DC-26.5 GHz Programmable 1,2,4,8 Binary Prescaler

Features

- Wide Operating Range: DC-26.5 GHz
- Low SSB Phase Noise: -153 dBc @ 10 kHz
- Large Output Swings: 750 mV ppk/ side
- Single-Ended and/or Differential Operation
- Low power consumption: 430 mW
- 4x4 ceramic leadless QFN package
- 3 Dividers-in-One with Pass Through
- DC-7 GHz Limit Amp

Description

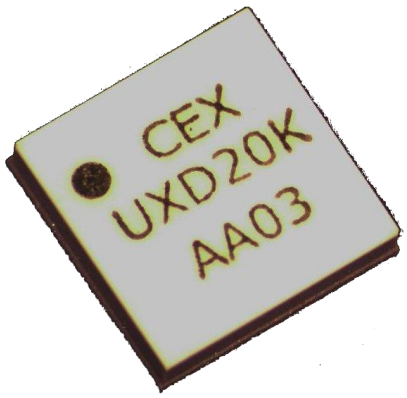
The UXD20K is a low noise DC to 26.5 GHz programmable prescaler featuring either divide by-1, divide-by-2, divide-by-4, or divide-by-8 division ratios. In the divide by 1 mode the UXD20K is also a limit amplifier. The device features differential inputs and outputs, adjustable output swing and high input sensitivity. The control inputs are CMOS and LVTTL compatible. The UXD20K is packaged in a 24 pin, 4 mm x 4 mm ceramic leadless surface mount package.

Application

The UXD20K can be used as a general purpose, fixed modulus prescaler in high frequency PLLs. The low phase noise of the divider makes it ideal for generating low jitter, synchronous clocks in telecom applications.

Pad Metallization

The QFN package pad metallization consists of a 500-1000 micro-inch Sn63 automated solder dip process.



Key Specifications (T = 25˚C):
Vee = -3.3 V, Iee = 130 mA, Zo=50 Ω

Parameter	Description	Min	Typ	Max
Fin (GHz)	Input Frequency	DC*	-	26.5
Pin (dBm)	Input Power	-10	0	10
Pout (dBm)	Output Power	-5	5	-
£ (dBc/Hz)	SSB Phase Noise @10 kHz Offset	-	-153	-
PDC (mW)	DC Power Dissipation	-	430	-
θjc (ºC/W)	Junction-Case Thermal Resistance	-	52	-

** Low frequency limit dependent on input edge speed*

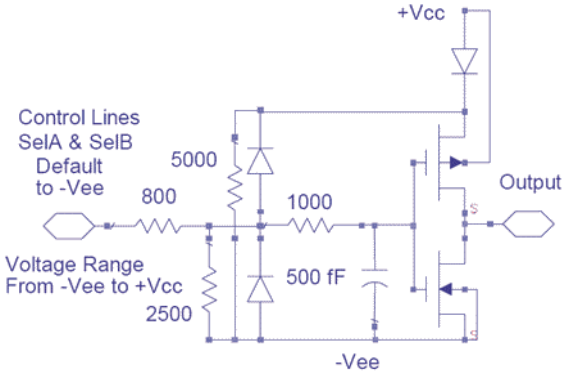
State	Bias Condition	Comment
Low (logic 0)	VEE @ 0 mA	Default condition (internally pulled low)
High (logic 1)	VCC @ 1 mA	

Simplified Control Logic Schematic



Application Notes

Divider Mode:

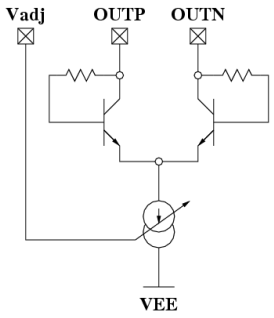
The UXD20K supports four division ratios controlled by two select lines which are compatible with CMOS/LVTTL signaling levels. Table 1 lists the four states for the given logic levels on the SelA and SelB select lines. For any of the four modes, circuitry which is not used is automatically powered down to reduce power consumption.

Divider Outputs:

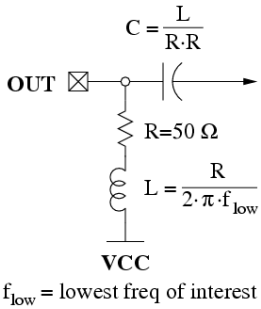
The equivalent circuit of the divider outputs is shown on the below. The outputs require a DC return path capable of handling ~35 mA per side. If DC coupling is employed, the DC resistance of the receiving circuits should be ~50 Ω (or less) to VCC to prevent excessive common mode voltage from saturating the prescaler outputs. If AC coupling is used, the perfect embodiment is shown in figure 2. The discrete R/L/C elements should be resonance free up to the maximum frequency of operation for broadband applications.

The output amplitude can be adjusted over a 1.5:1 range by one of the two methods The Vadj pin voltage can be set to VCC for maximum amplituded or VCC-1.3 V for an amplitude ~2/3 the max swing. Voltages between these two values will produce a linear change in output swing. Alternatively, users can use a 1k potentiometer or fixed resistor tied between Vadj and VCC. Resistor values approaching 0 ohms will lead to the maximum swing, while values approaching 1k will lead to the minimum output swing. Users who only need/want the maximum swing should simply tie Vadj to VCC.

