

AS1716 Capacitive Sensor Interface

1 General Description

AS1716 is an analog front end specifically designed for unbiased Capacitive Sensors, as for instance Knock Sensors in Automotive, to be interfaced with Analog Digital Converters with Sample and Hold input stages.

The device provides differential inputs, a 1st order low pass filter to cutoff the high frequency noise components, differential to single ended conversion, programmable gain stage and a 2 pole low pass Multiple Feedback Filter.

The Knock Sensor is a Piezo Electric device that generates a voltage if it is stressed. It senses knock and transmits information to the electronic engine management control unit. This influences process control in the engine, for example timing and fuel injection until knock is eliminated.

The capacitive sensor is biased via resistors to a voltage level of $V_{DDA}/2$.

2 Key Features

- Differential input stage with wide input range
- Resistive sensor biasing ($V_{DDA}/2$)
- Programmable Gain ($\times 0.5$, $\times 1$, $\times 2$, $\times 4$)
- Internal 2nd order low pass Multiple Feedback Filter with a min. cut off frequency of 16kHz
- Single supply operation: 4.5V to 5.5V
- Operating Temperature range: -40°C to +125°C
- High CMRR: 55dB (min)
- EMC characterized by IEC 61967-4 (1 Ω / 150 Ω Method)
- EMC characterized by IEC 62132-4 (Direct Power Injection)
- Automotive qualified to AECQ100 for IC and PPAP level 3
- 8-pin SOIC Package

3 Applications

Analog front end for Capacitive Sensors to Analog to Digital Converters and DSP.

Figure 1. AS1716 - Block Diagram

Pin Assignment

Figure 2. Pin Assignments (Top View)

Pin Description

Table 1. Pin Description

Pin Name	Pin Number	Description
VDDA	1	Positive Supply
GA	2	Gain selection. Internal pull-down of 100k Ω
GB	3	Gain selection. Internal pull-down of 100k Ω
INP	4	Non-Inverting Input
INN	5	Inverting Input
NC	6	Not Connected. Must be left unconnected in the application
VSSA	7	Negative Supply
OUT	8	Signal Output

5 Absolute Maximum Ratings

Stresses beyond those listed in [Table 2](#) may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in [Electrical Characteristics on page 4](#) is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Table 2. Absolute Maximum Ratings

Parameter	Min	Max	Units	Comments
Electrical Parameters				
VDDA, VSSA		+7	V	
GA, GB, OUT, INP, INN, NC	VSSA - 0.3	VDDA + 0.3	V	To get an overvoltage protection of up to +16V at the system level, apply external resistors (typ. 1k Ω) on the pins INP and INN.
Input Current (latch-up immunity)	-100	+100	mA	Norm: AEC-Q100-004, @ T _A = +25°C
Electrostatic Discharge				
Electrostatic Discharge HBM		± 4	kV	Norm: AEC-Q100-002, @ T _A = +25°C
Temperature Ranges and Storage Conditions				
Storage Temperature Range	-65	+150	°C	
Junction Temperature		+150	°C	
Package Body Temperature		+260	°C	The reflow peak soldering temperature (body temperature) specified is in accordance with IPC/JEDEC J-STD-020 "Moisture/Reflow Sensitivity Classification for Non-Hermetic Solid State Surface Mount Devices". The lead finish for Pb-free leaded packages is matte tin (100% Sn).
Humidity non-condensing	5	85	%	
Moisture Sensitive Level		3		Represents a max. floor life time of 168h

6 Electrical Characteristics

Parameters are measured at $V_{DDA} = 4.5V$ to $5.5V$, $R_{LOAD} = 100\Omega$ serial to $C_{LOAD} = 10nF$, $T_A = +25^\circ C$ and are referring to V_{SSA} , unless otherwise specified. Typical values are listed for reference only and will not be tested.

All limits are guaranteed. The parameters with min and max values are guaranteed with production tests or SQC (Statistical Quality Control) methods.

