5D1 H264 Encoder with 4-Channel A/V Decoder and 12 Channel External VD Inputs for Security Applications

The TW5864 is a H.264 encoder solution with integrated 4-channel analog A/V decoders. TW5864 can be used as a low cost single chip solution for 4-channel H.264 hardware compression PC cards, or 16-channel cards by using additional external TW2866 chips. There are 3 versions of TW5864 that can support no external video decoder (TW5864A), 4 channel external video decoders (TW5864B), and 12 channel external video decoders (TW5864C). TW5864 can also be used in embedded DVR applications as an AV front-end chip with H264 encoding capability. It can work with existing H.264 hardcore or DSP based CODECs. In existing H264 CODECs, performance may be limited due to limitation in both memory bandwidth and hardware resources. With the H.264 encoder built in at the front-end, the number of encoding channel supported scales with number of TW5864 chips used. The front-end H264 encoder offloads the processing from the backend CODECs to allow higher port count support and allows DSP resources saved and reserved for product differentiation features such as video analytic intelligence.

The TW5864 features H.264 baseline level 3 compliant encoder capable of performing up to 5 D1 equivalent video encoding (125 fps for PAL and 150 fps for NTSC), 17 channel G.726 ADPCM hardware audio encoder with one channel for two way audio communication. The H.264 video encoder supports dual-bitstream compression for both local storage and network port outputs. It also features a motion JPEG encoder for up to 25 frames per second shared among all video channels.

The TW5864 integrates 4 A/V decoders. It has 4 CVBS analog inputs fed into four internal high quality NTSC/PAL video decoders. In addition, it has 3 digital BT. 656 input, running up to 108 MHz, capable of receiving up to 12 D1 video channels from external multi-channel video decoders such as TW2866 / TW2867. This allows the TW5864 to support a total of 16 video input channels. The video streams from both on-chip/off-chip video decoders are fed into H.264 encoder as well as to external interfaces for preview purpose. The preview stream can go through either four BT. 656 video output interfaces or PCI interfaces. The four BT 656 ports support both multi-channel byte or line interleaved output to interface with various external display solutions.

The TW5864 has built-in de-interlacers and OSDs before encoding is performed. There are also 16 sets of motion detection / night detection / blind detection engine for channel alarm notification. In addition, the hardware encoder generated motion information of each channel is accessible to the external CPU for analytic purpose. TW5864 also integrates many sets of scalers for each of the H264 encoder, MJPEG, and preview paths. Each of these scalers is independently configured.

The TW5864 provides both asynchronous host interface and PCI interface for external CPU control and bitstream upload. The PCI interface can run at 33 or 66 MHz.

Analog Video Decoder

- 4 CVBS analog inputs fed into 4 sets of video decoder accept all NTSC(M/N/4.43) / PAL (B/D/G/H/I/K/L/M/N/60) standards with auto detection
- Integrated video analog anti-aliasing filters and 10 bit CMOS ADCs for each video decoder
- High performance adaptive 4H comb filters for all NTSC/PAL standards
- IF compensation filter for improvement of color demodulation
- Color Transient Improvement (CTI)
- Automatic white peak control
- Programmable hue, saturation, contrast, brightness and sharpness
- Proprietary fast video locking system for non-real-time application
- Noise Reduction to remove impulse noise

Digital Input Ports

- Three BT. 656 ports, each running at 108 MHz, directly interfaced with 3 external TW2866s

- Byte-interleaving supports 4 channels each port
  - Interlaced D1 interface at 60 / 50 fields per second
  - Progressive D1 interface at 30 / 25 frames per second
- **Pre-processing**
- Per channel triple high performance downscalers of each channel scales independently for H264, JPEG and preview output
- Per channel motion detector with 16 X 12 cells
  - Single Box
  - 1-bit per pixel text
  - 12-bit per pixel bitmap
- **Digital Output Ports**
- Preview video for external display chips
- Four BT. 656 ports for preview raw video output
- Byte-Interleaving interlaced D1 for all ports at 27 or 108 MHz
- Line-interleaving for the first 2 ports capable of supporting mix of interlaced D1 and CIF format at 27, 54, 81, or 108 MHz

H.264 Video Encoder

- H.264 baseline profile @ level 3 encoding
- Bit rate from 64 kbps up to 10 mbps each channel
- Maximum 125 fps (PAL) or 150 fps (NTSC)
- Real-time 4 D1 / 16 CIF or non-real-time 16 D1 main stream encoding
- Real-time 4 CIF / 16 QCIF or non-real-time 16 CIF secondary stream encoding
- VBR / CBR controllable
- Configurable GOP interval

Digital Audio CODEC

- Hardware G.726 ADPCM encoder
- Encodes maximum of 17 channels, with 1 channel for two way communication
- Decodes 1 channel of audio for playback
- RTC for AV sync

DDR Interface

- Two 16-bit external DDR SDRAM memories
- Running at 166 MHz
- Total 256 MB up to 1 GB
- Auto refresh

Host Interface

- Configurable 32-bit asynchronous host interface / PCI interface
- PCI Interface runs as both initiator and target at 33 / 66 MHz
- Per channel night / blind detections
- Per channel de-interlacer to convert Interlaced video into progressive before compression
- Per channel OSD for information overlay
- Motion vector granularity at full pel, ½ pel, and ¼ pel
- Motion vector ranges [-256, +255.75]
- In-loop de-blocking filter
- CAVLC entropy coding

Video Analytic Interface

- Per MB type / motion information
- 16x12 cells motion detection information
- Accessible through PCI / Async Host Interface

Motion JPEG Encoder

- Maximum of 25 fps, shared among all channels
- Support picture sizes of D1, CIF, and half-D1

Analog Audio CODEC

- Integrated five audio ADCs and one audio DAC providing multi-channel audio mixed analog output
- Supports a standard I2S interface for record output and playback input
- PCM 8/16 bit and u-Law/A-Law 8bit for audio word length
- Programmable audio sample rate that covers popular frequencies of 8/16/32/44.1/48kHz
- Video through PCI supporting various preview resolution such as
  - 2 D1
  - 1 D1 + 4 CIF
  - 9 CIF
  - 16 QCIF
  - 1 D1 + 15 QCIF
- I2C Interface for external Video Decoder chips configuration
- IRQs and GPIOs

System Clock

- Single 27 MHz external crystal clock input
- 3 built-in PLLs for internal clock generation

Package

- 352 BGA

PART NUMBER (NOTE 1)	PART MARKING	PACKAGE (Pb-free)	PKG. DWG. #
TW5864A-BB1-CR	TW5864A BB1-CR	352 BGA (27mmx27mm). Bonding Option A	V352.27x27
TW5864B-BB1-CR	TW5864B BB1-CR	352 BGA (27mmx27mm). Bonding Option B	V352.27x27
TW5864C-BB1-CR	TW5864C BB1-CR	352 BGA (27mmx27mm). Bonding Option C	V352.27x27

NOTE:

1. These Intersil Pb-free BGA packaged products employ special Pb-free material sets; molding compounds/die attach materials and SnAg –e2 solder ball terminals, which are RoHS compliant and compatible with both SnPb and Pb-free soldering operations. Intersil Pb-free BGA packaged products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.

VDDSPLL	B7	P	Power Internal 108 MHz clock PLL +3.3V
VSSSPLL	A7	G	Ground Internal 108 MHz clock PLL
VDDDLL	D14, H24	P	DLL Power +1.2V
VSSDLL	C14, G24	G	DLL Ground
VREFSSTL	C12, C17, E24, J24	P	SSTL Reference Voltage (1.25 V)
VSSRSSTL	D12, D17, F24, K24	G	SSTL Reference Ground
VDDO_SSTL	C9, C11, C13, C16, C18, C19, D21, G23, J23, L23, N23, R23, U23, Y23	P	SSTL I/O Power +2.5V

NAME	PIN #	TYPE	DESCRIPTION
VDD_SSTL	C15, C20, E23, M24, V23	P	SSTL Core Power +1.2V
VSS_SSTL	D9, D10, D11, D13, D15, D16, D18, D19, D20, D22, F23, H23, K23, L24, M23, P23, T23, V24, W23	G	SSTL I/O / Core Ground

Functional Description

The Techwell TW5864 features H264 base-line profile main stream encoding for up to 4 channel of D1 or 16 channels of CIF video content. In addition, TW5864 supports secondary stream encoding of up to ¼ size of each of the main stream channels. TW5864 also supports motion JPEG encoding. The encoded bitstream are available through the PCI / Asynchronous host interface.

There are 4 video decoders embedded in TW5864 to support up to 4 analog video CVBS inputs. In addition, there are 3 ITU-R BT. 656 digital ports to support up to 3 external TW2866 video decoder chips. The digital input interface runs up to 108 MHz to carry up to 4 channels of video streams in byte-interleaved format. In total, there are 16 video channels received by TW5864, with 4 in analog format, and 12 in digital format.

TW5864 supports 4 ITU-R BT. 656 output ports for preview purpose to an external display chip. The preview ports also runs up to 108 MHz also, to support total of 16 D1 channel output. The preview ports support both byte-interleaved and line-interleaved BT. 656 format for flexibility. In addition, the preview video can also be available through the PCI interface for PC-card application.

For each of the input video channel, there is a set of motion detection module generating the motion / blind / night detection alert signal for external CPU. There are also 3 downscalers to downscale D1 video into Half D1 (360x240) / CIF (360x120) and QCIF (180x120) size. Each of these picture sizes can be flexibly selected into the preview output ports, the H264 encoder engine, the motion JPEG engine, or the PCI preview channel.

CVBS Video Input

FORMATS

The TW5864 has build-in automatic standard discrimination circuitry. The circuit uses burst-phase, burst-frequency and frame rate to identify NTSC, PAL or SECAM color signals. The standards that can be identified are NTSC (M), NTSC (4.43), PAL (B, D, G, H, I), PAL (M), PAL (N), PAL (60) and SECAM (M). Each standard can be included or excluded in the standard recognition process by software control. The exceptions are the base standard NTSC and PAL, which are always enabled. The identified standard is indicated by the Standard Selection (SDT) register. Automatic standard detection can be overridden by software controlled standard selection.

TW5864 supports all common video formats as shown in Table 1.

TABLE 1. VIDEO INPUT FORMATS SUPPORTED BY THE TW5864

FORMAT	LINES	FIELDS	FSC	COUNTRY
NTSC-M	525	60	3.579545 MHz	U.S., many others
NTSC-Japan (Note 1)	525	60	3.579545 MHz	Japan
PAL-B, G, N	625	50	4.433619 MHz	Many
PAL-D	625	50	4.433619 MHz	China
PAL-H	625	50	4.433619 MHz	Belgium
PAL-I	625	50	4.433619 MHz	Great Britain, others
PAL-M	525	60	3.575612 MHz	Brazil
PAL-CN	625	50	3.582056 MHz	Argentina
SECAM	625	50	4.406MHz 4.250MHz	France, Eastern Europe, Middle East, Russia
PAL-60	525	60	4.433619 MHz	China
NTSC (4.43)	525	60	4.433619 MHz	Transcoding

NOTE:

1. NTSC-Japan has 0 IRE setup.

The analog front-end converts analog video signals to the required digital format. There are six analog front-end channels. Three channels are dedicated to analog video support. Every channel contains analog anti-aliasing filter, clamping circuit and 10-bit ADCs. It allows the support of CVBS, S-video and YPbPr component input signals for main or sub display. The other three channels are dedicated to YPbPr component video or RGB input support. Every channel contains the analog clamping circuit, variable gain amplifier and high speed ADCs. It allows three separate inputs to be connected simultaneously. A built-in line locked PLL is used to generate the sampling clock for various inputs.

ANALOG FRONT-END

The TW5864 contains four 10-bit ADC (Analog to Digital Converters) to digitize the analog video inputs. The ADC can be put into power-down mode by the V_ADC_PWDN register. The TW5864 also contains an anti-aliasing filter to prevent out-of-band frequency in analog video input signal. So there is no need of external components in analog input pin except ac coupling capacitor and termination resistor. 0 shows the frequency response of the anti-aliasing filter.

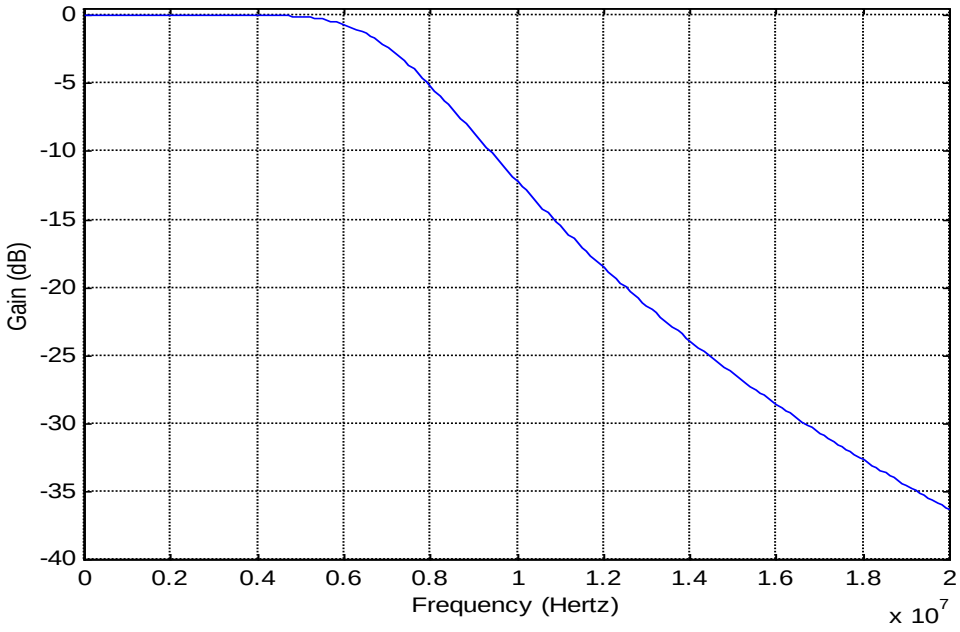

FIGURE 6. THE FREQUENCY RESPONSE OF THE VIDEO INPUT ANTI-ALIASING FILTER

DECIMATION FILTER

The digitized composite video data are over-sampled to simplify the design of analog filter. The decimation filter is required to achieve optimum performance and prevent high frequency components from being aliased back into the video image when down-sampled. 0 shows the characteristic of the decimation filter.

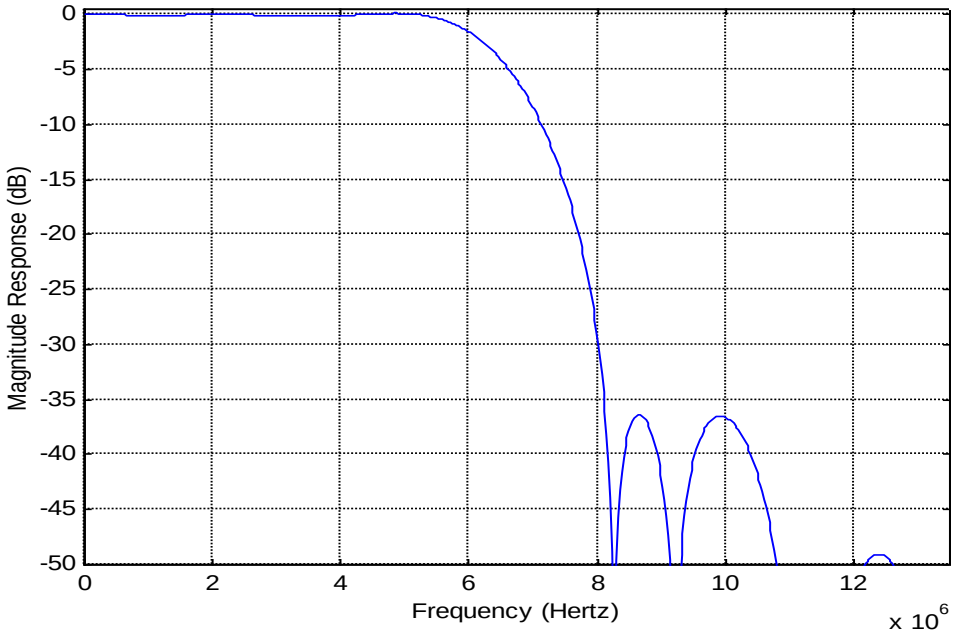

FIGURE 7. THE CHARACTERISTIC OF DECIMATION FILTER

AGC AND CLAMPING

All four analog channels have built-in clamping circuit that restores the signal DC level. The Y channel restores the back porch of the digitized video to a level of 60. This operation is automatic through internal

feedback loop. The Automatic Gain Control (AGC) of the Y channel adjusts input gain so that the sync tip is at a desired level. Programmable white peak protection logic is included to prevent saturation in the case of abnormal signal proportion between sync and white peak level.

SYNC PROCESSING

The sync processor of TW5864 detects horizontal synchronization and vertical synchronization signals in the composite video or in the Y signal of an S-video or component signal. The processor contains a digital phase-locked-loop and decision logic to achieve reliable sync detection in stable signal as well as in unstable signals such as those from VCR fast forward or backward.

The vertical sync separator detects the vertical synchronization pattern in the input video signals. In addition, the actual sync determination is controlled by a detection window to provide more reliable synchronization. An option is available to provide faster responses for certain applications. The field status is determined at vertical synchronization time. The field logic can also be controlled to toggle automatically while tracking the input

Y/C SEPARATION

The color-decoding block contains the luminance/chrominance separation for the composite video signal and multi-standard color demodulation. For NTSC and PAL standard signals, the luminance/chrominance separation can be done either by comb filter or notch/band-pass filter combination. For SECAM standard signals, adaptive notch/band-pass filter is used. The default selection for NTSC/PAL is comb filter.

In the case of comb filter, the TW5864 separates luminance (Y) and chrominance (C) of a NTSC/PAL composite video signal using a proprietary 4H adaptive comb filter. The filter uses a four-line buffer. Adaptive logic combines the upper-comb and the lower-comb results based on the signal changes among the previous, current and next lines. This technique leads to excellent Y/C separation with small cross luminance and cross color at both horizontal and vertical edges

Due to the line buffer used in the comb filter, there are always two lines processing delay at the output except for the component input mode which has only one line delay. The characteristic of the luminance notch filter is shown in Figure 8 for both NTSC and PAL system, when notch/band-pass filter is selected.

COLOR DECODING

CHROMINANCE DEMODULATION

The color demodulation for NTSC and PAL standard is done by first quadrature mixing the chrominance signal to the base band. A low-pass filter is then used to remove carrier signal and yield chrominance components. The low-pass filter characteristic can be selected for optimized transient color performance. For the PAL system, the PAL ID or the burst phase switching is identified to aid the PAL color demodulation.

For SECAM, the color information is FM modulated onto different carrier. The demodulation process therefore consists of FM demodulator and de-emphasis filter. During the FM demodulation, the chrominance carrier frequency is identified and used to control the SECAM color demodulation.

The sub-carrier signal for use in the color demodulator is generated by direct digital synthesis PLL that locks onto the input sub-carrier reference (color burst). This arrangement allows any sub-standard of NTSC and PAL to be demodulated easily with single crystal frequency.

0 and 0 show the frequency response of Chrominance Band-Pass and Low-Pass Filter Curves.

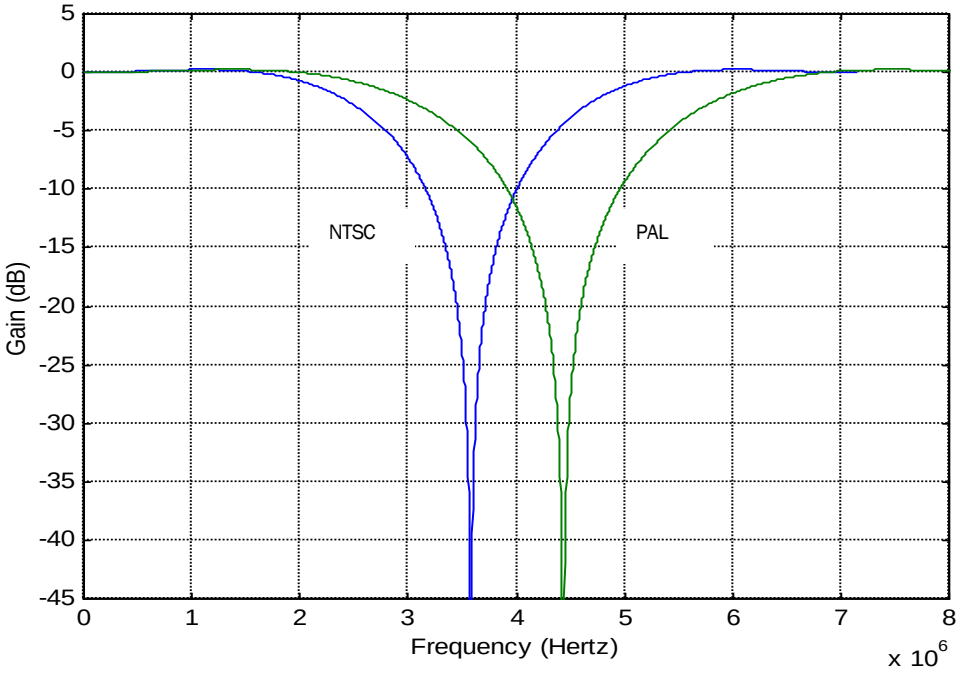

FIGURE 8. THE CHARACTERISTICS OF LUMINANCE NOTCH FILTER FOR NTSC AND PAL

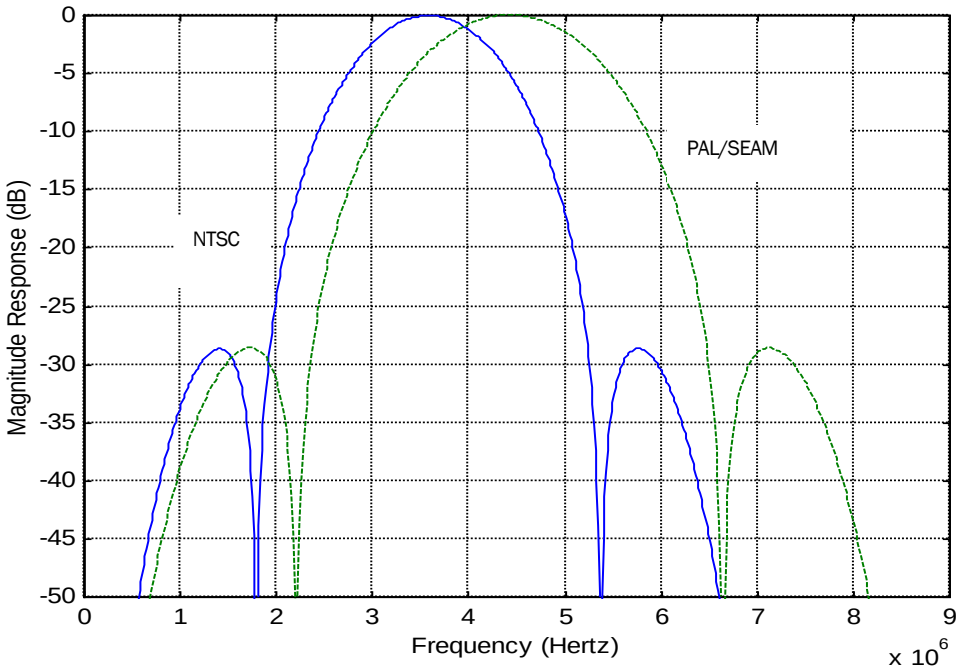

FIGURE 9. THE CHARACTERISTICS OF CHROMINANCE BAND-PASS FILTER FOR NTSC AND PAL

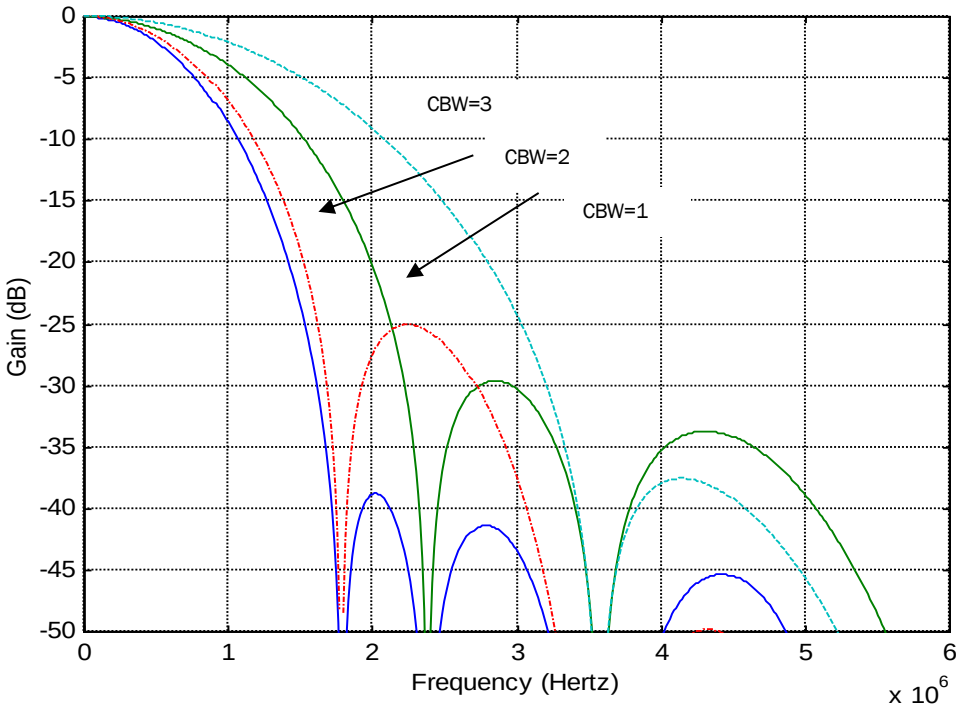

FIGURE 10. THE CHARACTERISTICS OF CHROMINANCE LOW-PASS FILTER CURVES

ACC (AUTOMATIC COLOR GAIN CONTROL)

The Automatic Chrominance Gain Control (ACC) compensates the reduced amplitudes caused by high-frequency loss in video signal. In the NTSC/PAL standard, the color reference signal is the burst on the back porch. It is measured to control the chrominance output gain. The range of ACC control is –6db to +24db.

