MICREL

Innovation Through Technology™

General Description

The MIC705, MIC706, MIC707, and MIC708 are inexpensive mircoprocessor supervisory circuit that monitors power supplies in microprocessor based systems. The circuit functions include a watchdog timer, microprocessor reset, backup battery switchover, power failure warning and a debounced manual reset input.

The MIC705 and MIC706 offer a watchdog timer function while the MIC707 and MIC708 have an active high reset output in addition to the active low reset output.

Supply voltage monitor levels of 4.65V and 4.4V are available. The MIC705 and MIC707 have a nominal reset threshold level of 4.65V while the MIC706 and MIC708 have a 4.4V nominal threshold level. When the supply voltage drops below the respective reset threshold level, /RESET is asserted.

Features

- 30µA Maximum Supply Current
- Debounced manual reset input is TTL/CMOS Compatible
- Reset Pulse Width, 200ms
- Watchdog timer, 1.6s (MIC706)
- Precision supply voltage monitor
- Early power fail warning or low battery detect

Applications

- Laptop computers
- Intelligent systems
- Critical microprocessor power monitoring
- Printers
- Computers
- Controllers

Ordering Information

Part Number		Temperature Range	Package
Standard	Pb-Free		
MIC70_ _N	MIC70_ _NY	–40ºC to +85ºC	8-Pin PDIP
MIC70_ _M	MIC70_ _MY	–40ºC to +85ºC	8-Pin SOIC

Typical Application

Pin Configuration

```
      ___

```

8-Pin PDIP Package
8-Pin SOIC Package

Pin Description

Pin Number MIC705/6	Pin Number MIC707/8	Pin Name	Pin Function
1	1	/MR	Manual Reset Input forces /RESET to assert when pulled below 0.8V. An internal pull-up current of 250µA on this input forces it high when left floating. this input can also be driven from TTL or CMOS logic.
2	2	VCC	Primary supply input, +5V
3	3	GND	IC ground pin, 0V reference
4	4	PFI	Power Fail Input. Internally connected to the power fail comparator which is referenced to 1.25V. The Power Fail Output (/PFO) remains high if PFI is above 1.25V. PFI should be connected to GND or V_{OUT} if the power fail comparator is not used.
5	5	/PFO	Power Fail Output. The power fail comparator is independent of all other function on this device.
6	N/A	WDI	Watch Dog Input. The WDI input monitors microprcessor activity, an internal watchdog timer resets itself with each transition on the watchdog input. If the WDIpin is held high or low for longer than the watchog timeout period, /WDO is forced to active low. the watchdog function can be diabled by floating the WDI pin.
N/A	6	N/C	Not Internally Connected
7	7	/RESET	/RESET is asserted if either V_{CC}goes below the reset threshold voltage or by low signal on the manual reset input (/MR). /RESET remains asserted for one reset timeout period (200ms) after V_{CC} exceeds the reset threshold voltage or after the manual reset pin transition from low to high. The watchdog timer will not assert /RESET unless /WDO is connected to /MR
8	N/A	/WDO	Output for the Watchdog Timer. The watchdog timer resets itself with each transition o the watchdog input. If the WDI pin is held high or low for longer than the watchdog timeout period, /WDO is forced low. /WDO will also be forced low id V_{CC} is below the reset threshold voltageand will remain low until V_{CC} returns to a valid level.
N/A	8	RESET	RESET is the compliment of /RESET and is asserted if either V_{CC} goes below the reset threshold voltage or by a low signal on the manual reset input (/MR). RESET is suitable for microprocessor systems that use active high reset.

