handshake. |
| 30 | 0x0<br>RW | **RSVD:** Reserved |
| 29 | 0x1<br>RW | **RSVD:** Reserved |
| 28 | 0x0<br>RW | **After G3 PHY Power Enable (AG3_PP_EN):** This bit determines the Host software contribution to whether the LAN PHY is powered up after exiting G3.This bit is in the RTC power well. |
| 27 | 0x0<br>RW | **Sx PHY Power Enable (SX_PP_EN):** This bit determines the Host software contribution to whether the LAN PHY remains powered in an Sx/MOFF state that was entered from S0 (rather than from G3). |
| 26:24 | 0x0<br>RO | **Reserved (RSVD_26_24):** Reserved. |
| 23 | 0x0<br>RW | **DRAM Initialization Scratchpad Bit (DISB):** This bit does not affect hardware functionality in any way.<br>It is provided as a scratchpad bit that is maintained through main power well resets and CF9h-initiated resets.<br>If the bit is 1, then the DRAM initialization was interrupted. |
| 22 | 0x0<br>RO | **Reserved (RSVD_22):** Reserved. |
| 21 | 0x0<br>RO/V | **Memory Placed in Self-Refresh (MEM_SR):** This bit will be set to 1 if DRAM should have remained powered and held in Self-Refresh through the last power state transition (i.e. the last time the system left S0). The scenarios where this should be the case are:<br>• successful S3 entry and exit<br>• successful Host partition reset without power cycle<br>This indicates that memory was successfully placed into Self-Refresh.<br>This bit will be cleared whenever the SoC begins a transition out of S0. |
| 20:19 | 0x0<br>RO | **Reserved (RSVD_20_19):** Reserved. |
| 18 | 0x0<br>RW/1C/V | **Minimum SLP_S4# Assertion Width Violation Status (MS4V):** Hardware sets this bit when the SLP_S4# assertion width is less than the time programmed in the SLP_S4# Minimum Assertion Width field in the GEN_PMCON_B register. |
| 17 | 0x0<br>RO | **Reserved (RSVD_17):** Reserved. |
| 16 | 0x0<br>RW/1C/V | **Global Reset Status (GBL_RST_STS):** This bit is set after a global reset (not G3 or DeepSx) occurs. See the GEN_PMCON_B.HOST_RST_STS bit for potential usage models. |
| 15 | 0x0<br>RW | **Allow iCLK PLL Shutdown in C0 (ALLOW_ICLK_PLL_SD_INC0):** When this bit is left at '0' (default), PMC allows iCLK PLL Shutdown only when the CPU is in a non-C0 state. |
| 14 | 0x0<br>RW | **Dynamic mPHY CRI Clock Gate Override (MPHY_CRICLK_GATE_OVR):**<br>• 0: Enable CRI clock gating in the modPHY<br>• 1: Disable CRI clock gating in the modPHY<br>BIOS reading this register should always return the correct value. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 13 | 0x0<br>RW | **Allow OPI PLL Shutdown in C0 (ALLOW_OPI_PLL_SD_INC0):** When this bit is left at '0' (default), PMC allows OPI PLL Shutdown only when the CPU is in a non-C0 state. When set to '1', the OPI PLL can be shut down when the CPU is in C0 or Cx state assuming all other gating conditions are satisfied. |
| 12 | 0x0<br>RW | **Allow SPXB Clock Gating in C0 (ALLOW_SPXB_CG_INC0):**<br>When this bit is left at '0' (default), PMC allows SBXB Clock gating only when the CPU is in a non-C0 state. |
| 11 | 0x0<br>RO | **Reserved (RSVD_11):** Reserved. |
| 10 | 0x0<br>RW | **BIOS PCI Express Enable (BIOS_PCI_EXP_EN):** This bit acts as a global enable for the SCI associated with the PCI express ports.<br>If this bit is not set, then the various PCI Express ports cannot cause the PCI_EXP_STS bit to go active. |
| 9 | 0x0<br>RO/V | **Power Button Level (PWRBTN_LVL):** This read-only bit indicates the current state of the PMU_PWRBTN_N signal.<br>• 1= High<br>• 0 = Low |
| 8 | 0x0<br>RO | **Reserved (RSVD_8):** Reserved. |
| 7 | 0x0<br>RW | **Allow L1.LOW Entry During C0 (ALLOW_L1LOW_C0):**<br>When this bit is 0, the PMC only allows L1.LOW entry if the CPU is in Cx (EA = 0).<br>When set to 1, the PMC allows L1.LOW entry regardless of the value of EA. |
| 6 | 0x0<br>RW | **Allow L1.LOW Entry with OPI Voltage On (ALLOW_L1LOW_OPI_ON):**<br>When this bit is 0, the PMC only allows L1.LOW entry if the OPI voltage is off.<br>When this bit is 1, the PMC allows L1.LOW entry regardless of whether the OPI voltage is on/off. |
| 5 | 0x0<br>RW | **Allow L1.LOW Entry with CPU BCLK REQ Asserted (ALLOW_L1LOW_BCLKREQ_ON):**<br>When this bit is 0, the PMC only allows L1.LOW entry if the CPUs BCLK request is de-asserted.<br>When this bit is 1, the PMC allows L1.LOW entry regardless of whether the CPUs BCLK request is asserted/de-asserted. |
| 4 | 0x0<br>RW/L | **SMI Lock (SMI_LOCK):** When this bit is set, writes to the GLB_SMI_EN bit will have no effect.<br>Once the SMI_LOCK bit is set, writes of 0 to SMI_LOCK bit will have no effect (i.e. once set, this bit can only be cleared by host_prim_rst_b). |
| 3 | 0x0<br>RW/L | **Reserved:** Reserved. |
| 2 | 0x0<br>RO | **Reserved (RSVD_2):** Reserved. |
| 1:0 | 0x0<br>RW | **Period SMI Select (PER_SMI_SEL):** Software sets these bits to control the rate at which the periodic SMI# is generated:<br>• 00 = 64 seconds (default)<br>• 01 = 32 seconds<br>• 10 = 16 seconds<br>• 11 = 8 seconds<br>Tolerance for the timer is ± 1 second. |

## 58.2.5 General PM Configuration B (GEN_PMCON_B)—Offset A4h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:2] + A4h

**Default:** 00004007h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:19 | 0x0<br>RO | **Reserved (RSVD_31_19):** Reserved. |
| 18 | 0x0<br>RW/L | **RSVD:** Reserved |
| 17 | 0x0<br>RW/L | **ACPI Base Lock (ACPI_BASE_LOCK):** When set to 1, this bit locks down the ACPI Base Address Register (ABASE) located at offset 40h.<br>The Base Address Field becomes read-only. This bit becomes locked when a value of 1b is written to it. |
| 16 | 0x0<br>RW/L | **RSVD:** Reserved |
| 15 | 0x0<br>RW | **PME B0 S5 Disable (PME_B0_S5_DIS):**<br>When cleared (default), wake events from PME_B0_STS are allowed in S5 if PME_B0_EN = 1.<br>When set to 1, this bit blocks wake events from PME_B0_STS in S5, regardless of the state of PME_B0_EN. The net effect of setting PME_B0_S5_DIS = 1 is described here:<br>• When PME_B0_EN = 0 and WOL Enable Override = 0: Don't Wake when in S5.<br>• When PME_B0_EN = 0 and WOL Enable Override = 1: Wake (LAN only) when in S5.<br>• When PME_B0_EN = 1 and WOL Enable Override = 0: Don't Wake when in S5.<br>• When PME_B0_EN = 1 and WOL Enable Override = 1: Wake (LAN only) when in S5.<br>This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active. |
| 14 | 0x1<br>RW/1C | **SUS Well Power Failure (SUS_PWR_FLR):** This bit is set to '1' whenever SUS well power is lost, as indicated by pri_pwrgood_rst_b assertion. |
| 13 | 0x0<br>RW | **WOL Enable Override (WOL_EN_OVRD):**<br>When this bit is set to 1, the integrated LAN is enabled to wake the system from S5 regardless of the value in the PME_B0_EN bit in the GPE0_EN register. |
| 12 | 0x0<br>RW/L | **Disable SLP_X Stretching After SUS Well Power Up (DIS_SLP_X_STRCH_SUS_UP):**<br>When this bit is set to 1, all PMU_SLP_* pin stretching is disabled when powering up after a SUS well power loss.<br>When this bit is left at 0, PMU_SLP_* stretching will be performed after SUS power failure as enabled in various other fields. |
| 11:10 | 0x0<br>RW/L | **SLP_S3# Minimum Assertion Width (SLP_S3_MIN_ASST_WDTH):** This 2-bit value indicates the minimum assertion width of the PMU_SLP_S3_N signal to guarantee that the Main power supplies have been fully power-cycled.<br>This value may be modified per platform depending on power supply capacitance, board capacitance, power failure detection circuits, etc.<br>Settings are:<br>• 00: 60 µsec<br>• 01: 1 ms<br>• 10: 50 ms<br>• 11: 2 sec<br>This field is not writable when the SLP_Sx# Stretching Policy Lock- Down bit is set.<br>This bit is cleared by the pri_pwrgood_rst_b pin. |
| 9 | 0x0<br>RW/1C/V | **Host Reset Status (HOST_RST_STS):** This bit is set by hardware when a host partition reset (not a global reset, DeepSx, or G3) occurs. |
| 8 | 0x0<br>RO | **Reserved (RSVD_8):** Reserved. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:6 | 0x0<br>RW | **SWSMI Rate Select (SWSMI_RATESEL):** This 2-bit value indicates when the SWSMI timer will time out.<br>Valid values are:<br>• 00 1.5ms ± 0.6ms<br>• 01 16ms ± 4ms<br>• 10 32ms ± 4ms<br>• 11 64ms ± 4ms<br>This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active. |
| 5:4 | 0x0<br>RW/L | **SLP_S4# Minimum Assertion Width (S4MAW):** This 2-bit value indicates the minimum assertion width of the SLP_S4# signal to guarantee that the DRAMs have been safely power-cycled.<br>This value may be modified per platform depending on DRAM types, power supply capacitance, etc.<br>Valid values are:<br>• 11: 1 second<br>• 10: 2 seconds<br>• 01: 3 seconds<br>• 00: 4 seconds<br>This value is used in two ways:<br>• 1. If the PMU_SLP_S45_N assertion width is ever shorter than this time, the status bit MS4V of the GEN_PMCON_A register is set for BIOS to read when S0 is entered<br>• 2. If enabled by bit 3 in this register, the hardware will prevent the PMU_SLP_S45_N signal from deasserting within this minimum time period after asserting. |
| 3 | 0x0<br>RW/L | **SLP_S4# Assertion Stretch Enable (S4ASE):**<br>When set to 1, the PMU_SLP_S45_N pin (which includes the ME override logic) will minimally assert for the time specified in bits 5:4 of this register.<br>When 0, the minimum assertion time for PMU_SLP_S45_N is the same as the timing defined in the timing tables. |
| 2 | 0x1<br>RW | **RTC_PWR_STS (RPS):** The SoC will set this bit to 1 to indicate a weak or missing battery. The bit will remain set until the software clears it by writing a 0 back to this bit position. This bit is in the RTC power well and is not cleared by any type of reset. |
| 1 | 0x1<br>RW/1C | **PWR_FLR (PF):**<br>• 0 = Indicates that the trickle current has not failed since the last time the bit was cleared.<br>• 1 = Indicates that the trickle current (from the main battery or trickle supply) was removed or failed.<br>Software writes a 1 to this bit to clear it. |
| 0 | 0x1<br>RW/V | **AFTERG3_EN (AG3E):** Determines what state to go to when power is reapplied after a power failure (G3 state).<br>• 0 = System will return to an S0 state (boot) after power is re-applied.<br>• 1 = System will return to the S5 state. In the S5 state, the only enabled wake-up event is the Power Button or any enabled wake event that was preserved through the power failure. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active. |

## 58.2.6 Extended Test Mode Register 3 (ETR3)—Offset ACh

This register resides in the primary Core well. All bits except bit[23:16] are reset by host_deep_rst_b. Bit[23:16] are reset by pri_pwrgood_rst_b only.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:2] + ACh

**Default:** 80000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x1<br>RW/V/L | **CF9h Lockdown (CF9LOCK):** When set, this will lock the "CF9h Global Reset" bit.<br>When set, this register locks itself. This register is reset by a CF9h reset.<br><br>***Note:*** In manufacturing/ debug environments this bit can be left as default 0b. In all other environments, BIOS must program this bit to 1b. |
| 30:21 | 0x0<br>RO | **Reserved (RSVD_30_21):** These bits are reserved for Intel. |
| 20 | 0x0<br>RW/L | **CF9h Global Reset (CF9GR):**<br>When this bit is set, a CF9h write of 6h or Eh will cause a Global Reset of both the Host and the ME partitions.<br>If this bit is cleared, a CF9h write of 6h or Eh will only reset the Host partition. |
| 19:0 | 0x0<br>RO | **Reserved (RSVD_19_0):** These bits are reserved for Intel. |

## 58.3 Registers in Memory Space—PWRMBASE

### 58.3.1 Wake Alarm Device Timer: AC (WADT_AC)—Offset 0h

Bits in this register only need to be valid for reading when the Main power well is up. However, since some of the events may initially be detected while the Main power well and SUS well are down, they are marked as DSW bits.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [PWRMBASE] + 0h

**Default:** FFFFFFFFh

**PWRMBASE Type:** PCI Configuration Register (Size: 32 bits)
**PWRMBASE Reference:** [B:0, D:31, F:2] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0xFFFFFFFF RW/V | **Wake Alarm Device Timer Value for AC Mode (WADT_AC_VAL):** This field contains the 32-bit wake alarm device timer value (granularity 1s) for AC power.<br>The timer begins decrementing when written to a value other than FFFFFFFFh (regardless of the power source when the write occurs).<br>Upon counting down to 0:<br>• If on AC power, GPE0b_STS.WADT_STS will be set. This status bit being set will generate a host wake if GPE0b_EN.WADT_EN is 1.<br>• If the power source is DC at this time, the status bit is not set. However, if AC power subsequently returns to the platform, the AC Expired Timer begins running. See the WADT_EXP_AC register for details.<br>• The timer returns to its default value of FFFFFFFFh. |

## 58.3.2 Wake Alarm Device Timer: DC (WADT_DC)—Offset 4h

Bits in this register only need to be valid for reading when the Main power well is up. However, since some of the events may initially be detected while the Main power well and SUS well are down, they are marked as DSW bits.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [PWRMBASE] + 4h

**Default:** FFFFFFFFh

**PWRMBASE Type:** PCI Configuration Register (Size: 32 bits)
**PWRMBASE Reference:** [B:0, D:31, F:2] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0xFFFFFFFF RW/V | **Wake Alarm Device Timer Value for DC Mode (WADT_DC_VAL):** This field contains the 32-bit wake alarm device timer value (granularity 1s) for DC power. The timer begins decrementing when written to a value other than FFFFFFFFh (regardless of the power source when the write occurs). Upon counting down to 0:<br>• If on DC power, GPE0b_STS.WADT_STS will be set. This status bit being set will generate a host wake if GPE0b_EN.WADT_EN is 1.<br>• If the power source is AC at this time, the status bit is not set. However, if DC power subsequently returns to the platform, the DC Expired Timer begins running. See the WADT_EXP_DC register for details.<br>• The timer returns to its default value of FFFFFFFFh. |

### 58.3.3 Wake Alarm Device Expired Timer: AC (WADT_EXP_AC)—Offset 8h

Bits in this register only need to be valid for reading when the Main power well is up. However, since some of the events may initially be detected while the Main power well and SUS well are down, they are marked as DSW bits.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [PWRMBASE] + 8h

**Default:** FFFFFFFFh

**PWRMBASE Type:** PCI Configuration Register (Size: 32 bits)
**PWRMBASE Reference:** [B:0, D:31, F:2] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0xFFFFFFFF RW/V | **Wake Alarm Device Expired Timer Value for AC Mode (WADT_EXP_AC_VAL):** This field contains the 32-bit wake alarm device "Expired Timer" value (granularity 1s) for AC power.<br>The timer begins decrementing after switching from DC to AC power, in the case where the WADT_AC timer has already expired while the platform was on DC power.<br>This timer only decrements while operating on AC power. So if the power source switches back to DC power, the timer will stop (but not reset).<br>When AC power returns, the timer will again begin decrementing.<br>***Note:*** This timer will only begin decrementing under the conditions described above if this field has been configured for something other than its default value of FFFFFFFFh (i.e. FFFFFFFFh = disabled).<br>Upon expiration of this timer:<br>• If on AC power, GPE0b_STS.WADT_STS will be set. This status bit being set will generate a host wake if GPE0b_EN.WADT_EN is 1.<br>• BOTH the AC and DC Expired Timers return to their defaults value of FFFFFFFFh. |

### 58.3.4 Wake Alarm Device Expired Timer: DC (WADT_EXP_DC)—Offset Ch

Bits in this register only need to be valid for reading when the Main power well is up. However, since some of the events may initially be detected while the Main power well and SUS well are down, they are marked as DSW bits.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [PWRMBASE] + Ch

**Default:** FFFFFFFFh

**PWRMBASE Type:** PCI Configuration Register (Size: 32 bits)
**PWRMBASE Reference:** [B:0, D:31, F:2] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0xFFFFFFFF RW/V | **Wake Alarm Device Expired Timer Value for DC Mode (WADT_EXP_DC_VAL):** This field contains the 32-bit wake alarm device "Expired Timer" value (granularity 1s) for DC power.<br>The timer begins decrementing after switching from AC to DC power, in the case where the WADT_DC timer has already expired while the platform was on AC power.<br>This timer only decrements while operating on DC power. So if the power source switches back to AC power, the timer will stop (but not reset).<br>When DC power returns, the timer will again begin decrementing.<br>***Note:*** This timer will only begin decrementing under the conditions described above if this field has been configured for something other than its default value of FFFFFFFFh (i.e. FFFFFFFFh = disabled).<br>Upon expiration of this timer:<br>• If on DC power, GPE0b_STS.WADT_STS will be set. This status bit being set will generate a host wake if GPE0b_EN.WADT_EN is 1.<br>• BOTH the AC and DC Expired Timers return to their defaults value of FFFFFFFFh. |

## 58.3.5 Power and Reset Status (PRSTS)—Offset 10h

Bits in this register only need to be valid for reading when the Main power well is up. However, since some of the events may initially be detected while the Main power well is down, they are marked as suspend well bits. All suspend well bits in this register are reset by global_rst_b.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [PWRMBASE] + 10h

**Default:** 05000000h

**PWRMBASE Type:** PCI Configuration Register (Size: 32 bits)
**PWRMBASE Reference:** [B:0, D:31, F:2] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x5<br>RO/V | **Power Management Controller Product ID (PMC_PRODID):** This field communicates the Product Family of the power management functionality. |
| 23:16 | 0x0<br>RO/V | **Power Management Controller Revision ID (PMC_REVID):** This field communicates the implementation revision of the power management functionality. |
| 15:12 | 0x0<br>RO | **Reserved (RSVD_15_12):** Reserved. |
| 11 | 0x0<br>RW/1C/V | **Patch Copied Over Status (PATCH_COPIED_STS):** The SoC sets this bit when the Patch code is successfully authenticated and loaded into the SoC from the flash. |
| 10 | 0x0<br>RO/V | **Patch Revision Not Compatible Status (PATCH_REV_NOT_COMP):** The SoC sets this bit when the Patch code is not compatible with the Power Management Controller Product and/or Revision.<br>This bit remains valid after a PMC Patch load is attempted until the next global_rst_b. |
| 9 | 0x0<br>RO/V | **Patch Load Timeout Status (PATCH_LOAD_TO):** The SoC sets this bit if the loading function fails to complete within a reasonable time limit. |
| 8 | 0x0<br>RO/V | **PMC Operational Status (PMC_OP_STS):** The SoC sets this bit when the PMC becomes operational after completing the Patch Load, or, if no patch is needed.<br>BIOS must wait for this bit to be set before performing resets or sleep events.<br>This bit remains valid after a PMC Patch load until the next global_rst_b. |
| 7 | 0x0<br>RW/1C/V | **VE Watch Dog Timer Status (VE_WDT_STS):** This bit will be set to '1' when the VE Watch Dog Timer triggers a reset.<br>It will be cleared by a write of '1' by software. |
| 6 | 0x0<br>RW/1C/V | **IE Host Wake Status (IE_HOST_WAKE_STS):** This bit is set when the IE generates a non-maskable wake event and is not affected by any other enable bit.<br>When this bit is set, the host power management logic wakes to S0. |
| 5 | 0x0<br>RW/1C/V | **Wake On LAN Override Wake Status (WOL_OVR_WK_STS):** This bit gets set when integrated LAN Signals a Power Management Event AND the system is in S5. BIOS can read this status bit to determine this wake source. Software clears this bit by writing a 1 to it. |
| 4 | 0x0<br>RO | **Reserved (RSVD_4):** Reserved. |
| 3 | 0x0<br>RO/V | **HR_SHAD_IE_EN_STS:** This register shadows the IE ROM Check in host space.<br>• 0 = IE is disabled<br>• 1 = IE is enabled |
| 2:1 | 0x0<br>RO | **Reserved (RSVD_2_1):** Reserved. |
| 0 | 0x0<br>RW/1C/V | **ME_HOST_WAKE_STS:** This bit is set when the ME generates a non-maskable wake event and is not affected by any other enable bit.<br>When this bit is set, the host power management logic wakes to S0. |

## 58.3.6 Power Management Configuration Reg 1 (PM_CFG)—Offset 18h

This register contains misc. fields used to configure the SoC power management behavior. This register is in multiple power wells and reset domains (see below).

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [PWRMBASE] + 18h

**Default:** 00000020h

**PWRMBASE Type:** PCI Configuration Register (Size: 32 bits)
**PWRMBASE Reference:** [B:0, D:31, F:2] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **SATA Interface Disable Indication (SATA_DIS_IND):**<br>When set to 1, this bit indicates that the SATA interface on the SoC is completely disabled. Therefore, the mPhy lanes normally assigned to SATA will operate through the PCIe controller (or not be used at all).<br>When cleared, it indicates that at least some of the SATA interface lanes may be used actively in the SoC by the SATA controller, so none of the four lanes assigned to SATA interface can operate through the PCIe controller. |
| 30 | 0x0<br>RW | **Timing t591 (TIMING_T591):** This field configures t591 timing involved in the over-clocking flow (Wait times between writes from PMC to ICC registers when executing BCLK slow ramp flow)<br>***Note:*** Encodings are all min timings. |
| 29 | 0x0<br>RW | **Allow 24MHz Crystal Oscillator Shutdown (ALLOW_24_OSC_SD):**<br>When this bit is '0', the 24MHz crystal oscillator will always be running while in S0.<br>When this bit is '1', the 24MHz crystal oscillator may be shut down in S0 (Cx only) if all other conditions allow. |
| 28 | 0x0<br>RW | **Time Sync Maximum Attempts (TS_MAXTRY):** The value of this bit determines how many times the PMC will retry time synchronization before stopping and reporting failure to the initiator.<br>Encoding:<br>• 0 Maximum of 5 attempts<br>• 1 Maximum of 10 attempts |
| 27 | 0x0<br>RW/L | **Debug Mode Lock (DBG_MODE_LOCK):** When this bit is set to '1', the following bit is locked down<br>• ETR3.SKIP_HOST_RST_HS<br>• ETR3.RST_SX_TO_DBG<br>• ETR3.PSMI_DGB_MODE_EN<br>This bit becomes locked when a value of 1b is written to it. Writes to 0 to this bit are always ignored. Once locked, the only way the bit gets cleared is through a PLTRST# assertion. |
| 26:24 | 0x0<br>RO | **Reserved (RSVD_26_24):** Reserved. |
| 23 | 0x0<br>RW | **Enable Global Reset on Uncorrectable Parity Error on PMC SRAM Interface (EN_PMC_UNC_ERR):** If this bit is set to '1', a global reset is triggered when a parity error is detected on PMC's SRAM interfaces.<br>No action is taken on such parity errors if this bit is '0'. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active. |
| 22 | 0x0<br>RO | **Reserved (RSVD_22):** Reserved. |
| 21 | 0x0<br>RW | **RTC Wake from DeepSx Disable (RTC_DSX_WAKE_DIS):** When set, this bit disables RTC wakes from waking the system from DeepSx. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active. |
| 20 | 0x0<br>RO | **Reserved (RSVD_20):** Reserved. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 19:18 | 0x0<br>RW/L | **SLP_SUS# Minimum Assertion Width (SLP_SUS_MIN_ASST_WDTH):** This 2-bit value indicates the minimum assertion width of the SLP_SUS# signal to guarantee that the SUS well power supplies have been fully power-cycled.<br>This value may be modified per platform depending on power supply capacitance, board capacitance, power failure detection circuits, etc.<br>Settings are:<br>• 00 = 0 ms (i.e. stretching disabled - default)<br>• 01 = 500ms<br>• 10 = 1s<br>• 11 = 4s<br>This field is not writable when the SLP_Sx# Stretching Policy Lock- Down bit is set.<br>This field is ignored when exiting a G3 state if the "Disable SLP_X Stretching After SUS Power Failure" bit is set. Note that unlike with all other SLP_* pin stretching, this disable bit only impacts SLP_SUS# stretching during G3 exit rather than both G3 and DeepSx exit. SLP_SUS# stretching always applies to DeepSx regardless of the disable bit.<br>**Programming Note:** For platforms that enable DeepSx, BIOS must program SLP_SUS# stretching to be greater than or equal to the largest stretching value on any other SLP_* pin (SLP_S3#, SLP_S4#, SLP_LAN#, or SLP_A#).<br>This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active. |
| 17:16 | 0x0<br>RW/L | **SLP_A# Minimum Assertion Width (SLP_A_MIN_ASST_WDTH):** This 2-bit value indicates the minimum assertion width of the SLP_A# signal to guarantee that the ASW power supplies have been fully power-cycled.<br>This value may be modified per platform depending on power supply capacitance, board capacitance, power failure detection circuits, etc.<br>Settings are:<br>00 = 0 ms (i.e. stretching disabled - default)<br>01 = 4 s<br>10 = 98 ms<br>11 = 2 s<br>This field is not writable when the SLP_Sx# Stretching Policy Lock- Down bit is set.<br>This field is ignored when exiting a G3 or DeepSx state if the "Disable SLP_X Stretching After SUS Power Failure" bit is set.<br>This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active. |
| 15:14 | 0x0<br>RW/L | **SLP_LAN# Minimum Assertion Width (SLP_LAN_MIN_ASST_WDTH):** This 2-bit value indicates the minimum assertion width of the SLP_LAN# signal to guarantee that the power to the PHY has been fully power-cycled.<br>This value may be modified per platform depending on power supply, capacitance, board capacitance, power failure detection circuits, etc.<br>This field is not writable when the SLP_Sx# Stretching Policy Lock Down bit is set to '1'. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active. |
| 13 | 0x0<br>RW | **After G3 Last State Enable (AG3_LS_EN):** When GEN_PMCON_B.AG3E is 0, AG3_LS_EN determines whether the SoC will consider the platforms previous state when determining whether to power-up after G3. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active.<br>Encodings:<br>• 0 (default): SoC power-up policies after G3 do not depend on the platforms state when the G3 occurred.<br>• 1: SoC power-up policies after G3 depend on the platforms state when the G3 occurred.<br>- If the power failure occurred while the platform was in S0 or while in the process of going to S0, the platform will power-up to S0 upon exiting G3.<br>- If the power failure occurred while the platform was in Sx or while in the process of going to Sx, the platform will stay in S4/S5 upon exiting G3.<br>***Note:*** This bit applies only when GEN_PMCON_B.AG3E is 0. If AG3E is 1, the platform will always stay in S4/S5 after G3 regardless of the value of AG3_LS_EN.<br>***Note:*** The destination state is considered to be S0 during both host wake and throughout host partition resets with/without power cycle. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 12 | 0x0<br>RW | **After Type 8 Global Reset Last State Enable (A8GR_LS_EN):** AGR_LS_EN determines whether the SoC will consider the platforms previous state when determining whether to power-up after non-thermal and non-explicitly requested type 8 global resets. See the Reset Sources table for a list of impacted reset types. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active.<br>Encodings:<br>• 0 (default): SoC power-up policies after a global reset do not depend on the platforms state when the reset occurred.<br>• 1: SoC power-up policies after a global reset depend on the platforms state when the reset occurred.<br>- If the global reset occurred while the platform was in S0 or while in the process of going to S0, the platform will power-up to S0 after the reset.<br>- If the global reset occurred while the platform was in Sx or while in the process of going to Sx, the platform will stay in S5 upon exiting G3.<br>***Note:*** The destination state is considered to be S0 during both host wake and throughout host partition resets with/without power cycle. |
| 11 | 0x0<br>RW | **Global Reset Three Strike Counter Enable (GR_TSC_EN):** When set, GR_TSC_EN will cause the PMC to keep the platform in S5 after the third consecutive type 7 global reset occurs during the boot flow. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active.<br>The three strike counter is reset in the following situations:<br>• The system reaches S0<br>• A type 8 global reset occurs, including after the three strike counter causes the system to stay in S5.<br>• RSMRST_N asserts (due to DeepSx entry or a G3 event occurring) |
| 10 | 0x0<br>RW | **Power Button Debounce Mode (PB_DB_MODE):** This bit controls when interrupts (SMI#, SCI) are generated in response to assertion of the PMU_PWRBTN_N pin. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active.<br>This bit's values cause the following behavior:<br>• '0': The 16ms debounce period applies to all usages of the PMU_PWRBTN_N pin (legacy behavior).<br>• '1': When a falling edge occurs on the PMU_PWRBTN_N pin, an interrupt is generated and the 16ms debounce timer starts. Subsequent interrupts are masked while the debounce timer is running.<br>***Note:*** Power button override logic always samples the post-debounce version of the pin. |
| 9:8 | 0x0<br>RW/L | **Reset Power Cycle Duration (PWR_CYC_DUR):** The value in this register determines the minimum time a platform will stay in reset (SLP_S3#, SLP_S4#, SLP_S5# asserted and also SLP_A# and SLP_LAN# asserted if applicable) during a host partition reset with power cycle or a global reset.<br>The duration programmed in this register takes precedence over the applicable SLP_# stretch timers in these reset scenarios. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active.<br>This field is not writable when the SLP_Sx# Stretching Policy Lock-Down bit is set.<br>Note that the duration programmed in this register should never be smaller than the stretch duration programmed in the following registers<br>• GEN_PMCON_3.SLP_S3_MIN_ASST_WDTH<br>• GEN_PMCON_3.S4MAW<br>• PM_CFG.SLP_A_MIN_ASST_WDTH<br>• PM_CFG.SLP_LAN_MIN_ASST_WDTH |
| 7:6 | 0x0<br>RO | **Reserved (RSVD_7_6):** Reserved. |

| 1:0 | 0x0<br>RW/V | **Timing t581 (TIMING_T581):** This field configures the t581 timing involved in the power down flow (CPUPWRGD inactive to ICC_ICLK_INIT inactive). Encodings (all min timings):<br>• 00: 10 us (default)<br>• 01: 100 us<br>• 10: 1 ms<br>• 11: 10 ms<br>reset_type=host_deep_rst_b |

### 58.3.7 PCH Power Management Status (PCH_PM_STS)—Offset 1Ch

This register contains misc. fields used to record events pertaining to SoC power management. Unless otherwise indicated, all RWC bits are cleared with a write of 1 by software. This register is in multiple power wells and reset domains (see below).

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [PWRMBASE] + 1Ch

**Default:** 00000000h

**PWRMBASE Type:** PCI Configuration Register (Size: 32 bits)
**PWRMBASE Reference:** [B:0, D:31, F:2] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:17 | 0x0<br>RO | **Reserved (RSVD_30_25):** Reserved. |
| 16 | 0x0<br>RW/1C/V | **ADR Reset Status (ADR_RST_STS):** When set to '1', this bit indicates that the Asynchronous DRAM Refresh (ADR) flow was executed during a prior global reset entry. |
| 15:13 | 0x0<br>RW | **BIOS Discovered DDR Speed (SPD_DDR_SPEED):**<br>• 000=DDR 1600<br>• 001=DDR 1867<br>• 010=DDR 2133<br>• 011=DDR 2400<br>• 100=DDR 2666 |
| 12 | 0x0<br>RW | **Equal Speed Enable (EQUAL_SPEED_ENABLE):**<br>• 0= Do not enable SSC PLL relock when SPD_DDR_SPEED = MAX_DDR_SKU<br>• 1= enable SSC PLL relock when SPD_DDR_SPEED = MAX_DDR_SK |

| 0 | 0x0<br>RW/1C/V | **ME Uncorrectable Error Status (ME_UE_STS):** PMC FW sets this bit as an indication that a ME uncorrectable error has been forwarded to PMC FW. |

## 58.3.8 PCH Power Management Status (PCH_PM_STS2)—Offset 24h

This register contains misc. fields used to record events pertaining to SoC power management. Unless otherwise indicated, all RWC bits are cleared with a write of '1' by software.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [PWRMBASE] + 24h

**Default:** 00000000h

**PWRMBASE Type:** PCI Configuration Register (Size: 32 bits)
**PWRMBASE Reference:** [B:0, D:31, F:2] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:21 | 0x0<br>RO | **Reserved (RSVD_31_21):** Reserved. |
| 20:17 | 0x0<br>RO/V | **Current SPD SPEED (CURRENT_SPD_SPEED):**<br>0xxxx = undefined, use max DDR mem config (fuse)<br>• 1000 = DDR1600<br>• 1001 = DDR1866<br>• 1010 = DDR2133<br>• 0000 = DDR2400<br>***Note:*** The value of current SPD SPEED is only updated when the SPD reset is happened. |
| 16 | 0x0<br>RO/V | **SPD_RESET_PCODE:**<br>• 0 = PMC indicates to Pcode that this is not a SPD Reset.<br>• 1 = PMC indicates to Pcode that this is a SPD Reset<br>Set by PMC when SPD Reset is triggered |

| 13 | 0x0<br>RW/1C/V | **ME Host Boot Prep Done Failure (ME_HBPD):** Intel® ME Host Boot Preparation did not complete. |
| 12 | 0x0<br>RW/1C/V | **PINSTOP Acknowledge Failure (PINSTOP_ACK):** The GbE PHY did not respond to the PINSTOP message. |
| 11 | 0x0<br>RW/1C/V | **PSCHS Acknowledge Failure (PSCHS_ACK):** The GbE MAC did not respond to the PSCHS message. |
| 10 | 0x0<br>RW/1C/V | **SMT Reset Acknowledge Failure (SMT_RST_ACK):** One or more SMT controllers did not respond to the Intel® Management Engine bus reset warning. |
| 9 | 0x0<br>RW/1C/V | **EXI State Transition Acknowledge Failure (EXI_STATE_TRANS_ACK):** EXI state transition ACK did not arrive. |
| 8 | 0x0<br>RW/1C/V | **SPI Common Prep Handshake Failure (SPI_HRHS):** The SPI controller did not complete the host partition reset/Sx entry handshake. |
| 7 | 0x0<br>RW/1C/V | **XCK Common Prep Handshake Failure (XCK_HRHS):** The integrated clocking unit did not complete the host partition reset/Sx entry handshake. |
| 6 | 0x0<br>RW/1C/V | **CPU S345/Reset Warn Acknowledge Failure (CPU_S345RW_ACK):** The CPU did not respond to the GO_S345 or RESET_WARN message. |
| 5 | 0x0<br>RW/1C/V | **CPU S1 Acknowledge Failure (CPU_S1_ACK):** The CPU did not respond to the GO_S1_XXX message. |
| 4 | 0x0<br>RW/1C/V | **DMI L23 Entry Failure (DMI_L23):** The DMI interface did not respond to the request to entry L23. |
| 3 | 0x0<br>RW/1C/V | **SMBus Host Reset Handshaking Failure (SMB_SRHS):** The host SMBus controller did not complete the host partition reset handshake. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 2 | 0x0<br>RW/1C/V | **South Port L23 Entry Failure (SP_L23):** The SoC PCI Express ports did not complete the host partition reset/Sx entry handshake. |
| 1 | 0x0<br>RW/1C/V | **XHCI Common Prep Handshake Failure (XHCI_HRHS):** The USB XHCI controller did not complete the host partition reset/Sx entry handshake. |
| 0 | 0x0<br>RW/1C/V | **EVA L23 Entry Failure (EVA_L23):** The EVA did not complete the host partition reset/Sx entry handshake. |

## 58.3.9 ADR Enable (ADR_EN)—Offset F0h

This register contains several enable bits related to the ”Automatic DIMM Self-Refresh” Asynchronous DRAM Refresh (ADR) feature. The default value of each bit is chosen based on the expected usage, but the values are programmable to retain flexibility. See the section on ADR later in chap. 16 for more information. This register is in the CORE power well and is reset by host_prim_rst_b.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [PWRMBASE] + F0h

**Default:** 200F0DE4h

**PWRMBASE Type:** PCI Configuration Register (Size: 32 bits)
**PWRMBASE Reference:** [B:0, D:31, F:2] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:30 | 0x0<br>RO | **Reserved (RSVD_31_30):** Reserved. |
| 29 | 0x1<br>RW | **ADR GPIO Reset Enable (ADR_GPIO_RST_EN):** If this bit is set to '1', a Global Reset will be generated once the internal flush sequence is completed after:<br>• Triggered by the ADR_TRIGGER signal pin (if available in the SoC product SKU).<br>-OR-<br>• Qualified internal events and the following are true:<br>The ADR feature is part of the particular SoC product SKU, and<br>ADR_FEAT_EN (bit 0) is a 1.<br>If this bit is cleared, the active-high ADR_TRIGGER signal pin can still be enabled to affect the internal flush, but on its own, the signal does not trigger a Global Reset.<br>***Note:*** Unlike the other ADR_EN bits in this register, this enable bit is not required to be set to 1 for this source to trigger the warning to the SoC and CPU. This bit only impacts whether or not this source will actually trigger a Global Reset. |
| 28:20 | 0x0<br>RO | **Reserved (RSVD_28_20):** Reserved. |
| 19 | 0x1<br>RW/V | **IE Uncorrectable Error ADR Enable (IE_UERR_ADR_EN):** If this bit is set to '1', the IE uncorrectable SRAM error is included in the ADR feature.<br>***Note:*** The default value for this bit was chosen to be '1' because this reset source is not considered to be time-critical. |
| 18 | 0x1<br>RW/V | **IE Initiated Global Reset ADR Enable (IEGBL_ADR_EN):** If this bit is set to '1', the IE-initiated global reset source is included in the ADR feature.<br>***Note:*** The default value for this bit was chosen to be '1' because this reset source is not considered to be time-critical. |
| 17 | 0x1<br>RW/V | **IE FW Watchdog Timer ADR Enable (IEWDT_ADR_EN):** If this bit is set to '1', the IE firmware watchdog timer global reset source is included in the ADR feature.<br>***Note:*** The default value for this bit was chosen to be '1' because this reset source is not considered to be time-critical. |
| 16 | 0x1<br>RW/V | **IE Initiated Power Button Override ADR Enable (IEPBO_ADR_EN):** If this bit is set to '1', the IE-Initiated Power Button Override Global Reset source is included in the ADR feature.<br>***Note:*** The default value for this bit was chosen to be '1' because this reset source is not considered to be time-critical. |
| 15 | 0x0<br>RO | **Reserved (RSVD_15):** Reserved. |
| 14 | 0x0<br>RW/V | **PMC Parity Error ADR Enable (PMC_PARERR_ADR_EN):** If this bit is set to '1', the PMC SUS RAM Parity Error Global Reset source is included in the ADR feature.<br>***Note:*** The default value for this bit was chosen to be '0' because this reset source is considered to be time-critical. |
| 13 | 0x0<br>RO | **Reserved (RSVD_13):** Reserved. |
| 12 | 0x0<br>RW/V | **SYS_PWROK Failure ADR Enable (SYSPWR_ADR_EN):** If this bit is set to '1', the SYS_PWROK Failure Global Reset source is included in the ADR feature.<br>***Note:*** The default value for this bit was chosen to be '0' because this reset source is considered to be time-critical. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 11 | 0x1<br>RW/V | **ME Uncorrectable Error ADR Enable (ME_UERR_ADR_EN):** If this bit is set to '1', the Intel® ME Uncorrectable SRAM error Global Reset source is included in the ADR feature.<br>***Note:*** Note: The default value for this bit was chosen to be '1' because this reset source is not considered to be time-critical. |
| 10 | 0x1<br>RW/V | **PMC FW Watchdog Timer ADR Enable (PMCWDT_ADR_EN):** If this bit is set to '1', the PMC Firmware Watchdog Timer Global Reset source is included in the ADR feature.<br>***Note:*** The default value for this bit was chosen to be '1' because this reset source is not considered to be time-critical. |
| 9 | 0x0<br>RO | **Reserved (RSVD_9):** Reserved. |
| 8 | 0x1<br>RW/V | **ME-Initiated Global Reset ADR Enable (MEGBL_ADR_EN):** If this bit is set to '1', the ME-initiated Global Reset source is included in the ADR feature.<br>***Note:*** The default value for this bit was chosen to be '1' because this reset source is not considered to be time-critical. |
| 7 | 0x1<br>RW/V | **ME FW Watchdog Timer ADR Enable (MEWDT_ADR_EN):** If this bit is set to '1', the ME Firmware Watchdog Timer Global Reset source is included in the ADR feature.<br>***Note:*** The default value for this bit was chosen to be '1' because this reset source is not considered to be time-critical. |
| 6 | 0x1<br>RW/V | **ME-Initiated Power Button Override ADR Enable (MEPBO_ADR_EN):** If this bit is set to '1', the ME-Initiated Power Button Override Global Reset source is included in the ADR feature.<br>***Note:*** The default value for this bit was chosen to be '1' because this reset source is not considered to be time-critical. |
| 5 | 0x1<br>RW/V | **Power Button Override ADR Enable (PBO_ADR_EN):** If this bit is set to '1', the Power Button Override Global Reset source is included in the ADR feature.<br>***Note:*** The default value for this bit was chosen to be '1' because this reset source is not considered to be time-critical. |
| 4:3 | 0x0<br>RO | **Reserved (RSVD_4_3):** Reserved. |
| 2 | 0x1<br>RW/V | **PMC FW-Initiated Global Reset ADR Enable (PMCGBL_ADR_EN):** If this bit is set to '1', all PMC firmware-initiated Global Reset sources are included in the ADR feature. The specific sources are:<br>- SMBUS slave unconditional power down message<br>• I/O space CF9h write or Shutdown Special-Cycle with the policy set for Global Reset.<br>• Host partition reset entry timeout.<br>• Sx entry timeout.<br>• Any Host partition reset triggered with the "Promote Host Partition Reset to Global Reset" policy bit set to 1.<br>***Note:*** The default value for this bit was chosen to be '1' because any FW-handled global reset source is not considered to be time-critical. |
| 1 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved. |
| 0 | 0x0<br>RW/V | **ADR Feature Enable (ADR_FEAT_EN):** If this bit is a '1' and the SoC product SKU supports ADR, SoC, support for Asynchronous DRAM Refresh is enabled. The other bits in this register determine which individual reset sources are included. |

## 58.3.10 System Time Capture Trigger (SYSTIMCT)—Offset F8h

This register contains bits related to the "Audio Time Capture (ATC)" feature. This register is in the CORE power well and is reset by host_prim_rst_b.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [PWRMBASE] + F8h

**Default:** 00000000h

**PWRMBASE Type:** PCI Configuration Register (Size: 32 bits)
**PWRMBASE Reference:** [B:0, D:31, F:2] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:1 | 0x0<br>RO | **Reserved (RSVD_31_1):** Reserved. |
| 0 | 0x0<br>RW/1S/V | **Capture Now (CAPTURE_NOW):** Write of '1' to this bit triggers time capture in all components supporting this feature.<br>Hardware clears this register to indicate that time capture is complete.<br>Once the bit is set to '1', subsequent writes of '0' or '1' have no effect until the bit is cleared by hardware.<br>Please refer to the Audio Time Synchronization section for more details on Audio Synchronization and for a list of consumers of the "capture" signal from PMC.<br>Implementation note: Once the bit is written to '1'. hardware should keep the "capture" signal asserted high for 16 PMC clocks, then keep the signal deasserted low for another 16 PMC clocks and then clear this register bit. |

## 58.3.11 ACPI Timer Control (ACPI_TMR_CTL)—Offset FCh

This register allows software to disable the ACPI Timer, which could result in power savings for the SoC. This register is in the CORE power well and is reset by host_prim_rst_b.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [PWRMBASE] + FCh

**Default:** 00000000h

**PWRMBASE Type:** PCI Configuration Register (Size: 32 bits)
**PWRMBASE Reference:** [B:0, D:31, F:2] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:2 | 0x0<br>RO | **Reserved (RSVD_31_2):** Reserved. |
| 1 | 0x0<br>RW | **ACPI Timer Disable (ACPI_TIM_DIS):** This bit determines whether the ACPI Timer is enabled to run. Note that even when enabled, the timer only runs during S0.<br>- 0: ACPI Timer is enabled (default)<br>- 1: ACPI Timer is disabled (halted at the current value) |
| 0 | 0x0<br>RW/1S/V | **ACPI Timer Clear (ACPI_TIM_CLR):** Writing a 1 to this bit will clear the ACPI Timer to all 0s. Hardware will automatically clear the bit back to '0' once the timer clear operation has completed. Writing a 0 to this bit has no effect.<br>Implementation Note: The SoC must be capable of honoring this bit even while ACPI_TIM_DIS=1. |

## 58.3.12 GPIO Configuration (GPIO_CFG)—Offset 120h

This register is in the PRIMARY power well and is reset by global_rst_b. reset_type=global_rst_b.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [PWRMBASE] + 120h

**Default:** 00000432h

**PWRMBASE Type:** PCI Configuration Register (Size: 32 bits)
**PWRMBASE Reference:** [B:0, D:31, F:2] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:11 | 0x0<br>RO | **Reserved (RSVD_31_11):** Reserved. |
| 10:8 | 0x4<br>RW | **GPIO Group to GPE_DW2 assignment encoding (GPE0_DW2):** This register assigns a specific GPIO Group to the ACPI GPE0[95:64].<br>• 0h = reserved[7:0] and GPP_A[23:0]<br>• 1h = reserved[7:0] and GPP_B[23:0]<br>• 2h = reserved[7:0] and GPP_C[23:0]<br>• 3h = reserved[7:0] and GPP_D[23:0]<br>• 4h = reserved[7:0] and GPP_E[23:0]<br>• 5h = reserved[7:0] and GPP_F[23:0]<br>• 6h = reserved[23:0] and GPP_G[7:0]<br>• 7h = reserved[20:0] and GPD[11:0] |
| 7 | 0x0<br>RO | **Reserved (RSVD_7):** Reserved. |
| 6:4 | 0x3<br>RW | **GPIO Group to GPE_DW1 assignment encoding (GPE0_DW1):** This register assigns a specific GPIO Group to the ACPI GPE0[63:32].<br>• 0h = reserved[7:0] and GPP_A[23:0]<br>• 1h = reserved[7:0] and GPP_B[23:0]<br>• 2h = reserved[7:0] and GPP_C[23:0]<br>• 3h = reserved[7:0] and GPP_D[23:0]<br>• 4h = reserved[7:0] and GPP_E[23:0]<br>• 5h = reserved[7:0] and GPP_F[23:0]<br>• 6h = reserved[23:0] and GPP_G[7:0]<br>• 7h = reserved[20:0] and GPD[11:0] |
| 3 | 0x0<br>RO | **Reserved (RSVD_3):** Reserved. |
| 2:0 | 0x2<br>RW | **GPIO Group to GPE_DW0 assignment encoding (GPE0_DW0):** This register assigns a specific GPIO Group to the ACPI GPE0[31:0].<br>• 0h = reserved[7:0] and GPP_A[23:0]<br>• 1h = reserved[7:0] and GPP_B[23:0]<br>• 2h = reserved[7:0] and GPP_C[23:0]<br>• 3h = reserved[7:0] and GPP_D[23:0]<br>• 4h = reserved[7:0] and GPP_E[23:0]<br>• 5h = reserved[7:0] and GPP_F[23:0]<br>• 6h = reserved[23:0] and GPP_G[7:0]<br>• 7h = reserved[20:0] and GPD[11:0] |

## 58.3.13 Global Reset Causes (GBLRST_CAUSE0)—Offset 124h

This register logs causes of host partition resets.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [PWRMBASE] + 124h

**Default:** 00000000h

**PWRMBASE Type:** PCI Configuration Register (Size: 32 bits)
**PWRMBASE Reference:** [B:0, D:31, F:2] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:25 | 0x0<br>RO | **Reserved (RSVD_31_25):** Shadow additional HW initiated GBLRST causes once they're added. |
| 24 | 0x0<br>RW/1C/V | **IE HW Uncorrectable Error (IE_UNCOR_ERR):** This bit is set to '1' by hardware when a global reset is triggered by IE hardware due to the detection of an uncorrectable ECC or parity error on a data read from one of its SRAMs. |
| 23 | 0x0<br>RW/1C/V | **IE FW Watchdog Timer (IE_WDT):** This bit is set to '1' by hardware when a global reset is triggered by the second expiration of the IE firmware watchdog timer. |
| 22 | 0x0<br>RW/1C/V | **IE-Initiated Global Reset (IE_GBL):** This bit is set to '1' by hardware when a global reset is triggered by an ME FW write of 1's to both GENCTL.'IE-Partition Reset' and GENCTL.'IE-Initiated Host Reset With Power Cycle' in the same write cycle (this is IE FW's method of requesting a global reset). |
| 21 | 0x0<br>RW/1C/V | **IE-Initiated Power Button Override (IE_PBO):** This bit is set to '1' by hardware when a global reset is triggered by an IE FW write of '1' to GENCTL.'IE-Initiated Power Button Override |
| 20 | 0x0<br>RW/1C/V | **Over-Clocking WDT Expiration In ICC Survivability Mode (OC_WDT_EXP_ICCSURV):** This bit is set to '1 by hardware when a global reset is triggered by the expiration of the over-clocking watchdog timer while running in a mode that has ICC survivability impact (OC_WDT_ICCSURV=1). |
| 19 | 0x0<br>RW/1C/V | **Over-Clocking WDT Expiration In Non-ICC Survivability Mode (OC_WDT_EXP_NO_ICCSURV):** This bit is set to '1 by hardware when a global reset is triggered by the expiration of the over-clocking watchdog timer while running in a mode that does not have ICC survivability impact (OC_WDT_ICCSURV=0). |
| 18 | 0x0<br>RW/1C/V | **ADR GPIO Reset (ADR_GPIO_RST):** This bit is set to '1' by hardware when a global reset is triggered by the assertion of the SoC ADR_TRIGGER signal pin. |
| 17 | 0x0<br>RW/1C/V | **ME HW Uncorrectable Error (ME_UNCOR_ERR):** This bit is set to '1' by hardware when a global reset is triggered by ME hardware due to the detection of an uncorrectable ECC or parity error on a data read from one of its SRAM s. |
| 16 | 0x0<br>RW/1C/V | **CPU Thermal Runaway Watchdog Timer (CPU_THRM_WDT):** This bit is set to '1' by hardware when a global reset is triggered by the expiration of the CPU Thermal Runaway Watchdog Timer. |
| 15:14 | 0x0<br>RW/1C/V | **Reserved (RSVD_15_14):** Reserved. |
| 13 | 0x0<br>RW/1C/V | **AS Well Power Failure (ASW_FLR):** This bit is set to '1' by hardware when a global reset is triggered by an unexpected loss of ASW power (i.e. a deassertion of APWROK at an unexpected time). |
| 12 | 0x0<br>RW/1C/V | **SYS_PWROK Failure (SYSPWR_FLR):** This bit is set to '1' by hardware when a global reset is triggered by an unexpected loss of SYS_PWROK. FW arms this global reset source via GBLRST_CTL.EN_SYSPWR_FLR. This register bit is in the RTC power well and is retained if the system has a functioning RTC battery during the G3 Mechanical Off state. |
| 11 | 0x0<br>RW/1C/V | **PCH_PWROK Failure (PCHPWR_FLR):** This bit is set to '1' by hardware when a global reset is triggered by an unexpected loss of PCH_PWROK. FW arms this global reset source via GBLRST_CTL.EN_PCHPWR_FLR. This register bit is in the RTC power well and is retained if the system has a functioning RTC battery during the G3 Mechanical Off state. |
| 10 | 0x0<br>RW/1C/V | **PMC Firmware Global Reset (PMC_FW):** This bit is set to '1' by hardware when a global reset is triggered by a request from PMC firmware (i.e. a write of '1' to the GBLRST_CTL.TRIG_GBL bit). |
| 9 | 0x0<br>RW/1C/V | **ME Firmware Watchdog Timer (ME_WDT):** This bit is set to '1' by hardware when a global reset is triggered by the second expiration of the ME firmware watchdog timer. |
| 8 | 0x0<br>RW/1C/V | **PMC Firmware Watchdog Timer (PMC_WDT):** This bit is set to '1' by hardware when a global reset is triggered by the second expiration of the PMC firmware watchdog timer. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RW/1C/V | **LTRESET# With Policy 1 (LTRST_POL1):** This bit is set to '1' by hardware when a global reset is triggered by an LTRESET# assertion with LT_E2STS.LT_RESET_POLICY = 1. |
| 6 | 0x0<br>RW/1C/V | **ME-Initiated Global Reset (ME_GBL):** This bit is set to '1' by hardware when a global reset is triggered by an ME FW write of 1's to both GENCTL."ME-Partition Reset" and GENCTL."ME-Initiated Host Reset With Power Cycle" in the same write cycle (this is ME FW's method of requesting a global reset). |
| 5 | 0x0<br>RW/1C/V | **CPU Thermal Trip (CPU_TRIP):** This bit is set to '1' by hardware when a global reset is triggered by a CPU thermal trip event (i.e. an assertion of the THRMTRIP# pin). |
| 4 | 0x0<br>RW/1C/V | **ME-Initiated Power Button Override (ME_PBO):** This bit is set to '1' by hardware when a global reset is triggered by an ME FW write of '1' to GENCTL."ME-Initiated Power Button Override." |
| 3 | 0x0<br>RW/1C/V | **ICH Catastrophic Temperature Event (ICH_CAT_TMP):** This bit is set to '1' by hardware when a global reset is triggered by a catastrophic temperature event from the ICH internal thermal sensor. |
| 2 | 0x0<br>RW/1C/V | **PMC SUS RAM Uncorrectable Error (PMC_UNC_ERR):** This bit is set to '1' by hardware when a global reset is triggered due to an uncorrectable parity error on a data read from one of the PMC SUS well register files. |
| 1 | 0x0<br>RW/1C/V | **Power Button Override (PB_OVR):** This bit is set to '1' by hardware when a global reset is triggered by a power button override (i.e. an assertion of the PMU_PWRBTN_N pin for 5.1 seconds). |
| 0 | 0x0<br>RO | **Reserved (RSVD_0):** Reserved. |

## 58.3.14 Global Reset Causes (GBLRST_CAUSE1)—Offset 128h

This register logs causes of host partition resets.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [PWRMBASE] + 128h

**Default:** 00000000h

**PWRMBASE Type:** PCI Configuration Register (Size: 32 bits)
**PWRMBASE Reference:** [B:0, D:31, F:2] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:6 | 0x0<br>RO | **Reserved (RSVD_31_6):** Reserved. |
| 5 | 0x0<br>RW/1C/V | **ME Set Power Button Status (ME_SET_PBO_STS):** If this bit is set, the cause of the previous global reset was ME FW setting the power button override status. |
| 4 | 0x0<br>RO | **Reserved (RSVD_4):** Reserved. |
| 3 | 0x0<br>RW/1C/V | **Host SMBus Message (HSMB_MSG):** If this bit is set, the cause of the previous global reset was a global reset request received over the host SMBus interface. |
| 2 | 0x0<br>RW/1C/V | **Host Partition Reset Promotion (HOST_RST_PROM):** If this bit is set, the cause of the previous global reset was a host partition reset that was promoted to a global reset either due to ME or host policy. |
| 1 | 0x0<br>RW/1C/V | **Sx Entry Timeout (SX_ENTRY_TIMEOUT):** If this bit is set, the cause of the previous global reset was an expiration of the timer that runs during Sx entry. |
| 0 | 0x0<br>RW/1C/V | **Host Partition Reset Timeout (HOST_RESET_TIMEOUT):** If this bit is set, the cause of the previous global reset was an expiration of the timer that runs during host partition resets. |

## 58.3.15 Host Partition Reset Causes (HPR_CAUSE0)—Offset 12Ch

This register logs causes of host partition resets.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [PWRMBASE] + 12Ch

