Advanced Multi-channel Single Chip UHF Transceiver

OVERVIEW

The AX5051 is a true single chip low-power CMOS transceiver primarily for use in SRD bands. The on-chip transceiver consists of a fully integrated RF front-end with modulator, and demodulator. Base band data processing is implemented in an advanced and flexible communication controller that enables user-friendly communication via the SPI interface.

Features

- Advanced Multi-channel Single Chip UHF Transceiver
- Configurable for Usage in 400–470 MHz and 800–940 MHz SRD Bands
- Wide Variety of Shaped Modulations Supported in RX and TX (ASK, PSK, MSK, FSK)
- Data Rates from 1 to 350 kbps (FSK, MSK), 1 to 600 kbps (ASK), 10 to 600 kbps (PSK)
- Ultra Fast Settling RF Frequency Synthesizer for Low-power Consumption
- Variable Channel Filtering from 40 kHz to 600 kHz
- RF Carrier Frequency and FSK Deviation Programmable in 1 Hz Steps
- Fully Integrated Frequency Synthesizer with VCO Auto-ranging and Band-width Boost Modes for Fast Locking
- Few External Components
- On-chip Communication Controller and Flexible Digital Modem
- Channel Hopping up to 2000 hops/s
- Sensitivity down to -116 dBm at 1.2 kbps
- Up to +16 dBm Programmable Transmitter Power Amplifier
- Crystal Oscillator with Programmable Transconductance and Programmable Internal Tuning Capacitors for Low Cost Crystals
- Automatic Frequency Control (AFC)
- SPI Micro-controller Interface
- Fully Integrated Current/Voltage References
- QFN28 Package
- Low Power Receiver: 18 21 mA in High Sensitivity Mode and 16 – 18 mA in Low Power Mode
- Low Power Transmitter: 11 45 mA during Transmit
- Extended Supply Voltage Range 2.2 V 3.6 V
- Internal Power-on-reset
- 32 Bit RX/TX Data FIFO

ORDERING INFORMATION

| Device | Туре | Qty | | |
|---------------|-------------|-------|--|--|
| AX5051-1-TA05 | Tape & Reel | 500 | | |
| AX5051-1-TW30 | Tape & Reel | 3,000 | | |

- Programmable Cyclic Redundancy Check (CRC-CCITT, CRC-16, CRC-32)
- Optional Spectral Shaping Using a Self Synchronizing Shift Register
- Brown–out Detection
- Integrated RX/TX Switching
- Differential Antenna Pins
- RoHS Compliant

Applications

- Telemetry
- Sensor Readout, Thermostats
- AMR
- Toys
- Wireless Audio
- Wireless Networks
- Wireless M-Bus
- Access Control
- Remote Keyless Entry
- Remote Controls
- Active RFID
- Compatible with FCC Part 15.247, FCC Part 15.249, EN 300 220 Wide Band, Wireless M–Bus S/T Mode 868 MHz, Konnex RF, ARIB T–67, 802.15.4

BLOCK DIAGRAM

Figure 1. Functional Block Diagram of the AX5051

Table 1. PIN FUNCTION DESCRIPTIONS

| Symbol | Pin(s) | Туре | ype Description | | |
|---------|--------|------|---|--|--|
| NC | 1 | N | Not to be connected | | |
| VDD | 2 | Р | Power supply, must be supplied with regulated voltage VREG | | |
| GND | 3 | Р | Ground | | |
| ANTP | 4 | А | Antenna input/output | | |
| ANTN | 5 | А | Antenna input/output | | |
| GND | 6 | Р | Ground | | |
| VDD | 7 | Р | Power supply, must be supplied with regulated voltage VREG | | |
| NC | 8 | N | Not to be connected | | |
| TST1 | 9 | I | Must be connected to GND | | |
| TST2 | 10 | I | Must be connected to GND | | |
| GND | 11 | Р | Ground | | |
| RESET_N | 12 | I | Optional reset input If this pin is not used it must be connected to VDD_IO | | |
| SYSCLK | 13 | I/O | Default functionality: Crystal oscillator (or divided) clock output Can be programmed to be used as a general purpose I/O pin | | |
| SEL | 14 | I | Serial peripheral interface select | | |
| CLK | 15 | I | Serial peripheral interface clock | | |
| MISO | 16 | 0 | Serial peripheral interface data output | | |
| MOSI | 17 | I | Serial peripheral interface data input | | |
| TST3 | 18 | I | Must be connected to GND | | |
| IRQ | 19 | I/O | Default functionality: Transmit and receive interrupt Can be programmed to be used as a general purpose I/O pin | | |
| VDD_IO | 20 | Р | Unregulated power supply | | |
| NC | 21 | N | Not to be connected | | |
| GND | 22 | Р | Ground | | |
| NC | 23 | N | Not to be connected | | |
| VREG | 24 | Р | Regulated output voltage VDD pins must be connected to this supply voltage A 1 μ F low ESR capacitor to GND must be connected to this pin | | |
| NC | 25 | Ν | Not to be connected | | |
| NC | 26 | Ν | Not to be connected | | |
| CLK16P | 27 | А | Crystal oscillator input/output | | |
| CLK16N | 28 | А | Crystal oscillator input/output | | |

