

S9S08RN16DS

S9S08RN16 Series Data Sheet

Supports: S9S08RN16 and S9S08RN8

Key features

- 8-Bit S08 central processor unit (CPU)
 - Up to 20 MHz bus at 2.7 V to 5.5 V across temperature range of -40 °C to 125 °C
 - Supporting up to 40 interrupt/reset sources
 - Supporting up to four-level nested interrupt
 - On-chip memory
 - Up to 16 KB flash read/program/erase over full operating voltage and temperature
 - Up to 256 byte EEPROM with ECC; 2-byte erase sector; EEPROM program and erase while executing code from flash
 - Up to 2048 byte random-access memory (RAM)
 - Flash and RAM access protection
- Power-saving modes
 - One low-power stop mode; reduced power wait mode
 - Peripheral clock enable register can disable clocks to unused modules, reducing currents; allows clocks to remain enabled to specific peripherals in stop3 mode
- Clocks
 - Oscillator (XOSC) - loop-controlled Pierce oscillator; crystal or ceramic resonator
 - Internal clock source (ICS) - containing a frequency-locked-loop (FLL) controlled by internal or external reference; precision trimming of internal reference allowing 1% deviation across temperature range of 0 °C to 70 °C and -40 °C to 85 °C, 1.5% deviation across temperature range of -40 °C to 105 °C, and 2% deviation across temperature range of -40 °C to 125 °C; up to 20 MHz
- System protection
 - Watchdog with independent clock source
 - Low-voltage detection with reset or interrupt; selectable trip points
 - Illegal opcode detection with reset
 - Illegal address detection with reset
- Development support
 - Single-wire background debug interface
 - Breakpoint capability to allow three breakpoints setting during in-circuit debugging
 - On-chip in-circuit emulator (ICE) debug module containing two comparators and nine trigger modes

Freescale reserves the right to change the detail specifications as may be required to permit improvements in the design of its products.

- Peripherals
 - ACMP - one analog comparator with both positive and negative inputs; separately selectable interrupt on rising and falling comparator output; filtering
 - ADC - 12-channel, 12-bit resolution for 48-, 32-pin packages; 10-channel, 10-bit resolution for 20-pin package; 8-channel, 10-bit for 16-pin package; 2.5 μ s conversion time; data buffers with optional watermark; automatic compare function; internal bandgap reference channel; operation in stop mode; optional hardware trigger
 - CRC - programmable cyclic redundancy check module
 - FTM - two flex timer modulators modules including one 6-channel and one 2-channel ones; 16-bit counter; each channel can be configured for input capture, output compare, edge- or center-aligned PWM mode
 - IIC - One inter-integrated circuit module; up to 400 kbps; multi-master operation; programmable slave address; supporting broadcast mode and 10-bit addressing
 - MTIM - One modulo timer with 8-bit prescaler and overflow interrupt
 - RTC - 16-bit real time counter (RTC)
 - SCI - two serial communication interface (SCI/UART) modules optional 13-bit break; full duplex non-return to zero (NRZ); LIN extension support
 - SPI - one 8-bit serial peripheral interface (SPI) modules; full-duplex or single-wire bidirectional; master or slave mode
 - TSI - supporting up to 16 external electrodes; configurable software or hardware scan trigger; fully support freescale touch sensing software library; capability to wake MCU from stop3 mode
- Input/Output
 - Up to 35 GPIOs including one output-only pin
 - One 8-bit keyboard interrupt module (KBI)
 - Two true open-drain output pins
 - Four, ultra-high current sink pins supporting 20 mA source/sink current
- Package options
 - 48-pin LQFP
 - 32-pin LQFP
 - 20-pin TSSOP
 - 16-pin TSSOP

1 Ordering parts

1.1 Determining valid orderable parts

Valid orderable part numbers are provided on the web. To determine the orderable part numbers for this device, go to freescale.com and perform a part number search for the following device numbers: RN16 and RN8.

2 Part identification

2.1 Description

Part numbers for the chip have fields that identify the specific part. You can use the values of these fields to determine the specific part you have received.