Chrominance Processing

CHROMINANCE GAIN, OFFSET AND HUE ADJUSTMENT

When decoding NTSC signals, TW5864 can adjust the hue of the chrominance signal. The hue is defined as a phase shift of the subcarrier with respect to the burst. This phase shift of NTSC decoding can be programmed through a control register. For the PAL standard, the PAL delay line is provided to compensate any hue error; therefore, there is no hue adjustment available. The color saturation can be adjusted by changing the gain of Cb and Cr signals for all NTSC, PAL and SECAM formats. The Cb and Cr gain can be adjusted independently for flexibility.

CTI (COLOR TRANSIENT IMPROVEMENT)

The TW5864 provides the Color Transient Improvement function to further enhance the image quality. The CTI enhance the color edge transient without any overshoot or under-shoot.

Luminance Processing

The TW5864 adjusts brightness by adding a programmable value (in register BRIGHTNESS) to the Y signal. It adjusts the picture contrast by changing the gain (in register CONTRAST) of the Y signal.

The TW5864 also provide programmable peaking function to further enhance the video sharpness. The peaking control has built-in coring function to prevent enhancement of noise.

The 0 shows the characteristics of the peaking filter for four different gain modes and different center frequencies.

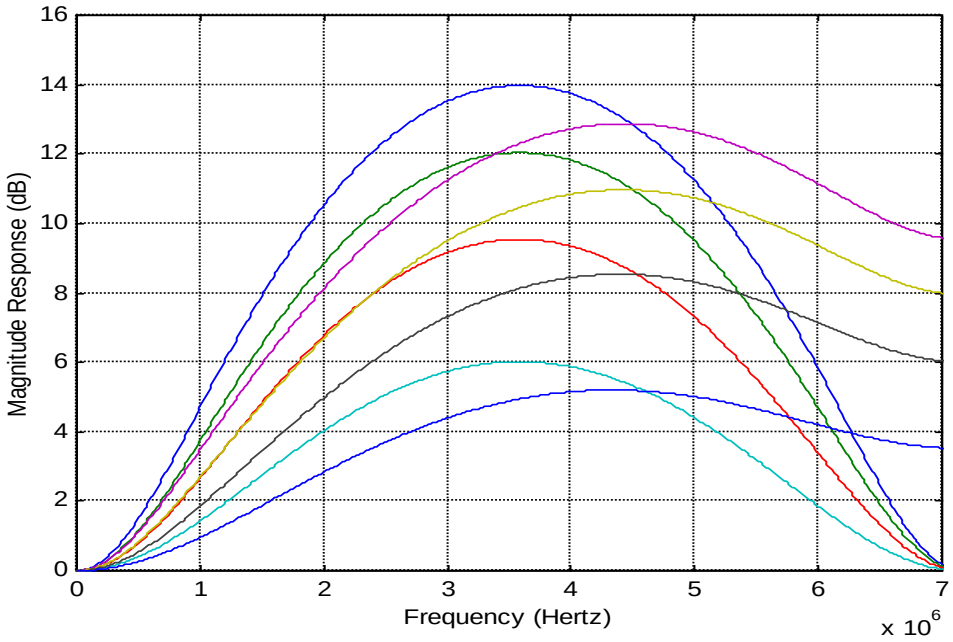

FIGURE 11. THE CHARACTERISTIC OF LUMINANCE PEAKING FILTER

ITU-R BT.656 Digital Input Ports

TW5864 supports 3 BT. 656 ports to connect up to 3 external video decoder chips. Each of the BT. 656 port runs at 108 MHz and supports 4 channels, in byte-interleaved format. In standard single channel ITU-R BT.656 format, SAV and EAV sequences are inserted into the data stream to indicate the active video time. It is noted that the number of active pixels per line is constant in this mode regardless of the actual incoming line length. The output timing is illustrated in Figure 12. The SAV and EAV sequences are shown in

Table 2. An optional set of 656 SAV/EAV code sequence can be enabled to identify no-video status using the NOVID_656 bit.

NOTE: * OPTION INCLUDES VIDEO LOSS INFORMATION IN ITU-R BT.656

In order to reduce pin counts and support more channels, four channel of D1 (720x480) video stream are time-division-multiplexed into a multi-channel data format. With this, TW5864 implements a single 8 bit bus at 4 times the base clock rate of 27MHz while quadrupling the data rate on a single bus to meet the new requirement, individually, each channel data arrangement still retains the base band 27MHz ITU-R BT.656 specification. For interface that can accept the new 108MHz clock bus, only one single clock at 108MHz is required. Embedded timing (SAV-EAV) code and Channel ID are inserted into each channel for de-multiplexing and separation of channel data.

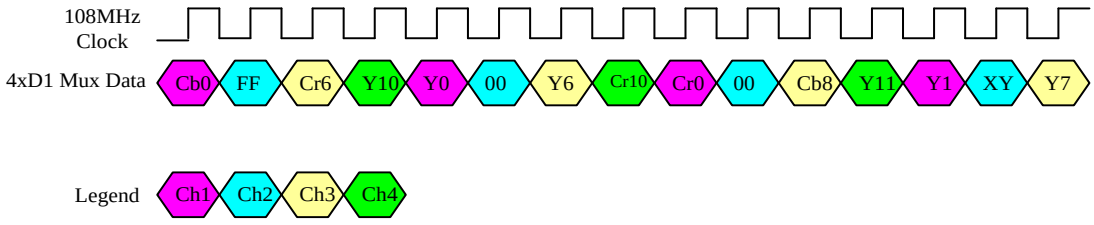

FIGURE 13. TIMING DIAGRAM OF 108MHZ 4 CH D1 TIME-DIVISION-MULTIPLEXED VIDEO DATA

Figure 13 depicts the temporal arrangement of the video data in 108MHz data rate. Each channel is byte level time-division multiplexed (TDM). Main clock is 108MHz clock. This bit stream can be de-multiplexed into 4 individual channels by sampling once in every 4 clock cycle, as show in Figure 14. After de-multiplexing, the channel ID can be identified through the EAV/SAV code from Table 3 and Table 4.

Pre-processing Modules

Behind the on-chip video decoder and the digital BT656 input ports are several pre-processing modules per channel such as the motion detection, downscalers, and channels selectors. The front-end pre-processing module prepares all the video streams into a format into a correct size that can be used by the backend modules such as line-interleaving preview module, H264 encoding module, motion JPEG encoding modules, and the PCI preview module.

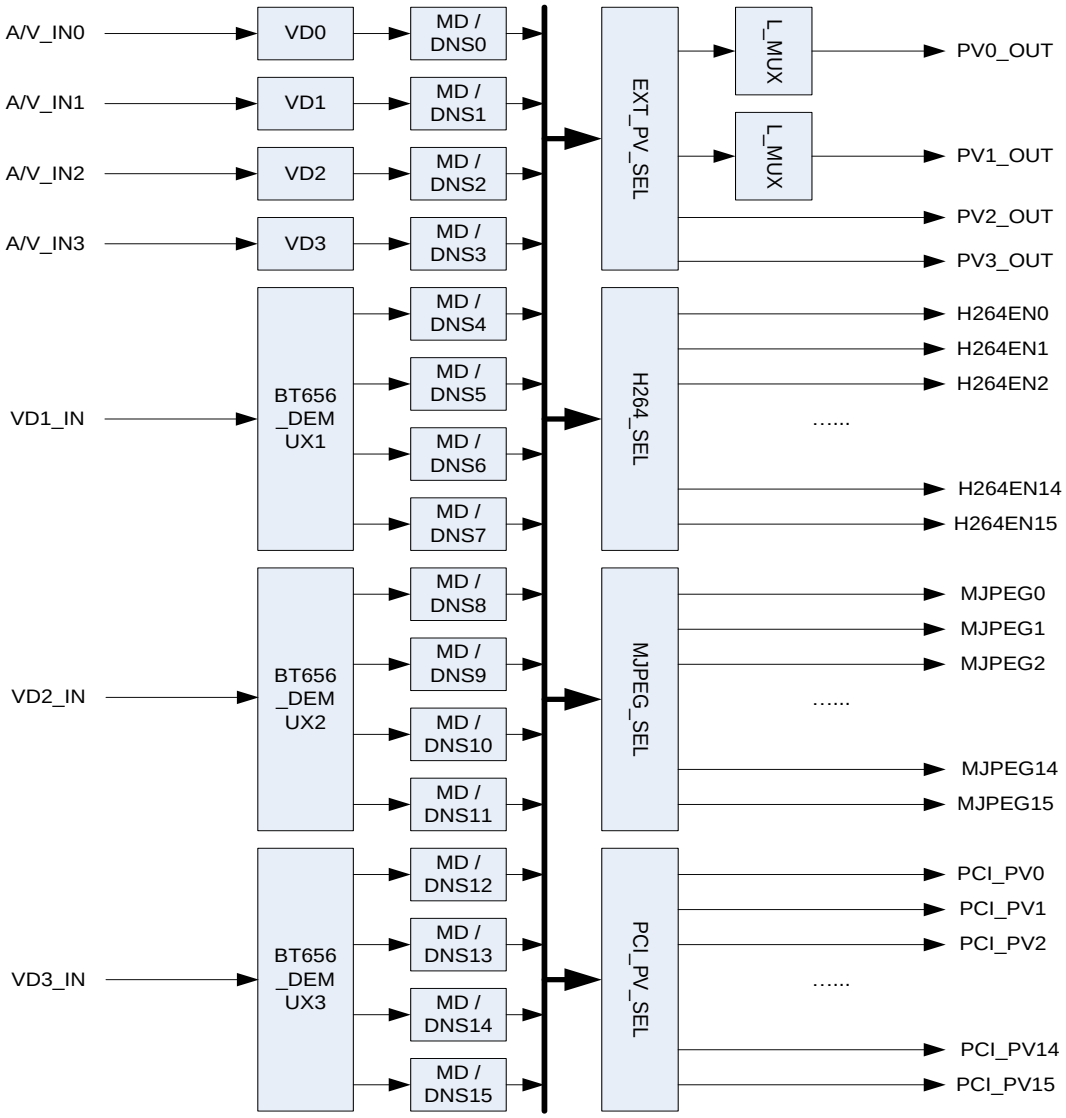

FIGURE 15. THE PRE-PROCESSING MODULE

DOWNSCALERS

The TW5864 has 16 sets of fixed downscalers, one for each incoming channel, to downscale the D1 picture size into one half horizontally (360 pixels), one quarter horizontally (180 pixels), and one half vertically (120 lines NTSC, or 144 lines PAL). With these, the combination of picture size can be 720x240, 360x240, 360x120, 180x120 (NTSC), or 720x288, 360x288, 360x144, 180x144 (PAL). These output pictures can be independently selected for each of the external digital preview port in line interleaved mode, the H264 encoding input, the Motion JPEG encoding input, and the PCI bus preview input.

MOTION DETECTION

The TW5864 supports a motion detector for each of the 16 incoming channels. The built-in motion detection algorithm uses the difference of luminance level between current and the reference field.

To detect motion properly according to situation needed, the TW5864 provides several sensitivity and velocity control parameters for each motion detector. The TW5864 supports manual strobe function to update motion detection so that it is more appropriate for user-defined motion sensitivity control.

When motion is detected in any video inputs, the TW5864 provides the interrupt request to host via the IRQ pin. Through which the host processor can read the motion information by accessing the motion status from register 0x3A0 ~ 0x3B7.

MASK AND DETECTION REGION SELECTION

The motion detection algorithm utilizes the full screen video data and detects individual motion of 16x12 cells. This full screen for motion detection consists of 704 pixels and 240 lines for NTSC and 288 lines for PAL. Starting pixel in horizontal direction can be shifted from 0 to 15 pixels using the MD_PIXEL_OS (0x301 ~ 0x37F) register.

Each cell can be masked via the MD_MASK (0x3E0 ~ 0x3F7) registers as illustrated in 0. If the mask bit in specific cell is set, the related cell is ignored for motion detection. The MD_MASK register has different function for reading and writing mode. For writing mode, setting MD_MASK register to “1” inhibits the specific cell from detecting motion. For reading mode, the MD_MASK register provides the results of the motion detection.

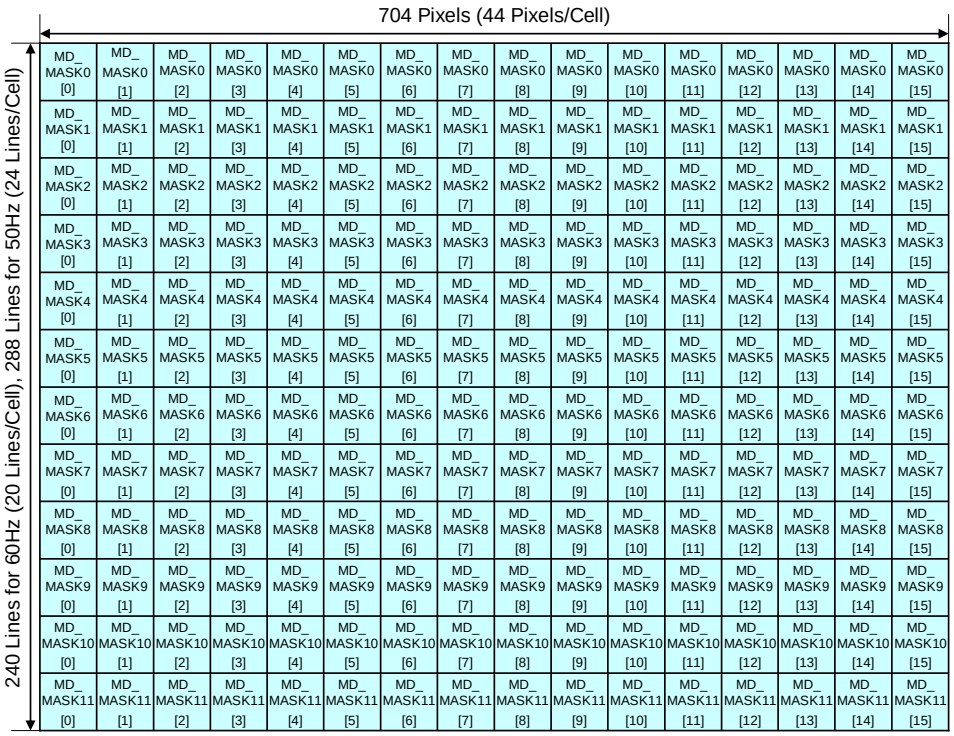

FIGURE 16. MOTION MASK AND DETECTION CELL

SENSITIVITY CONTROL

The motion detector has 4 sensitivity parameters to control threshold of motion detection such as the level sensitivity via the MD_LVSENS register, the spatial sensitivity via the MD_SPSENS and MD_CELSENS register, and the temporal sensitivity parameter via the MD_TMPSENS register.

LEVEL SENSITIVITY

In built-in motion detection algorithm, the motion is detected when luminance level difference between current and reference field is greater than MD_LVSENS value. Motion detector is more sensitive for the smaller MD_LVSENS value and less sensitive for the larger. When the MD_LVSENS is too small, the motion detector may be weak in noise.

SPATIAL SENSITIVITY

The TW5864 uses 192 (16x12) detection cells in full screen for motion detection. Each detection cell is composed of 44 pixels and 20 lines for NTSC and 24 lines for PAL. Motion detection using only luminance level difference between two fields is very weak for pictures with spatial random noise. To remove the fake motion detected from the random noise, the TW5864 supports a spatial filter via the MD_SPSENS register which defines the number of detected cell to decide motion detection in full size image. The large MD_SPSENS value increases the immunity of spatial random noise.

Each detection cell has 4 sub-cells. The actual motion detection result of each cell comes from comparison of 4 sub-cells in it. The MD_CELSENS defines the number of detected sub-cell to decide motion detection in cell. That is, the large MD_CELSENS value increases the immunity of spatial random noise in detection cell.

TEMPORAL SENSITIVITY

Similarly, temporal filter is used to remove the fake motion detection from the temporal random noise. The MD_TMPSENS regulates the number of taps in the temporal filter to control the temporal sensitivity so that the large MD_TMPSENS value increases the immunity of temporal random noise.

VELOCITY CONTROL

A motion has various velocities. That is, in a fast motion an object appears and disappears rapidly between the adjacent fields while in a slow motion it is to the contrary. As the built-in motion detection algorithm uses only the luminance level difference between two adjacent fields, a slow motion is harder to detect than a fast motion. To compensate this weakness, the current field is compared with a previous field up to 64-field time interval before. The MD_SPEED parameter adjusts the field interval in which the luminance level is compared. Thus, for detection of a fast motion a small value is needed and for a slow motion a large value is required. The parameter MD_SPEED value should be greater than MD_TMPSENS value.

Additionally, the TW5864 has 2 more parameters to control the selection of reference field. The MD_FLD register is a field selection parameter such as odd, even, any field or frame.

The MD_REFFLD register is used to control the updating period of reference field. For MD_REFFLD = “0”, the interval from current field to reference field is always same as the MD_SPEED. It means that the reference filed is always updated every field. The 0 shows the relationship between current and reference field for motion detection when the MD_REFFLD is “0”.

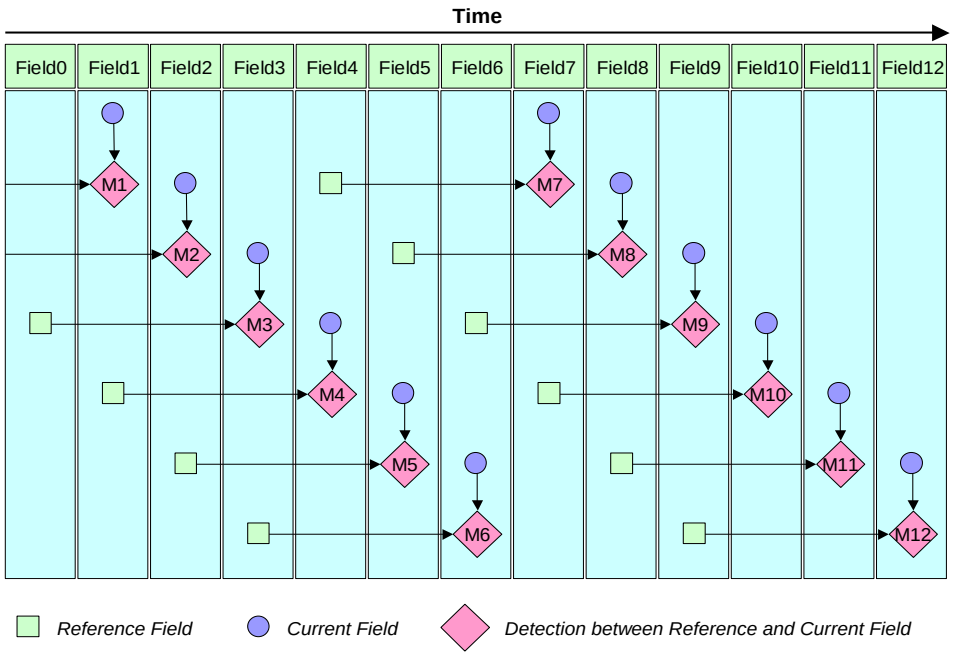

FIGURE 17. THE RELATIONSHIP BETWEEN CURRENT AND REFERENCE FIELD WHEN MD_REFFLD = “0”

The TW5864 can update the reference field only at the period of MD_SPEED when the MD_REFFLD is high. For this case, the TW5864 can detect a motion with sense of a various velocity. The 0 shows the relationship between current and reference field for motion detection when the MD_REFFLD = “1”.

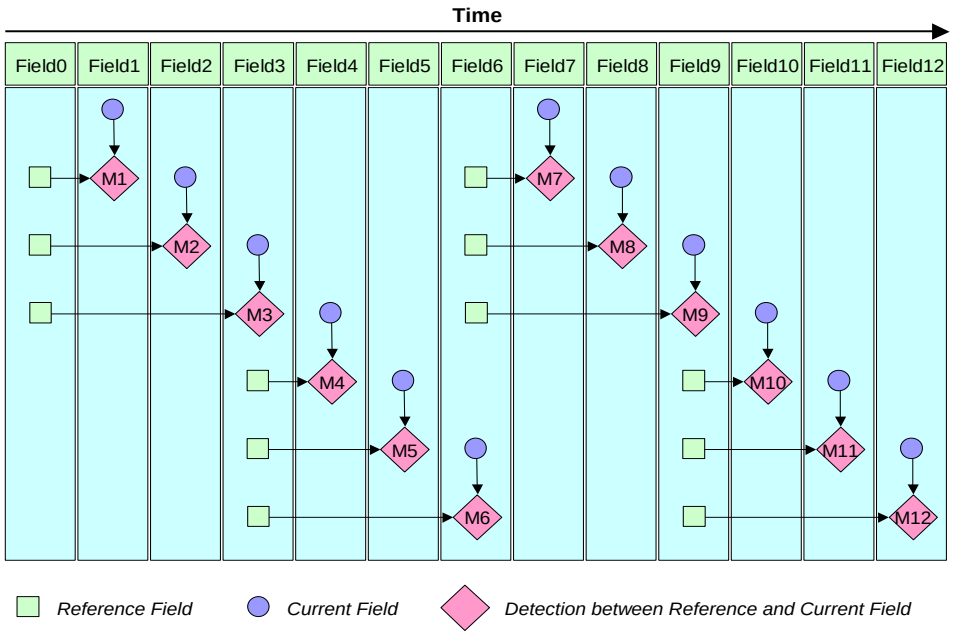

FIGURE 18. THE RELATIONSHIP BETWEEN CURRENT AND REFERENCE FIELD WHEN MD_REFFLD = "1"

The TW5864 also supports the manual detection timing control of the reference field/frame via the MD_STRB_EN and MD_STRB register. For MD_STRB_EN = "0", the reference field/frame is automatically updated and reserved on every reference field/frame. For MD_STRB_EN = "1", the reference field/frame is updated and reserved only when MD_STRB = "1". In this mode, the interval between current and reference field/frame depends on user's strobe timing. This mode is very useful for a specific purpose like non-periodical velocity control and very slow motion detection.

BLIND DETECTION

The TW5864 supports a blind detection for each of the 16 video inputs and generated an interrupt to the host when a blind condition is detected. A blind condition is detected when a camera is shaded / blocked by some unknown object and the video level in wide area of a field is almost equal to average video level of the field.

The TW5864 has two sensitivity parameters to detect blind input such as the level sensitivity via the BD_LVSENS register and spatial sensitivity via the BD_CELSENS register.

The TW5864 uses total 768 (30x224) cells in full screen for blind detection. The BD_LVSENS parameter controls the threshold of level between cell and field average. The BD_CELSENS parameter defines the number of cells to detect blind. For BD_CELSENS = "0", the number of cell whose level is same as average of field should be over than 60% to detect blind, 70% for BD_CELSENS = "1", 80% for BD_CELSENS = "2", and 90% for BD_CELSENS = "3". That is, the large value of BD_LVSENS and BD_CELSENS makes blind detector less sensitive.

The host can read blind detection information via MCU interrupt. When blind input is detected in any video inputs, the host processor can read the information by accessing the INTERRUPT_VECT registers. This status information is updated in the vertical blank period of each input.

NIGHT DETECTION

The TW5864 supports night detection for each of the 16 video inputs and generates an interrupt to the host when a night condition is detected. If an average of a field video level is very low, this input is interpreted as night. Otherwise, the input is treated as day.

The TW5864 has two sensitivity parameters to detect night input such as the level sensitivity via the ND_LVSENS register and the temporal sensitivity via the ND_TMPSENS register. The ND_LVSENS parameter controls threshold level of day and night. The ND_TMPSENS parameter regulates the number of taps in the temporal low pass filter to control the temporal sensitivity. The large value of ND_LVSENS and ND_TMPSENS makes night detector less sensitive.

The host can read night detection information via the MCU interrupt. When night input is detected in any video inputs, the TW5864 provides the interrupt request to host via the IRQ pin. The host processor can read the information of night detection by accessing the INTERRUPT_VECT register. This status information is updated in the vertical blank period of each input.

H264 ENCODING CHANNEL CAPTURE

The TW5864 supports up to 16 channels of real-time / non-real-time video for encoding simultaneously. Each of the 16 channels can be configured to capture picture size of either D1 (720x288 / 720x240) or Half D1 (360x288 / 360x240). The capture module can be configured to capture both fields (odd and even) or just single field. For a D1 compression, both fields should be captured. For CIF compression, however, only a single field needs to be captured in order to support a frame size of 360x288 / 360x240.

