1024MB DDR2 32bits SDRAM SO-DIMM

1024MB DDR2 SDRAM 32bits SO-DIMM based 128Mx8 , 8Banks, 1.8V DDR2 SDRAM with SPD

Features

Performance range (Bandwidth 5.3GB/sec)

Part No.	Max Freq. (Clock)	Speed Grade
78.02G87.405	333MHz(3ns@CL5)	667 Mbps

- JEDECstandard 1.8V ± 0.1V Power Supply
- VDDQ = 1.8V± 0.1V
- Internal Bank: 8 Bank
- Posted CAS
- Programmable CAS Latency: 3, 4, 5
- Programmable Additive Latency: 0, 1 , 2 , 3 and 4
- Write Latency(WL) = Read Latency(RL) -1
- Burst Length: 4 , 8(Interleave/nibble sequential)
- Programmable Sequential / Interleave Burst Mode
- Bi-directional Differential Data-Strobe (Single-ended data-strobe is an optional feature)
- Off-Chip Driver(OCD) Impedance Adjustment
- On Die Termination
- Refresh and Self Refresh
  Average Refesh Period 7.8us
- Serial presence detect with EEPROM
- Compliance with RoHS
- Compliance with CE
- Operating Temperature Rang:
- Commercial 0°C ≦ TC ≦ 85°C
- Refresh: auto-refresh, self-refresh
- —Average refresh period
  7.8us at 0°C ≦ TC ≦ 85°C
  3.9us at 85°C ≦ TC ≦ 95°C

Description

This module is 256M x 32 bit Double Data Rate SDRAM high density memory modules based on first generation of 1024MB DDR2 SDRAM respectively.

It consists of sixteen CMOS 128M x8 bit with 8banks Double Data Rate SDRAMs in 60Ball FBGA packages mounted on a 200pin glass-epoxy substrate. Three 0.1uF decoupling capacitors are mounted on the printed circuit board in parallel for each DDR2 SDRAM.

Synchronous design allows precise cycle control with the use of system clock. Data I/O transactions are possible on both edges of DQS. Range of operating frequencies, programmable latencies and burst lengths allow the same device to be useful for a variety of high bandwidth, high performance memory system applications.

Pin Configurations (Front side/Back side)

Pin	Front	Pin	Back	Pin	Front	Pin	Back	Pin	Front	Pin	Back	Pin	Front	Pin	Back
1	V_{REF}	2	V_{SS}	51	DQS2	52	DM2	101	A1	102	A0	151	NC	152	NC

Pin Description

Pin Name	Function	Pin Name	Function
CK0,CK1	Clock Inputs, positive line	SDA	SPD Data Input/Output
$\overline{CK}0$,$\overline{CK}1$	Clock Inputs, negative line	SA1,SA0	SPD address
CKE0,CKE1	Clock Enables	DQ0~DQ31	Data Input/Output
$\overline{RAS}$	Row Address Strobe	DM0~DM3	Data Masks
$\overline{CAS}$	Column Address Strobe	DQS0~DQS3	Data strobes
$\overline{WE}$	Write Enable	$\overline{DQS0}$~$\overline{DQS3}$	Data strobes complement
$\overline{S}0$	Chip Selects	TEST	Logic Analyzer specific test pin (No connect on So-DIMM)
A0~A9, A11~A13	Address Inputs	V_{DD}	Core and I/O Power
A10/AP	Address Input/Autoprecharge	V_{SS}	Ground
BA0,BA2	SDRAM Bank Address	V_{REF}	Input/Output Reference
ODT0,ODT1	On-die termination control	V_{DD}SPD	SPD Power
SCL	Serial Presence Detect(SPD) Clock Input	NC	Spare pins, No connect

Input/Output Functional Description

Symbol	Type	Function
CK0-CK1 CK0-CK1	Input	The system clock inputs. All address and command lines are sampled on the cross point of the rising edge of CK and falling edge of CK . A Delay Locked Loop (DLL) circuit is driven from the clock input and output timing for read operations is synchronized to the input clock.
CKE0-CKE1	Input	Activates the DDR2 SDRAM CK signal when high and deactivates the CK signal when low, By deactivating the clocks, CKE low initiates the Power Down mode or the Self Refesh mode.
S0	Input	Enables the associated DDR2 SDRAM command decoder when low and disables the command decoder when high. When the command decoder is disabled, new commands are ignored but previous operations continue. Rank 0 is selected by S0, Rank 1 is selected by S1. Ranks are also called “Physical banks”.
RAS, CAS, WE	Input	When sampled at the cross point of the rising edge of CK and falling edge of CK, CAS, RAS, and WE define the operation to be executed by the SDRAM.
BA0~BA2	Input	Selects which DDR2 SDRAM internal bank is activated.
ODT0~ODT1	Input	Asserts on-die termination for DQ, DM, DQS, and DQS signals if enabled via the DDR2 SDRAM Extended Mode Register Set (EMRS).
A0~A9, A10/AP, A11~A13	Input	During a Bank Activate command cycle, defines the row address when sampled at the cross point of the rising edge of CK and falling edge of CK. During a Read or Write command cycle, defines the column address when sampled at the cross point of the rising edge of CK and falling edge of CK. In addition to the column address, AP is used to invoke autoprecharge operation at the end of the burst read or write cycle. If AP is high, autoprecharge is selected and BA0-BAn defines the bank to be precharged. If AP is low, autoprecharge is disabled. During a Precharge command cycle, AP is used in conjunction with BA0-BAn to control which bank(s) to precharge. If AP is high, all banks will be pecharged regardless of the state of BA0-BAn inputs. If AP is low, then BA0-BAn are used to define which bank to precharge.
DQ0~DQ31	In/Out	Data Input/Output pins.
DM0~DM3	Input	The data write masks, associated with one data byte. In Write mode, DM operates as a byte mask by allowing input data to be written if it is low but blocks the write operation if it is high. In Read mode, DM lines have no effect.
DQS0~DQS3 DQS0~DQS3	In/Out	The data strobes, associated with one data byte, sourced with data transfers. In Write mode, the data strobe is sourced by the controller and is centered in the data window. In Read mode, the data strobe is sourced by the DDR2 SDRAMs and is sent at the leading edge of the data window. DQS signals are complements, and timing is relative to the crosspoint of respective DQS and DQS If the module is to be operated in single ended strobe mode, all DQS signals must be tied on the system board to VSS and DDR2 SDRAM mode registers programmed appropriately.
V_{DD},V_{DD} SPD,V_{SS}	Supply	Power supplies for core, I/O, Serial Presence Detect, and ground for the module.
SDA	In/Out	This is a bidirectional pin used to transfer data into or out of the SPD EEPROM. A resistor must be connected to V_{DD} to act as a pull up.
SCL	Input	This signal is used to clock data into and out of the SPD EEPROM. A resistor may be connected from SCL to V_{DD} to act as a pull up.
SA0~SA1	Input	Address pins used to select the Serial Presence Detect base address.
TEST	In/Out	The TEST pin is reserved for bus analysis tools and is not connected on normal memory modules(SO-DIMMs).

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits,General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