2.2 Format

Part numbers for this device have the following format:

S 9 S08 RN AA F1 B CC

2.3 Fields

This table lists the possible values for each field in the part number (not all combinations are valid):

| Field | Description | Values |
|-------|------------------------------|--|
| S | Qualification status | <ul style="list-style-type: none"> S = fully qualified, general market flow |
| 9 | Memory | <ul style="list-style-type: none"> 9 = flash based |
| S08 | Core | <ul style="list-style-type: none"> S08 = 8-bit CPU |
| RN | Device family | <ul style="list-style-type: none"> RN |
| AA | Approximate flash size in KB | <ul style="list-style-type: none"> 16 = 16 KB 8 = 8 KB |
| F1 | Fab and mask set identifier | <ul style="list-style-type: none"> W2 |
| B | Temperature range (°C) | <ul style="list-style-type: none"> M = -40 to 125 |
| CC | Package designator | <ul style="list-style-type: none"> LF = 48-LQFP |

| Field | Description | Values |
|-------|-------------|--|
| | | <ul style="list-style-type: none"> • LC = 32-LQFP • TJ = 20-TSSOP • TG = 16-TSSOP |

2.4 Example

This is an example part number:

S9S08RN16W2MLF

3 Parameter Classification

The electrical parameters shown in this supplement are guaranteed by various methods. To give the customer a better understanding, the following classification is used and the parameters are tagged accordingly in the tables where appropriate:

Table 1. Parameter Classifications

| | |
|---|--|
| P | Those parameters are guaranteed during production testing on each individual device. |
| C | Those parameters are achieved by the design characterization by measuring a statistically relevant sample size across process variations. |
| T | Those parameters are achieved by design characterization on a small sample size from typical devices under typical conditions unless otherwise noted. All values shown in the typical column are within this category. |
| D | Those parameters are derived mainly from simulations. |

NOTE

The classification is shown in the column labeled “C” in the parameter tables where appropriate.

4 Ratings

4.1 Thermal handling ratings

| Symbol | Description | Min. | Max. | Unit | Notes |
|------------------|-------------------------------|------|------|------|-------|
| T _{STG} | Storage temperature | -55 | 150 | °C | 1 |
| T _{SDR} | Solder temperature, lead-free | — | 260 | °C | 2 |

1. Determined according to JEDEC Standard JESD22-A103, *High Temperature Storage Life*.

- Determined according to IPC/JEDEC Standard J-STD-020, *Moisture/Reflow Sensitivity Classification for Nonhermetic Solid State Surface Mount Devices*.

4.2 Moisture handling ratings

| Symbol | Description | Min. | Max. | Unit | Notes |
|--------|----------------------------|------|------|------|-------|
| MSL | Moisture sensitivity level | — | 3 | — | 1 |

- Determined according to IPC/JEDEC Standard J-STD-020, *Moisture/Reflow Sensitivity Classification for Nonhermetic Solid State Surface Mount Devices*.

4.3 ESD handling ratings

| Symbol | Description | Min. | Max. | Unit | Notes |
|------------------|---|-------|-------|------|-------|
| V _{HBM} | Electrostatic discharge voltage, human body model | -6000 | +6000 | V | 1 |
| V _{CDM} | Electrostatic discharge voltage, charged-device model | -500 | +500 | V | 2 |
| I _{LAT} | Latch-up current at ambient temperature of 125°C | -100 | +100 | mA | 3 |

- Determined according to JEDEC Standard JESD22-A114, *Electrostatic Discharge (ESD) Sensitivity Testing Human Body Model (HBM)*.
- Determined according to JEDEC Standard JESD22-C101, *Field-Induced Charged-Device Model Test Method for Electrostatic-Discharge-Withstand Thresholds of Microelectronic Components*.
- Determined according to JEDEC Standard JESD78D, IC Latch-up Test.
 - Test was performed at 125 °C case temperature (Class II).
 - I/O pins pass +100/-100 mA I-test with I_{dd} current limit at 400mA.
 - I/O pins pass +20/-100 mA I-test with I_{dd} current limit at 1000mA.
 - Supply groups pass 1.5 V_{ccmax}.
 - RESET_B pin was only tested with negative I-test due to product conditioning requirement.

4.4 Voltage and current operating ratings

Absolute maximum ratings are stress ratings only, and functional operation at the maxima is not guaranteed. Stress beyond the limits specified in below table may affect device reliability or cause permanent damage to the device. For functional operating conditions, refer to the remaining tables in this document.