**Default:** 00000000h

**PWRMBASE Type:** PCI Configuration Register (Size: 32 bits)
**PWRMBASE Reference:** [B:0, D:31, F:2] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:19 | 0x0<br>RO | **Reserved (RSVD_31_19):** Reserved. |
| 18 | 0x0<br>RO/V | **IE Initiated Host Reset With Power Down (IE_HRPD):** IE initiated host reset with power down |
| 17 | 0x0<br>RO/V | **IE Initiated Host Reset With Power Cycle (IE_HRPC):** IE initiated host reset with power cycle. |
| 16 | 0x0<br>RO/V | **IE Initiated Host Rest Without Power Cycle (IE_HR):** IE initiated host reset without power cycle. |
| 15 | 0x0<br>RO | **Reserved (RSVD_15):** Reserved. |
| 14 | 0x0<br>RO/V | **LT Sleep Error (LT_SLPERR):** Sleep entry attempted while LT secrets were present in memory. |
| 13 | 0x0<br>RO/V | **Host SMBUS Host Reset With Power Cycle (HSMB_HRPC):** SMBus initiated host partition reset with power cycle. |
| 12 | 0x0<br>RO/V | **Host SMBUS Host Reset Without Power Cycle (HSMB_HR):** SMBus initiated host partition reset without power cycle. |
| 11 | 0x0<br>RO | **Reserved (RSVD_11_11):** Reserved. |
| 10 | 0x0<br>RO/V | **ME-Initiated Host Reset With Power Down (MI_HRPD):** Intel® ME initiated host reset with power down. |
| 9 | 0x0<br>RO/V | **ME-Initiated Host Reset With Power Cycle (MI_HRPC):** Intel® ME initiated host reset with power cycle. |
| 8 | 0x0<br>RO/V | **ME-Initiated Host Reset Without Power Cycle (MI_HR):** Intel® ME initiated host reset without power cycle. |
| 7 | 0x0<br>RO | **Reserved (RSVD_7):** Reserved. |
| 6 | 0x0<br>RO/V | **Host TCO Watchdog Timer Second Expiration (TCO_WDT):** Host TCO watchdog timer reached zero for the second time. |
| 5:4 | 0x0<br>RO | **Reserved (RSVD_5_4):** Reserved. |
| 3 | 0x0<br>RO/V | **LTRESET (LTRST):** LTRESET message received and the LT.RESET.POLICY bit = '0'. |
| 2 | 0x0<br>RO/V | |
| 1 | 0x0<br>RO/V | **Write to CF9 (CF9_ES):** This bit will be set when Host software writes a value of 6h or Eh to the CF9h register in Host I/O Space.<br>***Note:*** The "shutdown" special cycle from the CPU will also set this bit. |
| 0 | 0x0<br>RO | **Reserved (RSVD_0):** Reserved. |

## 58.3.16 modPHY Power Management Configuration Reg 1 (MODPHY_PM_CFG1)—Offset 200h

This register contains misc. fields used to configure the SoC power management behavior with respect to the modPHY.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [PWRMBASE] + 200h

**Default:** 0000FFFFh

**PWRMBASE Type:** PCI Configuration Register (Size: 32 bits)
**PWRMBASE Reference:** [B:0, D:31, F:2] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW | **ModPHY Lane S0 SUS Well Power Gating Policy [15:0] (MLS0SWPGP):** This is a bit per lane that controls SUS Well Power Gating for a ModPHY lane to be used for S0 and S0ix use models as described above in HAS.<br>• Bit 0: Corresponds to ModPHY Lane 0<br>• Bit 1: Corresponds to ModPHY Lane 1<br>• Bit 2: Corresponds to ModPHY Lane 2<br>:<br>:<br>Bit 15: Corresponds to ModPHY Lane 15<br>For each lane:<br>• 0: Lane power gating not permitted in S0.<br>• 1: Lane power gating is permitted in S0.<br>Note that strap information/PCIe Lane reversal information will be factored by BIOS when programming these bits in the configuration registers.<br>Note that it is illegal SW programming to have a bit location to be 1 in this field and the corresponding bit position to be 0 in MLSXSWPGP |
| 15:0 | 0xffff<br>RW | • **ModPHY Lane Sx SUS Well Power Gating Policy [15:0] (MLSXSWPGP):** This is a bit per lane that controls SUS Well Power Gating for a ModPHY lane when system is in Sx.<br>• Bit 0: Corresponds to ModPHY Lane 0<br>• Bit 1: Corresponds to ModPHY Lane 1<br>• Bit 2: Corresponds to ModPHY Lane 2<br>:<br>:<br>Bit 15: Corresponds to ModPHY Lane 15<br>For each lane:<br>• 0: Lane power gating not permitted in Sx.<br>• 1: Lane power gating is permitted in Sx.<br>Note that strap information/PCIe Lane reversal information will be factored by BIOS when programming these bits in the configuration registers.<br>For ease of PMC implementation, this field will be used to manage Sx policies even in S0. In other words, the earlier restriction that BIOS does not have to program this field if MLSPDDGE is 1 does not apply any more.<br>BIOS shall set this field appropriately for all cases. |

## 58.3.17 modPHY Power Management Configuration Reg 2 (MODPHY_PM_CFG2)—Offset 204h

This register contains misc. fields used to configure the SoC power management behavior with respect to the modPHY.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [PWRMBASE] + 204h

**Default:** 05000000h

**PWRMBASE Type:** PCI Configuration Register (Size: 32 bits)
**PWRMBASE Reference:** [B:0, D:31, F:2] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **Gen2PLL Request Control (G2PLLREQCTL):** This bit controls how PMC should treat Gen2PLL power request for ModPHY power gating flows.<br>• 0 - PMC should treat Gen2PLL request as non restore power request<br>• 1 - PMC should treat Gen2PLL request as restore power request |
| 30 | 0x0<br>RW | **ModPHY Lane SUS Power Domain Dynamic Gating Enable (MLSPDDGE):**<br>When this bit is set to 1, ModPHY Lane SUS Well Dynamic Gating is enabled.<br>ModPHY lane SPD is managed using the variables defined by the PMC.<br>When this bit is 0, ModPHY Lane SUS Well Gating can still be done at a more coarse level using MLSXSWPGP and MLS0SWPGP fields. |
| 29 | 0x0<br>RW | **Enable ModPHY FET Control (EMFC):** This bit enables PMC dynamic control of ModPHY external FET.<br>When this bit is 0 and MLSPDDGE is 1, PMC goes through all of the ModPHY power gating flows except that the external FET is not turned off.<br>This bit is being provided primarily to prevent External FET gating during EXI debug |
| 28:24 | 0x5<br>RW/L | **External FET Ramp Time (EFRT):** This field defines the ramp time of ModPHY FET.<br>• 00000b: 00us<br>• 00001b: 20us<br>• 00010b: 40us<br>• ...<br>• 00101b: 100us<br>• ...<br>• 11111b: 620us<br>This bit is locked while PM_SYNC_MISC_CFG.PM_SYNC_LOCK = '1' |
| 23:20 | 0x0<br>RO | **Reserved (RSVD_23_20):** Reserved. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 19:0 | 0x0<br>RW | **ASL Over-rides [19:0] (ASLOR):** This field provides ASL code to take over SPD power gating control.<br>If ASL code sets a bit corresponding to a controller, it implies that PMC shall ignore any other inputs from that controller and assume that the controller is ready for SPD power gating.<br>0 in a bit position: Use HW interfaces for the controller to manage SPD gating/wake-up.<br>1 in a bit position: Ignore HW interfaces for the controller, rely only on MSPDRTReq field thats managed by ASL code.<br>• Bit 0: Corresponds to PCIe Controller A, Function 0<br>• Bit 1: Corresponds to PCIe Controller A, Function 1<br>• Bit 2: Corresponds to PCIe Controller A, Function 2<br>• Bit 3: Corresponds to PCIe Controller A, Function 3<br>• Bit 4: Corresponds to PCIe Controller B, Function 0<br>• Bit 5: Corresponds to PCIe Controller B, Function 1<br>• Bit 6: Corresponds to PCIe Controller B, Function 2<br>• Bit 7: Corresponds to PCIe Controller B, Function 3<br>• Bit 8: Corresponds to PCIe Controller C, Function 0<br>• Bit 9: Corresponds to PCIe Controller C, Function 1<br>• Bit 10: Corresponds to PCIe Controller C, Function 2<br>• Bit 11: Corresponds to PCIe Controller C, Function 3<br>• Bit 12: Corresponds to SATA Controller<br>• Bit 13: Corresponds to Gbe Controller<br>• Bit 14: Corresponds to xHCI Controller<br>• Bit 15: Corresponds to xDCI Controller<br>• Bit 16: Corresponds to UFS Controller<br>• Bits[19:17]: Reserved<br>This field is going to be used in conjunction with MSPDRTReq and MSPDRTRAck fields above. If ASL code intends to over-ride HW decisions, it will set the corresponding bit for a controller/function to 1 in ASLOR and use MSPDRTReq bits to power-up/power-down SPD. |

## 58.3.18 modPHY Power Management Configuration Reg 3 (MODPHY_PM_CFG3)—Offset 208h

This register contains misc. fields used to configure the SoC power management behavior with respect to the modPHY.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [PWRMBASE] + 208h

**Default:** 00000000h

**PWRMBASE Type:** PCI Configuration Register (Size: 32 bits)
**PWRMBASE Reference:** [B:0, D:31, F:2] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:20 | 0x0<br>RO | **Reserved (RSVD_31_20):** Reserved. |
| 19:0 | 0x0<br>RW | **Controller SPD RTD3 Request [19:0] (MSPDRTREQ):** This field represents ASL code trigger request for ModPHY SPD gating.<br>If this bit is set (to 1) for a controller, it implies that ASL code provides consent for SPD to be gated for the corresponding controllers lanes.<br>Note that this bit could also be more statically used by BIOS to set this to 1 for a controller where SPD will only be managed through other interfaces implying ASL code does not exist for a controller.<br>This is not a POR mode of operation if a function is enabled ASL code will exist for all controllers that are enabled. However, the controllers that are not enabled (Function Disabled), this field will be statically set by BIOS to activate ASL component in SPD gating equations.<br>• Bit 0: Corresponds to PCIe Controller A, Function 0<br>• Bit 1: Corresponds to PCIe Controller A, Function 1<br>• Bit 2: Corresponds to PCIe Controller A, Function 2<br>• Bit 3: Corresponds to PCIe Controller A, Function 3<br>• Bit 4: Corresponds to PCIe Controller B, Function 0<br>• Bit 5: Corresponds to PCIe Controller B, Function 1<br>• Bit 6: Corresponds to PCIe Controller B, Function 2<br>• Bit 7: Corresponds to PCIe Controller B, Function 3<br>• Bit 8: Corresponds to PCIe Controller C, Function 0<br>• Bit 9: Corresponds to PCIe Controller C, Function 1<br>• Bit 10: Corresponds to PCIe Controller C, Function 2<br>• Bit 11: Corresponds to PCIe Controller C, Function 3<br>• Bit 12: Corresponds to SATA Controller<br>• Bit 13: Corresponds to Gbe Controller<br>• Bit 14: Corresponds to xHCI Controller<br>• Bit 15: Corresponds to xDCI Controller<br>• Bit 16: Corresponds to UFS Controller<br>• Bits[19:17]: Reserved |

## 58.3.19 modPHY Power Management Configuration Reg 4 (MODPHY_PM_CFG4)—Offset 20Ch

This register contains misc. fields used to configure the SoC power management behavior with respect to the modPHY.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [PWRMBASE] + 20Ch

**Default:** 00000000h

**PWRMBASE Type:** PCI Configuration Register (Size: 32 bits)
**PWRMBASE Reference:** [B:0, D:31, F:2] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:20 | 0x0<br>RO | **Reserved (RSVD_31_20):** Reserved. |
| 19:0 | 0x0<br>RO/V | **Controller SPD RTD3 Request Acknowledge [19:0] (MSPDRTRACK):** This field represents the acknowledge for ASL code trigger request for ModPHY SPD gating.<br>PMC sets a bit in this field to 1 to acknowledge that it has registered the corresponding MSPDRTREQ. Note that the action of setting this bit to 1 is immediate no other gating conditions are involved in this. Actual SPD shutdown may happen later once other power gating conditions have been satisfied as well.<br>PMC clears a bit to 0 in this field once the corresponding MSPTDRTREQ is cleared by the ASL code and SPD state has been fully restored.<br>• Bit 0: Corresponds to PCIe Controller A, Function 0<br>• Bit 1: Corresponds to PCIe Controller A, Function 1<br>• Bit 2: Corresponds to PCIe Controller A, Function 2<br>• Bit 3: Corresponds to PCIe Controller A, Function 3<br>• Bit 4: Corresponds to PCIe Controller B, Function 0<br>• Bit 5: Corresponds to PCIe Controller B, Function 1<br>• Bit 6: Corresponds to PCIe Controller B, Function 2<br>• Bit 7: Corresponds to PCIe Controller B, Function 3<br>• Bit 8: Corresponds to PCIe Controller C, Function 0<br>• Bit 9: Corresponds to PCIe Controller C, Function 1<br>• Bit 10: Corresponds to PCIe Controller C, Function 2<br>• Bit 11: Corresponds to PCIe Controller C, Function 3<br>• Bit 12: Corresponds to SATA Controller<br>• Bit 13: Corresponds to Gbe Controller<br>• Bit 14: Corresponds to xHCI Controller<br>• Bit 15: Corresponds to xDCI Controller<br>• Bit 16: Corresponds to UFS Controller<br>• Bits[19:17]: Reserved |

## 58.3.20 IE_STS (IE_STS)—Offset 3F0h

This register contains misc fields used to record events pertaining to the Innovation Engine (IE) status. This is shadowed from PMC XRAM IEPMMISC register.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [PWRMBASE] + 3F0h

**Default:** 00000000h

**PWRMBASE Type:** PCI Configuration Register (Size: 32 bits)
**PWRMBASE Reference:** [B:0, D:31, F:2] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RO/V | **Shadowed IEPMMISC[31:24] (SHAD_IEPMMISC_31_24):** Shadowed from PMC_XRAM_IEPMMISC |
| 23 | 0x0<br>RO/V | **Shadowed IEPMMISC[23] (SHAD_IEPMMISC):** Shadowed IEPMMISC[23] |
| 22 | 0x0<br>RO/V | **Shadowed Bios Authentication Result (SHAD_IE_BIOS_AUTH):** Written by IE OEM FW after it attempts to authenticate BIOS image.<br>• 0 = BIOS authentication failed<br>• 1 = BIOS authentication succeeded<br>***Note:*** This field is made available to OEM FW for its use. |
| 21 | 0x0<br>RO/V | **Shadowed FW Authentication Result (SHAD_IE_FW_AUTH):**<br>• 0 = IE FW authentication failed<br>• 1 = IE FW authentication succeeded |
| 20 | 0x0<br>RO/V | **Shadowed IE Hash Valid Fuse (SHAD_IE_HASHVALID_FUSE):** Written by IE ROM. Shadows the IE_HASHVALID_FUSE (OEM IFP) pulled by IE.<br>• 0 = use debug Hash<br>• 1 = use OEM Hash<br>FYI to ME FW and BIOS. |
| 19 | 0x0<br>RO/V | **Shadowed IE Locked (SHAD_IE_LOCKED):** Written by IE ROM. Shadows the IE_EOM_FUSE (OEM IFP) pulled by IE.<br>• 0 = OEM in manufacturing (default)<br>• 1 = OEM End-of-Manufacturing<br>FYI to ME FW and BIOS. |
| 18 | 0x0<br>RO/V | **Shadowed IE Verified Policy Fuse (SHAD_IE_VBPOLICY_FUSE):** Shadowed from PCI MMR_IE_STS |
| 17 | 0x0<br>RO/V | **Shadowed IE Disable Strap (SHAD_IE_DISABLE_STRAP):** Written by IE ROM. Shadows the IE_DISABLE_STRAP (soft strap) pulled by IE. FYI to ME FW and BIOS. |
| 16 | 0x0<br>RO/V | **Shadowed IE Policy Done (SHAD_IE_POLICY_DONE):** Set by IE ROM after it has set IE_DIS_HOST_WAK_SUS. This bit is a handshake from IE ROM to PMC FW.<br>• 1) PMC FW should treat IE_POLICY_DONE (IE) similar to PATCH_DONE (Intel® ME): both are used as handshakes; the reset sequence will pause until set. Also both conditions have (chicken-out) PMC timers that, upon expiration, will cause reset to proceed regardless of the handshake.<br>• 2) PMC FW should use IE_POLICY_DONE handshake to comprehend IE_DIS_HOST_WAK_SUS, even if S0_COMMIT was already asserted.<br>IE ROM must set IE_DIS_HOST_WAK_SUS (to prevent boot if VB fails).<br>***Note:*** See description of PPS.S0_COMMIT and GENCTL.DIS_HOST_WAK_SUS for more details. |
| 15:9 | 0x0<br>RO/V | **Shadowed IE_STS[15:9] (SHAD_IE_STS_15_9):** Shadowed from PMC XRAM IEPMMISC |
| 8 | 0x0<br>RO/V | **Shadowed IE_CIOFF_STS (SHAD_IE_CIOFF_STS):** Shadows IE_CIOFF_STS bit in XRAM space, which is controlled by PMC FW and set when CI0-)CIoff is completed.<br>BIOS shall poll this bit, after requesting CI0-)Cioff (indicated by IE_CIOFF_REQ). Once set BIOS should re-enumerate to remove IE devices and handoff to O/S.<br>O/S-discovered devices should be persistent. |
| 7:2 | 0x0<br>RO/V | **Shadowed IE_STS[7:2] (SHAD_IE_STS_7_2):** Shadowed from PMC XRAM IEPMMISC |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 1:0 | 0x0<br>RO/V | **Shadowed IE_STS[1:0] (SHAD_IE_STS_1_0):** Shadowed from PMC XRAM IEPMMISC |

## 58.3.21 ME_STS (ME_STS)—Offset 3F4h

This register contains misc. fields used to record events pertaining to the Intel® Management Engine status. This is shadowed from PMC XRAM MEPMMISC register.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [PWRMBASE] + 3F4h

**Default:** 00000000h

**PWRMBASE Type:** PCI Configuration Register (Size: 32 bits)
**PWRMBASE Reference:** [B:0, D:31, F:2] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **Reserved (RSVD_31_16):** Reserved. |
| 15:9 | 0x0<br>RO/V | **Shadowed ME_STS[15:9] (SHAD_ME_STS_15_9):** Shadowed from PMC_XRAM MEPMMISC[15:9] |
| 8 | 0x0<br>RO/V | **Shadowed ME_CMOFF_STS (SHAD_ME_CMOFF_STS):** Shadows ME_CMOFF_STS in XRAM space, which is controlled by PMC FW and set when CM0-)CMoff is completed.<br>BIOS shall poll this bit, after requesting CM0-)CMoff (indicated by IE_CMOFF_REQ). Once set BIOS should re-enumerate to remove ME devices and handoff to O/S.<br>Why? O/S-discovered devices should be persistent.<br>Shadowed from PMC XRAM MEPMMISC[8] |
| 7:0 | 0x0<br>RO/V | **Shadowed ME_STS[7:0] (SHAD_ME_STS_7_0):** Shadowed from PMC_XRAM MEPMMISC[7:0] |

## 58.3.22 Static PG Related Function Disable Register 1 (ST_PG_FDIS_PMC_1)—Offset 620h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [PWRMBASE] + 620h

**PWRMBASE Type:** PCI Configuration Register (Size: 32 bits)
**PWRMBASE Reference:** [B:0, D:31, F:2] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW/L | **Static Function Disable Lock (ST_FDIS_LK):** Lock control for all ST_PG_FDIS_PMC_* and NST_PG_FDIS_* registers (also self-locks when written to 1). |
| 30:13 | 0x0<br>RO | **Reserved (RSVD_30_13):** Reserved. |
| 12 | 0x0<br>RW/L | **EXI Function Disable (PMC Version) (EXI_FDIS_PMC):** BIOS is required to set this bit when EXI function is configured to be function disabled. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active. |
| 11 | 0x0<br>RW/L | **NPK Function Disable (PMC Version) (NPK_FDIS_PMC):** BIOS is required to set this bit when NPK function is configured to be function disabled. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active. |
| 10 | 0x0<br>RW/L | **IE Function Disable (PMC Version) (IE_FDIS_PMC):** BIOS is required to set this bit when IE function is configured to be function disabled. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active. |
| 9 | 0x0<br>RW/L | **ME Function Disable (PMC Version) (ME_FDIS_PMC):** BIOS is required to set this bit when ME function is configured to be function disabled. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active. |
| 8 | 0x0<br>RW/L | **XHCI Function Disable (PMC Version) (XHCI_FDIS_PMC):** BIOS is required to set this bit when XHCI function is configured to be function disabled. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active. |
| 7 | 0x0<br>RW/L | **eMMC (SCC) Function Disable (PMC Version) (EMMC_FDIS_PMC):** BIOS is required to set this bit when eMMC function is configured to be function disabled. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active. |
| 6 | 0x0<br>RW/L | **nCPM Function Disable (PMC Version) (NCPM_FDIS_PMC):** BIOS is required to set this bit when Intel® QuickAssist Technology function is configured to be function disabled. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active. |
| 5 | 0x0<br>RW/L | **PCIE1 Function Disable (PMC Version) (PCIE1_FDIS_PMC):** BIOS is required to set this bit when PCIE Ctrl 1 function is configured to be function disabled. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active. |
| 4 | 0x0<br>RW/L | **PCIE0 Function Disable (PMC Version) (PCIE0_FDIS_PMC):** BIOS is required to set this bit when PCIE Ctrl 0 function is configured to be function disabled. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active. |
| 3 | 0x0<br>RW/L | **SATA1 Function Disable (PMC Version) (SATA1_FDIS_PMC):** BIOS is required to set this bit when SATA Ctrl 1 function is configured to be function disabled. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active. |
| 2 | 0x0<br>RW/L | **SATA0 Function Disable (PMC Version) (SATA0_FDIS_PMC):** BIOS is required to set this bit when SATA Ctrl 0 function is configured to be function disabled. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active. |
| 1 | 0x0<br>RW/L | **GBE1 Function Disable (PMC Version) (GBE1_FDIS_PMC):** BIOS is required to set this bit when GBE Ctrl 1 function is configured to be function disabled. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active. |
| 0 | 0x0<br>RW/L | **GBE0 Function Disable (PMC Version) (GBE0_FDIS_PMC):** BIOS is required to set this bit when GBE Ctrl 0 function is configured to be function disabled. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active. |

## 58.3.23 Non-Static PG Related Function Disable Register 1 (NST_PG_FDIS_1)—Offset 628h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [PWRMBASE] + 628h

**Default:** 00000000h

**PWRMBASE Type:** PCI Configuration Register (Size: 32 bits)
**PWRMBASE Reference:** [B:0, D:31, F:2] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:4 | 0x0<br>RO | **Reserved (RSVD_31_4):** Reserved. |
| 3:0 | 0x0<br>RW | **LAN port disable control bits (LAN_PORT_DISABLE):** Host disable of the LAN ports, LAN_PORT_DISABLE[3:0] = Odem1[1:0] + Odem0[1:0] |

## 58.3.24 Non-Static PG Fuse Disable Read 1 Register (N_STPG_FUSE_SS_DIS_RD_1)—Offset 640h

This register contains fuse disable based information - which is not used for static power gating (this information is provided only for host/BIOS read access).

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [PWRMBASE] + 640h

**Default:** 00000000h

**PWRMBASE Type:** PCI Configuration Register (Size: 32 bits)
**PWRMBASE Reference:** [B:0, D:31, F:2] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:4 | 0x0<br>RO | **Reserved (RSVD_31_4):** Reserved. |
| 3:0 | 0x0<br>RO/V | **LAN port Disable status (LAN_PORT_DISABLE_STATUS):** Result of all fuses and straps and control bits of the LAN port disable, LAN_PORT_DISABLE_STATUS[3:0] = Odem1[1:0] + Odem0[1:0] |

## 58.3.25 Static PG Fuse and Soft Strap Disable Read Register 2 (STPG_FUSE_SS_DIS_RD_2)—Offset 644h

This register contains fuse and soft strap disable based information - all of which is used for static power-gating (for example, if a bit is set in this register for a particular IP, PMC keeps that IP in a power-gated state - except as noted below.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [PWRMBASE] + 644h

**Default:** 00000000h

**PWRMBASE Type:** PCI Configuration Register (Size: 32 bits)
**PWRMBASE Reference:** [B:0, D:31, F:2] + 48h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **Reserved (RSVD_31_16):** Reserved. |
| 15 | 0x0<br>RO/V | **Intel® Management Engine (Intel® ME) Fuse or Soft Strap Disable (ME_FUSE_SS_DIS):** RO bit indicating if the Intel® Management Engine function is disabled through fuse/soft strap. |
| 14 | 0x0<br>RO/V | **Innovation Engine Fuse or Soft Strap Disable (IE_FUSE_SS_DIS):** RO bit indicating if Innovation Engine function is disabled through fuse/soft strap. |
| 13 | 0x0<br>RO/V | **USB2 Fuse or Soft Strap Disable (USB2_FUSE_SS_DIS):** RO bit indicating if USB2 function is disabled through fuse/soft strap. |
| 12 | 0x0<br>RO/V | **LPC Fuse or Soft Strap Disable (LPC_FUSE_SS_DIS):** RO bit indicating if LPC function is disabled through fuse/soft strap. |
| 11 | 0x0<br>RO/V | **ESPISPI Fuse or Soft Strap Disable (ESPISPI_FUSE_SS_DIS):** RO bit indicating if ESPISPI function is disabled through fuse/soft strap. |
| 10 | 0x0<br>RO/V | **NPK Fuse or Soft Strap Disable (NPK_FUSE_SS_DIS):** RO bit indicating if NPK function is disabled through fuse/soft strap. |
| 9 | 0x0<br>RO | **Reserved (RSVD_9):** Reserved. |
| 8 | 0x0<br>RO/V | **eMMC Fuse or Soft Strap Disable (EMMC_FUSE_SS_DIS):** RO bit indicating if eMMC (SCC) function is disabled through fuse/soft strap. |
| 7 | 0x0<br>RO/V | **XHCI Fuse or Soft Strap Disable (XHCI_FUSE_SS_DIS):** RO bit indicating if XHCI function is disabled through fuse/soft strap. |
| 6 | 0x0<br>RO/V | **nCPM Fuse or Soft Strap Disable (NCPM_FUSE_SS_DIS):** RO bit indicating if Intel® QuickAssist Technology function is disabled through fuse/soft strap. |
| 5 | 0x0<br>RO/V | **PCIE Ctrl 1 Fuse or Soft Strap Disable (PCIE1_FUSE_SS_DIS):** RO bit indicating if PCIE Ctrl 1 function is disabled through fuse or Soft strap. |
| 4 | 0x0<br>RO/V | **PCIE Ctrl 0 Fuse or Soft Strap Disable (PCIE0_FUSE_SS_DIS):** RO bit indicating if PCIE Ctrl 0 function is disabled through fuse or Soft strap. |
| 3 | 0x0<br>RO/V | **SATA Ctrl 1 Fuse or Soft Strap Disable (SATA1_FUSE_SS_DIS):** RO bit indicating if SATA Ctrl 1 function is disabled through fuse or Soft strap. |
| 2 | 0x0<br>RO/V | **SATA Ctrl 0 Fuse or Soft Strap Disable (SATA0_FUSE_SS_DIS):** RO bit indicating if SATA Ctrl 0 function is disabled through fuse or Soft strap. |
| 1 | 0x0<br>RO/V | **GBE Ctrl 1 Fuse or Soft Strap Disable (GBE1_FUSE_SS_DIS):** RO bit indicating if GBE Ctrl 1 function is disabled through fuse or Soft strap. |
| 0 | 0x0<br>RO/V | **GBE Ctrl 0 Fuse or Soft Strap Disable (GBE0_FUSE_SS_DIS):** RO bit indicating if GBE Ctrl 0 function is disabled through fuse or Soft strap. |

## 58.4 Registers in I/O Space—ABASE

These registers are accessed in Host I/O Space starting at the relocatable I/O address defined by the Base Address Register (BAR) ABASE described in Section 58.2.2, "ACPI Base Address (ABASE)—Offset 40h" on page 2689.

### 58.4.1 Power Management 1 Enables and Status (PM1_EN_STS)—Offset 0h

**Type:** I/O Register
(Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABASE] + 0h

**ABASE Type:** PCI Configuration Register (Size: 32 bits)
**ABASE Reference:** [B:0, D:31, F:2] + 40h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **Reserved (RSVD_31):** Reserved. |
| 30 | 0x0<br>RW | **PCI Express Wake Disable (PCIEXP_WAKE_DIS):** This bit disables the inputs to the PCIEXP_WAKE_STS bit in the PM1 Status register from waking the system.<br>Modification of this bit has no impact on the value of the PCIEXP_WAKE_STS bit. |
| 29:27 | 0x0<br>RO | **Reserved (RSVD_29_27):** Reserved. |
| 26 | 0x0<br>RW/V | **RTC Alarm Enable (RTC_EN):** This is the RTC alarm enable bit. It works in conjunction with the SCI_EN bit. When RTC_STS is set, one of the following happens:<br>• When RTC_EN=0: No SMI# or SCI. If system was in S1-S5, no wake event occurs.<br>• When RTC_EN=1 and SCI_EN = 1: SCI. If system was in S1-S5, then a wake event occurs before the SCI.<br>• When RTC_EN=1 and SCI_EN = 0: SMI#. If system was in S1-S5, then a wake event occurs before the SMI#.<br>This register bit is circuitry in the SoC RTC power well in order to allow an RTC event to wake after a power failure. It is reset only when the active-low SRTCRST_N input signal pin is asserted. |
| 25 | 0x0<br>RO | **Reserved (RSVD_25):** Reserved. |
| 24 | 0x0<br>RW/V | **Power Button Enable (PWRBTN_EN):** This bit is the power button enable. It works in conjunction with the SCI_EN bit. When PWRBTN_STS is set, one of the following happens:<br>• When PWRBTN_EN=0: No SMI# or SCI.<br>• When PWRBTN_EN=1 and SCI_EN = 1: SCI.<br>• When PWRBTN_EN=1 and SCI_EN = 0: SMI#.<br>***Note:*** PWRBTN_EN has no effect on the PWRBTN_STS bit being set by the assertion of the power button. The Power Button is always enabled as a Wake event. |
| 23:22 | 0x0<br>RO | **Reserved (RSVD_23_22):** Reserved. |
| 21 | 0x0<br>RW | **Global Enable (GBL_EN):** The global enable bit. When both the GBL_EN and the GBL_STS are set, the SoC generates an SCI. |
| 20:17 | 0x0<br>RO | **Reserved (RSVD_20_17):** Reserved. |
| 16 | 0x0<br>RW | **Timer Overflow Interrupt Enable (TMROF_EN):** This is the timer overflow interrupt enable bit. It works in conjunction with the SCI_EN bit. When TMROF_STS is set, one of the following happens:<br>• When TMROF_EN=0: No SMI# or SCI.<br>• When TMROF_EN=1 and SCI_EN = 1: SCI.<br>When TMROF_EN=1 and SCI_EN = 0: SMI#. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RW/1C/V | **Wake Status (WAK_STS):** This bit is set when the system is in one of the Sleep states (via the SLP_EN bit) and an enabled SoC Wake event occurs. Upon setting this bit, the SoC will transition the system to the ON state.<br>This bit can only be set by hardware and can only be cleared by writing a one to this bit position.<br>This bit is not affected by hard resets caused by a CF9 write, but is reset by the SoC-internal pri_pwrgood_rst_b signal. |
| 14 | 0x0<br>RW/1C/V | **PCI Express Wake Status (PCIEXP_WAKE_STS):** This bit is set by hardware to indicate that the system woke due to a PCI Express wakeup event.<br>This event can be caused by the PCI Express WAKE# pin being active, or one or more of the PCI Express ports being in beacon state, or receipt of a PCI Express PME message at root port. |
| 13:12 | 0x0<br>RO | **Reserved (RSVD_13_12):** Reserved. |
| 11 | 0x0<br>RW/1C/V | **Power Button Override (PWRBTNOR_STS):** This bit is set when any of these occur:<br>• A Power Button Override Event occurs (i.e., the power button is pressed for at least four consecutive seconds)<br>• The corresponding bit is received in the SMBus slave message<br>• The Intel® ME-Initiated "Power Button Override" bit is set<br>• The Intel® ME-Initiated "Host Reset with Power Down" is set<br>• An internal thermal sensor catastrophic condition occurs<br>These events cause an unconditional transition to the S5 state. |
| 10 | 0x0<br>RW/1C/V | **RTC Status (RTC_STS):** This bit is set when the RTC generates an alarm (assertion of the IRQ8# signal), and is not affected by any other enable bit. See the RTC_EN bit in this register for the effect when RTC_STS goes active. |
| 9 | 0x0<br>RO | **Reserved (RSVD_9):** Reserved. |
| 8 | 0x0<br>RW/1C/V | **Power Button Status (PWRBTN_STS):** This bit is set when the PMU_PWRBTN_N input signal pin is asserted (low), independent of any other enable bit. See the PWRBTN_EN bit in this register for the effect when PWRBTN_STS goes active.<br>PWRBTN_STS is always a wake event. This bit is only set by hardware and can be cleared by software writing a one to this bit position. This bit is not affected by hard resets caused by a CF9 write, but is reset by the SoC internal pwrgood_rst_b. |
| 7:6 | 0x0<br>RO | **Reserved (RSVD_7_6):** Reserved. |
| 5 | 0x0<br>RW/1C/V | **GBL Status (GBL_STS):** This bit is set when an SCI is generated due to the BIOS wanting the attention of the SCI handler. BIOS has a corresponding bit, BIOS_RLS, which will cause an SCI and set this bit. The SCI handler should then clear this bit by writing a 1 to it.<br>This bit will not cause wake events or SMI#.<br>This bit is not affected by SCI_EN. |
| 4 | 0x0<br>RW/1C/V | **Bus Master Status (BM_STS):** This bit is set to 1 by the SoC when a SoC-visible bus master requests access to memory or the BM_BUSY# signal is active. This bit is cleared by the CPU writing a 1 to this bit position. This bit will not cause a wake event, SCI, or SMI. |
| 3:1 | 0x0<br>RO | **Reserved (RSVD_3_1):** Reserved. |
| 0 | 0x0<br>RW/1C/V | **Timer Overflow Status (TMROF_STS):** This is the timer overflow status bit. |

## 58.4.2 Power Management 1 Control —Offset 4h

Usage: ACPI or Legacy. Not lockable. Bits 0-9, 13-31 = Primary Power Well. Bits 10-12 = RTC Power Well.

**Type:** I/O Register (Size: 32 bits)

**BAR and Offset:** [ABASE] + 4h

**Default:** 00000000h

**ABASE Type:** PCI Configuration Register (Size: 32 bits)
**ABASE Reference:** [B:0, D:31, F:2] + 40h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:14 | 0x0<br>RO | **Reserved (RSVD_31_14):** Reserved. |
| 13 | 0x0<br>WO | **Sleep Enable (SLP_EN):** This is a write-only bit and reads to it always return a zero.<br>Setting this bit causes the system to sequence into the Sleep state defined by the SLP_TYP field. |
| 12:10 | 0x0<br>RW | **Sleep Type (SLP_TYP):** This 3-bit field defines the type of Sleep the system should enter when the SLP_EN bit is set to 1. These bits are in the RTC power well and are cleared when the SoC input signal pin SRTCRST_N is active.<br>• 000: Mode = ON, Typical Mapping = S0<br>• 001: Reserved<br>• 010: Reserved<br>• 011: Reserved<br>• 100: Reserved<br>• 101: Reserved<br>• 110: Mode = Suspend-To-Disk, Typical Mapping = S4<br>• 111: Mode = Soft Off, Typical Mapping = S5 |
| 9:3 | 0x0<br>RO | **Reserved (RSVD_9_3):** Reserved. |
| 2 | 0x0<br>WO | **GBL_RLS:** The Global Release bit is used by the ACPI software which writes a '1' to raise an event to the BIOS software.<br>This bit always reads as 0. |
| 1 | 0x0<br>RW | **BM_RLD:** This bit is treated as a scratchpad bit. |
| 0 | 0x0<br>RW | **SCI Enable (SCI_EN):** Selects the SCI interrupt or the SMI# for various events.<br>• 0 = These events will generate an SMI#.<br>• 1 = These events will generate an SCI. |

## 58.4.3 Power Management 1 Timer (PM1_TMR)—Offset 8h

Usage: ACPI. Not lockable. Primary Power Well.

**Type:** I/O Register
(Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABASE] + 8h

**ABASE Type:** PCI Configuration Register (Size: 32 bits)
**ABASE Reference:** [B:0, D:31, F:2] + 40h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RO | **Reserved (RSVD_31_24):** Reserved. Will always read 0. |
| 23:0 | 0x0<br>RO/V | **Timer Value (TMR_VAL):** This read-only field returns the running count of the PM timer.<br>This counter runs off a 3.579545 MHz clock (derived from 14.31818 MHz divided by 4).<br>It is reset (to 0) during a PCI reset, and then continues counting as long as the system is in the S0 state.<br>Anytime bit 22 of the timer goes HIGH to LOW (bits referenced from 0 to 23), the TMROF_STS bit is set. The High-to-Low transition will occur every 2.3435 seconds. Writes to this register have no effect. |

## 58.4.4 SMI Control and Enable (SMI_EN)—Offset 30h

Usage: ACPI or Legacy. Not lockable. Primary Power Well.
This register is symmetrical to the SMI Status Register.

**Type:** I/O Register
(Size: 32 bits)

**BAR and Offset:** [ABASE] + 30h

**Default:** 00000002h

**ABASE Type:** PCI Configuration Register (Size: 32 bits)
**ABASE Reference:** [B:0, D:31, F:2] + 40h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **XHCI SMI Enable (XHCI_SMI_EN):** Software sets this bit to enable XHCI SMI events. |
| 30 | 0x0<br>RW | **ME SMI Enable (ME_SMI_EN):** Software sets this bit to enable Intel® ME SMI# events. |
| 29 | 0x0<br>RW | **LPSS SMI Enable (LPSS_SMI_EN):** Software sets this bit to enable LPSS SMII events. |
| 28 | 0x0<br>RW/L | **Reserved:** Reserved. |
| 27 | 0x0<br>RW/1S | **GPIO Unlock SMI Enable (GPIO_UNLOCK_SMI_EN):** Setting this bit will cause the SoC to generate an SMI# when the GPIO_UNLOCK_SMI_STS bit is set in the SMI_STS register.<br>Once written to '1', this bit can only be cleared by host_prim_rst_b. |
| 26 | 0x0<br>RO | **Reserved (RSVD_26):** Reserved. |
| 25 | 0x0<br>RW | **SCC SMI Enable (SCC_SMI_EN):** Software sets this bit to enable SCC (eMMC) SMI events |
| 24 | 0x0<br>RO | **Reserved (RSVD_24):** Reserved. |
| 23 | 0x0<br>RW | **IE SMI Enable (IE_SMI_EN):** Software sets this bit to enable Innovation Engine (IE) SMI# events. |
| 22:19 | 0x0<br>RO | **Reserved (Rsvd_22_19):** Reserved. |
| 18 | 0x0<br>RW | **IEH (RAS Error Collector) SMI Enable (IEH_SMI_EN):** Software sets this bit to enable Internal Error Handler (IEH) SMI# events. |
| 17 | 0x0<br>RW | **Legacy USB 2 Enable (LEGACY_USB2_EN):** Enables legacy USB 2.0 logic to cause SMI#. |
| 16:15 | 0x0<br>RO | **Reserved (RSVD_16_15):** Reserved. |
| 14 | 0x0<br>RW | **Periodic Enable (PERIODIC_EN):** Setting this bit will cause the SoC to generate an SMI# when the PERIODIC_STS bit is set in the SMI_STS register. |
| 13 | 0x0<br>RW/L | **TCO Enable (TCO_EN):**<br>• 0 = Disables TCO logic generating an SMI#<br>• 1 = Enables the TCO logic to generate SMI#<br>If the NMI2SMI_EN bit is set, then SMI's that are caused by NMI's (i.e. rerouted) will not be gated by the TCO_EN bit. Even if the TCO_EN bit is 0, the NMI's will still be routed to cause the SMI#.<br>This bit can not be written once the TCO_LOCK bit (at offset 08h of TCO I/O Space) is set. This prevents unauthorized software from disabling the generation of TCO-based SMI's |
| 12 | 0x0<br>RO | **Reserved (RSVD_12):** Reserved. |
| 11 | 0x0<br>RW | **MCSMI Enable (MCSMI_EN):** Software sets this bit to 1 to enables the SoC to trap access to the microcontroller range (62h or 66h). |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 10:8 | 0x0<br>RO | **Reserved (RSVD_10_8):** Reserved. |
| 7 | 0x0<br>WO | **BIOS_RLS:** Enables the generation of an SCI interrupt for ACPI software when a '1' is written to this bit position by BIOS software. This bit always reads a zero.<br>GBL_STS being set will cause an SCI, even if the SCI_EN bit is not set. Software must take great care not to set the BIOS_RLS bit (which causes GBL_STS to be set) if the SCI handler is not in place. |
| 6 | 0x0<br>RW | **Software SMI Timer Enable (SWSMI_TMR_EN):** Software sets this bit to a '1' to start the Software SMI# Timer.<br>When the timer expires (depending on the SWSMI_RATE_SEL bits), it will generate an SMI# and set the SWSMI_TMR_STS bit. The SWSMI_TMR_EN bit will remain at 1 until software sets it back to 0.<br>Clearing the SWSMI_TMR_EN bit before the timer expires will reset the timer and the SMI# will not be generated. The default for this bit is 0. |
| 5 | 0x0<br>RW | **APMC Enable (APMC_EN):** If set, this enables writes to the APM_CNT register to cause an SMI# |
| 4 | 0x0<br>RW | **SMI On Sleep Enable (SMI_ON_SLP_EN):** If this bit is set, the SoC will generate an SMI# when a write access attempts to set the SLP_EN bit (in the PM1_CNT register).<br>Furthermore, the SoC will not put the system to a sleep state.<br>It is expected that the SMI# handler will turn off the SMI_ON_SLP_EN bit before actually setting the SLP_EN bit. |
| 3 | 0x0<br>RW | **Legacy USB Enable (LEGACY_USB_EN):** Enables legacy USB circuit to cause SMI#. |
| 2 | 0x0<br>RW | **BIOS Enable (BIOS_EN):** Enables the generation of SMI# when ACPI software writes a '1' to the GBL_RLS bit.<br>***Note:*** If the BIOS_STS bit, which gets set when software writes a 1 to GBL_RLS bit, is already a 1 at the time that BIOS_EN becomes 1, an SMI# will be generated when BIOS_EN gets set. |
| 1 | 0x1<br>RW/1S/V | **End of SMI (EOS):** This bit controls the arbitration of the SMI signal to the processor.<br>This bit must be set in order for the SoC to assert SMI# low to the processor after SMI# has been asserted previously. |
| 0 | 0x0<br>RW/L | **Global SMI Enable (GBL_SMI_EN):** When set, this bit enables the generation of SMIs in the system upon any enabled SMI event.<br>This bit is reset by a PCI reset event. If this bit is not set, no SMI# will be generated.<br>When the SMI_LOCK bit is set, this bit cannot be changed. |

## 58.4.5 SMI Status Register (SMI_STS)—Offset 34h

Usage: ACPI or Legacy. Not lockable. Primary Power Well.
If the corresponding _EN bit is set when the _STS bit is set, the SoC will cause an SMI# (except bits 8-10, which don't cause SMI#).

**Type:** I/O Register
(Size: 32 bits)

**BAR and Offset:** [ABASE] + 34h

**Default:** 00000000h

**ABASE Type:** PCI Configuration Register (Size: 32 bits)
**ABASE Reference:** [B:0, D:31, F:2] + 40h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO/V | **XHCI SMI Status (XHCI_SMI_STS):** This bit will be set when any USB 3.0 (XHCI) Host Controller is requesting an SMI. |
| 30 | 0x0<br>RO/V | **ME SMI Status (ME_SMI_STS):** This bit will be set when the Intel® ME is requesting an SMI#. |
| 29 | 0x0<br>RW/1C/V | **LPSS SMI Status (LPSS_SMI_STS):** This bit gets set when LPSS agent is requesting SMI #.<br>This bit is set by hardware and cleared by software writing a 1 to this bit position |
| 28 | 0x0<br>RO/V | **Reserved:** Reserved. |
| 27 | 0x0<br>RW/1C/V | **GPIO Unlock SMI Status (GPIO_UNLOCK_SMI_STS):** This bit will be set of the GPIO registers lock-down logic is requesting an SMI#. Writing a '1' to this bit position clears this bit to '0'. |
| 26 | 0x0<br>RO/V | **SPI_SMI Status (SPI_SMI_STS):** This bit will be set when the SPI logic is requesting an SMI#.<br>This bit is read only because the sticky status and enable bits associated with this function are located in the SPI registers. |
| 25 | 0x0<br>RW/1C/V | **SCC SMI Status (SCC_SMI_STS):** This bit gets set when SCC agent is requesting SMI#.<br>This bit is set by hardware and cleared by software writing a 1 to this bit position. |
| 24 | 0x0<br>RO | **Reserved (RSVD_24):** Reserved. |
| 23 | 0x0<br>RO/V | **IE SMI Status (IE_SMI_STS):** This bit will be set when the Innovation Engine (IE) is requesting an SMI#. |
| 22 | 0x0<br>RO/V | **INTERNAL_TT Status (INTERNAL_TT_STS):** This bit will be set if the internal thermal throttle mechanism has changed state.<br>This bit is read only because the sticky status and enable bit associated with this function is in the other unit. |
| 21 | 0x0<br>RO/V | **Monitor Status (MONITOR_STS):** This bit will be set if the Trap/SMI logic has caused the SMI.<br>This will occur when the CPU or a bus master accesses an assigned register (or a sequence of accesses). |
| 20 | 0x0<br>RO/V | **PCI_EXP_SMI Status (PCI_EXP_SMI_STS):** 1- PCI Express SMI event occurred.<br>This could be due to a PCI Express PME event or Hot Plug Event. |
| 19 | 0x0<br>RO/V | **RTC Update-In-Progress SMI Status (RTC_UIP_SMI_STS):** This bit will be set when the RTC Update-In-Progress signal transitions either from low-to-high or high-to-low, depending on the enables in the I/O Trap register space. |
| 18 | 0x0<br>RO/V | **IEH Status (IEH_STS) (IEH_SMI_STS):** This non-sticky read-only bit is a logical OR of each of the SMI status bits in the Internal Error Handler (IEH) Support register ANDed with the corresponding enable bits. This bit will not be active if the enable bits are not set. |
| 17 | 0x0<br>RO/V | **Legacy USB 2 Status (LEGACY_USB2_STS):** This non-sticky read-only bit is a logical OR of each of the SMI status bits in the USB 2.0 Legacy Support Register ANDed with the corresponding enable bits. This bit will not be active if the enable bits are not set. Writes to this bit will have no effect. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 16 | 0x0<br>RW/1C/V | **SMBUS_SMI Status (SMBUS_SMI_STS):** The SoC sets this bit to '1' to indicate that the SMI# was caused by:<br>• 1. The SMBus Slave receiving a message that an SMI# should be caused, or<br>• 2. The SMBALERT# signal goes active and the SMB_SMI_EN bit is set and the SMBALERT_DIS bit is cleared.<br>• 3. The SMBus Slave receiving a HOST_NOTIFY message and the HOST_NOTIFY_INTREN and the SMB_SMI_EN bits are set.<br>• 4. The SMBus Slave receiving a "SMI in S0" message.<br>This bit is sticky. It is cleared by writing a '1' to this bit position. |
| 15 | 0x0<br>RO/V | **SERIRQ_SMI Status (SERIRQ_SMI_STS):**<br>• 0 = SMI# not caused by SERIRQ decoder<br>• 1 = Indicates the SMI# was caused by the SERIRQ decoder<br>This bit is not sticky. Writes to this bit will have no effect. |
| 14 | 0x0<br>RW/1C/V | **Periodic Status (PERIODIC_STS):** This bit will be set at the rate determined by the PER_SMI_SEL bits.<br>If the PERIODIC_EN bit is also set, the SoC will generate an SMI#.<br>This bit is cleared by writing a '1' to this bit position. |
| 13 | 0x0<br>RW/1C/V | **TCO Status (TCO_STS):**<br>• 0 = SMI not caused by TCO logic.<br>• 1 = Indicates SMI was caused by the TCO logic<br>***Note:*** Will not cause wake event.<br>This bit is cleared by writing a '1' to this bit position. |
| 12 | 0x0<br>RO/V | **DEVMON Status (DEVMON_STS):** This read-only bit is set when bit 0 in the DEVTRAP_STS register is set. It is not sticky, so writes to this bit will have no effect. |
| 11 | 0x0<br>RW/1C/V | **MCSMI Status (MCSMI_STS):** This bit is set if there is an access to the power management microcontroller range (62h or 66h).<br>If this bit is set, and the MCSMI_EN bit is also set, the SoC will generate an SMI#.<br>This bit is set by hardware and cleared by software writing a '1' to its bit position. |
| 10 | 0x0<br>RO/V | **GPIO SMI Status (GPIO_SMI_STS):** This bit will be a 1 if any GPIO that is enabled to trigger SMI is asserted.<br>GPIOs that are not routed to cause an SMI will have no effect on this bit.<br>This bit is NOT sticky. Writes to this bit will have no effect. |
| 9 | 0x0<br>RO/V | **GPE0 Status (GPE0_STS):** There are several status/enable bit pairs in GPE0_STS/EN_127_96 that are capable of triggering SMIs.<br>This bit is a logical OR of all of those pairs (i.e. this bit is asserted whenever at least one of those pairs has both the status and enable bit asserted). This bit is NOT sticky. Writes to this bit will have no effect.<br>***Note:*** The setting of this bit does not cause the SMI#. |
| 8 | 0x0<br>RO/V | **PM1 Status Register (PM1_STS_REG):** This is an OR of the bits (except for bits 5 and 4) in the ACPI PM1 Status Reg. (offset PMBASE+00h).<br>Not sticky. Writes to this bit have no effect.<br>***Note:*** The setting of this bit does not cause the SMI#. |
| 7 | 0x0<br>RO | **Reserved (RSVD_7):** Reserved. |
| 6 | 0x0<br>RW/1C/V | **Software SMI Timer Status (SWSMI_TMR_STS):** This bit will be set to '1' by the hardware when the Software SMI# Timer expires. This bit will remain 1 until the software writes a '1' to this bit. |
| 5 | 0x0<br>RW/1C/V | **APM Status (APM_STS):** SMI# was generated by a write access to the APM control register and if the APMC_EN bit is set. This bit is cleared by writing a one to its bit position. |
| 4 | 0x0<br>RW/1C/V | **SMI_ON_SLP_EN Status (SMI_ON_SLP_EN_STS):** This bit will be set by the SoC when a write access attempts to set the SLP_EN bit. This bit is cleared by writing a '1' to this bit position |
| 3 | 0x0<br>RO/V | **Legacy USB Status (LEGACY_USB_STS):** This non-sticky read-only bit is a logical OR of each of the SMI status bits in the USB Legacy Keybd Register ANDed with the corresponding enable bits.<br>This bit will not be active if the enable bits are not set. Writes to this bit will have no effect. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 2 | 0x0<br>RW/1C/V | **BIOS Status (BIOS_STS):** This bit gets set by hardware when a 1 is written by software to the GBL_RLS bit. When both BIOS_EN and the BIOS_STS bit are set, an SMI# will be generated.<br>The BIOS_STS bit is cleared when software writes a '1' to this bit position. |
| 1:0 | 0x0<br>RO | **Reserved (RSVD_1_0):** Reserved. |

## 58.4.6 General Purpose Event Control (GPE_CTRL)—Offset 40h

Usage: ACPI or Legacy. Not lockable. Primary Power Well.

**Type:** I/O Register
(Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABASE] + 40h

**ABASE Type:** PCI Configuration Register (Size: 32 bits)
**ABASE Reference:** [B:0, D:31, F:2] + 40h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:18 | 0x0<br>RO | **Reserved (RSVD_31_18):** Reserved. |
| 17 | 0x0<br>RW/V | **Software GPE Control (SWGPE_CTRL):** This bit allows software to control the assertion of SWGPE_STS bit.<br>This bit is used by hardware as the level input signal for the SWGPE_STS bit in the GPE0_STS register.<br>When SWGPE_CTRL is 1, SWGPE_STS will be set to 1, and writes to SWGPE_STS with a value of 1 to clear SWGPE_STS will result in SWGPE_STS being set back to 1 by hardware.<br>When SWGPE_CTRL is 0, writes to SWGPE_STS with a value of '1' will clear SWGPE_STS to 0. |
| 16:0 | 0x0<br>RO | **Reserved (RSVD_16_0):** Reserved. |

## 58.4.7 Device Trap Status Register (DEVTRAP_STS)—Offset 44h

Usage: Legacy only. Not lockable. Primary Power Well.
Each bit indicates if an access has occurred to the corresponding device's trap range, or for bits 6:9 if the corresponding PCI interrupt is active. Write '1' to the same bit position to clear it. This register is used by APM power management software to see if there has been system activity. The periodic SMI# timer indicates if it is the right time to read the DEVTRAP_STS register.

**Type:** I/O Register
(Size: 32 bits)

**BAR and Offset:** [ABASE] + 44h

**Default:** 00000000h

**ABASE Type:** PCI Configuration Register (Size: 32 bits)
**ABASE Reference:** [B:0, D:31, F:2] + 40h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:13 | 0x0<br>RO | **Reserved (RSVD_31_13):** Reserved. |
| 12 | 0x0<br>RW/1C/V | **D12 Trap Status (D12_TRP_STS):** KBC (60/64h).<br>• 0 = Indicates that there has been no access to this device I/O range.<br>• 1 = This device I/O range has been accessed.<br>Clear this bit by writing a 1 to the bit location. |
| 11:10 | 0x0<br>RO | **Reserved (RSVD_11_10):** Reserved. |
| 9 | 0x0<br>RW/1C/V | **D9 Trap Status (D9_TRP_STS):** PIRQ[D or H].<br>• 0 = The corresponding PCI interrupts have not been active.<br>• 1 = At least one of the corresponding PCI interrupts have been active.<br>Clear this bit by writing a 1 to the bit location. |
| 8 | 0x0<br>RW/1C/V | **D8 Trap Status (D8_TRP_STS):** PIRQ[C or G].<br>• 0 = The corresponding PCI interrupts have not been active.<br>• 1 = At least one of the corresponding PCI interrupts have been active.<br>Clear this bit by writing a 1 to the bit location. |
| 7 | 0x0<br>RW/1C/V | **D7 Trap Status (D7_TRP_STS):** PIRQ[B or F].<br>• 0 = The corresponding PCI interrupts have not been active.<br>• 1 = At least one of the corresponding PCI interrupts have been active.<br>Clear this bit by writing a 1 to the bit location. |
| 6 | 0x0<br>RW/1C/V | **D6 Trap Status (D6_TRP_STS):** PIRQ[A or E].<br>• 0 = The corresponding PCI interrupts have not been active.<br>• 1 = At least one of the corresponding PCI interrupts have been active.<br>Clear this bit by writing a 1 to the bit location. |
| 5 | 0x0<br>RW/1C/V | **D5 Trap Status (D5_TRP_STS):** This will be set if any of the following are accessed (as determined by the I/O ranges in the LPC decoder (even if the LPC forwarding is not enabled): SP1, SP2, PP, FDC.<br>Clear this bit by writing a 1 to the bit location. |
| 4:1 | 0x0<br>RO | **Reserved (RSVD_4_1):** Reserved. |
| 0 | 0x0<br>RW/1C/V | **D0 Trap Status (D0_TRP_STS):** The access/SMI was due to the SATA logic.<br>There is no corresponding bit in the DEVTRAP_EN register because the enables are in the new SATA registers. |

## 58.4.8 PM2a Control Block (PM2A_CNT_BLK)—Offset 50h

Usage: ACPI or Legacy. Not lockable. Primary Power Well.
BIOS must describe this register as 1 byte wide to the OS.

**Type:** I/O Register
(Size: 32 bits)

**BAR and Offset:** [ABASE] + 50h

**Default:** 00000000h

**ABASE Type:** PCI Configuration Register (Size: 32 bits)
**ABASE Reference:** [B:0, D:31, F:2] + 40h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:1 | 0x0<br>RO | **Reserved (RSVD_31_1):** Reserved. |
| 0 | 0x0<br>RW | **ARB_DIS:** This bit is a scratchpad bit for legacy software compatibility. |

## 58.4.9 Over-Clocking WDT Control (OC_WDT_CTL)—Offset 54h

This register controls the operation of the SoCs Over-Clocking Watchdog Timer.

