

NBSG16M

2.5 V/3.3 V Multilevel Input to CML Clock/Data Receiver/Driver/Translator Buffer

Description

The NBSG16M is a differential current mode logic (CML) receiver/driver/translator buffer. The device is functionally equivalent to the EP16, LVEP16, or SG16 devices with CML output structure and lower EMI capabilities.

Inputs incorporate internal 50 Ω termination resistors and accept LVNECL (Negative ECL), LVPECL (Positive ECL), LVTTTL, LVCMOS, CML, or LVDS. The CML output structure contains internal 50 Ω source termination resistor to V_{CC} . The device generates 400 mV output amplitude with 50 Ω receiver resistor to V_{CC} .

The V_{BB} pin is internally generated voltage supply available to this device only. For all single-ended input conditions, the unused complementary differential input is connected to V_{BB} as a switching reference voltage. V_{BB} may also rebias AC coupled inputs. When used, decouple V_{BB} via a 0.01 μ F capacitor and limit current sourcing or sinking to 0.5 mA. When not used, V_{BB} output should be left open.