There are 4 separate DDR write paths embedded in the H264 capture module. The selection of channels in each path is as shown in Figure 19. In the first stage (CH_0' ~ CH_F'), one channel out of the 16 incoming channels (CH_0 ~ CH_F) is selected. Every 4 channel of the first stage channels are grouped into one DDR write path. In order to encode 4 D1 + 4CIF in H264, the module will only capture up to 4 channels of real-time D1 video streams. Each DDR write path captures 1 channel of real-time D1 video. The secondary stream is automatically generated from the main stream by downscaling ½ in each of the horizontal and vertical direction. In order to support 16 D1 non-real-time encoding, the module captures all 16 channels in D1 resolution while sub-sampling at time domain. The sub-sampling rate is controlled by the external MCU through register settings.

Note that although each video channel can be individually configured with either D1 or Half D1 size, the total peak throughput of each DDR write path should not exceed 2 D1 channel bandwidth, except on the first write path where 1D1+3CIF can be supported. The higher peak bandwidth on the first write path allows TW5864 to support 1D1+15CIF channel configuration. Due to the peak bandwidth limitation on the write path, the selection of channels merged into the same DDR write path has to be carefully selected.

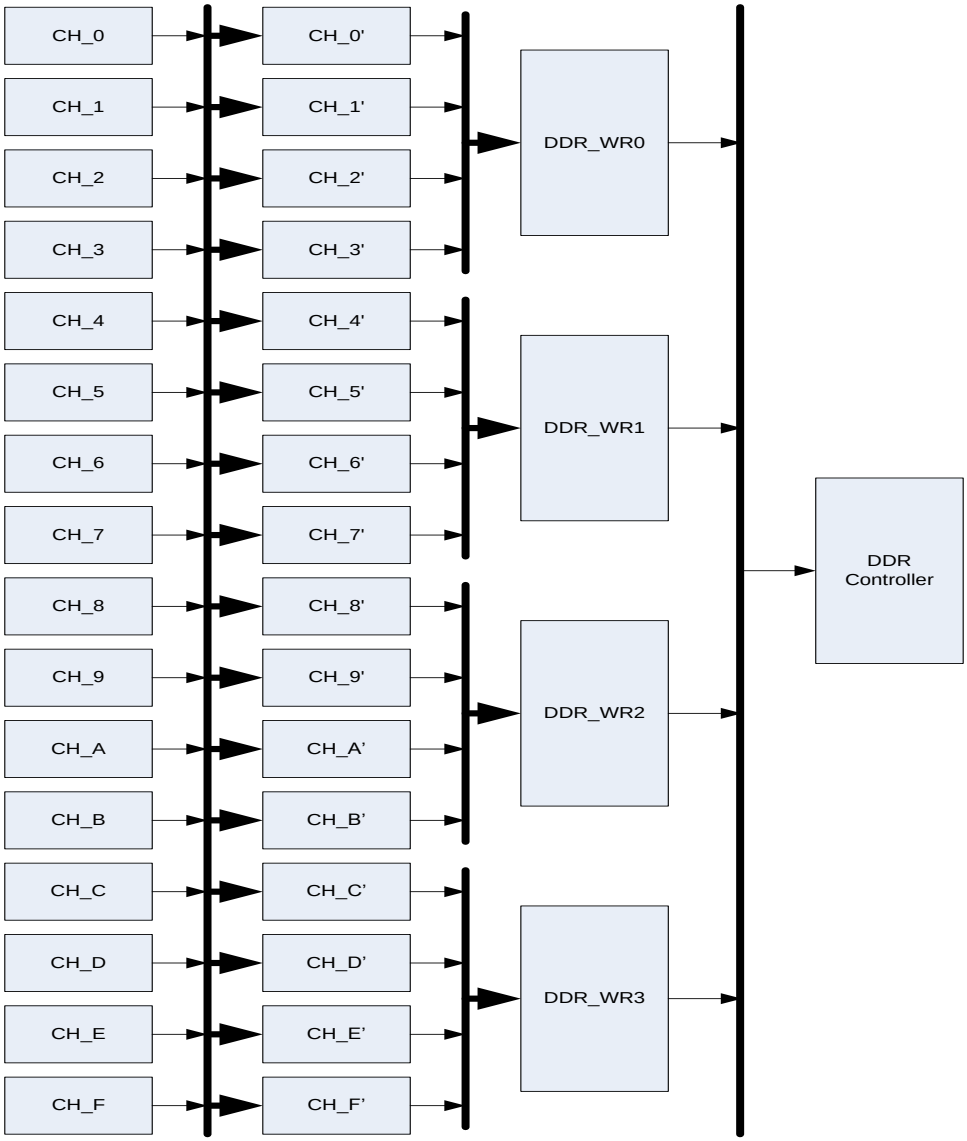

FIGURE 19. H264 ENCODING CAPTURE PATH CHANNEL SELECTION

MJPEG ENCODING CHANNEL CAPTURE

TW5864 MJPEG engine is designed to support a low frame rate encoding operation. When encoding multiple channels, it is time multiplexed between channels.

- At least 1 F/S for each of 16 channels in TW5864
- >= 25 F/S overall encoding capability
- At any time a maximum number of two frames can be captured simultaneously into DDR buffer for JPEG encoding

The TW5864 motion JPEG encoder supports two separate internal capture paths. Each capture path can select one channel out of any of the 16 incoming video channel at any instance of time. With this time sharing mechanism, the MJPEG module can support up to 1 D1 frame per second for each of the 16 channels.

The MJPEG capture modules select various picture sizes independently from channel to channel. The supported sizes are D1 (720x288 / 720x240), Half D1 (360x288 / 360x240), CIF (360x144 / 360x120), and Half CIF (180x144 / 180x120) sizes. The capture module can be configured to capture either both odd and even fields, or only a single field out of a frame.

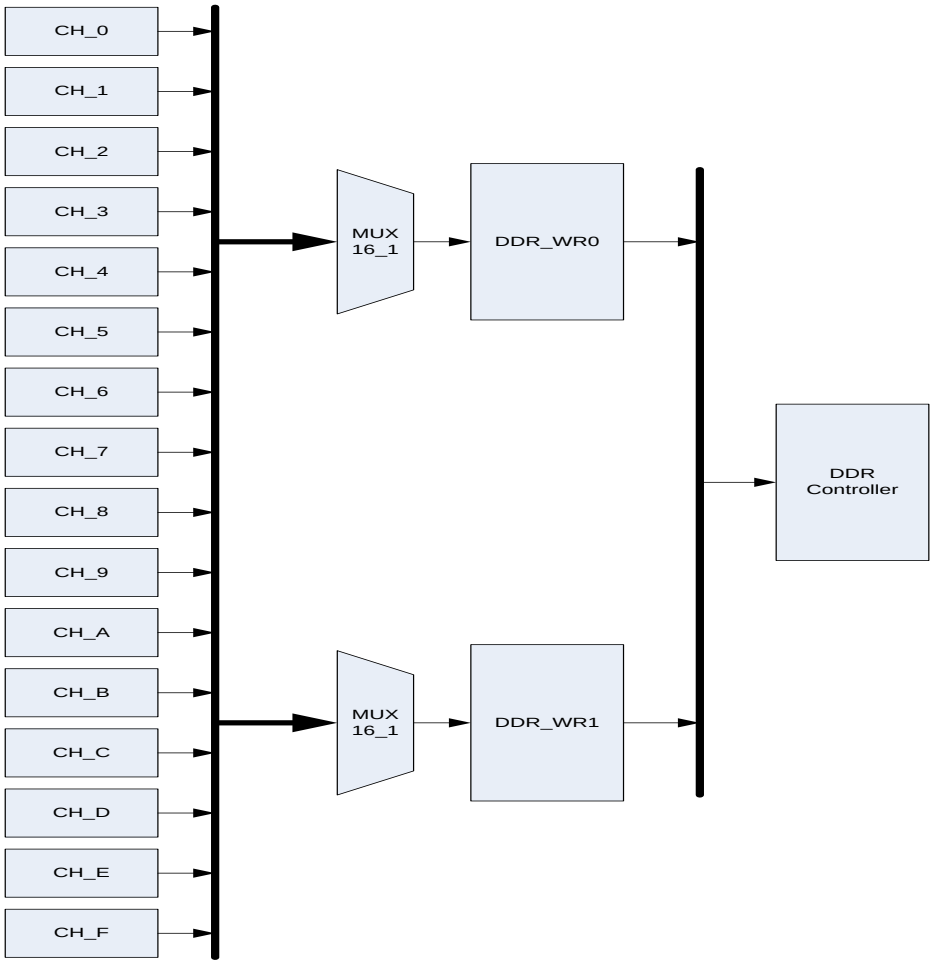

FIGURE 20. MJPEG ENCODING CAPTURE PATH CHANNEL SELECTION

PCI PREVIEW CHANNEL SELECTION

The PCI preview function is designed specifically for PC host application. PCI preview feature in TW5864 supports the following configuration.

- 1D1+1D1
- 4CIF+1D1
- 9CIF (Configurable RT or Non-RT)
- 16QCIF or 15QCIF+1D1 (Configurable RT or Non-RT)

All original video data in preview is sent from TW5864 to PC host in initiator mode. The maximum preview data being sent through PCI bus to PC host is bounded by the PCI bus bandwidth. The TW5864 PCI preview path supports 5 internal buffers BUF_0 ~ BUF_4 for sending the preview pictures onto the PCI bus. Each of the buffers is shared among any 4 channels selected out of 16 video channels except for BUF_4. The BUF_4 only shared among 2 channels. This is shown in Figure 21. At the input, there are total of 16 channels, from CH_0 through CH_F. Each of the first stage channel sections CH_0' through CH_F' can select one channel out of any of the 16 incoming channels. The second stage channel selection for input to BUF_0 selects one channel from of CH_0' ~ CH_0"3. Similarly BUF_1 with input from CH_4' ~ CH_7', BUF_2 with input from CH_8' ~ CH_B', and BUF_3 with input from CH_C' ~ CH_F'. BUF_4 has input from CH_2' and CH_3' only. Each Buffer has a limitation of supporting up to 1 D1 channel, 2 CIF channels, or 4 QCIF channels. In order to support 9 CIF channels, BUF_4 is used to support the addition CIF channel.

The PCI preview path input pictures of D1, Half D1, CIF, and Half CIF for each individual channels. Since there are limitations on sharing the internal buffers, all channels going to the same buffer have to be of the same picture size, either CIF or QCIF.

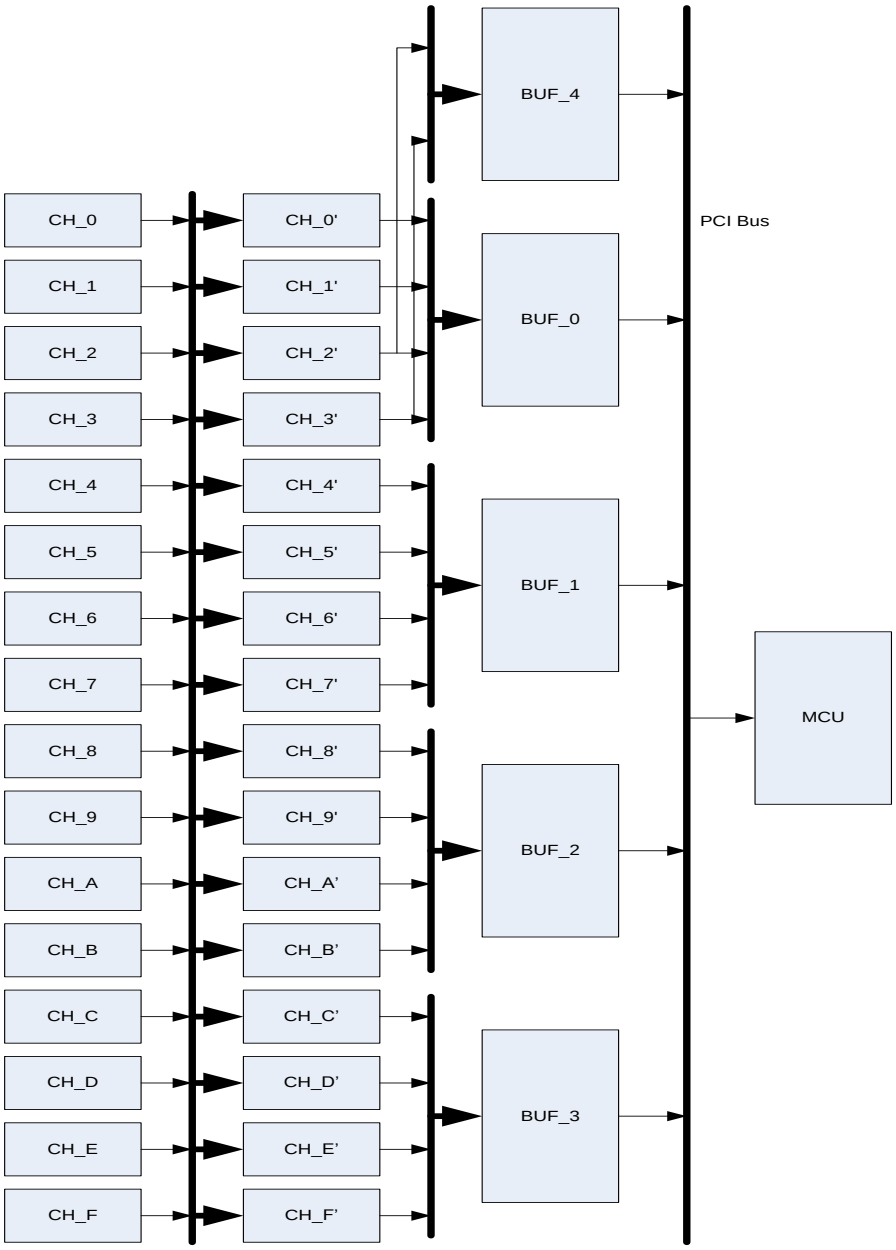

FIGURE 21. PCI PREVIEW PATH CHANNEL SELECTION

Digital Preview Output Port

TW5864 external preview ports support both byte-interleaving and line interleaving mode to put multiple channels into a single port. The following table shows the combination of mux modes supported among the 4 ports. Each port can be set independently, however, with one exception that preview ports 0, 1, 3 need to run at the same output clock rate.

TABLE 5. MUX MODES SUPPORTED IN THE PREVIEW OUTPUT PORTS

PV_SEL	MUX	PORT 0	PORT 1	PORT 2	PORT 3
0	Byte Interleaving	108 MHz D1 from on-chip VD0	108 MHz D1 from VD1	108 MHz D1 BI, from VD2	108 MHz D1 BI, from VD3

7	Line Interleaving	Line Mode, various Frequency	Line Mode, various Frequency	N/A	N/A

BYTE-INTERLEAVED FORMAT

The TW5864 has four sets of video output ports, each in BT. 656 interface. The video output sources can be from either the on-chip video decoders (108 MHz, 54 MHz, and 27 MHz) or simply select from the three digital video input ports at 108 MHz. In these cases, the output is in byte-interleaved format, the same as the input BT. 656 ports. The byte-interleaved modes supported in each of the 4 preview ports are the PV_SEL 0 ~ 6 as shown in Table 5.

In single channel standard ITU-R BT.656 format, SAV and EAV sequences are inserted into the data stream to indicate the active video time. It is noted that the number of active pixels per line is constant in this mode regardless of the actual incoming line length. The output timing is illustrated in Figure 22. The SAV and EAV sequences are shown in Table 6. An optional set of 656 SAV/EAV code sequence can be enabled to identify no-video status using the NOVID_656 bit.

NOTE: * OPTION INCLUDES VIDEO LOSS INFORMATION IN ITU-R BT.656

TWO CHANNEL D1 TIME-MULTIPLEXED FORMAT WITH 54MHZ

The TW5864 supports two channels ITU-R BT.656 time-multiplexed format with 54MHz that is useful to security application requiring two channel outputs through one channel video port. To de-multiplex the time-multiplexed data in the display mux chip, the channel ID can be inserted in the data stream using the CHID_MD register. Two kinds of channel ID format can be supported. One is horizontal blanking code with channel ID and the other is ITU-R BT.656 sync code with channel ID. The Figure 23 illustrates the logical timing diagram in the case of CH1 and CH2 time-multiplexed output through one video output port.

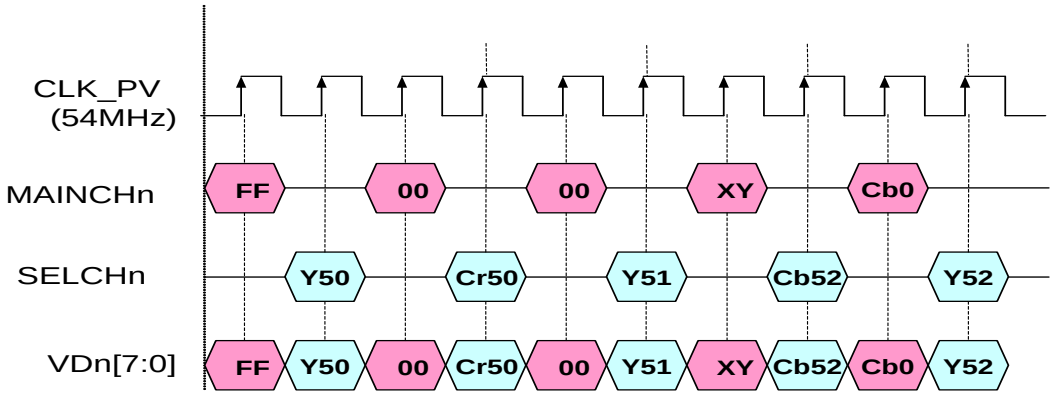

FIGURE 23. TIMING DIAGRAM OF TWO CHANNEL TIME-MULTIPLEXED FORMAT

Four Channel Half D1 Time-multiplexed Format with 54MHz

The four channel Half D1 (360x240x2) time-multiplexed format is supported at second preview port. For this format, each channel ITU-R BT.656 data stream is down-scaled horizontally into a 13.5MHz ITU-R BT.656 data stream except the sync code. Then, the four 13.5MHz ITU-R BT.656 data streams are time-multiplexed into 54MHz data stream. This format requires only one channel video port to transfer whole four channel HD1 data independently. In this mode, TW5864 can support one channel video port to transfer whole four channel D1 data at port 0 (108 MHz) or at both port 0 and port 1 (54 MHz), while using port 2 to ouput 4 channels of Half D1 video bitstreams simultaneously. To de-multiplex the time-multiplexed data in the display mux chip, the channel ID can be decoded from the SAV/EAV sync code. The Figure 24 and Table 7 illustrate the timing diagram and detailed channel ID format for four channel half D1 time-multiplexed format with 54MHz.

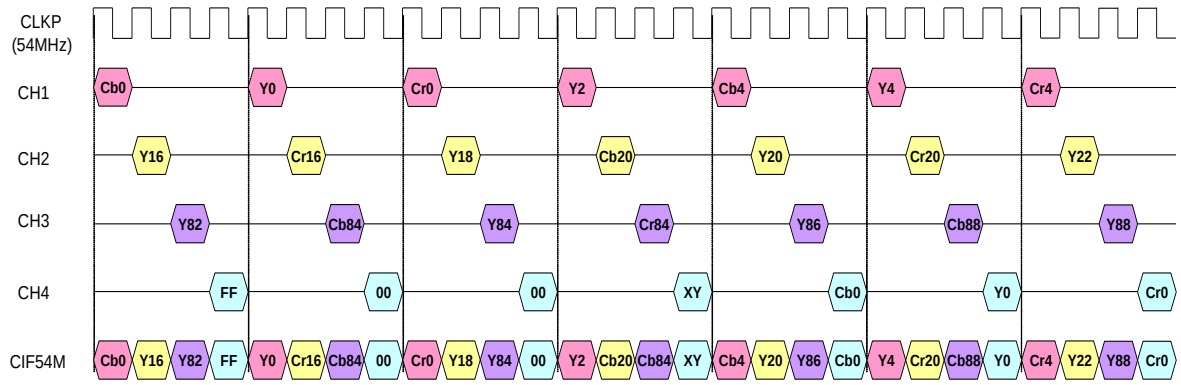

FIGURE 24. LOGICAL TIMING DIAGRAM OF 4 CH HALF D1 TIME-MULTIPLEXED FORMAT

Four Channel D1 Time-division-multiplexed Format with 108MHz

Four channel of D1 (720x480) at 27MHz video stream that are time-division-multiplexed at 108MHz data rate format is also implemented in TW5864. In order to reduce pin counts (thus shrink chip size) on both decoder's digital output port and the input port of the backend display mux devices, TW5864 implements single 8 bit bus at 4 times the base band pixel clock rate of 27MHz. While quadrupling the data rate on a single bus to meet the new requirement, individually, each channel data arrangement still retains the base band 27MHz ITU-R BT.656 specification. For interface that can accept the new 108MHz clock bus, only one single clock at 108MHz is required. Embedded timing (SAV-EAV) code and Channel ID are inserted into each channel for de-multiplexing and separation of channel data.

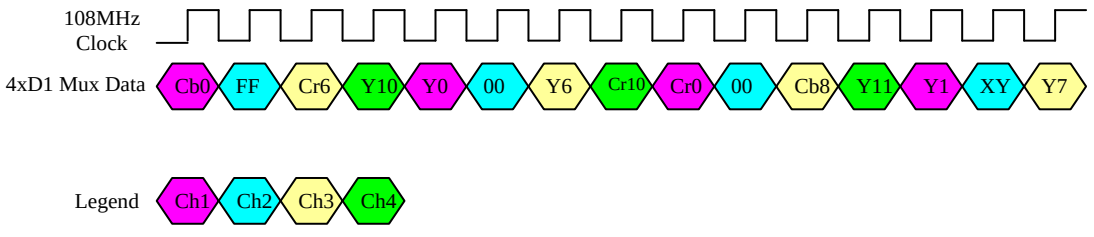

FIGURE 25. TIMING DIAGRAM OF 108MHZ 4 CH D1 TIME-DIVISION-MULTIPLEXED VIDEO DATA

Figure 31 depicts the temporal arrangement of the video data in 108MHz data rate. Each channel is byte level time-division multiplexed (TDM). Main clock is 108MHz clock.

LINE-INTERLEAVED FORMAT

In addition to the byte-interleaving mode, the first two digital preview ports support line-interleaved format to multiplex up to 9 channel of video content into each BT. 656 port. In this case, the source video can be scaled down into various sizes, and flexibly multiplexed together. The modes supported as shown in Table 9.

TABLE 9. LINE INTERLEAVING MODES SUPPORTED IN THE FIRST TWO PREVIEW OUTPUT PORTS

OUTPUT CHANNEL COMBINATION	CLOCK RATE	PICTURE SIZE
2 D1	54 MHz	720 x 240 (NTSC) / 720 x 288 (PAL)
4 D1	108 MHz	720 x 240 (NTSC) / 720 x 288 (PAL)
4 HD1	54 MHz	360 x 240 (NTSC) / 360 x 288 (PAL)
8 HD1	108 MHz	360 x 240 (NTSC) / 360 x 288 (PAL)
4 CIF	27 MHz	360 x 120 (NTSC) / 360 x 144 (PAL)
8 CIF	54 MHz	360 x 120 (NTSC) / 360 x 144 (PAL)
4 CIF + 1 D1	54 MHz	Combination
8 CIF + 1 D1	81 MHz	Combination

In line-interleaved format, the video data are interleaved based on each line as a unit. The original BT. 656 SAV/EAV codes are maintained. In addition, within the active line, an additional 4 bytes of header are inserted in order to describe the properties of the line of the original video content. The 4 bytes headers are shown in Figure 27. The 4-byte headers codes are shown in Table 10 . The definition of parameters in Table 10 is shown in Table 11.

Since all the video channels are asynchronous to each other, there is no fixed number of spacing among channel lines. Instead, the lines are inserted into the video stream based on the availability of the input source. When there are no lines available from any channel source, a dummy line will be inserted. The dummy line header bytes are 0x01 for all 4 header bytes. In line-interleaved mode, different line sizes can be multiplexed together in either full line (720 pixels) or half line (360 pixels). Because of this, a full line can either maintains a full line, or it can be split into 2 half lines.

H.264 Encoding Module

DE-INTERLACERS

The TW5864 de-interlacer sitting right before H264 encoder is an enhanced cost efficient de-interfacer that performs adaptive field weaving or 2D de-interlacing depending on the content motion. The de-interlacer works on a channel by channel base. Each of the channels can be independently controlled.

OSDS

The TW5864 supports pre-encoding OSD function which overlays fonts/graphics onto the video before H264 encoding is performed. The OSD overlays onto each channel of video independently. For each channel, up to 8 windows are supported. Additionally, in order to support good quality in both main and secondary stream, two different sets of fonts can be overlaid onto the main / secondary streams independently.