**Type:** I/O Register
(Size: 32 bits)

**BAR and Offset:** [ABASE] + 54h

**Default:** 00002000h

**ABASE Type:** PCI Configuration Register (Size: 32 bits)
**ABASE Reference:** [B:0, D:31, F:2] + 40h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>WO | **Over-Clocking WDT Reload (OC_WDT_RLD):** Software can write a '1' to this bit to reload (“ping”) the SoC over-clocking watchdog timer while it is running.<br>A write of '0' to this bit has no effect.<br>A write of '1' to this bit while OC_WDT_EN=0, or with the clearing of OC_WDT_EN, does not start or reload the WDT (i.e. OC_WDT_EN takes precedence).<br>The value in OC_WDT_TOV may be changed by software along with its setting of this bit. On a WDT reload, the current (potentially new) value in OC_WDT_TOV is loaded into the WDT as the new timeout value. |
| 30:26 | 0x0<br>RO | **Reserved (RSVD_30_26):** Reserved. |
| 25 | 0x0<br>RW/1C/V | **Over-Clocking WDT ICC Survivability Mode Timeout Status (OC_WDT_ICCSURV_STS):** This bit is set to '1' if the over-clocking WDT has timed out and triggered a global reset while running in a mode that has ICC survivability impact (OC_WDT_ICCSURV=1).<br>It is cleared by a software write of '1' or by the pri_pwrgood_rst_b. |
| 24 | 0x0<br>RW/1C/V | **Over-Clocking WDT Non-ICC Survivability Mode Timeout Status (OC_WDT_NO_ICCSURV_STS):** This bit is set to '1' if the over-clocking WDT has timed out and triggered a global reset while running in a mode that does not have ICC survivability impact (OC_WDT_ICCSURV=0). It is cleared by a software write of '1' or by the pri_pwrgood_rst_b. |
| 23:16 | 0x0<br>RW | **Over-Clocking WDT Scratchpad (OC_WDT_SCRATCH):** This field is available as scratchpad space for software and has no effect on SoC hardware operation. |
| 15 | 0x0<br>RW/L | **Over-Clocking WDT Force All (OC_WDT_FORCE_ALL):**<br>GATE_BIT: OC_WDT_CTL.OC_WDT_CTL_LCK.HIGH<br>When this bit is set to 1 and the OC_WDT is running, any included global reset source will behave as though the OC_WDT expired. |
| 14 | 0x0<br>RW/V/L | **Over-Clocking WDT Enable (OC_WDT_EN):** Software sets this bit to '1' to enable the SoC over-clocking watchdog timer. While the counter is running, if it expires before being reloaded by software via the OC_WDT_RLD bit or halted by software clearing this bit, then one of the status bits will be set (which one depends on the WDT operating mode at the time - see the OC_WDT_ICCSURV bit description), and a global reset will be triggered.<br>This bit is also set by the hardware when conditions allow the OC_WDT to self-start at power cycle reboot (effectively changes the default of this bit as seen by software). |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 13 | 0x1<br>RW/L | **Over-Clocking WDT ICC Survivability Impact (OC_WDT_ICCSURV):** This bit determines whether OC_WDT expiration will have an impact on ICC (Integrated Clock Controller) bootstrap survivability.<br>• 0 = Software should configure the OC_WDT to this mode if no ICC hardware auto-recovery actions are desired in the event of a timeout. A timeout in this mode will set OC_WDT_NO_ICCSURV_STS.<br>• 1 (Default) = An OC_WDT timeout while operating in this mode causes certain ICC hardware auto-recovery actions to take place. A timeout in this mode will set OC_WDT_ICCSURV_STS. |
| 12 | 0x0<br>RW/L | **OC_WDT_CTL Register Lock (OC_WDT_CTL_LCK):** This bit controls write-ability to this register. Encodings:<br>• 0 = All fields of register OC_WDT_CTL operate as normal and can be updated by software. Reads to the register operate as normal.<br>• 1 = All RW/L fields of register OC_WDT_CTL, including this lock control bit, are locked. Writes to these register fields have no effect and the register fields retain their current states. Reads to the register operate as normal.<br>Once this bit is set, it can only be cleared by CORE well power loss. |
| 11:10 | 0x0<br>RO | **Reserved (RSVD_11_10):** Reserved. |
| 9:0 | 0x0<br>RW/V/L | **Over-Clocking WDT Timeout Value (OC_WDT_TOV):** Software programs the desired over-clocking WDT timeout value into this register. This timer is zero-based and has a granularity of 1 second. Example timeout values:<br>• 000h: 1 second<br>• 001h: 2 seconds<br>• ...<br>• 3FFh: ~17 minutes (1024 seconds)<br>The value of OC_WDT_TOV may be changed by software along with its setting of the OC_WDT_RLD bit. On a WDT reload, the current (potentially new) value in OC_WDT_TOV is loaded into the WDT as the new timeout value.<br>This field is also updated by the hardware when conditions allow the OC_WDT to self-start at power cycle reboot (effectively changes the default of this field as seen by software). |

## 58.4.10 General Purpose Event 0 Status [31:0] (GPE0_STS_31_0)—Offset 80h

GPE0_STS bits 31:0 are assigned to certain SoC GPIO signals as GPE0_DW0. This register is symmetrical to the General Purpose Event 0 Enable [31:0] Register.

**Type:** I/O Register
(Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABASE] + 80h

**ABASE Type:** PCI Configuration Register (Size: 32 bits)
**ABASE Reference:** [B:0, D:31, F:2] + 40h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW/1C/V | **General Purpose Event 0 Status [31:0] (GPE0_STS_31_0):** These bits are mapped to the SoC General-Purpose I/O (GPIO) signals that can generate GPE0 when properly configured. |

## 58.4.11 General Purpose Event 0 Status [63:32] (GPE0_STS_63_32)—Offset 84h

GPE0_STS bits 63:32 are assigned to certain SoC GPIO signals as GPE0_DW1. This register is symmetrical to the General Purpose Event 0 Enable [63:32] Register.

**Type:** I/O Register
(Size: 32 bits)

**BAR and Offset:** [ABASE] + 84h

**Default:** 00000000h

**ABASE Type:** PCI Configuration Register (Size: 32 bits)
**ABASE Reference:** [B:0, D:31, F:2] + 40h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW/1C/V | **General Purpose Event 0 Status [63:32] (GPE0_STS_63_32):** These bits are mapped to the SoC General-Purpose I/O (GPIO) signals that can generate GPE0 when properly configured. |

## 58.4.12 General Purpose Event 0 Status [95:64] (GPE0_STS_95_64)—Offset 88h

GPE0_STS bits 95:64 are assigned to certain SoC GPIO signals as GPE0_DW2. This register is symmetrical to the General Purpose Event 0 Enable [95:64] Register.

**Type:** I/O Register
(Size: 32 bits)

**BAR and Offset:** [ABASE] + 88h

**Default:** 00000000h

**ABASE Type:** PCI Configuration Register (Size: 32 bits)
**ABASE Reference:** [B:0, D:31, F:2] + 40h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW/1C/V | **General Purpose Event 0 Status [95:64] (GPE0_STS_95_64):** These bits are mapped to the SoC General-Purpose I/O (GPIO) signals that can generate GPE0 when properly configured. |

## 58.4.13 General Purpose Event 0 Status [127:96] (GPE0_STS_127_96)—Offset 8Ch

This register is symmetrical to the General Purpose Event 0 Enable [127:96] Register. Unless indicated otherwise below, if the corresponding _EN bit is set, then when the STS bit get set, the SoC generates a Wake Event. Once back in an S0 state (or if already in an S0 state when the event occurs), the SoC also generates an SCI if the SCIEN bit is set, or an SMI# if the SCIEN bit is not set and GBL_SMI_EN is set.

**Type:** I/O Register
(Size: 32 bits)

**BAR and Offset:** [ABASE] + 8Ch

**Default:** 00000000h

**ABASE Type:** PCI Configuration Register (Size: 32 bits)
**ABASE Reference:** [B:0, D:31, F:2] + 40h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:19 | 0x0<br>RO | **Reserved (RSVD_31_19):** Reserved. |
| 18 | 0x0<br>RW/1C/V | **Wake Alarm Device Timer Status (WADT_STS):** This bit is set whenever the any of the wake alarm device timers signal a timer expiration. |
| 17 | 0x0<br>RW/1C/V | **USB Connection in/after DeepSx Status (USB_CON_DSX_STS):** This bit is set when a connection event occurs on any unmasked USB port while in DeepSx or while in Sx immediately after DeepSx.<br>***Note:*** This bit will be set regardless of the value of the DSX_CFG.USB_CON_DSX_MODE bit. |
| 16 | 0x0<br>RW/1C/V | **GPIO[27] Status (GP27_STS):** This bit is set whenever GPIO[27] is seen asserted low.<br>Note that unlike the GPI[n]_STS bits, GPIO[27] is always monitored as an input for the purpose of setting this bit, regardless of the actual GPIO configuration. |
| 15 | 0x0<br>RW/1C/V | **GPIO Tier2 SCI Status (GPIO_TIER2_SCI_STS):** This bit is a logical OR of sci_wake from tier 2 GPIO's.<br>reset_type = host_deep_rst_b |
| 14 | 0x0<br>RW/1C/V | **Reserved:** Reserved. |
| 13 | 0x0<br>RW/1C/V | **Power Management Event Bus 0 Status (PME_B0_STS):** This bit will be set to 1 by the SoC when any internal device with PCI Power Management capabilities on bus 0 asserts the equivalent of the PME# signal. Additionally, if the PME_B0_EN and SCI_EN bits are set, and the system is in an S0 state, then the setting of the PME_B0_STS bit will generate an SCI (or SMI# if SCI_EN is not set).<br>If the PME_B0_EN bit is set, and the system is in an S1-S4 state (or S5 state due to SLP_TYP and SLP_EN), then the setting of the PME_B0_STS bit will generate a wake event. If the system is in an S5 state due to power button override, then the PME_B0_STS bit will not cause a wake event or SCI.<br>This bit is cleared by a software write of '1'.<br>Internal devices which can set this bit:<br>• Integrated LAN<br>• SATA<br>• EHCI (USB 2.0)<br>• XHCI (USB 3.0)<br>• Intel® ME Maskable Host Wake |
| 12 | 0x0<br>RW/1C/V | **ME SCI Status (ME_SCI_STS):** This bit will be set when the Intel® ME is requesting an SCI. Software must clear the ME source of the SCI before clearing this bit.<br>***Note:*** This source is not able to cause a wake event. |
| 11 | 0x0<br>RW/1C/V | **Power Management Event Status (PME_STS):** This bit will be set to 1 by hardware when the PME# signal goes active.<br>Additionally, if the PME_EN and SCI_EN bits are set, and system is in an S0 state, then the setting of the PME_STS bit will generate an SCI (or SMI# if SCI_EN is not set).<br>If the PME_EN bit is set, and the system is in an S1-S4 state (or S5 state due to SLP_TYP and SLP_EN), then the setting of the PME_STS bit will generate a wake event. If the system is in an S5 state due to power button override, then PME_STS will not cause a wake event or SCI.<br>This bit is cleared by writing a 1 to this bit position. |
| 10 | 0x0<br>RO | **Reserved (RSVD_10):** Reserved. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 9 | 0x0<br>RW/1C/V | **PCI Express Status (PCI_EXP_STS):** This bit will be set to 1 by hardware to indicate that:<br>• The PME event message was received on one or more of the PCI-Express Ports<br>• An Assert PMEGPE message received from the MCH via DMI<br>***Note:*** The PCI WAKE# pin and the PCI-Express Beacons have no impact on this bit.<br>Software attempts to clear this bit by writing a 1 to this bit position. If the PCI_EXP_STS bit went active due to an Assert PMEGPE message, then a Deassert PMEGPE message must be received prior to the software write in order for the bit to be cleared.<br>If the bit is not cleared and the corresponding PCI_EXP_EN bit is set, the level-triggered SCI will remain active. |
| 8 | 0x0<br>RW/1C/V | **RI Status (RI_STS):** This bit will be set to1 by hardware when the RI# input signal goes active. This bit can be reset by writing a 1 to this bit position. |
| 7 | 0x0<br>RW/1C/V | **SMBus Wake Status (SMB_WAK_STS):** This bit is set to 1 by the hardware to indicate that the wake event was caused by the SoC's SMBus logic. This could be due to either the SMBus slave unit receiving a message or the SMBALERT# signal going active. |
| 6 | 0x0<br>RW/1C/V | **TCOSCI Status (TCOSCI_STS):** This bit will be set to 1 by hardware when the TCO logic or Thermal Sensor logic causes an SCI. This bit can be reset by writing a one to this bit position. |
| 5:4 | 0x0<br>RO | **Reserved (RSVD_5_4):** Reserved. |
| 3 | 0x0<br>RW/1C/V | **IE SCI Status (IE_SCI_STS):** This bit will be set when the Innovative Engine (IE) is requesting an SCI. Software must clear the IE source of the SCI before clearing this bit.<br>***Note:*** This source is not able to cause a wake event. |
| 2 | 0x0<br>RW/1C/V | **Software GPE Status (SWGPE_STS):** The SWGPE_CTRL bit (bit 1 of GPE_CTRL reg) acts as a level input to this bit. |
| 1 | 0x0<br>RW/1C/V | **Hot Plug Status (HOT_PLUG_STS):** This bit is set to 1 by hardware when a PCI-Express hot-plug event occurs. This will cause an SCI if the HOT_PLUG_EN and SCI_EN bits are set. This bit is cleared by writing a '1' to this bit position. The following events cause this bit to set:<br>• Assert_GPE message received from any of the PCI Express ports in the SoC<br>• Assert_HPGPE message received from any of the PCI Express ports in the SoC |
| 0 | 0x0<br>RO | **Reserved (RSVD_0):** Reserved. |

## 58.4.14 General Purpose Event 0 Enable [31:0] (GPE0_EN_31_0)—Offset 90h

GPE0_EN bits 31:0 are assigned to certain SoC GPIO signals as GPE0_DW0. This register is symmetrical to the General Purpose Event 0 Status [31:0] Register.

**Type:** I/O Register
(Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABASE] + 90h

**ABASE Type:** PCI Configuration Register (Size: 32 bits)
**ABASE Reference:** [B:0, D:31, F:2] + 40h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|

## 58.4.15 General Purpose Event 0 Enable [63:32] (GPE0_EN_63_32)—Offset 94h

GPE0_EN bits 63:32 are assigned to certain SoC GPIO signals as GPE0_DW1. This register is symmetrical to the General Purpose Event 0 Status [63:32] Register.

**Type:** I/O Register
(Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABASE] + 94h

**ABASE Type:** PCI Configuration Register (Size: 32 bits)
**ABASE Reference:** [B:0, D:31, F:2] + 40h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **General Purpose Event 0 Enable [63:32] (GPE0_EN_63_32):** See Chapter 26, "Customer General-Purpose I/O (GPIO)." |

## 58.4.16 General Purpose Event 0 Enable [95:64] (GPE0_EN_95_64)—Offset 98h

GPE0_EN bits 95:64 are assigned to certain SoC GPIO signals as GPE0_DW2. This register is symmetrical to the General Purpose Event 0 Status [95:64] Register.

**Type:** I/O Register
(Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABASE] + 98h

**ABASE Type:** PCI Configuration Register (Size: 32 bits)
**ABASE Reference:** [B:0, D:31, F:2] + 40h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **General Purpose Event 0 Enable [95:64] (GPE0_EN_95_64):** See Chapter 26, "Customer General-Purpose I/O (GPIO)." |

## 58.4.17 General Purpose Event 0 Enable [127:96] (GPE0_EN_127_96)—Offset 9Ch

This register is symmetrical to the General Purpose Event 0 Status [127:96] Register.

**Type:** I/O Register
(Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [ABASE] + 9Ch

**ABASE Type:** PCI Configuration Register (Size: 32 bits)
**ABASE Reference:** [B:0, D:31, F:2] + 40h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:19 | 0x0<br>RO | **Reserved (RSVD_31_19):** Reserved. |
| 18 | 0x0<br>RW | **Wake Alarm Device Timer Enable (WADT_EN):** Used to enable the setting of the WADT_STS bit to generate wake/SMI#/SCI. |
| 17 | 0x0<br>RW | **USB Connection in/after DeepSx Enable (USB_CON_DSX_EN):** Used to enable the setting of the USB_CON_DSX_STS bit to generate wake/SMI#/SCI. |
| 16 | 0x0<br>RW | **GPIO[27] Enable (GP27_EN):** Used to enable the setting of the GP27_STS bit to generate wake/SMI#/SCI. Host wake events from the PHY through GP27 cannot be disabled by clearing this bit.<br>***Note:*** GPIO[27] is a valid host wake event from Deep-Sx. But the wake enable configuration must persist even after a G3. To make this happen, this bit is in the SoC RTC power well. |
| 15 | 0x0<br>RW/V | **GPIO Tier2 SCI EN (GPIO_TIER2_SCI_EN):** Used to enable the setting of GPIO_TIER2_SCI_STS to generate wake/SCI#<br>reset_type =host_deep_rst_b |
| 14 | 0x0<br>RW/V | **Reserved:** Reserved. |
| 13 | 0x0<br>RW/V | **PME_B0 Enable (PME_B0_EN):** Enables the setting of the PME_B0_STS bit to generate a wake event and/or an SCI or SMI#. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active. |
| 12 | 0x0<br>RW/V | **ME SCI Enable (ME_SCI_EN):** Used to enable the setting of the ME_SCI_STS bit to generate a SCI. |
| 11 | 0x0<br>RW/V | **Power Management Event Enable (PME_EN):** Enables the setting of the PME_STS to generate a wake event and/or an SCI. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active. |
| 10 | 0x0<br>RO | **Reserved (RSVD_10):** Reserved. |
| 9 | 0x0<br>RW/V | **PCI Express Enable (PCI_EXP_EN):** Enables the SoC to cause an SCI when PCI_EXP_STS bit is set. This is used to allow the PCI Express ports to cause an SCI due to wake/PME events. |
| 8 | 0x0<br>RW/V | **RI Enable (RI_EN):** When RI_EN and RI_STS are both set, a Wake event will occur.<br>If RI_EN is not set, then when RI_STS is set, no Wake event will occur. This bit is in the RTC power well and is cleared when the SoC input signal pin SRTCRST_N is active. |
| 7 | 0x0<br>RO | **Reserved (RSVD_7):** Reserved.<br>***Note:*** For the SoC, the SMBus slave will always be enabled as a wake event, as will the SMBALERT# signal. |
| 6 | 0x0<br>RW/V | **TCOSCI Enable (TCOSCI_EN):** When TCOSCI_EN and TCOSCI_STS are both set, an SCI will be generated. |
| 5:4 | 0x0<br>RO | **Reserved (RSVD_5_4):** Reserved. |
| 3 | 0x0<br>RW/V | **IE SCI Enable (IE_SCI_EN):** Used to enable the setting of the IE_SCI_STS bit to generate a SCI. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 2 | 0x0<br>RW/V | **Software GPE Enable (SWGPE_EN):** This bit, when set to 1, enables the SW GPE function.<br>• If SWGPE_CTRL is written to a 1, hardware will set SWGPE_STS (acts as a level input).<br>• If SWGPE_STS, SWGPE_EN, and SCI_EN are all 1's, an SCI will be generated.<br>• If SWGPE_STS = 1, SWGPE_EN = 1, SCI_EN = 0, and GBL_SMI_EN = 1, then an SMI# will be generated. |
| 1 | 0x0<br>RW/V | **Hot Plug Enable (HOT_PLUG_EN):** Enables the SoC to cause an SCI when the HOT_PLUG_STS bit is set. This is used to allow the PCI Express ports to cause an SCI due to hot-plug events. The following events cause HOT_PLUG_STS bit to set:<br>• Assert_GPE message received from any of the PCI Express ports in the SoC<br>• Assert_HPGPE message received from any of the PCI Express ports in the SoC |
| 0 | 0x0<br>RO | **Reserved (RSVD_0):** Reserved. |

## 58.5 Registers in I/O Space—Fixed Addresses

This register is accessed in Host I/O Space through a fixed I/O address.

### 58.5.1 Reset Control Register (RST_CNT)

**Type:** I/O Register
(Size: 8 bits)

**Fixed Address in Host I/O Space:** CF9h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:4 | 0x0<br>RO | **Reserved (RSVD_7_4):** Reserved. |
| 3 | 0x0<br>RW | **Full Reset (FULL_RST):** When this bit is set to 1 and bit 1 is set to 1 (indicating Hard Reset, not Soft Reset), and the RST_CPU bit (bit 2) is written from 0 to 1, the SoC performs a full reset, including driving signal pins PMU_SLP_S3_N and PMU_SLP_S45_N active (low) for at least 3, and no more than 5, seconds.<br>When this bit is set, it also causes the full power cycle (PMU_SLP_S3_N and PMU_SLP_S45_N assertion) in response to PMU_RESETBUTTON_N, COREPWROK, and Watchdog Timer reset sources. |
| 2 | 0x0<br>RW | **Reset CPU (RST_CPU):** This bit will cause either a hard or soft reset to the CPU depending on the state of the SYS_RST bit (bit 1 in this same register).<br>The software will cause the reset by setting bit 2 from a 0 to a 1. |
| 1 | 0x0<br>RW | **System Reset (SYS_RST):** This bit determines the type of reset caused via RST_CPU (bit 2 of this register).<br>• If SYS_RST is 0 when RST_CPU goes from 0 to 1, then the SoC will force an internal Initialize (INIT#) signal to the CPU but system can hang due to the security concern with this internal initialize (INIT#) enabled.<br>• If SYS_RST is 1 when RST_CPU goes from 0 to 1, then the SoC will force PCI Reset active for about 1 ms, however the PMU_SLP_S3_N and PMU_SLP_S45_N signals assertions are dependent on the value of the FULL_RST (bit 3 of this register). |
| 0 | 0x0<br>RO | **Reserved (RSVD_0):** Reserved. |

## 58.6 Sideband Registers

The Sideband registers accessible to the Host are described here. They are accessible in Host Memory Space starting at the Sideband Base Address Register (SBREG_BAR). See Section 3.4.1, "Using SBREG_BAR Method" on page 187.

### 58.6.1 Advanced Power Management Status and Control Port (APM_STS_CNT)—Offset B0h

Usage: Legacy only. Not lockable. Primary Power Well.

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x82] + B0h
**Host Memory Space:** SBREG_BAR + 0x820000 + B0h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RW | **APM Status Port (APM_STS):** Used to pass data between the OS and the SMI handler.<br>Basically, this is a scratchpad register and is not effected by any other register or function (other than a PCI reset). |
| 23:16 | 0x0<br>RW | **Advanced Power Management Control Port (APM_CNT):** Used to pass an APM command between the OS and the SMI handler.<br>Writes to this port not only store data in the APMC register, but also generates an SMI# when the APMC_EN bit is set. |
| 15:0 | 0x0<br>RO | **Reserved (RSVD_15_0):** Reserved. |

### 58.6.2 Misc SB Reg0 (MISC_SBR0)—Offset B4h

Misc SB Reg0

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0x82] + B4h
**Host Memory Space:** SBREG_BAR + 0x820000 + B4h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:9 | 0x0<br>RO | **Reserved (RSVD_31_9):** Reserved. |
| 8 | 0x0<br>RW | **North Completed (NORTH_COMPLETED):** North Completed<br>• 0: Punit has not completed north preparation for Asynchronous DRAM Refresh (ADR)<br>• 1: Punit has completed north preparation for ADR<br>Set by Pcode through CRWt once Pcode has put DIMM in Self-refresh. |
| 7:5 | 0x0<br>RO | **Reserved (RSVD_7_5):** Reserved. |
| 4:1 | 0x0<br>RO/V | **FINAL DDR SPEED set by PMC FW (FINAL_DDR_SPEED):** FINAL_DDR_SPEED set by PMC firmware (CURRENT_SPD_SPEED):<br>• 0xxxx = undefined, use max DDR mem config (fuse) as IDI speed<br>• 1000 = DDR1600, 400MHz IDI freq<br>• 1001 = DDR1866, 466MHz IDI freq<br>• 1010 = DDR2133, 533MHz IDI freq<br>• 1011 = DDR2400, 600Mhz IDI freq<br>• 1100 = DDR2666, 667MHz IDI freq |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 0 | 0x0<br>RW/1C/V | **SPD_RESET_PCODE:** SPD_RESET_PCODE (SPD_RESET_PCODE)<br>• 0= PMC indicates to Pcode that this is NOT a SPD Reset.<br>• 1= PMC indicates to Pcode that this is a SPD ResetSet by PMC firmware during the SPD Reset clocking flow. |

§ §

# 59 SMBus - Legacy - B0, D31, F4

## 59.1 Introduction and Index

The host-accessible registers for the SMBus are described here.

To determine the number of devices/functions available refer to the following:

- Table 1-1, “Features by product SKU - Server and Cloud Storage SKUs 0 through 4”
- Table 1-2, “Features by Product SKU - Network and Enterprise Storage SKUs 5 through 10”
- Table 1-3, “Features by Product SKU - Extended Temperature SKUs 11 through 14”.

The legend for the register access codes are described in Chapter 43, “Introduction.”

### 59.1.1 Registers in Configuration Space

These registers are discovered in Host Configuration Space starting at Bus 0, Device 31 (decimal), Function 4. The offset addresses are listed.

**Table 59-1. Summary of PCI Configuration Registers—0/31/4**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 0 | 2 | 8086 | "Vendor ID (VID)—Offset 0h" on page 2755 |
| 2 | 2 | 19DF | "Device ID (DID)—Offset 2h" on page 2755 |
| 4 | 2 | 0000 | "Command (CMD)—Offset 4h" on page 2756 |
| 6 | 2 | 0280 | "Device Status (DS)—Offset 6h" on page 2757 |
| 8 | 1 | 00 | "Revision ID (RID)—Offset 8h" on page 2758 |
| 9 | 1 | 00 | "Programming Interface (PI)—Offset 9h" on page 2758 |
| A | 1 | 05 | "Sub Class Code (SCC)—Offset Ah" on page 2758 |
| B | 1 | 0C | "Base Class Code (BCC)—Offset Bh" on page 2758 |
| 10 | 4 | 00000004 | "SMBus Memory Base Address_31_0 (SMBMBAR_31_0)—Offset 10h" on page 2759 |
| 14 | 4 | 00000000 | "SMBus Memory Base Address_63_32 (SMBMBAR_63_32)—Offset 14h" on page 2759 |
| 20 | 4 | 00000001 | "SMB Base Address (SBA)—Offset 20h" on page 2760 |
| 2C | 2 | 0000 | "SVID—Offset 2Ch" on page 2760 |
| 2E | 2 | 0000 | "SID—Offset 2Eh" on page 2760 |
| 3C | 1 | 00 | "Interrupt Line (INTLN)—Offset 3Ch" on page 2761 |
| 3D | 3 | 01 | "Interrupt Pin (INTPN)—Offset 3Dh" on page 2761 |
| 40 | 1 | 00 | "Host Configuration (HCFG)—Offset 40h" on page 2762 |
| 50 | 4 | 00000001 | "TCO Base Address (TCOBASE)—Offset 50h" on page 2763 |
| 54 | 4 | 00000000 | "TCO Control (TCOCTL)—Offset 54h" on page 2763 |
| 64 | 4 | 08080000 | "Host_Timing (HTIM)—Offset 64h" on page 2764 |
| F8 | 4 | 01000F1C | "Manufacturer's ID (MANID)—Offset F8h" on page 2765 |

### 59.1.2 Registers in Memory Space—SMBMBAR

An index of the registers that are accessible in Host Memory Space is shown here.

**Table 59-2. Summary of Memory Mapped I/O Registers—SMBMBAR**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 0 | 2 | 00 | "Host Status Register Address (HSTS)—Offset 0h" on page 2766 |
| 2 | 1 | 00 | "Host Control Register (HCTL)—Offset 2h" on page 2767 |
| 3 | 1 | 00 | "Host Command Register (HCMD)—Offset 3h" on page 2769 |
| 4 | 1 | 00 | "Transmit Slave Address Register (TSA)—Offset 4h" on page 2769 |
| 5 | 1 | 00 | "Data 0 Register (HD0)—Offset 5h" on page 2769 |
| 6 | 1 | 00 | "Data 1 Register (HD1)—Offset 6h" on page 2770 |
| 7 | 1 | 00 | "Host Block Data (HBD)—Offset 7h" on page 2770 |
| 8 | 1 | 00 | "Packet Error Check Data Register (PEC)—Offset 8h" on page 2771 |
| 9 | 1 | 44 | "Receive Slave Address Register (RSA)—Offset 9h" on page 2771 |
| A | 2 | 0000 | "Slave Data Register (SD)—Offset Ah" on page 2772 |
| C | 1 | 00 | "Auxiliary Status (AUXS)—Offset Ch" on page 2773 |
| D | 1 | 00 | "Auxiliary Control (AUXC)—Offset Dh" on page 2774 |
| E | 1 | 04 | "SMLINK_PIN_CTL Register (SMLC)—Offset Eh" on page 2775 |
| F | 1 | 04 | "SMBUS_PIN_CTL Register (SMBC)—Offset Fh" on page 2776 |
| 10 | 1 | 00 | "Slave Status Register (SSTS)—Offset 10h" on page 2777 |
| 11 | 3 | 00 | "Slave Command Register (SCMD)—Offset 11h" on page 2778 |
| 14 | 2 | 00 | "Notify Device Address Register (NDA)—Offset 14h" on page 2779 |
| 16 | 1 | 00 | "Notify Data Low Byte Register (NDLB)—Offset 16h" on page 2779 |
| 17 | 1 | 00 | "Notify Data High Byte Register (NDHB)—Offset 17h" on page 2779 |

### 59.1.3 Registers in I/O Space—SBA

An index of the registers that are accessible in Host I/O Space is shown here.

**Table 59-3. Summary of I/O Registers—SBA**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 0 | 2 | 00 | "Host Status Register Address (HSTS)—Offset 0h" on page 2780 |
| 2 | 1 | 00 | "Host Control Register (HCTL)—Offset 2h" on page 2781 |
| 3 | 1 | 00 | "Host Command Register (HCMD)—Offset 3h" on page 2783 |
| 4 | 1 | 00 | "Transmit Slave Address Register (TSA)—Offset 4h" on page 2783 |
| 5 | 1 | 00 | "Data 0 Register (HD0)—Offset 5h" on page 2783 |
| 6 | 1 | 00 | "Data 1 Register (HD1)—Offset 6h" on page 2784 |
| 7 | 1 | 00 | "Host Block Data (HBD)—Offset 7h" on page 2784 |
| 8 | 1 | 00 | "Packet Error Check Data Register (PEC)—Offset 8h" on page 2785 |
| 9 | 1 | 44 | "Receive Slave Address Register (RSA)—Offset 9h" on page 2785 |
| A | 2 | 0000 | "Slave Data Register (SD)—Offset Ah" on page 2786 |
| C | 1 | 00 | "Auxiliary Status (AUXS)—Offset Ch" on page 2787 |
| D | 1 | 00 | "Auxiliary Control (AUXC)—Offset Dh" on page 2788 |
| E | 1 | 04 | "SMLINK_PIN_CTL Register (SMLC)—Offset Eh" on page 2789 |
| F | 1 | 04 | "SMBUS_PIN_CTL Register (SMBC)—Offset Fh" on page 2790 |
| 10 | 1 | 00 | "Slave Status Register (SSTS)—Offset 10h" on page 2791 |
| 11 | 3 | 00 | "Slave Command Register (SCMD)—Offset 11h" on page 2792 |
| 14 | 2 | 00 | "Notify Device Address Register (NDA)—Offset 14h" on page 2793 |
| 16 | 1 | 00 | "Notify Data Low Byte Register (NDLB)—Offset 16h" on page 2793 |
| 17 | 1 | 00 | "Notify Data High Byte Register (NDHB)—Offset 17h" on page 2793 |

### 59.1.4 Registers in I/O Space—TCOBASE

An index of the registers that are accessible in Host I/O Space is shown here.

**Table 59-4. Summary of I/O Registers—TCOBASE**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 0 | 2 | 0004 | "TCO_RLD Register (TRLD)—Offset 0h" on page 2794 |
| 2 | 1 | 00 | "TCO_DAT_IN Register (TDI)—Offset 2h" on page 2794 |
| 3 | 1 | 00 | "TCO_DAT_OUT Register (TDO)—Offset 3h" on page 2795 |
| 4 | 2 | 0000 | "TCO1_STS Register (TSTS1)—Offset 4h" on page 2795 |
| 6 | 2 | 0000 | "TCO2_STS Register (TSTS2)—Offset 6h" on page 2797 |
| 8 | 2 | 0000 | "TCO1_CNT Register (TCTL1)—Offset 8h" on page 2798 |
| A | 2 | 0008 | "TCO2_CNT Register (TCTL2)—Offset Ah" on page 2799 |
| 10 | 1 | 03 | "LEGACY_ELIM Register (LE)—Offset 10h" on page 2800 |
| 12 | 2 | 0004 | "TCO_TMR Register (TTMR)—Offset 12h" on page 2800 |

### 59.1.5 Sideband Registers—Host SMBus Private Configuration

An index of the Sideband registers that are accessible to the Host are listed here. Each is accessible in Host Memory Space using the Sideband Base Address Register (SBREG_BAR). See Section 3.4.1, "Using SBREG_BAR Method" on page 187.

**Table 59-5. Summary of Sideband Registers—0xCF**

| Offset (hex) | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|
| 0 | 00000000 | "TCO Configuration (TCOCFG)—Offset 0h" on page 2801 |
| C | 00000000 | "General Control (GC)—Offset Ch" on page 2802 |
| 10 | 00000009 | "Power Control Enable (PCE)—Offset 10h" on page 2803 |

### 59.1.6 Sideband Registers—CLTT SMBus Configuration Control

An index of the Sideband registers that are accessible to the Host are listed here. Each is accessible in Host Memory Space using the Sideband Base Address Register (SBREG_BAR). See Section 3.4.1, "Using SBREG_BAR Method" on page 187.

**Table 59-6. Summary of Sideband Registers—0xCC**

| Offset (hex) | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|
| 10 | 00000000 | "Ch0 Dimm0 Cfg Status (C0D0CFGSTS)—Offset 10h" on page 2805 |
| 14 | 01000000 | "Ch0 Dimm1 Cfg Status (C0D1CFGSTS)—Offset 14h" on page 2805 |
| 18 | 00000000 | "Ch0 Dimm2 Cfg Status (C0D2CFGSTS)—Offset 18h" on page 2806 |
| 1C | 00000000 | "Ch0 Dimm3 Cfg Status (C0D3CFGSTS)—Offset 1Ch" on page 2806 |
| 20 | 02000000 | "Ch1 Dimm0 Cfg Status (C1D0CFGSTS)—Offset 20h" on page 2807 |
| 24 | 03000000 | "Ch1 Dimm1 Cfg Status (C1D1CFGSTS)—Offset 24h" on page 2807 |
| 28 | 00000000 | "Ch1 Dimm2 Cfg Status (C1D2CFGSTS)—Offset 28h" on page 2808 |
| 2C | 00000000 | "Ch1 Dimm3 Cfg Status (C1D3CFGSTS)—Offset 2Ch" on page 2808 |
| 30 | 00000000 | "Ch0 Dimm Temp Status (C0TEMPSTS0)—Offset 30h" on page 2809 |
| 34 | 00000000 | "Ch0 Dimm Temp Status (C0TEMPSTS1)—Offset 34h" on page 2809 |
| 38 | 00000000 | "Ch1 Dimm Temp Status (C1TEMPSTS0)—Offset 38h" on page 2809 |
| 3C | 00000000 | "Ch1 Dimm Temp Status (C1TEMPSTS1)—Offset 3Ch" on page 2810 |
| 40 | 00 | "Host Configuration (HCFG)—Offset 40h" on page 2810 |

## 59.2 Registers in Configuration Space

### 59.2.1 Vendor ID (VID)—Offset 0h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:31, F:4] + 0h

**Default:** 8086h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0x8086<br>RO | **Vendor ID (VID):** Value indicates Intel as the vendor.<br><br>**Power Well:** Core |

### 59.2.2 Device ID (DID)—Offset 2h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:31, F:4] + 2h

**Default:** 19DFh

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0x19df<br>RO/V | **Device ID (DID):** Indicates the device number assigned by the SIG.<br><br>**Power Well:** Core |

## 59.2.3 Command (CMD)—Offset 4h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:31, F:4] + 4h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:11 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 10 | 0x0<br>RW | **Interrupt Disable (INTD):**<br>• 1 = Disables SMBus to assert its PIRQB# signal.<br>Defaults to 0.<br><br>**Power Well:** Core |
| 9 | 0x0<br>RO | **Fast Back to Back Enable (FBE):** Reserved as 0.<br>Read Only.<br><br>**Power Well:** Core |
| 8 | 0x0<br>RW | **SERR# Enable (SERRE):**<br>• 1 = Enables SERR# generation.<br><br>**Power Well:** Core |
| 7 | 0x0<br>RO | **Wait Cycle Control (WCC):** Reserved as 0.<br>Read Only.<br><br>**Power Well:** Core |
| 6 | 0x0<br>RW | **Parity Error Response (PER):**<br>• 1 = Sets Detected Parity Error bit when parity error is detected.<br><br>**Power Well:** Core |
| 5 | 0x0<br>RO | **VGA Palette Snoop (VGAPS):** Reserved as 0.<br>Read Only.<br><br>**Power Well:** Core |
| 4 | 0x0<br>RO | **Postable Memory Write Enable (PMWE):** Reserved as 0.<br>Read Only.<br><br>**Power Well:** Core |
| 3 | 0x0<br>RO | **Special Cycle Enable (SCE):** Reserved as 0.<br>Read Only.<br><br>**Power Well:** Core |
| 2 | 0x0<br>RO | **Bus Master Enable (BME):** Reserved as 0.<br>Read Only.<br><br>**Power Well:** Core |

## 59.2.4 Device Status (DS)—Offset 6h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:31, F:4] + 6h

**Default:** 0280h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RW/1C | **Detected Parity Error (DPE):** Reserved.<br><br>**Power Well:** Core |
| 14 | 0x0<br>RW/1C | **Signaled System Error (SSE):** Reserved.<br><br>**Power Well:** Core |
| 13 | 0x0<br>RO | **Received Master Abort (RMA):** Reserved as 0.<br><br>**Power Well:** Core |
| 12 | 0x0<br>RO | **Received Target Abort (RTA):** Reserved as 0.<br><br>**Power Well:** Core |
| 11 | 0x0<br>RO | **Signaled Target-Abort Status (STA):** Reserved as 0.<br><br>**Power Well:** Core |
| 10:9 | 0x1<br>RO | **DEVSEL# Timing Status (DEVT):** This 2-bit field defines the timing for DEVSEL# assertion.<br><br>**Power Well:** Core |
| 8 | 0x0<br>RO | **Data Parity Error Detected (DPED):** Reserved as 0.<br><br>**Power Well:** Core |
| 7 | 0x1<br>RO | **Fast Back-to-Back Capable (FBC):** Reserved as 1.<br><br>**Power Well:** Core |
| 6 | 0x0<br>RO | **User Definable Features (UDF):** Reserved as 0.<br><br>**Power Well:** Core |
| 5 | 0x0<br>RO | **66 MHz Capable (C_66M):** Reserved as 0.<br><br>**Power Well:** Core |
| 4 | 0x0<br>RO | **Capabilities List Indicator (CLI):** Hardwired to 0 because there are no capability list structures in this function.<br><br>**Power Well:** Core |
| 3 | 0x0<br>RO | **Interrupt Status (INTS):** This bit indicates that an interrupt is pending.<br>It is independent from the state of the Interrupt Enable bit in the command register.<br><br>**Power Well:** Core |
| 2:0 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |

## 59.2.5 Revision ID (RID)—Offset 8h

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:31, F:4] + 8h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO | **Revision ID (RID):** The value reported in this register depends on the global revision ID.<br><br>**Power Well:** Core |

## 59.2.6 Programming Interface (PI)—Offset 9h

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:31, F:4] + 9h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO | **Programming Interface (PI):** Programming interface.<br><br>**Power Well:** Core |

## 59.2.7 Sub Class Code (SCC)—Offset Ah

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:31, F:4] + Ah

**Default:** 05h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x5<br>RO | **Sub Class Code (SCC):** A value of 05h indicates that this device is a SM Bus serial controller.<br><br>**Power Well:** Core |

## 59.2.8 Base Class Code (BCC)—Offset Bh

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:31, F:4] + Bh

**Default:** 0Ch

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0xc<br>RO | **Base Class Code (BCC):** A value of 0Ch indicates that this device is a serial controller.<br><br>**Power Well:** Core |

## 59.2.9 SMBus Memory Base Address_31_0 (SMBMBAR_31_0)—Offset 10h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:4] + 10h

**Default:** 00000004h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0x0<br>RW | **Base Address (BA):** Provides the 32 byte system memory base address.<br><br>**Power Well:** Core |
| 7:4 | 0x0<br>RO | **Hardwired_0:** Hardwired to 0.<br><br>**Power Well:** Core |
| 3 | 0x0<br>RO | **Prefetchable (PREF):** Hardwired to 0.<br>Indicated that SMBMBAR is not prefetchable.<br><br>**Power Well:** Core |
| 2:1 | 0x2<br>RO | **Address Range (ADDRNG):** Indicates that this SMBMBAR can be located anywhere in 64 bit address space.<br><br>**Power Well:** Core |
| 0 | 0x0<br>RO | **Memory Space Indicator (MSI):** Indicates that the SMB logic is memory mapped.<br><br>**Power Well:** Core |

## 59.2.10 SMBus Memory Base Address_63_32 (SMBMBAR_63_32)—Offset 14h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:4] + 14h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **Base Address (BA):** Bits 63-32 of SMBus Memory Base Address.<br><br>**Power Well:** Core |

## 59.2.11 SMB Base Address (SBA)—Offset 20h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:4] + 20h

**Default:** 00000001h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 15:5 | 0x0<br>RW | **Base Address (BA):** Provides the 32 byte t system I/O base address for the SMB logic.<br><br>**Power Well:** Core |
| 4:1 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved.<br><br>**Power Well:** Core |
| 0 | 0x1<br>RO | **IO Space Indicator (IOSI):** This read-only bit always is 1, indicating that the SMB logic is I/O mapped.<br><br>**Power Well:** Core |

## 59.2.12 SVID—Offset 2Ch

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:31, F:4] + 2Ch

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0x0<br>RW/O | **SVID:** BIOS sets the value in this register to identify the Subsystem Vendor ID.<br>The SMBus SVID register, in combination with the SMBus Subsystem ID register, enables the operating system to distinguish each subsystem from the others.<br>***Note:*** The software can write to this register only once per core well reset. Writes should be done as a single 16-bit cycle.<br><br>**Power Well:** Core |

## 59.2.13 SID—Offset 2Eh

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:31, F:4] + 2Eh

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0x0<br>RW/O | **SID:** BIOS can write to this register to identify the Subsystem ID.<br>The SID register, in combination with the SVID, enable the operating system to distinguish each subsystem from other(s).<br>***Note:*** The software can write to this register only once per core well reset. Writes should be done as a single 16-bit cycle.<br><br>**Power Well:** Core |

## 59.2.14 Interrupt Line (INTLN)—Offset 3Ch

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:31, F:4] + 3Ch

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Interrupt Line (INTLN):** This data is not used by the hardware.<br>It is to communicate to software the interrupt line that the interrupt pin is connected to PIRQB#.<br><br>**Power Well:** Core |

## 59.2.15 Interrupt Pin (INTPN)—Offset 3Dh

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:31, F:4] + 3Dh

**Default:** 01h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x1<br>RO | **Interrupt Pin (INTPN):** This defines the interrupt pin to be used by the SMBus controller.<br>Bits: Pins<br>• 0h: No Interrupt<br>• 1h: INTA#<br>• 2h: INTB#<br>• 3h: INTC#<br>• 4h: INTD#<br>• 5h-Fh: Reserved BIOS<br><br>**Power Well:** Core |

## 59.2.16 Host Configuration (HCFG)—Offset 40h

**Type:** PCI Configuration Register (Size: 8 bits)

**Offset:** [B:0, D:31, F:4] + 40h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:5 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 4 | 0x0<br>RW/1L | **SPD Write Disable (SPDWD):** No SMB registers should be accessed while HSTS.HBSY bit is set, the same will apply to SPD write disable.<br><br>**Power Well:** Core |
| 3 | 0x0<br>RW | **SSRESET:** Soft SMBUS Reset: When this bit is 1, the SMBus state machine and logic is reset. The HW will reset this bit to 0 when reset operation is completed.<br><br>**Power Well:** Core |
| 2 | 0x0<br>RW | **I2C_EN (I2CEN):** When this bit is 1, the SMBus Host is enabled to communicate with I2C devices. This will change the formatting of some commands. When this bit is 0, behavior is for SMBus.<br><br>**Power Well:** Core |
| 1 | 0x0<br>RW | **SMB_SMI_EN (SSEN):** When this bit is set, any source of an SMB interrupt will instead be routed to generate an SMI#.<br>Refer to Section 28.8, "Interrupts and SMI" on page 722 (Interrupts/SMI#) for details.<br><br>**Power Well:** Core |
| 0 | 0x0<br>RW | **HST_EN (HSTEN):** When set, the SMB Host Controller interface is enabled to execute commands. The HST_INT_EN bit needs to be enabled in order for the SMB Host Controller to interrupt or SMI#. Additionally, the SMB Host Controller will not respond to any new requests until all interrupt requests have been cleared.<br><br>**Power Well:** Core |

## 59.2.17 TCO Base Address (TCOBASE)—Offset 50h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:4] + 50h

**Default:** 00000001h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 15:5 | 0x0<br>RW/L | **TCO Base Address (TCOBA):** Provides the 32 bytes of I/O space for TCO logic, mappable anywhere in the 64k I/O space on 32-byte boundaries.<br><br>**Power Well:** Core |
| 4:1 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved.<br><br>**Power Well:** Core |
| 0 | 0x1<br>RO | **I/O Space (IOS):** Indicates an I/O Space.<br><br>**Power Well:** Core |

## 59.2.18 TCO Control (TCOCTL)—Offset 54h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:4] + 54h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:9 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 8 | 0x0<br>RW | **TCO Base Enable (TCO_BASE_EN):** When set, decode of the I/O range pointed to by the TCO base register is enabled.<br><br>**Power Well:** Core |
| 7:1 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved.<br><br>**Power Well:** Core |
| 0 | 0x0<br>RW/O | **TCO Base Lock (TCO_BASE_LOCK):** When set to 1, this bit locks down the TCO Base Address Register (TCOBASE) at offset 50h.<br>The Base Address Field becomes read-only.<br>This bit becomes locked when a value of 1b is written to it.<br>Writes of 0 to this bit are always ignored.<br>Once locked by writing 1, the only way to clear this bit is to perform a platform reset.<br><br>**Power Well:** Core |

## 59.2.19 Host_Timing (HTIM)—Offset 64h

Setting these timing parameters will affect the SMBus host PHY layer. These values should only be changed when the SMBus is idle.

These timings are based off the 10MHz PHY clock. A higher frequency PHY clock will scale the timings accordingly. This register is in the suspend well.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:4] + 64h

**Default:** 08080000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x8<br>RW | **Thigh:** The time value in this field will be added/subtracted to the Thigh timing parameter as defined in SMB 2.0 spec.<br>• 00000000: -7 Clocks (-700ns)<br>• 00000001: -6 Clocks (-600ns)<br>• ----<br>• 00000111: -1 Clock (-100ns)<br>• 00001000: +0 Clock (0ns)<br>• 00001001: +1 Clock (+100ns)<br>• ----<br>• 11111111: +247 Clocks (+24700ns)<br>***Note:*** These are offsets that control the range of the nominal Thigh value in the PHY layers<br><br>**Power Well:** SUS |
| 23:16 | 0x8<br>RW | **Tiow:** The time value in this field will be added/subtracted to the Tiow timing parameter as defined in SMB 2.0 spec.<br>See Thigh field above<br><br>**Power Well:** SUS |
| 15:12 | 0x0<br>RW | **Thdsta:** The time value in this field will be added/subtracted to the Thdsta timing parameter as defined in SMB 2.0 spec.<br>• 1111: -7 Clocks (-700ns)<br>• 1110: -6 Clocks (-600ns)<br>• ----<br>• x000: +0 Clock (0ns)<br>• 0001: +1 Clock (+100ns)<br>• ----<br>• 0111: +7 Clocks (+700ns)<br><br>**Power Well:** SUS |
| 11:8 | 0x0<br>RW | **Tsusta:** The time value in this field will be added/subtracted to the Tsusta timing parameter as defined in SMB 2.0 spec.<br>See Thdsta field above.<br><br>**Power Well:** SUS |
| 7:4 | 0x0<br>RW | **Tbuf:** The time value in this field will be added/subtracted to the Tbuf timing parameter as defined in SMB 2.0 spec.<br>See Thdsta field above.<br><br>**Power Well:** SUS |
| 3:0 | 0x0<br>RW | **Tsusto:** The time value in this field will be added/subtracted to the Tsusto timing parameter as defined in SMB 2.0 spec.<br>See Thdsta field above.<br><br>**Power Well:** SUS |

## 59.2.20 Manufacturer's ID (MANID)—Offset F8h

This reflects the value of the Manufacturers ID which provides information on the details of the chip revision.

*Note:* A single Manufacturers ID is implemented based on information in the Fuse block and distributed to the devices via a message.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:4] + F8h

**Default:** 01000F1Ch

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:28 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 27:24 | 0x1<br>RO/V | **Dot Portion of Process ID (DPID):** Indicates the dot process as x.8.<br><br>**Power Well:** Core |
| 23:16 | 0x0<br>RO/V | **Stepping ID (SID):** This field is incremented for each stepping of the part.<br>***Note:*** This field can be used by software to differentiate steppings when the Revision ID may not change.<br><br>**Power Well:** Core |
| 15:8 | 0xf<br>RO/V | **Manufacturer (MaFa):** 0Fh = Intel.<br><br>**Power Well:** Core |
| 7:0 | 0x1C<br>RO/V | **Process/Dot (PD):** Indicates that the process base is 1271.<br><br>**Power Well:** Core |

## 59.3 Registers in Memory Space—SMBMBAR

These registers are accessed in Host Memory Space starting at the relocatable memory address defined by the Base Address Register (BAR) SMBMBAR.

### 59.3.1 Host Status Register Address (HSTS)—Offset 0h

All status bits are set by hardware and cleared by the software writing a one to the particular bit position. Writing a zero to any bit position has no affect.

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [SMBMBAR] + 0h

**SMBMBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMBMBAR Reference:** [B:0, D:31, F:4] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RW/1C | **BYTE_DONE_STS (BDS):** This bit will be set to 1 when the host controller has received a byte (for Block Read commands) or if it has completed transmission of a byte (for Block Write commands) when the 32-byte buffer is not being used.<br><br>**Power Well:** Core |
| 6 | 0x0<br>RW/1C | **In Use Status (IUS):** After a full PCI reset, a read to this bit returns a 0.<br>After the first read, subsequent reads will return a 1.<br>A write of a 1 to this bit will reset the next read value to 0.<br>Writing a 0 to this bit has no effect.<br><br>**Power Well:** Core |
| 5 | 0x0<br>RW/1C | **SMBALERT_STS (SMSTS):** SoC sets this bit to a 1 to indicates source of the interrupt or SMI# was the SMBAlert# signal.<br>Software resets this bit by writing a 1 to this location.<br>This bit should also be cleared by RSMRST# (but not PLTRST#).<br><br>**Power Well:** Core |
| 4 | 0x0<br>RW/1C | **Failed (FAIL):** When set, this indicates that the source of the interrupt or SMI# was a failed bus transaction.<br>This is set in response to the KILL bit being set to terminate the host transaction.<br><br>**Power Well:** Core |
| 3 | 0x0<br>RW/1C | **Bus Error (BERR):** When set, this indicates the source of the interrupt or SMI# was a transaction collision.<br><br>**Power Well:** Core |
| 2 | 0x0<br>RW/1C | **Device Error (DERR):** When set, this indicates that the source of the interrupt or SMI# was due one of the following:<br>• Illegal Command Field Unclaimed Cycle (host initiated)<br>• Host Device Time-out Error. CRC Error<br><br>**Power Well:** Core |
| 1 | 0x0<br>RW/1C | **Interrupt (INTR):** When set, this indicates that the source of the interrupt or SMI# was the successful completion of its last command.<br><br>**Power Well:** Core |
| 0 | 0x0<br>RW/1C | **Host Busy (HBSY):** A 1 indicates that the SMBus Host is running a command from the host interface. No SMB registers should be accessed while this bit is set.<br><br>**Power Well:** Core |

## 59.3.2 Host Control Register (HCTL)—Offset 2h

*Note:* A read to this register will clear the pointer in the 32-byte buffer.

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [SMBMBAR] + 2h

**SMBMBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMBMBAR Reference:** [B:0, D:31, F:4] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RW | **PEC_EN:** When set to 1, this bit causes the host controller to perform the SMBus transaction with the Packet Error Checking phase appended.<br>For writes, the value of the PEC byte is transferred from the PEC Register.<br>For reads, the PEC byte is loaded in to the PEC Register.<br><br>**Power Well:** Core |
| 6 | 0x0<br>RW | **START:** This write-only bit is used to initiate the command described in the SMB_CMD field.<br>All registers should be setup prior to writing a 1 to this bit position.<br>This bit always reads zero.<br><br>**Power Well:** Core |
| 5 | 0x0<br>RW | **LAST_BYTE:** Used for I2C Read commands as an indication that the next byte will be the last one to be received for that block.<br><br>**Power Well:** Core |
| 4:2 | 0x0<br>RW | **SMB_CMD:** As shown by the bit encoding below, indicates which command the SMBus Host is to perform.<br>If enabled, the SMBus Host will generate an interrupt or SMI# when the command has completed If the value is for a non-supported or reserved command, the SMBus Host will set the device error (DEV_ERR) status bit and generate an interrupt when the START bit is set.<br>The SMBus Controller will perform no command, and will not operate until DEV_ERR is cleared.<br>Val - Command Description:<br>• 000 - Quick: The slave address and read/write value (bit 0) are stored in the tx slave address register.<br>• 001 - Byte: This command uses the transmit slave address and command registers. Bit 0 of the slave address register determines if this is a read or write command.<br>• 010 - Byte Data: This command uses the transmit slave address, command, and DATA0 registers. Bit 0 of the slave address register determines if this is a read or write command. If it is a read, the DATA0 register will contain the read data.<br>• 011 - Word Data: This command uses the transmit slave address, command, DATA0 and DATA1 registers. Bit 0 of the slave address register determines if this is a read or write command. If it is a read, after the command completes the DATA0 and DATA1 registers will contain the read data.<br>• 100 - Process Call: This command uses the transmit slave address, command, DATA0 and DATA1 registers. Bit 0 of the slave address register determines if this is a read or write command. After the command completes, the DATA0 and DATA1 registers will contain the read data.<br>• 101 - Block: This command uses the transmit slave address, command, and DATA0 registers, and the Block Data Byte register. For block write, the count is stored in the DATA0 register and indicates how many bytes of data will be transferred. For block reads, the count is received and stored in the DATA0 register. Bit 0 of the slave address register selects if this is a read or write command. For writes, data is retrieved from the first n (where n is equal to the specified count) addresses of the SRAM array. For reads, the data is stored in the Block Data Byte register.<br>• 110 - I2C Read: This command uses the transmit slave address, command, DATA0, DATA1 registers, and the Block Data Byte register. The read data is stored in the Block Data Byte register. The SoC will continue reading data until the NAK is received.<br>• 111 - Block-Process: This command uses the transmit slave address, command, DATA0 and the Block Data Byte register. For block write, the count is stored in the DATA0 register and indicates how many bytes of data will be transferred. For block read, the count is received and stored in the DATA0 register. Bit 0 of the slave address register always indicate a write command. For writes, data is retrieved from the first m (where m is equal to the specified count) addresses of the SRAM array. For reads, the data is stored in the Block Data Byte register.<br>***Note:*** E32B bit in the Auxiliary Control Register must be set for this command to work.<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 1 | 0x0<br>RW | **KILL:** When set, kills the current host transaction taking place, sets the FAILED status bit, and asserts the interrupt (or SMI#) selected by the SMB_INTRSEL field.<br>This bit, once set, must be cleared to allow the SMB Host Controller to function normally.<br><br>**Power Well:** Core |
| 0 | 0x0<br>RW | **INTREN:** Enable the generation of an interrupt or SMI# upon the completion of the command.<br><br>**Power Well:** Core |

## 59.3.3 Host Command Register (HCMD)—Offset 3h

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [SMBMBAR] + 3h

**SMBMBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMBMBAR Reference:** [B:0, D:31, F:4] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Host Command Register (HCMD):** This eight bit field is transmitted by the host controller in the command field of the SMB protocol during the execution of any command.<br><br>**Power Well:** Core |

## 59.3.4 Transmit Slave Address Register (TSA)—Offset 4h

This register is transmitted by the host controller in the slave address field of the SMB protocol. This is the address of the target.