Equivalent Circuit of Output Buffer



Recommended Circuit for AC Coupled Outputs



Low Frequency Operation:

Low frequency operation is limited by external bypass capacitors and the slew rate of the input clock. The next paragraph shows the calculations for the bypass capacitors. If DC coupled, the device operates down to DC for square-wave inputs. Sine-wave inputs are limited to ~50 MHz due to the 10 dBm max input power limitation.

The values of the coupling capacitors for the high-speed inputs and outputs (I/O's) are determined by the lowest frequency the IC will be operated at.

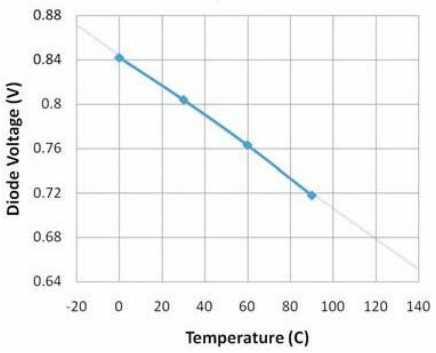
$$C >> \frac{1}{2 \cdot \pi \cdot 50\Omega \cdot f_{lowest}}$$

For example to use the device below 30 kHz, coupling capacitors should be larger than 0.1uF.

Temperature Diode:

An optional on chip temperature diode is provided for users interested in evaluating the IC's temperature. A single resistor to VCC establishes a nominal current thru the diode. The voltage developed across the temperature pin (pin 8) referenced to VEE (pin 9) can then be used to indicate the surface temperature of the IC. The plot below was obtained by forcing a fixed current of 120uA thru the diode for an unbiased device at multiple temperatures and fitting a line to the data to allow extrapolation over a range of temperatures.

Diode Voltage vs Temp



Diode Voltage vs Temp, 1d = 120 µA
T=(0.84-Vd)/0.00133

Package Heatsink:

The package backside provides the primary heat conduction path and should be attached to a good heatsink on the PC board to maximize performance. User PC boards should maximize the contact area to the package paddle and contain an array of vias to aid thermal conduction to either a backside heatsink or internal copper planes.

IC Assembly:

The device is designed to operate with either single-ended or differential inputs. Figures 4, 5 & 6 show the IC assembly diagrams for positive and negative supply voltages. In either case the supply should be capacitively bypassed to the ground to provide a good AC ground over the frequency range of interest. The backside of the chip should be connected to a good thermal heat sink.

All RF I/O's are connected to VCC through on-chip termination resistors. This implies that when VCC is not DC grounded (as in the case of positive supply), the RF I/O's should be AC coupled through series capacitors unless the connecting circuit can generate the correct levels through level shifting.

CML Logic Levels for DC Coupling (T = 25˚C):

Assuming 50 Ω Terminations at Inputs and Outputs

Parameter			Minimum	Typical	Maximum
Input	Differential	Logic $Input_{high}$	Vcc	Vcc	Vcc
		Logic $Input_{low}$	Vcc - 0.05 V	Vcc - 0.3 V	Vcc - 1 V
	Single	Logic $Input_{high}$	Vcc + 0.05 V	Vcc + 0.3 V	Vcc + 1 V
		Logic $Input_{low}$	Vcc - 0.05 V	Vcc - 0.3 V	Vcc - 1 V
Output	Differential & Single	Logic $Input_{high}$	Vcc - 0.9 V	Vcc – 0.6 V	Vcc – 0.5 V
		Logic $Input_{low}$	Vcc – 1.3 V	Vcc – 1.6 V	Vcc – 1.7 V

Differential vs. Single-Ended:

The UXD20K is fully differential to maximize signal-to-noise ratios for high-speed operation. High speed inputs are terminated to VCC with on-chip resistors (refer to functional block diagram for specific resistor values). The maximum DC voltage on any terminal must be limited to V max to prevent damaging the termination resistors with excessive current. Regardless of bias conditions, the following equation should be satisfied when driving the inputs differentially:

$$| V_{dm}/2 + V_{cm} | < V_{cc} \geq V_{max}$$

where Vdm is the differential input signal and Vcm is the common-mode voltage.

In addition to the maximum input signal levels, single-ended operation imposes additional restrictions: the average DC value of the waveform at IC should be equal to VCC for single-ended operation. In practice, this is easily achieved with a single capacitor on the input acting as a DC block. The value of the capacitor should be large enough to pass the lowest frequencies of interest. Use the positive terminals for single-ended operation while terminating the negative terminal to VCC.

Note that a potential oscillation mechanism exists if both inputs are static and have identical DC voltages; a small DC offset on either input is sufficient to prevent possible oscillations. Tying unused inputs directly to VCC shorts out the internal 50 Ω bias resistor, imposing a DC offset sufficient to prevent oscillations. Driving the differential inputs with DC blocks, or driving the single-ended inputs without terminating unused inputs, is not recommended without taking additional steps to eliminate the potential oscillation issues.

Microsemi Corporation (Nasdaq: MSCC) offers a comprehensive portfolio of semiconductor and system solutions for communications, defense and security, aerospace, and industrial markets. Products include high-performance and radiation-hardened analog mixed-signal integrated circuits, FPGAs, SoCs, and ASICs; power management products; timing and synchronization devices and precise time solutions, setting the world's standard for time; voice processing devices; RF solutions; discrete components; security technologies and scalable anti-tamper products; Power-over-Ethernet ICs and midspans; as well as custom design capabilities and services. Microsemi is headquartered in Aliso Viejo, Calif. and has approximately 3,400 employees globally. Learn more at **www.microsemi.com**.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits,General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