This device contains circuitry protecting against damage due to high static voltage or electrical fields; however, it is advised that normal precautions be taken to avoid application of any voltages higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are tied to an appropriate logic voltage level (for instance, either V_{SS} or V_{DD}) or the programmable pullup resistor associated with the pin is enabled.

| Symbol | Description | Min. | Max. | Unit |
|-----------|---|----------------|----------------|------|
| V_{DD} | Supply voltage | -0.3 | 5.8 | V |
| I_{DD} | Maximum current into V_{DD} | — | 120 | mA |
| V_{DIO} | Digital input voltage (except RESET, EXTAL, XTAL, or true open drain pin PTA2 and PTA3) | -0.3 | $V_{DD} + 0.3$ | V |
| | Digital input voltage (true open drain pin PTA2 and PTA3) | -0.3 | 6 | V |
| V_{AIO} | Analog ¹ , RESET, EXTAL, and XTAL input voltage | -0.3 | $V_{DD} + 0.3$ | V |
| I_D | Instantaneous maximum current single pin limit (applies to all port pins) | -25 | 25 | mA |
| V_{DDA} | Analog supply voltage | $V_{DD} - 0.3$ | $V_{DD} + 0.3$ | V |

1. All digital I/O pins, except open-drain pin PTA2 and PTA3, are internally clamped to V_{SS} and V_{DD} . PTA2 and PTA3 is only clamped to V_{SS} .

5 General

5.1 Nonswitching electrical specifications

5.1.1 DC characteristics

This section includes information about power supply requirements and I/O pin characteristics.

Table 2. DC characteristics

| V_{hys} | C | Input hysteresis | All digital inputs | — | $0.06 \times V_{DD}$ | — | — | mV |
| I_{in} | P | Input leakage current | All input only pins (per pin) | $V_{IN} = V_{DD}$ or V_{SS} | — | 0.1 | 1 | μ A |
| I_{OZ} | P | Hi-Z (off-state) leakage current | All input/output (per pin) | $V_{IN} = V_{DD}$ or V_{SS} | — | 0.1 | 1 | μ A |
| I_{OZTOT} | C | Total leakage combined for all inputs and Hi-Z pins | All input only and I/O | $V_{IN} = V_{DD}$ or V_{SS} | — | — | 2 | μ A |
| R_{PU} | P | Pullup resistors | All digital inputs, when enabled (all I/O pins other than PTA2 and PTA3) | — | 30.0 | — | 50.0 | k Ω |
| R_{PU}^3 | P | Pullup resistors | PTA2 and PTA3 pin | — | 30.0 | — | 60.0 | k Ω |
| I_{IC} | D | DC injection current ^{4, 5, 6} | Single pin limit | $V_{IN} < V_{SS}$, $V_{IN} > V_{DD}$ | -0.2 | — | 2 | mA |
| | | | Total MCU limit, includes sum of all stressed pins | | -5 | — | 25 | |
| C_{in} | C | Input capacitance, all pins | | | — | — | 7 | pF |
| V_{RAM} | C | RAM retention voltage | | | — | 2.0 | — | V |

1. Typical values are measured at 25 °C. Characterized, not tested.
2. Only PTB4, PTB5 support ultra high current output.
3. The specified resistor value is the actual value internal to the device. The pullup value may appear higher when measured externally on the pin.
4. All functional non-supply pins, except for PTA2 and PTA3, are internally clamped to V_{SS} and V_{DD} .
5. Input must be current-limited to the value specified. To determine the value of the required current-limiting resistor, calculate resistance values for positive and negative clamp voltages, then use the large one.
6. Power supply must maintain regulation within operating V_{DD} range during instantaneous and operating maximum current conditions. If the positive injection current ($V_{in} > V_{DD}$) is higher than I_{DD} , the injection current may flow out of V_{DD} and could result in external power supply going out of regulation. Ensure that external V_{DD} load will shunt current higher than maximum injection current when the MCU is not consuming power, such as no system clock is present, or clock rate is very low (which would reduce overall power consumption).