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [SMBMBAR] + 4h

**SMBMBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMBMBAR Reference:** [B:0, D:31, F:4] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:1 | 0x0<br>RW | **ADDRESS (ADDR):** 7-bit address of the targeted slave.<br>***Note:*** Writes to TSA values of A0h - AEh are blocked depending on the setting of the SPD write disable bit in HCFG - HostConfiguration.<br><br>**Power Well:** Core |
| 0 | 0x0<br>RW | **RW:** Direction of the host transfer.<br>• 1 = Read.<br>• 0 = Write.<br><br>**Power Well:** Core |

## 59.3.5 Data 0 Register (HD0)—Offset 5h

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [SMBMBAR] + 5h

**SMBMBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMBMBAR Reference:** [B:0, D:31, F:4] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **DATA0/COUNT (DATA0_COUNT):** This field contains the eight bit data sent in the DATA0 field of the SMB protocol.<br>For block write commands, this register reflects the number of bytes to transfer.<br>This register should be programmed to a value between 1 and 32 for block counts.<br>A count of 0 or a count above 32 will result in unpredictable behavior.<br>The host controller does not check or log illegal block counts.<br><br>**Power Well:** Core |

## 59.3.6 Data 1 Register (HD1)—Offset 6h

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [SMBMBAR] + 6h

**SMBMBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMBMBAR Reference:** [B:0, D:31, F:4] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **DATA1:** This eight bit register is transmitted in the DATA1 field of the SMB protocol during the execution of any command.<br><br>**Power Well:** Core |

## 59.3.7 Host Block Data (HBD)—Offset 7h

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [SMBMBAR] + 7h

**SMBMBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMBMBAR Reference:** [B:0, D:31, F:4] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Block Data (BDTA):** This is either a register, or a pointer into a 32- byte block array, depending upon whether the E32B bit is set in the Auxiliary Control register.<br>When the E32B bit is cleared, this is a register containing a byte of data to be sent on a block write or read from on a block read, just as it behaved on the SoC.<br>When the E32B bit is set, reads and writes to this register are used to access the 32-byte block data storage array. An internal index pointer is used to address the array, which is reset to 0 by reading the HCTL register (offset 02h).<br>The index pointer then increments automatically upon each access to this register.<br>The transfer of block data into (read) or out of (write) this storage array during an SMBus transaction always starts at index address 0.<br>When the E2B bit is set, for writes, software will write up to 32-bytes to this register as part of the setup for the command. After the Host Controller has sent the Address, Command, and Byte Count fields, it will send the bytes in the SRAM pointed to by this register.<br>When the E2B bit is cleared for writes, software will place a single byte in this register. After the host controller has sent the address, command, and byte count fields, it will send the byte in this register. If there is more data to send, software will write the next series of bytes to the SRAM pointed to by this register and clear the DONE_STS bit.<br>The controller will then send the next byte. During the time between the last byte being transmitted to the next byte being transmitted, the controller will insert wait-states on the interface.<br>When the E2B bit is set for reads, after receiving the byte count into the Data0 register, the first series of data bytes go into the SRAM pointed to by this register. If the byte count has been exhausted or the 32-byte SRAM has been filled, the controller will generate an SMI# or interrupt (depending on configuration) and set the DONE_STS bit.<br>Software will then read the data. During the time between when the last byte is read from the SRAM to when the DONE_STS bit is cleared, the controller will insert wait states on the interface.<br><br>**Power Well:** Core |

## 59.3.8 Packet Error Check Data Register (PEC)—Offset 8h

*Note:* This register may reside in either the core well or the suspend well.

To simplify the implementation, this register will be in the suspend well with the suspend well version of PCI reset (URST33B). This register contains the 8-bit CRC value that is used as the Packet Error Check on SMBus.

For writes, this register is written by software prior to running the command.

For reads, this register is read by software after the read command is completed on SMBus.

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**BAR and Offset:** [SMBMBAR] + 8h

**Default:** 00h

**SMBMBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMBMBAR Reference:** [B:0, D:31, F:4] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **PEC_DATA:** This 8-bit register is written with the SMBus PEC data prior to a write transaction. For read transactions, the PEC data is loaded from the SMBus into this register and is then read by software.<br>Software must ensure that the INUSE_STS bit is properly maintained to avoid having this field over-written by a write transaction following a read transaction.<br><br>**Power Well:** Core |

## 59.3.9 Receive Slave Address Register (RSA)—Offset 9h

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**BAR and Offset:** [SMBMBAR] + 9h

**Default:** 44h

**SMBMBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMBMBAR Reference:** [B:0, D:31, F:4] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Resume |
| 6:0 | 0x44<br>RW | **SLAVE_ADDR[6:0] (SA_6_0):** This field is the slave address that the SoC decodes for read and write cycles.<br>The default is not 0 so that it can respond even before the CPU comes up (or if the CPU is dead).<br>This register is reset by RSMRST#, but not by PLTRST#.<br><br>**Power Well:** Resume |

## 59.3.10 Slave Data Register (SD)—Offset Ah

**Type:** Memory Mapped I/O Register (Size: 16 bits)

**Default:** 0000h

**BAR and Offset:** [SMBMBAR] + Ah

**SMBMBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMBMBAR Reference:** [B:0, D:31, F:4] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0x0<br>RO/V | **SLAVE_DATA[15:0] (SD_15_0):** This field is the 16-bit data value written by the external SMBus master.<br>The CPU can then read the value from this register.<br>This register is reset by RSMRST#, but not by PLTRST#.<br>• SLAVE_DATA [15:8] corresponds to the Data Message Byte 1 at Slave Write Register 5 in the table.<br>• SLAVE_DATA [7:0] corresponds to the Data Message Byte 0 at Slave Write Register 4 in the table.<br><br>**Power Well:** Resume |

## 59.3.11 Auxiliary Status (AUXS)—Offset Ch

All bits in this register are in the core well.

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [SMBMBAR] + Ch

**SMBMBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMBMBAR Reference:** [B:0, D:31, F:4] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:5 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 4 | 0x0<br>RO/V | **SMT3EN:** Register value determines if SMT3 is enabled and connected on SMLink1.<br>Disabled means the device is not connected to the pins.<br>• 0: Disable.<br>• 1: Enable.<br><br>**Power Well:** Core |
| 3 | 0x0<br>RO/V | **SMT2EN:** Register value determines if SMT2 is enabled and connected on SMLink0.<br>Disabled means the device is not connected to the pins.<br>• 0: Disable.<br>• 1: Enable.<br><br>**Power Well:** Core |
| 2 | 0x0<br>RO/V | **SMT1EN:** Register value determines if SMT1 is enabled and connected on SMBus.<br>Disabled means the device is not connected to the pins.<br>• 0: Disables.<br>• 1: Enable.<br><br>**Power Well:** Core |
| 1 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved.<br><br>**Power Well:** Core |
| 0 | 0x0<br>RW/1C | **CRC Error (CRCE):** This bit is set if a received message contained a CRC error.<br>When this bit is set, the DERR bit of the host status register will also be set.<br>This bit will be set by the controller if a software abort occurs in the middle of the CRC portion of the cycle or an abort happens after the SMBus Controller has received the final data bit transmitted by the external slave.<br><br>**Power Well:** Core |

## 59.3.12 Auxiliary Control (AUXC)—Offset Dh

All bits in this register are in the resume well.

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [SMBMBAR] + Dh

**SMBMBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMBMBAR Reference:** [B:0, D:31, F:4] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:2 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Resume |
| 1 | 0x0<br>RW | **Enable 32-byte Buffer (E32B):** When set, the Host Block Data register is a pointer into a 32-byte buffer, as opposed to a single register.<br>This enables the block commands to transfer or receive up to 32-bytes before the controller generates an interrupt.<br><br>**Power Well:** Resume |
| 0 | 0x0<br>RW | **Automatically Append CRC (AAC):** When set, the SMBus Controller will automatically append the CRC.<br>This bit must not be changed during SM Bus transactions, or undetermined behavior will result.<br>It should be programmed only once during the lifetime of the function.<br><br>**Power Well:** Resume |

## 59.3.13 SMLINK_PIN_CTL Register (SMLC)—Offset Eh

*Note:* This register is in the resume well and is reset by RSMRST#.

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**BAR and Offset:** [SMBMBAR] + Eh

**Default:** 04h

**SMBMBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMBMBAR Reference:** [B:0, D:31, F:4] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:3 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Resume |
| 2 | 0x1<br>RW | **SMLINK_CLK_CTL:**<br>• 0 = SMBus Controller will drive the SMLINK[0] pin low, independent of what the other SMLINK logic would otherwise indicate for the SMLINK(0) pin.<br>• 1 = The SMLINK[0] pin is Not overdriven low. The other SMLINK logic controls the state of the pin.<br><br>**Power Well:** Resume |
| 1 | 0x0<br>RO/V | **SMLINK[1]_CUR_STS (SMLINK1_CUR_STS):** This bit has a default value that is dependent on an external signal level.<br>This returns the value on the SMLINK[1] pin.<br>It will be 1 to indicate high, 0 to indicate low.<br>This allows software to read the current state of the pin.<br><br>**Power Well:** Resume |
| 0 | 0x0<br>RO/V | **SMLINK[0]_CUR_STS (SMLINK0_CUR_STS):** This bit has a default value that is dependent on an external signal level.<br>This returns the value on the SMLINK[0] pin. It will be 1 to indicate high, 0 to indicate low.<br>This allows software to read the current state of the pin.<br><br>**Power Well:** Core |

## 59.3.14 SMBUS_PIN_CTL Register (SMBC)—Offset Fh

*Note:* This register is in the resume well and is reset by RSMRST#.

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 04h

**BAR and Offset:** [SMBMBAR] + Fh

**SMBMBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMBMBAR Reference:** [B:0, D:31, F:4] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:3 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Resume |
| 2 | 0x1<br>RW | **SMBCLK_CTL:**<br>• 0 = SMBus Controller will drive the SMBCLK pin low, independent of what the other SMB logic would otherwise indicate for the SMBCLK pin.<br>• 1 = The SMBCLK pin is Not overdriven low. The other SMBus logic controls the state of the pin.<br><br>**Power Well:** Resume |
| 1 | 0x0<br>RO/V | **SMBDATA_CUR_STS:** This bit has a default value that is dependent on an external signal level.<br>This returns the value on the SMBDATA pin.<br>It will be 1 to indicate high, 0 to indicate low.<br>This allows software to read the current state of the pin.<br><br>**Power Well:** Resume |
| 0 | 0x0<br>RO/V | **SMBCLK_CUR_STS:** This bit has a default value that is dependent on an external signal level.<br>This returns the value on the SMBCLK pin.<br>It will be 1 to indicate high, 0 to indicate low.<br>This allows software to read the current state of the pin.<br><br>**Power Well:** Resume |

## 59.3.15 Slave Status Register (SSTS)—Offset 10h

All bits in this register are implemented in the 64 kHz clock domain. Therefore, software must poll the register until a write takes effect before assuming that a write has completed internally.

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**BAR and Offset:** [SMBMBAR] + 10h

**Default:** 00h

**SMBMBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMBMBAR Reference:** [B:0, D:31, F:4] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:1 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Resume |
| 0 | 0x0<br>RW/1C | **HOST_NOTIFY_STS (HNS):** The SMBus Controller sets this bit to a 1 when it has completely received a successful Host Notify Command on the SMBus pins.<br>Software reads this bit to determine that the source of the interrupt or SMI# was the reception of the Host Notify Command.<br>Software clears this bit after reading any information needed from the Notify address and data registers by writing a 1 to this bit.<br>***Note:*** The controller will allow the Notify Address and Data registers to be over-written once this bit has been cleared.<br>When this bit is 1, the SMBus Controller will NACK the first byte (host address) of any new Host Notify commands on the SMBus.<br>Writing a 0 to this bit has no effect.<br><br>**Power Well:** Resume |

## 59.3.16 Slave Command Register (SCMD)—Offset 11h

All bits in this register are implemented in the 64 kHz clock domain. Therefore, software must poll the register until a write takes effect before assuming that a write has completed internally. Also, software must confirm the prior written value before writing to the register again.

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**BAR and Offset:** [SMBMBAR] + 11h

**Default:** 00h

**SMBMBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMBMBAR Reference:** [B:0, D:31, F:4] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:3 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Resume |
| 2 | 0x0<br>RW | **SMBALERT_DIS (SMB_D):** Software sets this bit to 1 to block the generation of the interrupt or SMI# due to the SMBALERT# source.<br>This bit is logically inverted and ANDed with the SMBALERT_STS bit.<br>The resulting signal is distributed to the SMI# and/or interrupt generation logic.<br>This bit does not effect the wake logic.<br><br>**Power Well:** Resume |
| 1 | 0x0<br>RW | **HOST_NOTIFY_WKEN (HNW):** Software sets this bit to 1 to enable the reception of a Host Notify command as a wake event.<br>When enabled this event is ORed in with the other SMBus wake events and is reflected in the SMB_WAK_STS bit of the General Purpose Event 0 Status register.<br><br>**Power Well:** Resume |
| 0 | 0x0<br>RW | **HOST_NOTIFY_INTREN (HNI):** Software sets this bit to 1 to enable the generation of interrupt or SMI# when HOST_NOTIFY_STS is 1.<br>This enable does not affect the setting of the HOST_NOTIFY_STS bit.<br>When the interrupt is generated, either PIRQB or SMI# is generated, depending on the value of the SMB_SMI_EN bit (D31, F3, Off40h, B1).<br>If the HOST_NOTIFY_STS bit is set when this bit is written to a 1, then the interrupt (or SMI#) will be generated.<br>The interrupt (or SMI#) is logically generated by ANDing the STS and INTREN bits.<br><br>**Power Well:** Resume |

## 59.3.17 Notify Device Address Register (NDA)—Offset 14h

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [SMBMBAR] + 14h

**SMBMBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMBMBAR Reference:** [B:0, D:31, F:4] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:1 | 0x0<br>RO/V | **DEVICE_ADDRESS (Dev_Addr):** This field contains the 7-bit device address received during the Host Notify protocol of the SMBus 2.0 specification.<br>Software should only consider this field valid when the HOST_NOTIFY_STS bit is set to 1.<br><br>**Power Well:** Resume |
| 0 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Resume |

## 59.3.18 Notify Data Low Byte Register (NDLB)—Offset 16h

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [SMBMBAR] + 16h

**SMBMBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMBMBAR Reference:** [B:0, D:31, F:4] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO | **DATA_LOW_BYTE (DLB):** This field contains the first (low) byte of data received during the Host Notify protocol of the SMBus 2.0 specification.<br>Software should only consider this field valid when the HOST_NOTIFY_STS bit is set to 1.<br><br>**Power Well:** Resume |

## 59.3.19 Notify Data High Byte Register (NDHB)—Offset 17h

**Type:** Memory Mapped I/O Register (Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [SMBMBAR] + 17h

**SMBMBAR Type:** PCI Configuration Register (Size: 64 bits)
**SMBMBAR Reference:** [B:0, D:31, F:4] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO | **DATA_HIGH_BYTE (DHB):** This field contains the second (high) byte of data received during the Host Notify protocol of the SMBus 2.0 specification.<br>Software should only consider this field valid when the HOST_NOTIFY_STS bit is set to 1.<br><br>**Power Well:** Resume |

## 59.4 Registers in I/O Space—SBA

These registers are accessed in Host I/O Space starting at the relocatable I/O address defined by the Base Address Register (BAR) SBA.

### 59.4.1 Host Status Register Address (HSTS)—Offset 0h

All status bits are set by hardware and cleared by the software writing a one to the particular bit position. Writing a zero to any bit position has no affect.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [SBA] + 0h

**SBA Type:** PCI Configuration Register (Size: 32 bits)
**SBA Reference:** [B:0, D:31, F:4] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RW/1C | **BYTE_DONE_STS (BDS):** This bit will be set to 1 when the host controller has received a byte (for Block Read commands) or if it has completed transmission of a byte (for Block Write commands) when the 32-byte buffer is not being used.<br><br>**Power Well:** Core |
| 6 | 0x0<br>RW/1C | **In Use Status (IUS):** After a full PCI reset, a read to this bit returns a 0.<br>After the first read, subsequent reads will return a 1.<br>A write of a 1 to this bit will reset the next read value to 0.<br>Writing a 0 to this bit has no effect.<br><br>**Power Well:** Core |
| 5 | 0x0<br>RW/1C | **SMBALERT_STS (SMSTS):** The SoC sets this bit to a 1 to indicates source of the interrupt or SMI# was the SMBAlert# signal.<br>Software resets this bit by writing a 1 to this location.<br>This bit should also be cleared by RSMRST# (but not PLTRST#).<br><br>**Power Well:** Core |
| 4 | 0x0<br>RW/1C | **Failed (FAIL):** When set, this indicates that the source of the interrupt or SMI# was a failed bus transaction.<br>This is set in response to the KILL bit being set to terminate the host transaction.<br><br>**Power Well:** Core |
| 3 | 0x0<br>RW/1C | **Bus Error (BERR):** When set, this indicates the source of the interrupt or SMI# was a transaction collision.<br><br>**Power Well:** Core |
| 2 | 0x0<br>RW/1C | **Device Error (DERR):** When set, this indicates that the source of the interrupt or SMI# was due one of the following:<br>• Illegal Command Field Unclaimed Cycle (host initiated)<br>• Host Device Time-out Error. CRC Error<br><br>**Power Well:** Core |
| 1 | 0x0<br>RW/1C | **Interrupt (INTR):** When set, this indicates that the source of the interrupt or SMI# was the successful completion of its last command.<br><br>**Power Well:** Core |
| 0 | 0x0<br>RW/1C | **Host Busy (HBSY):** A 1 indicates that the SMBus Host is running a command from the host interface. No SMB registers should be accessed while this bit is set.<br><br>**Power Well:** Core |

## 59.4.2 Host Control Register (HCTL)—Offset 2h

*Note:* A read to this register will clear the pointer in the 32-byte buffer.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [SBA] + 2h

**SBA Type:** PCI Configuration Register (Size: 32 bits)
**SBA Reference:** [B:0, D:31, F:4] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RW | **PEC_EN:** When set to 1, this bit causes the host controller to perform the SMBus transaction with the Packet Error Checking phase appended.<br>For writes, the value of the PEC byte is transferred from the PEC Register.<br>For reads, the PEC byte is loaded in to the PEC Register. When this bit is cleared to 0, the SMBus host controller does not perform the transaction with the PEC phase appended.<br>This bit must be written prior to the write in which the START bit is set.<br><br>**Power Well:** Core |
| 6 | 0x0<br>RW | **START:** This write-only bit is used to initiate the command described in the SMB_CMD field.<br>All registers should be setup prior to writing a 1 to this bit position.<br>This bit always reads zero.<br>The HOST_BUSY bit in the Host Status register (offset 00h) can be used to identify when the SMBus Controller has finished the command.<br><br>**Power Well:** Core |
| 5 | 0x0<br>RW | **LAST_BYTE:** Used for I2C Read commands as an indication that the next byte will be the last one to be received for that block.<br>The algorithm and usage model for this bit will be as follows (assume a message of n bytes):<br>• A. When the software sees the BYTE_DONE_STS bit set (bit 7 in the SMBus Host Status Register) for each of bytes 1 through n-2 of the message, the software should then read the Block Data Byte Register to get the byte that was just received.<br>• B. After reading each of bytes 1 to n-2 of the message, the software will then clear the BYTE_DONE_STS bit.<br>• C. After receiving byte n-1 of the message, the software will then set the LAST BYTE bit. The software will then clear the BYTE_DONE_STS bit.<br>• D. The SoC will then receive the last byte of the message (byte n). However, the controller state machine will see the LAST BYTE bit set, and instead of sending an ACK after receiving the last byte, it will instead send a NAK.<br>• E. After receiving the last byte (byte n), the software will still clear the BYTE_DONE_STS bit. However, the LAST_BYTE bit will be irrelevant at that point.<br>***Note:*** This bit may be set when the TCO timer causes the SECOND_TO_STS bit to be set. See the TCO2_STS Register in Volume 1, bit 1 for more details on that bit.<br>The SMBus device driver should clear the LAST_BYTE bit (if it is set) before starting any new command.<br>***Note:*** In addition to I2C Read Commands, the LAST_BYTE bit will also cause Block Read/Write cycles to stop prematurely (at the end of the next byte).<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 4:2 | 0x0<br>RW | **SMB_CMD:** As shown by the bit encoding below, indicates which command the SMBus Host is to perform.<br>If enabled, the SoC will generate an interrupt or SMI# when the command has completed If the value is for a non-supported or reserved command, the SoC will set the device error (DEV_ERR) status bit and generate an interrupt when the START bit is set.<br>The controller will perform no command, and will not operate until DEV_ERR is cleared.<br>Val - Command Description:<br>• 000 - Quick: The slave address and read/write value (bit 0) are stored in the tx slave address register.<br>• 001 - Byte: This command uses the transmit slave address and command registers. Bit 0 of the slave address register determines if this is a read or write command.<br>• 010 - Byte Data: This command uses the transmit slave address, command, and DATA0 registers. Bit 0 of the slave address register determines if this is a read or write command. If it is a read, the DATA0 register will contain the read data.<br>• 011 - Word Data: This command uses the transmit slave address, command, DATA0 and DATA1 registers. Bit 0 of the slave address register determines if this is a read or write command. If it is a read, after the command completes the DATA0 and DATA1 registers will contain the read data.<br>• 100 - Process Call: This command uses the transmit slave address, command, DATA0 and DATA1 registers. Bit 0 of the slave address register determines if this is a read or write command. After the command completes, the DATA0 and DATA1 registers will contain the read data.<br>• 101 - Block: This command uses the transmit slave address, command, and DATA0 registers, and the Block Data Byte register. For block write, the count is stored in the DATA0 register and indicates how many bytes of data will be transferred. For block reads, the count is received and stored in the DATA0 register. Bit 0 of the slave address register selects if this is a read or write command. For writes, data is retrieved from the first n (where n is equal to the specified count) addresses of the SRAM array. For reads, the data is stored in the Block Data Byte register.<br>• 110 - I2C Read: This command uses the transmit slave address, command, DATA0, DATA1 registers, and the Block Data Byte register. The read data is stored in the Block Data Byte register. The SMBus Controller will continue reading data until the NAK is received.<br>• 111 - Block-Process: This command uses the transmit slave address, command, DATA0 and the Block Data Byte register. For block write, the count is stored in the DATA0 register and indicates how many bytes of data will be transferred. For block read, the count is received and stored in the DATA0 register. Bit 0 of the slave address register always indicate a write command. For writes, data is retrieved from the first m (where m is equal to the specified count) addresses of the SRAM array. For reads, the data is stored in the Block Data Byte register.<br>***Note:*** E32B bit in the Auxiliary Control Register must be set for this command to work.<br><br>**Power Well:** Core |
| 1 | 0x0<br>RW | **KILL:** When set, kills the current host transaction taking place, sets the FAILED status bit, and asserts the interrupt (or SMI#) selected by the SMB_INTRSEL field.<br>This bit, once set, must be cleared to allow the SMB Host Controller to function normally.<br><br>**Power Well:** Core |
| 0 | 0x0<br>RW | **INTREN:** Enable the generation of an interrupt or SMI# upon the completion of the command.<br><br>**Power Well:** Core |

## 59.4.3 Host Command Register (HCMD)—Offset 3h

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [SBA] + 3h

**SBA Type:** PCI Configuration Register (Size: 32 bits)
**SBA Reference:** [B:0, D:31, F:4] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Host Command Register (HCMD):** This eight bit field is transmitted by the host controller in the command field of the SMB protocol during the execution of any command.<br><br>**Power Well:** Core |

## 59.4.4 Transmit Slave Address Register (TSA)—Offset 4h

This register is transmitted by the host controller in the slave address field of the SMB protocol. This is the address of the target.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [SBA] + 4h

**SBA Type:** PCI Configuration Register (Size: 32 bits)
**SBA Reference:** [B:0, D:31, F:4] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:1 | 0x0<br>RW | **ADDRESS (ADDR):** 7-bit address of the targeted slave.<br>***Note:*** Writes to TSA values of A0h - AEh are blocked depending on the setting of the SPD write disable bit in HCFG - HostConfiguration.<br><br>**Power Well:** Core |
| 0 | 0x0<br>RW | **RW:** Direction of the host transfer.<br>• 1 = Read.<br>• 0 = Write.<br><br>**Power Well:** Core |

## 59.4.5 Data 0 Register (HD0)—Offset 5h

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [SBA] + 5h

**SBA Type:** PCI Configuration Register (Size: 32 bits)
**SBA Reference:** [B:0, D:31, F:4] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **DATA0/COUNT (DATA0_COUNT):** This field contains the eight bit data sent in the DATA0 field of the SMB protocol.<br>For block write commands, this register reflects the number of bytes to transfer.<br>This register should be programmed to a value between 1 and 32 for block counts.<br>A count of 0 or a count above 32 will result in unpredictable behavior.<br>The host controller does not check or log illegal block counts.<br><br>**Power Well:** Core |

## 59.4.6 Data 1 Register (HD1)—Offset 6h

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [SBA] + 6h

**SBA Type:** PCI Configuration Register (Size: 32 bits)
**SBA Reference:** [B:0, D:31, F:4] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **DATA1:** This eight bit register is transmitted in the DATA1 field of the SMB protocol during the execution of any command.<br><br>**Power Well:** Core |

## 59.4.7 Host Block Data (HBD)—Offset 7h

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [SBA] + 7h

**SBA Type:** PCI Configuration Register (Size: 32 bits)
**SBA Reference:** [B:0, D:31, F:4] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Block Data (BDTA):** This is either a register, or a pointer into a 32- byte block array, depending upon whether the E32B bit is set in the Auxiliary Control register.<br>When the E32B bit is cleared, this is a register containing a byte of data to be sent on a block write or read from on a block read, just as it behaved on the SoC.<br>When the E32B bit is set, reads and writes to this register are used to access the 32-byte block data storage array.<br>An internal index pointer is used to address the array, which is reset to 0 by reading the HCTL register (offset 02h).<br>The index pointer then increments automatically upon each access to this register.<br>The transfer of block data into (read) or out of (write) this storage array during an SMBus transaction always starts at index address 0.<br>When the E2B bit is set, for writes, software will write up to 32-bytes to this register as part of the setup for the command.<br>After the Host Controller has sent the Address, Command, and Byte Count fields, it will send the bytes in the SRAM pointed to by this register.<br>When the E2B bit is cleared for writes, software will place a single byte in this register.<br>After the host controller has sent the address, command, and byte count fields, it will send the byte in this register.<br>If there is more data to send, software will write the next series of bytes to the SRAM pointed to by this register and clear the DONE_STS bit.<br>The controller will then send the next byte.<br>During the time between the last byte being transmitted to the next byte being transmitted, the controller will insert wait-states on the interface.<br>When the E2B bit is set for reads, after receiving the byte count into the Data0 register, the first series of data bytes go into the SRAM pointed to by this register.<br>If the byte count has been exhausted or the 32-byte SRAM has been filled, the controller will generate an SMI# or interrupt (depending on configuration) and set the DONE_STS bit.<br>Software will then read the data. During the time between when the last byte is read from the SRAM to when the DONE_STS bit is cleared, the controller will insert wait states on the interface.<br><br>**Power Well:** Core |

## 59.4.8 Packet Error Check Data Register (PEC)—Offset 8h

*Note:* This register may reside in either the core well or the suspend well.

To simplify the implementation, this register will be in the suspend well with the suspend well version of PCI reset (URST33B). This register contains the 8-bit CRC value that is used as the Packet Error Check on SMBus. For writes, this register is written by software prior to running the command. For reads, this register is read by software after the read command is completed on SMBus.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [SBA] + 8h

**SBA Type:** PCI Configuration Register (Size: 32 bits)
**SBA Reference:** [B:0, D:31, F:4] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **PEC_DATA:** This 8-bit register is written with the SMBus PEC data prior to a write transaction. For read transactions, the PEC data is loaded from the SMBus into this register and is then read by software.<br>Software must ensure that the INUSE_STS bit is properly maintained to avoid having this field over-written by a write transaction following a read transaction.<br><br>**Power Well:** Core |

## 59.4.9 Receive Slave Address Register (RSA)—Offset 9h

**Type:** I/O Register
(Size: 8 bits)

**Default:** 44h

**BAR and Offset:** [SBA] + 9h

**SBA Type:** PCI Configuration Register (Size: 32 bits)
**SBA Reference:** [B:0, D:31, F:4] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Resume |
| 6:0 | 0x44<br>RW | **SLAVE_ADDR[6:0] (SA_6_0):** This field is the slave address that the SMBus Host decodes for read and write cycles.<br>The default is not 0 so that it can respond even before the CPU comes up (or if the CPU is dead).<br>This register is reset by RSMRST#, but not by PLTRST#.<br><br>**Power Well:** Resume |

## 59.4.10 Slave Data Register (SD)—Offset Ah

**Type:** I/O Register
(Size: 16 bits)

**Default:** 0000h

**BAR and Offset:** [SBA] + Ah

**SBA Type:** PCI Configuration Register (Size: 32 bits)
**SBA Reference:** [B:0, D:31, F:4] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:0 | 0x0<br>RO/V | **SLAVE_DATA[15:0] (SD_15_0):** This field is the 16-bit data value written by the external SMBus master.<br>The CPU can then read the value from this register.<br>This register is reset by RSMRST#, but not by PLTRST#.<br>• SLAVE_DATA [15:8] corresponds to the Data Message Byte 1 at Slave Write Register 5 in the table.<br>• SLAVE_DATA [7:0] corresponds to the Data Message Byte 0 at Slave Write Register 4 in the table.<br><br>**Power Well:** Resume |

## 59.4.11 Auxiliary Status (AUXS)—Offset Ch

All bits in this register are in the core well.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [SBA] + Ch

**SBA Type:** PCI Configuration Register (Size: 32 bits)
**SBA Reference:** [B:0, D:31, F:4] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:5 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 4 | 0x0<br>RO/V | **SMT3EN:** Register value determines if SMT3 is enabled and connected on SMLink1.<br>Disabled means the device is not connected to the pins.<br>• 0: Disable.<br>• 1: Enable.<br><br>**Power Well:** Core |
| 3 | 0x0<br>RO/V | **SMT2EN:** Register value determines if SMT2 is enabled and connected on SMLink0.<br>Disabled means the device is not connected to the pins.<br>• 0: Disable.<br>• 1: Enable.<br><br>**Power Well:** Core |
| 2 | 0x0<br>RO/V | **SMT1EN:** Register value determines if SMT1 is enabled and connected on SMBus.<br>Disabled means the device is not connected to the pins.<br>• 0: Disables.<br>• 1: Enable.<br><br>**Power Well:** Core |
| 1 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved.<br><br>**Power Well:** Core |
| 0 | 0x0<br>RW/1C | **CRC Error (CRCE):** This bit is set if a received message contained a CRC error.<br>When this bit is set, the DERR bit of the host status register will also be set.<br>This bit will be set by the controller if a software abort occurs in the middle of the CRC portion of the cycle or an abort happens after SMBus Host has received the final data bit transmitted by external slave.<br><br>**Power Well:** Core |

## 59.4.12 Auxiliary Control (AUXC)—Offset Dh

All bits in this register are in the resume well.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [SBA] + Dh

**SBA Type:** PCI Configuration Register (Size: 32 bits)
**SBA Reference:** [B:0, D:31, F:4] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:2 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Resume |
| 1 | 0x0<br>RW | **Enable 32-byte Buffer (E32B):** When set, the Host Block Data register is a pointer into a 32-byte buffer, as opposed to a single register.<br>This enables the block commands to transfer or receive up to 32-bytes before the SoC generates an interrupt.<br><br>**Power Well:** Resume |
| 0 | 0x0<br>RW | **Automatically Append CRC (AAC):** When set, the SoC will automatically append the CRC.<br>This bit must not be changed during SM Bus transactions, or undetermined behavior will result.<br>It should be programmed only once during the lifetime of the function.<br><br>**Power Well:** Resume |

## 59.4.13 SMLINK_PIN_CTL Register (SMLC)—Offset Eh

*Note:* This register is in the resume well and is reset by RSMRST#.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 04h

**BAR and Offset:** [SBA] + Eh

**SBA Type:** PCI Configuration Register (Size: 32 bits)
**SBA Reference:** [B:0, D:31, F:4] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:3 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Resume |
| 2 | 0x1<br>RW | **SMLINK_CLK_CTL:**<br>• 0 = SMBus Controller will drive the SMLINK[0] pin low, independent of what the other SMLINK logic would otherwise indicate for the SMLINK(0) pin.<br>• 1 = The SMLINK[0] pin is Not overdriven low. The other SMLINK logic controls the state of the pin.<br><br>**Power Well:** Resume |
| 1 | 0x0<br>RO/V | **SMLINK[1]_CUR_STS (SMLINK1_CUR_STS):** This bit has a default value that is dependent on an external signal level.<br>This returns the value on the SMLINK[1] pin.<br>It will be 1 to indicate high, 0 to indicate low.<br>This allows software to read the current state of the pin.<br><br>**Power Well:** Resume |
| 0 | 0x0<br>RO/V | **SMLINK[0]_CUR_STS (SMLINK0_CUR_STS):** This bit has a default value that is dependent on an external signal level.<br>This returns the value on the SMLINK[0] pin.<br>It will be 1 to indicate high, 0 to indicate low.<br>This allows software to read the current state of the pin.<br><br>**Power Well:** Core |

## 59.4.14 SMBUS_PIN_CTL Register (SMBC)—Offset Fh

*Note:* This register is in the resume well and is reset by RSMRST#.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 04h

**BAR and Offset:** [SBA] + Fh

**SBA Type:** PCI Configuration Register (Size: 32 bits)
**SBA Reference:** [B:0, D:31, F:4] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:3 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Resume |
| 2 | 0x1<br>RW | **SMBCLK_CTL:**<br>• 0 = SMBus Controller will drive the SMBCLK pin low, independent of what the other SMB logic would otherwise indicate for the SMBCLK pin.<br>• 1 = The SMBCLK pin is Not overdriven low.<br>The other SMBus logic controls the state of the pin.<br><br>**Power Well:** Resume |
| 1 | 0x0<br>RO/V | **SMBDATA_CUR_STS:** This bit has a default value that is dependent on an external signal level.<br>This returns the value on the SMBDATA pin.<br>It will be 1 to indicate high, 0 to indicate low.<br>This allows software to read the current state of the pin.<br><br>**Power Well:** Resume |
| 0 | 0x0<br>RO/V | **SMBCLK_CUR_STS:** This bit has a default value that is dependent on an external signal level.<br>This returns the value on the SMBCLK pin.<br>It will be 1 to indicate high, 0 to indicate low.<br>This allows software to read the current state of the pin.<br><br>**Power Well:** Resume |

## 59.4.15 Slave Status Register (SSTS)—Offset 10h

All bits in this register are implemented in the 64 kHz clock domain. Therefore, software must poll the register until a write takes effect before assuming that a write has completed internally.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [SBA] + 10h

**SBA Type:** PCI Configuration Register (Size: 32 bits)
**SBA Reference:** [B:0, D:31, F:4] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:1 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Resume |
| 0 | 0x0<br>RW/1C | **HOST_NOTIFY_STS (HNS):** The SMBus Controller sets this bit to a 1 when it has completely received a successful Host Notify Command on the SMBus pins.<br>Software reads this bit to determine that the source of the interrupt or SMI# was the reception of the Host Notify Command.<br>Software clears this bit after reading any information needed from the Notify address and data registers by writing a 1 to this bit.<br>***Note:*** The SMBus Controller will allow the Notify Address and Data registers to be over-written once this bit has been cleared.<br>When this bit is 1, the SMBus Controller will NACK the first byte (host address) of any new Host Notify commands on the SMBus.<br>Writing a 0 to this bit has no effect.<br><br>**Power Well:** Resume |

## 59.4.16 Slave Command Register (SCMD)—Offset 11h

All bits in this register are implemented in the 64 kHz clock domain. Therefore, software must poll the register until a write takes effect before assuming that a write has completed internally. Also, software must confirm the prior written value before writing to the register again.

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [SBA] + 11h

**SBA Type:** PCI Configuration Register (Size: 32 bits)
**SBA Reference:** [B:0, D:31, F:4] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:3 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Resume |
| 2 | 0x0<br>RW | **SMBALERT_DIS (SMB_D):** Software sets this bit to 1 to block the generation of the interrupt or SMI# due to the SMBALERT# source.<br>This bit is logically inverted and ANDed with the SMBALERT_STS bit.<br>The resulting signal is distributed to the SMI# and/or interrupt generation logic.<br>This bit does not effect the wake logic.<br><br>**Power Well:** Resume |
| 1 | 0x0<br>RW | **HOST_NOTIFY_WKEN (HNW):** Software sets this bit to 1 to enable the reception of a Host Notify command as a wake event.<br>When enabled this event is ORed in with the other SMBus wake events and is reflected in the SMB_WAK_STS bit of the General Purpose Event 0 Status register.<br><br>**Power Well:** Resume |
| 0 | 0x0<br>RW | **HOST_NOTIFY_INTREN (HNI):** Software sets this bit to 1 to enable the generation of interrupt or SMI# when HOST_NOTIFY_STS is 1.<br>This enable does not affect the setting of the HOST_NOTIFY_STS bit.<br>When the interrupt is generated, either PIRQB or SMI# is generated, depending on the value of the SMB_SMI_EN bit (D31, F3, Off40h, B1).<br>If the HOST_NOTIFY_STS bit is set when this bit is written to a 1, then the interrupt (or SMI#) will be generated.<br>The interrupt (or SMI#) is logically generated by ANDing the STS and INTREN bits.<br><br>**Power Well:** Resume |

## 59.4.17 Notify Device Address Register (NDA)—Offset 14h

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [SBA] + 14h

**SBA Type:** PCI Configuration Register (Size: 32 bits)
**SBA Reference:** [B:0, D:31, F:4] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:1 | 0x0<br>RO/V | **DEVICE_ADDRESS (Dev_Addr):** This field contains the 7-bit device address received during the Host Notify protocol of the SMBus 2.0 specification.<br>Software should only consider this field valid when the HOST_NOTIFY_STS bit is set to 1.<br><br>**Power Well:** Resume |
| 0 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Resume |

## 59.4.18 Notify Data Low Byte Register (NDLB)—Offset 16h

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [SBA] + 16h

**SBA Type:** PCI Configuration Register (Size: 32 bits)
**SBA Reference:** [B:0, D:31, F:4] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO | **DATA_LOW_BYTE (DLB):** This field contains the first (low) byte of data received during the Host Notify protocol of the SMBus 2.0 specification.<br>Software should only consider this field valid when the HOST_NOTIFY_STS bit is set to 1.<br><br>**Power Well:** Resume |

## 59.4.19 Notify Data High Byte Register (NDHB)—Offset 17h

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [SBA] + 17h

**SBA Type:** PCI Configuration Register (Size: 32 bits)
**SBA Reference:** [B:0, D:31, F:4] + 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RO | **DATA_HIGH_BYTE (DHB):** This field contains the second (high) byte of data received during the Host Notify protocol of the SMBus 2.0 specification.<br>Software should only consider this field valid when the HOST_NOTIFY_STS bit is set to 1.<br><br>**Power Well:** Resume |

## 59.5 Registers in I/O Space—TCOBASE

These registers are accessed in Host I/O Space starting at the relocatable I/O address defined by the Base Address Register (BAR) TCOBASE described in Section 59.2.17, "TCO Base Address (TCOBASE)—Offset 50h" on page 2763.

### 59.5.1 TCO_RLD Register (TRLD)—Offset 0h

**Type:** I/O Register
(Size: 16 bits)

**Default:** 0004h

**BAR and Offset:** [TCOBASE] + 0h

**TCOBASE Type:** PCI Configuration Register (Size: 32 bits)
**TCOBASE Reference:** [B:0, D:31, F:4] + 50h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:10 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 9:0 | 0x4<br>RW | **TCORLD:** Reading this register will return the current count of the TCO timer.<br>Writing any value to this register will reload the timer to prevent the timeout.<br><br>**Power Well:** Core |

### 59.5.2 TCO_DAT_IN Register (TDI)—Offset 2h

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [TCOBASE] + 2h

**TCOBASE Type:** PCI Configuration Register (Size: 32 bits)
**TCOBASE Reference:** [B:0, D:31, F:4] + 50h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **TCO_DAT_IN (TDI):** Data Register for passing commands from the OS to the SMI handler.<br>Writes to this register will cause an SMI and set the OS_TCO_SMI bit in the TCO_STS register.<br><br>**Power Well:** Core |

## 59.5.3 TCO_DAT_OUT Register (TDO)—Offset 3h

**Type:** I/O Register
(Size: 8 bits)

**Default:** 00h

**BAR and Offset:** [TCOBASE] + 3h

**TCOBASE Type:** PCI Configuration Register (Size: 32 bits)
**TCOBASE Reference:** [B:0, D:31, F:4] + 50h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **TCO_DAT_OUT (TDO):** Data Register for passing commands from the SMI handler to the OS. Writes to this register will set the TCO_INT_STS bit in the TCO_STS register. It also causes an interrupt, as selected by the TCO_IRQ_SEL bits.<br><br>**Power Well:** Core |

## 59.5.4 TCO1_STS Register (TSTS1)—Offset 4h

Unless otherwise indicated, these bits are sticky and are cleared by writing a 1 to the corresponding bit position.

**Type:** I/O Register
(Size: 16 bits)

**Default:** 0000h

**BAR and Offset:** [TCOBASE] + 4h

**TCOBASE Type:** PCI Configuration Register (Size: 32 bits)
**TCOBASE Reference:** [B:0, D:31, F:4] + 50h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:14 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 13 | 0x0<br>RO | **TCO Slave Select (TCO_SLVSEL):** This register bit indicates the value of TCO Slave Select Soft Strap.<br>Refer to the Section 19, "Serial Peripheral Interface (SPI)" on page 592 for details.<br><br>**Power Well:** Core |
| 12 | 0x0<br>RW/1C | **CPUSERR_STS:** Reserved<br><br>**Power Well:** Core |
| 11 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved.<br><br>**Power Well:** Core |
| 10 | 0x0<br>RW/1C | **CPUSMI_STS:** Reserved<br><br>**Power Well:** Core |
| 9 | 0x0<br>RW/1C | **CPUSCI_STS:** Reserved<br><br>**Power Well:** Core |
| 8 | 0x0<br>RW/1C | **BIOSWR_STS:** The SoC sets this bit to 1 and generates and SMI# to indicate an illegal attempt to write to the BIOS. (The BIOS write could be either to FirmwareHUB (FWH) or SPI Flash). This occurs when either:<br>• a) The WP bit (10.1.7.4 bit 0) is changed from 0 to 1 and the LE bit (10.1.7.4 bit 1) is also set.<br>• b) Any write is attempted to the BIOS and the WP bit is also set.<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RW/1C | **NEWCENTURY_STS:** This bit will be set when the year rolls over from 1999 to 2000.<br>If the bit is already 1, it will remain 1.<br>This bit can be cleared either by software writing a 1 back to the bit position, or by RTEST# going active.<br>When this bit is set, an SMI# will be generated. However, this will not be a wake event.<br>***Note:*** This bit 7 is not valid when the RTC battery is first put in (or if the RTC battery does not provide sufficient power when the system is unplugged).<br><br>**Power Well:** Core |
| 6:4 | 0x0<br>RO | **Reserved (RSVD_2):** Reserved.<br><br>**Power Well:** Core |
| 3 | 0x0<br>RW/1C | **TIMEOUT:** Bit set to 1 by the SoC to indicate that the SMI was caused by TCO timer reaching 0.<br>***Note:*** The SMI handler should clear this bit to prevent an immediate re-entry to the SMI handler.<br><br>**Power Well:** Core |
| 2 | 0x0<br>RW/1C | **TCO_INT_STS:** Bit set to 1 when SMI handler caused the interrupt by writing to the TCO_DAT_OUT register.<br><br>**Power Well:** Core |
| 1 | 0x0<br>RW/1C | **OS_TCO_SMI:** Bit set to 1 when OS code caused an SMI# by writing to the TCO_DAT_IN register.<br><br>**Power Well:** Core |
| 0 | 0x0<br>RO/V | **NMI2SMI_STS:** This bit is set when an SMI# occurs because an event occurred that would otherwise have caused an NMI.<br><br>**Power Well:** Core |

## 59.5.5 TCO2_STS Register (TSTS2)—Offset 6h

**Type:** I/O Register
(Size: 16 bits)

**Default:** 0000h

**BAR and Offset:** [TCOBASE] + 6h

**TCOBASE Type:** PCI Configuration Register (Size: 32 bits)
**TCOBASE Reference:** [B:0, D:31, F:4] + 50h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:5 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Resume |
| 4 | 0x0<br>RW/1C | **SMLINK_SLAVE_SMI_STS:** Reserved<br><br>**Power Well:** Resume |
| 3:2 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved.<br><br>**Power Well:** Resume |
| 1 | 0x0<br>RW/1C | **SECOND_TO_STS:** The SoC sets this bit to 1 to indicate that the TIMEOUT bit had been (or is currently) set and a second timeout occurred before the TCO_RLD register was written.<br>If this bit is set and the NO_REBOOT config bit is 0, then the SoC will reboot the system after the second timeout.<br>The reboot is done by asserting PLTRST#.<br>This bit is only cleared by writing a 1 to this bit or by a RSMRST#.<br><br>**Power Well:** Resume |
| 0 | 0x0<br>RW/1C | **INTRD_DET:** Intruder Detect. Bit set to 1 by the SoC to indicate that an intrusion was detected.<br>This is latched. This bit is cleared by writing a 1 to this bit or by RTEST#.<br>This bit is backed in the RTC Well.<br>***Note:*** If the INTRUDER# signal is active when the software attempts to clear the INTRD_DET bit, the bit will remain as a 1, and the SMI# will be generated again immediately.<br><br>**Power Well:** Resume |

## 59.5.6 TCO1_CNT Register (TCTL1)—Offset 8h

**Type:** I/O Register
(Size: 16 bits)

**Default:** 0000h

**BAR and Offset:** [TCOBASE] + 8h

**TCOBASE Type:** PCI Configuration Register (Size: 32 bits)
**TCOBASE Reference:** [B:0, D:31, F:4] + 50h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:13 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 12 | 0x0<br>RW | **TCO_LOCK:** When set to 1, this bit prevents writes from changing the TCO_EN bit (in offset 30h of Power Management I/O space).<br>Once this bit is set to 1, it can not be cleared by software writing a 0 to this bit location.<br>A core-well reset is required to change this bit from 1 to 0. This bit defaults to 0.<br><br>**Power Well:** Core |
| 11 | 0x0<br>RW | **TCO_TMR_HALT:** 1 = The TCO timer will halt.<br>It will not count, and thus cannot reach a value that would cause an SMI# or to cause the SECOND_TO_STS bit to be set.<br>This will also prevent rebooting.<br>• 0 = The TCO timer is enabled to count. This is the default.<br><br>**Power Well:** Core |
| 10 | 0x0<br>RW | **SEND_NOW:** Reserved.<br>**Power Well:** Core |
| 9 | 0x0<br>RW | **NMI2SMI_EN:** Setting this bit "1" forces all NMIs to instead cause an SMI#, and will be reported in the TCO1_STS register. This bit is set and the NMI_EN# bit is set to "0", the NMI# will be routed to cause an SMI#. No NMI# will be caused. However, if the GL_SMI_EN bit is not set, then no SMI# will be generated either. If this bit is set but the NMI_EN# bit is set to "1", then no NMI nor SMI# will be generated.<br><br>The following shows the possible combination:<br>• NMI_EN#, GBL_SMI_EN 00: No SMI# based on NMI events ( since no EMI# at all because SMI_EN =0)<br>• NMI_EN#, GBL_SMI_EN 01: SMI# will be caused based on NMI events<br>• NMI_EN#, GBL_SMI_EN 10: No SMI# at all because SMI_EN is 0<br>• NMI_EN#, GBL_SMI_EN 11: No SMI# based on NMI events because NMI_EN#=1<br><br>**Power Well:** Core |
| 8 | 0x0<br>RW | **NMI_NOW:** Writing a 1 to this bit causes an NMI. this allows the BIOS or SMI handler to force entry to the NMI handler. The NMI handler is expected to clear this bit. Another NMI will not be generated until the bit is cleared by writing a 1 back to the same bit position.<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved.<br><br>**Power Well:** Core |

## 59.5.7 TCO2_CNT Register (TCTL2)—Offset Ah

**Type:** I/O Register
(Size: 16 bits)

**Default:** 0008h

**BAR and Offset:** [TCOBASE] + Ah

**TCOBASE Type:** PCI Configuration Register (Size: 32 bits)
**TCOBASE Reference:** [B:0, D:31, F:4] + 50h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:6 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Resume |
| 5:4 | 0x0<br>RW | **OS_POLICY:** OS-based software writes to these bits to select the policy that the BIOS will use after the platform resets due the WDT.<br>The following convention is recommended for the BIOS and OS:<br>• 00 Boot normally.<br>• 01 Shut down.<br>• 10 Don’t load OS. Hold in pre-boot state and use LAN to determine next step.<br>• 11 Reserved Implementation.<br>***Note:*** These are just scratch pad bits. They should not be reset when the TCO logic resets the platform due to Watchdog Timer.<br><br>**Power Well:** Resume |
| 3 | 0x1<br>RW | **SMB_ALERT_DISABLE:** Disables GP/SMBALERT# as an alert source for the heartbeats and the SMBus slave.<br>At reset (RSMRST# pin assertion only), this bit is set and the muxed GP/SMBALERT# are disabled.<br><br>**Power Well:** Resume |
| 2:1 | 0x0<br>RW | **INTRD_SEL:** Selects the action to take if the INTRUDER# signal goes active.<br>• 11 Reserved.<br>• 01 Interrupt. For IRQ routing see Section 59.6.1, “TCO Configuration (TCOCFG)—Offset 0h” on page 2801.<br>• 10 SMI#.<br>• 00 INTRUDER# doesn't cause SMI# or interrupt.<br><br>**Power Well:** Resume |
| 0 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved.<br><br>**Power Well:** Resume |

## 59.5.8 LEGACY_ELIM Register (LE)—Offset 10h

**Type:** I/O Register
(Size: 8 bits)

**Default:** 03h

**BAR and Offset:** [TCOBASE] + 10h

**TCOBASE Type:** PCI Configuration Register (Size: 32 bits)
**TCOBASE Reference:** [B:0, D:31, F:4] + 50h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:2 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 1 | 0x1<br>RW | **IRQ12_CAUSE:** When software sets the bit to 1, IRQ12 will be high (asserted).<br>When software sets the bit to 0, IRQ12 will be low (not asserted).<br>Default for this bit is 1.<br><br>**Power Well:** Core |
| 0 | 0x1<br>RW | **IRQ1_CAUSE:** When software sets the bit to 1, IRQ1 will be high (asserted).<br>When software sets the bit to 0, IRQ1 will be low (not asserted).<br>Default for this bit is 1.<br><br>**Power Well:** Core |

## 59.5.9 TCO_TMR Register (TTMR)—Offset 12h

**Type:** I/O Register
(Size: 16 bits)

**Default:** 0004h

**BAR and Offset:** [TCOBASE] + 12h

**TCOBASE Type:** PCI Configuration Register (Size: 32 bits)
**TCOBASE Reference:** [B:0, D:31, F:4] + 50h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:10 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 9:0 | 0x4<br>RW | **TCOTMR:** Value that is loaded into the timer each time the TCO_RLD register is written.<br>Values of 0000h or 0001h will be ignored and should not be attempted.<br>The timer is clocked at approximately 0.6 seconds, and thus allows timeouts ranging from 1.2 second to 613.8 seconds.<br>***Note:*** The timer has an error of +/- 1 tick (0.6s).<br><br>**Power Well:** Core |

## 59.6 Sideband Registers—Host SMBus Private Configuration

The Sideband registers accessible to the Host are described here. They are accessible in Host Memory Space starting at the Sideband Base Address Register (SBREG_BAR). See Section 3.4.1, "Using SBREG_BAR Method" on page 187.

### 59.6.1 TCO Configuration (TCOCFG)—Offset 0h

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0xCF] + 0h
**Host Memory Space:** SBREG_BAR + 0xCF0000 + 0h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 7 | 0x0<br>RW | **TCO IRQ Enable (IE):** When set, TCO IRQ is enabled, as selected by the TCO_IRQ_SEL field. When cleared, TCO IRQ is disabled.<br><br>**Power Well:** Core |
| 6:3 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved.<br><br>**Power Well:** Core |
| 2:0 | 0x0<br>RW | **TCO IRQ Select (IS):** Specifies on which IRQ the TCO will internally appear.<br>If not using the APIC, the TCO interrupt must be routed to IRQ9-11, and that interrupt is not sharable with the SERIRQ stream, but is shareable with other PCI interrupts.<br>If using the APIC, the TCO interrupt can also be mapped to IRQ20-23, and can be shared with other interrupts.<br>Bits TCO Map<br>• 000 IRQ9 (maps to 8259 and APIC).<br>• 001 IRQ10 (maps to 8259 and APIC).<br>• 010 IRQ11 (maps to 8259 and APIC).<br>• 011 Reserved 100 IRQ20 (maps to APIC).<br>• 101 IRQ21 (maps to APIC).<br>• 110 IRQ22 (maps to APIC).<br>• 111 IRQ23 (maps to APIC).<br>If the TCO IRQ is programmed to be routed to both the 8259 and the APIC, only one of these interrupt controllers should be enabled to service the interrupt.<br>When setting the these bits, the TCO IRQ Enable (IE) bit must be cleared to prevent glitching.<br>When the interrupt is mapped to APIC interrupts 9, 10 or 11, the APIC should be programmed for active-high reception.<br>When the interrupt is mapped to APIC interrupts 20 through 23, the APIC should be programmed for active-low reception.<br><br>**Power Well:** Core |

## 59.6.2 General Control (GC)—Offset Ch

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0xCF] + Ch
**Host Memory Space:** SBREG_BAR + 0xCF0000 + Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:3 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 2 | 0x0<br>RW | **SMB Static Clock Gating Enable (SMBSCGE):** SMB cluster static clock gating is enabled.<br>***Note:*** Setting this bit will also clock gate all the TCO logic functionality.<br><br>**Power Well:** Core |
| 1 | 0x0<br>RW | **No Reboot (NR):** This bit is set when the "No TCO Reboot Enable" SoC Hard Pin Strap pin (pin name GPIO[12]) is sampled high on the rising edge of the active-low RSMRST_N SoC signal pin.<br><br>This bit may be set or cleared by software if the Hard Pin Strap is sampled low but may not override the strap when it indicates No TCO Reboot.<br><br>When set, the TCO Watchdog Timer counts down and generates the SMI# on the first timeout, but will not reboot on the second timeout.<br><br>**Power Well:** Core |
| 0 | 0x0<br>RW | **Function Disable (FD):** When set to one, this disables the PCI configuration register space for the SMBus device.<br><br>**Power Well:** Core |

## 59.6.3 Power Control Enable (PCE)—Offset 10h

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0xCF] + 10h
**Host Memory Space:** SBREG_BAR + 0xCF0000 + 10h

**Default:** 00000009h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:6 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 5 | 0x0<br>RW | **Hardware Autonomous Enable (HAE):** When set, the SMB will automatically engage power gating when it has reached its idle condition.<br><br>**Power Well:** Core |
| 4 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved.<br><br>**Power Well:** Core |
| 3 | 0x1<br>RO | **Sleep Enable (SE):** When this bit is clear, the SMB will never assert Sleep to the retention flops. If set, then SMB may assert Sleep during power gating.<br><br>**Power Well:** Core |
| 2 | 0x0<br>RO | **D3-Hot Enable (D3HE):** No support for D3 Hot power gating.<br><br>**Power Well:** Core |
| 1 | 0x0<br>RO | **I3 Enable (I3E):** No support for S0i3 power gating.<br><br>**Power Well:** Core |
| 0 | 0x1<br>RW | **PMC Request Enable (PMCRE):** When set to 1, the SMB will engage power gating if it is idle and the power-gating request is granted by the PMC.<br><br>**Power Well:** Core |

## 59.7 Sideband Registers—CLTT SMBus Configuration Control

The Sideband registers accessible to the Host are described here. They are accessible in Host Memory Space starting at the Sideband Base Address Register (SBREG_BAR). See Section 3.4.1, "Using SBREG_BAR Method" on page 187.

