MAXIM

Quad, 12-Bit, Low-Power, 2-Wire, Serial Voltage-Output DAC

General Description

The MAX5842 is a quad, 12-bit voltage-output, digital-to-analog converter (DAC) with an I²C™-compatible, 2-wire interface that operates at clock rates up to 400kHz. The device operates from a single 2.7V to 5.5V supply and draws only 230µA at V_{DD} = 3.6V. A power-down mode decreases current consumption to less than 1µA. The MAX5842 features three software-selectable power-down output impedances: 100kΩ, 1kΩ, and high impedance. Other features include internal precision Rail-to-Rail® output buffers and a power-on reset (POR) circuit that powers up the DAC in the 100kΩ power-down mode.

The MAX5842 features a double-buffered I²C-compatible serial interface that allows multiple devices to share a single bus. All logic inputs are CMOS-logic compatible and buffered with Schmitt triggers, allowing direct interfacing to optocoupled and transformer-isolated interfaces. The MAX5842 minimizes digital noise feedthrough by disconnecting the clock (SCL) signal from the rest of the device when an address mismatch is detected.

The MAX5842 is specified over the extended temperature range of -40°C to +85°C and is available in a miniature 10-pin µMAX package. Refer to the MAX5841 data sheet for the 10-bit version.

Applications

Digital Gain and Offset Adjustments

Programmable Voltage and Current Sources

Programmable Attenuation

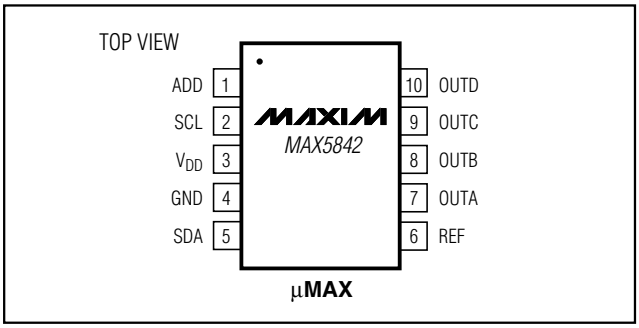
VCO/Varactor Diode Control

Low-Cost Instrumentation

Battery-Powered Equipment

ATE

Pin Configuration



Rail-to-Rail is a registered trademark of Nippon Motorola, Ltd.
I²C is a trademark of Philips Corp.

Features

- **Ultra-Low Supply Current**
  230µA at V_{DD} = 3.6V
  280µA at V_{DD} = 5.5V
- **300nA Low-Power Power-Down Mode**
- **Single 2.7V to 5.5V Supply Voltage**
- **Fast 400kHz I²C-Compatible 2-Wire Serial Interface**
- **Schmitt-Trigger Inputs for Direct Interfacing to Optocouplers**
- **Rail-to-Rail Output Buffer Amplifiers**
- **Three Software-Selectable Power-Down Output Impedances**
  100kΩ, 1kΩ, and High Impedance
- **Read-Back Mode for Bus and Data Checking**
- **Power-On Reset to Zero**
- **10-Pin µMAX Package**

Ordering Information

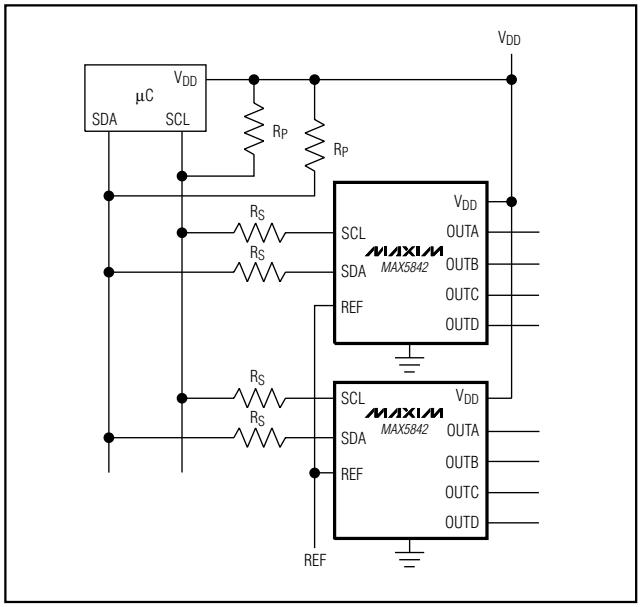
MAX5842MEUB	-40°C to +85°C	10 µMAX	1011 10X