A = analog signal

I = digital input signal

O = digital output signal

I/O = digital input/output signal

N = not to be connected

P = power or ground

All digital inputs are Schmitt trigger inputs; digital input and output levels are LVCMOS/LVTTL compatible and 5 V tolerant.

The center pad of the QFN28 package should be connected to GND.

SPECIFICATIONS

Table 2. ABSOLUTE MAXIMUM RATINGS

| Symbol | Description | Condition | Min | Max | Units |
|------------------|--|-----------|-------|------|-------|
| VDD_IO | Supply voltage | | -0.5 | 5.5 | V |
| IDD | Supply current | | | 100 | mA |
| P _{tot} | Total power consumption | | | 800 | mW |
| Pl | Absolute maximum input power at receiver input | | | 15 | dBm |
| I _{I1} | DC current into any pin except ANTP, ANTN | | -10 | 10 | mA |
| I _{I2} | DC current into pins ANTP, ANTN | | -100 | 100 | mA |
| I _O | Output current | | | 40 | mA |
| V _{ia} | Input voltage ANTP, ANTN pins | | -0.5 | 5.5 | V |
| | Input voltage digital pins | | -0.5 | 5.5 | V |
| V _{es} | Electrostatic handling | НВМ | -2000 | 2000 | V |
| T _{amb} | Operating temperature | | -40 | 85 | °C |
| T _{stg} | Storage temperature | | -65 | 150 | °C |
| Тj | Junction temperature | | | 150 | °C |

Stresses exceeding those listed in the Maximum Ratings table may damage the device. If any of these limits are exceeded, device functionality should not be assumed, damage may occur and reliability may be affected.

1. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

DC Characteristics

Table 3. SUPPLIES

| Symbol | Description | Condition | Min | Тур | Max | Units |
|-------------------------|--|--|-----|-------|-----|-------|
| T _{AMB} | Operational ambient temperature | | -40 | 27 | 85 | °C |
| VDD_IO | I/O and voltage regulator supply voltage | RX operation or TX operation up to 4 dBm output power | 2.2 | 3.0 | 3.6 | V |
| | | TX operation up to 16 dBm output power | 2.4 | 3.0 | 3.6 | V |
| VREG | Internally regulated supply voltage | Power-down mode PWRMODE=0x00 | | 1.7 | | V |
| | | All other power modes | 2.1 | 2.5 | 2.8 | V |
| VREG _{droptyp} | Regulator voltage drop | RX operation or TX operation up to 4 dBm output power | | | 50 | mV |
| VREG _{dropmax} | Regulator voltage drop at maximum internal current consumption | TX mode with 16 dBm output power | | | 300 | mV |
| I _{PDOWN} | Power-down current | PWRMODE = 0x00 | | 0.5 | | μA |
| I _{RX-HS} | Current consumption RX High sensitivity mode: VCO_I = 001; REF_I = 011 | Bit rate 10 kbit/s | | 19 | | mA |
| I _{RX-LP} | Current consumption RX Low power mode: VCO_I = 001; REF_I = 101 | Bit rate 10 kbit/s | | 17 | | mA |
| I _{TX} | Current consumption TX | 868 MHz, 15 dBm | | 45 | | mA |
| | VCO_I = 001; REF_I = 011; LOCURST = 1, (Note 1) | 433 MHz, 15 dBm | | 45 | | |
| TX _{varvdd} | Variation of output power over voltage | VDD > 2.5 V | | ± 0.5 | | dB |
| TX _{vartemp} | Variation of output power over temperature | VDD > 2.5 V | | ± 0.5 | | dB |

1. The PA voltage is regulated to 2.5 V. Between 2.2 V and 2.55 V VDD_IO a drop of 1 dBm of output power is visible.

Note on Current Consumption in TX Mode

To achieve best output power the matching network has to be optimized for the desired output power and frequency. As a rule of thumb a good matching network produces about 50% efficiency with the AX5051 power amplifier although over 90% are theoretically possible. A typical matching network has between 1 dB and 2 dB loss (P_{loss}).