### 59.7.1 CLTT Status (CLTT_STS)—Offset 0h

CLTT Status

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0xCC] + 0h
**Host Memory Space:** SBREG_BAR + 0xCC0000 + 0h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:2 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 1 | 0x0<br>RO/V | **Done (DONE):** Indicates that HW has completed the SMBusCmd.<br><br>**Power Well:** Core |
| 0 | 0x0<br>RO/V | **Busy (BUSY):** Indicates that HW is busy completing an SMBusCmd.<br><br>**Power Well:** Core |

## 59.7.2 Ch0 Dimm0 Cfg Status (C0D0CFGSTS)—Offset 10h

Memory Channel 0 DIMM 0 Configuration and Status Register.

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0xCC] + 10h
**Host Memory Space:** SBREG_BAR + 0xCC0000 + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **Valid (VALID):** Channel DIMM is Populated.<br><br>**Power Well:** Core |
| 30:24 | 0x0<br>RW | **Slave ID (SLAVE_ID):** SMBus Slave ID.<br><br>**Power Well:** Core |
| 23:16 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 15:0 | 0x0<br>RO/V | **Read_Data (READ_DATA):** Data retrieved from SMBus.<br><br>**Power Well:** Core |

## 59.7.3 Ch0 Dimm1 Cfg Status (C0D1CFGSTS)—Offset 14h

Memory Channel 0 DIMM 1 Configuration and Status Register.

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0xCC] + 14h
**Host Memory Space:** SBREG_BAR + 0xCC0000 + 14h

**Default:** 01000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **Valid (VALID):** Channel DIMM is Populated.<br><br>**Power Well:** Core |
| 30:24 | 0x1<br>RW | **Slave ID (SLAVE_ID):** SMBus Slave ID.<br><br>**Power Well:** Core |
| 23:16 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 15:0 | 0x0<br>RO/V | **Read_Data (READ_DATA):** Data retrieved from SMBus.<br><br>**Power Well:** Core |

## 59.7.4 Ch0 Dimm2 Cfg Status (C0D2CFGSTS)—Offset 18h

Memory Channel 0 DIMM 2 Configuration and Status Register.

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0xCC] + 18h
**Host Memory Space:** SBREG_BAR + 0xCC0000 + 18h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **Valid (VALID):** Channel DIMM is Populated.<br><br>**Power Well:** Core |
| 30:24 | 0x0<br>RW | **Slave ID (SLAVE_ID):** SMBus Slave ID.<br><br>**Power Well:** Core |
| 23:16 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 15:0 | 0x0<br>RO/V | **Read_Data (READ_DATA):** Data retrieved from SMBus.<br><br>**Power Well:** Core |

## 59.7.5 Ch0 Dimm3 Cfg Status (C0D3CFGSTS)—Offset 1Ch

Memory Channel 0 DIMM 3 Configuration and Status Register.

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0xCC] + 1Ch
**Host Memory Space:** SBREG_BAR + 0xCC0000 + 1Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **Valid (VALID):** Channel DIMM is Populated.<br><br>**Power Well:** Core |
| 30:24 | 0x0<br>RW | **Slave ID (SLAVE_ID):** SMBus Slave ID.<br><br>**Power Well:** Core |
| 23:16 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 15:0 | 0x0<br>RO/V | **Read_Data (READ_DATA):** Data retrieved from SMBus.<br><br>**Power Well:** Core |

## 59.7.6 Ch1 Dimm0 Cfg Status (C1D0CFGSTS)—Offset 20h

Memory Channel 1 DIMM 0 Configuration and Status Register.

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0xCC] + 20h
**Host Memory Space:** SBREG_BAR + 0xCC0000 + 20h

**Default:** 02000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **Valid (VALID):** Channel DIMM is Populated.<br><br>**Power Well:** Core |
| 30:24 | 0x2<br>RW | **Slave ID (SLAVE_ID):** SMBus Slave ID.<br><br>**Power Well:** Core |
| 23:16 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 15:0 | 0x0<br>RO/V | **Read_Data (READ_DATA):** Data retrieved from SMBus.<br><br>**Power Well:** Core |

## 59.7.7 Ch1 Dimm1 Cfg Status (C1D1CFGSTS)—Offset 24h

Memory Channel 1 DIMM 1 Configuration and Status Register.

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0xCC] + 24h
**Host Memory Space:** SBREG_BAR + 0xCC0000 + 24h

**Default:** 03000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **Valid (VALID):** Channel DIMM is Populated.<br><br>**Power Well:** Core |
| 30:24 | 0x3<br>RW | **Slave ID (SLAVE_ID):** SMBus Slave ID.<br><br>**Power Well:** Core |
| 23:16 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 15:0 | 0x0<br>RO/V | **Read_Data (READ_DATA):** Data retrieved from SMBus.<br><br>**Power Well:** Core |

## 59.7.8 Ch1 Dimm2 Cfg Status (C1D2CFGSTS)—Offset 28h

Memory Channel 1 DIMM 2 Configuration and Status Register.

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0xCC] + 28h
**Host Memory Space:** SBREG_BAR + 0xCC0000 + 28h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **Valid (VALID):** Channel DIMM is Populated.<br><br>**Power Well:** Core |
| 30:24 | 0x0<br>RW | **Slave ID (SLAVE_ID):** SMBus Slave ID.<br><br>**Power Well:** Core |
| 23:16 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 15:0 | 0x0<br>RO/V | **Read_Data (READ_DATA):** Data retrieved from SMBus.<br><br>**Power Well:** Core |

## 59.7.9 Ch1 Dimm3 Cfg Status (C1D3CFGSTS)—Offset 2Ch

Memory Channel 1 DIMM 3 Configuration and Status Register.

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0xCC] + 2Ch
**Host Memory Space:** SBREG_BAR + 0xCC0000 + 2Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **Valid (VALID):** Channel DIMM is Populated.<br><br>**Power Well:** Core |
| 30:24 | 0x0<br>RW | **Slave ID (SLAVE_ID):** SMBus Slave ID.<br><br>**Power Well:** Core |
| 23:16 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 15:0 | 0x0<br>RO/V | **Read_Data (READ_DATA):** Data retrieved from SMBus.<br><br>**Power Well:** Core |

## 59.7.10 Ch0 Dimm Temp Status (C0TEMPSTS0)—Offset 30h

Memory Channel 0 DIMM TSOD Temperature Status Register. This register is protected by SAI WAC #1 and can be locked by CLTT_SMBUS_Mode (CSMBM) register Bit[1].

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0xCC] + 30h
**Host Memory Space:** SBREG_BAR + 0xCC0000 + 30h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW/V/L | **Read_Temp_Data1 (READ_TEMP_DATA1):** Read_Temp_Data1: Data retrieved from DIMM1.<br><br>**Power Well:** Core |
| 15:0 | 0x0<br>RW/V/L | **Read_Temp_Data0 (READ_TEMP_DATA0):** Read_Temp_Data0: Data retrieved from DIMM0.<br><br>**Power Well:** Core |

## 59.7.11 Ch0 Dimm Temp Status (C0TEMPSTS1)—Offset 34h

Memory Channel 0 DIMM TSOD Temperature Status Register. This register is protected by SAI WAC #1 and can be locked by CLTT_SMBUS_Mode (CSMBM) register Bit[1].

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0xCC] + 34h
**Host Memory Space:** SBREG_BAR + 0xCC0000 + 34h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW/V/L | **Read_Temp_Data3 (READ_TEMP_DATA3):** Read_Temp_Data3: Data retrieved from DIMM3.<br><br>**Power Well:** Core |
| 15:0 | 0x0<br>RW/V/L | **Read_Temp_Data2 (READ_TEMP_DATA2):** Read_Temp_Data2: Data retrieved from DIMM2.<br><br>**Power Well:** Core |

## 59.7.12 Ch1 Dimm Temp Status (C1TEMPSTS0)—Offset 38h

Memory Channel 1 DIMM TSOD Temperature Status Register. This register is protected by SAI WAC #1 and can be locked by CLTT_SMBUS_Mode (CSMBM) register Bit[1].

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0xCC] + 38h
**Host Memory Space:** SBREG_BAR + 0xCC0000 + 38h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW/V/L | **Read_Temp_Data1 (READ_TEMP_DATA1):** Read_Temp_Data1: Data retrieved from DIMM1.<br><br>**Power Well:** Core |
| 15:0 | 0x0<br>RW/V/L | **Read_Temp_Data0 (READ_TEMP_DATA0):** Read_Temp_Data0: Data retrieved from DIMM0.<br><br>**Power Well:** Core |

## 59.7.13 Ch1 Dimm Temp Status (C1TEMPSTS1)—Offset 3Ch

Memory Channel 1 DIMM TSOD Temperature Status Register. This register is protected by SAI WAC #1 and can be locked by CLTT_SMBUS_Mode (CSMBM) register Bit[1].

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0xCC] + 3Ch
**Host Memory Space:** SBREG_BAR + 0xCC0000 + 3Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW/V/L | **Read_Temp_Data3 (READ_TEMP_DATA3):** Read_Temp_Data3: Data retrieved from DIMM3.<br><br>**Power Well:** Core |
| 15:0 | 0x0<br>RW/V/L | **Read_Temp_Data2 (READ_TEMP_DATA2):** Read_Temp_Data2: Data retrieved from DIMM2.<br><br>**Power Well:** Core |

## 59.7.14 Host Configuration (HCFG)—Offset 40h

**Type:** Sideband Register
(Size: 8 bits)

**Sideband Port and Offset:** [Port: 0xCC] + 40h
**Host Memory Space:** SBREG_BAR + 0xCC0000 + 40h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:5 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 4 | 0x0<br>RW/O | **SPD Write Disable (SPD_WRITE_DISABLE):** Reserved.<br><br>**Power Well:** Core |
| 3 | 0x0<br>RW/V | **SSRESET:** Soft SMBUS Reset: When this bit is 1, the SMBus state machine and logic is reset. The HW will reset this bit to 0 when reset operation is completed.<br><br>**Power Well:** Core |
| 2 | 0x0<br>RW | **I2C_EN:** When this bit is 1, the SMB Controller is enabled to communicate with I2C devices. This will change the formatting of some commands. When this bit is 0, behavior is for SMBus.<br><br>**Power Well:** Core |
| 1 | 0x0<br>RW | **SMB_SMI_EN:** When this bit is set, any source of an SMB interrupt will instead be routed to generate an SMI#. Refer to Section 6.7 (Interrupts/SMI#) for details.<br><br>**Power Well:** Core |
| 0 | 0x0<br>RW/V | **HST_EN:** When set, the SMB Host Controller interface is enabled to execute commands. The HST_INT_EN bit needs to be enabled in order for the SMB Host Controller to interrupt or SMI#. Additionally, the SMB Host Controller will not respond to any new requests until all interrupt requests have been cleared.<br><br>**Power Well:** Core |

§ §

# 60 SPI Controller - B0, D31, F5

## 60.1 Introduction and Index

The host-accessible registers for the SPI Controller are described here.

To determine the number of devices and functions available refer to the following:

- Table 1-1, "Features by product SKU - Server and Cloud Storage SKUs 0 through 4"
- Table 1-2, "Features by Product SKU - Network and Enterprise Storage SKUs 5 through 10"
- Table 1-3, "Features by Product SKU - Extended Temperature SKUs 11 through 14".

The legend for the register access codes are described in Chapter 43, "Introduction."

### 60.1.1 Host Configuration Space

These registers are discovered in Host Configuration Space starting at Bus 0, Device 31 (decimal), Function 5. The offset addresses and default values are listed.

**Table 60-1. Summary of PCI Configuration Registers—0/31/5**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 0 | 4 | 19E08086 | "Device ID and Vendor ID (BIOS_SPI_DID_VID)—Offset 0h" on page 2815 |
| 4 | 4 | 00000400 | "Status and Command (BIOS_SPI_STS_CMD)—Offset 4h" on page 2816 |
| 8 | 4 | 0C800000 | "Revision ID (BIOS_SPI_CC_RID)—Offset 8h" on page 2818 |
| C | 4 | 00000000 | "BIST, Header Type, Latency Timer, Cache Line Size (BIOS_SPI_BIST_HTYPE_LT_CLS)—Offset Ch" on page 2818 |
| 10 | 4 | 00000000 | "SPI BAR0 MMIO (BIOS_SPI_BAR0)—Offset 10h" on page 2819 |
| 28 | 4 | 00000000 | "Cardbus CIS Pointer (BIOS_SPI_CCP)—Offset 28h" on page 2819 |
| 2C | 4 | 00000000 | "Subsystem and Vendor ID (BIOS_SPI_SID_SVID)—Offset 2Ch" on page 2819 |
| 30 | 4 | 00000000 | "Expansion ROM Base Address (BIOS_SPI_XRBAR)—Offset 30h" on page 2820 |
| 34 | 4 | 00000000 | "Capabilities List Pointer (BIOS_SPI_CAPP)—Offset 34h" on page 2820 |
| D0 | 4 | 00000000 | "SPI Unsupported Request Status (BIOS_SPI_UR_STS_CTL)—Offset D0h" on page 2820 |
| D8 | 4 | 0000FFCF | "BIOS Decode Enable (BIOS_SPI_BDE)—Offset D8h" on page 2821 |
| DC | 4 | 00000028 | "BIOS Control (BIOS_SPI_BC)—Offset DCh" on page 2823 |

## 60.1.2 Host Memory Space—BIOS_SPI_BAR0

An index of the registers that are accessible in Host Memory Space is shown here.

**Table 60-2. Summary of Memory Mapped I/O Registers—BIOS_SPI_BAR0**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 0 | 4 | 00000000 | "SPI BIOS MMIO PRI (BIOS_BFPREG)—Offset 0h" on page 2825 |
| 4 | 4 | 00002000 | "Hardware Sequencing Flash Status and Control (BIOS_HSFSTS_CTL)—Offset 4h" on page 2826 |
| 8 | 4 | 00000000 | "Flash Address (BIOS_FADDR)—Offset 8h" on page 2828 |
| C | 4 | 00000000 | "Discrete Lock Bits (BIOS_DLOCK)—Offset Ch" on page 2829 |
| 10 | 4 | 00000000 | "Flash Data 0 (BIOS_FDATA0)—Offset 10h" on page 2830 |
| 14 | 4 | 00000000 | "Flash Data 1 (BIOS_FDATA1)—Offset 14h" on page 2830 |
| 18 | 4 | 00000000 | "Flash Data 2 (BIOS_FDATA2)—Offset 18h" on page 2830 |
| 1C | 4 | 00000000 | "Flash Data 3 (BIOS_FDATA3)—Offset 1Ch" on page 2831 |
| 20 | 4 | 00000000 | "Flash Data 4 (BIOS_FDATA4)—Offset 20h" on page 2831 |
| 24 | 4 | 00000000 | "Flash Data 5 (BIOS_FDATA5)—Offset 24h" on page 2831 |
| 28 | 4 | 00000000 | "Flash Data 6 (BIOS_FDATA6)—Offset 28h" on page 2832 |
| 2C | 4 | 00000000 | "Flash Data 7 (BIOS_FDATA7)—Offset 2Ch" on page 2832 |
| 30 | 4 | 00000000 | "Flash Data 8 (BIOS_FDATA8)—Offset 30h" on page 2832 |
| 34 | 4 | 00000000 | "Flash Data 9 (BIOS_FDATA9)—Offset 34h" on page 2833 |
| 38 | 4 | 00000000 | "Flash Data 10 (BIOS_FDATA10)—Offset 38h" on page 2833 |
| 3C | 4 | 00000000 | "Flash Data 11 (BIOS_FDATA11)—Offset 3Ch" on page 2833 |
| 40 | 4 | 00000000 | "Flash Data 12 (BIOS_FDATA12)—Offset 40h" on page 2834 |
| 44 | 4 | 00000000 | "Flash Data 13 (BIOS_FDATA13)—Offset 44h" on page 2834 |
| 48 | 4 | 00000000 | "Flash Data 14 (BIOS_FDATA14)—Offset 48h" on page 2834 |
| 4C | 4 | 00000000 | "Flash Data 15 (BIOS_FDATA15)—Offset 4Ch" on page 2834 |
| 50 | 4 | 000042C2 | "Flash Region Access Permissions (BIOS_FRACC)—Offset 50h" on page 2835 |
| 54 | 4 | 00007FFF | "Flash Region 0 (BIOS_FREG0)—Offset 54h" on page 2836 |
| 58 | 4 | 00007FFF | "Flash Region 1 (BIOS_FREG1)—Offset 58h" on page 2836 |
| 5C | 4 | 00007FFF | "Flash Region 2 (BIOS_FREG2)—Offset 5Ch" on page 2837 |
| 60 | 4 | 00007FFF | "Flash Region 3 (BIOS_FREG3)—Offset 60h" on page 2837 |
| 64 | 4 | 00007FFF | "Flash Region 4 (BIOS_FREG4)—Offset 64h" on page 2838 |
| 68 | 4 | 00007FFF | "Flash Region 5 (BIOS_FREG5)—Offset 68h" on page 2838 |
| 6C | 4 | 00007FFF | "Flash Region 6 (BIOS_FREG6)—Offset 6Ch" on page 2839 |
| 70 | 4 | 00007FFF | "Flash Region 7 (BIOS_FREG7)—Offset 70h" on page 2839 |
| 74 | 4 | 00007FFF | "Flash Region 8 (BIOS_FREG8)—Offset 74h" on page 2840 |
| 78 | 4 | 00007FFF | "Flash Region 9 (BIOS_FREG9)—Offset 78h" on page 2840 |
| 7C | 4 | 00000000 | "Flash Region 10 (BIOS_FREG10)—Offset 7Ch" on page 2841 |
| 80 | 4 | 00000000 | "Flash Region 11 (BIOS_FREG11)—Offset 80h" on page 2841 |
| 84 | 4 | 00000000 | "Flash Protected Range 0 (BIOS_FPR0)—Offset 84h" on page 2842 |
| 88 | 4 | 00000000 | "Flash Protected Range 1 (BIOS_FPR1)—Offset 88h" on page 2843 |
| 8C | 4 | 00000000 | "Flash Protected Range 2 (BIOS_FPR2)—Offset 8Ch" on page 2844 |

## Table 60-2. Summary of Memory Mapped I/O Registers—BIOS_SPI_BAR0 (Continued)

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 90 | 4 | 00000000 | "Flash Protected Range 3 (BIOS_FPR3)—Offset 90h" on page 2845 |
| 94 | 4 | 00000000 | "Flash Protected Range 4 (BIOS_FPR4)—Offset 94h" on page 2846 |
| 98 | 4 | 00000000 | "Global Protected Range 0 (BIOS_GPR0)—Offset 98h" on page 2847 |
| A0 | 4 | FE000000 | "Software Sequencing Flash Status and Control (BIOS_SSFSTS_CTL)—Offset A0h" on page 2848 |
| A4 | 4 | 00000000 | "Prefix Opcode and Opcode Type Configuration (BIOS_PREOP_OPTYPE)—Offset A4h" on page 2850 |
| A8 | 4 | 00000000 | "Opcode Menu0 Configuration (BIOS_OPMENU0)—Offset A8h" on page 2851 |
| AC | 4 | 00000000 | "Opcode Menu1 Configuration (BIOS_OPMENU1)—Offset ACh" on page 2852 |
| B0 | 4 | 00000000 | "Secondary Flash Region Access Permissions (BIOS_SFRACC)—Offset B0h" on page 2852 |
| B4 | 4 | 00000000 | "Flash Descriptor Observability Control (BIOS_FDOC)—Offset B4h" on page 2853 |
| B8 | 4 | 00000000 | "Flash Descriptor Observability Data (BIOS_FDOD)—Offset B8h" on page 2854 |
| C0 | 4 | 00000000 | "Additional Flash Control (BIOS_AFC)—Offset C0h" on page 2854 |
| C4 | 4 | 00002000 | "Vendor Specific Component Capabilities for Component 0 (BIOS_SFDP0_VSCC0)—Offset C4h" on page 2855 |
| C8 | 4 | 00002000 | "Vendor Specific Component Capabilities for Component 1 (BIOS_SFDP1_VSCC1)—Offset C8h" on page 2858 |
| CC | 4 | 00000000 | "Parameter Table Index (BIOS_PTINX)—Offset CCh" on page 2860 |
| D0 | 4 | 00000000 | "Parameter Table Data (BIOS_PTDATA)—Offset D0h" on page 2861 |

| 114 | 4 | 00000000 | "RPMC SFDP Table (BIOS_RPMC1_D1)—Offset 114h" on page 2867 |
| 118 | 4 | 000000C2 | "BIOS Master Read Access Permissions (BIOS_BM_RAP)—Offset 118h" on page 2868 |
| 11C | 4 | 00000042 | "BIOS Master Write Access Permissions (BIOS_BM_WAP)—Offset 11Ch" on page 2868 |
| 1B0 | 4 | 00000000 | "IE Flash Protected Range 0 (BIOS_IE_PR0)—Offset 1B0h" on page 2869 |
| 1B4 | 4 | 00000000 | "IE Flash Protected Range 1 (BIOS_IE_PR1)—Offset 1B4h" on page 2870 |
| 1B8 | 4 | 00000000 | "IE Flash Protected Range 2 (BIOS_IE_PR2)—Offset 1B8h" on page 2871 |
| 1BC | 4 | 00000000 | "IE Flash Protected Range 3 (BIOS_IE_PR3)—Offset 1BCh" on page 2872 |
| 1C0 | 4 | 00000000 | "IE Flash Protected Range 4 (BIOS_IE_PR4)—Offset 1C0h" on page 2873 |

## 60.2 Registers in Configuration Space

### 60.2.1 Device ID and Vendor ID (BIOS_SPI_DID_VID)—Offset 0h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:5] + 0h

**Default:** 19E08086h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x19e0<br>RO/V | **Device Identification (DID):** |
| 15:0 | 0x8086<br>RO | **Vendor Identification (VID):** This field identifies the manufacturer of the device. Valid vendor identifiers are allocated by the PCI SIG to ensure uniqueness.<br>0x8086 indicates Intel. |

## 60.2.2 Status and Command (BIOS_SPI_STS_CMD)—Offset 4h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:5] + 4h

**Default:** 00000400h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW/1C/V | **Detected Parity Error (DPE):** Detected Parity Error (DPE). |
| 30 | 0x0<br>RW/1C/V | **Signaled System Error (SSE):** Signaled System Error (SSE). |
| 29 | 0x0<br>RO | **Received Master Abort (RMA):** Received Master Abort (RMA). |
| 28 | 0x0<br>RO | **Received Target Abort (RTA):** Received Target Abort (RTA). |
| 27 | 0x0<br>RW/1C/V | **Signaled Target Abort (STA):** Signaled Target Abort (STA). |
| 26:25 | 0x0<br>RO | **Devsel Timing (DEVT):** Devsel Timing (DEVT). |
| 24 | 0x0<br>RO | **Master Data Parity Error (MDPE):** Master Data Parity Error (MDPE). |
| 23 | 0x0<br>RO | **Fast Back to Back Capable (FBTBC):** Fast Back to Back Capable (FBTBC). |
| 22 | 0x0<br>RO | **Reserved (RSVD0):** Reserved (RSVD). |
| 21 | 0x0<br>RO | **66 MHz Capable (MCAP):** Not 66MHz Capable Device. |
| 20 | 0x0<br>RO | **Capabilities List (CAPL):** Capabilities List. |
| 19 | 0x0<br>RO | **Interrupt Status (INTS):** Interrupt Status. |
| 18:11 | 0x0<br>RO | **Reserved (RSVD1):** Reserved. |
| 10 | 0x1<br>RO | **Interrupt Disable (INTD):** Interrupt Disable. |
| 9 | 0x0<br>RO | **Fast Back to Back Enable (FBTBEN):** Fast Back to Back Enable. |
| 8 | 0x0<br>RW | **System Error Enable (SERREN):** System Error Enable. |
| 7 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 6 | 0x0<br>RW | **Parity Error Response (PERRR):** Parity Error Response. |
| 5 | 0x0<br>RO | **VGA Palette Snoop (VGAPS):** VGA Palette Snoop. |
| 4 | 0x0<br>RO | **Memory Write and Invalidate Enable (MWRIEN):** Memory Write and Invalidate Enable. |
| 3 | 0x0<br>RO | **Special Cycles (SPCYC):** Special Cycles. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 2 | 0x0<br>RW | **Bus Master Enable (BME):** Bus Master Enable. |
| 1 | 0x0<br>RW | **Memory Space Enable (MSE):** Memory Space Enable. |
| 0 | 0x0<br>RO | **IO Space Enable (IOSE):** IO Space Enable. |

## 60.2.3 Revision ID (BIOS_SPI_CC_RID)—Offset 8h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:5] + 8h

**Default:** 0C800000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0xc<br>RO/V | **Base Class Code (BCC):** Base Class Code. |
| 23:16 | 0x80<br>RO/V | **Sub-Class Code (SCC):** Sub-Class Code. |
| 15:8 | 0x0<br>RO/V | **Programming Interface (PI):** Programming Interface. |
| 7:0 | 0x0<br>RO/V | **Revision ID (RID):** Indicates the part revision. |

## 60.2.4 BIST, Header Type, Latency Timer, Cache Line Size (BIOS_SPI_BIST_HTYPE_LT_CLS)—Offset Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:5] + Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 23 | 0x0<br>RO/V | **Multi-function Device (MFD):** Multi-function Device. |
| 22:16 | 0x0<br>RO | **Header Type (HTYPE):** Header Type. |
| 15:8 | 0x0<br>RO | **Latency Timer (LT):** Latency Timer. |
| 7:0 | 0x0<br>RO | **Cacheline Size (CLSZ):** Cacheline Size. |

## 60.2.5 SPI BAR0 MMIO (BIOS_SPI_BAR0)—Offset 10h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:5] + 10h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:12 | 0x0<br>RW | **Memory BAR (MEMBAR):** Software programs this register with the base address of the device's memory region.<br>The Host/BIOS MMIO registers in the flash controller are offset from this BAR. |
| 11:4 | 0x0<br>RO | **Memory Size (MEMSIZE):** Hardwired to 0 to indicate 4KB of memory space. |
| 3 | 0x0<br>RO | **Prefetchable (PREFETCH):** A device can mark a range as prefetchable if there are no side effects on reads, the device returns all bytes on reads regardless of the byte enables.<br>Hardwired to 1 to indicate the device's memory space as prefetchable. |
| 2:1 | 0x0<br>RO | **Type (TYP):** Hardwired to 0 to indicate that Base register is 32 bits wide and mapping can be done anywhere in the 32-bit Memory Space. |
| 0 | 0x0<br>RO | **Memory Space Indicator (MEMSPACE):** Hardwired to 0 to identify a Memory BAR. |

## 60.2.6 Cardbus CIS Pointer (BIOS_SPI_CCP)—Offset 28h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:5] + 28h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |

## 60.2.7 Subsystem and Vendor ID (BIOS_SPI_SID_SVID)—Offset 2Ch

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:5] + 2Ch

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RW/O | **Subsystem ID (SSID):** Subsystem ID. |
| 15:0 | 0x0<br>RW/O | **Subsystem Vendor ID (SSVID):** Subsystem Vendor ID. |

## 60.2.8 Expansion ROM Base Address (BIOS_SPI_XRBAR)—Offset 30h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:5] + 30h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |

## 60.2.9 Capabilities List Pointer (BIOS_SPI_CAPP)—Offset 34h

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:5] + 34h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 7:0 | 0x0<br>RO | **Capabilities Pointer (CAPP):** Indicates the pointer for the first entry in the capabilities list. |

## 60.2.10 SPI Unsupported Request Status (BIOS_SPI_UR_STS_CTL)—Offset D0h

See the IOSF Specification for required behavior.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:5] + D0h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:2 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 1 | 0x0<br>RW/1C/V | **Unsupported Request Detected (URD):** Set to 1 by hardware upon detecting an Unsupported Request that is not considered an Advisory Non-Fatal error.<br>Cleared to 0 when software writes a 1 to this register. |
| 0 | 0x0<br>RW | **Unsupported Request Reporting Enabled (URRE):** If set to 1 by software, the flash controller generates a DoSERR sideband message when the URD bit transitions from 0 to 1. |

## 60.2.11 BIOS Decode Enable (BIOS_SPI_BDE)—Offset D8h

This register only effects BIOS decode if BIOS is resident on SPI.

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:5] + D8h

**Default:** 0000FFCFh

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **Reserved (RSVD):** |
| 15 | 0x1<br>RO | **F8-FF Enable (EF8):** Enables decoding of 512K of the following BIOS range:<br>• Data space: FFF80000h - FFFFFFFFh |
| 14 | 0x1<br>RW | **F0-F8 Enable (EF0):** Enables decoding of 512K of the following BIOS range:<br>• Data space: FFF00000h - FFF7FFFFh |
| 13 | 0x1<br>RW | **E8-EF Enable (EE8):** Enables decoding of 512K of the following BIOS range:<br>• Data space: FFE80000h - FFEFFFFFh |
| 12 | 0x1<br>RW | **E0-E8 Enable (EE0):** Enables decoding of 512K of the following BIOS range:<br>• Data space: FFE00000h - FFE7FFFFh |
| 11 | 0x1<br>RW | **D8-DF Enable (ED8):** Enables decoding of 512K of the following BIOS range:<br>• Data space: FFD80000h - FFDFFFFFh |
| 10 | 0x1<br>RW | **D0-D7 Enable (ED0):** Enables decoding of 512K of the following BIOS range:<br>• Data space: FFD00000h - FFD7FFFFh |
| 9 | 0x1<br>RW | **C8-CF Enable (EC8):** Enables decoding of 512K of the following BIOS range:<br>• Data space: FFC80000h - FFCFFFFFh |
| 8 | 0x1<br>RW | **C0-C7 Enable (EC0):** Enables decoding of 512K of the following BIOS range:<br>• Data space: FFC00000h - FFC7FFFFh |
| 7 | 0x1<br>RW | **Legacy F Segment Enable (LFE):** This enables the decoding of the legacy 64KB range at F0000h - FFFFFh<br>***Note:*** Decode for the BIOS legacy F segment is enabled by the LFE bit only, it is not affected by the GEN_PMCON_1.iA64_EN bit. |
| 6 | 0x1<br>RW | **Legacy E Segment Enable (LEE):** This enables the decoding of the legacy 64KB range at E0000h - EFFFFh<br>***Note:*** Decode for the BIOS legacy E segment is enabled by the LEE bit only, it is not affected by the GEN_PMCON_1.iA64_EN bit. |
| 5:4 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved. |
| 3 | 0x1<br>RW | **70-7F Enable (E70):** Enables decoding of 1 MB of the following BIOS range:<br>• Data space: FF700000h - FF7FFFFFh |
| 2 | 0x1<br>RW | **60-6F Enable (E60):** Enables decoding of 1 MB of the following BIOS range:<br>• Data space: FF600000h - FF6FFFFFh |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 1 | 0x1<br>RW | **50-5F Enable (E50):** Enables decoding of 1 MB of the following BIOS range:<br>• Data space: FF500000h - FF5FFFFFh |
| 0 | 0x1<br>RW | **40-4F Enable (E40):** Enables decoding of 1 MB of the following BIOS range:<br>• Data space: FF400000h - FF4FFFFFh |

## 60.2.12 BIOS Control (BIOS_SPI_BC)—Offset DCh

**Type:** PCI Configuration Register (Size: 32 bits)

**Offset:** [B:0, D:31, F:5] + DCh

**Default:** 00000028h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:12 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 11 | 0x0<br>RW/L | **Async SMI Enable for BIOS Write Protection (ASE_BWP):** When set to '1' the flash controller will generate an SMI when it blocks a BIOS write or erase due to WPD=0.<br>The value in this field can be written by software as long as the BIOS Interface Lock-Down (BILD) is not set. |
| 10 | 0x0<br>RO/V | **Asynchronous SMI Status (SPI_ASYNC_SS):** Status indication that the SPI Flash Controller has asserted an asynchronous SMI.<br>Hardware clears the bit when it sends the De-assert SMI message.<br>• 0 = Default state<br>• 1 = SPI flash controller asserted asynchronous SMI |
| 9 | 0x0<br>RW/L | Reserved. |
| 8 | 0x0<br>RW/1C/V | **Synchronous SMI Status (SPI_SYNC_SS):** Status indication that the SPI Flash Controller has asserted a synchronous SMI.<br>Hardware clears the bit when it sends the De-assert Synchronous SMI message.<br>• 0 = Default state<br>• 1 = SPI flash controller asserted Synchronous SMI |
| 7 | 0x0<br>RW/L | **BIOS Interface Lock-Down (BILD):** When set, prevents TS and BBS from being changed. This bit can only be written from 0 to 1 once. |
| 6 | 0x0<br>RW/V/L | **Boot BIOS Strap (BBS):** This field determines the destination of accesses to the BIOS memory range. For the default, “Functional Strap” section of Signal Description chapter for details.<br>Bit Description<br>• 0 = SPI<br>• 1 = LPC<br>The value in this field can be overwritten by software as long as the BIOS Interface Lock-Down (BILD) is not set |
| 5 | 0x1<br>RW/L | **Enable InSMM.STS (EISS):** When this bit is set, the BIOS region is not writable until the CPU sets the InSMM.STS bit.<br>If this bit [5] is set, then WPD must be a '1' and InSMM.STS must be '1' also in order to write to BIOS region of SPI Flash.<br>If this bit [5] is clear, then the InSMM.STS is a don't care.<br>This bit is locked by LE. |
| 4 | 0x0<br>RO/V | **Top Swap Status (TSS):** This bit provides a read-only path to view the state of the Top Swap bit. It is duplicated here to be consistent with the LPC version of the BC register. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 3:2 | 0x2<br>RW | **SPI Read Configuration (SRC):** These bits are located in PCI Config space to allow them to be set early in the boot flow. This 2-bit field controls two policies related to BIOS reads on the SPI interface:<br>Bit 3- Prefetch Enable<br>Bit 2- Cache Disable<br>Settings are summarized below:<br>Bits 3:2 Description<br>• 00 No prefetching, but caching enabled. Direct Memory reads load the read buffer cache with "valid" data, allowing repeated reads to the same range to complete quickly<br>• 01 No prefetching and no caching. One-to-one correspondence of host BIOS reads to SPI cycles. This value can be used to invalidate the cache.<br>• 10 Prefetching and Caching enabled. This mode is used for long sequences of short reads to consecutive addresses (i.e. shadowing).<br>• 11 Illegal. Caching must be enabled when Prefetching is enabled. This eliminates the need for a complex prefetch-flushing mechanism. |
| 1 | 0x0<br>RW/L | **Lock Enable (LE):** When set, setting the WPD bit will cause SMI. When cleared, setting the WPD bit will not cause SMI.<br>Once set, this bit can only be cleared by a PLTRST#.<br>When this bit is set, EISS - bit [5] of this register is locked down. |
| 0 | 0x0<br>RW | **Write Protect Disable (WPD):** When set, access to the BIOS space is enabled for both read and write cycles to BIOS.<br>When cleared, only read cycles are permitted to the FWH or SPI flash.<br>When this bit is written from a '0' to a '1' and the LE bit is also set, an SMI# is generated.<br>This ensures that only SMM code can update BIOS. |

## 60.3 Registers in Memory Space—BIOS_SPI_BAR0

These registers are accessed in Host Memory Space starting at the relocatable memory address defined by the Base Address Register (BAR) BIOS_SPI_BAR0.

### 60.3.1 SPI BIOS MMIO PRI (BIOS_BFPREG)—Offset 0h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [BIOS_SPI_BAR0] + 0h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO/V | **Shadowed BIOS Region Select (SBRS):** |
| 30:16 | 0x0<br>RO/V | **BIOS Flash Primary Region Limit (PRL):** This specifies address bits 26:12 for the Primary Region Limit.<br>The value in this register is loaded from the contents in the Flash Descriptor.FLREG1.Region Limit, or the Flash Descriptor.FLREG6.Region Limit depending on the BFPREG.SBRS bit. |
| 15 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 14:0 | 0x0<br>RO/V | **BIOS Flash Primary Region Base (PRB):** This specifies address bits 26:12 for the Primary Region Base.<br>The value in this register is loaded from the contents in the Flash Descriptor.FLREG1.Region Base, or the Flash Descriptor.FLREG6.Region Base depending on the BFPREG.SBRS bit. |

## 60.3.2 Hardware Sequencing Flash Status and Control (BIOS_HSFSTS_CTL)—Offset 4h

Note: If operating in Non-Descriptor mode, hardware sequencing is not allowed.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [BIOS_SPI_BAR0] + 4h

**Default:** 00002000h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW | **Flash SPI SMI# Enable (FSMIE):** When set to 1, the SPI asserts an SMI# request whenever the Flash Cycle Done but is 1. |
| 30 | 0x0<br>RO | Reserved. |
| 29:24 | 0x0<br>RW | **Flash Data Byte Count (FDBC):** The field specifies the number of bytes to shift in or out during the data portion of the SPI cycle.<br>The contents of this register are 0s based with 0b representing 1 byte and 3Fh representing 64 bytes.<br>The number of bytes transferred is the value of this field plus 1.<br>The field is ignored for the Block Erase command. |
| 23:22 | 0x1<br>RO | Reserved. |
| 21 | 0x0<br>RW | **Write Enable Type (WET):** Write Enable Type (WET)<br>• 0 - Use 06h as the write enable instruction<br>• 1 - Use 50h as the write enable instruction |
| 20:17 | 0x0<br>RW | **FLASH Cycle (FCYCLE):** This field defines the Flash SPI cycle type generated to the FLASH when the FGO but is set as defined below:<br>• 0 - Read (1 up to 64 bytes by setting FDBC)<br>• 1 - Reserved<br>• 2 - Write (1 up to 64 bytes by setting FDBC)<br>• 3 - 4k Block Erase<br>• 4 - 64K Sector Erase<br>• 5 - Read SFDP<br>• 6 - Read JEDEC ID<br>• 7 - Write Status<br>• 8 - Read Status<br>• 9 - RPMC Op1<br>• A - RPMC Op2<br>Flash controller hardware automatically inserts a write enable opcode prior to write and erase operations.<br>Hardware automatically polls for device not-busy using read status after write and erase operations.<br>Flash controller hardware automatically polls for device not-ready using read status and RPMC Op2 after RPMC Op1 operations.<br>Read status is repeated until the device is not-busy, then RPMC Op2 is repeated until the device is not-busy.<br>If the device does not support 64k erase size (or if it doesn't support SFDP) then only 4k is allowed.<br>***Note:*** If reserved 1 is programmed to this field, flash controller will handle it as if it is 0 (Read). |
| 16 | 0x0<br>RW/1S/V | Flash Cycle Go (FGO): A write to this register with a 1 in this but initiates a request to the Flash SPI Arbiter to start a cycle.<br>This register is cleared by hardware when the cycle is granted by the SPU arbiter to run the cycle on the SPI bus. When the cycle is complete, the FDONE bit is set.<br>Software is forbidden to write to any register in the HSFLCTL register between the FGO bit getting set and the FDONE bit being cleared. Any attempt to violate this rule will be ignored by hardware.<br>Hardware allows other bits in this register to be programmed for the same transaction when writing this bit to 1. This saves an additional memory write.<br>This but always returns 0 on reads. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15 | 0x0<br>RW/L | **Flash Configuration Lock-Down (FLOCKDN):** When set to 1, those Flash Program Registers that are locked down by this FLOCKDN but cannot be written.<br>Once set to 1, this but can only be cleared by a hardware reset. |
| 14 | 0x0<br>RO/V | **Flash Descriptor Valid (FDV):** This bit is set to a 1 if the Flash Controller read the correct Flash Descriptor Signature.<br>If the Flash Descriptor Valid bit is not 1, software cannot use the Hardware Sequencing registers, but must use the software sequencing registers. Any attempt to use the Hardware Sequencing registers will result in the FCERR bit being set. |
| 13 | 0x1<br>RO/V | **Flash Descriptor Override Pin-Strap Status (FDOPSS):** This register reflects the value the Flash Descriptor Override Pin-Strap.<br>• 1 - No override<br>• 0 - The Flash Descriptor Override strap is set |
| 12 | 0x0<br>RW/L | **PRR3 PRR4 Lock-Down (PRR34_LOCKDN):** When set to 1, the BIOS PRR3 and PRR4 registers cannot be written.<br>Once set to 1, this bit can only be cleared by a hardware reset. |
| 11 | 0x0<br>RW/L | **Flash Configuration Lock-Down (WRSDIS):**<br>• 0 - Write status operation may be used using Hardware Sequencing<br>• 1 - Write status is not allowed as a Hardware Sequencing Operation. The flash controller will block the operation and set the FCERR but when software sets the “go” bit. |
| 10:6 | 0x0<br>RO | Reserved. |
| 5 | 0x0<br>RO/V | **SPI Cycle In Progress (H_SCIP):** hardware sets this bit when software sets the Flash Cycle Go (FGO) bit in the Hardware Sequencing Flash Control register.<br>This bit remains set until the cycle completes on the SPI interface. Hardware automatically sets and clears this bit so that software can determine when read data is valid and/or when it is safe to begin programming the next command.<br>Software must only program the next command when this bit is 0. |
| 4:0 | 0x0<br>RO | Reserved. |

## 60.3.3 Flash Address (BIOS_FADDR)—Offset 8h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [BIOS_SPI_BAR0] + 8h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:27 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 26:0 | 0x0<br>RW | **Flash Linear Address (FLA):** The FLA is the starting byte linear address of a SPI Read or Write cycle or an address within a Block for the Block Erase command.<br>The Flash Linear Address must fall within a region for which BIOS has access permissions.<br>Hardware must convert the FLA into a Flash Physical Address (FPA) before running this cycle on the SPI bus. When operating in non-descriptor mode bit [26:24] is ignored and the FLA [23:0] is the FPA. |

## 60.3.4 Discrete Lock Bits (BIOS_DLOCK)—Offset Ch

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [BIOS_SPI_BAR0] + Ch

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:17 | 0x0<br>RW | **Reserved (RSVD):** Whenever modifying BIOS_DLOCK read the value of bits 31:17 and write back the value read. |
| 16 | 0x0<br>RW/L | **SSEQ Lock-Down (SSEQLOCKDN):** IA FW Software Sequencing registers are locked when the logical OR of this bit and FLOCKDN is true.<br>The affected registers are BIOS_SSFSTS_CTL.SCF, BIOS_PREOP_OPTYPE, BIOS_OPMENU0, and BIOS_OPMENU1.<br>Once set to 1 this register is only cleared by host partition reset. |
| 15:13 | 0x0<br>RW | **Reserved (RSVD):** Whenever modifying BIOS_DLOCK read the value of bits 15:13 and write back the value read. |
| 12 | 0x0<br>RW/L | **PR4 Lock-Down (PR4LOCKDN):** IA FW PR4 register is locked when the logical OR of this bit and FLOCKDN is true.<br>Once set to 1 this register is only cleared by host partition reset. |
| 11 | 0x0<br>RW/L | **PR3 Lock-Down (PR3LOCKDN):** IA FW PR3 register is locked when the logical OR of this bit and FLOCKDN is true.<br>Once set to 1 this register is only cleared by host partition reset. |
| 10 | 0x0<br>RW/L | **PR2 Lock-Down (PR2LOCKDN):** IA FW PR2 register is locked when the logical OR of this bit and FLOCKDN is true.<br>Once set to 1 this register is only cleared by host partition reset. |
| 9 | 0x0<br>RW/L | **PR1 Lock-Down (PR1LOCKDN):** IA FW PR1 register is locked when the logical OR of this bit and FLOCKDN is true.<br>Once set to 1 this register is only cleared by host partition reset. |
| 8 | 0x0<br>RW/L | **PR0 Lock-Down (PR0LOCKDN):** IA FW PR0 register is locked when the logical OR of this bit and FLOCKDN is true.<br>Once set to 1 this register is only cleared by host partition reset. |
| 7:4 | 0x0<br>RW | **Reserved (RSVD):** Whenever modifying BIOS_DLOCK read the value of bits 7:4 and write back the value read. |
| 3 | 0x0<br>RW/L | **SBMRAG Lock-Down (SBMRAGLOCKDN):** IA FW SFRACC.BMRAG register bits are locked when the logical OR of this bit and FLOCKDN is true.<br>Once set to 1 this register is only cleared by host partition reset. |
| 2 | 0x0<br>RW/L | **SBMWAG Lock-Down (SBMWAGLOCKDN):** IA FW SFRACC.BMWAG register bits are locked when the logical OR of this bit and FLOCKDN is true.<br>Once set to 1 this register is only cleared by host partition reset. |
| 1 | 0x0<br>RW/L | **BMRAG Lock-Down (BMRAGLOCKDN):** IA FW FRACC.BMRAG register bits are locked when the logical OR of this bit and FLOCKDN is true.<br>Once set to 1 this register is only cleared by host partition reset. |
| 0 | 0x0<br>RW/L | **BMWAG Lock-Down (BMWAGLOCKDN):** IA FW FRACC.BMWAG register bits are locked when the logical OR of this bit and FLOCKDN is true.<br>Once set to 1 this register is only cleared by host partition reset. |

## 60.3.5 Flash Data 0 (BIOS_FDATA0)—Offset 10h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [BIOS_SPI_BAR0] + 10h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW/V | **Flash Data 0 (FD0):** This field is shifted out as the SPI Data on the Master-Out Slave-In Data pin during the data portion of the SPI cycle.<br>This register also shifts in the data from the Master-In Slave-Out pin into this register during the data portion of the SPI cycle.<br>The data is always shifted starting with the least significant byte, msb to lsb, followed by the next least significant byte, msb to lsb, etc.<br>Specifically, the shift order on SPI in terms of bits within this register is: 7-6-5-4-3-2-1-0-15-14-13-?8-23-22-?16-31?24 Bit 24 is the last bit shifted out/in.<br>There are no alignment assumptions; byte 0 always represents the value specified by the cycle address.<br>***Note:*** The data in this register may be modified by the hardware during any programmed SPI transaction. Direct Memory Reads do not modify the contents of this register. |

## 60.3.6 Flash Data 1 (BIOS_FDATA1)—Offset 14h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [BIOS_SPI_BAR0] + 14h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW/V | **Flash Data 1 (FD1):** Similar definition as Flash Data 0.<br>However, this register does not begin shifting until FD0 has completely shifted in/out. |

## 60.3.7 Flash Data 2 (BIOS_FDATA2)—Offset 18h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [BIOS_SPI_BAR0] + 18h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW/V | **Flash Data 2 (FD2):** Similar definition as Flash Data 0.<br>However, this register does not begin shifting until FD1 has completely shifted in/out. |

## 60.3.8 Flash Data 3 (BIOS_FDATA3)—Offset 1Ch

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [BIOS_SPI_BAR0] + 1Ch

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW/V | **Flash Data 3 (FD3):** Similar definition as Flash Data 0.<br>However, this register does not begin shifting until FD2 has completely shifted in/out. |

## 60.3.9 Flash Data 4 (BIOS_FDATA4)—Offset 20h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [BIOS_SPI_BAR0] + 20h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW/V | **Flash Data 4 (FD4):** Similar definition as Flash Data 0.<br>However, this register does not begin shifting until FD3 has completely shifted in/out. |

## 60.3.10 Flash Data 5 (BIOS_FDATA5)—Offset 24h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [BIOS_SPI_BAR0] + 24h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW/V | **Flash Data 5 (FD5):** Similar definition as Flash Data 0.<br>However, this register does not begin shifting until FD4 has completely shifted in/out. |

## 60.3.11 Flash Data 6 (BIOS_FDATA6)—Offset 28h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [BIOS_SPI_BAR0] + 28h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW/V | **Flash Data 6 (FD6):** Similar definition as Flash Data 0.<br>However, this register does not begin shifting until FD5 has completely shifted in/out. |

## 60.3.12 Flash Data 7 (BIOS_FDATA7)—Offset 2Ch

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [BIOS_SPI_BAR0] + 2Ch

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW/V | **Flash Data 7 (FD7):** Similar definition as Flash Data 0.<br>However, this register does not begin shifting until FD6 has completely shifted in/out. |

## 60.3.13 Flash Data 8 (BIOS_FDATA8)—Offset 30h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [BIOS_SPI_BAR0] + 30h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW/V | **Flash Data 8 (FD8):** Similar definition as Flash Data 0.<br>However, this register does not begin shifting until FD7 has completely shifted in/out. |

## 60.3.14 Flash Data 9 (BIOS_FDATA9)—Offset 34h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [BIOS_SPI_BAR0] + 34h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW/V | **Flash Data 9 (FD9):** Similar definition as Flash Data 0.<br>However, this register does not begin shifting until FD8 has completely shifted in/out. |

## 60.3.15 Flash Data 10 (BIOS_FDATA10)—Offset 38h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [BIOS_SPI_BAR0] + 38h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW/V | **Flash Data 10 (FD10):** Similar definition as Flash Data 0.<br>However, this register does not begin shifting until FD9 has completely shifted in/out. |

## 60.3.16 Flash Data 11 (BIOS_FDATA11)—Offset 3Ch

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [BIOS_SPI_BAR0] + 3Ch

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW/V | **Flash Data 11 (FD11):** Similar definition as Flash Data 0.<br>However, this register does not begin shifting until FD10 has completely shifted in/out. |

## 60.3.17 Flash Data 12 (BIOS_FDATA12)—Offset 40h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [BIOS_SPI_BAR0] + 40h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW/V | **Flash Data 12 (FD12):** Similar definition as Flash Data 0.<br>However, this register does not begin shifting until FD11 has completely shifted in/out. |

## 60.3.18 Flash Data 13 (BIOS_FDATA13)—Offset 44h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [BIOS_SPI_BAR0] + 44h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW/V | **Flash Data 13 (FD13):** Similar definition as Flash Data 0.<br>However, this register does not begin shifting until FD12 has completely shifted in/out. |

## 60.3.19 Flash Data 14 (BIOS_FDATA14)—Offset 48h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [BIOS_SPI_BAR0] + 48h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW/V | **Flash Data 14 (FD14):** Similar definition as Flash Data 0.<br>However, this register does not begin shifting until FD13 has completely shifted in/out. |

## 60.3.20 Flash Data 15 (BIOS_FDATA15)—Offset 4Ch

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [BIOS_SPI_BAR0] + 4Ch

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW/V | **Flash Data 15 (FD15):** Similar definition as Flash Data 0.<br>However, this register does not begin shifting until FD14 has completely shifted in/out. |

## 60.3.21 Flash Region Access Permissions (BIOS_FRACC)—Offset 50h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 000042C2h

**BAR and Offset:** [BIOS_SPI_BAR0] + 50h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RW/L | **BIOS Master Write Access Grant (BMWAG):** Each bit [31:24] corresponds to Master [7:0].<br>BIOS can grant one or more masters write access to the BIOS region 1 overriding the permissions in the Flash Descriptor.<br>The contents of this register are locked by the FLOCKDN bit. |
| 23:16 | 0x0<br>RW/L | **BIOS Master Read Access Grant (BMRAG):** Each bit [23:16] corresponds to Master [7:0].<br>BIOS can grant one or more masters read access to the BIOS region 1 overriding the read permissions in the Flash Descriptor.<br>The contents of this register are locked by the FLOCKDN bit. |
| 15:8 | 0x42<br>RO/V | **BIOS Region Write Access (BRWA):** Each bit [15:8] corresponds to Regions [7:0].<br>If the bit is set, this master can erase and write that particular region through register accesses.<br><br>The contents of this register are that of the Flash Descriptor.Flash Master 1.Master Region Write Access OR a particular master has granted BIOS write permissions in their Master Write Access Grant register OR the Flash Descriptor Security Override strap is set.<br>BIOS always have the write access to its own Region 1 and Region 6 by default. Thus, the reset default of this field will be read as “42h”regardless of descriptor or non-descriptor mode. |
| 7:0 | 0xc2<br>RO/V | **BIOS Region Read Access (BRRA):** Each bit [7:0] corresponds to Regions [7:0]. If the bit is set, this master can read that particular region through register accesses.<br><br>The contents of this register are that of the Flash Descriptor.Flash Master 1.Master Region Write Access OR a particular master has granted BIOS read permissions in their Master Read Access Grant register OR the Flash Descriptor Security Override strap is set.<br>BIOS always have the read access to its own Region 1 and Region 6 by default. Thus, the reset default of this field will be read as “42h” regardless of descriptor or non-descriptor mode. |

## 60.3.22 Flash Region 0 (BIOS_FREG0)—Offset 54h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00007FFFh

**BAR and Offset:** [BIOS_SPI_BAR0] + 54h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 30:16 | 0x0<br>RO/V | **Region Limit (RL):** This specifies address bits 26:12 for the Region 0 Limit.<br>The value in this register is loaded from the contents in the Flash Descriptor.FLREG0.Region Limit. |
| 15 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved. |
| 14:0 | 0x7fff<br>RO/V | **Region Base (RB):** This specifies address bits 26:12 for the Region 0 Base.<br>The value in this register is loaded from the contents in the Flash Descriptor.FLREG0.Region Base. |

## 60.3.23 Flash Region 1 (BIOS_FREG1)—Offset 58h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00007FFFh

**BAR and Offset:** [BIOS_SPI_BAR0] + 58h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 30:16 | 0x0<br>RO/V | **Region Limit (RL):** This specifies address bits 26:12 for the Region 1 Limit.<br>The value in this register is loaded from the contents in the Flash Descriptor.FLREG1.Region Limit. |
| 15 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved. |
| 14:0 | 0x7fff<br>RO/V | **Region Base (RB):** This specifies address bits 26:12 for the Region 1 Base.<br>The value in this register is loaded from the contents in the Flash Descriptor.FLREG1.Region Base. |

## 60.3.24 Flash Region 2 (BIOS_FREG2)—Offset 5Ch

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00007FFFh

**BAR and Offset:** [BIOS_SPI_BAR0] + 5Ch

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 30:16 | 0x0<br>RO/V | **Region Limit (RL):** This specifies address bits 26:12 for the Region 2 Limit.<br>The value in this register is loaded from the contents in the Flash Descriptor.FLREG2.Region Limit. |
| 15 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved. |
| 14:0 | 0x7fff<br>RO/V | **Region Base (RB):** This specifies address bits 26:12 for the Region 2 Base.<br>The value in this register is loaded from the contents in the Flash Descriptor.FLREG2.Region Base. |

## 60.3.25 Flash Region 3 (BIOS_FREG3)—Offset 60h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00007FFFh

**BAR and Offset:** [BIOS_SPI_BAR0] + 60h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 30:16 | 0x0<br>RO/V | **Region Limit (RL):** This specifies address bits 26:12 for the Region 3 Limit.<br>The value in this register is loaded from the contents in the Flash Descriptor.FLREG3.Region Limit. |
| 15 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved. |
| 14:0 | 0x7fff<br>RO/V | **Region Base (RB):** This specifies address bits 26:12 for the Region 3 Base.<br>The value in this register is loaded from the contents in the Flash Descriptor.FLREG3.Region Base. |

## 60.3.26 Flash Region 4 (BIOS_FREG4)—Offset 64h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00007FFFh

**BAR and Offset:** [BIOS_SPI_BAR0] + 64h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 30:16 | 0x0<br>RO/V | **Region Limit (RL):** This specifies address bits 26:12 for the Region 4 Limit.<br>The value in this register is loaded from the contents in the Flash Descriptor.FLREG4.Region Limit. |
| 15 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved. |
| 14:0 | 0x7fff<br>RO/V | **Region Base (RB):** This specifies address bits 26:12 for the Region 4 Base.<br>The value in this register is loaded from the contents in the Flash Descriptor.FLREG4.Region Base. |

## 60.3.27 Flash Region 5 (BIOS_FREG5)—Offset 68h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00007FFFh

**BAR and Offset:** [BIOS_SPI_BAR0] + 68h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 30:16 | 0x0<br>RO/V | **Region Limit (RL):** This specifies address bits 26:12 for the Region 5 Limit.<br>The value in this register is loaded from the contents in the Flash Descriptor.FLREG5.Region Limit |
| 15 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved. |
| 14:0 | 0x7fff<br>RO/V | **Region Base (RB):** This specifies address bits 26:12 for the Region 5 Base.<br>The value in this register is loaded from the contents in the Flash Descriptor.FLREG5.Region Base |