H264 ENCODERS

TW5864 has a build-in baseline H264 encoder capable of encoding up to 5D1 in real-time. The H264 encoder performance is summarized as the following:

- H.264 Baseline @ Level 3 encoding, without arbitrary slice ordering (ASO), flexible MB ordering (FMO), and redundant picture
- One slice per frame
- Bitrates from 64 kbps to 10 mbps
- 4 D1 or 16 CIF encoding at 30 frames per second (NTSC) or 25 frame per second (PAL)
- Support VBR / CBR
- Configurable IDR/I Interval
- Support intra-mode (16x16 and 4x4)
- Support variable block size (16x16, 16x8, and 8x8)
- Motion vector granularity at full-pel, ½ pel, and ¼ pel
- Motion vector range [-256, +255.75]
- In-loop deblocking filter
- CAVLC entropy coding
- Collect video analytic information to MPU
- Same channel dual-stream encoding (D1/CIF, D1/QCIF, or CIF/QCIF)

The typical configuration for multichannel encoding is given here as examples:

- 4D1 main streams and 4CIF/QCIF second streams
- 16CIF main streams and 16QCIF second streams
- 16D1 sub-frame rate encoding with aggregated total encoding frames <=125 F/S
- N channel D1 and (16-N) channel CIF.

NOTE: WHEN TW5864 IS ENCODING MORE THAN 4 PHYSICAL CHANNELS, IT NEEDS ADDITIONAL TW2864 EQUIVALENT VIDEO DECODER.

H.264 CODED STREAM

TW5864 generates H.264 standard compliant base-line profile bitstream, decodable by 3rd party standard compliant decoder. TW5864 H.264 bitstream contains progressive I-frame and P-frame information, without arbitrary slice ordering, flexible MB-ordering and redundant picture feature supports.

TW5864 bitstream follows H.264 standard byte stream format by constructed from the NAL (Network Abstraction Layer) unit stream format in decoding order and prefixing each NAL unit with a start code prefix (0x00000001). For each NAL bitstream unit, zero-valued bits or zero-valued bytes are padded in the end of I-frame and P-frame payload data to form an unit of multiple of 4-byte in length.

The NAL unit stream format can be extracted from the byte stream format by searching for the location of the unique start code prefix pattern within this stream of bytes.

In TW5864 bitstream, a SPS (Sequence Parameter Set) and a PPS (Picture Parameter Set) NAL unit are proceeded each IDR (Instantaneous Decoding Refresh)-frame NAL. The following tables describe NAL unit, SPS and PPS syntax in tabular form.

TABLE 13. TW5864 NAL UNIT SYNTAX

Audio A/D Decoder and D/A Encoder

The audio A/D and D/A codec in the TW5864 is composed of five audio Analog-to-Digital converters, 1 Digital-to-Analog converter, audio mixer, digital serial audio interface and audio detector shown as shown in Figure 28. The TW5864 can accept 5 analog audio signals and 1 digital serial audio data and produce 1 mixing analog audio signal and 2 digital serial audio data.

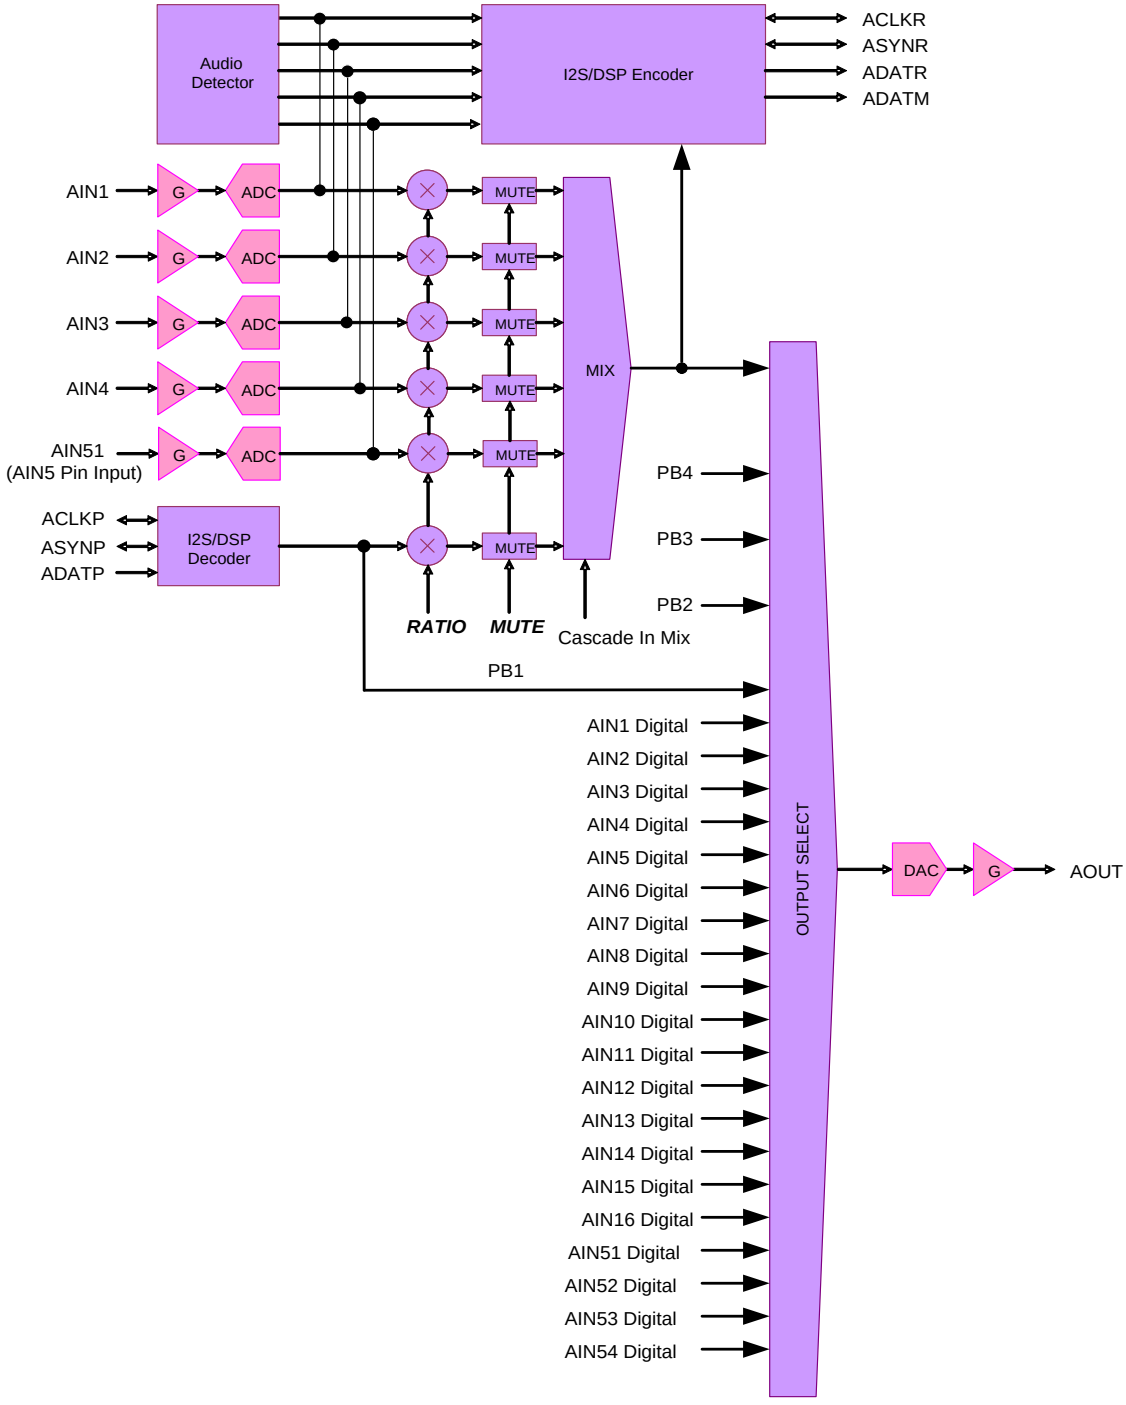

FIGURE 28. BLOCK DIAGRAM OF AUDIO CODEC

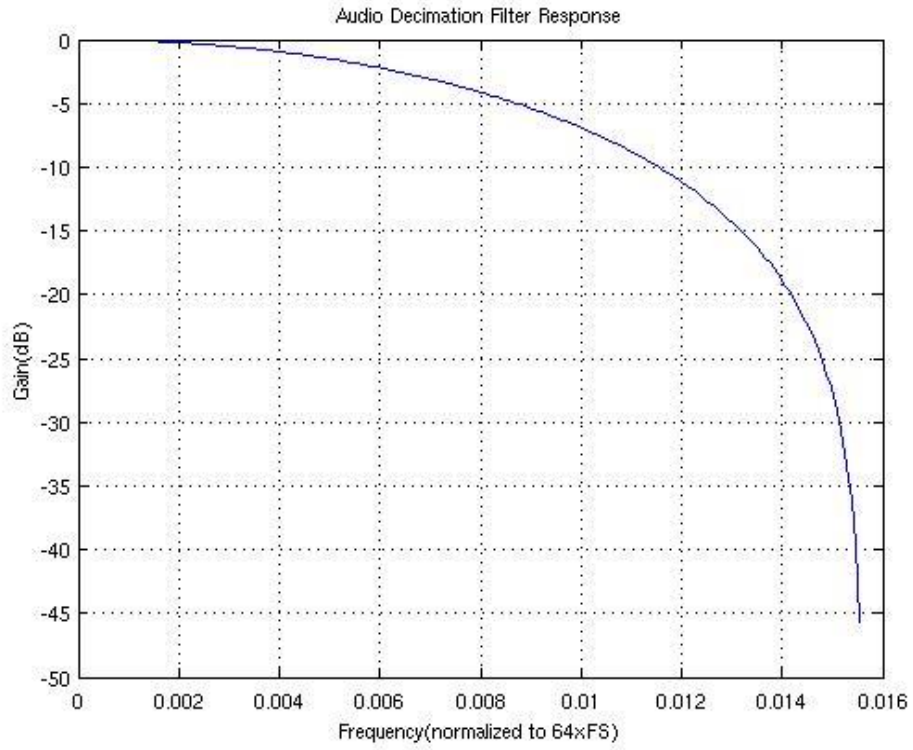
The level of analog audio input signal AIN1 ~ AIN5 can be adjusted respectively by internal programmable gain amplifiers that are defined via the AIGAIN1, AIGAIN2, AIGAIN3, AIGAIN4, and AIGAIN5 registers and then sampled by each Analog-to-Digital converters. Figure 29 shows the audio decimation filter response. The digital serial audio input data through the ACLKP, ASYNP and ADATP pin are used for playback function assuming an external audio decoder chip is used to decode the ADPCM audio bitstream. To record audio data, the TW5864 provides the digital serial audio output via the ACLKR, ASYNR and ADATR port, and feed into the back-end ADPCM audio encoding module.

The TW5864 can mix all of audio inputs including analog audio signal and digital audio data according to the predefined mixing ratio for each audio via the MIX_RATIO1 ~ MIX_RATIO5 and MIX_RATIOP registers. This mixing audio output can be provided through the analog and digital interfaces. The embedded audio Digital-to-Analog converter supports the analog mixing audio output whose level can be controlled by programmable gain amplifier via the A_DAC_IBCTL register. The ADATM pin supports the digital mixing audio output and its digital serial audio timings are provided through the ACLKR and ASYNR ports that are shared with the digital serial audio record timing pins.



(*) 0.016 line = 0.016x64xFs

FIGURE 29. AUDIO DECIMATION FILTER RESPONSE

AUDIO DETECTION

The TW5864 has an audio detector for each individual of 5 channels. There are 2 kinds of audio detection method defined by the ADET_MTH. One is the detection of absolute amplitude and the other is of differential amplitude. For both detection methods, the accumulating period is defined by the ADET_FILT register and the detecting threshold value is defined by ADET_TH1 ~ ADET_TH5 registers. The status for audio detection is read by the STATE_AVDET register and it also makes the interrupt request through the IRQ pin with the combination of the status for video loss detection.

SERIAL AUDIO INTERFACE

There are 3 kinds of digital serial audio interfaces in the TW5864, the first is a recording output, the second is a mixing output and the third is a playback input. These 3 digital serial audio interfaces follow a standard I2S or DSP interface as shown in the Figure 30.

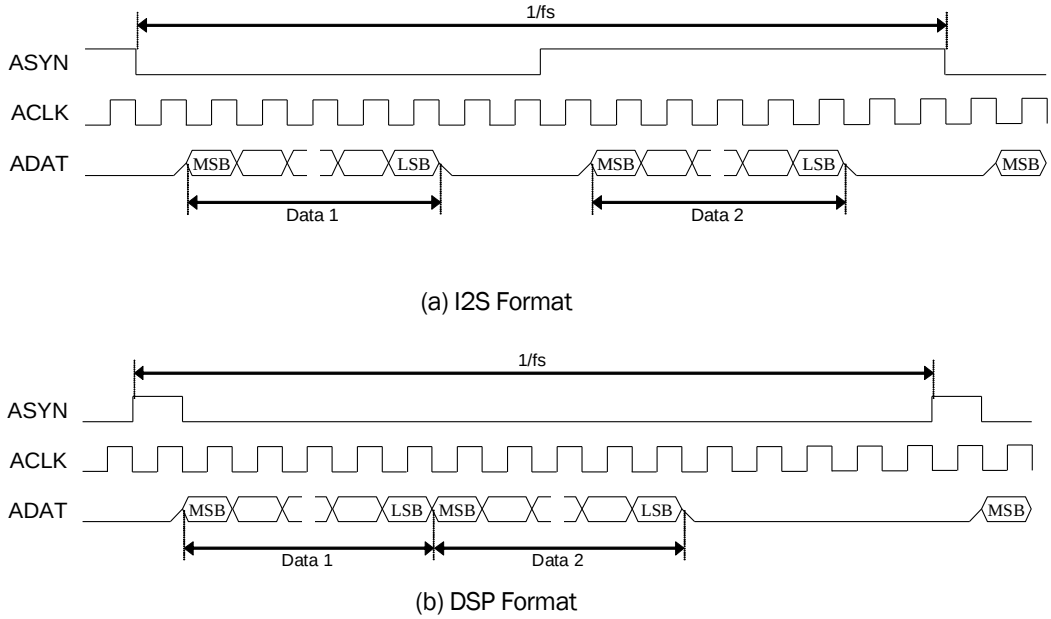


FIGURE 30. TIMING CHART OF SERIAL AUDIO INTERFACE

Playback Input

The serial interface using the ACLKP, ASYNP and ADATP pins accepts the digital serial audio data for the playback purpose. The ACLKP and ASYNP pins can be operated as master or slave mode. For master mode, these pins work as output pin and generate the standard audio clock and synchronizing signal. For slave mode, these pins are input mode and accept the standard audio clock and synchronizing signal. The ADATP pin is always input mode regardless of operating mode. In order to use the on-chip ADPCM decoder, the playback port has to run at the master mode. One of audio data in left or right channel should be selected for playback audio by the PB_LRSEL.

Record Output

To record audio data, the TW5864 provides the digital serial audio data through the ACLKR, ASYNR and ADATR ports. Sampling frequency comes from 256xfs, 320xfs, or 384xfs audio system clock setting. Even though the standard I2S and DSP format can have only 2 audio data on left and right channel, the TW5864 can provide an extended I2S and DSP format which can have 16-channel audio data through ADATR pin. The R_MULTCH defines the number of audio data to be recorded by the ADATR pin. ASYNR signal is always fs frequency rate. One ASYNR period is always equal to 256xACLKR clock length with AIN5MD=0. Figure 31 shows the digital serial audio data organization for multi-channel audio.

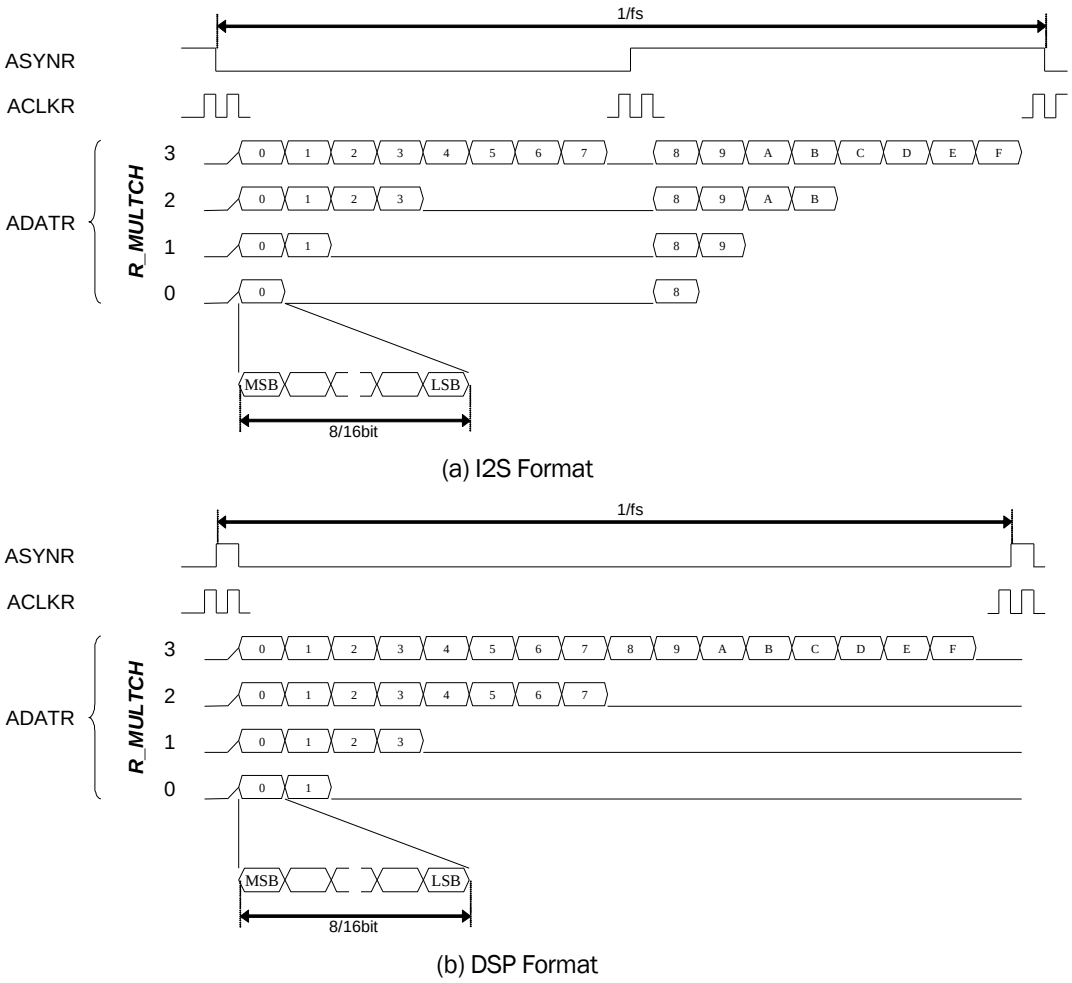

FIGURE 31. TIMING CHART OF MULTI-CHANNEL AUDIO RECORD

The following table shows the sequence of audio data to be recorded for each mode of the R_MULTCH register. The sequences of 0 ~ F do not mean actual audio channel number but represent sequence only. The actual audio channel should be assigned to sequence 0 ~ F by the R_SEQ_0 ~ R_SEQ_F register. When the ADATM pin is used for record via the R_ADATM register, the audio sequence of ADATM is shown also in Table 16.

TABLE 16. SEQUENCE OF MULTI-CHANNEL AUDIO RECORD
(A) I2S FORMAT

R_MULTCH	PIN	LEFT CHANNEL								RIGHT CHANNEL							
0	ADATR	0								8							
	ADATM	F								7							
1	ADATR	0	1							8	9						
	ADATM	F	E							7	6						
2	ADATR	0	1	2	3					8	9	A	B				
	ADATM	F	E	D	C					7	6	5	4				
3	ADATR	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F
	ADATM	F	E	D	C	B	A	9	8	7	6	5	4	3	2	1	0

(B) DSP FORMAT

R_MULTCH	PIN	LEFT/RIGHT CHANNEL															
0	ADATR	0	1														
	ADATM	F	E														
1	ADATR	0	1	2	3												
	ADATM	F	E	D	C												
2	ADATR	0	1	2	3	4	5	6	7								
	ADATM	F	E	D	C	B	A	9	8								
3	ADATR	0	1	2	3	4	5	6	7	8	9	A	B	C	D	E	F
	ADATM	F	E	D	C	B	A	9	8	7	6	5	4	3	2	1	0

Mix Output

The digital serial audio data on the ADATM pin has 2 different audio data which are mixing audio and playback audio. The mixing digital serial audio data is the same as analog mixing output. The sampling frequency, bit width and number of audio for the ADATM pin are same as the ADATR pin because the ACLKR and ASYNR pins are shared with the ADATR and ADATM pins.

AUDIO MULTI-CHIP CASCADE

TW5864 can output 16 channel audio data on ACLKR/ASYNR/ADATR to the back-end ADPCM module simultaneously. Therefore, up to 3 external TW2866 chips can be connected on most multi-Chip application cases. ALINKI pin is the audio cascade serial input, and ALINKO pin is the audio cascade serial output.

Each stage chip can accept 5 analog audio signals so that four cascaded chips will be 16-channel audio controller as default AIN5MD=0. The first stage chip provides 16ch digital serial audio data for record. Even though the first stage chip has only 1 digital serial audio data pin ADATR for record, the TW5864 can generate 16 channel data simultaneously using multi-channel format. Also, each stage chip can support 4 channel record outputs that are corresponding with analog audio inputs. This first stage chip can also output 16 channels mixing audio data by the digital serial audio data and analog audio signal. The last stage chip accepts the digital serial audio data for playback. The digital playback data can be converted to analog signal by Digital-to-Analog Converter in the last stage chip.

In Multi-Chip Audio operation mode, one same Oscillator clock source (27 MHz) needs to be connected to all TW5864 XTI or TW2866 CLKI pins.

Several Master/Slave mode configurations are available. The Figure 32 shows the most recommended and demanded system with Clock Master Mode (ACLKRMASTER=1).

In each of the following figures, Mix1-16-51-54/Pb1 means Mix output of AIN1-16, AIN51-AIN54, and Playback1. AIN1-16-51-54/Pb1 means one selected Audio output in AIN1-16-51-54/Pb1.

If one TW5864 uses AIN5MD=1, all other cascaded TW2866 chips must set up AIN5MD=1 also. Generally, 4 audio input mode (AIN5MD=0) are most used in this cascade system.

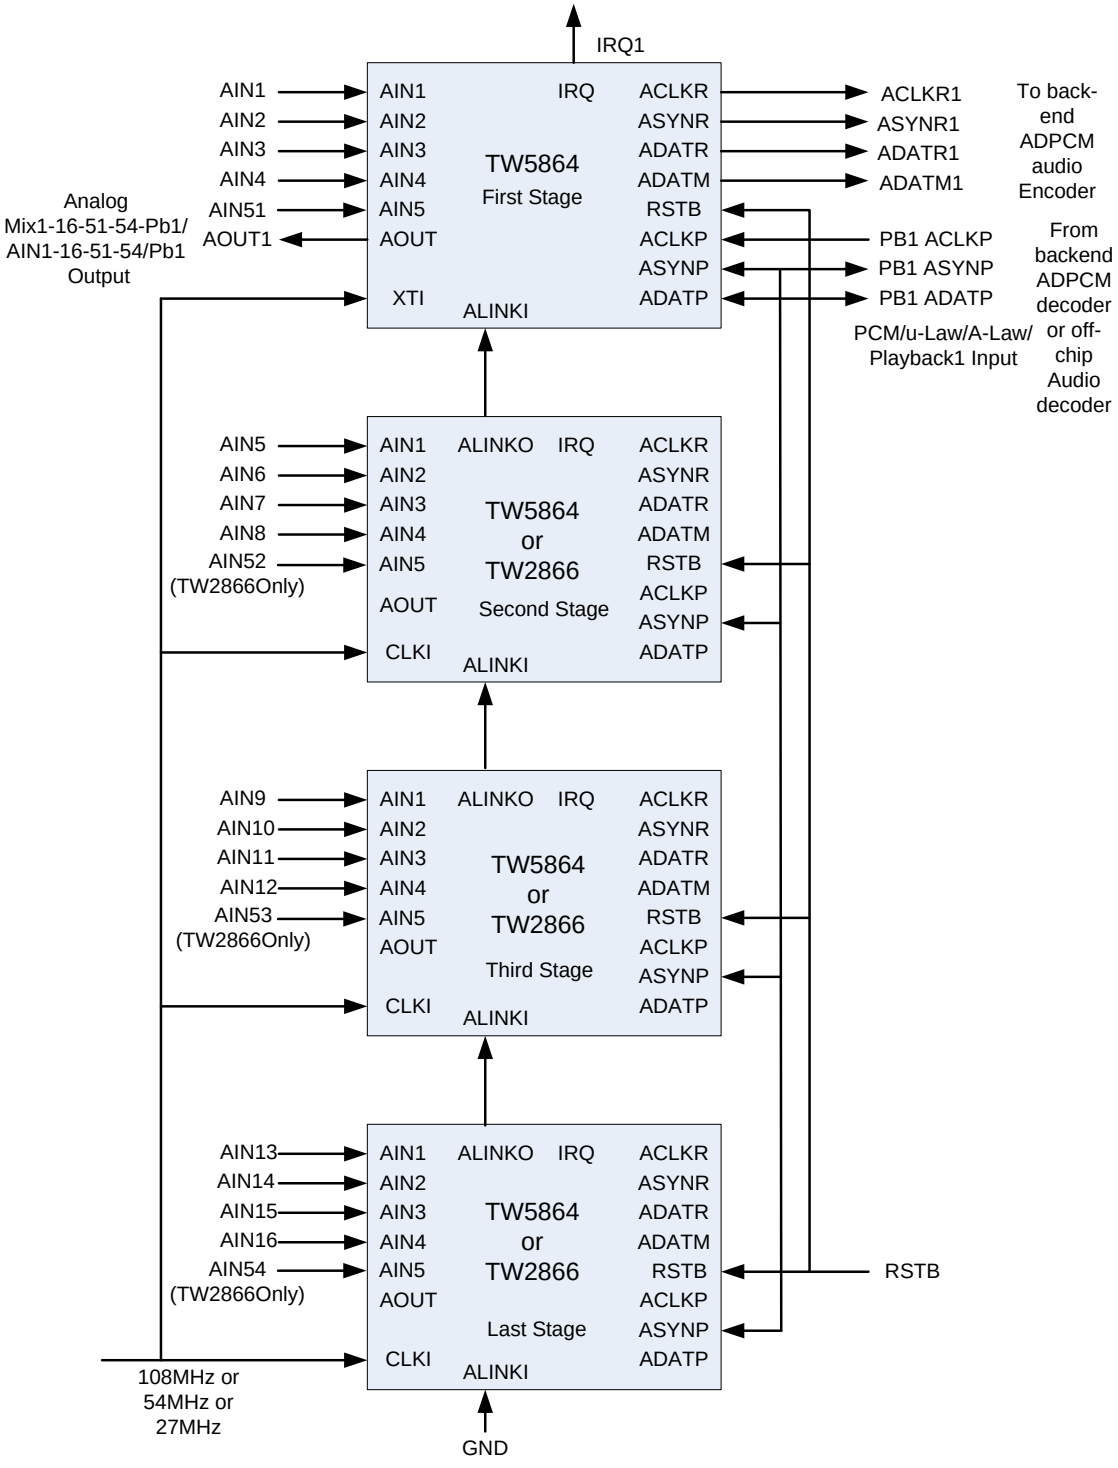

FIGURE 32. RECOMMENDED CLOCK MASTER CASCADE MODE SYSTEM WITH ACLKRMASTER=1

ACLKP/ASYNP SLAVE MODE DATA OUTPUT TIMING

The following 8 data input timing figures are supported. The ADATPDLY register needs to be set up according to the difference of ADATP data input timings. Data1 is only used as default. MSB bit is the first input bit as default PBINSWAP=0. If PBINSWAP=1, LSB bit is the first input bit.