The current consumption can be calculated as

$$I_{TX}[mA] = \frac{1}{PA_{efficiency}} \times 10^{\left(\frac{P_{out}[dBm] + P_{loss}[dB]}{10}\right)} \div 2.5V + I_{offset}$$

 I_{offset} is about 12 mA for the VCO at 400–470 MHz and 11 mA for 800–940 MHz. The following table shows calculated current consumptions versus output power for $P_{loss} = 1$ dB, $PA_{efficiency} = 0.5$ and $I_{offset} = 11$ mA at 868 MHz.

Table 4.

| Pout [dBm] | l [mA] |
|------------|--------|
| 0 | 13.0 |
| 1 | 13.2 |
| 2 | 13.6 |
| 3 | 14.0 |

| 4 | 14.5 |
|----|-------|
| 5 | 15.1 |
| 6 | 16.0 |
| 7 | 17.0 |
| 8 | 18.3 |
| 9 | 20.0 |
| 10 | 22.0 |
| 11 | 24.6 |
| 12 | 27.96 |
| 13 | 32.1 |
| 14 | 37.3 |
| 15 | 43.8 |

The AX5051 power amplifier runs from the regulated VDD supply and not directly from the battery. This has the advantage that the current and output power do not vary much over supply voltage and temperature from 2.55 V to 3.6 V supply voltage. Between 2.55 V and 2.2 V a drop of about 1 dB in output power occurs.

Table 5. LOGIC

| Symbol | Description | Condition | Min | Тур | Max | Units | |
|-----------------|---|-------------------------|-----|-----|-----|-------|--|
| Digital Input | Digital Inputs | | | | | | |

| gm _{osc} | Transconductance oscillator | XTALOSCGM = 0000 | | 1 | | mS |
| | | XTALOSCGM = 0001 | | 2 | | |
| | | XTALOSCGM = 0010 default | | 3 | | |
| | | XTALOSCGM = 0011 | | 4 | | |
| | | XTALOSCGM = 0100 | | 5 | | |
| | | XTALOSCGM = 0101 | | 6 | | |
| | | XTALOSCGM = 0110 | | 6.5 | | |
| | | XTALOSCGM = 0111 | | 7 | | |
| | | XTALOSCGM = 1000 | | 7.5 | | |
| | | XTALOSCGM = 1001 | | 8 | | |
| | | XTALOSCGM = 1010 | | 8.5 | | |
| | | XTALOSCGM = 1011 | | 9 | | |
| | | XTALOSCGM = 1100 | | 9.5 | | |
| | | XTALOSCGM = 1101 | | 10 | | |
| | | XTALOSCGM = 1110 | | 10.5 | | |
| | | XTALOSCGM = 1111 | | 11 | | |
| C _{osc} | Programmable tuning capacitors at pins | XTALCAP = 000000 default | | 2 | | pF |
| | CLK16N and CLK16P | XTALCAP = 111111 | | 33 | | |
| C _{osc-lsb} | Programmable tuning capacitors, increment per LSB of XTALCAP | | | 0.5 | | pF |
| f _{ext} | External clock input | Notes 2, 3 | 15.5 | 15 | 25 | MHz |
| RIN _{osc} | Input DC impedance | | 10 | | | kΩ |

Tolerances and start-up times depend on the crystal used. Depending on the RF frequency and channel spacing the IC must be calibrated to the exact crystal frequency using the readings of the register TRKFREQ.
 If an external clock is used, it should be input via an AC coupling at pin CLK16P with the oscillator powered up and XTALCAP = 000000
 Lower frequencies than 15.5 MHz or higher frequencies than 25 MHz can be used. However, not all typical RF frequencies can then be

generated.

| Tch | CLK high duration | | 40 | | | ns |

1. For SPI access during power-down mode the period should be relaxed to 100 ns.

For a figure showing the SPI timing parameters see section Serial Peripheral Interface (SPI).

CIRCUIT DESCRIPTION

The AX5051 is a true single chip low-power CMOS transceiver primarily for use in SRD bands. The on-chip transceiver consists of a fully integrated RF front-end with modulator, and demodulator. Base band data processing is implemented in an advanced and flexible communication controller that enables user-friendly communication via the SPI interface.

AX5051 can be operated from 2.2 V to 3.6 V power supply over a temperature range from -40° C to 85° C, it consumes 11 – 45 mA for transmitting depending on the output power, 19 mA for receiving in high sensitivity mode and 18 mA for receiving in low power mode.