## 60.3.28 Flash Region 6 (BIOS_FREG6)—Offset 6Ch

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00007FFFh

**BAR and Offset:** [BIOS_SPI_BAR0] + 6Ch

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 30:16 | 0x0<br>RO/V | **Region Limit (RL):** This specifies address bits 26:12 for the Region 6 Limit.<br>The value in this register is loaded from the contents in the Flash Descriptor.FLREG6.Region Limit if the Server Feature Disable Fuse 6 is '0'. If the Server Feature Disable Fuse 6 is a '1' then this field is loaded with all zeros. |
| 15 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved. |
| 14:0 | 0x7fff<br>RO/V | **Region Base (RB):** This specifies address bits 26:12 for the Region 6 Base.<br>The value in this register is loaded from the contents in the Flash Descriptor.FLREG6.Region Base if the Server Feature Disable Fuse 6 is '0'. If the Server Feature Disable Fuse 6 is a '1' then this field is loaded with all ones. |

## 60.3.29 Flash Region 7 (BIOS_FREG7)—Offset 70h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00007FFFh

**BAR and Offset:** [BIOS_SPI_BAR0] + 70h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 30:16 | 0x0<br>RO/V | **Region Limit (RL):** This specifies address bits 26:12 for the Region 7 Limit.<br>The value in this register is loaded from the contents in the Flash Descriptor.FLREG7.Region Limit. |
| 15 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved. |
| 14:0 | 0x7fff<br>RO/V | **Region Base (RB):** This specifies address bits 26:12 for the Region 7 Base.<br>The value in this register is loaded from the contents in the Flash Descriptor.FLREG7.Region Base. |

## 60.3.30 Flash Region 8 (BIOS_FREG8)—Offset 74h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00007FFFh

**BAR and Offset:** [BIOS_SPI_BAR0] + 74h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 30:16 | 0x0<br>RO/V | **Region Limit (RL):** This specifies address bits 26:12 for the Region 8 Limit.<br>The value in this register is loaded from the contents in the Flash Descriptor.FLREG8.Region Limit. |
| 15 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved. |
| 14:0 | 0x7fff<br>RO/V | **Region Base (RB):** This specifies address bits 26:12 for the Region 8 Base.<br>The value in this register is loaded from the contents in the Flash Descriptor.FLREG8.Region Base. |

## 60.3.31 Flash Region 9 (BIOS_FREG9)—Offset 78h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00007FFFh

**BAR and Offset:** [BIOS_SPI_BAR0] + 78h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 30:16 | 0x0<br>RO/V | **Region Limit (RL):** This specifies address bits 26:12 for the Region 9 Limit.<br>The value in this register is loaded from the contents in the Flash Descriptor.FLREG9.Region Limit. |
| 15 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved. |
| 14:0 | 0x7fff<br>RO/V | **Region Base (RB):** This specifies address bits 26:12 for the Region 9 Base.<br>The value in this register is loaded from the contents in the Flash Descriptor.FLREG9.Region Base. |

## 60.3.32 Flash Region 10 (BIOS_FREG10)—Offset 7Ch

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [BIOS_SPI_BAR0] + 7Ch

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 30:16 | 0x0<br>RO/V | **Region Limit (RL):** This specifies address bits 26:12 for the Region 10 Limit.<br>The value in this register is loaded from the contents in the Flash Descriptor.FLREG10.Region Limit. |
| 15 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved. |
| 14:0 | 0x0<br>RO/V | **Region Base (RB):** This specifies address bits 26:12 for the Region 10 Base.<br>The value in this register is loaded from the contents in the Flash Descriptor.FLREG10.Region Base. |

## 60.3.33 Flash Region 11 (BIOS_FREG11)—Offset 80h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [BIOS_SPI_BAR0] + 80h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 30:16 | 0x0<br>RO/V | **Region Limit (RL):** This specifies address bits 26:12 for the Region 11 Limit.<br>The value in this register is loaded from the contents in the Flash Descriptor.FLREG11.Region Limit. |
| 15 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved. |
| 14:0 | 0x0<br>RO/V | **Region Base (RB):** This specifies address bits 26:12 for the Region 11 Base.<br>The value in this register is loaded from the contents in the Flash Descriptor.FLREG11.Region Base. |

## 60.3.34 Flash Protected Range 0 (BIOS_FPR0)—Offset 84h

This register can not be written when the FLOCKDN bit is set to 1.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [BIOS_SPI_BAR0] + 84h

**Default:** 00000000h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW/L | **Write Protection Enable (WPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware.<br>The base and limit fields are ignored when this bit is cleared. |
| 30:16 | 0x0<br>RW/L | **Protected Range Limit (PRL):** This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range.<br>Address bits 11:0 are assumed to be FFFh for the limit comparison.<br>Any address greater than the value programmed in this field is unaffected by this protected range. |
| 15 | 0x0<br>RW/L | **Read Protection Enable (RPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that read directed to addresses between them (inclusive) must be blocked by hardware.<br>The base and limit fields are ignored when this bit is cleared. |
| 14:0 | 0x0<br>RW/L | **Protected Range Base (PRB):** This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range.<br>Address bits 11:0 are assumed to be 000h for the base comparison.<br>Any address less than the value programmed in this field is unaffected by this protected range. |

## 60.3.35 Flash Protected Range 1 (BIOS_FPR1)—Offset 88h

This register can not be written when the FLOCKDN bit is set to 1.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [BIOS_SPI_BAR0] + 88h

**Default:** 00000000h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW/L | **Write Protection Enable (WPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware.<br>The base and limit fields are ignored when this bit is cleared. |
| 30:16 | 0x0<br>RW/L | **Protected Range Limit (PRL):** This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range.<br>Address bits 11:0 are assumed to be FFFh for the limit comparison.<br>Any address greater than the value programmed in this field is unaffected by this protected range. |
| 15 | 0x0<br>RW/L | **Read Protection Enable (RPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that read directed to addresses between them (inclusive) must be blocked by hardware.<br>The base and limit fields are ignored when this bit is cleared. |
| 14:0 | 0x0<br>RW/L | **Protected Range Base (PRB):** This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range.<br>Address bits 11:0 are assumed to be 000h for the base comparison.<br>Any address less than the value programmed in this field is unaffected by this protected range. |

## 60.3.36 Flash Protected Range 2 (BIOS_FPR2)—Offset 8Ch

This register can not be written when the FLOCKDN bit is set to 1.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [BIOS_SPI_BAR0] + 8Ch

**Default:** 00000000h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW/L | **Write Protection Enable (WPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware.<br>The base and limit fields are ignored when this bit is cleared. |
| 30:16 | 0x0<br>RW/L | **Protected Range Limit (PRL):** This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range.<br>Address bits 11:0 are assumed to be FFFh for the limit comparison.<br>Any address greater than the value programmed in this field is unaffected by this protected range. |
| 15 | 0x0<br>RW/L | **Read Protection Enable (RPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that read directed to addresses between them (inclusive) must be blocked by hardware.<br>The base and limit fields are ignored when this bit is cleared. |
| 14:0 | 0x0<br>RW/L | **Protected Range Base (PRB):** This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range.<br>Address bits 11:0 are assumed to be 000h for the base comparison.<br>Any address less than the value programmed in this field is unaffected by this protected range. |

## 60.3.37 Flash Protected Range 3 (BIOS_FPR3)—Offset 90h

This register can not be written when the PRR34_LOCKDN bit is set to 1.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [BIOS_SPI_BAR0] + 90h

**Default:** 00000000h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW/L | **Write Protection Enable (WPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware.<br>The base and limit fields are ignored when this bit is cleared. |
| 30:16 | 0x0<br>RW/L | **Protected Range Limit (PRL):** This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range.<br>Address bits 11:0 are assumed to be FFFh for the limit comparison.<br>Any address greater than the value programmed in this field is unaffected by this protected range. |
| 15 | 0x0<br>RW/L | **Read Protection Enable (RPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that read directed to addresses between them (inclusive) must be blocked by hardware.<br>The base and limit fields are ignored when this bit is cleared. |
| 14:0 | 0x0<br>RW/L | **Protected Range Base (PRB):** This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range.<br>Address bits 11:0 are assumed to be 000h for the base comparison.<br>Any address less than the value programmed in this field is unaffected by this protected range. |

## 60.3.38 Flash Protected Range 4 (BIOS_FPR4)—Offset 94h

This register can not be written when the PRR34_LOCKDN bit is set to 1.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [BIOS_SPI_BAR0] + 94h

**Default:** 00000000h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW/L | **Write Protection Enable (WPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware.<br>The base and limit fields are ignored when this bit is cleared. |
| 30:16 | 0x0<br>RW/L | **Protected Range Limit (PRL):** This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range.<br>Address bits 11:0 are assumed to be FFFh for the limit comparison.<br>Any address greater than the value programmed in this field is unaffected by this protected range. |
| 15 | 0x0<br>RW/L | **Read Protection Enable (RPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that read directed to addresses between them (inclusive) must be blocked by hardware.<br>The base and limit fields are ignored when this bit is cleared. |
| 14:0 | 0x0<br>RW/L | **Protected Range Base (PRB):** This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range.<br>Address bits 11:0 are assumed to be 000h for the base comparison.<br>Any address less than the value programmed in this field is unaffected by this protected range. |

## 60.3.39 Global Protected Range 0 (BIOS_GPR0)—Offset 98h

This register is initialized via softstraps. This protected range applies globally to all masters / flash requesters.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [BIOS_SPI_BAR0] + 98h

**Default:** 00000000h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO/V | **Write Protection Enable (WPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware.<br>The base and limit fields are ignored when this bit is cleared. |
| 30:16 | 0x0<br>RO/V | **Protected Range Limit (PRL):** This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range.<br>Address bits 11:0 are assumed to be FFFh for the limit comparison.<br>Any address greater than the value programmed in this field is unaffected by this protected range. |
| 15 | 0x0<br>RO/V | **Read Protection Enable (RPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that read directed to addresses between them (inclusive) must be blocked by hardware.<br>The base and limit fields are ignored when this bit is cleared. |
| 14:0 | 0x0<br>RO/V | **Protected Range Base (PRB):** This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range.<br>Address bits 11:0 are assumed to be 000h for the base comparison.<br>Any address less than the value programmed in this field is unaffected by this protected range. |

## 60.3.40 Software Sequencing Flash Status and Control (BIOS_SSFSTS_CTL)—Offset A0h

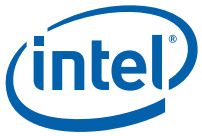
**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** FE000000h

**BAR and Offset:** [BIOS_SPI_BAR0] + A0h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:27 | 0x1f<br>RO | **Reserved (RSVD):** This field is not programmable, it is fixed at 1Fh. |
| 26:24 | 0x6<br>RW/L | **SPI Cycle Frequency (SCF):**<br>The listed frequencies are approximate.<br>• 010: 17MHz<br>• 100: 30MHz<br>• 110: 48MHz<br>• All Others: Reserved<br>This register sets frequency to use for all SPI Software Sequencing cycles (write, erase, fast read, read status,.etc) except for the Read cycle which always run at 20MHz.<br>This register is locked when the SPI Configuration Lock-Down (FLOCKDN) bit is set. |
| 23 | 0x0<br>RW | **SPI SMI# Enable (SME):** When set to 1, the SPI asserts an SMI# request whenever the Cycle Done Status bit is 1. |
| 22 | 0x0<br>RW | **Data Cycle (DS):** When set to 1, there is data that corresponds to this transaction.<br>When 0, no data is delivered for this cycle, and the DBC and data fields themselves are don't cares. |
| 21:16 | 0x0<br>RW | **Data Byte Count (DBC):** This field specifies the number of bytes to shift in or out during the data portion of the SPI cycle. The valid settings (in decimal) are any value from 0 to 63. The number of bytes transferred is the value of this field plus 1.<br>***Note:*** When this field is 00_0000b, then there is 1 byte to transfer and that 11_1111b means there are 64 bytes to transfer. |
| 15 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved. |
| 14:12 | 0x0<br>RW | **Cycle Opcode Pointer (COP):** This field selects one of the programmed opcodes in the Opcode Menu to be used as the SPI Command/Opcode.<br>In the case of an Atomic Cycle Sequence, this determines the second command. |
| 11 | 0x0<br>RW | **Sequence Prefix Opcode Pointer (SPOP):** This field selects one of the two programmed prefix opcodes for use when performing an Atomic Cycle Sequence.<br>A value of 0 points to the opcode in the least significant byte of the Prefix Opcodes register.<br>By making this programmable, the ICH supports flash devices that have different opcodes for enabling writes to the data space vs. status register. |
| 10 | 0x0<br>RW | **Atomic Cycle Sequence (ACS):** When set to 1 along with the SCGO assertion, the SoC will execute a sequence of commands on the SPI interface without allowing another master to arbitrate and interleave cycles.<br>The sequence is composed of:<br>• Atomic Sequence Prefix Command (8-bit opcode only)<br>• Primary Command specified below by software (can include address and data)<br>• Polling the Flash Status Register (opcode 05h) until bit 0 becomes 0b.<br>The SPI Cycle in Progress bit remains set and the Cycle Done Status bit remains unset until the Busy bit in the Flash Status Register returns 0. |
| 9 | 0x0<br>RW/1S/V | **SPI Cycle Go (SCGO):** This bit always returns 0 on reads. However, a write to this register with a '1' in this bit starts the SPI cycle defined by the other bits of this register. The "SPI Cycle in Progress" (SCIP) bit gets set by this action.<br>Hardware must ignore writes to this bit while the Cycle In Progress bit is set.<br>Hardware allows other bits in this register to be programmed for the same transaction when writing this bit to 1.<br>This saves an additional memory write. |
| 8 | 0x0<br>RO | **Reserved (RSVD_2):** Reserved. |



| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RO/V | **Fast Read Supported (FAST_READ_SUPPORT):** This bit reflects the value of the Fast Read Support bit in the Flash Descriptor Component Section. |
| 6 | 0x0<br>RO/V | **Dual Output Fast Read Supported (DUAL_FAST_READ_SUPPORT):** This bit reflects the value of the Dual Output Fast Read Support bit in the Flash Descriptor Component Section. |
| 5 | 0x0<br>RO | **Reserved (RSVD_3):** Reserved. |
| 4 | 0x0<br>RO/V | **Access Error Log (AEL):** This bit reflects the value of the Hardware Sequencing Status.AEL register. |
| 3 | 0x0<br>RW/1C/V | **Flash Cycle Error (FCERR):** Hardware sets this bit to 1 when a programmed access is blocked from running on the SPI interface due to one of the protection policies or when any of the programmed cycle registers is written while a programmed access is already in progress.<br>This bit remains asserted until cleared by software writing a 1 or hardware reset. |
| 2 | 0x0<br>RW/1C/V | **Cycle Done Status (CYCLE_DONE_STS):** The SoC sets this bit to 1 when the SPI Cycle completes (i.e., SCIP bit is 0) after software sets the GO bit. This bit remains asserted until cleared by software writing a 1 or hardware reset.<br>When this bit is set and the SPI SMI# Enable bit is set, an internal signal is asserted to the SMI# generation block.<br>Software must make sure this bit is cleared prior to enabling the SPI SMI# assertion for a new programmed access. |
| 1 | 0x0<br>RO | **Reserved (RSVD_4):** Reserved. |
| 0 | 0x0<br>RO/V | **SPI Cycle In Progress (SCIP):** Hardware sets this bit when software sets the SPI Cycle Go bit in the Command register. |

## 60.3.41 Prefix Opcode and Opcode Type Configuration (BIOS_PREOP_OPTYPE)—Offset A4h

This register is not writable when the Flash Configuration Lock-Down (FLOCKDN) bit is set. Entries in this register correspond to the entries in the Opcode Menu Configuration register.

Note that the definition below only provides write protection for opcodes that have addresses associated with them. Therefore, any erase or write opcodes that do not use an address should be avoided (for example, "Chip Erase" and "Auto-Address Increment Byte Program").

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [BIOS_SPI_BAR0] + A4h

**Default:** 00000000h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:30 | 0x0 RW/L | **Opcode Type 7 (OPCODE_TYPE7):** See the description for bits 17:16. |
| 29:28 | 0x0 RW/L | **Opcode Type 6 (OPCODE_TYPE6):** See the description for bits 17:16. |
| 27:26 | 0x0 RW/L | **Opcode Type 5 (OPCODE_TYPE5):** See the description for bits 17:16. |
| 25:24 | 0x0 RW/L | **Opcode Type 4 (OPCODE_TYPE4):** See the description for bits 17:16. |
| 23:22 | 0x0 RW/L | **Opcode Type 3 (OPCODE_TYPE3):** See the description for bits 17:16. |
| 21:20 | 0x0 RW/L | **Opcode Type 2 (OPCODE_TYPE2):** See the description for bits 17:16. |
| 19:18 | 0x0 RW/L | **Opcode Type 1 (OPCODE_TYPE1):** See the description for bits 17:16. |
| 17:16 | 0x0 RW/L | **Opcode Type 0 (OPCODE_TYPE0):** This field specifies information about the corresponding Opcode 0. This information allows the hardware to 1) know whether to use the address field and 2) provide BIOS and Shared Flash protection capabilities.The hardware implementation also uses the read vs. write information for modifying the behavior of the SPI interface logic. The encoding of the two bits is:<br>• 00 = No Address associated with this Opcode and Read Cycle type<br>• 01 = No Address associated with this Opcode and Write Cycle type<br>• 10 = Address required; Read cycle type<br>• 11 = Address required; Write cycle type |
| 15:8 | 0x0 RW/L | **Prefix Opcode 1 (PREFIX_OPCODE1):** Software programs an SPI opcode into this field that is permitted to run as the first command in an atomic cycle sequence. |
| 7:0 | 0x0 RW/L | **Prefix Opcode 0 (PREFIX_OPCODE0):** Software programs an SPI opcode into this field that is permitted to run as the first command in an atomic cycle sequence. |

## 60.3.42 Opcode Menu0 Configuration (BIOS_OPMENU0)—Offset A8h

This register is not writable when the SPI Configuration Lock-Down bit (FLOCKDN) is set. Eight entries are available in this register to give BIOS a sufficient set of commands for communicating with the flash device, while also restricting what malicious software can do. This keeps the hardware flexible enough to operate with a wide variety of SPI devices.

It is recommended that BIOS avoid programming Write Enable opcodes in this menu. Malicious software could then perform writes and erases to the SPI flash without using the atomic cycle mechanism. This could cause functional failures in a shared flash environment. Write Enable opcodes should only be programmed in the Prefix Opcodes.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [BIOS_SPI_BAR0] + A8h

**Default:** 00000000h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RW/L | **Allowable Opcode 3 (OPCODE3):** See the description for bits 7:0. |
| 23:16 | 0x0<br>RW/L | **Allowable Opcode 2 (OPCODE2):** See the description for bits 7:0. |
| 15:8 | 0x0<br>RW/L | **Allowable Opcode 1 (OPCODE1):** See the description for bits 7:0. |
| 7:0 | 0x0<br>RW/L | **Allowable Opcode 0 (OPCODE0):** Software programs an SPI opcode into this field for use when initiating SPI commands through the Control Register. |

## 60.3.43 Opcode Menu1 Configuration (BIOS_OPMENU1)—Offset ACh

This register is not writable when the SPI Configuration Lock-Down bit (FLOCKDN) is set. Eight entries are available in this register to give BIOS a sufficient set of commands for communicating with the flash device, while also restricting what malicious software can do. This keeps the hardware flexible enough to operate with a wide variety of SPI devices.

It is recommended that BIOS avoid programming Write Enable opcodes in this menu. Malicious software could then perform writes and erases to the SPI flash without using the atomic cycle mechanism. This could cause functional failures in a shared flash environment. Write Enable opcodes should only be programmed in the Prefix Opcodes.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [BIOS_SPI_BAR0] + ACh

**Default:** 00000000h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RW/L | **Allowable Opcode 7 (OPCODE7):** See the description for bits 7:0. |
| 23:16 | 0x0<br>RW/L | **Allowable Opcode 6 (OPCODE6):** See the description for bits 7:0. |
| 15:8 | 0x0<br>RW/L | **Allowable Opcode 5 (OPCODE5):** See the description for bits 7:0. |
| 7:0 | 0x0<br>RW/L | **Allowable Opcode 4 (OPCODE4):** Software programs an SPI opcode into this field for use when initiating SPI commands through the Control Register. |

## 60.3.44 Secondary Flash Region Access Permissions (BIOS_SFRACC)—Offset B0h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [BIOS_SPI_BAR0] + B0h

**Default:** 00000000h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RW/L | **Secondary BIOS Master Write Access Grant (SECONDARYBIOS_MWAG):** Each bit [31:29] corresponds to Master [7:0]. BIOS can grant one or more masters write access to the Secondary BIOS region 6 overriding the permissions in the Flash Descriptor. The contents of this register are locked by the FLOCKDN bit. |
| 23:16 | 0x0<br>RW/L | **Secondary BIOS Master Read Access Grant (SECONDARYBIOS_MRAG):** Each bit [28:16] corresponds to Master [7:0]. BIOS can grant one or more masters read access to the Secondary BIOS region 6 overriding the read permissions in the Flash Descriptor. The contents of this register are locked by the FLOCKDN bit. |
| 15:0 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |

## 60.3.45 Flash Descriptor Observability Control (BIOS_FDOC)—Offset B4h

This is a test mode only register that can be used to observe the contents of the Flash Descriptor that is stored internally in the SoC Flash Controller. The CPU Complex soft straps are not observable in SoC as these are forwarded to the CPU Complex and not stored.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [BIOS_SPI_BAR0] + B4h

**Default:** 00000000h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:15 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 14:12 | 0x0<br>RW | **Flash Descriptor Section Select (FDSS):** Selects which section within the loaded Flash Descriptor to observe.<br>• 000: Flash Signature and Descriptor Map<br>• 001: Component<br>• 010: Region<br>• 011: Master<br>• 100: Soft Straps<br>• Other: Reserved |
| 11:2 | 0x0<br>RW | **Flash Descriptor Section Index (FDSI):** Selects the DW offset within the Flash Descriptor Section to observe. |
| 1:0 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved. |

## 60.3.46 Flash Descriptor Observability Data (BIOS_FDOD)—Offset B8h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [BIOS_SPI_BAR0] + B8h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **Flash Descriptor Section Data (FDSD):** Returns the DW of data to observe as selected in the Flash Descriptor Observability Control. |

## 60.3.47 Additional Flash Control (BIOS_AFC)—Offset C0h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [BIOS_SPI_BAR0] + C0h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:10 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 9:1 | 0x0<br>RW | **Reserved RW Scratch Pad (Reserved_SCRATCHPAD):** Scratch Pad bits that are R/W to be used |
| 0 | 0x0<br>RW/V/P | **Stop Prefetch on Flush Pending (SPFP):** When set to '1', the in progress of a prefetch will be ended if subsequence access from the master of the same interface (SPXB or MBB) is detected to be a cache-miss and read cache will be flushed. When set to '0', the prefetch will be allowed to complete prior to flushing.<br>This register is only reset on a Early boot reset of both the Host and the ME partitions.NOTE: This should change to reset on a host reset and a different SPFP bit used for the Intel® Management Engine cache. Future<br>project fix?<br>The reset value of this bit is determined by the SoC soft strap PCHSTRP0.SPI_SPFP. |

## 60.3.48 Vendor Specific Component Capabilities for Component 0 (BIOS_SFDP0_VSCC0)—Offset C4h

*Note:* Intel is planning to deprecate support for non-SFDP capable flash devices.

VSCC registers were previously used to allow software to configure flash device-specific parameters. Since Serial Flash Discoverable Parameters were standardized in 2011 this capability is less important. For SPT, the VSCC registers will be renamed SFDP registers. If the flash controller discovers SFDP devices, then hardware will populate the appropriate register fields from the SFDP table and treat them as read-only by software. If SFDP is not discovered then the registers will remain writable by software. This change is intended to allow microarchitectural cleanup by having device parameters sourced from a single location. The SPI flash controller uses the Quad Enable Requirements (QER) data from the SFDP table to ensure that the flash device is enabled for Quad-mode prior to issuing any Quad-mode reads. If quad reads are disabled via softstraps then the flash controller may ignore QER. If the QE bit is in the flash status register, the controller reads the status register. If the QE bit is 0 then the controller sets it to 1 and writes the status register back to the flash device using a write_enable, write_status sequence.

The QER bits are used by software/firmware as follows:

1. Manufacturing time: FITC tool is used to initialize the set of vendor-specific VSCC entries in the FLUMAP portion of the descriptor, where each entry is a pair of (device ID, VSCC value).
2. Boot time: Intel® Management Engine firmware and BIOS perform the SoC register initialization.
   a. Read JEDEC ID from each flash device.
   b. Scan through VSCC tables pointed to by FLUMAP.
   c. Copy the entry from FLUMAP which matches device 0 into VSCC0, copy entry which matches device 1 into VSCC1.
3. In software sequencing, BIOS/Intel® Management Engine ensure QE bit is not cleared while doing status register write.

The flash controller uses the polling delays to set internal timers after initiating a write, erase, or RPMC operation. After the internal timer expires the flash controller begins polling the flash busy status in bit 0 of the status register. [OPEN: Move requirement to a standalone section] If the RPMC polling requirements bit is set to poll with RPMC Op2, then the flash controller issues an RPMC Op2 instead of a read status (05h). The RPMC Op2 operation uses “fast read” timing with 8 dummy bits between the address and valid data. Bit 0 of the first byte returned from RPMC Op2 is the busy bit.

The fields in this register pertain to cycles targeting addresses less than FLCOMP.C0DEN, i.e. within Component 0.

If the CPPTV bit is '0', software must configure the VSCC register appropriately. If the CPPTV bit is '1', the corresponding parameter values discovered via SFDP will be used. In most cases, software is not required to configure the VSCC register. However, if the SFDP table indicates an erase size other than 4k Byte, then software is required to program the VSCC.EO register with the correct erase opcode.

If the CPPTV bit is '0' and the VSCC register is not programmed and the Flash is operating in Flash Mode (as opposed to EEPROM mode), then software cannot use hardware sequencing. This requirement is not enforced by hardware, but is a requirement of the power-on usage model.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00002000h

**BAR and Offset:** [BIOS_SPI_BAR0] + C4h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO/V | **Component Property Parameter Table Valid (CPPTV):** This bit is set to a 1 if the Flash Controller detects a valid SFDP Component Property Parameter Table in Component 0.<br>***Note:*** If this bit is set software must not overwrite bits that were initialized by hardware via SFDP discovery. |
| 30 | 0x0<br>RW/L | **Vendor Component Lock (VCL):**<br>0 = The lock bit is not set.<br>1 = The Vendor Component Lock bit is set. This register locks itself when set. |
| 29 | 0x0<br>RW/V/L | **64k Erase Valid (EO_64k_VALID):**<br>0 = The EO_64k opcode is not valid.<br>1 = The EO_64k opcode is valid. |
| 28 | 0x0<br>RW/V/L | **4k Erase Valid (EO_4k_VALID):**<br>0 = The EO_4k opcode is not valid.<br>1 = The EO_4k opcode is valid. |
| 27 | 0x0<br>RW/L | **RPMC Supported (RPMC_SUPPORTED):**<br>0 = The device does not support RPMC.<br>1 = The device supports RPMC. |
| 26 | 0x0<br>RW/V/L | **Deep Powerdown Supported (DEEP_PWRDN_SUPPORTED):**<br>0 = The device does not support Deep Powerdown.<br>1 = The device supports Deep Powerdown. |
| 25 | 0x0<br>RW/V/L | **Suspend/Resume Supported (SUSPEND_RESUME_SUPPORTED):**<br>0 = The device does not support Suspend/Resume.<br>1 = The device supports Suspend/Resume. |
| 24 | 0x0<br>RW/V/L | **Soft Reset Supported (SOFT_RST_SUPPORTED):**<br>0 = The device does not support Soft Reset.<br>1 = The device supports Soft Reset. |
| 23:16 | 0x0<br>RW/V/L | **64k Erase Opcode (EO_64k):**<br>This register is programmed with the Flash 64k sector erase instruction opcode for component 0.<br>This register is locked by the Vendor Component Lock (VCL) bit or the CPPTV bit. |
| 15:8 | 0x20<br>RW/V/L | **4k Erase Opcode (EO_4k):** This register is programmed with the Flash 4k subsector erase instruction opcode for component 0. Software must program this register if the SFDP table for this component does not show 4 k Byte erase capability.<br>This register is locked by the Vendor Component Lock (VCL) bit or the CPPTV bit. |
| 7:5 | 0x0<br>RW/V/L | **Quad Enable Requirements (QER):**<br>• 000 Part does not require a Quad Enable bit to be set, either because Quad is not supported or because the manufacturer somehow permanently enables Quad capability.<br>• 001 Part requires bit 9 in status register 2 to be set to enable quad IO. Writing one byte to status register clears all bits in register 2, therefore status register writes MUST be two bytes.<br>• 010 Part requires bit 6 of status register 1 to be set to enable quad IO.<br>• 011 Part requires bit 7 of the configuration register to be set to enable Quad.<br>• 100 Part requires bit 9 in status register 2 to be set to enable quad IO. Writing one byte to the status register does not clear the second byte.<br>This register is locked by the Vendor Component Lock (VCL) bit.<br>If the SFDP table contains this information, the flash controller loads these bits from the table.<br>The flash controller uses this information to prevent clearing the QE bit in the flash device's status register when WSR=1. |
| 4 | 0x0<br>RW/V/L | **Write Enable on Write Status (WEWS):**<br>0 = 50h is the opcode to enable a status register write.<br>1 = 06h is the opcode to enable a status register write.<br>This register is locked by the Vendor Component Lock (VCL) bit or the CPPTV bit.<br>***Note:*** Hardware ignores the state of this bit. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 3 | 0x0<br>RW/V/L | **Write Status Required (WSR):**<br>0 = No requirement to write to the Write Status Register prior to a write<br>1 = A write is required to the Write Status Register prior to write and erase to remove any protection. This is required for SST components.<br>This register is locked by the Vendor Component Lock (VCL) bit or the CPPTV bit.<br>***Note:*** Hardware ignores the state of this bit. |
| 2 | 0x0<br>RW/V/L | **Write Granularity (WG):**<br>0 = Reserved.<br>1 = 64 Byte.<br>This register is locked by the Vendor Component Lock (VCL) bit or the CPPTV bit.<br>***Note:*** Hardware ignores the state of this bit. |
| 1:0 | 0x0<br>RW/L | **Reserved (RSVD):** Reserved. |

## 60.3.49 Vendor Specific Component Capabilities for Component 1 (BIOS_SFDP1_VSCC1)—Offset C8h

*Note:* Intel is planning to deprecates support for non-SFDP capable flash devices.

See 31.1, Section 4)a). The fields in this register pertain to cycles targeting addresses greater than or equal to FLCOMP.C0DEN, i.e. outside of Component 0. The lockable bits in this register are locked when either CPPTV is set to '1' by hardware or when VCL is '1'.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [BIOS_SPI_BAR0] + C8h

**Default:** 00002000h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO/V | **Component Property Parameter Table Valid (CPPTV):** This bit is set to a 1 if the Flash Controller detects a valid SFDP Component Property Parameter Table in Component 1.<br>***Note:*** If this bit is set software must not overwrite bits that were initialized by hardware via SFDP discovery. |
| 30 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 29 | 0x0<br>RW/V/L | **64k Erase Valid (EO_64k_VALID):**<br>0 = The EO_64k opcode is not valid.<br>1 = The EO_64k opcode is valid. |
| 28 | 0x0<br>RW/V/L | **4k Erase Valid (EO_4k_VALID):**<br>0 = The EO_4k opcode is not valid.<br>1 = The EO_4k opcode is valid. |
| 27 | 0x0<br>RW/L | **RPMC Supported (RPMC_SUPPORTED):**<br>0 = The device does not support RPMC.<br>1 = The device supports RPMC. |
| 26 | 0x0<br>RW/V/L | **Deep Powerdown Supported (DEEP_PWRDN_SUPPORTED):**<br>0 = The device does not support Deep Powerdown.<br>1 = The device supports Deep Powerdown. |
| 25 | 0x0<br>RW/V/L | **Suspend/Resume Supported (SUSPEND_RESUME_SUPPORTED):**<br>0 = The device does not support Suspend/Resume.<br>1 = The device supports Suspend/Resume. |
| 24 | 0x0<br>RW/V/L | **Soft Reset Supported (SOFT_RST_SUPPORTED):**<br>0 = The device does not support Soft Reset.<br>1 = The device supports Soft Reset. |
| 23:16 | 0x0<br>RW/V/L | **64k Erase Opcode (EO_64k):** This register is programmed with the Flash 64k sector erase instruction opcode for component 1.<br>This register is locked by the Vendor Component Lock (VCL) bit or the CPPTV bit. |
| 15:8 | 0x20<br>RW/V/L | **4k Erase Opcode (EO_4k):** This register is programmed with the Flash 4k subsector erase instruction opcode for component 1.<br>Software must program this register if the SFDP table for this component does not show 4 k Byte erase capability.<br>This register is locked by the Vendor Component Lock (VCL) bit or the CPPTV bit. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:5 | 0x0<br>RW/V/L | **Quad Enable Requirements (QER):**<br>• 000 Part does not require a Quad Enable bit to be set, either because Quad is not supported or because the manufacturer somehow permanently enables Quad capability.<br>• 001 Part requires bit 9 in status register 2 to be set to enable quad IO. Writing one byte to status register clears all bits in register 2, therefore status register writes MUST be two bytes.<br>• 010 Part requires bit 6 of status register 1 to be set to enable quad IO.<br>• 011 Part requires bit 7 of the configuration register to be set to enable Quad.<br>• 100 Part requires bit 9 in status register 2 to be set to enable quad IO. Writing one byte to the status register does not clear the second byte.<br>This register is locked by the Vendor Component Lock (VCL) bit.<br>If the SFDP table contains this information, the flash controller loads these bits from the table.<br>The flash controller uses this information to prevent clearing the QE bit in the flash device's status register when WSR=1. |
| 4 | 0x0<br>RW/V/L | **Write Enable on Write Status (WEWS):**<br>0 = 50h is the opcode to enable a status register write.<br>1 = 06h is the opcode to enable a status register write.<br>Must be set to '1' for Intel's Blanshard Flash Component and for Atmel. This register is locked by the Vendor Component Lock (VCL) bit or the CPPTV bit.<br>***Note:*** Hardware ignores the state of this bit. |
| 3 | 0x0<br>RW/V/L | **Write Status Required (WSR):**<br>0 = No requirement to write to the Write Status Register prior to a write.<br>1 = A write is required to the Write Status Register prior to write and erase to remove any protection. This is required for SST components.<br>This register is locked by the Vendor Component Lock (VCL) bit or the CPPTV bit.<br>***Note:*** Hardware ignores the state of this bit. |
| 2 | 0x0<br>RW/V/L | **Write Granularity (WG):**<br>0 = Reserved.<br>1 = 64 Byte.<br>This register is locked by the Vendor Component Lock (VCL) bit or the CPPTV bit.<br>***Note:*** Hardware ignores the state of this bit. |
| 1:0 | 0x0<br>RW/L | **Reserved (RSVD_1):** Reserved. |

## 60.3.50 Parameter Table Index (BIOS_PTINX)—Offset CCh

Observability control for Component Property Tables.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [BIOS_SPI_BAR0] + CCh

**Default:** 00000000h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 15:14 | 0x0<br>RW | **Supported Parameter Table (SPT):** Selects which supported parameter table to observe.<br>• 00: Component 0 Property Parameter Table.<br>• 01: Component 1 Property Parameter Table.<br>• 10: Reserved.<br>• 11: Reserved. |
| 13:12 | 0x0<br>RW | **Header or Data (HORD):** Select parameter table header DW vs Data DW.<br>• 00: SFDP Header.<br>• 01: Parameter Table Header.<br>• 10: Data.<br>• 11: Reserved. |
| 11:2 | 0x0<br>RW | **Parameter Table DW Index (PTDWI):** Selects the DW offset within the parameter table to observe. |
| 1:0 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved. |

## 60.3.51 Parameter Table Data (BIOS_PTDATA)—Offset D0h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [BIOS_SPI_BAR0] + D0h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RO/V | **Parameter Table DW Data (PTDWD):** Returns the DW of data to observe as selected in the Parameter Table Index register.<br>***Note:*** The returned value of reserved fields in the SFDP header or table must be ignored by software.<br>The flash controller may return either 0 or 1 for these fields. |

## 60.3.52 SPI Bus Requester Status (BIOS_SBRS)—Offset D4h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [BIOS_SPI_BAR0] + D4h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO/V | **TPM access ongoing (TPM_ACC_ONG):** |
| 30:18 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 17:15 | 0x0<br>RO/V | **Master 6 Status (M6STATUS):** See description under M1STATUS. |
| 14:12 | 0x0<br>RO/V | **Master 5 Status (M5STATUS):** See description under M1STATUS. |
| 11:9 | 0x0<br>RO/V | **Master 4 Status (M4STATUS):** See description under M1STATUS. |
| 8:6 | 0x0<br>RO/V | **Master 3 Status (M3STATUS):** See description under M1STATUS. |
| 5:3 | 0x0<br>RO/V | **Master 2 Status (M2STATUS):** See description under M1STATUS. |
| 2:0 | 0x0<br>RO/V | **Master 1 Status (M1STATUS):** Indicates whether this master has an outstanding transaction enqueued or in flight and the transaction type.<br>• 0xx: No transaction.<br>• 100: Flash read transaction.<br>• 101: Flash write transaction.<br>• 110: Flash erase transaction.<br>• 111: Flash RPMC transaction. |

## 60.3.53 Flash Region 12 (BIOS_FREG12)—Offset E0h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [BIOS_SPI_BAR0] + E0h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 30:16 | 0x0<br>RO/V | **Region Limit (RL):** This specifies address bits 26:12 for the Region 12 Limit.<br>The value in this register is loaded from the contents in the Flash Descriptor.FLREG12.Region Limit. |
| 15 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved. |
| 14:0 | 0x0<br>RO/V | **Region Base (RB):** This specifies address bits 26:12 for the Region 12 Base.<br>The value in this register is loaded from the contents in the Flash Descriptor.FLREG12.Region Base. |

## 60.3.54 Flash Region 13 (BIOS_FREG13)—Offset E4h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [BIOS_SPI_BAR0] + E4h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 30:16 | 0x0<br>RO/V | **Region Limit (RL):** This specifies address bits 26:12 for the Region 13 Limit.<br>The value in this register is loaded from the contents in the Flash Descriptor.FLREG13.Region Limit. |
| 15 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved. |
| 14:0 | 0x0<br>RO/V | **Region Base (RB):** This specifies address bits 26:12 for the Region 13 Base.<br>The value in this register is loaded from the contents in the Flash Descriptor.FLREG13.Region Base. |

## 60.3.55 Flash Region 14 (BIOS_FREG14)—Offset E8h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [BIOS_SPI_BAR0] + E8h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 30:16 | 0x0<br>RO/V | **Region Limit (RL):** This specifies address bits 26:12 for the Region 14 Limit.<br>The value in this register is loaded from the contents in the Flash Descriptor.FLREG14.Region Limit. |
| 15 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved. |
| 14:0 | 0x0<br>RO/V | **Region Base (RB):** This specifies address bits 26:12 for the Region 14 Base.<br>The value in this register is loaded from the contents in the Flash Descriptor.FLREG14.Region Base. |

## 60.3.56 Flash Region 15 (BIOS_FREG15)—Offset ECh

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [BIOS_SPI_BAR0] + ECh

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 30:16 | 0x0<br>RO/V | **Region Limit (RL):** This specifies address bits 26:12 for the Region 15 Limit.<br>The value in this register is loaded from the contents in the Flash Descriptor.FLREG15.Region Limit. |
| 15 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved. |
| 14:0 | 0x0<br>RO/V | **Region Base (RB):** This specifies address bits 26:12 for the Region 15 Base.<br>The value in this register is loaded from the contents in the Flash Descriptor.FLREG15.Region Base. |

## 60.3.57 Set Strap Msg Lock (SSML)—Offset F0h

Lockable: Yes

Power Well: Resume

reset_type= wrsmrst#.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [BIOS_SPI_BAR0] + F0h

**Default:** 00000000h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:1 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 0 | 0x0<br>RW/L | **Set_Strap Lock (SSL):** When set to '1', all of SSML, SSMC and SSMD is locked, including this Lock bit.<br>Note that this bit is reset on CF9 resets.<br>reset_type= wrsmrst# |

## 60.3.58 Set Strap Msg Control (SSMC)—Offset F4h

Lockable: Yes

Power Well: DSW

reset_type= dsw_pok

The DSW bits are all cleared by dsw_pok, but must not be cleared by CF9h resets.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [BIOS_SPI_BAR0] + F4h

**Default:** 00000000h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:1 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 0 | 0x0<br>RW/L | **Set_Strap Mux Select (SSMS):** When set to '1', the Set strap message bits [47:32] come from the Set_Strap Msg Data register.<br>This bit is reset by the RSMRST# pin only. When '0', the Set-Strap data continues to come from the soft straps themselves.<br>reset_type=dsw_pok<br>This register field is locked by the Set Strap Lock (SSML.SSL) bit. |

## 60.3.59 Set Strap Msg Data (SSMD)—Offset F8h

Lockable: Yes
Power Well: DSW
Reset Type: dsw_pok

This register is used to provide a BIOS programmable sticky register which contains data that will be used in the Set-Strap type 1 msg on subsequent resets. The bits in the message control certain CPU features, for which see the CPU spec. These bits are in the resume well, so only reset on G3.

The usage model is that on each reset BIOS will check the state of the CPU. If the state is correct, then BIOS continues. If not, then BIOS writes the SSMD and SSMC registers and does a CF9 reset. On the reset the value of what was written to SSMD takes effect. Note that some mobile platforms force G3 on S5 requests. For those platforms, if the user/BIOS wants to have these bits set, there will be 2 resets on every power-on. If the platform accepts the default of '0' for these controls, then there is only one reset. The bits are in DSW and not RTC well because this allows a user upgrade, assuming the user unplugged the system before doing the upgrade, to revert to a setting of 0. This should reduce any interoperability concerns regarding user upgrades. The DSW bits are all cleared dsw_pok, and must not be cleared by CF9h resets.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [BIOS_SPI_BAR0] + F8h

**Default:** 00000000h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 15:0 | 0x0<br>RW/L | **Set_Strap Data (SSD):** When SSMS is '1', then this data is sent in the Set-Strap msg Type 1 upon reset. This data is sent in the 2nd DW of data, bits[15:0].<br>reset_type=int_sus_pok<br>This register field is locked by the Set Strap Lock (SSML.SSL) bit. |

## 60.3.60 RPMC SFDP Table (BIOS_RPMC0_D0)—Offset 108h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [BIOS_SPI_BAR0] + 108h

**Default:** 00000000h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **RPMC SFDP Table dword 0 Device 0 (RPMC0_D0):** |

## 60.3.61 RPMC SFDP Table (BIOS_RPMC1_D0)—Offset 10Ch

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [BIOS_SPI_BAR0] + 10Ch

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **RPMC SFDP Table dword 1 Device 0 (RPMC1_D0):** |

## 60.3.62 RPMC SFDP Table (BIOS_RPMC0_D1)—Offset 110h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [BIOS_SPI_BAR0] + 110h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **RPMC SFDP Table dword 0 Device 1 (RPMC0_D1):** |

## 60.3.63 RPMC SFDP Table (BIOS_RPMC1_D1)—Offset 114h

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**Default:** 00000000h

**BAR and Offset:** [BIOS_SPI_BAR0] + 114h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW | **RPMC SFDP Table dword 0 Device 1 (RPMC1_D1):** |

## 60.3.64 BIOS Master Read Access Permissions (BIOS_BM_RAP)—Offset 118h

This register is implemented in DNV, LBG and subsequent programs.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [BIOS_SPI_BAR0] + 118h

**Default:** 000000C2h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 15:0 | 0xc2<br>RO/V | **BIOS Master Read Access Permissions (BMRAP) (BMRAP):** Each bit [15:0] corresponds to Regions [15:0].<br>If the bit is set, this master can read that particular region through register accesses.<br>The contents of this register are that of the Flash Descriptor.Flash Master 1.Master Region Read Access OR a particular master has granted BIOS read permissions in their Master Read Access Grant register OR the Flash Descriptor Security Override strap is set.<br>BIOS has read access to its own Region 1, 6 and 7 by default. Thus, the reset default of this field will be read as "C2h". |

## 60.3.65 BIOS Master Write Access Permissions (BIOS_BM_WAP)—Offset 11Ch

This register is implemented in DNV, LBG and subsequent programs.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [BIOS_SPI_BAR0] + 11Ch

**Default:** 00000042h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **Reserved (RSVD):** Reserved. |
| 15:0 | 0x42<br>RO/V | **BIOS Master Write Access Permissions (BMWAP) (BMWAP):** Each bit [15:0] corresponds to Regions [15:0]. If the bit is set, this master can erase and write that particular region through register accesses.<br>The contents of this register are that of the Flash Descriptor.Flash Master 1.Master Region Write Access OR a particular master has granted BIOS write permissions in their Master Write Access Grant register OR the Flash Descriptor Security Override strap is set.<br>BIOS has write access to its own Region 1 and 6 by default. Thus, the reset default of this field will be read as "42h". |

## 60.3.66 IE Flash Protected Range 0 (BIOS_IE_PR0)—Offset 1B0h

This register can not be written when the FLOCKDN bit is set to 1.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [BIOS_SPI_BAR0] + 1B0h

**Default:** 00000000h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO/V | **Write Protection Enable (WPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware.<br>The base and limit fields are ignored when this bit is cleared. |
| 30:16 | 0x0<br>RO/V | **Protected Range Limit (PRL):** This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range.<br>Address bits 11:0 are assumed to be FFFh for the limit comparison.<br>Any address greater than the value programmed in this field is unaffected by this protected range. |
| 15 | 0x0<br>RO/V | **Read Protection Enable (RPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that read directed to addresses between them (inclusive) must be blocked by hardware.<br>The base and limit fields are ignored when this bit is cleared. |
| 14:0 | 0x0<br>RO/V | **Protected Range Base (PRB):** This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range.<br>Address bits 11:0 are assumed to be 000h for the base comparison.<br>Any address less than the value programmed in this field is unaffected by this protected range. |

## 60.3.67 IE Flash Protected Range 1 (BIOS_IE_PR1)—Offset 1B4h

This register can not be written when the FLOCKDN bit is set to 1.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [BIOS_SPI_BAR0] + 1B4h

**Default:** 00000000h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO/V | **Write Protection Enable (WPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware.<br>The base and limit fields are ignored when this bit is cleared. |
| 30:16 | 0x0<br>RO/V | **Protected Range Limit (PRL):** This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range.<br>Address bits 11:0 are assumed to be FFFh for the limit comparison.<br>Any address greater than the value programmed in this field is unaffected by this protected range. |
| 15 | 0x0<br>RO/V | **Read Protection Enable (RPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that read directed to addresses between them (inclusive) must be blocked by hardware.<br>The base and limit fields are ignored when this bit is cleared. |
| 14:0 | 0x0<br>RO/V | **Protected Range Base (PRB):** This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range.<br>Address bits 11:0 are assumed to be 000h for the base comparison.<br>Any address less than the value programmed in this field is unaffected by this protected range. |

## 60.3.68 IE Flash Protected Range 2 (BIOS_IE_PR2)—Offset 1B8h

This register can not be written when the FLOCKDN bit is set to 1.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [BIOS_SPI_BAR0] + 1B8h

**Default:** 00000000h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO/V | **Write Protection Enable (WPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware.<br>The base and limit fields are ignored when this bit is cleared. |
| 30:16 | 0x0<br>RO/V | **Protected Range Limit (PRL):** This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range.<br>Address bits 11:0 are assumed to be FFFh for the limit comparison.<br>Any address greater than the value programmed in this field is unaffected by this protected range. |
| 15 | 0x0<br>RO/V | **Read Protection Enable (RPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that read directed to addresses between them (inclusive) must be blocked by hardware.<br>The base and limit fields are ignored when this bit is cleared. |
| 14:0 | 0x0<br>RO/V | **Protected Range Base (PRB):** This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range.<br>Address bits 11:0 are assumed to be 000h for the base comparison.<br>Any address less than the value programmed in this field is unaffected by this protected range. |

## 60.3.69 IE Flash Protected Range 3 (BIOS_IE_PR3)—Offset 1BCh

This register can not be written when the FLOCKDN bit is set to 1.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [BIOS_SPI_BAR0] + 1BCh

**Default:** 00000000h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO/V | **Write Protection Enable (WPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware.<br>The base and limit fields are ignored when this bit is cleared. |
| 30:16 | 0x0<br>RO/V | **Protected Range Limit (PRL):** This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range.<br>Address bits 11:0 are assumed to be FFFh for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range. |
| 15 | 0x0<br>RO/V | **Read Protection Enable (RPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that read directed to addresses between them (inclusive) must be blocked by hardware.<br>The base and limit fields are ignored when this bit is cleared. |
| 14:0 | 0x0<br>RO/V | **Protected Range Base (PRB):** This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range.<br>Address bits 11:0 are assumed to be 000h for the base comparison.<br>Any address less than the value programmed in this field is unaffected by this protected range. |

## 60.3.70 IE Flash Protected Range 4 (BIOS_IE_PR4)—Offset 1C0h

This register can not be written when the FLOCKDN bit is set to 1.

**Type:** Memory Mapped I/O Register (Size: 32 bits)

**BAR and Offset:** [BIOS_SPI_BAR0] + 1C0h

**Default:** 00000000h

**BIOS_SPI_BAR0 Type:** PCI Configuration Register (Size: 32 bits)
**BIOS_SPI_BAR0 Reference:** [B:0, D:31, F:5] + 10h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RO/V | **Write Protection Enable (WPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that writes and erases directed to addresses between them (inclusive) must be blocked by hardware.<br>The base and limit fields are ignored when this bit is cleared. |
| 30:16 | 0x0<br>RO/V | **Protected Range Limit (PRL):** This field corresponds to FLA address bits 26:12 and specifies the upper limit of the protected range. Address bits 11:0 are assumed to be FFFh for the limit comparison. Any address greater than the value programmed in this field is unaffected by this protected range. |
| 15 | 0x0<br>RO/V | **Read Protection Enable (RPE):** When set, this bit indicates that the Base and Limit fields in this register are valid and that read directed to addresses between them (inclusive) must be blocked by hardware. The base and limit fields are ignored when this bit is cleared. |
| 14:0 | 0x0<br>RO/V | **Protected Range Base (PRB):** This field corresponds to FLA address bits 26:12 and specifies the lower base of the protected range. Address bits 11:0 are assumed to be 000h for the base comparison. Any address less than the value programmed in this field is unaffected by this protected range. |

# 61 Programmable Interval Timer - Legacy

## 61.1 Introduction and Index

The host-accessible registers for the Programmable Interval Timer (PIT) are described here.

The legend for the register access codes are described in Chapter 43, “Introduction.”

### 61.1.1 Host I/O Space—Fixed Address

An index of the registers that are accessible in Host I/O Space is shown here.

## 61.2 Registers in I/O Space—Fixed Addresses

### Table 61-1. Summary of I/O Registers—Fixed I/O Ports

| I/O Port (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 40 | 1 | C4 | "Counter 0 - Interval Timer Status Byte Format Register (C0_ITSBFR)—Offset 40h" on page 2876 |
| 42 | 1 | C4 | "Counter 2 - Interval Timer Status Byte Format Register (C2_ITSBFR)—Offset 42h" on page 2877 |
| 43 | 1 | 00 | "Timer Control Word Register (TCW)—Offset 43h" on page 2878 |
| 42 | 1 | 00 | "Counter 2 - Counter Access Ports Register (C2_CAPR)—Offset 42h" on page 2879 |
| 43 | 1 | C0 | "Read Back Command (RBC)—Offset 43h" on page 2880 |
| 43 | 1 | 00 | "Counter Latch Command (CLC)—Offset 43h" on page 2881 |
| 61 | 1 | 00 | "NMI Status and Control (NMI_STS_CNT)—Offset 61h" on page 2882 |

These registers are accessed in Host I/O Space through fixed I/O Port addresses.

## 61.2.1 Counter 0 - Interval Timer Status Byte Format Register (C0_ITSBFR)—Offset 40h

Each counter's status byte can be read following a Read Back Command. If latch status is chosen (bit 4=0, Read Back Command) as a read back option for a given counter, the next read from the counter's Counter Access Ports Register (I/O Port 40h for counter 0 and I/O Port 42h for counter 2) returns the status byte. The status byte returns the following:

**Type:** I/O Register
(Size: 8 bits)

**I/O Port:** 40h

**Default:** C4h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x1<br>RO | **Counter OUT Pin State (COPS):**<br>• When this bit is a 1, the OUT pin of the counter is also a 1.<br>• When this bit is a 0, the OUT pin of the counter is also a 0.<br><br>**Power Well:** Core |
| 6 | 0x1<br>RO | **Count Register Status (CRSTS):** This bit indicates when the last count written to the Count Register (CR) has been loaded into the counting element (CE).<br>The exact time this happens depends on the counter mode, but until the count is loaded into the counting element (CE), the count value will be incorrect.<br>• 0 - Count has been transferred from CR to CE and is available for reading.<br>• 1 - Null Count. Count has not been transferred from CR to CE and is not yet available for reading.<br><br>**Power Well:** Core |
| 5:4 | 0x0<br>RO | **Read/Write Selection Status (RW_SLT_STS):** These reflect the read/write selection made through bits[5:4] of the control register.<br>The binary codes returned during the status read match the codes used to program the counter read/write selection.<br>• 00 - Counter Latch Command<br>• 01 - Read/Write Least Significant Byte (LSB)<br>• 10 - Read/Write Most Significant Byte (MSB)<br>• 11 - Read/Write LSB then MSB<br><br>**Power Well:** Core |
| 3:1 | 0x2<br>RO | **Mode Selection Status (MD_SLT_STS):** These bits return the counter mode programming.<br>The binary code returned matches the code used to program the counter mode, as listed under the bit function above.<br>• 000 - Out signal on end of count (=0)<br>• 001 - Hardware retriggerable one-shot<br>• x10 - Rate generator (divide by n counter)<br>• x11 - Square wave output<br>• 100 - Software triggered strobe<br>• 101 - Hardware triggered strobe<br><br>**Power Well:** Core |
| 0 | 0x0<br>RO | **Countdown Type Status (CDT_STS):** This bit reflects the current countdown type, ether 0 for binary countdown or a 1 for binary coded decimal (BCD) countdown.<br><br>**Power Well:** Core |

## 61.2.2 Counter 2 - Interval Timer Status Byte Format Register (C2_ITSBFR)—Offset 42h

Each counter's status byte can be read following a Read Back Command. If latch status is chosen (bit 4=0, Read Back Command) as a read back option for a given counter, the next read from the counter's Counter Access Ports Register (I/O Port 40h for counter 0 and I/O Port 42h for counter 2) returns the status byte. The status byte returns the following:

**Type:** I/O Register
(Size: 8 bits)

**I/O Port:** 42h

**Default:** C4h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x1<br>RO | **Counter OUT Pin State (COPS):**<br>• When this bit is a 1, the OUT pin of the counter is also a 1.<br>• When this bit is a 0, the OUT pin of the counter is also a 0.<br><br>**Power Well:** Core |
| 6 | 0x1<br>RO | **Count Register Status (CRSTS):** This bit indicates when the last count written to the Count Register (CR) has been loaded into the counting element (CE).<br>The exact time this happens depends on the counter mode, but until the count is loaded into the counting element (CE), the count value will be incorrect.<br>• 0 - Count has been transferred from CR to CE and is available for reading.<br>• 1 - Null Count. Count has not been transferred from CR to CE and is not yet available for reading.<br><br>**Power Well:** Core |
| 5:4 | 0x0<br>RO | **Read/Write Selection Status (RW_SLT_STS):** These reflect the read/write selection made through bits[5:4] of the control register.<br>The binary codes returned during the status read match the codes used to program the counter read/write selection.<br>• 00 - Counter Latch Command<br>• 01 - Read/Write Least Significant Byte (LSB)<br>• 10 - Read/Write Most Significant Byte (MSB)<br>• 11 - Read/Write LSB then MSB<br><br>**Power Well:** Core |
| 3:1 | 0x2<br>RO | **Mode Selection Status (MD_SLT_STS):** These bits return the counter mode programming. The binary code returned matches the code used to program the counter mode, as listed under the bit function above.<br>• 000 - Out signal on end of count (=0)<br>• 001 - Hardware retriggerable one-shot<br>• x10 - Rate generator (divide by n counter)<br>• x11 - Square wave output<br>• 100 - Software triggered strobe<br>• 101 - Hardware triggered strobe<br><br>**Power Well:** Core |
| 0 | 0x0<br>RO | **Countdown Type Status (CDT_STS):** This bit reflects the current countdown type, ether 0 for binary countdown or a 1 for binary coded decimal (BCD) countdown.<br><br>**Power Well:** Core |

### 61.2.3 Timer Control Word Register (TCW)—Offset 43h

This register is programmed prior to any counter being accessed to specify counter modes. Following reset, the control words for each register are undefined and each counter output is 0. Each timer must be programmed to bring it into a known state. There are two special commands that can be issued to the counters through this register, the Read Back Command and the Counter Latch Command. When these commands are chosen, several bits within this register are redefined.

