## NOTES

### 1. Switch mounting

Mount the switch with the hole cutting dimensions shown in the drawing.

### 2. Adjustment of the operating device:

With respect to the position of the operating device and the switch body, set the position as indicated in the condition on the right. If this condition is exceeded, the mechanical and electrical performance will be impaired. In addition, the force applied by the operating device should be in a perpendicular direction. Even if the pushbutton is used in the full total travel position, there will be no influence on the life of the switch.

### 3. Confirming insulating distance

Before mounting and wiring, the insulating distance between terminals and between the terminals and ground should be checked for assurance of proper distance. With respect to the terminal connections, it is recommended that receptacles with insulating sleeves or "Positive Lock Connector\*" be used. Also consideration should be given to the wiring not to apply force to the terminal section normally.

\*Registered by AMP, Ltd.

### 4. Regarding fastening lead wires to terminals

Use .250 receptacle (terminal thickness 0.8mm) or .110 receptacle (terminal thickness 0.5mm) should be used for connection. Make sure the sockets are straight. If they are skewed, the terminals will require excessive insertion force. The insertion force varies according to manufacturer's specifications. Check it for

the sockets you are using.

### 5. Material of the panel

Steel sheet is recommended as the panel material. When using soft material, confirm the condition for actual use.

### 6. Quality check under actual loading conditions

To improve reliability, check the switch under actual loading conditions. Avoid any situation that may adversely affect switching performance.

### 7. Avoid using and keeping switches in the following conditions.

- In corrosive gases
- In a dusty environment
- Where silicon atmosphere prevails

## REFERENCE

### 1. Outline of UL1054 test

Overload test

Standard type: 12.5A 250V AC  
(Power factor 0.75 to 0.8)

Endurance test

Standard type: 10A 250V AC  
(Power factor 0.75 to 0.8)

After testing, temperature rise of terminals should be less than 30°C and no abnormality should be observed in characteristics.

### 2. Outline of EN61058-1 test

After switching 25,000 times on the above load condition at both 85<sup>+5</sup>°C and 25±10°C, temperature rise of terminals should be less than 55°C and no abnormality should be observed in characteristics.