The AX5051 features make it an ideal interface for integration into various battery powered SRD solutions such as ticketing or as transceiver for telemetric applications e.g. in sensors. As primary application, the transceiver is intended for UHF radio equipment in accordance with the European Telecommunication Standard Institute (ETSI) specification EN 300 220-1 and the US Federal Communications Commission (FCC) standard CFR47, part 15. The use of AX5051 in accordance to FCC Par 15.247, allows for improved range in the 915 MHz band. Additionally AX5051 is compatible with the low frequency standards of 802.15.4 (ZigBee). It therefore incorporates a DSSS engine, which spreads data on the transmitter and despreads data for the receiver. Spreading and despreading is possible on all data rates and modulation schemes. The net transfer rate is reduced by a factor of 15 in this case. For 802.15.4 either 600 or 300 kbps modes have to be chosen.

The AX5051 sends and receives data via the SPI port in frames. This standard operation mode is called Frame Mode. Pre and post ambles as well as checksums can be generated automatically. Interrupts control the data flow between a controller and the AX5051.

The AX5051 behaves as a SPI slave interface. Configuration of the AX5051 is also done via the SPI interface.

AX5051 supports any data rate from 1 kbps to 350 kbps for FSK and MSK and from 1 kbps for 600 kbps for ASK and 10 kbps to 600 kbps PSK. To achieve optimum performance for specific data rates and modulation schemes several register settings to configure the AX5051 are necessary, they are outlined in the following, for details see the AX5051 Programming Manual.

The receiver supports multi-channel operation for all data rates and modulation schemes.

Voltage Regulator

The AX5051 uses an on-chip voltage regulator to create a stable supply voltage for the internal circuitry at pin VREG from the primary supply VDD_IO. All VDD pins of the device must be connected to VREG. The antenna pins ANTP and ANTN must be DC biased to VREG. The I/O level of the digital pins is VDD_IO. The voltage regulator requires a 1 μF low ESR capacitor at pin VREG.

In power-down mode the voltage regulator typically outputs 1.7 V at VREG, if it is powered-up its output rises to typically 2.5 V. At device power-up the regulator is in power-down mode.

The voltage regulator must be powered–up before receive or transmit operations can be initiated. This is handled automatically when programming the device modes via the PWRMODE register.

Register VREG contains status bits that can be read to check if the regulated voltage is above 1.3 V or 2.3 V, sticky versions of the bits are provided that can be used to detect low power events (brown–out detection).

Crystal Oscillator

The on-chip crystal oscillator allows the use of an inexpensive quartz crystal as the RF generation subsystem's timing reference. Although a wider range of crystal frequencies can be handled by the crystal oscillator circuit, it is recommended to use 16 MHz as reference frequency for ASK and PSK modulations independent of the data rate. For FSK it is recommended to use a 16 MHz crystal for data rates below 200 kbps and 24 MHz for data rates above 200 kbps.

The oscillator circuit is enabled by programming the PWRMODE register. At power-up it is not enabled.

To adjust the circuit's characteristics to the quartz crystal being used without using additional external components, both the transconductance and the tuning capacitance of the crystal oscillator can be programmed.

The transconductance is programmed via register bits XTALOSCGM[3:0] in register XTALOSC.

The integrated programmable tuning capacitor bank makes it possible to connect the oscillator directly to pins CLK16N and CLK16P without the need for external capacitors. It is programmed using bits XTALCAP[5:0] in register XTALCAP.

To synchronize the receiver frequency to a carrier signal, the oscillator frequency could be tuned using the capacitor bank however, the recommended method to implement frequency synchronization is to make use of the high resolution RF frequency generation sub-system together with the Automatic Frequency Control, both are described further down.

Alternatively a single ended reference (TXCO, CXO) may be used. The CMOS levels should be applied to CLK16P via an AC coupling with the crystal oscillator enabled.

SYSCLK Output

The SYSCLK pin outputs the reference clock signal divided by a programmable integer. Divisions from 1 to 2048 are possible. For divider ratios > 1 the duty cycle is

50%. Bits SYSCLK[3:0] in the PINCFG1 register set the divider ratio. The SYSCLK output can be disabled.

Outputting a frequency that is identical to the IF frequency (default 1 MHz) on the SYSCLK pin is not recommended during receive operation, since it requires extensive decoupling on the PCB to avoid interference.

Power-on-reset (POR) and RESET_N Input

AX5051 has an integrated power-on-reset block. No external POR circuit or signal at the RESET_N pin is required, prior to POR the RESET_N pin is disabled. After POR the AX5051 can be reset in two ways:

- 1. By SPI accesses: the bit RST in the PWRMODE register is toggled.
- 2. Via the RESET_N pin: A low pulse is applied at the RESET_N pin. With the rising edge of RESET_N the device goes into its operational state.

After POR or reset all registers are set to their default values.

If the RESET_N pin is not used it must be tied to VDD_IO.