**Type:** I/O Register (Size: 8 bits)

**I/O Port:** 43h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:6 | 0x0<br>WO | **Counter Select (CNT_SLT):** The Counter Selection bits select the counter the control word acts upon as shown below.<br>The Read Back Command is selected when bits[7:6] are both 1.<br>• 00 - Counter 0 select<br>• 01 - Reserved<br>• 10 - Counter 2 select<br>• 11 - Read Back Command<br><br>**Power Well:** Core |
| 5:4 | 0x0<br>WO | **Read/Write Select: (RW_SLT):** These bits are the read/write control bits.<br>The actual counter programming is done through the counter port (40h for counter 0 and 42h for counter 2).<br>• 00 - Counter Latch Command<br>• 01 - Read/Write Least Significant Byte (LSB)<br>• 10 - Read/Write Most Significant Byte (MSB)<br>• 11 - Read/Write LSB then MSB<br><br>**Power Well:** Core |
| 3:1 | 0x0<br>WO | **Counter Mode Selection (CNT_MD_SLTN):** These bits select one of six possible modes of operation for the selected counter.<br>• 000 - Out signal on end of count (=0)<br>• 001 - Hardware retriggerable one-shot<br>• x10 - Rate generator (divide by n counter)<br>• x11 - Square wave output<br>• 100 - Software triggered strobe<br>• 101 - Hardware triggered strobe<br><br>**Power Well:** Core |
| 0 | 0x0<br>WO | **Binary/BCD Countdown Select (B_BCD_CNTDWN_SLT):**<br>• 0 - Binary countdown is used. The largest possible binary count is $2^{16}$<br>• 1 - Binary coded decimal (BCD) count is used.The largest possible BCD count is $10^4$<br><br>**Power Well:** Core |

## 61.2.4 Counter 2 - Counter Access Ports Register (C2_CAPR)—Offset 42h

**Type:** I/O Register
(Size: 8 bits)

**I/O Port:** 42h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW/V | **Counter Port (CP):** Each counter port address is used to program the 16-bit Count Register.<br>The order of programming, either LSB only, MSB only, or LSB then MSB, is defined with the Interval Counter Control Register at I/O Port 43h.<br>The counter port is also used to read the current count from the Count Register, and return the status of the counter programming following a Read Back Command.<br><br>**Power Well:** Core |

## 61.2.5 Read Back Command (RBC)—Offset 43h

The Read Back Command is used to determine the count value, programmed mode, and current states of the OUT pin and Null count flag of the selected counter or counters.

**Type:** I/O Register (Size: 8 bits)

**I/O Port:** 43h

**Default:** C0h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:6 | 0x3<br>WO | **Read Back Command (RBC):** Must be 11 to select the Read Back Command (RBC). Otherwise, see "Counter Latch Command (CLC)—Offset 43h" on page 2881.<br><br>**Power Well:** Core |
| 5 | 0x0<br>WO | **Latch Count of Selected Counters (LCSC):**<br>• 0 - Current count value of the selected counters will be latched<br>• 1 - Current count will not be latched<br><br>**Power Well:** Core |
| 4 | 0x0<br>WO | **Latch Status of Selected Counters (LSSC):**<br>• 0 - Status of the selected counters will be latched<br>• 1 - Status will not be latched<br><br>**Power Well:** Core |
| 3 | 0x0<br>WO | **Counter 2 Select (CNT_2_SLT):**<br>When set to 1, Counter 2 count and/or status will be latched<br><br>**Power Well:** Core |
| 2 | 0x0<br>WO | **Reserved (RSVD):** Reserved<br><br>**Power Well:** Core |
| 1 | 0x0<br>WO | **Counter 0 Select (CNT_0_SLT):**<br>When set to 1, Counter 0 count and/or status will be latched.<br><br>**Power Well:** Core |
| 0 | 0x0<br>WO | **Reserved (RSVD_1):** Must be 0.<br><br>**Power Well:** Core |

### 61.2.6 Counter Latch Command (CLC)—Offset 43h

The Counter Latch Command latches the current count value. This command is used to insure that the count read from the counter is accurate.

**Type:** I/O Register (Size: 8 bits)

**I/O Port:** 43h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:6 | 0x0<br>WO | **Counter Selection (CNT_SLT):** These bits select the counter for latching.<br>• 00 - Counter 0<br>• 01 - Reserved<br>• 10 - Counter 2<br>***Note:*** If 11 is written, then the write is interpreted as a Read Back Command (RBC). See "Read Back Command (RBC)—Offset 43h" on page 2880.<br><br>**Power Well:** Core |
| 5:4 | 0x0<br>WO | **Counter Latch Command (CLC):** Write 00 to select the Counter Latch Command.<br><br>**Power Well:** Core |
| 3:0 | 0x0<br>WO | **Reserved (RSVD):** Must be 0.<br><br>**Power Well:** Core |

## 61.2.7 NMI Status and Control (NMI_STS_CNT)—Offset 61h

NMI Status and Control Register

**Type:** I/O Register
(Size: 8 bits)

**I/O Port:** 61h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RO | **SERR# NMI Source Status (SERR_NMI_STS):** This bit is set by any of the sources of the internal SERR signal of the SoC. This includes SERR assertions forwarded from the secondary PCI bus, error from a PCIe port, or internal Bus 0 functions that generate SERR#.<br>Bit 2 must be cleared in this register in order for this bit to be set. This interrupt source is enabled by setting bit 2 to 0.<br>To reset the interrupt, set bit 2 to 1 and then set it to 0.<br>This bit is read-only. When writing to port 61h, this bit must be 0.<br><br>**Power Well:** Core |
| 6 | 0x0<br>RO | **IOCHK# NMI Source Status (IOCHK_NMI_STS):** This bit is set if an ISA/LPC agent (via SERIRQ) asserts IOCHK# and bit 3 is cleared in this register. This interrupt source is enabled by setting bit 3 to 0.<br>To reset the interrupt, set bit 3 to 1 and then set it to 0.<br>This bit is read-only. When writing to port 61h, this bit must be a 0.<br><br>**Power Well:** Core |
| 5 | 0x0<br>RO | **Timer Counter 2 OUT Status (TMR2_OUT_STS):** This bit reflects the current state of the 8254 Counter 2 output. Counter 2 must be programmed following any PCI reset for this bit to have a determinate value.<br>When writing to port 61h, this bit must be a 0.<br><br>**Power Well:** Core |
| 4 | 0x0<br>RO | **Reserved (RSVD):** Will return 0 when read. Writes to this bit will be ignored.<br><br>**Power Well:** Core |
| 3 | 0x0<br>RW | **IOCHK# NMI Enable (IOCHK_NMI_EN):**<br>• When this bit is a 1, IOCHK# NMIs are disabled and cleared.<br>• When this bit is a 0, IOCHK# NMIs are enabled.<br><br>**Power Well:** Core |
| 2 | 0x0<br>RW | **PCI SERR# Enable (PCI_SERR_EN):**<br>• When this bit is a 1, the SERR# NMIs are disabled and cleared.<br>• When this bit is a 0, SERR# NMIs are enabled.<br><br>**Power Well:** Core |
| 1 | 0x0<br>RW | **Reserved (RSVD):** Unused<br><br>**Power Well:** Core |
| 0 | 0x0<br>RW | **Timer Counter 2 Enable (TIM_CNT2_EN):**<br>When this bit is a 0, Counter 2 counting is disabled.<br>Counting is enabled when this bit is 1.<br><br>**Power Well:** Core |

# 62 Real Time Clock - Legacy

## 62.1 Introduction and Index

The host-accessible registers for the Real Time Clock are described here.

The legend for the register access codes are described in Chapter 43, "Introduction."

### 62.1.1 Host I/O Space—Fixed Address

An index of the registers that are accessible in Host I/O Space is shown here. For a description of the RTC Configuration (RC) register see "RTC Configuration (RC)—Offset 3400h" on page 2900.

**Table 62-1. Summary of I/O Registers—Fixed Address**

| I/O Port (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 70 (also 74) | 1 | 80 | "NMI Enable (and Real Time Clock Index) (NMI_EN)—Port 70h" on page 2888 |
| 71 (also 75) | 1 | n/a | "Real Time Clock Data—Port 71h" on page 2889 |
| **If RTC Configuration (RC) bit 2 = 0** | | | |
| 72 (also 76) | 1 | 80 | (Alias) "NMI Enable (and Real Time Clock Index) (NMI_EN)—Port 70h" on page 2888 |
| 73 (also 77) | 1 | n/a | (Alias) "Real Time Clock Data—Port 71h" on page 2889 |
| **If RTC Configuration (RC) bit 2 = 1** | | | |
| 72 (also 76) | 1 | 0 | "Real Time Clock Index to Extended RAM—Port 72h" on page 2889 |
| 73 (also 77) | 1 | n/a | "Real Time Clock Data—Port 73h" on page 2889 |

### 62.1.2 Host I/O Space—RTC Standard Static RAM Bank (Indexed Data)

An index of the registers that are accessible in Host I/O Space is shown here. The Index Value is provided by the RTC Standard RAM Index Register. If the Upper 128 Byte Enable (UE) bit is = 0, the Index value is aliased to the RTC Extended RAM Index Register. For the UE bit of the RC register see "RTC Configuration (RC)—Offset 3400h" on page 2900.

**Table 62-2. Summary of RTC Standard Static RAM Bank — Indexed Data**

| Index Value (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 0 | 1 | 00 | "Seconds (Sec)—Index 0h" on page 2890 |
| 1 | 1 | 00 | "Seconds Alarm (Sec_Alarm)—Index 1h" on page 2890 |
| 2 | 1 | 00 | "Minutes—Index 2h" on page 2890 |
| 3 | 1 | 00 | "Minutes Alarm (Minutes_Alarm)—Index 3h" on page 2891 |
| 4 | 1 | 00 | "Hours—Index 4h" on page 2891 |
| 5 | 1 | 00 | "Hours Alarm (Hours_Alarm)—Index 5h" on page 2891 |
| 6 | 1 | 00 | "Day of Week (Day_of_Week)—Index 6h" on page 2892 |
| 7 | 1 | 00 | "Day of Month (Day_of_Month)—Index 7h" on page 2892 |
| 8 | 1 | 00 | "Month—Index 8h" on page 2892 |
| 9 | 1 | 00 | "Year—Index 9h" on page 2893 |
| A | 1 | 20 | "Register A (Register_A)—Index Ah" on page 2894 |
| B | 1 | 80 | "Register B - General Configuration (Register_B)—Index Bh" on page 2895 |
| C | 1 | 00 | "Register C - Flag Register (Register_C)—Index Ch" on page 2897 |
| D | 1 | 80 | "Register D - Flag Register (Register_D)—Index Dh" on page 2898 |
| E through 7F | 1 (each access) | n/a | "User RAM—Index Eh through 7Fh" on page 2898 |

### 62.1.3 Host I/O Space—RTC Extended Static RAM Bank (Indexed Data)

An index of the registers that are accessible in Host I/O Space is shown here. The Index Value is provided by the RTC Extended RAM Index Register if the Upper 128 Byte Enable (UE) bit is = 1. For the UE bit of the RC register see "RTC Configuration (RC)—Offset 3400h" on page 2900.

**Table 62-3. Summary of RTC Extended Static RAM Bank — Indexed Data**

| Index Value (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 0 through 7F | 1 (each access) | n/a | "User RAM—Index 0h through 7Fh" on page 2899 |

### 62.1.4 Sideband Registers

An index of the Sideband registers that are accessible to the Host are listed here. Each is accessible in Host Memory Space using the Sideband Base Address Register (SBREG_BAR). See Section 3.4.1, "Using SBREG_BAR Method" on page 187.

**Table 62-4. Summary of Sideband Registers—0xD1**

| Offset (hex) | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|
| 3400 | 00000000 | "RTC Configuration (RC)—Offset 3400h" on page 2900 |
| 3414 | 00 | "Backed Up Control (BUC)—Offset 3414h" on page 2901 |
| 3F04 | 00000000 | "RTC Update In Progress SMI Control (UIPSMI)—Offset 3F04h" on page 2902 |
| 3418 | 00000000 | "RTC Dynamic Clock Gating Control (RTCDCG)—Offset 3418h" on page 2903 |

## 62.2 Registers in I/O Space—Fixed Addresses

These registers are accessed in Host I/O Space through fixed I/O addresses.

### 62.2.1 NMI Enable (and Real Time Clock Index) (NMI_EN)—Port 70h

This register is write-only for normal operation. In Alternate-Access mode, this register can be read to find the NMI Enable status and the RTC index value.

Alternate-Access Mode is enabled by setting Alternate Access Mode Enable (AME), bit 17 of the 32-bit General Interrupt Control (GIC) register in relocatable Memory Space at offset D0_31FCh from SBREG_BAR.

When the Upper 128 Byte Enable (UE) bit of the RTC Configuration (RC) Register = 0, The NMI_EN register is aliased to I/O Ports 72h and 76h. See "RTC Configuration (RC)—Offset 3400h" on page 2900.

I/O Writes to 72h, 74h, and 76h do not affect the NMI Enable bit (bit 7 of 70h).

**Type:** I/O Register (Size: 8 bits)

**I/O Port:** 70h (aliased 74h. If UE = 0, also aliased to 72h and 76h)

**Default:** 80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x1<br>RW/V | **NMI_EN# (NMI_EN):**<br>When this bit is a 1, all NMI sources are disabled.<br>When this bit is a 0, NMI sources are enabled.<br>I/O Writes to 72h, 74h, and 76h do not affect the state of NMI_EN. |
| 6:0 | 0x0<br>RW/V | **Real Time Clock Index (Address) (RTC_INDX):** This data goes to the RTC to select which register or CMOS RAM address is being accessed.<br><br>**Power Well:** RTC |

## 62.2.2 Real Time Clock Data—Port 71h

RTC data located at index address defined by RTC_INDX.

When the Upper 128 Byte Enable (UE) bit of the RTC Configuration (RC) Register = 0, The NMI_EN register is aliased to I/O Ports 73h and 77h. See "RTC Configuration (RC)—Offset 3400h" on page 2900.

**Type:** I/O Register
(Size: 8 bits)

**I/O Port:** 71h (aliased 75h. If UE = 0, also aliased to 73h and 77h)

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Real Time Clock Data:** This is the data located at RTC_INDX. The data is either an RTC register or CMOS RAM.<br><br>**Power Well:** RTC |

## 62.2.3 Real Time Clock Index to Extended RAM—Port 72h

This register is accessible only when the Upper 128 Byte Enable (UE) bit of the RTC Configuration (RC) Register = 1. If UE = 0, see "NMI Enable (and Real Time Clock Index) (NMI_EN)—Port 70h" on page 2888. For the RC register see "RTC Configuration (RC)—Offset 3400h" on page 2900.

**Type:** I/O Register
(Size: 8 bits)

**I/O Port:** 72h (aliased 76h)

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RO | **Reserved:** Reserved. |
| 6:0 | 0x0<br>RW | **Real Time Clock Extended Index (Address)** This data goes to the RTC to select which Extended CMOS RAM address is being accessed.<br><br>**Power Well:** RTC |

## 62.2.4 Real Time Clock Data—Port 73h

RTC data located at index address defined by the Real Time Clock Extended Index register. This register is accessible only when the Upper 128 Byte Enable (UE) bit of the RTC Configuration (RC) Register = 1. If UE = 0, see "Real Time Clock Data—Port 71h" on page 2889. For the RC register see "RTC Configuration (RC)—Offset 3400h" on page 2900.

**Type:** I/O Register
(Size: 8 bits)

**I/O Port:** 73h (aliased 77h)

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Real Time Clock Data:** This is the data located at the Extended RAM address defined by the Real Time Clock Extended Index register. The data is Extended CMOS RAM.<br><br>**Power Well:** RTC |

## 62.3 Registers in Host I/O Space—RTC Standard Static RAM Bank (Indexed Data)

### 62.3.1 Seconds (Sec)—Index 0h

RTC Index: 00h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores current time second.

**Type:** RTC Standard Static RAM (Size: 8 bits) **Index:** 0h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Seconds (Sec):** Time Seconds<br><br>**Power Well:** RTC |

### 62.3.2 Seconds Alarm (Sec_Alarm)—Index 1h

RTC Index: 01h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores Seconds Alarm.

**Type:** RTC Standard Static RAM (Size: 8 bits) **Index:** 1h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Seconds Alarm (Sec_Alarm):** Sec_Alarm<br><br>**Power Well:** RTC |

### 62.3.3 Minutes—Index 2h

RTC Index: 02h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores current time Minutes.

**Type:** RTC Standard Static RAM (Size: 8 bits) **Index:** 2h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Minutes:** Time Minutes<br><br>**Power Well:** RTC |

### 62.3.4 Minutes Alarm (Minutes_Alarm)—Index 3h

RTC Index: 03h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores Alarm Minutes.

**Type:** RTC Standard Static RAM (Size: 8 bits) **Index:** 3h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Minutes Alarm (Minutes_Alarm):** Alarm Minutes<br><br>**Power Well:** RTC |

### 62.3.5 Hours—Index 4h

RTC Index: 04h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores current time Hours.

**Type:** RTC Standard Static RAM (Size: 8 bits) **Index:** 4h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Hours:** Time Hours<br><br>**Power Well:** RTC |

### 62.3.6 Hours Alarm (Hours_Alarm)—Index 5h

RTC Index: 05h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores Alarm Hours.

**Type:** RTC Standard Static RAM (Size: 8 bits) **Index:** 5h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Hours Alarm (Hours_Alarm):** Alarm Hours<br><br>**Power Well:** RTC |

## 62.3.7 Day of Week (Day_of_Week)—Index 6h

RTC Index: 06h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores current Day of Week.

**Type:** RTC Standard Static RAM (Size: 8 bits)

**Index:** 6h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Day of Week (Day_of_Week):** This field indicates current Day of Week<br><br>**Power Well:** RTC |

## 62.3.8 Day of Month (Day_of_Month)—Index 7h

RTC Index: 07h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores current Day of Month.

**Type:** RTC Standard Static RAM (Size: 8 bits)

**Index:** 7h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Day of Month (Day_of_Month):** This field indicates current Day of Month<br><br>**Power Well:** RTC |

## 62.3.9 Month—Index 8h

RTC Index: 08h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores current Month.

**Type:** RTC Standard Static RAM (Size: 8 bits)

**Index:** 8h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Month:** This field indicates current Month<br><br>**Power Well:** RTC |

## 62.3.10 Year—Index 9h

RTC Index: 09h. Attribute: Read/Write. Default Value: Undefined. Size: 8-bit. This register stores current Year.

**Type:** RTC Standard Static RAM (Size: 8 bits)

**Index:** 9h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Year:** This field indicates current Year<br><br>**Power Well:** RTC |

## 62.3.11 Register A (Register_A)—Index Ah

RTC Index: 0Ah Attribute: Read/Write Default Value: Undefined Size: 8-bit Lockable: No Power Well: RTC This register is used for general configuration of the RTC functions. None of the bits are affected by RSMRST# or any other reset signal.

**Type:** RTC Standard Static RAM (Size: 8 bits)

**Index:** Ah

**Default:** 20h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RW | **UPDATE IN PROGRESS (UIP):** This bit may be monitored as a status flag.<br>When asserted as a 1, the update is soon to occur or is in progress.<br>If 0, the update cycle will not start for at least 488 s. The time, calendar, and alarm information in RAM is always available when the UIP bit is 0. The ICH provides the ability to generate SMI# based on either the 0-to-1 or 1-to-0 transition of this bit. This can be useful for work-arounds and debug in silicon.<br><br>**Power Well:** RTC |
| 6:4 | 0x2<br>RW | **Division Chain Select (DV_2_0):** These three bits control the divider chain for the oscillator, and are not affected by RSMRST# or any other reset signal. DV(2) corresponds to bit 6.<br>• 010 Normal Operation<br>• 11X Divider Reset<br>• 101 Bypass 15 stages (test mode only)<br>• 100 Bypass 10 stages (test mode only)<br>• 011 Bypass 5 stages (test mode only)<br>• 001 Invalid<br>• 000 Invalid<br><br>**Power Well:** RTC |
| 3:0 | 0x0<br>RW | **Rate Select (RS_3_0):** Selects one of 13 taps of the 15 stage divider chain. The selected tap can generate a periodic interrupt if the PIE bit is set in Register B. Otherwise this tap will set the PF flag of Register C. If the periodic interrupt is not to be used, these bits should all be set to zero. RS3 corresponds to bit 3. The Periodic Rate is as follows:<br>• 0000 Interrupt never toggles<br>• 0001 3.90625 ms<br>• 0010 7.8125 ms<br>• 0011 122.070 s<br>• 0100 244.141 s<br>• 0101 488.281 s<br>• 0110 976.5625 s<br>• 0111 1.953125 ms<br>• 1000 3.90625 ms<br>• 1001 7.8125 ms<br>• 1010 15.625 ms<br>• 1011 31.25 ms<br>• 1100 62.5 ms<br>• 1101 125 ms<br>• 1110 250 ms<br>• 1111 500 ms<br><br>**Power Well:** RTC |

## 62.3.12 Register B - General Configuration (Register_B)—Index Bh

RTC Index: 0Bh Attribute: Read/Write Default Value: U0U00UUU Size: 8-bit Lockable: No Power Well: RTC

**Type:** RTC Standard Static RAM (Size: 8 bits) **Index:** Bh

**Default:** 80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x1<br>RW | **Update Cycle Inhibit (SET):** Enables/Inhibits the update cycles.<br>When SET is 0, update cycle occurs normally once each second.<br>If set to one, a current update cycle will abort and subsequent update cycles will not occur until SET is returned to zero.<br>When set is one, the BIOS may initialize time and calendar bytes safely.<br>This bit is not affected by RSMRST# nor any other reset signal.<br>***Note:*** Software must ensure this bit is at least transitioned from '1' to '0' once whenever the RTC coin battery is inserted. This is to ensure that the internal RTC time updates occur properly.<br><br>**Power Well:** RTC |
| 6 | 0x0<br>RW | **Periodic Interrupt Enable (PIE):** If set to 1, the Periodic Interrupt Enable (PIE) bit allows an interrupt to occur with a time base set with the RS bits of register A.<br>This bit is cleared by RSMRST#, but not on any other reset<br><br>**Power Well:** RTC |
| 5 | 0x0<br>RW | **Alarm Interrupt Enable (AIE):** If set to one, the Alarm Interrupt Enable (AIE) bit allows an interrupt to occur when the AF is one as set from an alarm match from the update cycle.<br>An alarm can occur once a second, one an hour, once a day, or once a month.<br>This bit is cleared by RTEST# #, but not on any other reset<br><br>**Power Well:** RTC |
| 4 | 0x0<br>RW | **Update-ended Interrupt Enable: (UIE):** If set to one, the Update-ended Interrupt Enable (UIE) bit allows an interrupt to occur when the update cycle ends.<br>This bit is cleared by RSMRST#, but not on any other reset<br><br>**Power Well:** RTC |
| 3 | 0x0<br>RW | **Square Wave Enable (SQWE):** The Square Wave Enable bit serves no function in this device, yet is left in this register bank to provide compatibility with the Motorola 146818B.<br>There is not SQW pin on this device.<br>This bit is cleared by RSMRST#, but not on any other reset.<br><br>**Power Well:** RTC |
| 2 | 0x0<br>RW | **Data Mode (DM):** The Data Mode (DM) bit specifies either binary or BCD data representation.<br>A one denotes binary, and zero denotes BCD.<br>This bit is not affected by RSMRST# nor any other reset signal.<br><br>**Power Well:** RTC |
| 1 | 0x0<br>RW | **Hour Format (HOURFORM):** This bit indicates the hour byte format.<br>If one, twenty-four hour mode is selected.<br>If zero, twelve-hour mode is selected. In twelve hour mode, the seventh bit represents AM as zero and PM as one.<br>This bit is not affected by RSMRST# nor any other reset signal.<br><br>**Power Well:** RTC |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 0 | 0x0<br>RW | **Daylight Savings Enable (DSE):** The Daylight Savings Enable bit triggers two special hour updates per year when set to one.<br>One is on the first Sunday in April, where time increments from 1:59:59 AM to 3:00:00 AM.<br>The other is the last Sunday in October when the time first reaches 1:59:59 AM, it is changed to 1:00:00 AM.<br>The time must increment normally for at least two update cycles (seconds) previous to these conditions for the time change to occur properly.<br>These special update conditions do not occur when the DSE bit is set to zero.<br>The days for the hour adjustment are those specified in United States federal law as of 1987, which is different than previous years.<br>This bit is not affected by RSMRST# nor any other reset signal.<br>If BUC.DSO bit is set, the DSE bit continues to be a R/W bit, but Daylight Saving is disabled regardless of the DSE bit.<br><br>**Power Well:** RTC |

## 62.3.13 Register C - Flag Register (Register_C)—Index Ch

RTC Index: 0Ch Attribute: Read-Only (Writes have no effect). Default Value: 00U00000 Size: 8-bit Lockable: No Power Well: RTC

**Type:** RTC Standard Static RAM (Size: 8 bits)

**Index:** Ch

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RO | **Interrupt Request Flag (IRQF):** Interrupt Request Flag = PF * PIE + AF * AIE + UF * UFE.<br>This also causes the RTC Interrupt to be asserted.<br>This bit is cleared upon RSMRST# or a read of Register C.<br><br>**Power Well:** RTC |
| 6 | 0x0<br>RO | **Periodic Interrupt Flag (PF):** Periodic interrupt Flag will be one when the tap as specified by the RS bits of register A is one.<br>If no taps are specified, this flag bit will remain at zero.<br>This bit is cleared upon RSMRST# or a read of Register C.<br><br>**Power Well:** RTC |
| 5 | 0x0<br>RO | **Alarm Flag (AF):** Alarm Flag will be high after all Alarm values match the current time.<br>This bit is cleared upon RTEST# or a read of Register C.<br><br>**Power Well:** RTC |
| 4 | 0x0<br>RO | **Update-ended Flag (UF):** Updated-ended flag will be high immediately following an update cycle for each second.<br>The bit is cleared upon RSMRST# or a read of Register C.<br><br>**Power Well:** RTC |
| 3:0 | 0x0<br>RO | **Reserved (RSVD):** Will always report 0<br><br>**Power Well:** RTC |

## 62.3.14 Register D - Flag Register (Register_D)—Index Dh

RTC Index: 0Dh Attribute: Read/Write Default Value: 10UUUUUU Size: 8-bit Lockable: No Power Well: RTC

**Type:** RTC Standard Static RAM (Size: 8 bits)

**Index:** Dh

**Default:** 80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x1<br>RW | **Valid RAM and Time Bit (VRT):** This bit is hard-wired to 1 in the RTC power well.<br>This bit should always be written as a 0 for write cycle, however it will return a 1 for read cycles.<br><br>**Power Well:** RTC |
| 6 | 0x0<br>RW | **Reserved (RSVD):** This bit always returns a 0 and should be set to 0 for write cycles.<br><br>**Power Well:** RTC |
| 5:0 | 0x0<br>RW | **Date Alarm (Date_Alarm):** These bits store the date of month alarm value.<br>If set to 000000, then a dont care state is assumed.<br>The host must configure the dates alarm for these bits to do anything, yet they can be written at any time.<br>If the date alarm is not enabled, these bits will return zeros to mimic the functionality of the Motorola 146818B.<br>These bits are not affected by any reset assertion.<br><br>**Power Well:** RTC |

## 62.3.15 User RAM—Index Eh through 7Fh

Access to 114 bytes of user Static RAM located in the RTC Power Well of the SoC.

**Type:** RTC Standard Static RAM (Size: 8 bits)

**Index:** Dh through 7Fh

**Default:** 80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | n/a<br>RW | **User RAM Data:**<br><br>**Power Well:** RTC |

## 62.4 Registers in Host I/O Space—RTC Extended Static RAM Bank (Indexed Data)

### 62.4.1 User RAM—Index 0h through 7Fh

Access to 128 bytes of user Static RAM located in the RTC Power Well of the SoC.

**Type:** RTC Standard Static RAM (Size: 8 bits)

**Index:** 0h through 7Fh

**Default:** 80h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | n/a<br>RW | **User RAM Data:**<br><br>**Power Well:** RTC |

## 62.5 Sideband Registers

The Sideband registers accessible to the Host are described here. They are accessible in Host Memory Space starting at the Sideband Base Address Register (SBREG_BAR). See Section 3.4.1, "Using SBREG_BAR Method" on page 187.

### 62.5.1 RTC Configuration (RC)—Offset 3400h

All bits in this register are in the Primary Well and cleared by host_side_rst_b.

**Type:** Sideband Register (Size: 32 bits)

**Sideband Port and Offset:** [Port: 0xD1] + 3400h
**Host Memory Space:** SBREG_BAR + 0xD10000 + 3400h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31 | 0x0<br>RW/1L | **Bios Interface Lock-Down (BILD):** When set, prevents RTC version of TS (BUC.TS) from being changed.<br>This bit can only be written from 0 to 1 once.<br>This BILD bit has different function compared to the LPC and SPI version but BIOS should set all the corresponding bits after reset in order to lock down the BIOS interface correctly.<br><br>**Power Well:** Core |
| 30:7 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved<br><br>**Power Well:** Core |
| 6 | 0x0<br>RW | **RTC High Power Mode HW Disable (HPM_HW_DIS):**<br>When set to 1 the internal VRM that generates the rtc well supply voltage in SUS mode is disabled when SLP_S0# is asserted to '0'. (via irtcdswen pin to RTC EBB).<br>When 0, HW control of the RTC internal VRM is disabled.<br><br>**Power Well:** Core |
| 5 | 0x0<br>RW | **RTC High Power Mode SW Disable (HPM_SW_DIS):**<br>When set to 1 the internal VRM that generates the rtc well supply voltage in SUS mode is disabled (via irtcdswen pin to RTC EBB).<br>When 0 the internal VRM powers the rtc well when RSMRST# is '1'. (default)<br><br>**Power Well:** Core |
| 4 | 0x0<br>RW/1L | **Upper 128 Byte Lock (UL):** When set, bytes 38h-3Fh in the upper 128 byte bank of RTC RAM are locked and cannot be accessed.<br>Writes will be dropped and reads will not return any guaranteed data. Bit reset on system reset.<br><br>**Power Well:** Core |
| 3 | 0x0<br>RW/1L | **Lower 128 Byte Lock (LL):** When set, bytes 38h-3Fh in the lower 128 byte bank of RTC RAM are locked and cannot be accessed.<br>Writes will be dropped and reads will not return any guaranteed data. Bit reset on system reset.<br><br>**Power Well:** Core |
| 2 | 0x0<br>RW | **Upper 128 Byte Enable (UE):** When set, the upper 128 byte bank of RTC RAM can be accessed.<br><br>**Power Well:** Core |
| 1:0 | 0x0<br>RO | **Reserved (RSVD_2):** Reserved<br><br>**Power Well:** Core |

## 62.5.2 Backed Up Control (BUC)—Offset 3414h

All bits in this register are in the RTC well and only cleared by RTEST.

**Type:** Sideband Register
(Size: 8 bits)

**Sideband Port and Offset:** [Port: 0xD1] + 3414h
**Host Memory Space:** SBREG_BAR + 0xD10000 + 3414h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved<br><br>**Power Well:** RTC |
| 6 | 0x0<br>RW | **Reserved (RSVD_2):** Reserved<br><br>**Power Well:** RTC |
| 5 | 0x0<br>RW | **LAN Disable (LanDisable):**<br>• '0': LAN is Enabled '1': LAN is Disabled. It will not claim any configuration cycles on SPXB or MBB nor initiate any cycles on SPXB or MBB. When the RTC backup copy of the LAN Disable Fuse is set, this register is Read Only.<br>• '1'. If the RTC backup copy of the LAN Disable Fuse is not set, this register is reset to 0 on RTEST#. If the Function Disable SUS Well Lockdown register is set, this bit can not be changed by software.<br><br>**Power Well:** RTC |
| 4 | 0x0<br>RW | **Daylight Savings Override (SDO):**<br>• When this bit is a '1', the DSE bit in the RTC Register B bit(0) is a RW bit but has no effect where daylight savings is hard-disabled internally.<br>• When this bit is a '0', the DSE bit in the RTC register B bit(0) is a RW bit that is configurable by software to enable the daylight savings. System BIOS shall configure this bit accordingly during the boot process before RTC time is initialized.<br><br>**Power Well:** RTC |
| 3 | 0x0<br>RW | **NetDetect Enable (NDE):**<br>• If this bit is '1' and the South MLink Enable bit is '0' (ME PM RTCPMCFG.SMLEN), then the GPIO(14) input signal is muxed onto the South MLink MLCLK pin as a NetDetect Request signal to the wireless LAN component.<br>• If the South MLink Enable bit is a '1', then the South MLink MLCLK pin is used as MLCLK, independent of the value of this register.<br>• If both the South MLink Enable bit is '0' and this NetDetect Enable bit is '0', then the South MLink MLCLK pin is tri-stated. This register is in the RTC well instead of the SUS well to maintain state if the SUS well power is removed in S4.<br><br>**Power Well:** RTC |
| 2 | 0x0<br>RW | **Reserved (RSVD_3):** Reserved<br><br>**Power Well:** RTC |
| 1 | 0x0<br>RO | **Reserved (RSVD_4):** Reserved<br><br>**Power Well:** RTC |
| 0 | 0x0<br>RW | **Top Swap (TS):** This should be set by BIOS when the corresponding TS bit in the LPC controller is set in order to properly restore the state of that field after reset since they are not preserved in an RTC well bit in those devices.<br>If SoC is strapped for Top-Swap (GNT(3)# is low at rising edge of PWROK), then this bit cannot be cleared by software.<br>The strap jumper should be removed and the system rebooted.<br><br>**Power Well:** RTC |

### 62.5.3 RTC Update In Progress SMI Control (UIPSMI)—Offset 3F04h

This register exists in the RTC power well.

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0xD1] + 3F04h
**Host Memory Space:** SBREG_BAR + 0xD10000 + 3F04h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:18 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved<br><br>**Power Well:** Core |
| 17 | 0x0<br>RW/1C | **RTC UIP Low-to-High (UIP_L2H):** This sticky status bit is set whenever the RTC Update-In-Progress signal transitions from low to high (i.e., at the start of an update).<br><br>**Power Well:** Core |
| 16 | 0x0<br>RW/1C | **RTC UIP High-to-Low (UIP_H2L):** This sticky status bit is set whenever the RTC Update-In-Progress signal transitions from high to low (i.e., at the start of an update).<br><br>**Power Well:** Core |
| 15:2 | 0x0<br>RO | **Reserved (RSVD_2):** Reserved<br><br>**Power Well:** Core |
| 1 | 0x0<br>RW | **RTC UIP Low-to-High SMI Enable (UIP_L2H_SMI_en):** When this bit is set, a '1' in bit 17 will assert the internal SMI signal to the Power Management SMI logic<br><br>**Power Well:** Core |
| 0 | 0x0<br>RW | **RTC UIP High-to-Low SMI Enable (UIP_H2L_SMI_en):** When this bit is set, a '1' in bit 16 will assert the internal SMI signal to the Power Management SMI logic<br><br>**Power Well:** Core |

### 62.5.4 RTC Dynamic Clock Gating Control (RTCDCG)—Offset 3418h

All bits in this register are in the Primary Well and cleared by host_side_rst_b.

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0xD1] + 3418h
**Host Memory Space:** SBREG_BAR + 0xD10000 + 3418h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0x0<br>RO | **Reserved (RSVD_2):** Reserved<br><br>**Power Well:** RTC |
| 7:3 | 0x0<br>RW | **Reserved (RSVD_1):** Reserved for future use<br><br>**Power Well:** Core |
| 2 | 0x0<br>RW | **pgcb_clk (12MHz) Dynamic Clock Gate Enable (RTCPGCBDCGEN):**<br>• 0 - Disable dynamic clock gate on pgcb_clk (Default)<br>• 1 - Enable dynamic clock gate on pgcb_clk<br><br>**Power Well:** Core |
| 1 | 0x0<br>RW | **ipciclk_clk (24MHz) Dynamic Clock Gate Enable (RTCPCICLKDCGEN):**<br>• 0 - Disable dynamic clock gate on ipci_clk (Default)<br>• 1 - Enable dynamic clock gate on ipci_clk<br><br>**Power Well:** Core |
| 0 | 0x0<br>RW | **rosc_side_clk (120MHz) Dynamic Clock Gate Enable (RTCROSIDEDCGEN):**<br>• 0 - Disable dynamic clock gate on rosc_side_clk (Default)<br>• 1 - Enable dynamic clock gate on rosc_side_clk<br><br>**Power Well:** Core |

# 63 High Precision Event Timer - Legacy

## 63.1 Introduction and Index

The host-accessible registers for the High Precision Event Timer are described here.

The legend for the register access codes are described in Chapter 43, "Introduction."

### 63.1.1 Host Memory Space—Fixed Address

An index of the registers that are accessible in Host Memory Space is shown here.

**Table 63-1. Summary of Memory Mapped I/O Registers—0xFED00000**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 10 | 8 | 0000000000000000 | "General Config Register (GEN_CFG)—Offset 10h" on page 2906 |
| 20 | 8 | 0000000000000000 | "General Interrupt Status Register (GEN_INT_STS)—Offset 20h" on page 2907 |

## 63.2 Registers in Memory Space—Fixed Addresses

These registers are accessed in Host Memory Space through fixed memory addresses.

### 63.2.1 General Config Register (GEN_CFG)—Offset 10h

Software can read the various bytes in this register using 32-bit or 64-bit accesses. 32-bit accesses may only be done to offset 010h or 014h. 64-bit accesses may only be done to 010h.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**Address:** [0xFED00000] + 10h

**Default:** 0000000000000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:2 | 0x0<br>RO | **Reserved (RSV_63_2):** These bits will return 0 when read. Writes will have no effect.<br>**Power Well:** Core |
| 1 | 0x0<br>RW | **Legacy Rout (LEG_RT_CNF)**<br>If the LEG_RT_CNF bit is set, then the interrupts will be routed as follows:<br>• **Timer 0** will be routed to IRQ0 in 8259 or IRQ2 in the I/O APIC<br>• **Timer 1** will be routed to IRQ8 in 8259 or IRQ8 in the I/O APIC<br>• **Timer 2-7** will be routed as per the routing in that timer config register.<br>If the LEG_RT_CNF bit is set, the individual routing bits for timers 0 and 1 (APIC or FSB) will have no impact.<br>Otherwise, if the LEG_RT_CNF bit is not set, the individual routing bits for each of the timers are used.<br>**Power Well:** Core |
| 0 | 0x0<br>RW | **Overall Enable (ENABLE_CNF):** This bit must be set to enable any of the timers to generate interrupts.<br>If this bit is 0, then the main counter will halt (will not increment) and no interrupts will be caused by any of these timers.<br>This bit will default to 0. BIOS can set it to 1 or 0.<br>**Power Well:** Core |

### 63.2.2 General Interrupt Status Register (GEN_INT_STS)—Offset 20h

Software can read the various bytes in this register using 32-bit or 64-bit accesses. 32-bit accesses may only be done to offset 020h or 024h. 64-bit accesses may only be done to 020h.

**Type:** Memory Mapped I/O Register (Size: 64 bits)

**Address:** [0xFED00000] + 20h

**Default:** 0000000000000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:8 | 0x0<br>RO | **Reserved (RSV):** These bits will return 0 when read. Writes will have no effect.<br>**Power Well:** Core |
| 7 | 0x0<br>RW/1C | **Timer 7 Interrupt Active (T07_INT_STS)**<br>Same functionality as Timer 0 Interrupt Active (T00_INT_STS).<br>**Power Well:** Core |
| 6 | 0x0<br>RW/1C | **Timer 6 Interrupt Active (T06_INT_STS)**<br>Same functionality as Timer 0 Interrupt Active (T00_INT_STS).<br>**Power Well:** Core |
| 5 | 0x0<br>RW/1C | **Timer 5 Interrupt Active (T05_INT_STS)**<br>Same functionality as Timer 0 Interrupt Active (T00_INT_STS).<br>**Power Well:** Core |
| 4 | 0x0<br>RW/1C | **Timer 4 Interrupt Active (T04_INT_STS)**<br>Same functionality as Timer 0 Interrupt Active (T00_INT_STS).<br>**Power Well:** Core |
| 3 | 0x0<br>RW/1C | T**imer 3 Interrupt Active (T03_INT_STS)**<br>Same functionality as Timer 0 Interrupt Active (T00_INT_STS).<br>**Power Well:** Core |
| 2 | 0x0<br>RW/1C | **Timer 2 Interrupt Active (T02_INT_STS)**<br>Same functionality as Timer 0 Interrupt Active (T00_INT_STS).<br>**Power Well:** Core |
| 1 | 0x0<br>RW/1C | **Timer 1 Interrupt Active (T01_INT_STS)**<br>Same functionality as Timer 0 Interrupt Active (T00_INT_STS).<br>**Power Well:** Core |
| 0 | 0x0<br>RW/1C | **Timer 0 Interrupt Active (T00_INT_STS)**<br>The functionality of this bit depends on whether the edge or level-triggered mode is used for this timer:<br>• If set to edge triggered mode: This bit will always read as 0 and writes will have no effect.<br>• If set to level-triggered mode: This bit will be set by hardware if the corresponding timer interrupt is active. Once the bit is set, it can be cleared by software writing a 1 to the same bit position. Writes of 0 to this bit will have no effect. For example if the bit is already set, a write of 0 will not clear the bit.<br>This bit defaults to 0.<br>**Power Well:** Core |

§ §

# 64 PIC and I/O APIC Controllers

## 64.1 Introduction and Index

The host-accessible registers for the PIC and I/O APIC Controller are described here.

The legend for the register access codes are described in Chapter 43, "Introduction."

### 64.1.1 Host Configuration Space

These registers are discovered in Host Configuration Space starting at Bus 0, Device 31 (decimal), Function 1. The offset addresses are listed.

**Table 64-1. Summary of PCI Configuration Registers—0/31/1**

| Offset (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 64 | 2 | 0000 | "IOxAPIC Configuration (IOAC)—Offset 64h" on page 2913 |

### 64.1.2 Host Memory Space—Fixed Address

An index of the registers that are accessible in Host Memory Space is shown here.

The IOxAPIC Interrupt Message table is located in Host Memory Space starting at address FEE0_0000h. Construction of the address for a table entry is shown in Table 64-2.

**Table 64-2. IOxAPIC Interrupt Message Address**

| Address Bit | Short Description | Description |
|---|---|---|
| 31:20 | FEEh | Hardwired as FEEh |
| 19:12 | Destination ID | Destination ID of the local APIC - from DID field of the interrupt RTE |
| 11:4 | Extended Destination ID | Extended destination ID of the local APIC - from EDID field of the interrupt RTE |
| 3 | Redirection Hint | Redirection Hint - '1" If the DLM field = “Lowest Priority” (001) for the interrupt RTE. Otherwise '0' |
| 2 | Destination Mode | Used by the Local APIC to determine whether it is the destination of the Interrupt Message |
| 1:0 | 00 | Hardwired as 00 - Interrupt Message data is written as a Double Word (32 bits) |

For the description of an IOxAPIC Interrupt Message, see Section 64.3.3, “IOxAPIC Interrupt Messages for Local APIC—FEE0_0000h” on page 2914.

Also located in Host Memory Space are the 32-bit IOxAPIC Index (IDX), Window (WDW), and End-of-Interrupt (EOI) registers. See Table 64-3, “Summary of Memory-Mapped Registers—Fixed Addresses” on page 2910.

For the information accessible through the IOxAPIC Index/Window mechanism, see Table 64-4, “Summary of IOxAPIC Index/Window-Accessed Registers” on page 2911.

**Table 64-3. Summary of Memory-Mapped Registers—Fixed Addresses**

| Address (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| FECO_0000 | 4 | 00000000 | “Index Register (IDX)—FEC0_0000h” on page 2914 |
| FECO_0010 | 4 | 00000000 | “Window Register (WDW)—FEC0_0010h” on page 2914 |

## Table 64-4. Summary of IOxAPIC Index/Window-Accessed Registers

| Index (IDX) Value (hex) | Double-Word Accesses | Default Value (hex) | Contents of Window (WDW) Register Name (Register Symbol) |
|---|---|---|---|
| 1 | 1 | 00770020 | "Version (VS)—Offset 1h" on page 2917 |
| 2 through F | 1 | 00000000 | Reserved |
| 10, 11 | 2 | 0000000000010000 | "Redirection Table Entry 0 (RTE0)—Offset 10h" on page 2918 |
| 12, 13 | 2 | 0000000000010000 | "Redirection Table Entry 1 (RTE1)—Offset 12h" on page 2920 |
| 14, 15 | 2 | 0000000000010000 | "Redirection Table Entry 2 (RTE2)—Offset 14h" on page 2922 |
| through | ... | ... | ... |
| FC, FD | 2 | 0000000000010000 | "Redirection Table Entry 118 (RTE118)—Offset FCh" on page 2924 |
| FE, FF | 2 | 0000000000010000 | "Redirection Table Entry 119 (RTE119)—Offset FEh" on page 2926 |

### 64.1.3 Host I/O Space—Fixed Address

An index of the registers that are accessible in Host I/O Space is shown here.

**Table 64-5. Summary of I/O Registers—Fixed Location**

| I/O Port Address (hex) | Bytes | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|---|
| 20 | 1 | 11 | "Master Initialization Command Word 1 (MICW1)—I/O Port 20h" on page 2928 |
| 21 | 1 | 00 | "Master Initialization Command Word 2 (MICW2)—I/O Port 21h" on page 2929 |
| 21 | 1 | 07 | "Master Initialization Command Word 3 (MICW3)—I/O Port 21h" on page 2929 |
| 21 | 1 | 00 | "Master Initialization Command Word 4 (MICW4)—I/O Port 21h" on page 2930 |
| 21 | 1 | 00 | "Master Operational Control Word 1 (MOCW1)—I/O Port 21h" on page 2930 |
| 20 | 1 | 00 | "Master Operational Control Word 2 (MOCW2)—I/O Port 20h" on page 2931 |
| 20 | 1 | 08 | "Master Operational Control Word 3 (MOCW3)—I/O Port 20h" on page 2932 |
| A0 | 1 | 11 | "Slave Initialization Command Word 1 (SICW1)—I/O Port A0h" on page 2933 |
| A1 | 1 | 00 | "Slave Initialization Command Word 2 (SICW2)—I/O Port A1h" on page 2934 |
| A1 | 1 | 07 | "Slave Initialization Command Word 3 (SICW3)—I/O Port A1h" on page 2934 |
| A1 | 1 | 00 | "Slave Initialization Command Word 4 (SICW4)—I/O Port A1h" on page 2935 |
| A1 | 1 | 00 | "Slave Operational Control Word 1 (SOCW1)—I/O Port A1h" on page 2935 |
| A0 | 1 | 00 | "Slave Operational Control Word 2 (SOCW2)—I/O Port A0h" on page 2936 |
| A0 | 1 | 08 | "Slave Operational Control Word 3 (SOCW3)—I/O Port A0h" on page 2937 |
| 4D0 | 1 | 00 | "Master Edge/Level Control (ELCR1)—I/O Port 4D0h" on page 2938 |
| 4D1 | 1 | 00 | "Slave Edge/Level Control (ELCR2)—I/O Port 4D1h" on page 2938 |

## 64.2 Registers in Configuration Space

### 64.2.1 IOxAPIC Configuration (IOAC)—Offset 64h

**Type:** PCI Configuration Register (Size: 16 bits)

**Offset:** [B:0, D:31, F:1] + 64h

**Default:** 0000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 15:9 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 8 | 0x0<br>RW | **Address Enable (AE):** When set, the P2SB will decode the IOxAPIC Host Root memory-address range selected by bits 7:0 below.<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RW | **APIC Range Select (ASEL):** These eight bits define the eight address bits 19:12 for the IOxAPIC range.<br>The default value of 00h enables compatibility with prior Intel products as an initial value. This value must not be changed by software unless the IOxAPIC Address Enable (AE) bit is cleared.<br><br>**Power Well:** Core |

## 64.3 Registers in Memory Space—Fixed Addresses

These registers are accessed in Host Memory Space through fixed memory addresses.

### 64.3.1 Index Register (IDX)—FEC0_0000h

This 8-bit register selects which indirect register appears in the window register to be manipulated by software. Software will program this register to select the desired APIC internal register.

**Type:** Memory-Mapped I/O Register (Size: 32 bits)

**Address:** FEC0_0000h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:8 | 0x0<br>RO | **Reserved (RSVD):** Reserved.<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RW | **Index Register (IDX):** Index Register for APIC<br><br>**Power Well:** Core |

### 64.3.2 Window Register (WDW)—FEC0_0010h

This 32-bit register specifies the data to be read or written to the register pointed to by the IDX register. This register can be accessed only in DWord quantities.

**Type:** Memory-Mapped I/O Register (Size: 32 bits)

**Address:** FEC0_0010h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:0 | 0x0<br>RW/V | **Window Register (WDW):** Window Register for APIC<br><br>**Power Well:** Core |

### 64.3.3 IOxAPIC Interrupt Messages for Local APIC—FEE0_0000h

The 32-bit IOxAPIC Interrupt Messages sent to the Local APICs are written in Host Memory Space starting at address FEE0_0000h through address FEEF_FFFCh. Each message has the following data format.

**Type:** Memory-Mapped I/O Register (Size: 32 bits)

**Address:** FEE0_0000h through FEEF_FFCh

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **Reserved:** Reserved. Hardwired as 0. |
| 15 | 0x0<br>RO | **Trigger Mode:** From the TM field of the Redirection Table Entry (RTE).<br>• '0' indicates the interrupt is edge sensitive.<br>• '1' indicates the interrupt is level sensitive. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 14 | 0x0<br>RO | **Delivery Status:** Is always '1' indicating an "Assert Message" cycle. |
| 13:12 | 0x0<br>RO | **Reserved:** Reserved. Hardwired as 0. |
| 11 | 0x0<br>RO | **Destination Mode:** From the DSM field of the RTE. Used by the Local APIC to determine whether it is the destination of the message. |
| 10:8 | 0x0<br>RO | **Delivery Mode:** From the DLM field of the RTE. Establishes how the APICs listed in the destination field should act upon reception of this signal.<br>Certain Delivery Modes will only operate as intended when used in conjunction with a specific trigger mode. |
| 7:0 | 0x0<br>RO | **Vector:** From the VCT field of the RTE. Defines the Interrupt Vector for this interrupt.<br>Values range between 10h and FEh. |

## 64.4 Registers Accessed through IOxAPIC IDX and WDW

These registers are accessed through the IOxAPIC Index/Window mechanism. For each Index (IDX) value, one double-word is accessible in the Window (WDW) register.

### 64.4.1 Version (VS)—Offset 1h

**Type:** IOxAPIC IDX/WDW (Size: 32 bits)

**IDX:** 1h

**Default:** 00770020h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:24 | 0x0<br>RO | **Reserved (RSVD):** Reserved<br><br>**Power Well:** Core |
| 23:16 | 0x77<br>RW/O | **Maximum Redirection Entries (MRE):** This is the entry number (0 being the lowest entry) of the highest entry in the redirection table.<br>The default value is 77h to indicate a maximum of 120 (decimal) Redirection Table Entries.<br>This field is Read-Write-Once. BIOS must write to this field after PLTRST# to lockdown the value.<br>This allows BIOS to utilize some of the entries for its own purpose and thus advertising fewer IOxAPIC Redirection Table Entries to the Operating System.<br>BIOS may to program this field up to 77h (maximum 120 entries).<br><br>**Power Well:** Core |
| 15 | 0x0<br>RO | **Pin Assertion Register Supported (PRQ):** The default value indicates that the IOxAPIC does not implement the Pin Assertion Register.<br><br>**Power Well:** Core |
| 14:8 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved<br><br>**Power Well:** Core |
| 7:0 | 0x20<br>RO | **Version (VS):** Identifies the implementation version as IOxAPIC.<br><br>**Power Well:** Core |

## 64.4.2 Redirection Table Entry 0 (RTE0)—Offset 10h

**Type:** IOxAPIC IDX/WDW (Size: 64 bits)

**IDX:** 10h, 11h

**Default:** 0000000000010000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:56 | 0x0<br>RW | **Destination ID (DID):** Destination ID of the local APIC<br><br>**Power Well:** Core |
| 55:48 | 0x0<br>RW | **Extended Destination ID (EDID):** Extended destination ID of the local APIC.<br><br>**Power Well:** Core |
| 47:17 | 0x0<br>RO | **Reserved (RSVD):** Reserved<br><br>**Power Well:** Core |
| 16 | 0x1<br>RW | **Mask (MSK):**<br>When set, interrupts are not delivered nor held pending.<br>When cleared, and edge or level on this interrupt results in the delivery of the interrupt.<br><br>**Power Well:** Core |
| 15 | 0x0<br>RW | **Trigger Mode (TM):**<br>When cleared, the interrupt is edge sensitive.<br>When set, the interrupt is level sensitive.<br><br>**Power Well:** Core |
| 14 | 0x0<br>RO/V | **Remote IRR (RIRR):** This is used for level triggered interrupts - its meaning is undefined for edge triggered interrupts.<br>This bit is set when IOxAPIC sends the level interrupt message to the CPU.<br>This bit is cleared when an EOI message is received that matches the VCT field.<br>This bit is never set for SMI, NMI, INIT, or ExtINT delivery modes.<br><br>**Power Well:** Core |
| 13 | 0x0<br>RW | **Polarity (POL):** This specifies the polarity of each interrupt input.<br>When cleared, the signal is active high.<br>When set, the signal is active low.<br><br>**Power Well:** Core |
| 12 | 0x0<br>RO/V | **Delivery Status (DS):** This field contains the current status of the delivery of this interrupt.<br>When set, an interrupt is pending and not yet delivered.<br>When cleared, there is no activity for this entry<br><br>**Power Well:** Core |
| 11 | 0x0<br>RW | **Destination Mode (DSM):** This field is used by the local APIC to determine whether it is the destination of the message.<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 10:8 | 0x0<br>RW | **Delivery Mode (DLM):** This field specifies how the APICs listed in the destination field should act upon reception of this signal. Certain Delivery Modes will only operate as intended when used in conjunction with a specific trigger mode. These encodings are:<br>• 000 - Fixed<br>• 001 - Lowest Priority<br>• 010 - SMI (Not supported)<br>• 011 - Reserved<br>• 100 - NMI (Not supported)<br>• 101 - INIT (Not supported)<br>• 110 - Reserved<br>• 111 - ExtINT<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RW | **Vector (VCT):** This field contains the interrupt vector for this interrupt.<br>Values range between 10h and FEh.<br><br>**Power Well:** Core |

### 64.4.3 Redirection Table Entry 1 (RTE1)—Offset 12h

**Type:** IOxAPIC IDX/WDW (Size: 64 bits)

**IDX:** 12h, 13h

**Default:** 0000000000010000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:56 | 0x0<br>RW | **Destination ID (DID):** Destination ID of the local APIC<br><br>**Power Well:** Core |
| 55:48 | 0x0<br>RW | **Extended Destination ID (EDID):** Extended destination ID of the local APIC.<br><br>**Power Well:** Core |
| 47:17 | 0x0<br>RO | **Reserved (RSVD):** Reserved<br><br>**Power Well:** Core |
| 16 | 0x1<br>RW | **Mask (MSK):**<br>When set, interrupts are not delivered nor held pending.<br>When cleared, and edge or level on this interrupt results in the delivery of the interrupt.<br><br>**Power Well:** Core |
| 15 | 0x0<br>RW | **Trigger Mode (TM):**<br>When cleared, the interrupt is edge sensitive.<br>When set, the interrupt is level sensitive.<br><br>**Power Well:** Core |
| 14 | 0x0<br>RO/V | **Remote IRR (RIRR):** This is used for level triggered interrupts - its meaning is undefined for edge triggered interrupts.<br>This bit is set when IOxAPIC sends the level interrupt message to the CPU.<br>This bit is cleared when an EOI message is received that matches the VCT field.<br>This bit is never set for SMI, NMI, INIT, or ExtINT delivery modes.<br><br>**Power Well:** Core |
| 13 | 0x0<br>RW | **Polarity (POL):** This specifies the polarity of each interrupt input.<br>When cleared, the signal is active high.<br>When set, the signal is active low.<br><br>**Power Well:** Core |
| 12 | 0x0<br>RO/V | **Delivery Status (DS):** This field contains the current status of the delivery of this interrupt.<br>When set, an interrupt is pending and not yet delivered.<br>When cleared, there is no activity for this entry<br><br>**Power Well:** Core |
| 11 | 0x0<br>RW | **Destination Mode (DSM):** This field is used by the local APIC to determine whether it is the destination of the message.<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 10:8 | 0x0<br>RW | **Delivery Mode (DLM):** This field specifies how the APICs listed in the destination field should act upon reception of this signal. Certain Delivery Modes will only operate as intended when used in conjunction with a specific trigger mode. These encodings are:<br>• 000 - Fixed<br>• 001 - Lowest Priority<br>• 010 - SMI (Not supported)<br>• 011 - Reserved<br>• 100 - NMI (Not supported)<br>• 101 - INIT (Not supported)<br>• 110 - Reserved<br>• 111 - ExtINT<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RW | **Vector (VCT):** This field contains the interrupt vector for this interrupt.<br>Values range between 10h and FEh.<br><br>**Power Well:** Core |

### 64.4.4 Redirection Table Entry 2 (RTE2)—Offset 14h

**Type:** IOxAPIC IDX/WDW (Size: 64 bits)

**IDX:** 14h, 15h

**Default:** 0000000000010000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 63:56 | 0x0<br>RW | **Destination ID (DID):** Destination ID of the local APIC<br><br>**Power Well:** Core |
| 55:48 | 0x0<br>RW | **Extended Destination ID (EDID):** Extended destination ID of the local APIC.<br><br>**Power Well:** Core |
| 47:17 | 0x0<br>RO | **Reserved (RSVD):** Reserved<br><br>**Power Well:** Core |
| 16 | 0x1<br>RW | **Mask (MSK):**<br>When set, interrupts are not delivered nor held pending.<br>When cleared, and edge or level on this interrupt results in the delivery of the interrupt.<br><br>**Power Well:** Core |
| 15 | 0x0<br>RW | **Trigger Mode (TM):**<br>When cleared, the interrupt is edge sensitive.<br>When set, the interrupt is level sensitive.<br><br>**Power Well:** Core |
| 14 | 0x0<br>RO/V | **Remote IRR (RIRR):** This is used for level triggered interrupts - its meaning is undefined for edge triggered interrupts.<br>This bit is set when IOxAPIC sends the level interrupt message to the CPU.<br>This bit is cleared when an EOI message is received that matches the VCT field.<br>This bit is never set for SMI, NMI, INIT, or ExtINT delivery modes.<br><br>**Power Well:** Core |
| 13 | 0x0<br>RW | **Polarity (POL):** This specifies the polarity of each interrupt input.<br>When cleared, the signal is active high.<br>When set, the signal is active low.<br><br>**Power Well:** Core |
| 12 | 0x0<br>RO/V | **Delivery Status (DS):** This field contains the current status of the delivery of this interrupt.<br>When set, an interrupt is pending and not yet delivered.<br>When cleared, there is no activity for this entry<br><br>**Power Well:** Core |
| 11 | 0x0<br>RW | **Destination Mode (DSM):** This field is used by the local APIC to determine whether it is the destination of the message.<br><br>**Power Well:** Core |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 10:8 | 0x0<br>RW | **Delivery Mode (DLM):** This field specifies how the APICs listed in the destination field should act upon reception of this signal. Certain Delivery Modes will only operate as intended when used in conjunction with a specific trigger mode. These encodings are:<br>• 000 - Fixed<br>• 001 - Lowest Priority<br>• 010 - SMI (Not supported)<br>• 011 - Reserved<br>• 100 - NMI (Not supported)<br>• 101 - INIT (Not supported)<br>• 110 - Reserved<br>• 111 - ExtINT<br><br>**Power Well:** Core |
| 7:0 | 0x0<br>RW | **Vector (VCT):** This field contains the interrupt vector for this interrupt.<br>Values range between 10h and FEh.<br><br>**Power Well:** Core |

## 64.4.5 Redirection Table Entry 118 (RTE118)—Offset FCh

**Type:** IOxAPIC IDX/WDW (Size: 64 bits)

**IDX:** FCh, FDh

**Default:** 0000000000010000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|

## 64.5 Registers in I/O Space—Fixed Addresses

These registers are accessed in Host I/O Space through fixed I/O Port addresses.