Typical Operating Circuit



Quad, 12-Bit, Low-Power, 2-Wire, Serial Voltage-Output DAC

ABSOLUTE MAXIMUM RATINGS

V_{DD}, SCL, SDA to GND .....-0.3V to +6V
OUT_, REF, ADD to GND.....-0.3V to V_{DD} + 0.3V
Maximum Current into Any Pin.....50mA
Continuous Power Dissipation (T_A = +70°C)
10-Pin µMAX (derate 5.6mW above +70°C) 444mW
Operating Temperature Range .....-40°C to +85°C
Storage Temperature Range .....-65°C to +150°C
Maximum Junction Temperature .....+150°C
Lead Temperature (soldering, 10s) .....+300°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

(V_{DD} = +2.7V to +5.5V, GND = 0, V_{REF} = V_{DD}, R_L = 5kΩ, C_L = 200pF, T_A = T_{MIN} to T_{MAX}, unless otherwise noted. Typical values are at V_{DD} = +5V, T_A = +25°C.) (Note 1)

Pin Description

PIN	NAME	FUNCTION
1	ADD	Address Select. A logic high sets the address LSB to 1; a logic low sets the address LSB to zero.
2	SCL	Serial Clock Input
3	V_{DD}	Power Supply
4	GND	Ground
5	SDA	Bidirectional Serial Data Interface
6	REF	Reference Input
7	OUTA	DAC A Output
8	OUTB	DAC B Output
9	OUTC	DAC C Output
10	OUTD	DAC D Output

Detailed Description

The MAX5842 is a quad, 12-bit, voltage-output DAC with an I²C/SMBus-compatible 2-wire interface. The device consists of a serial interface, power-down circuitry, four input and DAC registers, four 12-bit resistor string DACs, four unity-gain output buffers, and output resistor networks. The serial interface decodes the address and control bits, routing the data to the proper input or DAC register. Data can be directly written to the DAC register, immediately updating the device output, or can be written to the input register without changing the DAC output. Both registers retain data as long as the device is powered.

DAC Operation

The MAX5842 uses a segmented resistor string DAC architecture, which saves power in the overall system and guarantees output monotonicity. The MAX5842's input coding is straight binary, with the output voltage given by the following equation:

$$V_{OUT-} = \frac{V_{REF} \times (D)}{2^N}$$

where N = 12 (bits), and D = the decimal value of the input code (0 to 4095).

Output Buffer

The MAX5842 analog outputs are buffered by precision, unity-gain followers that slew 0.5V/µs. Each buffer output swings rail-to-rail, and is capable of driving 5kΩ in parallel with 200pF. The output settles to ±0.5LSB within 4µs.

Power-On Reset

The MAX5842 features an internal POR circuit that initializes the device upon power-up. The DAC registers are set to zero scale and the device is powered down, with the output buffers disabled and the outputs pulled to GND through the 100kΩ termination resistor. Following power-up, a wake-up command must be initiated before any conversions are performed.

Power-Down Modes

The MAX5842 has three software-controlled, low-power, power-down modes. All three modes disable the output buffers and disconnect the DAC resistor strings from REF, reducing supply current draw to 1µA and the reference current draw to less than 1µA. In power-down mode 0, the device output is high impedance. In power-down mode 1, the device output is internally pulled to GND by a 1kΩ termination resistor. In power-down mode 2, the device output is internally pulled to GND by a 100kΩ termination resistor. Table 1 shows the power-down mode command words.

Upon wake-up, the DAC output is restored to its previous value. Data is retained in the input and DAC registers during power-down mode.

Digital Interface

The MAX5842 features an I²C/SMBus-compatible 2-wire interface consisting of a serial data line (SDA) and a serial clock line (SCL). The MAX5842 is SMBus compatible within the range of V_{DD} = 2.7V to 3.6V. SDA and SCL facilitate bidirectional communication between the MAX5842 and the master at rates up to 400kHz. Figure 1 shows the 2-wire interface timing diagram. The MAX5842 is a transmit/receive slave-only device, relying upon a master to generate a clock signal. The master (typically a microcontroller) initiates data transfer on the bus and generates SCL to permit that transfer.

A master device communicates to the MAX5842 by transmitting the proper address followed by command and/or data words. Each transmit sequence is framed

Table 1. Power-Down Command Bits

POWER-DOWN COMMAND BITS		MODE/FUNCTION
PD1	PD0

0	1	Power-down mode 0. Power down device with output floating.
1	0	Power-down mode 1. Power down device with output terminated with 1kΩ to GND.
1	1	Power-down mode 2. Power down device with output terminated with 100kΩ to GND.

by a START (S) or REPEATED START (S_r) condition and a STOP (P) condition. Each word transmitted over the bus is 8 bits long and is always followed by an acknowledge clock pulse.