ASYNP is ACLKP Falling Edge Triggered Input

AUDIO CLOCK GENERATION

TW5864 has built-in field locked audio clock generator for use in video capture applications. The circuitry will generate the same predefined number of audio sample clocks per field to ensure synchronous playback of video and audio after digital recording or compression. The audio clock is digitally synthesized from the crystal clock input. The master audio clock frequency is programmable through ACKN and ACKI register based following two equations.

ACKN = round (F AMCLK / F field), it gives the Audio master Clock per Field.

ACKI = round (F AMCLK / F 27MHz * 2^23), it gives the Audio master Clock Nominal increment.

Following table provides setting example of some common used audio frequency assuming Video Decoder system clock frequency of 27MHz. If ACLKRMASTER register bit is set to 1, following AMCLK is used as audio system clock inside TW5864.

If Slave Playback-in lock mode is required, ACKN=00100hex and PBREFEN=1 needs to be set up. The number of AMCLK clock per one ASYNP input cycle is locked (fixed) to 256 in this mode.

Frequency equation is “AMCLK (Freq) = 256 x ASYNP (Freq)”.

AUDIO CLOCK AUTO SETUP

If ACLKRMASTER=1 audio clock master mode is selected, and AFAUTO register is set to “1”,TW5864 set up ACKI register by AFMD register value automatically. ACKI control input in ACKG module block is automatically set up to the required value by the condition of AIN5MD and AFS384 register value.

TABLE 20. AUDIO FREQUENCY AUTO SETUP

AFAUTO	AFMD	ACKG MODULE ACKI CONTROL INPUT VALUE
1	0	8kHz mode value by each AIN5MD/AFS384 case.
1	1	16kHz mode value by each AIN5MD/AFS384 case.
1	2	32kHz mode value by each AIN5MD/AFS384 case.
1	3	44.1kHz mode value by each AIN5MD/AFS384 case.
1	4	48kHz mode value by each AIN5MD/AFS384 case.
0	X	ACKI register set up ACKI control input value.

Audio Encoding / Decoding

TW5864 provides a simple ADPCM G.726 hardware CODEC, mainly for speech coding purpose. It is used to map a series of 8-bit u-law (or a-low) PCM samples into a series of 4-bit ADPCM samples.

The ADPCM encoder takes the I2S format audio samples from the on-chip front-end audio analog decoder as well as the off-chip audio input through the I2S input ports. The ADPCM encoder is capable of encoding 17 audio channels simultaneously.

The ADPCM decoder decodes the 4-bit samples back into the I2S format, and drives the on-chip audio DAC to drive the external speaker or pre-amplifier for playback purpose. The decoder can decode only 1 audio channel at a time.

Host Interfaces

TW5864 supports two types of host interfaces, through which external processors control and interact with TW5864 for configuration and data transfer. One is through the standard asynchronous memory bus interface, and the other is through the PCI interface working at either the target or the initiator mode, depending on the operation. While using as a PC card, the PCI interface is always used. In an embedded system, either asynchronous host interface or the PCI interface can be used. TW5864 has the same registers map for these two interfaces so that the firmware on embedded platform does not need to differentiate which interface is in use except the bus control modules in TW5864 driver.

These two interfaces share some common I/O pins, and can only be used exclusively. The interrupt signal is also shared for both PCI and the asynchronous interface.

The host interface supports several modes: single read / write access, burst read / write access, DDR burst read / write, and PCI initiator write access.

PCI INTERFACE

The PCI module in TW5864 will work both as an initiator and target. It is an initiator when it is sending the preview, h264 and audio coded streams to host PC. It is in target mode when PC host is configuring the registers and programming the chip. The PCI interface supports both 33MHz and 66MHz operation.

Single Read/Write Access

Similar to the asynchronous host interface, the TW5864 PCI interface supports the single read/write operation. The address space mapping and the entire indirect access / DDR memory page are used the same way as the asynchronous host interface. Similarly to the asynchronous host interface, the single R/W access runs in the PCI target mode, which makes the TW5864 a slave device to the external MCU.

Target Burst Read

The PCI target burst read of TW5864 allows the external MCU to burst read a whole block of data of a continuous address space from TW5864. This target burst read function is only used to access the TW5864 on-chip double buffer A. The double buffer A is only used for DMA movement between the external DDRs and TW5864.

In order to burst read a space of an external DDR memory, a DMA operation is started to read data from external DDR into the double buffer A. The MCU then issues target burst read operation to read data from the double buffer A into the MCU.

A DMA write operation to the external DDR is supported. However the TW5864 does not support PCI target burst write operation. The MCU has to fill data into the double buffer A through multiple single write operation. Once the double buffer A is filled, a DMA write operation is started to write the data in double buffer A into the external DDR.

Master Burst Write

The TW5864 PCI interface can act as a PCI initiator to burst write a block of data automatically into the memory space of the external MCU. This master burst write function is used by several modules – H264 encoder, the audio ADPCM encoder, and the PCI preview module. When this mode is used, the bitstreams or data sent by each module does not go through the external DDR. They are sent from each module into a buffer for each path, and push into the external MCU memory space.

ASYNCHRONOUS INTERFACE

In addition to the PCI host interface, TW5864 also support commonly used Asynchronous Interface. The most commonly used ARM and PPC processors are supported. The data width can be either 16 bit or 32bit.

Asynchronous host interface only supports single access read and write operation. Using this interface, the TW5864 is always slave to the external MCU. The MCU issue single word read/write operation to access all registers / memory space inside the address map.

The address space of this asynchronous host interface is the same as the PCI interface. It includes all the on-chip registers, a page of space mapped for the external DDR_A and DDR_B, and an indirect access mechanism to read/write the registers at the front-end video / audio decoder registers and external preview multiplexing control registers.

The external DDRs are mapped into a page of address space through a page select register. Each page is 16 Kbytes. The page select register select a page area in either of the external DDRs such that accessing to this address space is equivalent to access the external DDR directly.

Some front-end registers related to embedded video decoder / audio decoder / preview multiplexing previews are accessed through indirect access through the registers 0xB800 ~ 0xB80C.

Although the asynchronous host interfaces only support single word read / writes operation, a block move is possible as long as the external MCU has a DMA controller to access a block of address space continuously though multiple single access automatically.

External DRAM Interface

TW5864 uses two external DDR SDRAMs for various functions. The memory controller of the TW5864 supports 16-bit data width up to 166 MHz clock rate. The memory capacity is 256 Mbytes. The capacity used depends on the feature used on TW5864. If the TW5864 is used for 4 D1 / 16 CIF configuration, and minimum capacity of 256 Mbytes can be used. If, however, a 16 non-real-time D1 configuration is used, a much bigger video frame buffer is needed. At this time DDR of 1 Bytes of memory is needed.

When the chip is powered up, the CPU is responsible for setting all the on-chip configuration registers for DDR memory configuration. Once the registers are set, the CPU releases the software reset signal, then the DDR memory controller initializes the DDR memory configuration using the parameters in the registers. After the initialization is done, the DDR memory is ready for use. After the initialization, the memory controller does the memory refresh automatically.

HW Operation Flow

The key data paths on TW5864 for various encoding and decoding functions are illustrated in Figure 41. The HW operational flow for the four major functions (H.264, JPWG, Audio, Preview) in TW5864 will be described in detail subsequently.

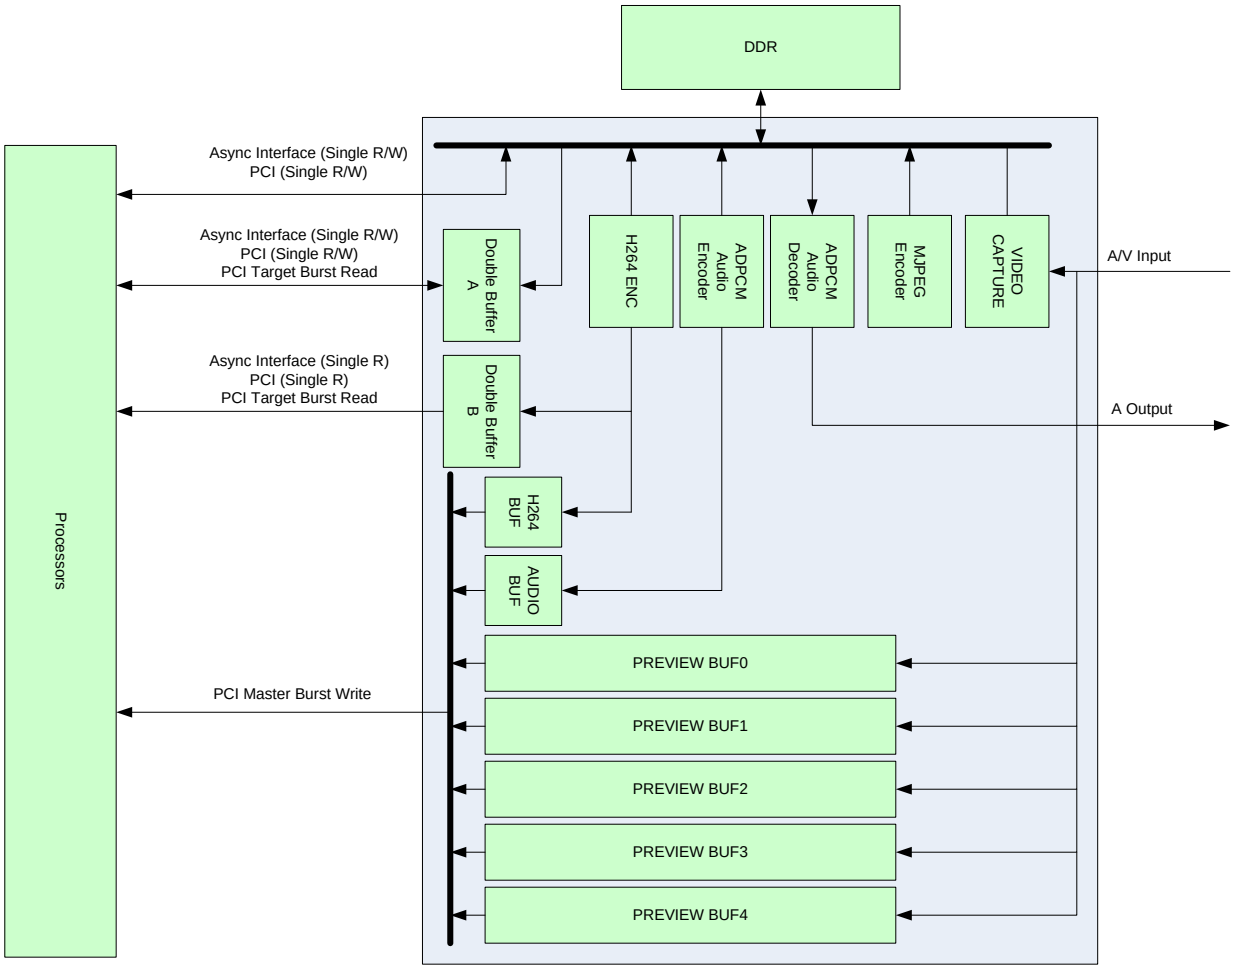

FIGURE 41. TW5864 HW DATA FLOW

H264 Encoding Data Flow

The H264 encoding data flow on TW5864 is shown in the figure below. The video data are captured into the external DDR memory by the video capture module. All the previous encoded reference frames are also stored in the DDR. From there, the H264 encoder generates the reference frame pixels for used for future use into the external DDR. The encoded VLC bitstream is either stored back into DDR, or simply write into the double buffer B.

When the VLC bitstream is stored in the DDR, the external MCU instruct the on-chip DMA module to move the data from external DDR into the double buffer A, from which the external MCU can perform single read or PCI target burst read to move the data from double buffer A into the MCU memory space.

When the VLC bitstream is stored in the double buffer B, the external MCU simply read the bitstream from this data buffer through either single read or PCI target burst read.

With the coded VLC stream in DDR, the MCU has more flexibility in performing the data movement. While if the codec VLC stream is stored in double buffer B, the MCU has to attend to read the data stream quickly to make sure the buffer is not over flown.

When PCI master mode is used, the encoded VLC stream can be pushed into the MCU memory space automatically, as shown in the green arrow below.

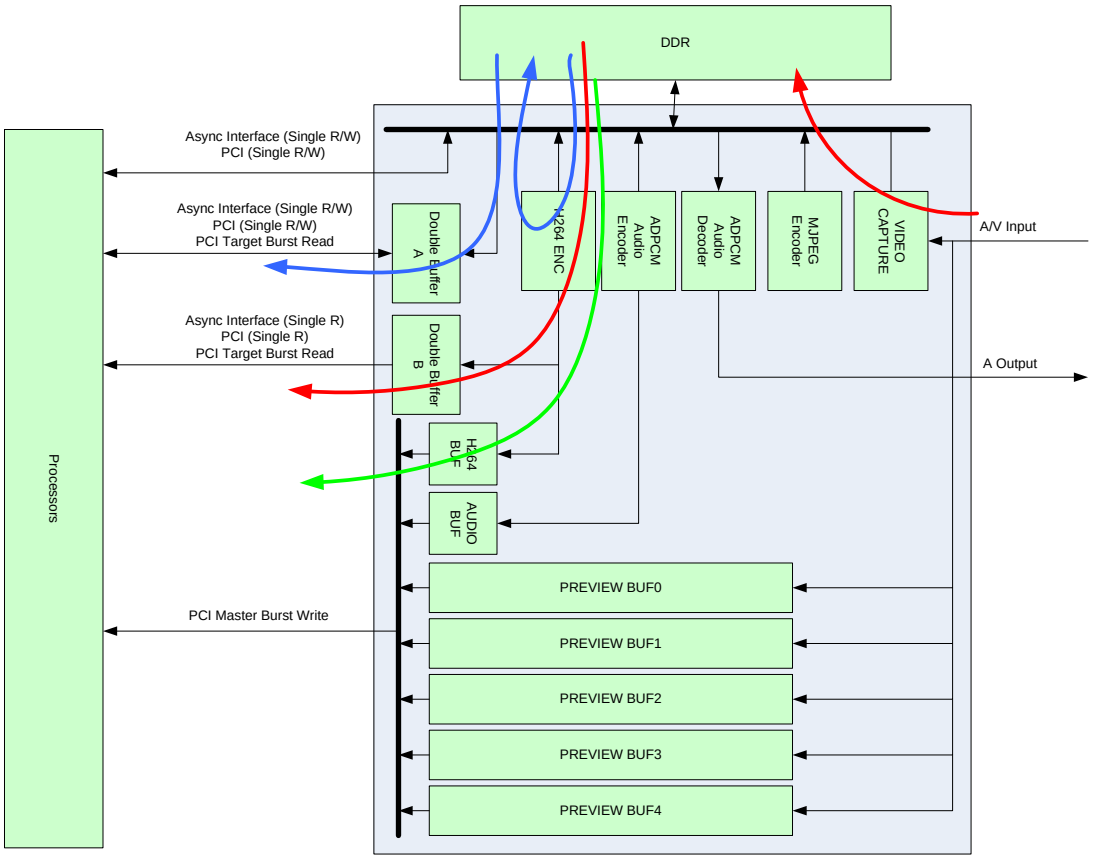

FIGURE 42. H264 ENCODING DATA FLOW

MJPEG Encoding Data Flow

TW5864 MJPEG encoder always encodes the frames/fields back into the DDR memory.

The only way MCU fetch the encoded bitstream is through the double buffer A.

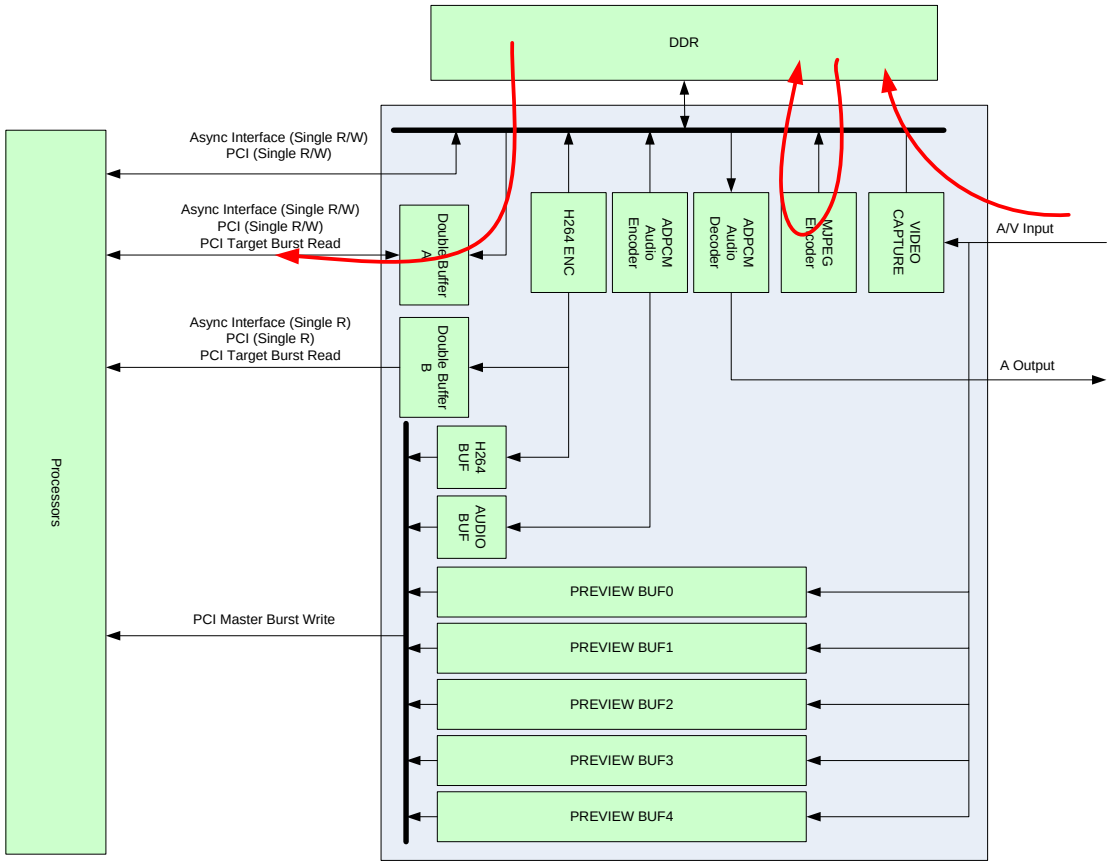

FIGURE 43. MJPEG ENCODING DATA FLOW

ADPCM Encoding Data Flow

Audio ADPCM coded bitstream can be fetched either through the external DDR, or it can be pushed into the audio buffer when PCI master mode is used.

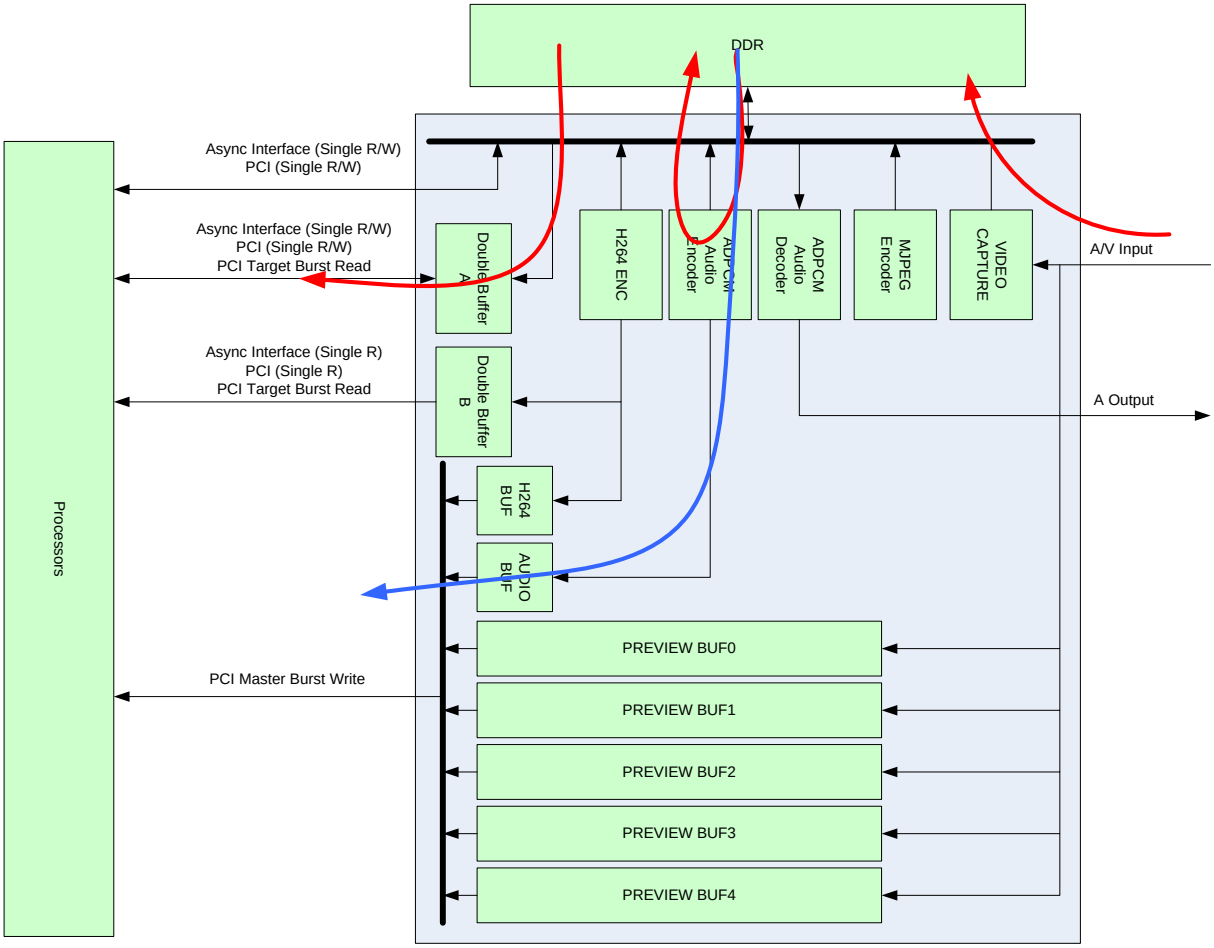

FIGURE 44. ADPCM ENCODING DATA FLOW

ADPCM Decoding Data Flow

Audio ADPCM decoder bitstream can be put into the DDR through either double buffer A, or just through single access read/write of external DDR through page mode mapping. Once the bitstream is in the DDR, the ADPCM decoder can be started to decode and output audio samples through I2S interface.

