### Calculating Maximum Frequency

Based on the rise and fall time data given in Table 1 through 5, the maximum frequency the oscillator can operate with a guaranteed full swing of the output voltage over temperature is calculated as follows:

$$Max. Frequency = \frac{1}{5 \times T_{r/f}}$$

Example:

Calculate F<sub>max</sub> of a 1MHz ~ 110MHz device with the following condition:

- V<sub>dd</sub> = 1.8V (Table 1)
- Capacitive Load = 30pF
- Desired T<sub>r/f</sub> Time: = 3ns (rise/fall time option code “E”)

The F<sub>max</sub> is 66.66666MHz.

Pin	Name		Functionality
1	OE/ $\overline{ST}$	Output Enable	H or Open <sup>(4)</sup> : specified frequency output L: output is high impedance. Only output driver is disabled
		Standby	H or Open <sup>(4)</sup> : specified frequency output L: output is low (weak pull down). Device goes to sleep mode. Supply current reduces to $I_{std}$ .
		No Connect	Any voltage between 0 and $V_{dd}$ or Open <sup>(4)</sup> : specified frequency output. Pin 1 has no function.
2	GND	Power	Electrical ground <sup>(5)</sup>
3	Out	Output	Oscillator clock output
4	$V_{dd}$	Power	Power supply voltage <sup>(5)</sup>

- Notes: 4. In OE or  $\overline{ST}$  mode, a pull-up resistor of 10k $\Omega$  or less between OE/ $\overline{ST}$  pin and  $V_{dd}$  is recommended if pin 1 is not externally driven. If pin 1 needs to be left floating, use the NC option.  
5. A capacitor value of 0.1 $\mu$ F or higher between  $V_{dd}$  and GND is required.