Table 3. LVD and POR Specification

| Symbol | C | Description | Min | Typ | Max | Unit | |
|---------------------|---|---|-----------------------------|------|------|------|---|
| V _{POR} | D | POR re-arm voltage ^{1,2} | 1.5 | 1.75 | 2.0 | V | |
| V _{LVDH} | C | Falling low-voltage detect threshold - high range (LVDV = 1) ³ | 4.2 | 4.3 | 4.4 | V | |

| V _{BG} | P | Buffered bandgap output ⁴ | 1.14 | 1.16 | 1.18 | V | |

1. Maximum is highest voltage that POR is guaranteed.
2. POR ramp time must be longer than 20us/V to get a stable startup.
3. Rising thresholds are falling threshold + hysteresis.
4. Voltage factory trimmed at V_{DD} = 5.0 V, Temp = 125 °C

1. Data in Typical column was characterized at 5.0 V, 25 °C or is typical recommended value.
2. RTC adder cause <1 μA I_{DD} increase typically, RTC clock source is 1kHz LPO clock.
3. ACMP adder cause <10 μA I_{DD} increase typically.
4. The current varies with TSI configuration and capacity of touch electrode. Please refer to [TSI electrical specifications](#).
5. LVD is periodically woken up from stop3 by 5% duty cycle. The period is equal to or less than 2 ms.

5.1.3 EMC performance

Electromagnetic compatibility (EMC) performance is highly dependent on the environment in which the MCU resides. Board design and layout, circuit topology choices, location and characteristics of external components as well as MCU software operation all play a significant role in EMC performance. The system designer should consult Freescale applications notes such as [AN2321](#), [AN1050](#), [AN1263](#), [AN2764](#), and [AN1259](#) for advice and guidance specifically targeted at optimizing EMC performance.

1. Typical values are based on characterization data at $V_{DD} = 5.0\text{ V}$, $25\text{ }^\circ\text{C}$ unless otherwise stated.
2. This is the shortest pulse that is guaranteed to be recognized as a reset pin request.
3. To enter BDM mode following a POR, BKGD/MS must be held low during the powerup and for a hold time of t_{MSH} after V_{DD} rises above V_{LVD} .
4. Timing is shown with respect to 20% V_{DD} and 80% V_{DD} levels. Temperature range $-40\text{ }^\circ\text{C}$ to $125\text{ }^\circ\text{C}$.

5.2.3 FTM module timing

Synchronizer circuits determine the shortest input pulses that can be recognized or the fastest clock that can be used as the optional external source to the timer counter. These synchronizers operate from the current bus rate clock.

5.3 Thermal specifications

5.3.1 Thermal characteristics

This section provides information about operating temperature range, power dissipation, and package thermal resistance. Power dissipation on I/O pins is usually small compared to the power dissipation in on-chip logic and voltage regulator circuits, and it is user-determined rather than being controlled by the MCU design. To take $P_{I/O}$ into account in power calculations, determine the difference between actual pin voltage and V_{SS} or V_{DD} and multiply by the pin current for each I/O pin. Except in cases of unusually high pin current (heavy loads), the difference between pin voltage and V_{SS} or V_{DD} will be very small.

Table 8. Thermal characteristics

| Rating | Symbol | Value | Unit |
|--|---------------|---------------------------|-----------------------------|
| Operating temperature range (packaged) | T_A | T_L to T_H -40 to 125 | $^{\circ}\text{C}$ |
| Junction temperature range | T_J | -40 to 135 | $^{\circ}\text{C}$ |
| Thermal resistance single-layer board | | | |
| 48-pin LQFP | θ_{JA} | 82 | $^{\circ}\text{C}/\text{W}$ |
| 32-pin LQFP | θ_{JA} | 88 | $^{\circ}\text{C}/\text{W}$ |
| 20-pin TSSOP | θ_{JA} | 116 | $^{\circ}\text{C}/\text{W}$ |
| 16-pin TSSOP | θ_{JA} | 130 | $^{\circ}\text{C}/\text{W}$ |
| Thermal resistance four-layer board | | | |

Table continues on the next page...