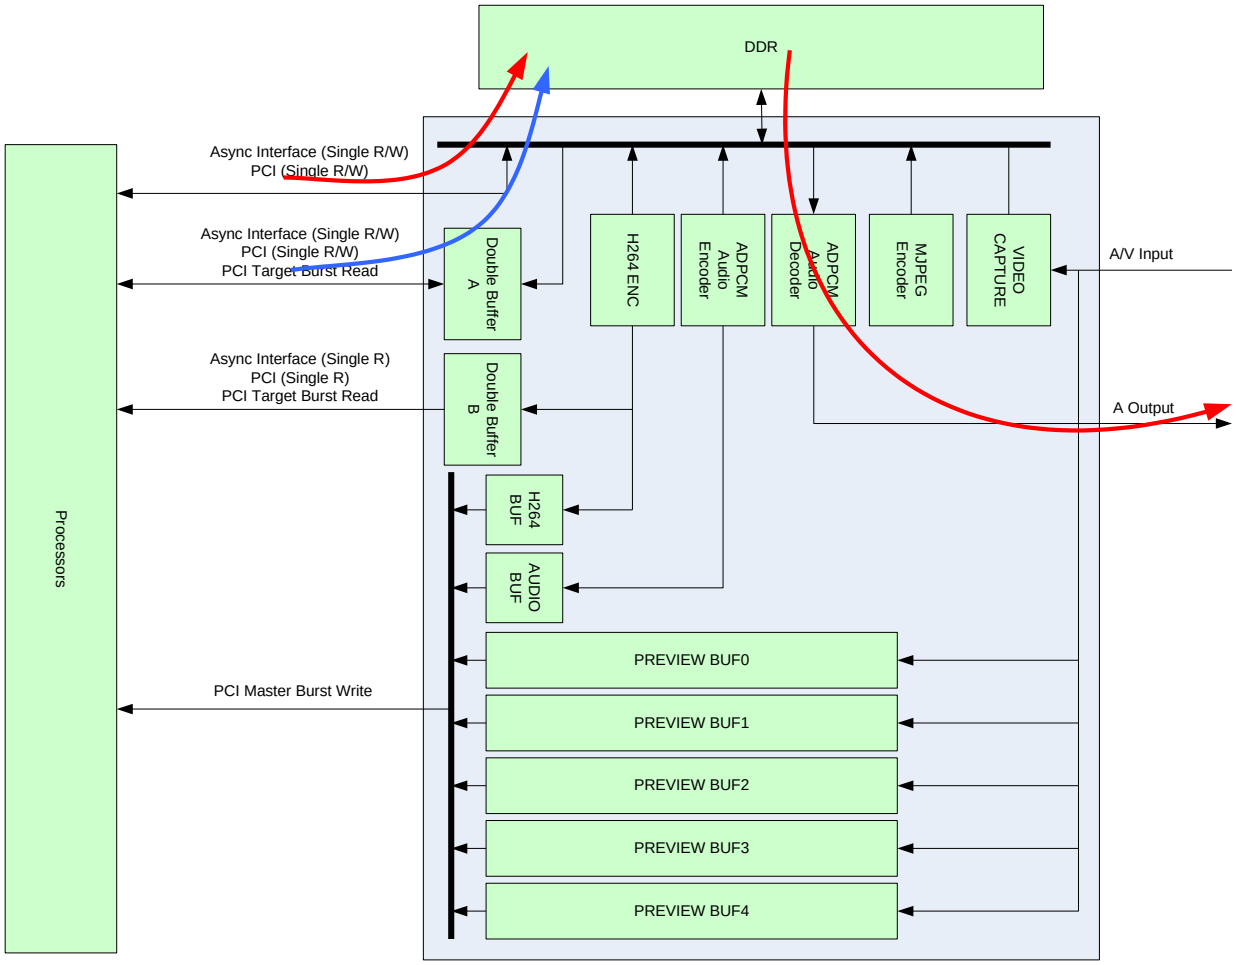

FIGURE 45. ADPCM DECODING DATA FLOW

PCI Preview Data Flow

TW5864 PCI preview path only allows data to push into the external MCU memory space through PCI master mode. The data does not go through the external DDR memory.

0x8024			1	SYSPLL_PD				SYSPLL_RST

The system / DDR clock (166 MHz) is generated with an on-chip system clock PLL (SYSPLL) using input crystal clock of 27 MHz. The system clock PLL frequency is controlled with the following equation.

CLK_OUT = CLK_IN * (M+1) / ((N+1) * P)

SYSPLL_M — M parameter

SYSPLL_N — N parameter

SYSPLL_P — Select P parameter from the following

0	1
1	2
2	4
3	8

SYSPLL_IREF — SYSPLL bias current control

0	Lower current (default)
1	30% higher current

SYSPLL_CP_SEL — SYSPLL charge pump current selection

0	1,5µA
1	4µA
2	9µA
3	19µA
4	39µA
5	79µA

	6	159μA
	7	319μA
SYSPLL_VCO	VCO Range selection	
	00	5 ~ 75 MHz
	01	50 ~ 140 MHz
	10	110 ~ 320 MHz
	11	270 ~ 700 MHz
SYSPLL_LP_X8	Loop resister	
	0	38.5KΩ
	1	6.6KΩ (default)
	2	2.2KΩ
	3	1.1KΩ
SYSPLL_ICP_SEL	PLL charge pump fine tune	
	00	x1 (default)
	01	x1/2
	10	x1/7
	11	x1/8
SYSPLL_LPF_5PF	PLL low pass filter phase margin adjustment	
	0	no 5pF (default)
	1	5pF added
SYSPLL_ED_SEL	PFD select edge for detection	
	0	Falling edge (default)
	1	Rising edge
SYSPLL_RST	Reset SYSPLL	
SYSPLL_PD	Power down SYSPLL	

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x801C				SPLL_CFG	LOAD	SYSPLL_CFG		SRST

SRST — Issue Soft Reset from Async Host Interface / PCI Interface clock domain. Become valid after sync to the xtal clock domain. This bit is set only if LOAD register bit is also set to 1.

SYSPLL_CFG — Issue SYSPLL (166 MHz) configuration latch from Async host interface / PCI Interface clock domain. The configuration setting becomes effective only if LOAD register bit is also set to 1.

SPLL_CFG — Issue SPLL (108 MHz) configuration load from Async host interface / PCI Interface clock domain. The configuration setting becomes effective only if the LOAD register bit is also set to 1.

LOAD — Set this bit to latch the SRST, SYSPLL_CFG, and SPLL_CFG setting into the xtal clock domain to restart the PLL. This bit is self cleared.

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x8028		SPLL_IREF	SPLL_LPX4		SPLL_CPX4		SPLL_PD	SPLL_DBG

SPLL_DBG — Internal use only. Set to 0.

SPLL_PD — Power down 108 MHz SPLL.

SPLL_CPX4 — 108 MHz PLL charge pump select

0 1μA
1 5μA (default)
2 10μA
3 15μA

SPLL_LPX4 — 108 MHz PLL loop filter select

0 80KΩ
1 40KΩ (default)
2 30KΩ
3 20KΩ

SPLL_IREF 108 MHz PLL current control

0 Low current (default)

1 Higher current (30% more than setting to 0)

0xA000 ~ 0xA8FF – DDR Controller Register Map

DDR Controller A:

Address	[15:3]	[2:0]
0xA000	Reserved	RD_ACK_VLD_MUX

RD_ACK_VLD_MUX Data valid counter after read command to DDR
This is the delay value to show how many cycles the data will be back from DDR after we issue a read command.

Address	[15:12]	[11:8]	[7:4]	[2:0]
0xA004	TRAS_CNT_MAX	RFC_CNT_MAX	TCD_CNT_MAX	TWR_CNT_MAX

TRAS_CNT_MAX Tras value, the minimum cycle of active to precharge command period, default is 7

RFC_CNT_MAX Trfc value, the minimum cycle of refresh to active or refresh command period, default is 4'hf

TCD_CNT_MAX Trcd value, the minimum cycle of active to internal read/write command period, default is 4'h2,

TWR_CNT_MAX Twr value, write recovery time, default is 4'h3

Address	[15:3]	[2:0]
0xA008	Reserved	CAS_LATENCY

CAS_LATENCY CAS latency, the delay cycle between internal read command and the availability of the first bit of output data, default is 3

Address	[15:0]
0xA00C	DDR_REF_CNTR_MAX

DDR_REF_CNTR_MAX Maximum average periodic refresh, the value is based on the current frequency to match 7.8μs.

Address	[15:3]	[2:0]
0xA01C	Reserved	DDR_ON_CHIP_MAP

DDR_ON_CHIP_MAP [1:0]
0x0 256M DDR on board
0x1 512M DDR on board
0x2 1G DDR on board

DDR_ON_CHIP_MAP [2]
0x0 Only one DDR chip
0x1 Two DDR chips

Address	[15:6]	[5:4]	[2]	[1]	[0]

0xA020	Reserved	DATA_MODE	WRITE_FLAG	SINGLE_PROC	MASTER_MODE

MASTER_MODE
0 Common read/write mode
1 DDR self-test mode

SINGLE_PROC
0 DDR self-test single read/write
1 DDR self-test burst read/write

WRITE_FLAG
0 DDR self-test write command
1 DDR self-test read command

DATA_MODE [1:0]
0x0 write 32'haaaa5555 to DDR
0x1 write 32'hffffffff to DDR
0x2 write 32'hha5a55a5a to DDR
0x3 write increasing data to DDR

Address	[15:8]	[7:0]
0xA024	Reserved	BURST_CNTR_MAX

BURST_CNTR_MAX The maximum data of one burst in DDR self-test mode

Address	[15:0]
0xA028	DDR_PROC_CNTR_MAX_L

DDR_PROC_CNTR_MAX_L The maximum burst counter (bit 15~0) in DDR self-test mode

Address	[15:0]
0xA02C	DDR_PROC_CNTR_MAX_H

DDR_PROC_CNTR_MAX_H The maximum burst counter (bit 31~16) in DDR self-test mode

Address	[15:1]	[0]
0xA030	Reserved	DDR_SELF_TEST_CMD

DDR_SELF_TEST_CMD 1 Start one DDR self-test
0 No self-test

Address	[15:0]
0xA034	ERR_CNTR_L

ERR_CNTR_L The maximum error counter (bit15 ~ 0) in DDR self-test

Address	[15]	[14:0]
0xA038	END_FLAG	ERR_CNTR_H

ERR_CNTR_H The maximum error counter (bit30 ~ 16) in DDR self-test

END_FLAG DDR self-test end flag

DDR Controller B:

Address	[15:3]	[2:0]
0xA800	Reserved	RD_ACK_VLD_MUX

RD_ACK_VLD_MUX Data valid counter after read command to DDR

Address	[15:12]	[11:8]	[7:4]	[2:0]
0xA804	TRAS_CNT_MAX	RFC_CNT_MAX	TCD_CNT_MAX	TWR_CNT_MAX

TRAS_CNT_MAX Tras maximum value

RFC_CNT_MAX Trfc maximum value

TCD_CNT_MAX Tcd maximum value

TWR_CNT_MAX Twr maximum value

Address	[15:3]	[2:0]
0xA808	Reserved	CAS_LATENCY

CAS_LATENCY CAS latency

Address	[15:0]
0xA80C	DDR_REF_CNTR_MAX

DDR_REF_CNTR_MAX Maximum value of DDR auto refresh

Address	[15:3]	[2:0]

	Reserved							
	[31]	[30]	[29]	[28]	[27]	[26]	[25]	[24]
	BUSY						ENABLE	R/W

IND_ADDR	Address used to access indirect register space.
BUSY	Wait until this bit is '0' before using indirect access
ENABLE	Activate the indirect access. This bit is self cleared.
R/W	Read/Write command

Address	[31:0]
0xB804	IND_DATA

IND_DATA	Data used to read/write indirect register space

In order to access the indirect register space, the following procedure is followed.

Write Registers:

(1) Write IND_DATA at 0xB804 ~ 0xB807

(2) Read BUSY flag from 0xB803. Wait until BUSY signal is 0.

(3) Write IND_ADDR at 0xB800 ~ 0xB801. Set R/W to '1', ENABLE to '1'

Read Registers:

(1) Read BUSY flag from 0xB803. Wait until BUSY signal is 0.

(2) Write IND_ADDR at 0xB800 ~ 0xB801. Set R/W to '0', ENABLE to '1'

(3) Read BUSY flag from 0xB803. Wait until BUSY signal is 0.

(4) Read IND_DATA from 0xB804 ~ 0xB807

0xC000 ~ 0xC7FC -- Preview Register Map

Address	[15:0]

	PCI_PV_BUS3_MAP_CH3				PCI_PV_BUS3_MAP_CH2			

PCI_PV_BUSm_MAP_CHn	The16-to-1 MUX configuration register for each preview channel (total of 16 channels). Four bits for each preview channel.

0xC800 ~ 0xC804 -- JPEG Capture Register Map

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0xC800	JPG_CAP_FMT_0		JPG_CAP_CH_0				JPG_BRST_CAP_0	JPG_SING_CAP_0
	[15]	[14]	[13]	[12]	[11]	[10]	[9]	[8]
							JPG_DNS_0	JPG_PROG_0
Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0xC804	JPG_CAP_FMT_1		JPG_CAP_CH_1				JPG_BRST_CAP_1	JPG_SING_CAP_1
	[15]	[14]	[13]	[12]	[11]	[10]	[9]	[8]
							JPG_DNS_1	JPG_PROG_1

JPG_SING_CAP_n — JPEG Path Command for Single capture for bus n

- 1 — Start to capture next frame, de-activated when frame ends
- 0 — No command

JPG_BRST_CAP_n — JPEG Path Command for Burst capture for bus n

- 1 — Start to capture frames until CPU set ENC command
- 0 — No command

JPG_CAP_CH_n — JPEG Path Capture channel Select for bus n

JPG_CAP_FMT_n — JPEG Capture Path Format for bus n

- 00 — D1 (For D1 frame)
- 01 — CIF with ½ size in X (for QCIF frame mode)
- 10 — (Reserved)
- 11 — D1 with ½ size in X (for CIF frame)

JPG_DNS_n — JPEG Capture Path Downscale Input for bus n

- 1 — Downscale in Y to 1/2
- 0 — Does not downscale

JPG_PROG_n — JPEG Path channel n is progressive

- 1 — Progressive (Not valid for TW5864B)
- 0 — Interlaced (TW5864B default)

0xD000 ~ 0xD0FC -- JPEG Control Register Map

Address	[31：0]
0xD000	JPEG_QSCALE

JPEG_QSCALE Jpeg quality scale register. The default value should be 32'h10

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0xD004			JPG_NEWEST_BUF0		JPG_VLD_FRM0			
	[15]	[14]	[13]	[12]	[11]	[10]	[9]	[8]
	JPG_VLD_FRM_RES0							
	[23]	[22]	[21]	[20]	[19]	[18]	[17]	[16]
	JPG_VLD_FRM_CHID0[7:0]							
	[31]	[30]	[29]	[28]	[27]	[26]	[25]	[24]
	JPG_VLD_FRM_CHID0[15:0]							

Valid frame indication register, after one frame of path 0 have been stored in the DDR the corresponding bit of this register become valid. Software can acknowledge now it can encode which frame in DDR through this register. This is a read only register

JPG_VLD_FRM0 For every path, there are 4 buffers in DDR and every bit correspond to one buffer, and the order is bit 0 for buffer 0, bit 1 for buffer 1, and so on

JPG_NEWEST_BUF0 Specify the buffer operated recently

JPG_VLD_FRM_RES0 Frame resolution, every buffer use 2 bits

00 D1

01 not used

10 CIF

11 HD1

JPG_VLD_FRM_CHID0Channel ID, every buffer use 4 bits

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0xD008			JPG_NEWEST_BUF1		JPG_VLD_FRM1			
	[15]	[14]	[13]	[12]	[11]	[10]	[9]	[8]
	JPG_VLD_FRM_RES1							
	[23]	[22]	[21]	[20]	[19]	[18]	[17]	[16]
	JPG_VLD_FRM_CHID1[7:0]							
	[31]	[30]	[29]	[28]	[27]	[26]	[25]	[24]
	JPG_VLD_FRM_CHID1[15:0]							

Valid frame indication register is used for indicating the path1 buffer status.

JPG_VLD_FRM1 For every path, there are 4 buffers in DDR and every bit correspond to one buffer, and the order is bit 0 for buffer 0, bit 1 for buffer 1, and so on

JPG_NEWEST_BUF1 Specify the buffer operated recently

JPG_VLD_FRM_RES1 Frame resolution, every buffer use 2 bits

00: D1

01: not used

10: CIF

11: HD1

JPG_VLD_FRM_CHID1Channel ID, every buffer use 4 bits

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0xD00C					BUFFER_SEL			ENCODE_EN

Encode indicate register, through it software can control which buffer is encoded.

ENCODE_EN Encode enable bit

BUFFER_SEL Buffer select. 000-111 indicates all of the eight buffers of two paths. For example, 000 is buffer0 in path0, 001 is buffer1 in path0, 111 is buffer3 in path1, and so on

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0xD010	ENCODE_COMP							

Encode complete indication register, through rolling this register. Application software can acknowledge which frame has been encoded completely. This register is read only

ENCODE_COMP	Encode complete

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0xD014								CAP_ENABLE_0

Channel 0 capture enable indication register. Application software should write this bit to 1 after starting to capture one frame using register 0xC800

CAP_ENABLE_0	Channel 0 capture enable indicate

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0xD018								CAP_ENABLE_1

Channel 1 capture enable indication register. Application software should write this bit to 1 after starting to capture one frame using register 0xC804

CAP_ENABLE_1 Channel 1 capture enable indicate

Address	[31:0]
0xD01C	CAP_TIMEOUT_VALUE

This register is the maximal time interval between capture register is set and one frame has been stored in the DDR. Using this register to enhance system error-tolerance. The default value is 0x80000000. Normally **application software can set this register to 0x01000000, and other value base on DDR load.**

CAP_TIMEOUT_VALUE Capture timeout register

Address	[31:0]
0xD040	JPG_LENGTH0
0xD044	JPG_LENGTH1
0xD048	JPG_LENGTH2
0xD04C	JPG_LENGTH3
0xD050	JPG_LENGTH4
0xD054	JPG_LENGTH5
0xD058	JPG_LENGTH6
0xD05C	JPG_LENGTH7

JPG_LENGTHx Jpeg stream length registers

Address	[31:16]	[15:0]
0xD060	JPG_TIMESTAMP1	JPG_TIMESTAMP1
0xD064	JPG_TIMESTAMP3	JPG_TIMESTAMP2
0xD068	JPG_TIMESTAMP5	JPG_TIMESTAMP4
0xD06C	JPG_TIMESTAMP7	JPG_TIMESTAMP6

JPG_TIMESTAMPx Every channel original video timestamp

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0xD07C								JPG_NTSC

JPG_NTSC 1: NTSC 0: PAL (default)

Address	[31:0]
0xD0F0	DELAY_NUMBER

DELAY_NUMBER The capture will timeout complete beyond this time. Normally this register should be set to all 1

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0xD0F8	RESERVE							PCI_MODE

PCI mode The stream will be pushed up to system memory through PCI master

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0xD0FC								SOFT_RST

If there are some special situations, like the original source video is not stable and so on, which will make the jpeg encode enter into the incorrect status, the application software can only reset jpeg module and not affect other procession. At first, set 1 to kick off the reset action, and then set 0 to stop it, after this, jpeg core can work again normally.

SOFT_RST	1	start reset
	0	reset complete

0xE000 ~ 0xFC00 – Motion Vector Register Map

Address	[31:0]
0xE000 -0xE7FC	ME_MV_VEC

ME_MV_VEC ME Motion Vector data (Four Byte Each)

Address	[15:0]
0x84000 -0x87FFC	DPR_BUF_ADDR

DPR_BUF_DATA SRAM Buffer MPI Access Space. Totally 16 KB.

Register Description – Indirect Map Space

The indirect space is accessed through 0xB800 ~ 0xB807 registers in direct access space.

Analog Video / Audio Decoder / Encoder

#	Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0	0x000	VDLOSS*	HLOCK*	SLOCK*	FLD*	VLOCK*	NOVIDEO*	MONO*	DET50*
1	0x010								
2	0x020								
3	0x030								

* Read only bits

VDLOSS	1	Video not present. (sync is not detected in number of consecutive line periods specified by MISSCNT register)
	0	Video detected.
HLOCK	1	Horizontal sync PLL is locked to the incoming video source.
	0	Horizontal sync PLL is not locked.
SLOCK	1	Sub-carrier PLL is locked to the incoming video source.
	0	Sub-carrier PLL is not locked.
FLD	1	Even field is being decoded.
	0	Odd field is being decoded.
VLOCK	1	Vertical logic is locked to the incoming video source.
	0	Vertical logic is not locked.
NOVIDEO	Reserved for TEST.	
MONO	1	No color burst signal detected.
	0	Color burst signal detected.
DET50	0	60Hz source detected
	1	50Hz source detected

The actual vertical scanning frequency depends on the current standard invoked.

#	Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0	0x001	VCR*	WKAIR*	WKAIR1*	VSTD*	NINTL*	VSHP		
1	0x011								
2	0x021								
3	0x031								

* Read only bits

VCR — VCR signal indicator

WKAIR — Weak signal indicator 2.

WKAIR1 — Weak signal indicator controlled by WKTH

VSTD
1 = Standard signal
0 = Non-standard signal

NINTL
1 = Non-interlaced signal
0 = interlaced signal

VSHP
Vertical Sharpness Control
0 = None (default)
7 = Highest
**Note: VSHP must be set to '0' if COMB = 0

#	Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0	0x006	0	0	VACTIVE_XY[8]	VDELAY_XY[8]	HACITIVE_XY[9:8]		HDELAY_XY[9:8]	
1	0x016								
2	0x026								
3	0x036								
0	0x002	HDELAY_XY[7:0]							
1	0x012								
2	0x022								
3	0x032								

HDELAY_XY — This 10bit register defines the starting location of horizontal active pixel for display / record path. A unit is 1 pixel. The default value is 0x00F for NTSC and 0x00A for PAL.

#	Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0	0x006	0	0	VACTIVE_XY[8]	VDELAY_XY[8]	HACITIVE_XY[9:8]		HDELAY_XY[9:8]	
1	0x016								
2	0x026								
3	0x036								
0	0x003	HACTIVE_XY[7:0]							
1	0x013								
2	0x023								
3	0x033								

HACTIVE_XY — This 10bit register defines the number of horizontal active pixel for display / record path. A unit is 1 pixel. The default value is decimal 720.

#	Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0	0x006	0	0	VACTIVE_XY[8]	VDELAY_XY[8]	HACITIVE_XY[9:8]		HDELAY_XY[9:8]	
1	0x016								
2	0x026								
3	0x036								
0	0x004	VDELAY_XY[7:0]							
1	0x014								
2	0x024								
3	0x034								

VDELAY_XY — This 9bit register defines the starting location of vertical active for display / record path. A unit is 1 line. The default value is decimal 6.

#	Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0	0x006	0	0	VACTIVE_XY[8]	VDELAY_XY[8]	HACITIVE_XY[9:8]		HDELAY_XY[9:8]	
1	0x016								
2	0x026								
3	0x036								
0	0x005	VACTIVE_XY[7:0]							
1	0x015								
2	0x025								
3	0x035								

VACTIVE_XY — This 9bit register defines the number of vertical active lines for display / record path. A unit is 1 line. The default value is decimal 240.

#	Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0	0x007	HUE							
1	0x017								
2	0x027								
3	0x037								

HUE — These bits control the color hue as 2's complement number. They have value from +36° (7Fh) to -36° (80h) with an increment of 2.8°. The 2 LSB has no effect. The positive value gives greenish tone and negative value gives purplish tone. The default value is 0° (00h). This is effective only on NTSC system. The default is 00h.

#	Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0	0x008	SCURVE	VSF	CTI		SHARPNESS			
1	0x018								
2	0x028								
3	0x038								

SCURVE — This bit controls the center frequency of the peaking filter. The corresponding gain adjustment is HFLT.
0 Low
1 center

VSF — This bit is for internal used. The default is 0.

CTI — CTI level selection. The default is 1.
0 None
3 Highest

SHARPNESS — These bits control the amount of sharpness enhancement on the luminance signals. There are 16 levels of control with '0' having no effect on the output image. 1 through 15 provides sharpness enhancement with 'F' being the strongest. The default is 1.

#	Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0	0x009	CNTRST							
1	0x019								
2	0x029								
3	0x039								

CNTRST — These bits control the luminance contrast gain. A value of 100 (64h) has a gain of 1. The range adjustment is from 0% to 255% at 1% per step. The default is 64h.

VIN	Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0	0x00A	BRIGHT							
1	0x01A								
2	0x02A								
3	0x03A								

BRIGHT — These bits control the brightness. They have value of –128 to 127 in 2's complement form. Positive value increases brightness. A value 0 has no effect on the data. The default is 00h.

#	Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0	0x00B	SAT_U							
1	0x01B								
2	0x02B								
3	0x03B								

SAT_U — These bits control the digital gain adjustment to the U (or Cb) component of the digital video signal. The color saturation can be adjusted by adjusting the U and V color gain components by the same amount in the normal situation. The U and V can also be adjusted independently to provide greater flexibility. The range of adjustment is 0 to 200%. A value of 128 (80h) has gain of 100%. The default is 80h.

#	Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0	0x00C	SAT_V							
1	0x01C								
2	0x02C								
3	0x03C								

SAT_V — These bits control the digital gain adjustment to the V (or Cr) component of the digital video signal. The color saturation can be adjusted by adjusting the U and V color gain components by the same amount in the normal situation. The U and V can also be adjusted independently to provide greater flexibility. The range of adjustment is 0 to 200%. A value of 128 (80h) has gain of 100%. The default is 80h.