RF Frequency Generation Subsystem

The RF frequency generation subsystem consists of a fully integrated synthesizer, which multiplies the reference frequency from the crystal oscillator to get the desired RF frequency. The advanced architecture of the synthesizer enables frequency resolutions of 1 Hz, as well as fast settling times of $5 - 50 \,\mu$ s depending on the settings (see section: AC Characteristics). Fast settling times mean fast start–up and fast RX/TX switching, which enables low–power system design.

For receive operation the RF frequency is fed to the mixer, for transmit operation to the power–amplifier.

The frequency must be programmed to the desired carrier frequency. The RF frequency shift by the IF frequency that is required for RX operation, is automatically set when the receiver is activated and does not need to be programmed by the user. The default IF frequency is 1 MHz. It can be programmed to other values. Changing the IF–frequency and thus the center frequency of the digital channel filter can be used to adapt the blocking performance of the device to specific system requirements.

The synthesizer loop bandwidth can be programmed. This serves three purposes:

- 1. Start-up time optimization, start-up is faster for higher synthesizer loop bandwidths.
- TX spectrum optimization, phase-noise at 300 kHz to 1 MHz distance from the carrier improves with lower synthesizer loop bandwidths.
- 3. Adaptation of the bandwidth to the data-rate. For transmission of FSK and MSK it is required that the synthesizer bandwidth must be in the order of the data-rate.

VCO

An on-chip VCO converts the control voltage generated by the charge pump and loop filter into an output frequency. This frequency is used for transmit as well as for receive operation. The frequency can be programmed in 1 Hz steps in the FREQ registers. For operation in the 433 MHz band, the BANDSEL bit in the PLLLOOP register must be programmed.

VCO Auto-Ranging

The AX5051 has an integrated auto-ranging function, which allows to set the correct VCO range for specific frequency generation subsystem settings automatically. Typically it has to be executed after power-up. The function is initiated by setting the RNG_START bit in the PLLRANGING register. The bit is readable and a 0 indicates the end of the ranging process. The RNGERR bit indicates the correct execution of the auto-ranging.

Loop Filter and Charge Pump

The AX5051 internal loop filter configuration together with the charge pump current sets the synthesizer loop band width. The loop-filter has three configurations that can be programmed via the register bits FLT[1:0] in register PLLLOOP, the charge pump current can be programmed using register bits PLLCPI[1:0] also in register PLLLOOP. Synthesizer bandwidths are typically 50 – 500 kHz depending on the PLLLOOP settings, for details see the section: AC Characteristics.

Registers

| Register | Bits | Purpose |
|--------------------|-------------|---|
| PLLLOOP | FLT[1:0] | Synthesizer loop filter bandwidth, recommended usage is to increase the bandwidth for faster settling time, bandwidth increases of factor 2 and 5 are possible. |
| | PLLCPI[2:0] | Synthesizer charge pump current, recommended usage is to decrease the bandwidth (and improve the phase-noise) for low data-rate transmissions. |
| | BANDSEL | Switches between 868 MHz / 915 MHz and 433 MHz bands |
| FREQ | | Programming of the carrier frequency |
| IFFREQHI, IFFREQLO | | Programming of the IF frequency |
| PLLRANGING | | Initiate VCO auto-ranging and check results |

Table 12. REGISTERS

RF Input and Output Stage (ANTP/ANTN)

The AX5051 uses fully differential antenna pins. RX/TX switching is handled internally; an external RX/TX switch is not required.

LNA

The LNA amplifies the differential RF signal from the antenna and buffers it to drive the I/Q mixer. An external matching network is used to adapt the antenna impedance to the IC impedance. A DC feed to the regulated supply voltage VREG must be provided at the antenna pins. For recommendations see section: Application Information.

I/Q Mixer

The RF signal from the LNA is mixed down to an IF of typically 1 MHz. I– and Q–IF signals are buffered for the analog IF filter.

PA

In TX mode the PA drives the signal generated by the frequency generation subsystem out to the differential antenna terminals. The output power of the PA is programmed via bits TXRNG[3:0] in the register TXPWR. Output power as well as harmonic content will depend on the external impedance seen by the PA, recommendations are given in the section: Application Information.

Analog IF Filter

The mixer is followed by a complex band-pass IF filter, which suppresses the down-mixed image while the wanted signal is amplified. The center frequency of the filter is 1 MHz, with a pass-band width of 1 MHz. The RF frequency generation subsystem must be programmed in such a way that for all possible modulation schemes the IF frequency spectrum fits into the pass-band of the analog filter.

Digital IF Channel Filter and Demodulator

The digital IF channel filter and the demodulator extract the data bit-stream from the incoming IF signal. They must be programmed to match the modulation scheme as well as the data rate. Inaccurate programming will lead to loss of sensitivity.

The channel filter offers bandwidths of 40 kHz up to 600 kHz.