Absolute Maximum Ratings[1]

Terminal Voltage

V_{CC} ....–0.3V to +6.0V
All other inputs.............................–0.3V to (V_{OUT} + 0.3V)

Input Current

V_{CC}, Gnd 25mA

Output Current (all outputs)...................................... 20mA

Lead Temperature (soldering, 10 sec.)...................... 300°C

Storage Temperature................................ –65°C to +150°C

Operating Ratings[2]

Operating Temperature Range

MIC70_N .... –40°C to +85°C
MIC70_M .... –40°C to +85°C

Power Dissipation (PDIP)..475mW
Power Dissipation (SOP)...400mW

Electrical Characteristics[3]

V_{CC} = 2.70V to 5.5V for MIC70_P/R; V_{CC} = 3.00V to 5.5V for MIC70_S; V_{CC} = 3.15V to 5.5V for MIC70_T;
T_A = Operating Temperature Range, **bold** values indicate –40°C ≤ T_A ≤ +85°C; unless noted

| Parameter	Conditions	Min.	Typ.	Max	Units
Operating Voltage Range, V_{CC}		1.4		5.5	V
Supply Current				30	µA
Reset Voltage Threshold	MIC70_P/R	2.55	2.63	2.70	V
	MIC70_S	2.85	2.93	3.00	V
	MIC70_T	3.00	3.08	3.15	V
Reset Threshold Hysteresis			20		mV
Reset Pulse Width, t_{RS}		140	200	280	ms
/RESET Output Voltage (MIC70_R/S/T)	I_{Source} = 200µA	0.8 × V_{CC}			V
	I_{Sink} = 1.2mA			0.3	V
	I_{Sink} = 50µA, V_{CC} = 1.4V			0.3	V
RESET Output Voltage (MIC706P)	I_{Source} = 200µA	0.8 × V_{CC}			V
	I_{Sink} = 1.2mA			0.3	V
RESET Output Voltage (MIC708R/S/T)	I_{Source} = 200µA	0.8 × V_{CC}			V
	I_{Sink} = 500µA			0.3	V
Watchdog Timeout Period, t_{WD}		1.0	1.6	2.25	sec
WDI Minimum Input Pulse, t_{WP}	V_{IL} = 0.4V, V_{IH} = 80% of V_{CC}	100			ns
	V_{IL} = 0.4V, V_{IH} = 80% of V_{CC} > 4.5V	50			ns
WDI Threshold Voltage	V_{IH}	0.7 × V_{CC}			V
	V_{IL}			0.6	V
WDI Input Current	WDI = 0V or V_{CC}	-1		1	µA
WDO Output Voltage	I_{Source} = 200µA	0.8 × V_{CC}			V
	I_{Sink} = 500µA			0.3	V
/MR Pull-Up Current	/MR = 0V	20	250	600	µA
/MR Pulse Width, t_{MR}	V_{CC} = 4.5V	500			ns
		150			ns
/MR Input Threshold	V_{IL}	0.7 × V_{CC}		0.6	V
	V_{IH}				V
/MR to Reset Output Delay, t_{MD}				750	ns
PFI Input Threshold		1.2	1.25	1.3	V
PFI Input Current		-25	0.01	+25	nA
/PFO Output Voltage	I_{Sink} = 1.2mA			0.3	V
	I_{Source} = 200µA	0.8 × V_{CC}			V

Note 1. Exceeding the absolute maximum rating may damage the device.

Note 2. The device is not guaranteed to function outside its operating rating.
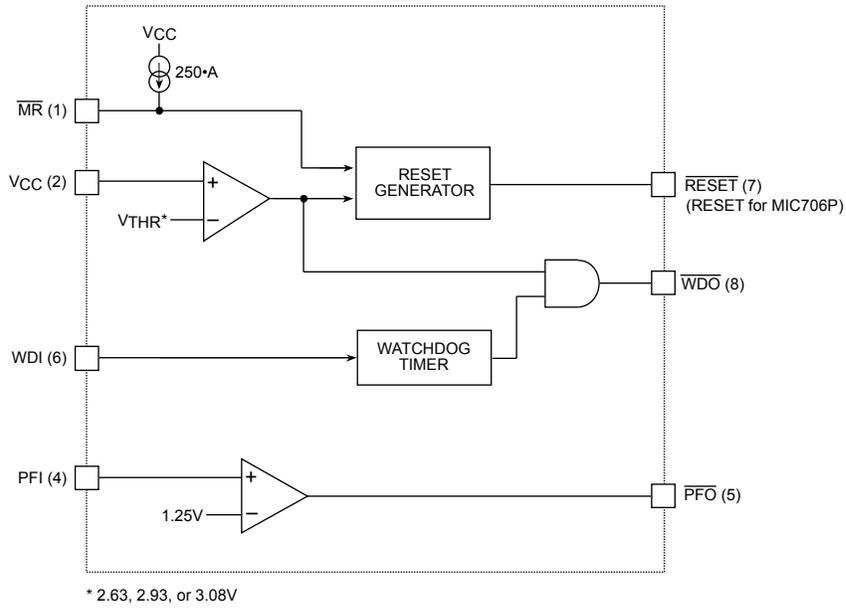