#	Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0	0x00D	SF*	PF*	FF*	KF*	CSBAD*	MCVSN*	CSTRIPE*	CTYPE2*
1	0x01D								
2	0x02D								
3	0x03D								

* Read only bits

SF — This bit is for internal use

PF — This bit is for internal use

FF — This bit is for internal use

KF — This bit is for internal use

CSBAD
1 Macrovision color stripe detection may be un-reliable

MCVSN
1 Macrovision AGC pulse detected.
0 Not detected.

CSTRIPE
1 Macrovision color stripe protection burst detected.
0 Not detected.

CTYPE2
This bit is valid only when color stripe protection is detected, i.e. if CSTRIPE=1,
1 Type 2 color stripe protection
0 Type 3 color stripe protection

#	Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0	0x00E	DETSTUS*	STDNOW*			ATREG	STANDARD		
1	0x01E								
2	0x02E								
3	0x03E								

* Read only bits

DETSTUS
- 0 Idle
- 1 Detection in progress

STDNOW

Current standard invoked
- 0 NTSC (M)
- 1 PAL (B, D, G, H, I)
- 2 SECAM
- 3 NTSC4.43
- 4 PAL (M)
- 5 PAL (CN)
- 6 PAL 60
- 7 Not valid

ATREG
- 1 Disable the shadow registers
- 0 Enable VACTIVE and HDELAY shadow registers value depending on STANDARD. (Default)

STANDARD

Standard selection
- 0 NTSC (M)
- 1 PAL (B, D, G, H, I)
- 2 SECAM
- 3 NTSC4.43
- 4 PAL (M)
- 5 PAL (CN)
- 6 PAL 60
- 7 Auto detection (Default)

#	Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0	0x00F	ATSTART	PAL60EN	PALCNEN	PALMEN	NTSC44EN	SECAMEN	PALBEN	NTSCEN
1	0x01F								
2	0x02F								
3	0x03F								

ATSTART	1	Writing 1 to this bit will manually initiate the auto format detection process. This bit is a self-clearing bit
	0	Manual initiation of auto format detection is done. (Default)
PAL60EN	1	Enable recognition of PAL60 (Default)
	0	Disable recognition
PALCNEN	1	Enable recognition of PAL (CN). (Default)
	0	Disable recognition
PALMEN	1	Enable recognition of PAL (M). (Default)
	0	Disable recognition
NTSC44EN	1	Enable recognition of NTSC 4.43. (Default)
	0	Disable recognition
SECAMEN	1	Enable recognition of SECAM. (Default)
	0	Disable recognition
PALBEN	1	Enable recognition of PAL (B, D, G, H, I). (Default)
	0	Disable recognition
NTSCEN	1	Enable recognition of NTSC (M). (Default)
	0	Disable recognition

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x041	0	0	0	0	0	0	vd34_108_pol	vd12_108_pol

VD34_108_POL Use falling edge to sample VD34 from 54 MHz to 108 MHz

VD12_108_POL Use falling edge to sample VD12 from 54 MHz to 108 MHz

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x042	PTRN_CTL							

PTRN_CTL Control setting for internal pattern generator. For testing purpose only.

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x045	0	0	VSMODE	FLDPOL	HSPOL	VSPOL	DECVSMODE	DECFLDPOL

VSMODE Control the VS and field flag timing
- 0 VS and field flag is aligned with vertical sync of incoming video (Default)
- 1 VS and field flag is aligned with HS

FLDPOL Select the FLD polarity
- 0 Odd field is high
- 1 Even field is high (Default)

HSPOL Select the HS polarity
- 0 Low for sync duration (Default)
- 1 High for sync duration

VSPOL Select the VS polarity
- 0 Low for sync duration (Default)
- 1 High for sync duration

DECVSMODE 0 Default

DECFLDPOL 0 Default

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x046	AGCEN4	AGCEN3	AGCEN2	AGCEN1	AGCGAIN4[8]	AGCGAIN3[8]	AGCGAIN2[8]	AGCGAIN1[8]
0x047	AGCGAIN1[7:0]							
0x048	AGCGAIN2[7:0]							
0x049	AGCGAIN3[7:0]							
0x04A	AGCGAIN4[7:0]							

AGCENn — Select Video AGC loop function on VIN of channel n
- 0 AGC loop function enabled (recommended for most application cases) (default).
- 1 AGC loop function disabled. Gain is set by AGCGAINn

AGCGAINn — These registers control the AGC gain of channel n when AGC loop is disabled. Default value is 0F0h.

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x04B	PD_BIAS	V_ADC_SAVE			0	0	0	YFLEN

PD_BIAS
- 1 Power down the bias of all 4 VADC
- 0 Do not power down the bias

V_ADC_SAVE — Power Saving Mode Selection.
- 0 Most Power Consuming
- 7 Most Power Saving

IREF
- 0 Internal current reference 1 for Video ADC (default)
- 1 Internal current reference increase 30% for Video ADC.

VREF
- 0 Internal voltage reference for Video ADC (default)
- 1 Internal voltage reference shut down for Video ADC

YFLEN — Analog Video CH1/CH2/CH3/CH4 anti-alias filter control
- 1 Enable (default)
- 0 Disable

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x04D	TST_ADC_VD1	ADC_SEL1			0	0	0	0

TST_ADC_VD1 0 Default

ADC_SEL1 0 Default

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x04E	TST_ADC_VD2	ADC_SEL2			0	0	0	0

TST_ADC_VD2 0 Default

ADC_SEL2 0 Default

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x04F	FRM		YNR		CLMD		PSP	

FRM Free run mode control
0 Auto (default)
2 Default to 60Hz
3 Default to 50Hz

YNR Y HF noise reduction
0 None(default)
1 Smallest
2 Small
3 Medium

CLMD Clamping mode control
0 Sync top
1 Auto (default)
2 Pedestal
3 N/A

PSP Slice level control
0 Low
1 Medium (default)
2 High

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x050	HFLT2				HFLT1			
0x051	HFLT4				HFLT3			

HFLTn — HFLTn controls the peaking function of channel n. Reserved for test purpose.

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x052	CTEST	YCLEN	0	AFLTEN	GTEST	VLPF	CKLY	CKLC

CTEST — Clamping control for debugging use. (Test purpose only) (default 0)

YCLEN
- 1 Y channel clamp disabled (Test purpose only)
- 0 Enabled (default)

AFLTEN
- 1 Analog Audio input Anti-Aliasing Filter enabled (default)
- 0 Disabled

GTEST
- 1 Test (Test purpose only)
- 0 Normal operations (default)

VLPF — Clamping filter control (default 0)

CKLY — Clamping current control 1 (default 0)

CKLC — Clamping current control 2 (default 0)

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x053	NT502	NT501						

NT501
- 1 Force the Video Decoder 1 to a special NTSC 50 Hz format
- 0 Do not force to NTSC 50 Hz format

NT502
- 1 Force the Video Decoder 2 to a special NTSC 50 Hz format
- 0 Do not force to NTSC 50 Hz format

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x054	NT504	NT503	DIV_RST	DOUT_RST	ACALEN	AADC_SAVE		

NT503 1 Force the Video Decoder 4 to a special NTSC 50 Hz format
0 Do not force to NTSC 50 Hz format

NT504 1 Force the Video Decoder 4 to a special NTSC 50 Hz format
0 Do not force to NTSC 50 Hz format

DIV_RST Audio ADC divider reset. This bit must be set to 0 again after reset.

DOUT_RST Audio ADC digital output reset for all channel. This bit must be setup up to 0 again after reset.

ACALEN Audio ADC Calibration control. This be must be set up to 0 again after enabled.

AADC_SAVE Audio ADC Power Saving Mode. 7 is most power saving.

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x055	FLD*				VAV*			

FLD Status of the field flag for corresponding channel (*Read only)*
FLD [3:0] are FIELD ID for VIN3 to VIN0.
0 Odd field when FLDPOL (0x045) = 1
1 Even field when FLDPOL (0x045) = 1

VAV Status of the vertical active video signal for corresponding channel (*Read only).* VAV [3:0] is Vertical Active Video Signal for VIN3 to VIN0.
0 Vertical blanking time
1 Vertical active time

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x057	SHCOR				ANA_SW4	ANA_SW3	ANA_SW2	ANA_SW1

SHCOR These bits provide coring function for the sharpness control (default 3h)

ANA_SWn Control the analog input channel switch for VIN1 to VIN4 input
0 VIN_A channel is selected (default)
1 VIN_B channel is selected

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x058	PBW	DEM	PALSW	SET7	COMB	HCOMP	YCOMB	PDLY

PBW
1 Wide Chroma BPF BW (Default)
0 Normal Chroma BPF BW

DEM
Reserved (Default 1)

PALSW
1 PAL switch sensitivity low.
0 PAL switch sensitivity normal (Default)

SET7
1 The black level is 7.5 IRE above the blank level.
0 The black level is the same as the blank level (Default)

COMB
1 Adaptive comb filter for NTSC and PAL (Recommended). This setting is not for SECAM (Default)
0 Notch filter. For SECAM, always set to 0.

HCOMP
1 Operation mode 1 (Recommended) (Default)
0 Mode 0

YCOMB
1 Bypass Comb filter when no burst presence
0 No bypass (Default)

PDLY
0 Enable PAL delay line (default)
1 Disable PAL delay line

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x059	GMEN	CKHY		HSDLY				

GMEN
Reserved (Default 0)

CKHY
Color killer hysteresis.
0 Fastest (Default)
1 Fast
2 Medium
3 Slow

HSDLY
Reserved for test

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x05A	CTCOR		CCOR		VCOR		CIF	

CTCOR — These bits control the coring for CTI (Default 1h)

CCOR — These bits control the low level coring function for the Cb/Cr output (Default 0h)

VCOR — These bits control the coring function of vertical peaking (Default 1h)

CIF — These bits control the IF compensation level.
0 None (default)
1 1.5dB
2 3dB
3 6dB

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x05B	CLPEND				CLPST			

CLPEND — These 4 bits set the end time of the clamping pulse. Its value should be larger than the value of CLPST (Default 5h)

CLPST — These 4 bits set the start time of the clamping. It is referenced to PCLAMP position. (Default 0h)

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x05C	NMGAIN				WPGAIN			FC27

NMGAIN — These bits control the normal AGC loop maximum correction value (Default 4h)

WPGAIN — Peak AGC loop gain control (Default 1h)

FC27 — 1 Normal ITU-R656 operation (Default)
0 Squared Pixel mode for test purpose only

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x05D	PEAKWT							

PEAKWT — These bits control the white peak detection threshold. Setting ‘FF’ can disable this function (Default D8h)

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x05E	CLMPLD	CLMPL						

CLMPLD
0 Clamping level is set by CLMPL
1 Clamping level preset at 60d (Default)

CLMPL
These bits determine the clamping level of the Y channel (Default 3Ch)

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x05F	SYNCTD	SYNCT						

SYNCTD
0 Reference sync amplitude is set by SYNCT
1 Reference sync amplitude is preset to 38h (Default)

SYNCT
These bits determine the standard sync pulse amplitude for AGC reference (Default 38h)

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x060	AIGAIN2				AIGAIN1			
0x061	AIGAIN4				AIGAIN3			

AIGAINx
Audio Input ADC gain control

0 0.25
1 0.31
2 0.38
3 0.44
4 0.50
5 0.63
6 0.75
7 0.88
8 1.00 (default)
9 1.25
10 1.50
11 1.75
12 2.00
13 2.25
14 2.50
15 2.75

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x062	M_RLSWAP	RM_SYNC	RM_PBSEL		R_ADATM		R_MULTCH	

M_RLSWAP — Define the sequence of mixing and playback audio data on the ADATM pin

If RM_SYNC=0: I2S format

0 Mixing audio on position 0 and playback audio on position 8 (Default)

1 Playback audio on position 0 and mixing audio on position 8

If RM_SYNC=1: DSP format

0 Mixing audio on position 0 and playback audio on position 1 (Default)

1 Playback audio on position 0 and mixing audio on position 1

RM_SYNC — Define the digital serial audio data format for record and mixing audio on the ACLKR, ASYNR, ADATR and ADATM pin

0 I2S format (Default)

1 DSP format

RM_PBSEL — Select the output PlayBackIn data for the ADATM pin

0 First Stage PalyBackIn audio (Default)

1 Second Stage PalyBackIn audio

2 Third Stage PalyBackIn audio

3 Last Stage PalyBackIn audio

R_ADATM — Select the output mode for the ADATM pin

0 Digital serial data of mixing audio (Default)

1 Digital serial data of ADATR format record audio

2 Digital serial data of ADATM format record audio

R_MULTCH — Define the number of audio for record on the ADATR pin

0 2 audios (Default)

1 4 audios

2 8 audios

3 16 audios

Number of output data is limited as shown on Sequence of Multi-channel Audio Record table. Also, each output position data are selected by R_SEQ_0/R_SEQ_1/.../R_SEQ_F registers.

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x063	AAUTO_MUTE	PBREFEN	VRSTSEL		FIRSTCNUM			

AAUTO_MUTE
1 When input Analog data is less than ADET_TH level, output PCM data will be set to 0. Audio DAC data input is 0x200.
0 No effect

PBREFEN
Audio ACKG Reference (refin) input select
0 ACKG has video VRST refin input selected by VRSTSEL register (Default)
1 ACKG has audio ASYNP refin input

VRSTSEL
Select VRST (V reset) signal on ACKG (Audio Clock Generator) refin input.
0 VIN0 Video Decoder Path VRST (default)
1 VIN1 Video Decoder Path VRST
2 VIN2 Video Decoder Path VRST
3 VIN3 Video Decoder Path VRST

FIRSTCNUM
Set up First Stage number on audio cascade mode connection.
Set up the value of (Cascade chip number-1). In 4 chips cascade case, this value is 3h for ALINK mode. In single chip application case, this doesn't need to be set up.
0 (default)

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x064	R_SEQ_1				R_SEQ_0			
0x065	R_SEQ_3				R_SEQ_2			
0x066	R_SEQ_5				R_SEQ_4			
0x067	R_SEQ_7				R_SEQ_6			
0x068	R_SEQ_9				R_SEQ_8			
0x069	R_SEQ_B				R_SEQ_A			
0x06A	R_SEQ_D				R_SEQ_C			
0x06B	R_SEQ_F				R_SEQ_E			

R_SEQ
Define the sequence of record audio on the ADATR pin.
Refer to Table 16 for the detail of the R_SEQ_0 ~ R_SEQ_F.
The default value of R_SEQ_0 is "0", R_SEQ_1 is "1", and R_SEQ_F is "F".

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x06C	ADACEN	AADCEN	PB_ MASTER	PB_LRSEL	PB_SYNC	RM_8BIT	ASYNROEN	ACLKRMASTER

ADACEN — Audio DAC Function mode
- 0 Audio DAC function disable (test purpose only)
- 1 Audio DAC function enable (Default)

AADCEN — Audio ADC Function mode
- 0 Audio ADC function disable (test purpose only)
- 1 Audio ADC function enable (Default)

PB_MASTER — Define the operation mode of the ACLKP and ASYNP pin for playback.
- 0 All type I2S/DSP Slave mode (ACLKP and ASYNP is input) (Default)
- 1 TW5864 type I2S/DSP Master mode (ACLKP and ASYNP is output)

PB_LRSEL — Select the channel for playback.
- 0 Left channel audio is used for playback input (Default)
- 1 Right channel audio is used for playback input

PB_SYNC — Define the digital serial audio data format for playback audio on the ACLKP, ASYNP and ADATP pin.
- 0 I2S format (Default)
- 1 DSP format

RM_8BIT — Define output data format per one word unit on ADATR pin.
- 0 16bit one word unit output (Default)
- 1 8bit one word unit packed output

ASYNROEN — Define input/output mode on the ASYNR pin.
- 1 ASYNR pin is input
- 0 ASYNR pin is output (Default)

ACLKRMASTER — Define input/output mode on the ACLKR pin and set up audio 256xfs system processing
- 0 ACLKR pin is input. External 256xfs clock should be connected to ACLKR pin. This function is single chip Audio slave mode only.
- 1 ACLKR pin is output. Internal ACKG generates 256xfs clock (Default)

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x06D	LAWMD		MIX_ DERATIO	MIX_MUTE				

LAWMD — Select u-Law/A-Law/PCM/SB data output format on ADATR and ADATM pin.
0 PCM output (default)
1 SB (Signed MSB bit in PCM data is inverted) output
2 u-Law output
3 A-Law output

MIX_DERATIO — Disable the mixing ratio value for all audio.
0 Apply individual mixing ratio value for each audio (default)
1 Apply nominal value for all audio commonly

MIX_MUTE[n] — Enable the mute function for audio channel AINn when n is 0 to 3. It effects only for mixing. When n = 4, it enable the mute function of the playback audio input. It effects only for single chip or the last stage chip
0 Normal
1 Muted (default)

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]

0x073	ADET_TH2[3:0]				ADET_TH1[3:0]			
0x074	ADET_TH4[3:0]				ADET_TH3[3:0]			

AAMPMD — Define the audio detection method.
0 Detect audio if absolute amplitude is greater than threshold
1 Detect audio if differential amplitude is greater than Threshold (default)

ADET_FILT — Select the filter for audio detection (default 4h)
0 Wide LPF
: :
7 Narrow LPF

ADET_THn — Define the threshold value for audio detection of AINn (Default Ah)
0 Low value
: :
31 High value

If fs = 8kHz Audio Clock setting mode, Registers
0x072 = 0xC0
0x073 = 0xAA
0x074 = 0xAA
are typical setting.

If fs=16kHz/32kHz/44.1kHz/48kHz Audio Clock setting mode, Registers
0x072 = 0xE0
0x073 = 0xBB
0x074 = 0xBB
are typical setting.

0x0DD	A5OUT_OFF	ADATM_ I2SOEN	MIX_MUTE _A5	ADET_TH5				

A5OUT_OFF — AIN5 data output control on ADATR record signal.
- 0 Output AIN51/AIN52/AIN53/AIN54 record data on DATR
- 1 Not output AIN51/AIN52/AIN53/AIN54 record data on ADATR

ADATM_I2SOEN — Define ADATM pin output 2 word data to make standard I2S output.
- 0 Output Mixing or Playback data only on ADATM pin as specified by M_RLSWAP register (Default)
- 1 L/R data on ADATM pin is selected by I2SO_RSEL/I2SO_LSEL registers

MIX_MUTE_A5 — Audio input AIN5 mute function control
- 0 Normal
- 1 Muted

ADET_TH5 — AIN5 threshold value for audio detection

I2SO_RSEL/ I2SO_LSEL — Select L/R output data on ADATM pin when ADATM_I2SOEN=1. Both I2SO_RSEL and I2SO_LSEL select output data by following order.
- 0 Select record audio of channel 1(AIN0)
- 1 Select record audio of channel 2(AIN1)
- 2 Select record audio of channel 3(AIN2)
- 3 Select record audio of channel 4(AIN3)

- 18(12h) Select playback audio of the third stage chip (PB3)
- 19(13h) Select playback audio of the last stage chip (PB4)
- 20(14h) Select mixed audio
- 21(15h) Select record audio of channel 51(AIN51) (default)
- 22(16h) Select record audio of channel 52(AIN52)
- 23(17h) Select record audio of channel 53(AIN53)
- 24(18h) Select record audio of channel 54(AIN54)
- Others No audio output

I2SRECSEL5n — Select output data of port n in the position below

0 AIN51
1 AIN52
2 AIN53
3 AIN54

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x0DE					MIX_RATIO5			

MIX_RATIO5 — Define the ratio values for audio mixing of channel AIN4 using MIX_RATIO4 to the ratio values for audio mixing of playback audio input

If MRATIOMD = 0 (default)

0 0.25
1 0.31
2 0.38
3 0.44
4 0.50
5 0.63
6 0.75
7 0.88
8 1.00 (default)
9 1.25
10 1.50
11 1.75
12 2.00
13 2.25
14 2.50
15 2.75

If MRATIONMD = 1, Mixing ratio is MIX_RATIO4 / 64

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x0DF	ATHROUGH	ASYNSERIAL	ACLKR128	ACLKR64	AFS384	AIN5MD	0	0

ATHROUGH Default 0

ASYNSERIAL Default 0

ACLKR128 ACLKR clock output mode for special 16x8bit (total 128bit) data interface.
0 ACLKR output is normal (Default).
1 the number of ACLKR clock per fs is 128.This function is effective with RM_8BIT=1 8bit mode (special purpose).

ACLKR64 ACLKR clock output mode for special 4 word output interface. ACLKRMASTER=1 mode only.
0 ACLKR output is normal (Default)
1 the number of ACLKR clock per fs is 64.

AFS384 Special Audio fs Sampling mode.
0 Audio fs Sampling mode is normal 256xfs if AIN5 = 0. (Default)
1 Audio fs Sampling mode is 384xfs mode. In this mode, AIMANU=1, A1NUM=0, A2NUM=1, A3NUM=2, A4NUM = 3, A5NUM=4 setting are needed.

AIN5MD Audio Input process mode
0 AIN1/AIN2/AIN3/AIN4 4 audio input mode. This mode is 256xfs if AFS384 = 0. In this mode, AIN5 is not used.
1 AIN1/AIN2/AIN3/AIN4/AIN5 5 audio input mode. This mode is 320xfs mode if AFS384 = 0.

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x0E0	MRATIOMD	ADACTEST	0	0	0	0	0	0

MRATIOMD
1 Use a more exponential way to interpret the MRATIO. Perform the following transformation before using the ratio
0 ~ 3 => 4 ~ 7
4 ~ 7 => 8 ~ 14
8 ~ 11 => 16 ~ 28
12 ~ 15 => 32 ~ 44
0 Use the MRATIO as the ratio

ADACTEST Test feature for ADAC. Set to 0.

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x0E3	EXT_ADATP	ACLKPPOLO	ACLKRPOL	ACLKPPOLI	AFAUTO	AFMD		

EXT_ADATP — ADATP signal is coming from external ADPCM decoder, instead of on-chip ADPCM decoder.

ACLKPPOLO — ACLKP output signal polarity inverse

ACLKRPOL — ACLKR input signal polarity inverse.
0 Not inversed (Default)
1 Inversed

ACLKPPOLI — ACLKP input signal polarity inverse.
0 Not inversed (Default)
1 Inversed

AFAUTO — ACKI [21:0] control automatic set up with AFMD registers
This mode is only effective when ACLKRMASTER=1
0 ACKI [21:0] registers set up ACKI control
1 ACKI control is automatically set up by AFMD register values

AFMD — AFAUTO control mode
0 8kHz setting (Default)
1 16kHz setting
2 32kHz setting
3 44.1kHz setting
4 48kHz setting

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x0E4	I2S8MODE	MASCKMD	PBINSWAP	ASYNRDLY	ASYNPDLY	ADATPDLY	INLAWMD	

I2S8MODE — 8bit I2S Record output mode.
0 L/R half length separated output (Default).
1 One continuous packed output equal to DSP output format.

MASCKMD — Audio Clock Master ACLKR output wave format.
0 High periods is one 27MHz clock period (default).
1 Almost duty 50-50% clock output on ACLKR pin. If this mode is selected, two times bigger number value need to be set up on the ACKI register. If AFAUTO=1, ACKI control is automatically set up even if MASCKMD=1.

PBINSWAP — Playback ACLKP/ASYNP/ADATP input data MSB-LSB swapping.
0 Not swapping
1 Swapping.

ASYNRDLY — ASYNR input signal delay.
0 No delay
1 Add one 27MHz period delay in ASYNR signal input

ASYNPDLY — ASYNP input signal delay.
0 no delay
1 add one 27MHz period delay in ASYNP signal input

ADATPDLY — ADATP input data delay by one ACLKP clock.
0 No delay (Default).This is for I2S type 1T delay input interface.
1 Add 1 ACLKP clock delay in ADATP input data. This is for left-justified type 0T delay input interface.

INLAWMD — Select u-Law/A-Law/PCM/SB data input format on ADATP pin.
0 PCM input (Default)
1 SB (Signed MSB bit in PCM data is inverted) input
2 u-Law input
3 A-Law input

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x0E5	0	0	0	0	0	0	AINTPOFF	A5DETENA

AINTPOFF — Test feature for ADAC. Set to 0.

A5DETENA — Enable state register updating and interrupt request of audio AIN5 detection for each input
0 Disable state register updating and interrupt request
1 Enable state register updating and interrupt request

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x0E7	HASYNC	OFDLY			DECOUTMD	0	0	0

HASYNC
1 The length of EAV to SAV is set up and fixed by HBLEN register
0 The length of SAV to EAV is setup and fixed by HACTIVE registers

OFDLY
FIELD output delay
0h 0H line delay FIELD output (601 mode only)
1h~6h 1H ~ 6H line delay FIELD output
7h Reserved

DECOUTMD
Default 1

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x0E8	HBLEN							

HBLEN
These bits are effective when HASYNC bit is set to 1. These bits setup the length of EAV to SAV code when HASYNC bit is 1. Normal value is (Total pixel per line – HACTIVE) value.

NTSC/PAL-M (60Hz) 8Ah = 858 – 720
PAL/SECAM (50Hz) 90h = 864 – 720

If register 0x0E[3] (ATREG for CH1) is set to 0, this value changes into 8Ah or 90h at audio video format detection initial time automatically according to CH1 video detection status.