For detailed instructions how to program the digital channel filter and the demodulator see the AX5051 Programming Manual, an overview of the registers involved is given in the following table. The register setups typically must be done once at power–up of the device.

| Register | Remarks |
|---|--|
| CICDEC | This register programs the bandwidth of the digital channel filter. |
| DATARATEHI, DATARATELO | These registers specify the receiver bit rate, relative to the channel filter bandwidth. |
| TMGGAINHI, TMGGAINLO | These registers specify the aggressiveness of the receiver bit timing recovery. More aggressive settings allow the receiver to synchronize with shorter preambles, at the expense of more timing jitter and thus a higher bit error rate at a given signal-to-noise ratio. |
| MODULATION | This register selects the modulation to be used by the transmitter and the receiver, i.e. whether ASK, PSK , FSK, MSK or OQPSK should be used. |
| PHASEGAIN, FREQGAIN, FREQGAIN2, AMPLGAIN | These registers control the bandwidth of the phase, frequency offset and amplitude tracking loops. Recommended settings are provided in the Programming Manual. |
| AGCATTACK, AGCDECAY | These registers control the AGC (automatic gain control) loop slopes, and thus the speed of gain adjustments. The faster the bit rate, the faster the AGC loop should be. Recommended settings are provided in the Programming Manual. |
| TXRATE | These registers control the bit rate of the transmitter. |
| FSKDEV | These registers control the frequency deviation of the transmitter in FSK mode. The receiver does not explicitly need to know the frequency deviation, only the channel filter bandwidth has to be set wide enough for the complete modulation to pass. |

Encoder

The encoder is located between the Framing Unit, the Demodulator and the Modulator. It can optionally transform the bit-stream in the following ways:

- It can invert the bit stream.
- It can perform differential encoding. This means that a zero is transmitted as no change in the level, and a one is transmitted as a change in the level. Differential encoding is useful for PSK, because PSK transmissions can be received either as transmitted or inverted, due to

the uncertainty of the initial phase. Differential encoding / decoding removes this uncertainty.

- It can perform Manchester encoding. Manchester encoding ensures that the modulation has no DC content and enough transitions (changes from 0 to 1 and from 1 to 0) for the demodulator bit timing recovery to function correctly, but does so at a doubling of the data rate.
- It can perform Spectral Shaping. Spectral Shaping removes DC content of the bit stream, ensures

transitions for the demodulator bit timing recovery, and makes sure that the transmitted spectrum does not have discrete lines even if the transmitted data is cyclic. It does so without adding additional bits, i.e. without changing the data rate. Spectral Shaping uses a self-synchronizing feedback shift register.

The encoder is programmed using the register ENCODING, details and recommendations on usage are given in the AX5051 Programming Manual.

Framing and FIFO

Most radio systems today group data into packets. The framing unit is responsible for converting these packets into a bit-stream suitable for the modulator, and to extract packets from the continuous bit-stream arriving from the demodulator.

The Framing unit supports four different modes:

- HDLC
- Raw
- Raw with Preamble Match
- 802.15.4 Compliant

The micro-controller communicates with the framing unit through a 4 level \times 10 bit FIFO. The FIFO decouples micro-controller timing from the radio (modulator and demodulator) timing. The bottom 8 bits of the FIFO contain transmit or receive data. The top 2 bit are used to convey meta information in HDLC and 802.15.4 modes. They are unused in Raw and Raw with Preamble Match modes. The meta information consists of packet begin / end information and the result of CRC checks.

The AX5051 contains one FIFO. Its direction is switched depending on whether transmit or receive mode is selected.

The FIFO can be operated in polled or interrupt driven modes. In polled mode, the micro-controller must periodically read the FIFO status register or the FIFO count register to determine whether the FIFO needs servicing.

In interrupt mode EMPTY, NOT EMPTY, FULL, NOT FULL and programmable level interrupts are provided. The AX5051 signals interrupts by asserting (driving high) its IRQ line. The interrupt line is level triggered, active high. Interrupts are acknowledged by removing the cause for the interrupt, i.e. by emptying or filling the FIFO.

Basic FIFO status (EMPTY, FULL, Overrun, Under-run, and the top two bits of the top FIFO word) are also provided during each SPI access on MISO while the micro-controller shifts out the register address on MOSI. See the SPI interface section for details. This feature significantly reduces the number of SPI accesses necessary during transmit and receive.

HDLC Mode

NOTE: HDLC mode follows High–Level Data Link Control (HDLC, ISO 13239) protocol.

HDLC Mode is the main framing mode of the AX5051. In this mode, the AX5051 performs automatic packet delimiting, and optional packet correctness check by inserting and checking a cyclic redundancy check (CRC) field.

The packet structure is given in the following table.

