

# MAX626/7/8-TSC426/7/8

## Dual Power MOSFET Drivers

### General Description

The MAX626/7/8 are dual monolithic power MOSFET drivers designed to translate TTL inputs to high voltage/current outputs. The MAX626 is a dual inverting power MOSFET driver. The MAX627 is a dual non-inverting power MOSFET driver, and the MAX628 contains one inverting section and one non-inverting section. Delay times are nearly independent of  $V_{DD}$  (See Typical Operating Characteristics). High current output drivers rapidly charge and discharge the gate capacitance of even the largest power MOSFETs to within millivolts of the supply rail. This produces the power MOSFET's minimum ON resistance. The MAX626/7/8's high speed minimizes power losses in switching power supplies and DC-DC converters.

### Applications

Switching Power Supplies  
 DC-DC Converters  
 Motor Controllers  
 Pin Diode Drivers  
 Charge Pump Voltage Inverters

### Pin Configurations

### Features

- ◆ Improved Second Source For TSC426/7/8
- ◆ Fast Rise and Fall Times: Typically 20ns with 1000pF Load
- ◆ Wide Supply Range:  $V_{DD} = 4.5$  to 18 Volts
- ◆ Low Power Consumption:  
     7mW with Inputs Low  
     150mW with Inputs High
- ◆ TTL/CMOS Input Compatible
- ◆ Low  $R_{OUT}$ : Typically 4Ω
- ◆ MAX626 is Pin Equivalent to TSC426, DS0026/DS0056

### Ordering Information

| PART      | TEMP. RANGE     | PIN-PACKAGE        |
|-----------|-----------------|--------------------|
| MAX626CPA | 0°C to +70°C    | 8 Lead Plastic DIP |
| MAX626CSA | 0°C to +70°C    | 8 Lead SO          |
| MAX626C/D | 0°C to +70°C    | Dice               |
| MAX626MJA | -55°C to +125°C | 8 Lead Cerdip      |
| MAX627CPA | 0°C to +70°C    | 8 Lead Plastic DIP |
| MAX627CSA | 0°C to +70°C    | 8 Lead SO          |
| MAX627C/D | 0°C to +70°C    | Dice               |
| MAX627MJA | -55°C to +125°C | 8 Lead Cerdip      |
| MAX628CPA | 0°C to +70°C    | 8 Lead Plastic DIP |
| MAX628CSA | 0°C to +70°C    | 8 Lead SO          |
| MAX628C/D | 0°C to +70°C    | Dice               |
| MAX628MJA | -55°C to +125°C | 8 Lead Cerdip      |
| TSC426CPA | 0°C to +70°C    | 8 Lead Plastic DIP |
| TSC426CBA | 0°C to +70°C    | 8 Lead SO          |
| TSC426MJA | -55°C to +125°C | 8 Lead Cerdip      |
| TSC427CPA | 0°C to +70°C    | 8 Lead Plastic DIP |
| TSC427CBA | 0°C to +70°C    | 8 Lead SO          |
| TSC427MJA | -55°C to +125°C | 8 Lead Cerdip      |
| TSC428CPA | 0°C to +70°C    | 8 Lead Plastic DIP |
| TSC428CBA | 0°C to +70°C    | 8 Lead SO          |
| TSC428MJA | -55°C to +125°C | 8 Lead Cerdip      |

### ABSOLUTE MAXIMUM RATINGS

|   |                              |   |                 |
|---|------------------------------|---|-----------------|
| Supply Voltage $V_{DD}$ to GND                    | +20V                         | CERDIP (derate above 70°C<br>by 8.0mW/°C) | 640mW           |
| Input Voltage                                     | $V_{DD} + 0.3V$ to GND -0.3V | Maximum Chip Temperature                  | +150°C          |
| Package Dissipation                               |                              | Storage Temperature                       | -55°C to +160°C |
| Plastic DIP (derate above 70°C<br>by 6.25mW/°C)   | 500mW                        | Lead Temperature (10 seconds)             | +300°C          |
| Small Outline (derate above 70°C<br>by 5.88mW/°C) | 450mW                        |   |                 |

Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions above those indicated in the operational sections of the specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

### ELECTRICAL CHARACTERISTICS—MAX626/7/8 and TSC426/7/8

( $V_{DD}$  = 4.5V to 18V, Over Temperature unless otherwise noted.)