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x0E9	CKLM	YDLY			0	0	0	0

CKLM
Color Killer mode.
0 Normal (Default)
1 Fast (For special application)

TDLY
Luma delay fine adjustment. This 2's complement number provides –4 to +3 unit delay control (Default 3h)

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x0EA	0	0	ADECRST	0	VDEC4RST	VDEC3RST	VDEC2RST	VDEC1RST

ADECRST
A 1 written to this bit resets the audio portion to its default state but all register content remains unchanged. This bit is self-cleared.

VDECnRST
A 1 written to this bit resets the VINn path Video Decoder portion to its default state but all register content remain unchanged. This bit is self cleared.

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x0EB	MISSCNT				HSWIN			

MISSCNT — These bits set the threshold for horizontal sync miss count threshold (Default 4h)

HSWIN — These bits determine the VCR mode detection threshold (Default 4h)

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x0EC	PCLAMP							

PCLAMP — These bits set the clamping position from the PLL sync edge (Default 2Ah)

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x0ED	VLCKI		VLCKO		VMODE	DETV	AFLD	VINT

VLCKI — Vertical lock in time
0 Fastest (Default)
:
3 Slowest.

VLCKO — Vertical lock out time
0 Fastest (Default)
:
3 Slowest

VMODE — This bit controls the vertical detection window
1 Search mode
0 Vertical countdown mode (Default)

DETV
1 Recommended for special application only
0 Normal Vsync logic (Default)

AFLD — Auto field generation control
0 Off (Default)
1 On

VINT — Vertical integration time control
1 Short
0 Normal (Default)

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x0EE	BSHT			VSHT				

BSHT — Burst PLL center frequency control (Default 0h)

VSHT — Vsync output delay control in the increment of half line length (Default 0h)

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x0EF	CKILLMAX		CKILLMIN					

CKILLMAX — These bits control the amount of color killer hysteresis. The hysteresis amount is proportional to the value (Default 1h)

CKILLMIN — These bits control the color killer threshold. Larger value gives lower killer level (Default 28h)

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]

ACCT — ACC time constant
- 0 No ACC
- 1 Slow
- 2 Medium (Default)
- 3 Fast

SPM — Burst PLL control
- 0 Slowest
- 1 Slow (Default)
- 2 Fast
- 3 Fastest

CBW — Chroma low pass filter bandwidth control. Refer to filter curves (Default 1)

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x0F3	NKILL	PKILL	SKILL	CBAL	FCS	LCS	CCS	BST

NKILL
1 Enable noisy signal color killer function in NTSC mode (Default)
0 Disabled

PKILL
1 Enable automatic noisy color killer function in PAL mode (Default)
0 Disabled

SKILL
1 Enable automatic noisy color killer function in SECAM Mode (Default)
0 Disabled

CBAL
0 Normal output (Default)
1 Special output mode.

FCS
1 Force decoder output value determined by CCS
0 Disabled (Default)

LCS
1 Enable pre-determined output value indicated by CCS when video loss is detected
0 Disabled (Default)

CCS
When FCS is set high or video loss condition is detected when LCS is set high, one of two colors display can be selected.
1 Blue color
0 Black (Default)

BST
1 Enable blue stretch
0 Disabled (Default)

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x0F4	0	0	MONITOR					
0x0F5	HREF*							

These registers are for test purpose only. The MONITOR is used to select the HREF status of a certain video decoder port in Reg0x0F5 HREF

MONITOR Value
Select video decoder port for register 0x0F5
00h VIN0 Video Decoder Path HREF [9:2] value
10h VIN1 Video Decoder Path HREF [9:2] value
20h VIN2 Video Decoder Path HREF [9:2] value
30h VIN3 Video Decoder Path HREF [9:2] value

0x0FA	IDX1		NSEN1/SSEN1/PSEN1/WKTH1					
0x0FB	IDX2		NSEN2/SSEN2/PSEN2/WKTH2					
0x0FC	IDX3		NSEN3/SSEN3/PSEN3/WKTH3					
0x0FD	IDX4		NSEN4/SSEN4/PSEN4/WKTH4					

NSENn/SSENn/PSENn/WKTHn shared the same 6 bits in the register. IDXn is used to select which of the four parameters is being controlled. The write sequence is a two steps process unless the same register is written. A write of {ID, 000000} selects one of the four registers to be written. A subsequent write will actually write into the register. (Default 0h)

IDXn
- 0 Controls the NTSC color carrier detection sensitivity (NSENn) (Default 1Ah)
- 1 Controls the SECAM ID detection sensitivity (SSENn) (Default 20h)
- 2 Controls the PAL ID detection sensitivity (PSENn) (Default 1Ch)
- 3 Controls the weak signal detection sensitivity (WKTHn) (Default 2Ah)

0x3B6	MOTION_FLAG[183:176]							
0x3B7	MOTION_FLAG[191:184]							

MOTION_FLAG — 192 bit motion flag of the channel specified by RGR_MOTION_SEL in 0x382

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x3B8	MD_DI_CNT[7:0]*							
0x3B9							MD_DI_CNT[9:8]*	

* Read only

MD_DI_CNT — The motion cell count of a specific channel selected by 0x382. This is for DI purpose.

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x3BA	MD_DI_CELLSENS							
0x3BB	MD_DI_LVSENS							

MD_DI_CELLSENS — The motion detection cell sensitivity for DI purpose

MD_DI_LVSENS — The motion detection threshold level for DI purpose

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x3E0	MOTION_MASK[7:0]

0x3EF	MOTION_ MASK [127:120]							
0x3F0	MOTION_ MASK [135:128]							
0x3F1	MOTION_ MASK [143:136]							
0x3F2	MOTION_ MASK [151:144]							
0x3F3	MOTION_ MASK [159:152]							
0x3F4	MOTION_ MASK [167:160]							
0x3F5	MOTION_ MASK [175:168]							
0x3F6	MOTION_ MASK [183:176]							
0x3F7	MOTION_ MASK [191:184]							

MOTION_MASK 192 bit motion mask of the channel specified by MASK_CH_SEL in 0x3FE

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0x3FE				MASK_CH_SEL				

MASK_CH_SEL The channel selection to access masks in 0x3E0 ~ 0x3F7

Clock PLL / Analog IP Control

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0xEB0	CLK81_LOCK	CLK81_PD	EXT_CLK81_SEL	CLK81_IREF	CLK81_CPX4		CLK81_LPX4	

CLK81_LPX4 — 81 MHz clock PLL loop filter select
- 0 80K Ohms
- 1 40K Ohms (default)
- 2 30K Ohms
- 3 20K Ohms

CLK81_CPX4 — 81 MHz clock PLL charge pump select
- 0 1μA
- 1 5μA (default)
- 2 10μA
- 3 15μA

CLK81_IREF — 81 MHz clock PLL current control
- 0 Low current (default)
- 1 Higher current (30% more)

EXT_CLK81_SEL
- 0 Select 81 MHz clock from internal PLL (default)
- 1 Select 81 MHz clock from EXT_CLK81 pin

CLK81_PD
- 0 Do not power down 81 MHz PLL (default)
- 1 Power down 81 MHz PLL

CLK81_LOCK — PLL Lock signal. Used for FPGA mode only. Read only.

Address	[7]	[6]	[5]	[4]	[3]	[2]	[1]	[0]
0xEB8	CLK108_LOCK	CLK108_PD		CLK108_IREF	CLK108_CPX4		CLK108_LPX4	

CLK108_LPX4 — 108 MHz clock PLL loop filter select
- 0 80K Ohms
- 1 40K Ohms (default)
- 2 30K Ohms
- 3 20K Ohms

CLK108_CPX4 — 108 MHz clock PLL charge pump select
- 0 1μA
- 1 5μA (default)
- 2 10μA
- 3 15μA

CLK108_IREF — 108 MHz clock PLL current control
- 0 Low current (default)
- 1 Higher current (30% more)

CLK108_PD
- 0 Do not power down 108 MHz PLL
- 1 Power down 108 MHz PLL

CLK108_LOCK — The 108 MHz clock PLL is locked. Used for FPGA mode only. Read Only.

Load Capacitance	CL	-	20	-	pF

PARAMETER	SYMBOL	MIN (NOTE 1)	TYPICAL	MAX (NOTE 1)	UNITS
Series Resistor	RS	-	80	-	Ω

NOTE:

1. Compliance to datasheet limits is assured by one or more methods: production test, characterization and/or design.

DDR Interface AC Characteristics

TABLE 22. DDR INTERFACE AC CHARACTERISTICS

SYMBOL	PARAMETER	MIN (NOTE 1)	TYPICAL	MAX (NOTE 1)
$SLEW_R$	Input Signal Minimum Rising Slew Rate	1.0 V/ns		
$SLEW_F$	Input Signal Minimum Falling Slew Rate	1.0 V/ns		
$V_{IH}(ac)$	Maximum AC Input Logic High	$V_{REFSSTL}$ + 0.31V		
$V_{IH}(dc)$	Minimum DC Input Logic High	$V_{REFSSTL}$ + 0.15V		$V_{DDOSSTL}$ + 0.3V
$V_{IL}(ac)$	Minimum AC Input Logic Low			$V_{REFSSTL}$ – 0.31V
$V_{IL}(dc)$	Maximum DC Input Logic Low	-0.3V		$V_{REFSSTL}$ – 0.15V
V_{SWING}	Input Maximum Swing			1.5V

DDR Interface AC Timing

TABLE 23. DDR INTERFACE AC TIMING

SYMBOL	PARAMETER	MIN (ns) (NOTE 1)	TYP (NS)	MAX (ns) (NOTE 1)
t_{AC}	Access Window of DQ Input from CK/CK#	-0.7		0.7
t_{DQSCK}	Access Window of DQS Input from CK/CK#	-0.6		0.6
$t_{CK(avg)}$ CL = 3.0	Clock Cycle Time Measured at either Rising or Falling Edge	5		7.5
t_{CH}	Average Clock High Level Width	0.45CK		0.55CK
t_{CL}	Average Clock Low Level Width	0.45CK		0.55CK
$t_{PER\_JIT\ (PK-PK)}$	DDR Clock Period Jitter (Peak to Peak)		0.93	1.15
t_{HP}	Half Clock Period	min(tCH,tCL)		max(t_{CH},t_{CL})
t_{DQSQ}	DQS – DQ Skew, DQS to Last DQ Valid, Per Group	0		0.6
t_{QH}	DQS – DQ Hold, DQS to First DQ to go Non-valid, per Group			$t_{HP\ (min)}$ – 0.5
t_{DQSS}	Write Command to DQS First Latching Transition	0.72CK		1.28CK
t_{DSS}	DQS Falling Edge to CK Rising Setup Time	0.25CK		
t_{DSH}	DQS Falling Edge from CK Rising Hold Time	0.25CK		
t_{HZ}	Data Hi-Z Windows from CK/CK#			0.7

SYMBOL	PARAMETER	MIN (ns) (NOTE 1)	TYP (NS)	MAX (ns) (NOTE 1)
t_{LZ}	Data Low-Z windows from CK/CK#	-0.7		
t_{WPRE}	DQS Write Preamble	0.25CK		
t_{WPST}	DQS Write Postamble	0.4CK		0.6CK
t_{RPRE} CL = 3.0	DQS Read Preamble	0.9CK		1.1CK
t_{RPST}	DQS Read Postamble	0.4CK		0.6CK
t_{DQSH}	DQS High Pulse Width	0.35CK		
t_{DQSL}	DQS Low Pulse Width	0.35CK		
t_{DS}	DQ and DM Output Setup Time Relative to DQS	0.6		
t_{DH}	DQ and DM Output Hold Time Relative to DQS	0.6		
t_{IS}	Address and Control Output Setup Time	0.8		
t_{IH}	Address and Control Output Hold Time	0.8		

NOTE:

1. Compliance to datasheet limits is assured by one or more methods: production test, characterization and/or design.
2. The Vref on the evaluation is 1.25v. VDDQ is 2.5v.
3. CK: clock period
4. For all the timing, please refer to the figures below.

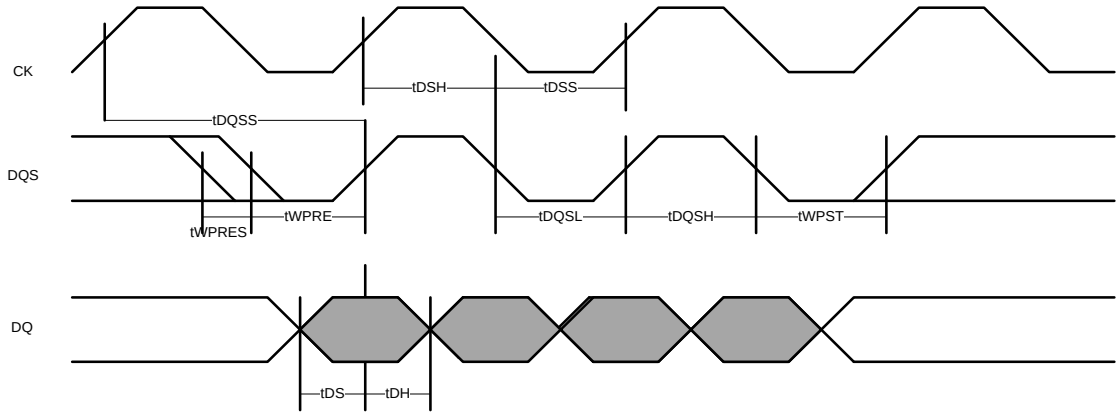

FIGURE 47. DDR INTERFACE OUTPUT TIMING

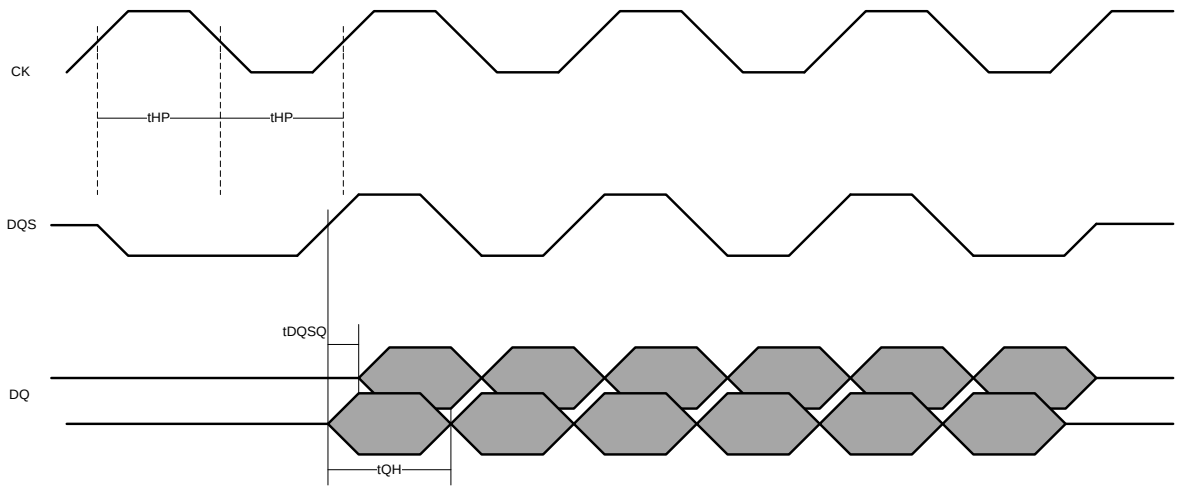

FIGURE 48. DDR INTERFACE INPUT TIMING (I)

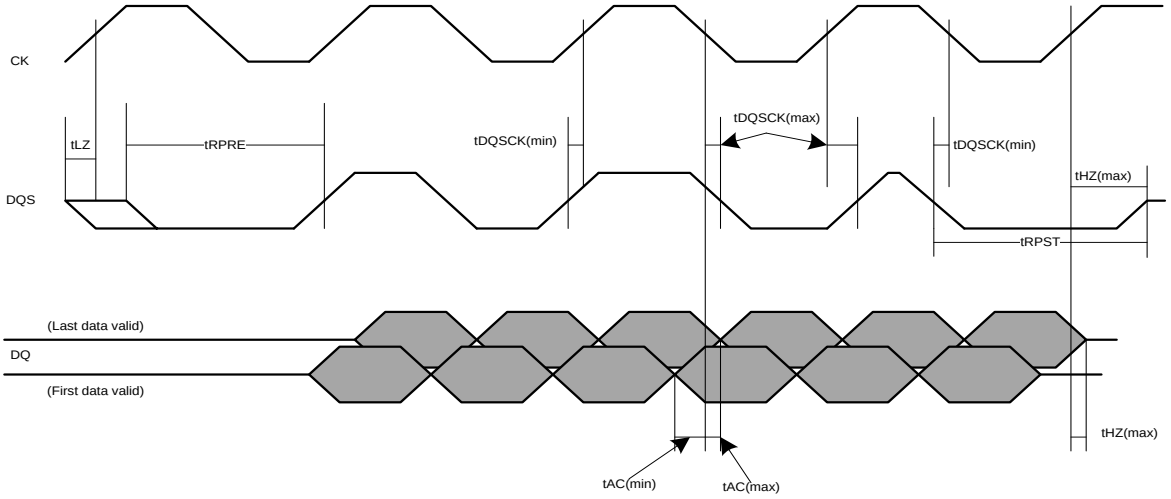

FIGURE 49. DDR INTERFACE INPUT TIMING (II)

PCI Interface AC Timing

TABLE 24. PCI INTERFACE AC TIMING

SYMBOL	PARAMETER	66 MHZ		33 MHZ		
		MIN (NOTE 1)	MAX (NOTE 1)	MIN (NOTE 1)	MAX (NOTE 1)	UNITS
t_{SU}	Input Setup Time to PCI_CLK – Bused Signals	3	-	7	-	ns
$t_{SU(PTP)}$	Input Setup Time to PCI_CLK – Point-to-Point	5	-	10, 12(4)	-	
t_H	Input Hold Time from PCI_CLK	0	-	0	-	
t_{VAL}	PCI_CLK to Signal Valid Delay – Bused Signals	2	6	2	11	
$t_{VAL(PTP)}$	PCI_CLK to Signal Valid Delay – Point-to-Point	2	6	2	12	
t_{ON}	Float to Active Delay	2	-	2	-	
t_{OFF}	Active to Float Delay	-	14	-	28	
t_{CYCLE}	PCI_CLK Cycle Time	15	30	30		
t_{HIGH}	PCI_CLK High Time	6	-	11		
t_{LOW}	PCI_CLK Low Time	6	-	11		
t_{RST}	Reset Active Time After Power Stable	1		1		ms
$t_{RST-CLK}$	Reset Active Time After PCI_CLK Stable	100		100		µs
$t_{RST-OFF}$	Reset Active to Output Float		40		40	ns

NOTE:

1. Compliance to datasheet limits is assured by one or more methods: production test, characterization and/or design.
2. See PCI Signal Timing Measurement Conditions.
3. All interface signals are synchronized to PCI_CLK.
4. Point-to-point signals are PCI_REQ_N, PCI_GNT_N. Bused signals are PCI_AD, PCI_CBE_N, PCI_PAR, PCI_PERR_N, PCI_SERR_N, PCI_STOP_N, PCI_FRAME_N, PCI_IRDY_N, PCI_TRDY_N, PCI_DEVSEL_N, and PCI_IDSEL.
5. REQ_N signals have a setup of 10 and GNT_N signals have a setup of 12.

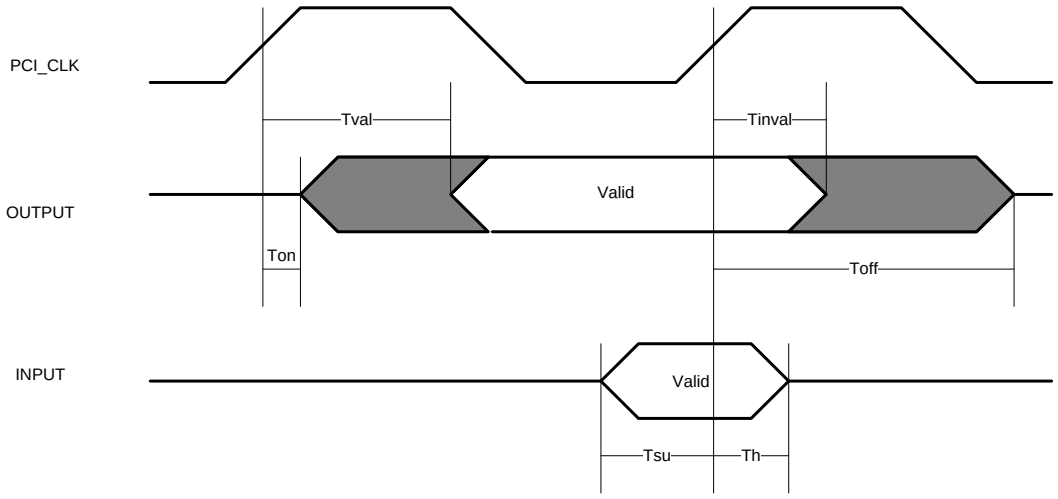

FIGURE 50. PCI INTERFACE TIMING CONDITION

Video Interface AC Timing

TABLE 25. VIDEO INTERFACE AC TIMING

SYMBOL	PARAMETER	MIN (NOTE 5)	MAX (NOTE 5)	UNITS
t_{SU}	VDx Input Setup Time to VD_CLKx	3	-	ns
t_H	VDx Input Hold Time from VD_CLKx	0	-	
t_{DELAY}	Delay from PV_CLKx to PV_DATAx	2	7	

NOTE:

1. VD_CLKx – VD_CLK1, VD_CLK2, VD_CLK3
2. VDx – VD1 [7:0], VD2 [7:0], VD3 [7:0]
3. PV_CLKx – PV_CLK0, PV_CLK1, PV_CLK2, PV_CLK3
4. PV_DATAx – PV_DATA0 [7:0], PV_DATA1 [7:0], PV_DATA2 [7:0], PV_DATA [7:0]
5. Compliance to datasheet limits is assured by one or more methods: production test, characterization and/or design.

I2C Interface AC Timing

TABLE 26. I2C INTERFACE AC TIMING

SYMBOL	PARAMETER	MIN (NOTE 1)	MAX (NOTE 1)	UNITS
t_{BF}	Bus Free Time Between STOP and START	1.3		µs
t_{S_SDAT}	SDAT Setup Time	100		
t_{H_SDAT}	SDAT Hold Time		0.9	
t_{S_STA}	Setup Time for START Condition	0.6		
t_{H_STA}	Hold Time for START Condition	0.6		
t_{S_STO}	Setup Time for STOP Condition	0.6		
t_R	Rising Time for SDAT and SCLK		300	
t_F	Falling Time for SDAT and SCLK		300	
C_{BUS}	Capacity Load for Each Bus Line		400	pF
F_{SCLK}	SCLK Clock Frequency		400	KHz

NOTE:

1. Compliance to datasheet limits is assured by one or more methods: production test, characterization and/or design.

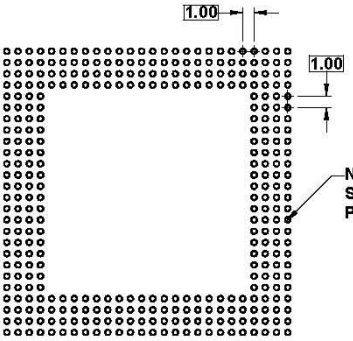
NOTES:

1. All dimensions and tolerances conform to ASME Y14.5-1994.
2. Dimensions are in millimeters.
3. Dimension is measured at the maximum solder ball diameter, parallel to primary datum C.
4. Primary datum C and seating plane are defined by the spherical crowns of the solder balls.
5. This drawing confirms to the JEDEC registered outline MS-034 variation AAL-1.
6. Dimensions in ( ) are for reference only



TYPICAL RECOMMENDED LAND PATTERN

Life Support Policy

These products are not authorized for use as critical components in life support devices or systems.

Revision History

DATE	REVISION	CHANGES NOTE
January 10, 2012	FN7961.1	Corrected lead finish note in “Ordering Information” on page 6 to reflect e2 classification instead of e1. Changed from: “These Intersil Pb-free WLCSP and BGA packaged products employ special Pb-free material sets; molding compounds/die attach materials and SnAgCu - e1 solder ball terminals, which are RoHS compliant and compatible with both SnPb and Pb-free soldering operations. Intersil Pb-free WLCSP and BGA packaged products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.” to: “These Intersil Pb-free BGA packaged products employ special Pb-free material sets; molding compounds/die attach materials and SnAg –e2 solder ball terminals, which are RoHS compliant and compatible with both SnPb and Pb-free soldering operations. Intersil Pb-free BGA packaged products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.”
December 1, 2011	FN7961.0	Revised datasheet from rev A1 chip into rev B1 (1) Added 0xD0F0, 0xD0F8 register (2) Added bit 7 of 0x18004 register (3) Added bit 7 of 0x1800C register (4) Added 0x18050, 0x18060, 0x18064 registers (5) Added 0x180C0 ~ 0x180DC registers (6) Remove unused 0x0040 register (7) Added 0xB004 ~ 0xB018 registers (8) Added missing description of 0x4018, 0x402C, x4048 (9) Revise register description of 0xA000 ~ 0xA00C, 0xEE6 ~0xEEE (10) Added AC timing for various digital interfaces (11) Fixed cross reference errors Modified the ordering info from TW5864-BA1-GR to TW5864-BB1-CR. This datasheet is for bonding option A/B/C.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits,General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