Table 14.

| Flag | Address | Control | Information | FCS | (Optional Flag) |
|-------|---------|-------------|---|-------------|-----------------|
| 8 bit | 8 bit | 8 or 16 bit | Variable length, 0 or more bits in multiples of 8 | 16 / 32 bit | 8 bit |

HDLC packets are delimited with flag sequences of content 0x7E.

In AX5051 the meaning of address and control is user defined. The Frame Check Sequence (FCS) can be programmed to be CRC–CCITT, CRC–16 or CRC–32.

The receiver checks the CRC, the result can be retrieved from the FIFO, the CRC is appended to the received data.

For details on implementing a HDLC communication see the AX5051 Programming Manual.

Raw Mode

In Raw mode, the AX5051 does not perform any packet delimiting or byte synchronization. It simply serializes transmit bytes and de-serializes the received bit-stream and groups it into bytes.

This mode is ideal for implementing legacy protocols in software.

Raw Mode with Preamble Match

Raw mode with preamble match is similar to raw mode. In this mode, however, the receiver does not receive anything until it detects a user programmable bit pattern (called the preamble) in the receive bit-stream. When it detects the preamble, it aligns the de-serialization to it.

The preamble can be between 4 and 32 bits long.

802.15.4 (ZigBee) DSSS

802.15.4 uses binary phase shift keying (PSK) with 300 kbit/s (868 MHz band) or 600 kbit/s (915 MHz band) on the radio. The usable bit rate is only a 15^{th} of the radio bit rate, however. A spreading function in the transmitter expands the user bit rate by a factor of 15, to make the transmission more robust. The despreader function of the receiver undoes that.

In 802.15.4 mode, the AX5051 framing unit performs the spreading and despreading function according to the 802.15.4 specification. In receive mode, the framing unit will also automatically search for the 802.15.4 preamble, meaning that no interrupts will have to be serviced by the micro-controller until a packet start is detected.

The 802.15.4 is a universal DSSS mode, which can be used with any modulation or data rate as long as it does not violate the maximum data rate of the modulation being used. Therefore the maximum DSSS data rate is 16 kbps for FSK and 40 kbps for ASK and PSK.

RX AGC and RSSI

AX5051 features two receiver signal strength indicators (RSSI):

1. RSSI before the digital IF channel filter. The gain of the receiver is adjusted in order to keep the analog IF filter output level inside the working range of the ADC and demodulator. The register AGCCOUNTER contains the current value of the AGC and can be used as an RSSI. The step size of this RSSI is 0.625 dB. The value can be used as soon as the RF frequency generation sub-system has been programmed.

2. RSSI behind the digital IF channel filter. The demodulator also provides amplitude information in the TRK_AMPLITUDE register. By combining both the AGCCOUNTER and the TRK_AMPLITUDE registers, a high resolution (better than 0.1 dB) RSSI value can be computed at the expense of a few arithmetic operations on the micro-controller. Formulas for this computation can be found in the AX5051 Programming Manual.

Modulator

Depending on the transmitter settings the modulator generates various inputs for the PA (see Table 15):

Table 15.

| Modulation | Bit = 0 | Bit = 1 | Main Lobe Bandwidth | Max. Bitrate |
|------------|-----------------------------|-----------------------------|------------------------------|--------------|
| ASK | PA off | PA on | BW = BITRATE | 600 kBit/s |
| FSK/MSK | $\Delta f = -f_{deviation}$ | $\Delta f = +f_{deviation}$ | $BW = (1 + h) \cdot BITRATE$ | 350 kBit/s |
| PSK | $\Delta \Phi = 0^{\circ}$ | $\Delta \Phi$ = 180° | BW = BITRATE | 600 kBit/s |

Table 16.

| h | Modulation index. It is the ratio of the deviation compared to the bit-rate. AX5051 can demodulate signals with $h < 32$. |
|------------------------|--|
| f _{deviation} | 0.5 h BITRATE |
| ASK | Amplitude shift keying |
| FSK | Frequency shift keying |
| MSK | Minimum shift keying. MSK is a special case of FSK, where h = 0.5, and therefore f _{deviation} = 0.25·BITRATE; the advantage of MSK over FSK is that it can be demodulated more robustly. |
| PSK | Phase shift keying |
| OQPSK | Offset quadrature shift keying. The AX5051 supports OQPSK. However, unless compatibility to an existing system is required, MSK should be preferred. |

All modulation schemes are binary.

Automatic Frequency Control (AFC)

The AX5051 has a frequency tracking register TRKFREQ to synchronize the receiver frequency to a carrier signal. For AFC adjustment, the frequency offset can be computed with the following formula:

$$\Delta f = \frac{\text{TRKFREQ}}{2^{16}} \text{ BITRATE} \times \text{FSKMUL}$$

FSKMUL is the FSK oversampling factor, it depends on the FSK bit-rate and deviation used. To determine it for a specific case, see the AX5051 Programming Manual. For modulations other than FSK, FSKMUL = 1.