**Note 3.** Specification for packaged product only.

Applications Information

Power Fail Warning

An additional comparator which is independent of the other functions on the MIC706P/R/S/T is provided for early warning of power failure. An external voltage divider can be used to compare unregulated DC to an internal 1.25V reference. The voltage divider ratio on the input of the power-fail comparator (PFI) can be chosen so as to trip the power fail comparator a few milliseconds before V_{CC} falls below the maximum reset threshold voltage. The output of the power-fail comparator (/PFO) can be used to interrupt the microprocessor when used in this mode and execute shut-down procedures prior to power loss. Hysteresis can be added to this comparator with external resistors, as is commonly done with any comparator. When VCC < VBATT - 1.2V (typ.), the power-fail comparator is turned off and /PFO is pulled low in order to conserve power.

Figure 1. Power Fail Comparator

Watchdog Timer

The microprocessor can be monitored by connecting the WDI pin (watchdog input) to a bus line or an I/O line. If a transition doesn't occur on the WDI pin with in the watchdog timeout (Table 1.), the microprocessor is reset. /RESET will remain asserted for 200ms when this occurs. A minimum pulse of 100ns or any transition low-to-high or high-to-low on the WDI pin will reset the watchdog timer. The output of the watchdog timer (WDO) will remain high, if WDI sees a valid transition within the watchdog period or if VCC falls below the reset threshold as the watchdog timer is disabled when this happens.
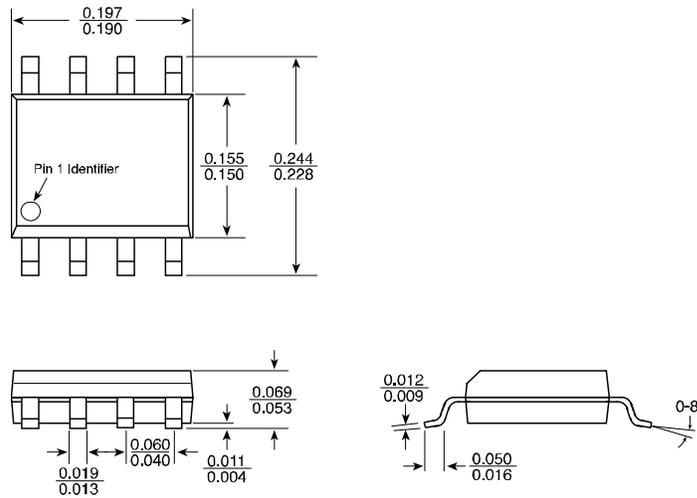

Microprocessor Reset

The /RESET pin is asserted whenever V_{CC} falls below the reset threshold voltage. The reset pin remains asserted for a period of 200ms after VCC has risen above the reset threshold voltage. The reset timeout period can also be selected by the end user, see Table 1. The reset function ensures the microprocessor is properly reset and powers up into a known condition after a power failure. /RESET will remain valid with VCC as low as 1.4V and when auxiliary power is connected to VBATT (VBATT > 2.0V), the reset pin will remain valid with VCC from 0V to 5.5V.

Package Information

8-Pin PDIP (N)

8-Pin SOIC (M)

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:
- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits,General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:
- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