The MAX5842 SDA and SCL drivers are open-drain outputs, requiring a pullup resistor to generate a logic high voltage (see *Typical Operating Circuit)*. Series resistors R_S are optional. These series resistors protect the input stages of the MAX5842 from high-voltage spikes on the bus lines, and minimize crosstalk and undershoot of the bus signals.

Bit Transfer

One data bit is transferred during each SCL clock cycle. The data on SDA must remain stable during the high period of the SCL clock pulse. Changes in SDA while SCL is high are control signals (see *START and STOP Conditions)*. Both SDA and SCL idle high when the I²C bus is not busy.

START and STOP Conditions

When the serial interface is inactive, SDA and SCL idle high. A master device initiates communication by issuing a START condition. A START condition is a high-to-low transition on SDA with SCL high. A STOP condition is a low-to-high transition on SDA, while SCL is high (Figure 2). A START condition from the master signals the beginning of a transmission to the MAX5842. The master terminates transmission by issuing a not acknowledge followed by a STOP condition (see *Acknowledge Bit (ACK*)). The STOP condition frees the bus. If a repeated START condition (Sr) is generated instead of a STOP condition, the bus remains active. When a STOP condition or incorrect address is detected, the MAX5842 internally disconnects SCL from the serial interface until the next START condition, minimizing digital noise and feedthrough.

Early STOP Conditions

The MAX5842 recognizes a STOP condition at any point during transmission except if a STOP condition occurs in the same high pulse as a START condition (Figure 3). This condition is not a legal I²C format; at least one clock pulse must separate any START and STOP conditions.

Repeated START Conditions

A REPEATED START (S_r) condition may indicate a change of data direction on the bus. Such a change occurs when a command word is required to initiate a read operation. S_r may also be used when the bus master is writing to several I²C devices and does not want to relinquish control of the bus. The MAX5842 serial interface supports continuous write operations with or without an S_r condition separating them. Continuous