Table 8. Thermal characteristics (continued)

| Rating | Symbol | Value | Unit |
|--------------|---------------|-------|------|
| 48-pin LQFP | θ_{JA} | 58 | °C/W |
| 32-pin LQFP | θ_{JA} | 59 | °C/W |
| 20-pin TSSOP | θ_{JA} | 76 | °C/W |
| 16-pin TSSOP | θ_{JA} | 87 | °C/W |

The average chip-junction temperature (T_J) in °C can be obtained from:

$$T_J = T_A + (P_D \times \theta_{JA})$$

Where:

T_A = Ambient temperature, °C

θ_{JA} = Package thermal resistance, junction-to-ambient, °C/W

$$P_D = P_{int} + P_{I/O}$$

$P_{int} = I_{DD} \times V_{DD}$, Watts - chip internal power

$P_{I/O}$ = Power dissipation on input and output pins - user determined

For most applications, $P_{I/O} \ll P_{int}$ and can be neglected. An approximate relationship between P_D and T_J (if $P_{I/O}$ is neglected) is:

$$P_D = K \div (T_J + 273 \text{ °C})$$

Solving the equations above for K gives:

$$K = P_D \times (T_A + 273 \text{ °C}) + \theta_{JA} \times (P_D)^2$$

where K is a constant pertaining to the particular part. K can be determined by measuring P_D (at equilibrium) for a known T_A . Using this value of K, the values of P_D and T_J can be obtained by solving the above equations iteratively for any value of T_A .

1. Data in Typical column was characterized at 5.0 V, 25 °C or is typical recommended value.
2. When ICS is configured for FEE or FBE mode, input clock source must be divisible using RDIV to within the range of 31.25 kHz to 39.0625 kHz.
3. See crystal or resonator manufacturer's recommendation.
4. Load capacitors (C_1, C_2), feedback resistor (R_F) and series resistor (R_S) are incorporated internally when RANGE = HGO = 0.
5. This parameter is characterized and not tested on each device.
6. Proper PC board layout procedures must be followed to achieve specifications.
7. This specification applies to any time the FLL reference source or reference divider is changed, trim value changed, or changing from FLL disabled (FBELP, FBILP) to FLL enabled (FEI, FEE, FBE, FBI). If a crystal/resonator is being used as the reference, this specification assumes it is already running.
8. Jitter is the average deviation from the programmed frequency measured over the specified interval at maximum f_{Bus} . Measurements are made with the device powered by filtered supplies and clocked by a stable external clock signal. Noise injected into the FLL circuitry via V_{DD} and V_{SS} and variation in crystal oscillator frequency increase the C_{Jitter} percentage for a given interval.

6.4 Communication interfaces

6.4.1 SPI switching specifications

The serial peripheral interface (SPI) provides a synchronous serial bus with master and slave operations. Many of the transfer attributes are programmable. The following tables provide timing characteristics for classic SPI timing modes. Refer to the SPI chapter of the chip's reference manual for information about the modified transfer formats used for communicating with slower peripheral devices. All timing is shown with respect to 20% V_{DD} and 70% V_{DD} , unless noted, and 100 pF load on all SPI pins. All timing assumes slew rate control is disabled and high drive strength is enabled for SPI output pins.

7 Dimensions

7.1 Obtaining package dimensions

Package dimensions are provided in package drawings.

To find a package drawing, go to freescale.com and perform a keyword search for the drawing's document number:

| If you want the drawing for this package | Then use this document number |
|--|-------------------------------|
| 16-pin TSSOP | 98ASH70247A |
| 20-pin TSSOP | 98ASH70169A |
| 32-pin LQFP | 98ASH70029A |
| 48-pin LQFP | 98ASH00962A |

8 Pinout

8.1 Signal multiplexing and pin assignments

The following table shows the signals available on each pin and the locations of these pins on the devices supported by this document. The Port Control Module is responsible for selecting which ALT functionality is available on each pin.

1. This is a high current drive pin when operated as output.
2. This is a true open-drain pin when operated as output.

Note

When an alternative function is first enabled, it is possible to get a spurious edge to the module. User software must clear any associated flags before interrupts are enabled. The table above illustrates the priority if multiple modules are enabled. The

highest priority module will have control over the pin. Selecting a higher priority pin function with a lower priority function already enabled can cause spurious edges to the lower priority module. Disable all modules that share a pin before enabling another module.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