Table 3. Electrical Characteristics

Symbol	Parameter	Condition	Min	Typ	Max	Unit
TAMB	Operating Temperature Range		-45		+125	°C
DC Electrical Characteristics						
VDDA	Supply Voltage Range	@ pin VDDA	4.5	5	5.5	V
IDD A	Supply Current	@ pin VDDA	3	4.5	9	mA
PSRR ¹	Power Supply Rejection Ratio				6	dB
VCM	Common Mode input Range	@ pins INN, INP	VSSA		VDDA	V
CMRR	Common Mode Rejection Ratio		55			dB
RIN	Differential Input Resistance	between pins INN and INP	70	100	130	kΩ
VREF	Internal Common Mode Input Voltage	INP shorted to INN	$V_{DDA}/2 - 2\%$	$V_{DDA}/2$	$V_{DDA}/2 + 2\%$	V
VOFF	Offset Voltage	Gain1, $V_{INP} = V_{INN}$ @ $V_{CM} = V_{DDA}/2$, @ pin OUT	$V_{REF} - 10$		$V_{REF} + 10$	mV
VIL	Logic Low (GA, GB)	@ pin GA and GB			1.2	V
VIH	Logic High (GA, GB)	@ pin GA and GB	2.0			V
I _{LEAK}	Leakage Current (GA, GB)	$V_{DDA} = 5V$, Gain4		1		μA
VHYS ¹	Hysteresis	@ pin GA and GB	100	200		mV
RPD	Pull-Down Resistor	@ pin GA and GB	50	100	150	kΩ
Gain0.5	Overall gain 0.5	GA = GB = 1	0.5-10%	0.5	0.5+10%	
Gain1	Overall gain 1	GA = 1, GB = 0	1-10%	1	1+10%	
Gain2	Overall gain 2	GA = 0, GB = 1	2-5%	2	2+5%	
Gain4	Overall gain 4	GA = GB = 0, default setting	4-5%	4	4+5%	
RL	External Serial Resistor	RL serial to CL (see Figure 13 on page 8)	100		1k	Ω
CL	External Capacitive Load		0.01		10	nF
ISHORT+	Positive Short Circuit Current	VOUT is driven to VDDA and VOUT is connected to VSSA		25		mA
ISHORT-	Negative Short Circuit Current	VOUT is driven to VSSA and VOUT is connected to VDDA		25		mA
VOUT-L	Output Range Low	@ pin VOUT		$V_{SSA} + 0.05$		V
VOUT-H	Output Range High	@ pin VOUT		$V_{DDA} - 0.05$		V
AC Electrical Characteristics						
fc	Filter Cut-off Frequency	$V_{DDA} = 4.5V$, GA = GB = 0, INP-INN = $1V_{PP}$, $f_{IN} = 16kHz$ and $29kHz$	16	23	29	kHz
THD	Total Harmonic Distortion	$V_{DDA} = 5V$, $f_{IN} = 1kHz$, INP-INN = $8V_{PP}$, Gain0.5		80		dB
VNOISE	RMS noise at OUT	Gain4, $f_c = 50Hz - 23kHz$			1	mV _{RMS}

8 Detailed Description

Sensor Biasing and Input Protection Resistors

Due to the capacitive and differential nature of the knock sensor, the common mode voltage for the sensor must be set. This is ensured by the first amplifier, whose virtual ground is biasing the sensor via a of $50\text{k}\Omega$ resistor. Due to a failure, voltages up to 16V can occur on the input pins. In this case two external serial resistors of $1\text{k}\Omega$ must be applied at the inputs. These resistors are limiting the current, when the on chip protection diode opens.

Figure 9. Sensor Biasing

Inverting Input Structure

The Input Structure is a first order low-pass filter and fulfills two main functions. First, it is used for biasing the sensor and second, the first order low-pass filter characteristic is used for noise suppression.

Figure 10. Input Buffer

Fully Differential to Single Ended Conversion

The Subtractor block converts the filtered differential sensor signal into a single ended signal. Further this block provides also the gain setting (see Section Gain Settings).

Figure 11. Subtractor Block

Gain Settings

By means of pins GA and GB, 4 gain settings (x0.5, x1, x2, x4) can be realized.

The default gain setting is 4, GA=0 and GB=0.

Table 4. Gain Settings

Gain	GA	GB
0.5	1	1
1	1	0
2	0	1
4	0	0

Multiple Feedback Filter

The Multiple Feedback Filter provides a second order low pass characteristics with a minimum cut-off frequency of 16kHz and a typical f_c of 23kHz. The Multiple Feedback configuration is used to avoid aliasing, to filter out high frequency components. The Output is able to drive a resistor from 100Ω to 1kΩ serial to a 10nF capacitor.

Figure 12. Multiple Feedback Filter

9 Application Information

Figure 13. Application Diagram, minimal requirements

Values of the suggested external components are indicative and need to be characterized for each specific application.

Typical Piezo Sensor:

- Resistor from 500kΩ to 1MΩ
- Capacity from 900nF to 1.5µF

Typical wire equivalent circuit:

- Capacity to ground from 100pF to 400pF / meter
- Capacity between wires strongly depends on type of wires (twisted-pair strongly suggested)
- Resistance is typical 50mΩ / meter @ 20°C

Layout rules

- Input Resistors and Capacitors at the inputs should be placed as close as possible to the stronger possible source of disturbances (i.e. the input connector).
- The input lines should be kept as short as possible and routed close to each other.
- The filter capacitor (100nF) on supply should be a ceramic type and placed as close as possible to the chip.
- VSSA and VDDA lines on PCB should have larger width than other signals to minimize resistance, especially if the 10µF capacitor is not very close to the chip.
- The output line should be kept as short as possible.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