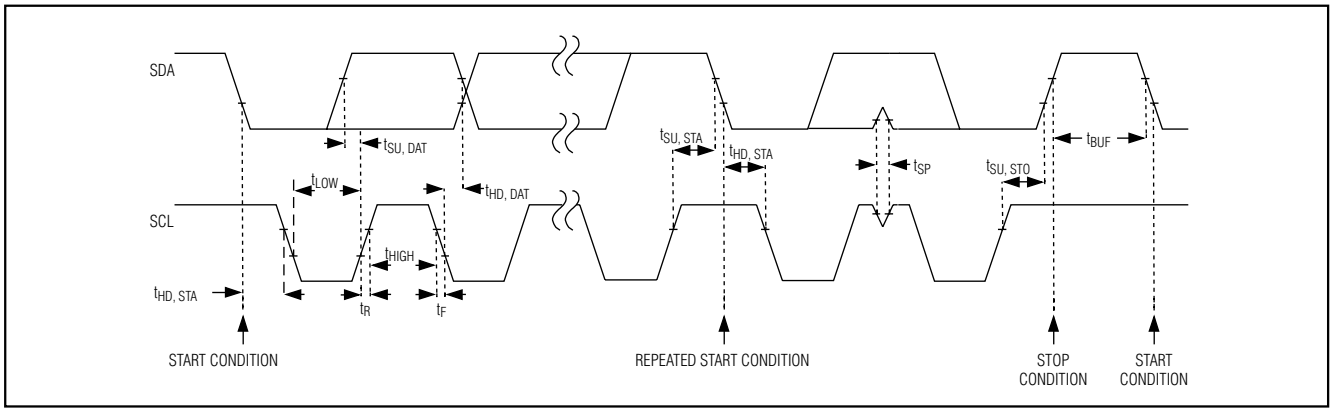

Figure 1. 2-Wire Serial Interface Timing Diagram

Quad, 12-Bit, Low-Power, 2-Wire, Serial Voltage-Output DAC

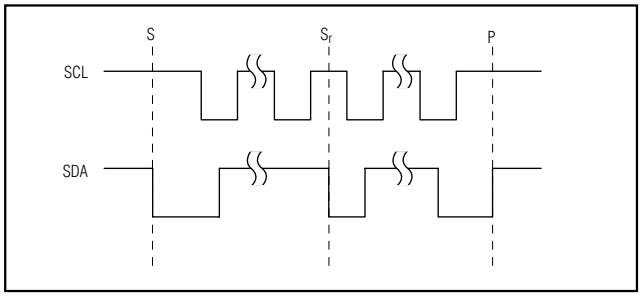

Figure 2. START and STOP Conditions

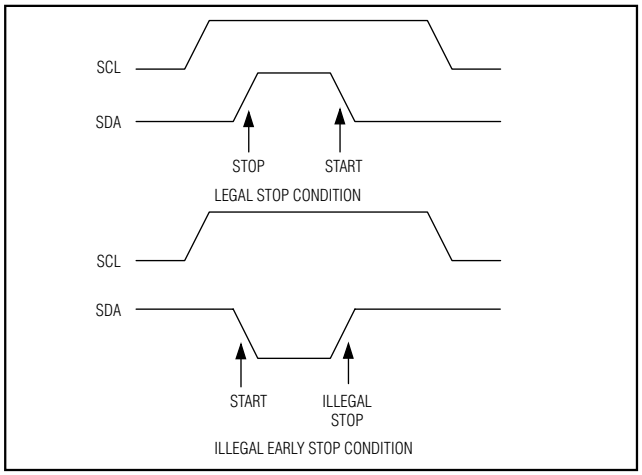

Figure 3. Early STOP Conditions

read operations require S_r conditions because of the change in direction of data flow.

Acknowledge Bit (ACK)

The acknowledge bit (ACK) is the ninth bit attached to any 8-bit data word. ACK is always generated by the receiving device. The MAX5842 generates an ACK when receiving an address or data by pulling SDA low during the ninth clock period. When transmitting data, the MAX5842 waits for the receiving device to generate an ACK. Monitoring ACK allows for detection of unsuccessful data transfers. An unsuccessful data transfer occurs if a receiving device is busy or if a system fault has occurred. In the event of an unsuccessful data transfer, the bus master should reattempt communication at a later time.

Slave Address

A bus master initiates communication with a slave device by issuing a START condition followed by the 7-bit slave address (Figure 4). When idle, the MAX5842 waits for a START condition followed by its slave address. The serial interface compares each address value bit by bit, allowing the interface to power down immediately if an incorrect address is detected. The LSB of the address word is the Read/$\overline{\text{Write}}$ (R/$\overline{W}$) bit. R/$\overline{W}$ indicates whether the master is writing to or reading from the MAX5842 (R/$\overline{W}$ = 0 selects the write condition, R/$\overline{W}$ = 1 selects the read condition). After receiving the proper address, the MAX5842 issues an ACK by pulling SDA low for one clock cycle.

The MAX5842 has four different factory/user-programmed addresses (Table 2). Address bits A6 through A1 are preset, while A0 is controlled by ADD. Connecting ADD to GND sets A0 = 0. Connecting ADD to V_{DD} sets A0 = 1. This feature allows up to four MAX5842s to share the same bus.

Table 2. MAX5842 I²C Slave Addresses

PART	V_{ADD}	DEVICE ADDRESS (A6...A0)
MAX5842L	GND	0111 100
MAX5842L	V_{DD}	0111 101
MAX5842M	GND	1011 100
MAX5842M	V_{DD}	1011 101

Write Data Format

In write mode (R/$\overline{W}$ = 0), data that follows the address byte controls the MAX5842 (Figure 5). Bits C3-C0 configure the MAX5842 (Table 3). Bits D11-D0 are DAC data. Input and DAC registers update on the falling edge of SCL during the acknowledge bit. Should the write cycle be prematurely aborted, data is not updated and the write cycle must be repeated. Figure 6 shows two example write data sequences.

Extended Command Mode

The MAX5842 features an extended command mode that is accessed by setting C3-C0 = 1 and D11-D8 = 0. The next data byte writes to the shutdown registers (Figure 7). Setting bits A, B, C, or D to 1 sets that DAC