### 64.5.1 Master Initialization Command Word 1 (MICW1)—I/O Port 20h

A write to Initialization Command Word 1 (ICW1) starts the interrupt controller initialization sequence, during which the following occurs:

1. The Interrupt Mask register is cleared.
2. IRQ7 input is assigned priority 7.
3. The slave mode address is set to 7.
4. Special Mask Mode is cleared and Status Read is set to IRR.

Once this write occurs, the controller expects writes to ICW2, ICW3, and ICW4 to complete the initialization sequence.

**Type:** I/O Register (Size: 8 bits)

**I/O Port Address:** 20h

**Default:** 11h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:5 | 0x0<br>WO | **ICW/OCW select (ICW_OCW_SLT1):** These bits are MCS-85 specific, and not needed. Should be programmed to 000<br><br>**Power Well:** Core |
| 4 | 0x1<br>WO | **ICW/OCW select (ICW_OCW_SLT2):** This bit must be a 1 to select ICW1 and enable the ICW2, ICW3, and ICW4 sequence.<br><br>**Power Well:** Core |
| 3 | 0x0<br>WO | **Edge/Level Bank Select (LTIM):** Disabled. Replaced by the edge/level triggered control registers (ELCR).<br><br>**Power Well:** Core |
| 2 | 0x0<br>WO | **ADI-IGNORED (ADI):** Ignored by the SoC. Should be programmed to 0.<br><br>**Power Well:** Core |
| 1 | 0x0<br>WO | **Single or Cascade (SNGL):** Must be programmed to a 0 to indicate two controllers operating in cascade mode.<br><br>**Power Well:** Core |
| 0 | 0x1<br>WO | **ICW4 Write Required (IC4):** This bit must be programmed to a 1 to indicate that ICW4 needs to be programmed.<br><br>**Power Well:** Core |

## 64.5.2 Master Initialization Command Word 2 (MICW2)—I/O Port 21h

ICW2 is used to initialize the interrupt controller with the five most significant bits of the interrupt vector address. The value programmed for bits[7:3] is used by the CPU to define the base address in the interrupt vector table for the interrupt routines associated with each IRQ on the controller. Typical ISA ICW2 values are 08h for the master controller and 70h for the slave controller.

**Type:** I/O Register
(Size: 8 bits)

**I/O Port Address:** 21h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:3 | 0x0<br>WO | **Interrupt Vector Base Address (IVBA):** Bits [7:3] define the base address in the interrupt vector table for the interrupt routines associated with each interrupt request level input.<br><br>**Power Well:** Core |
| 2:0 | 0x0<br>WO | **Interrupt Request Level (IRL):** When writing ICW2, these bits should all be 0. During an interrupt acknowledge cycle, these bits are programmed by the interrupt controller with the interrupt to be serviced. This is combined with bits [7:3] to form the interrupt vector driven onto the data bus during the second INTA# cycle.<br>The code is a three bit binary code:<br>Code Master Interrupt Slave Interrupt<br>• 000 IRQ0 IRQ8<br>• 001 IRQ1 IRQ9<br>• 010 IRQ2 IRQ10<br>• 011 IRQ3 IRQ11<br>• 100 IRQ4 IRQ12<br>• 101 IRQ5 IRQ13<br>• 110 IRQ6 IRQ14<br>• 111 IRQ7 IRQ15<br><br>**Power Well:** Core |

## 64.5.3 Master Initialization Command Word 3 (MICW3)—I/O Port 21h

**Type:** I/O Register
(Size: 8 bits)

**I/O Port Address:** 21h

**Default:** 07h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:3 | 0x0<br>WO | **MICW3 [7:3] (MICW3_7_3):** These bits must be programmed to zero.<br><br>**Power Well:** Core |
| 2 | 0x1<br>WO | **Cascaded Controller Connection (CCC):** This bit must always be programmed to a 1 to indicate the slave controller for interrupts 8 - 15 is cascaded on IRQ2.<br><br>**Power Well:** Core |
| 1:0 | 0x3<br>WO | **MICW [1:0] (MICW3_1_0):** These bits must be programmed to zero.<br><br>**Power Well:** Core |

## 64.5.4 Master Initialization Command Word 4 (MICW4)—I/O Port 21h

**Type:** I/O Register
(Size: 8 bits)

**I/O Port Address:** 21h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:5 | 0x0<br>WO | **Reserved (RSVD):** Must be 0.<br><br>**Power Well:** Core |
| 4 | 0x0<br>WO | **Special Fully Nested Mode (SFNM):** Should normally be disabled by writing a 0 to this bit.<br>If SFNM=1, the special fully nested mode is programmed.<br><br>**Power Well:** Core |
| 3 | 0x0<br>WO | **Buffered Mode (BUF):** Must be cleared for non-buffered mode.<br>Writing 1 will result in undefined behavior.<br><br>**Power Well:** Core |
| 2 | 0x0<br>WO | **Master/Slave in Buffered Mode (MSBM):** Not used. Should always be programmed to 0.<br><br>**Power Well:** Core |
| 1 | 0x0<br>WO | **Automatic End of Interrupt (AEOI):** This bit should normally be programmed to 0.<br>This is the normal end of interrupt. If this bit is 1, the automatic end of interrupt mode is programmed. AEOI is discussed in Section 13.1.7.2<br><br>**Power Well:** Core |
| 0 | 0x0<br>WO | **Microprocessor Mode (MM):** This bit must be written to 1 to indicate that the controller is operating in an Intel Architecture-based system.<br>Writing 0 will result in undefined behavior.1<br><br>**Power Well:** Core |

## 64.5.5 Master Operational Control Word 1 (MOCW1)—I/O Port 21h

**Type:** I/O Register
(Size: 8 bits)

**I/O Port Address:** 21h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Interrupt Request Mask (IRM):** When a 1 is written to any bit in this register, the corresponding IRQ line is masked.<br>When a 0 is written to any bit in this register, the corresponding IRQ mask bit is cleared, and interrupt requests will again be accepted by the controller.<br>Masking IRQ2 on the master controller will also mask the interrupt requests from the slave controller.<br><br>**Power Well:** Core |

## 64.5.6 Master Operational Control Word 2 (MOCW2)—I/O Port 20h

Following a part reset or ICW initialization, the controller enters the fully nested mode of operation. Non-specific EOI without rotation is the default. Both rotation mode and specific EOI mode are disabled following initialization.

**Type:** I/O Register
(Size: 8 bits)

**I/O Port Address:** 20h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:5 | 0x0<br>WO | **Rotate and EOI Codes (REOI):** R, SL, EOI - These three bits control the Rotate and End of Interrupt modes and combinations of the two. A chart of these combinations is listed above under the bit definition.<br>• 000 Rotate in Auto EOI Mode (Clear)<br>• 001 Non-specific EOI command<br>• 010 No Operation<br>• 011 *Specific EOI Command<br>• 100 Rotate in Auto EOI Mode (Set)<br>• 101 Rotate on Non-Specific EOI Command<br>• 110 *Set Priority Command<br>• 111 *Rotate on Specific EOI Command<br>• *L0 - L2 Are Used<br><br>**Power Well:** Core |
| 4:3 | 0x0<br>WO | **OCW2 Select (O2S):** When selecting OCW2, bits 4:3 = 00<br><br>**Power Well:** Core |
| 2:0 | 0x0<br>WO | **Interrupt Level Select (L2, L1, L0) (ILSLT):** L2, L1, and L0 determine the interrupt level acted upon when the SL bit is active.<br>A simple binary code, outlined above, selects the channel for the command to act upon. When the SL bit is inactive, these bits do not have a defined function, programming L2, L1 and L0 to 0 is sufficient in this case.<br><br>**Power Well:** Core |

## 64.5.7 Master Operational Control Word 3 (MOCW3)—I/O Port 20h

**Type:** I/O Register
(Size: 8 bits)

**I/O Port Address:** 20h

**Default:** 08h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7 | 0x0<br>RO | **Reserved (RSVD):** Must be 0.<br><br>**Power Well:** Core |
| 6 | 0x0<br>WO | **Special Mask Mode (SMM):** If this bit is set, the Special Mask Mode can be used by an interrupt service routine to dynamically alter the system priority structure while the routine is executing, through selective enabling/ disabling of the other channel's mask bits. Bit 6, the ESMM bit, must be set for this bit to have any meaning.<br><br>**Power Well:** Core |
| 5 | 0x0<br>WO | **Enable Special Mask Mode (ESMM):**<br><br>**Power Well:** Core |
| 4:3 | 0x1<br>WO | **OCW3 Select (O3S):** When selecting OCW3, bits 4:3 = 01<br><br>**Power Well:** Core |
| 2 | 0x0<br>WO | **Poll Mode Command (PMC):** When cleared, poll command is not issued. When set, the next I/O read to the interrupt controller is treated as an interrupt acknowledge cycle.<br>An encoded byte is driven onto the data bus, representing the highest priority level requesting service.<br><br>**Power Well:** Core |
| 1:0 | 0x0<br>WO | **Register Read Command (RRC):** . To retain the current selection (read ISR or read IRR), always write a 0 to bit 1 when programming this register. The selected register can be read repeatedly without reprogramming OCW3. To select a new status register, OCW3 must be reprogrammed prior to attempting the read.<br>Value Command<br>• 00 No Action<br>• 01 No Action<br>• 10 Read IRQ Register<br>• 11 Read IS Register<br><br>**Power Well:** Core |

## 64.5.8 Slave Initialization Command Word 1 (SICW1)—I/O Port A0h

A write to Initialization Command Word 1 starts the interrupt controller initialization sequence, during which the following occurs: 1. The Interrupt Mask register is cleared. 2. IRQ7 input is assigned priority 7. 3. The slave mode address is set to 7. 4. Special Mask Mode is cleared and Status Read is set to IRR. Once this write occurs, the controller expects writes to ICW2, ICW3, and ICW4 to complete the initialization sequence.

**Type:** I/O Register (Size: 8 bits)

**I/O Port Address:** A0h

**Default:** 11h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:5 | 0x0<br>WO | **ICW/OCW select (ICW_OCW_SLT1):** These bits are MCS-85 specific, and not needed. Should be programmed to 000<br><br>**Power Well:** Core |
| 4 | 0x1<br>WO | **ICW/OCW select (ICW_OCW_SLT2):** This bit must be a 1 to select ICW1 and enable the ICW2, ICW3, and ICW4 sequence.<br><br>**Power Well:** Core |
| 3 | 0x0<br>WO | **Edge/Level Bank Select (LTIM):** Disabled. Replaced by the edge/level triggered control registers (ELCR).<br><br>**Power Well:** Core |
| 2 | 0x0<br>WO | **ADI-IGNORED (ADI):** Ignored by the SoC. Should be programmed to 0.<br><br>**Power Well:** Core |
| 1 | 0x0<br>WO | **Single or Cascade (SNGL):** Must be programmed to a 0 to indicate two controllers operating in cascade mode.<br><br>**Power Well:** Core |
| 0 | 0x1<br>WO | **ICW4 Write Required (IC4):** This bit must be programmed to a 1 to indicate that ICW4 needs to be programmed.<br><br>**Power Well:** Core |

## 64.5.9 Slave Initialization Command Word 2 (SICW2)—I/O Port A1h

ICW2 is used to initialize the interrupt controller with the five most significant bits of the interrupt vector address. The value programmed for bits[7:3] is used by the CPU to define the base address in the interrupt vector table for the interrupt routines associated with each IRQ on the controller. Typical ISA ICW2 values are 08h for the master controller and 70h for the slave controller.

**Type:** I/O Register
(Size: 8 bits)

**I/O Port Address:** A1h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:3 | 0x0<br>WO | **Interrupt Vector Base Address (IVBA):** Bits [7:3] define the base address in the interrupt vector table for the interrupt routines associated with each interrupt request level input.<br><br>**Power Well:** Core |
| 2:0 | 0x0<br>WO | **Interrupt Request Level (IRL):** When writing ICW2, these bits should all be 0. During an interrupt acknowledge cycle, these bits are programmed by the interrupt controller with the interrupt to be serviced. This is combined with bits [7:3] to form the interrupt vector driven onto the data bus during the second INTA# cycle.<br>The code is a three bit binary code:<br>Code Master Interrupt Slave Interrupt<br>• 000 IRQ0 IRQ8<br>• 001 IRQ1 IRQ9<br>• 010 IRQ2 IRQ10<br>• 011 IRQ3 IRQ11<br>• 100 IRQ4 IRQ12<br>• 101 IRQ5 IRQ13<br>• 110 IRQ6 IRQ14<br>• 111 IRQ7 IRQ15<br><br>**Power Well:** Core |

## 64.5.10 Slave Initialization Command Word 3 (SICW3)—I/O Port A1h

**Type:** I/O Register
(Size: 8 bits)

**I/O Port Address:** A1h

**Default:** 07h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:3 | 0x0<br>WO | **Reserved (RSVD):** Must be 0.<br><br>**Power Well:** Core |
| 2:0 | 0x7<br>WO | **Slave Identification Code (SIC):** This field must be programmed to 02h to match the code broadcast by the master controller during the INTA# sequence.<br><br>**Power Well:** Core |

## 64.5.11 Slave Initialization Command Word 4 (SICW4)—I/O Port A1h

**Type:** I/O Register
(Size: 8 bits)

**I/O Port Address:** A1h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:5 | 0x0<br>WO | **Reserved (RSVD):** Must be 0.<br><br>**Power Well:** Core |
| 4 | 0x0<br>WO | **Special Fully Nested Mode (SFNM):** Should normally be disabled by writing a 0 to this bit.<br>If SFNM=1, the special fully nested mode is programmed.<br><br>**Power Well:** Core |
| 3 | 0x0<br>WO | **Buffered Mode (BUF):** Must be cleared for non-buffered mode. Writing 1 will result in undefined behavior.<br><br>**Power Well:** Core |
| 2 | 0x0<br>WO | **Master/Slave in Buffered Mode (MSBM):** Not used. Should always be programmed to 0.<br><br>**Power Well:** Core |
| 1 | 0x0<br>WO | **Automatic End of Interrupt (AEOI):** This bit should normally be programmed to 0.<br>This is the normal end of interrupt.<br>If this bit is 1, the automatic end of interrupt mode is programmed. AEOI is discussed in Section 13.1.7.2<br><br>**Power Well:** Core |
| 0 | 0x0<br>WO | **Microprocessor Mode (MM):** This bit must be written to 1 to indicate that the controller is operating in an Intel Architecture-based system.<br>Writing 0 will result in undefined behavior.1<br><br>**Power Well:** Core |

## 64.5.12 Slave Operational Control Word 1 (SOCW1)—I/O Port A1h

**Type:** I/O Register
(Size: 8 bits)

**I/O Port Address:** A1h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:0 | 0x0<br>RW | **Interrupt Request Mask (IRM):** When a 1 is written to any bit in this register, the corresponding IRQ line is masked. When a 0 is written to any bit in this register, the corresponding IRQ mask bit is cleared, and interrupt requests will again be accepted by the controller.<br>Masking IRQ2 on the master controller will also mask the interrupt requests from the slave controller.<br><br>**Power Well:** Core |

## 64.5.13 Slave Operational Control Word 2 (SOCW2)—I/O Port A0h

Following a part reset or ICW initialization, the controller enters the fully nested mode of operation. Non-specific EOI without rotation is the default. Both rotation mode and specific EOI mode are disabled following initialization.

**Type:** I/O Register
(Size: 8 bits)

**I/O Port Address:** A0h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:5 | 0x0<br>WO | **Rotate and EOI Codes (REOI):** R, SL, EOI - These three bits control the Rotate and End of Interrupt modes and combinations of the two.<br>A chart of these combinations is listed above under the bit definition.<br>• 000 Rotate in Auto EOI Mode (Clear)<br>• 001 Non-specific EOI command<br>• 010 No Operation<br>• 011 *Specific EOI Command<br>• 100 Rotate in Auto EOI Mode (Set)<br>• 101 Rotate on Non-Specific EOI Command<br>• 110 *Set Priority Command<br>• 111 *Rotate on Specific EOI Command<br>*L0 - L2 Are Used<br><br>**Power Well:** Core |

## 64.5.15 Master Edge/Level Control (ELCR1)—I/O Port 4D0h

Master Edge/Level Control Register

**Type:** I/O Register
(Size: 8 bits)

**I/O Port Address:** 4D0h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:3 | 0x0<br>RW | **Edge Level Control (ELC_7_3):** In edge mode, (bit cleared), the interrupt is recognized by a low to high transition.<br>In level mode (bit set), the interrupt is recognized by a high level.<br><br>**Power Well:** Core |
| 2:0 | 0x0<br>RO | **Reserved (RSVD):** The cascade channel(IRQ2), heart beat timer (IRQ0), and keyboard controller (IRQ1), cannot be put into level mode<br><br>**Power Well:** Core |

## 64.5.16 Slave Edge/Level Control (ELCR2)—I/O Port 4D1h

Slave Edge/Level Control Register

**Type:** I/O Register
(Size: 8 bits)

**I/O Port Address:** 4D1h

**Default:** 00h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 7:6 | 0x0<br>RW | **Edge Level Control (ELC_15_14):** In edge mode, (bit cleared), the interrupt is recognized by a low to high transition.<br>In level mode (bit set), the interrupt is recognized by a high level. Bit 7 applies to IRQ15, and bit 6 to IRQ14.<br><br>**Power Well:** Core |

# 65 Customer General-Purpose I/O Controller

## 65.1 Introduction and Index

The host-accessible registers for the Customer General-Purpose I/O Controller are described here. Also, the registers that allow the selection of one of a number of shared, signal functions are also described here.

Besides the Host, the customer general-purpose I/O controller are also accessible through Intel® ME Configuration Space and IE configuration Space using their own Bus, Device and Function Numbers.

The legend for the register access codes are described in Chapter 43, "Introduction."

*Note:* The following statement needs to be noted when referring to register Table 65-1 and Table 65-2:

The internal pull-up resistor option is not supported for 1.8V GPIOs.
The internal pull-down resistor option is not supported for 3.3V GPIOs.

### 65.1.1 Sideband Registers—Configurable I/O Signals

An index of the Sideband Registers that are accessible to the Host are listed here. Each is accessible in Host Memory Space using the Sideband Base Address Register (SBREG_BAR). See Section 3.4.1, "Using SBREG_BAR Method."

**Table 65-1. Summary of Sideband Registers, Part 1 of 2—Sideband Port 0xC2 (Sheet 1 of 4)**

| Offset (hex) | Default Value (hex) | Register Name (Register Symbol) |
|---|---|---|
| C | 00000400 | "Pad Base Address (PADBAR)—Offset Ch" on page 2953 |
| 10 | 00021000 | "Miscellaneous Configuration (MISCCFG)—Offset 10h" on page 2954 |
| 20 | 00000000 | "Pad Ownership (PAD_OWN_NORTH_ALL_0)—Offset 20h" on page 2955 |
| 24 | 00000000 | "Pad Ownership (PAD_OWN_NORTH_ALL_1)—Offset 24h" on page 2957 |
| 28 | 00000000 | "Pad Ownership (PAD_OWN_NORTH_ALL_2)—Offset 28h" on page 2959 |
| 2C | 00000000 | "Pad Ownership (PAD_OWN_NORTH_ALL_3)—Offset 2Ch" on page 2961 |
| 30 | 00000000 | "Pad Ownership (PAD_OWN_NORTH_ALL_4)—Offset 30h" on page 2963 |
| 34 | 00000000 | "Pad Ownership (PAD_OWN_NORTH_ALL_5)—Offset 34h" on page 2965 |
| 90 | 00000000 | "Pad Configuration Lock (PADCFGLOCK_NORTH_ALL_0)—Offset 90h" on page 2966 |
| 94 | 00000000 | "Pad Configuration Lock (PADCFGLOCKTX_NORTH_ALL_0)—Offset 94h" on page 2968 |
| 98 | 00000000 | "Pad Configuration Lock (PADCFGLOCK_NORTH_ALL_1)—Offset 98h" on page 2970 |
| 9C | 00000000 | "Pad Configuration Lock (PADCFGLOCKTX_NORTH_ALL_1)—Offset 9Ch" on page 2971 |
| C0 | 00000000 | "Host Software Pad Ownership (HOSTSW_OWN_NORTH_ALL_0)—Offset C0h" on page 2972 |
| C4 | 00000000 | "Host Software Pad Ownership (HOSTSW_OWN_NORTH_ALL_1)—Offset C4h" on page 2974 |
| 100 | 00000000 | "GPI Interrupt Status (GPI_IS_NORTH_ALL_0)—Offset 100h" on page 2975 |
| 104 | 00000000 | "GPI Interrupt Status (GPI_IS_NORTH_ALL_1)—Offset 104h" on page 2977 |
| 120 | 00000000 | "GPI Interrupt Enable (GPI_IE_NORTH_ALL_0)—Offset 120h" on page 2978 |
| 124 | 00000000 | "GPI Interrupt Enable (GPI_IE_NORTH_ALL_1)—Offset 124h" on page 2980 |
| 140 | 00000000 | "GPI General Purpose Events Status (GPI_GPE_STS_NORTH_ALL_0)—Offset 140h" on page 2981 |
| 144 | 00000000 | "GPI General Purpose Events Status (GPI_GPE_STS_NORTH_ALL_1)—Offset 144h" on page 2983 |
| 160 | 00000000 | "GPI General Purpose Events Enable (GPI_GPE_EN_NORTH_ALL_0)—Offset 160h" on page 2984 |
| 164 | 00000000 | "GPI General Purpose Events Enable (GPI_GPE_EN_NORTH_ALL_1)—Offset 164h" on page 2986 |
| 180 | 00000000 | "SMI Status (GPI_SMI_STS_NORTH_ALL_0)—Offset 180h" on page 2987 |
| 184 | 00000000 | "SMI Status (GPI_SMI_STS_NORTH_ALL_1)—Offset 184h" on page 2989 |
| 1A0 | 00000000 | "SMI Enable (GPI_SMI_EN_NORTH_ALL_0)—Offset 1A0h" on page 2990 |

## 65.2 Sideband Registers, Part 1 of 2—Sideband Port 0xC2

### 65.2.1 Pad Base Address (PADBAR)—Offset Ch

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0xC2] + Ch
**Host Memory Space:** SBREG_BAR + 0xC20000 + Ch

**Default:** 00000400h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:16 | 0x0<br>RO | **Reserved (RSVD_0):** Reserved. |
| 15:0 | 0x400<br>RO | **Pad Base Address (PADBAR):**<br>This field provides the starting byte-align address of Pad0 register sets within a Community.<br>It is meant for software to discover from where the very first Pad register (i.e. Pad0 register) starts to compute the next Pad address offsets. |

## 65.2.2 Miscellaneous Configuration (MISCCFG)—Offset 10h

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0xC2] + 10h
**Host Memory Space:** SBREG_BAR + 0xC20000 + 10h

**Default:** 00021000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:20 | 0x0<br>RW | **Reserved (Reserved1):** Reserved |
| 19:16 | 0x2<br>RW | **GPIO Group to GPE_DW0 assignment encoding (GPE0_DW2):**<br>This register assigns a specific GPIO Group to the ACPI GPE0[95:64].<br>The setting is SoC specific. |
| 15:12 | 0x1<br>RW | **GPIO Group to GPE_DW0 assignment encoding (GPE0_DW1):**<br>This register assigns a specific GPIO Group to the ACPI GPE0[63:32].<br>The setting is SoC specific. |
| 11:8 | 0x0<br>RW | **GPIO Group to GPE_DW0 assignment encoding (GPE0_DW0):** GPIO Group to GPE_DW0 assignment encoding (GPE0_DW0[3:0]):<br>This register assigns a specific GPIO Group to the ACPI GPE0[31:0].<br>The setting is SoC specific. |
| 7:5 | 0x0<br>RW | **Reserved (Reserved2):** Reserved |
| 4 | 0x0<br>RW | **NCSI Outbound Signal Staging Control (NCSI_STAGE_EN):** NCSI Signal Staging Control:<br>This register controls the bypass/staging logic for the GBE NCSI output signals - when 1, the signals will be staged with NCSI_ARB_CLK; when 0, the flops will be bypassed. |
| 3 | 0x0<br>RW | **GPIO Driver IRQ Route (GPIO_DRIVER_IRQ_ROUTE):** GPIO Driver IRQ_ROUTE[1:0]:<br>Specifies the APIC IRQ globally for all pads within the current community (GPI_IS with corresponding GPI_IE enable).<br>• 0 = IRQ14<br>• 1 = IRQ15 |
| 2 | 0x0<br>RW | **GSX Static Local Clock Gating (GSXSLCGEN):** GSX Static Local Clock Gating (GSXSLCGEn)<br>Specify whether the GSX controller should be statically clock gated for power saving if it is not enabled (even though the capability is available).<br>• 0 = Disable dynamic local clock gating<br>• 1 = Enable dynamic local clock gating |
| 1 | 0x0<br>RW | **GPIO Dynamic Partition Clock Gating Enable (GPDPCGEN):** GPIO Dynamic Partition Clock Gating Enable (GPDPCGEn)<br>Specify whether the GPIO Community should take part in partition clock gating<br>• 0 = Disable participation in dynamic partition clock gating<br>• 1 = Enable participation in dynamic partition clock gating |
| 0 | 0x0<br>RW | **GPIO Dynamic Local Clock Gating Enable (GPDLCGEN):** GPIO Dynamic Local Clock Gating Enable (GPDLCGEn)<br>Specify whether the GPIO Community should perform local clock gating<br>• 0 = Disable dynamic local clock gating<br>• 1 = Enable dynamic local clock gating |

## 65.2.3 Pad Ownership (PAD_OWN_NORTH_ALL_0)—Offset 20h

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0xC2] + 20h
**Host Memory Space:** SBREG_BAR + 0xC20000 + 20h

**Default:** 00000000h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:30 | 0x0<br>RO | **Reserved (RSVD_0):** Reserved. |
| 29:28 | 0x0<br>RW | **Pad Ownership (PAD_OWN_GBE1_SDP3):** This register can be written by the Intel® Management Engine (Intel® ME) GPIO Function only.** Write access without Intel® ME GPIO Function SAI shall be dropped. There is no SAI restriction on register read. Encoding:<br>• 00 = Host GPIO ACPI Mode or GPIO Driver Mode. Host software (ACPI or GPIO Driver) has ownership of the pad. In Host GPIO Driver Mode (refer to HOSTSW_OWN), GPIO input event update is limited to GPI_INT_STS update only. Otherwise in Host ACPI Mode, updates are limited to GPI_GPE_STS, GPI_NMI_STS and/or GPI_SMI_STS. No read/write restriction to the Pad Configuration register set during host ownership. During host ownership, Intel® ME, IE and ISH do not own this pad and are not notified of the GPIO input event.<br>• 01 = Intel® ME GPIO Mode. The Intel® ME has ownership of the pad. All accesses to Pad Configuration register set must be verified with Intel® ME GPIO Function SAI **. Non-posted cycle access without Intel® ME SAI shall result in Unsuccessful Completion status. Posted cycle access without Intel® ME SAI shall be dropped. In Intel® ME GPIO Mode, the host related status registers related to the pad (refer to host ownership above) are masked from being updated by GPIO input event. If IOSF-SB Virtual Wire message generation is enabled for this pad, GPIO hardware sends the Virtual Wire message to Intel® ME GPIO Function. Only the Intel® ME GPIO Function is notified of the GPIO input event.<br>• 10 = ISH GPIO Mode. Same description as Intel® ME GPIO Mode above except verifying ISH GPIO Function SAI for pad related register accesses and the Virtual Wire message is delivered to the ISH GPIO Function.<br>• 11 = IE GPIO Mode. Same description as Intel® ME GPIO Mode above except verifying IE GPIO Function SAI for pad related register accesses and the Virtual Wire message is delivered to the IE GPIO Function.<br>**During DFx mode, Secure DFx can write to the PAD_OWN. |
| 27:26 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved. |
| 25:24 | 0x0<br>RW | **Pad Ownership (PAD_OWN_GBE0_SDP3):** See Description for bits [29:28] of this register. |
| 23:22 | 0x0<br>RO | **Reserved (RSVD_2):** Reserved. |
| 21:20 | 0x0<br>RW | **Pad Ownership (PAD_OWN_GBE1_SDP2):** See Description for bits [29:28] of this register. |
| 19:18 | 0x0<br>RO | **Reserved (RSVD_3):** Reserved. |

## 65.2.32 Pad Configuration DW0 (PAD_CFG_DW0_GBE0_SDP0)—Offset 400h

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0xC2] + 400h
**Host Memory Space:** SBREG_BAR + 0xC20000 + 400h

**Default:** 45000200h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:30 | 0x1<br>RW | **Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below:<br>• 00 = Powergood (i.e. sticky reset)<br>• 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b)<br>• 10 = GPIO Reset (i.e. host reset: host_rst_b)<br>• 11 = Reserved; tied to inactive (i.e. '1' for active low reset)<br>For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b<br>The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. |
| 29 | 0x0<br>RW | **RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0).<br>• 0 = Raw RX pad state directly from CFIO RX buffer<br>• 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings) |
| 28 | 0x0<br>RW | **RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV.<br>• 0 = No Override<br>• 1 = RX drive 1 internally |
| 27 | 0x0<br>RO | **Reserved (RSVD_0):** Reserved. |
| 26:25 | 0x2<br>RW | **RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller.<br>• 0h = Level<br>• 1h = Edge<br>• 2h = Drive '0'<br>• 3h = Reserved (implement as setting 0h) |
| 24 | 0x1<br>RW | **Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not.<br>This field only makes sense when the RX buffer is configured as an input and is not disabled.<br>• 0 = Select synchronized, non filtered RX pad state<br>• 1 = Select synchronized, filtered RX pad state<br>The selected RX pad state can be further subjected to polarity inversion through RXINV |
| 23 | 0x0<br>RW | **RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode.<br>The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel.<br>This bit does not affect GPIORXState.<br>During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI.<br>• 0 = No inversion<br>• 1 = Inversion |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 22:21 | 0x0<br>RO | **RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode).<br>Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0.<br>• 0 = Function defined in Pad Mode controls TX and RX Enables<br>• 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally<br>• 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally<br>• 3 = Function controls TX Enabled and RX is always enabled |
| 20 | 0x0<br>RW | **GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect.<br>• 0 = Routing does not cause peripheral IRQ<br>• 1 = Routing can cause peripheral IRQ<br>***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s). |
| 19 | 0x0<br>RW | **GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect.<br>• 0 = Routing does not cause SCI<br>• 1 = Routing can cause SCI<br>***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU. |
| 18 | 0x0<br>RO | **GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect.<br>• 0 = Routing does not cause SMI.<br>• 1 = Routing can cause SMI.<br>***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). |
| 17 | 0x0<br>RO | **GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect.<br>• 0 = Routing does not cause NMI.<br>• 1 = Routing can cause NMI.<br>***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. |
| 16:13 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved. |
| 12:10 | 0x0<br>RW | **Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad.<br>Bits [12:10] decode:<br>• 0 = GPIO controls the Pad<br>• 1 = Function 1, if applicable, controls the Pad<br>• 2 = Function 2, if applicable, controls the Pad<br>• ...<br>• 7 = Function 7, if applicable, controls the Pad |
| 9 | 0x1<br>RW | **GPIO RX Disable (GPIORXDIS):**<br>• 0 = Enable the input buffer (active low enable) of the pad<br>• 1 = Disable the input buffer of the pad.<br>***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP. |
| 8 | 0x0<br>RW | **GPIO TX Disable (GPIOTXDIS):**<br>• 0 = Enable the output buffer (active low enable) of the pad<br>• 1 = Disable the output buffer of the pad; i.e. Hi-Z |
| 7:2 | 0x0<br>RO | **Reserved (RSVD_2):** Reserved. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 1 | 0x0<br>RO | **GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings. |
| 0 | 0x0<br>RW | **GPIO TX State (GPIOTXSTATE):**<br>• 0 = Drive a level '0' to the TX output pad<br>• 1 = Drive a level '1' to the TX output pad |

## 65.2.33 Pad Configuration DW1 (PAD_CFG_DW1_GBE0_SDP0)—Offset 404h

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0xC2] + 404h
**Host Memory Space:** SBREG_BAR + 0xC20000 + 404h

**Default:** 00000018h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:14 | 0x0<br>RO | **Reserved**. |
| 13:10 | 0x0<br>RW | **Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to:<br>• 0h = none<br>• 2h = 5k weak Pull-Down<br>• 4h = 20k weak Pull-Down<br>• 8h = none<br>• 9h = 1k weak Pull-Up<br>• Ah = 5k weak Pull-Up<br>• Bh = 2k weak Pull-Up<br>• Ch = 20k weak Pull-Up<br>• Dh = 1k and 2k weak Pull-Up<br>• Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad.<br>• All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction.<br>The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily. |
| 9:8 | 0x0<br>RO | **Reserved**. |
| 7:0 | 0x18<br>RO | **Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad.<br>• 0 = Interrupt Line 0<br>• 1 = Interrupt Line 1<br>Up to the max IOxAPIC IRQ supported by the SoC. |

## 65.2.34 Pad Configuration DW0 (PAD_CFG_DW0_GBE1_SDP0)—Offset 408h

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0xC2] + 408h
**Host Memory Space:** SBREG_BAR + 0xC20000 + 408h

**Default:** 45000200h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:30 | 0x1<br>RW | **Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below:<br>• 00 = Powergood (i.e. sticky reset)<br>• 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b)<br>• 10 = GPIO Reset (i.e. host reset: host_rst_b)<br>• 11 = Reserved; tied to inactive (i.e. '1' for active low reset)<br>For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b<br>The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. |
| 29 | 0x0<br>RW | **RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0).<br>• 0 = Raw RX pad state directly from CFIO RX buffer<br>• 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings) |
| 28 | 0x0<br>RW | **RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV.<br>• 0 = No Override<br>• 1 = RX drive 1 internally |
| 27 | 0x0<br>RO | **Reserved (RSVD_0):** Reserved. |
| 26:25 | 0x2<br>RW | **RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller.<br>• 0h = Level<br>• 1h = Edge<br>• 2h = Drive '0'<br>• 3h = Reserved (implement as setting 0h) |
| 24 | 0x1<br>RW | **Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not.<br>This field only makes sense when the RX buffer is configured as an input and is not disabled.<br>• 0 = Select synchronized, non filtered RX pad state<br>• 1 = Select synchronized, filtered RX pad state<br>The selected RX pad state can be further subjected to polarity inversion through RXINV |
| 23 | 0x0<br>RW | **RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode.<br>The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel.<br>This bit does not affect GPIORXState.<br>During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. ## 65.2.35 Pad Configuration DW1 (PAD_CFG_DW1_GBE1_SDP0)—Offset 40Ch

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0xC2] + 40Ch
**Host Memory Space:** SBREG_BAR + 0xC20000 + 40Ch

**Default:** 00000019h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:14 | 0x0<br>RO | **Reserved**. |
| 13:10 | 0x0<br>RW | **Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to:<br>• 0h = none<br>• 2h = 5k weak Pull-Down<br>• 4h = 20k weak Pull-Down<br>• 8h = none<br>• 9h = 1k weak Pull-Up<br>• Ah = 5k weak Pull-Up<br>• Bh = 2k weak Pull-Up<br>• Ch = 20k weak Pull-Up<br>• Dh = 1k and 2k weak Pull-Up<br>• Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad.<br>• All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction.<br>The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily. |
| 9:8 | 0x0<br>RO | **Reserved**. |
| 7:0 | 0x19<br>RO | **Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad.<br>• 0 = Interrupt Line 0<br>• 1 = Interrupt Line 1<br>Up to the max IOxAPIC IRQ supported by the SoC. |

## 65.2.36 Pad Configuration DW0 (PAD_CFG_DW0_GBE0_SDP1)—Offset 410h

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0xC2] + 410h
**Host Memory Space:** SBREG_BAR + 0xC20000 + 410h

**Default:** 45000200h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:30 | 0x1<br>RW | **Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below:<br>• 00 = Powergood (i.e. sticky reset)<br>• 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b)<br>• 10 = GPIO Reset (i.e. host reset: host_rst_b)<br>• 11 = Reserved; tied to inactive (i.e. '1' for active low reset)<br>For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b<br>The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. |
| 29 | 0x0<br>RW | **RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0).<br>• 0 = Raw RX pad state directly from CFIO RX buffer<br>• 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings) |
| 28 | 0x0<br>RW | **RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV.<br>• 0 = No Override<br>• 1 = RX drive 1 internally |
| 27 | 0x0<br>RO | **Reserved (RSVD_0):** Reserved. |
| 26:25 | 0x2<br>RW | **RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller.<br>• 0h = Level<br>• 1h = Edge<br>• 2h = Drive '0'<br>• 3h = Reserved (implement as setting 0h) |
| 24 | 0x1<br>RW | **Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not.<br>This field only makes sense when the RX buffer is configured as an input and is not disabled.<br>• 0 = Select synchronized, non filtered RX pad state<br>• 1 = Select synchronized, filtered RX pad state<br>The selected RX pad state can be further subjected to polarity inversion through RXINV |
| 23 | 0x0<br>RW | **RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode.<br>The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel.<br>This bit does not affect GPIORXState.<br>During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily. |
| 9:8 | 0x0<br>RO | **Reserved**. |
| 7:0 | 0x1b<br>RO | **Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad.<br>• 0 = Interrupt Line 0<br>• 1 = Interrupt Line 1<br>Up to the max IOxAPIC IRQ supported by the SoC. |

## 65.2.40 Pad Configuration DW0 (PAD_CFG_DW0_GBE0_SDP2)—Offset 420h

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0xC2] + 420h
**Host Memory Space:** SBREG_BAR + 0xC20000 + 420h

**Default:** 45000200h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:30 | 0x1<br>RW | **Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below:<br>• 00 = Powergood (i.e. sticky reset)<br>• 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b)<br>• 10 = GPIO Reset (i.e. host reset: host_rst_b)<br>• 11 = Reserved; tied to inactive (i.e. '1' for active low reset)<br>For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b<br>The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. |
| 29 | 0x0<br>RW | **RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0).<br>• 0 = Raw RX pad state directly from CFIO RX buffer<br>• 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings) |
| 28 | 0x0<br>RW | **RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV.<br>• 0 = No Override<br>• 1 = RX drive 1 internally |
| 27 | 0x0<br>RO | **Reserved (RSVD_0):** Reserved. |
| 26:25 | 0x2<br>RW | **RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller.<br>• 0h = Level<br>• 1h = Edge<br>• 2h = Drive '0'<br>• 3h = Reserved (implement as setting 0h) |
| 24 | 0x1<br>RW | **Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not.<br>This field only makes sense when the RX buffer is configured as an input and is not disabled.<br>• 0 = Select synchronized, non filtered RX pad state<br>• 1 = Select synchronized, filtered RX pad state<br>The selected RX pad state can be further subjected to polarity inversion through RXINV |
| 23 | 0x0<br>RW | **RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode.<br>The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel.<br>This bit does not affect GPIORXState.<br>During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI.<br>• 0 = No inversion<br>• 1 = Inversion |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 22:21 | 0x0<br>RO | **RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode).<br>Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0.<br>• 0 = Function defined in Pad Mode controls TX and RX Enables<br>• 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally<br>• 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally<br>• 3 = Function controls TX Enabled and RX is always enabled |
| 20 | 0x0<br>RW | **GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect.<br>• 0 = Routing does not cause peripheral IRQ<br>• 1 = Routing can cause peripheral IRQ<br>***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s). |
| 19 | 0x0<br>RW | **GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect.<br>• 0 = Routing does not cause SCI<br>• 1 = Routing can cause SCI<br>***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the GPE indication to the intended recipient(s), e.g. PMU. |
| 18 | 0x0<br>RO | **GPIO Input Route SMI (GPIROUTSMI):** Determines if the pad can be routed to cause SMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect.<br>• 0 = Routing does not cause SMI.<br>• 1 = Routing can cause SMI.<br>***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the SMI indication to the intended recipient(s). |
| 17 | 0x0<br>RO | **GPIO Input Route NMI (GPIROUTNMI):** Determines if the pad can be routed to cause NMI when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect.<br>• 0 = Routing does not cause NMI.<br>• 1 = Routing can cause NMI.<br>***Note:*** This bit also affects GPI_NMI_STS. If '0', GPI_NMI_STS is always clear. If '1', GPI_NMI_STS could be set (depending on GPIOOwn setting) when there is an event. Whether a NMI indication is generated and sent to the intended recipient(s) is also depending on the corresponding GPI_NMI_EN bit. |
| 16:13 | 0x0<br>RO | **Reserved (RSVD_1):** Reserved. |
| 12:10 | 0x0<br>RW | **Pad Mode bits (PMODE):** Bits [12:10] of this DW0 register determine whether the Pad is controlled by GPIO controller logic or one of the SoC native functions is assigned to the Pad.<br>Bits [12:10] decode:<br>• 0 = GPIO controls the Pad<br>• 1 = Function 1, if applicable, controls the Pad<br>• 2 = Function 2, if applicable, controls the Pad<br>• ...<br>• 7 = Function 7, if applicable, controls the Pad |
| 9 | 0x1<br>RW | **GPIO RX Disable (GPIORXDIS):**<br>• 0 = Enable the input buffer (active low enable) of the pad<br>• 1 = Disable the input buffer of the pad.<br>***Note:*** When the input buffer is disabled, the internal pad state is always driven to '0' by CFIO HIP. |
| 8 | 0x0<br>RW | **GPIO TX Disable (GPIOTXDIS):**<br>• 0 = Enable the output buffer (active low enable) of the pad<br>• 1 = Disable the output buffer of the pad; i.e. Hi-Z |
| 7:2 | 0x0<br>RO | **Reserved (RSVD_2):** Reserved. |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 1 | 0x0<br>RO | **GPIO RX State (GPIORXSTATE):** This is the current internal RX pad state after Glitch Filter logic stage and is not affected by PMode and RXINV settings. |
| 0 | 0x0<br>RW | **GPIO TX State (GPIOTXSTATE):**<br>• 0 = Drive a level '0' to the TX output pad<br>• 1 = Drive a level '1' to the TX output pad |

## 65.2.41 Pad Configuration DW1 (PAD_CFG_DW1_GBE0_SDP2)—Offset 424h

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0xC2] + 424h
**Host Memory Space:** SBREG_BAR + 0xC20000 + 424h

**Default:** 0000001Ch

## 65.2.45 Pad Configuration DW1 (PAD_CFG_DW1_GBE0_SDP3)—Offset 434h

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0xC2] + 434h
**Host Memory Space:** SBREG_BAR + 0xC20000 + 434h

**Default:** 0000001Eh

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:14 | 0x0<br>RO | **Reserved**. |
| 13:10 | 0x0<br>RW | **Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to:<br>• 0h = none<br>• 2h = 5k weak Pull-Down<br>• 4h = 20k weak Pull-Down<br>• 8h = none<br>• 9h = 1k weak Pull-Up<br>• Ah = 5k weak Pull-Up<br>• Bh = 2k weak Pull-Up<br>• Ch = 20k weak Pull-Up<br>• Dh = 1k and 2k weak Pull-Up<br>• Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad.<br>• All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction.<br>The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily. |
| 9:8 | 0x0<br>RO | **Reserved**. |
| 7:0 | 0x1e<br>RO | **Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad.<br>• 0 = Interrupt Line 0<br>• 1 = Interrupt Line 1<br>Up to the max IOxAPIC IRQ supported by the SoC. |

## 65.2.46 Pad Configuration DW0 (PAD_CFG_DW0_GBE1_SDP3)—Offset 438h

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0xC2] + 438h
**Host Memory Space:** SBREG_BAR + 0xC20000 + 438h

**Default:** 45000200h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:30 | 0x1<br>RW | **Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below:<br>• 00 = Powergood (i.e. sticky reset)<br>• 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b)<br>• 10 = GPIO Reset (i.e. host reset: host_rst_b)<br>• 11 = Reserved; tied to inactive (i.e. '1' for active low reset)<br>For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b<br>The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. |
| 29 | 0x0<br>RW | **RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0).<br>• 0 = Raw RX pad state directly from CFIO RX buffer<br>• 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings) |
| 28 | 0x0<br>RW | **RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV.<br>• 0 = No Override<br>• 1 = RX drive 1 internally |
| 27 | 0x0<br>RO | **Reserved (RSVD_0):** Reserved. |
| 26:25 | 0x2<br>RW | **RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller.<br>• 0h = Level<br>• 1h = Edge<br>• 2h = Drive '0'<br>• 3h = Reserved (implement as setting 0h) |
| 24 | 0x1<br>RW | **Pre Glitch Filter Stage RX Pad State Select (PREGFRXSEL):** Determines if the synchronized version of the raw RX pad state should be subjected to glitch filter or not.<br>This field only makes sense when the RX buffer is configured as an input and is not disabled.<br>• 0 = Select synchronized, non filtered RX pad state<br>• 1 = Select synchronized, filtered RX pad state<br>The selected RX pad state can be further subjected to polarity inversion through RXINV |
| 23 | 0x0<br>RW | **RX Invert (RXINV):** This bit determines if the selected pad state should go through the polarity inversion stage. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode.<br>The polarity inversion takes place at the mux node of raw vs filtered or non-filtered RX pad state, as determined by PreGfRXsel and RXPadStSel.<br>This bit does not affect GPIORXState.<br>During host ownership GPIO Mode, when this bit is set to '1', then the RX pad state is inverted as it is sent to the GPIO-to-IOxAPIC, GPE/SCI, SMI, NMI logic or GPI_IS[n] that is using it. This is used to allow active-low and active-high inputs to cause IRQ, SMI#, SCI or NMI.<br>• 0 = No inversion<br>• 1 = Inversion |

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 22:21 | 0x0<br>RO | **RX/TX Enable Config (RXTXENCFG):** This controls the RX and TX buffer enables for the function selected by Pad Mode, but is not applicable when Pad Mode is 0 (i.e. GPIO mode).<br>Hardware shall ensure GPIOTxDis and GPIORxDis are controlling the RX and TX buffers when this field is 0 and Pad Mode is 0.<br>• 0 = Function defined in Pad Mode controls TX and RX Enables<br>• 1 = Function controls TX Enable and RX Disabled with RX drive 0 internally<br>• 2 = Function controls TX Enable and RX Disabled with RX drive 1 internally<br>• 3 = Function controls TX Enabled and RX is always enabled |
| 20 | 0x0<br>RW | **GPIO Input Route IOxAPIC (GPIROUTIOXAPIC):** Determines if the pad can be routed to cause peripheral IRQ when configured in GPIO input mode. If the pad is not configured in GPIO input mode, this field has no effect.<br>• 0 = Routing does not cause peripheral IRQ<br>• 1 = Routing can cause peripheral IRQ<br>***Note:*** This bit does not affect any interrupt status bit within GPIO, but is used as the last qualifier for the peripheral IRQ indication to the intended recipient(s). |
| 19 | 0x0<br>RW | **GPIO Input Route SCI (GPIROUTSCI):** Determines if the pad can be routed to cause SCI when configured in GPIO input mode. ## 65.2.51 Pad Configuration DW1 (PAD_CFG_DW1_GBE2_LED1)—Offset 44Ch

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0xC2] + 44Ch
**Host Memory Space:** SBREG_BAR + 0xC20000 + 44Ch

**Default:** 00000021h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:14 | 0x0<br>RO | **Reserved**. |
| 13:10 | 0x0<br>RW | **Termination (TERM):** The Pad Termination state defines the different weak Pull-Up and Pull-Down settings that are supported by the buffer. The settings for register bits [13:10] correspond to:<br>• 0h = none<br>• 2h = 5k weak Pull-Down<br>• 4h = 20k weak Pull-Down<br>• 8h = none<br>• 9h = 1k weak Pull-Up<br>• Ah = 5k weak Pull-Up<br>• Bh = 2k weak Pull-Up<br>• Ch = 20k weak Pull-Up<br>• Dh = 1k and 2k weak Pull-Up<br>• Fh = The TERM register does not define the termination. Instead, the SoC internal circuitry controls the type and value of the termination, if any, on this pad.<br>• All others bit settings are reserved. If a reserved value is programmed, the pad may malfunction.<br>The setting of this register field is applicable in all Pad Modes including GPIO. As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily. |
| 9:8 | 0x0<br>RO | **Reserved**. |
| 7:0 | 0x21<br>RO | **Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad.<br>• 0 = Interrupt Line 0<br>• 1 = Interrupt Line 1<br>Up to the max IOxAPIC IRQ supported by the SoC. |

## 65.2.52 Pad Configuration DW0 (PAD_CFG_DW0_GBE0_I2C_CLK)—Offset 450h

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0xC2] + 450h
**Host Memory Space:** SBREG_BAR + 0xC20000 + 450h

**Default:** 45000600h

| Bit Range | Default & Access | Field Name (ID): Description |
|---|---|---|
| 31:30 | 0x1<br>RW | **Pad Reset Config (PADRSTCFG):** This field controls which reset is used to reset the specified Pad Register fields. It is the SoC responsibilities to decide the number of configurable reset required with an example below:<br>• 00 = Powergood (i.e. sticky reset)<br>• 01 = Deep GPIO Reset (i.e. host deep reset: host_deep_rst_b)<br>• 10 = GPIO Reset (i.e. host reset: host_rst_b)<br>• 11 = Reserved; tied to inactive (i.e. '1' for active low reset)<br>For DSW well pads, this register default to 00b. For Primary well GPIO pads, this register default to 01b<br>The hardware must ensure that when this field is programmed, the muxed reset signal does not glitch to cause momentarily reset assertion. |
| 29 | 0x0<br>RW | **RX Pad State Select (RXPADSTSEL):** Determines from which node the RX pad state for native function should be taken from. This field only affects the pad state value being fanned out to native function(s) and is not meaningful if the pad is in GPIO mode (i.e. Pad Mode = 0).<br>• 0 = Raw RX pad state directly from CFIO RX buffer<br>• 1 = Internal RX pad state (subject to RXINV and PreGfRXSel settings) |
| 28 | 0x0<br>RW | **RX Raw Override to '1' (RXRAW1):** This bit determines if the selected pad state is being overridden to '1'. This field only makes sense when the RX buffer is configured as an input in either GPIO Mode or native function mode. The override takes place at the internal pad state directly from buffer and before the RXINV.<br>• 0 = No Override<br>• 1 = RX drive 1 internally |
| 27 | 0x0<br>RO | **Reserved (RSVD_0):** Reserved. |
| 26:25 | 0x2<br>RW | **RX Level/Edge Configuration (RXEVCFG):** Determines if the internal RX pad state (synchronized, filtered vs non-filtered version as determined by PreGfRXSel, and is further subject to RXInv) should be passed on to the next logic stage as is, as a pulse, or level signal. This field does not affect the received pad state (to GPIORXState or native functions) but how the interrupt or wake triggering events should be delivered to the GPIO Community Controller.<br>• 0h = Level<br>• 1h = Edge<br>• 2h = Drive '0'<br>• 3h = Reserved (implement as setting 0h) |

As each Pad Mode may require different termination and isolation, care must be taken by software and BIOS in the transition with appropriate register programming. The actual transition sequence requirement may vary on case-by-case basis depending on the native functions involved. For example, before changing the pad from the output to input direction, the weak Pull-Up/Pull-Down settings should be programmed first to ensure the input does not float momentarily. |
| 9:8 | 0x0<br>RO | **Reserved**. |
| 7:0 | 0x23<br>RO | **Interrupt Select (INTSEL):** The Interrupt Select defines which interrupt line driven from the GPIO Controller toggles when an interrupt is detected on this pad.<br>• 0 = Interrupt Line 0<br>• 1 = Interrupt Line 1<br>Up to the max IOxAPIC IRQ supported by the SoC. |

## 65.2.56 Pad Configuration DW0 (PAD_CFG_DW0_GBE1_I2C_CLK)—Offset 460h

**Type:** Sideband Register
(Size: 32 bits)

**Sideband Port and Offset:** [Port: 0xC2] + 460h
**Host Memory Space:** SBREG_BAR + 0xC20000 + 460h

**Default:** 45000600h

| Bit Range | Default & Access | Field Name (ID): Description |