# MAX626/7/8-TSC426/7/8

## Dual Power MOSFET Drivers

### Application Hints

The MAX626/7/8 have an easy to drive input, however, the input must never be allowed to stay between  $V_{IH}$  and  $V_{IL}$  for more than 50ns. Unused inputs should always be connected to ground to minimize supply current. Drivers can be paralleled on the MAX626 or MAX627 by tying both inputs together and both outputs together.

Supply bypassing and grounding are extremely important with the MAX626/7/8 as the peak supply and output currents can be greater than 2 Amps. Ground drops are a form of negative feedback with inverters and, hence, will degrade the delay and transition time of the MAX626/8. Ringing may also be a problem with large  $dV/dt$  and/or large AC currents.

Suggested bypass capacitors are a 4.7 $\mu$ F (low ESR) capacitor in parallel with a 0.1 $\mu$ F ceramic capacitor, mounted as close as possible to the MAX626/7/8. Use a ground plane if possible, or separate ground returns for inputs and outputs. Ringing can be minimized with a 5-20 $\Omega$  resistor in series with the output but this may degrade output transition time.

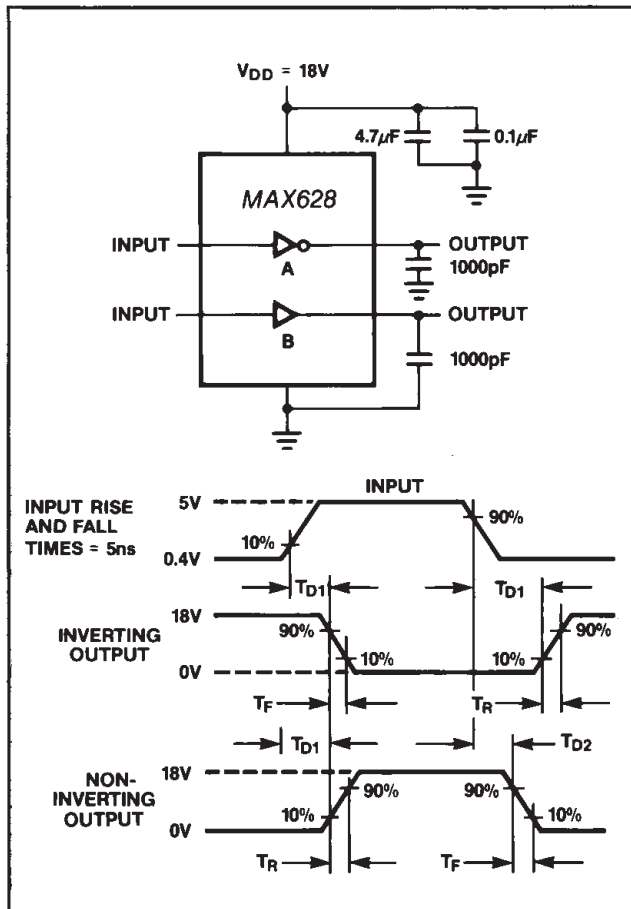

Figure 1. Inverting and Non-inverting Test Circuit

### Power Dissipation

Power dissipation of the MAX626/7/8 consists of:

- 1) Input inverter losses;
- 2) Crowbar current through the output devices;
- 3) Output current (either capacitive or resistive).

The sum of these must be kept below the maximum power dissipation limit.

The DC input inverter losses are 0.4mA when both inputs are low and 4mA when both inputs are high.

The Crowbar current through an output device making a transition is approximately 100mA for a few nanoseconds. This is a small portion of the total supply current, except for high switching frequencies or a small load capacitance (100pF).

The MAX626/7/8 power dissipation when driving a ground referenced resistive load is:

$$P = D \times R_{ON(MAX)} \times I_{LOAD}^2$$

where D is the percentage of time the MAX626/7/8 output pulls high,  $R_{ON(MAX)}$  is the maximum on resistance of the inverting sections of MAX626/8 with  $V_{IN} = V_{IH}$  ( $V_{IN} = V_{IL}$  for non-inverting sections), the  $I_{LOAD}$  is the load current of the MAX626/7/8.

For capacitive loads, the power dissipation is:

$$P = C_{LOAD} \times V_{DD}^2 \times FREQ$$

where  $C_{LOAD}$  is the capacitive load,  $V_{DD}$  is the MAX626/7/8 supply voltage, and FREQ is the toggle frequency.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