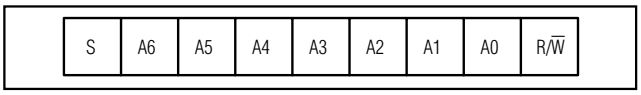

Figure 4. Slave Address Byte Definition

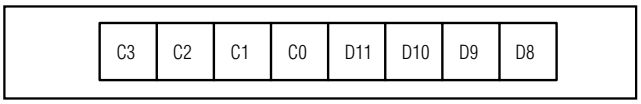

Figure 5. Command Byte Definition

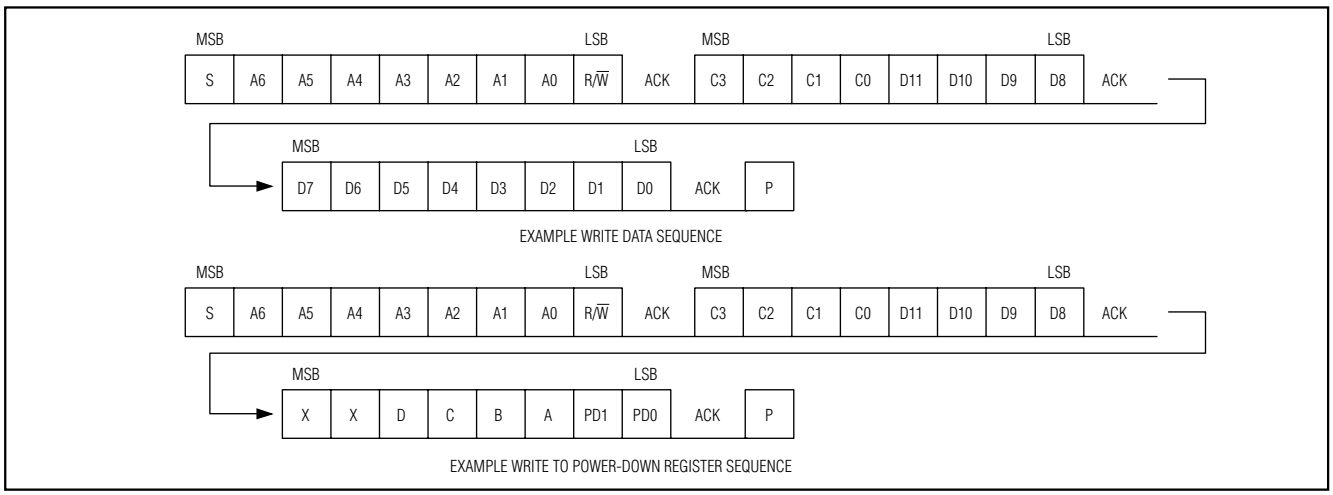

Figure 6. Example Write Command Sequences

to the selected power-down mode based on the states of PD0 and PD1 (Table 1). Any combination of the four DACs can be controlled with a single write sequence.

Read Data Format

In read mode (R/$\overline{W}$ = 1), the MAX5842 writes the contents of the DAC register to the bus. The direction of data flow reverses following the address acknowledge by the MAX5842. The device transmits the first byte of data, waits for the master to acknowledge, then transmits the second byte. Figure 8 shows an example read data sequence.

I²C Compatibility

The MAX5842 is compatible with existing I²C systems. SCL and SDA are high-impedance inputs; SDA has an open drain that pulls the data line low during the ninth clock pulse. The *Typical Operating Circuit* shows a typical I²C application. The communication protocol supports the standard I²C 8-bit communications. The general call address is ignored. The MAX5842 address is compatible with the 7-bit I²C addressing protocol only. No 10-bit address formats are supported.

Digital Feedthrough Suppression

When the MAX5842 detects an address mismatch, the serial interface disconnects the SCL signal from the core circuitry. This minimizes digital feedthrough caused by the SCL signal on a static output. The serial interface reconnects the SCL signal once a valid START condition is detected.

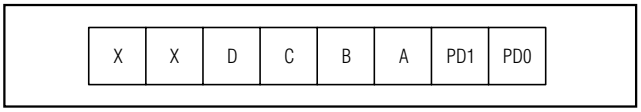

Figure 7. Extended Command Byte Definition

Applications Information

Digital Inputs and Interface Logic

The MAX5842 2-wire digital interface is I²C/SMBus compatible. The two digital inputs (SCL and SDA) load the digital input serially into the DAC. Schmitt-trigger buffered inputs allow slow-transition interfaces such as optocouplers to interface directly to the device. The digital inputs are compatible with CMOS logic levels.

Power-Supply Bypassing and Ground Management

Careful PC board layout is important for optimal system performance. Keep analog and digital signals separate to reduce noise injection and digital feedthrough. Use a ground plane to ensure that the ground return from GND to the power-supply ground is short and low impedance. Bypass V_{DD} with a 0.1µF capacitor to ground as close to the device as possible.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits,General Dynamics и др.);