PWRMODE Register

The PWRMODE register controls, which parts of the chip are operating.

| PWRMODE Register | Name | Description | Typical Idd |
|------------------|-----------|---|-------------|
| 0000 | POWERDOWN | All digital and analog functions, except the register file, are disabled. The core supply voltage is reduced to conserve leakage power. SPI registers are still accessible, but at a slower speed. | 0.5 μA |
| 0100 | VREGON | All digital and analog functions, except the register file, are disabled. The core voltage, however is at its nominal value for operation, and all SPI registers are accessible at the maximum speed. | 200 μA |

Table 17. PWRMODE REGISTER

| PWRMODE Register | Name | Description | Typical Idd |
|------------------|---------|--|-------------|
| 0101 | STANDBY | The crystal oscillator is powered on; receiver and transmitter are off. | 650 μA |
| 1000 | SYNTHRX | The synthesizer is running on the receive frequency. Transmitter and receiver are still off. This mode is used to let the synthesizer settle on the correct frequency for receive. | 11 mA |
| 1001 | FULLRX | Synthesizer and receiver are running. | 17 – 19 mA |
| 1100 | SYNTHTX | The synthesizer is running on the transmit frequency. Transmitter and receiver are still off. This mode is used to let the synthesizer settle on the correct frequency for transmit. | 10 mA |
| 1101 | FULLTX | Synthesizer and transmitter are running. Do not switch into this mode before the synthesizer has completely settled on the transmit frequency (in SYNTHTX mode), otherwise spurious spectral transmissions will occur. | 11 – 45 mA |

Table 17. PWRMODE REGISTER

Table 18. A TYPICAL PWRMODE SEQUENCE FOR A TRANSMIT SESSION

| Step | PWRMODE | Remarks |
|------|-----------|---|
| 1 | POWERDOWN | |
| 2 | STANDBY | The settling time is dominated by the crystal used, typical value 3 ms. |
| 3 | SYNTHTX | The synthesizer settling time is 5 – 50 μs depending on settings, see section AC Characteristics |
| 4 | FULLTX | Data transmission |
| 5 | SYNTHTX | This step must be programmed after FULLTX mode, or the device will not enter POWERDOWN or STANDBY mode. |
| 6 | POWERDOWN | |

Table 19. A TYPICAL PWRMODE SEQUENCE FOR A RECEIVE SESSION

| Step | PWRMODE [3:0] | Remarks |
|------|---------------|---|
| 1 | POWERDOWN | |
| 2 | STANDBY | The settling time is dominated by the crystal used, typical value 3 ms. |
| 3 | SYNTHRX | The synthesizer settling time is 5 – 50 μs depending on settings, see section AC Characteristics |
| 4 | FULLRX | Data reception |
| 5 | POWERDOWN | |

Serial Peripheral Interface

The AX5051 can be programmed via a four wire serial interface according SPI using the pins CLK, MOSI, MISO and SEL. Registers for setting up the AX5051 are programmed via the serial peripheral interface in all device modes.

When the interface signal SEL is pulled low, a 16-bit configuration data stream is expected on the input signal pin MOSI, which is interpreted as D0...D7, A0...A6, R_N/W. Data read from the interface appears on MISO.

Figure 3 shows a write/read access to the interface. The data stream is built of an address byte including read/write information and a data byte. Depending on the R_N/W bit and address bits A[6..0], data D[7..0] can be written via MOSI or read at the pin MISO.

 $R_N/W = 0$ means read mode, $R_N/W = 1$ means write mode.

The read sequence starts with 7 bits of status information S[6..0] followed by 8 data bits.

The status bits contain the following information:

Table 20.

Figure 3. Serial Peripheral Interface Timing

REGISTER BANK DESCRIPTION

This section describes the bits of the register bank in detail. The registers are grouped by functional block to facilitate programming.

No checks are made whether the programmed combination of bits makes sense! Bit 0 is always the LSB.

NOTES: Whole registers or register bits marked as reserved should be kept at their default values. All addresses not documented here must not be accessed, neither in reading nor in writing.

APPLICATION INFORMATION

Typical Application Diagram

Figure 4. Typical Application Diagram

It is mandatory to add 1 μF (low ESR) between VREG and GND.

Decoupling capacitors are not all drawn. It is recommended to add 100 nF decoupling capacitor for every

VDD and VDD_IO pin. In order to reduce noise on the antenna inputs it is recommended to add 27 pF on the VDD pins close to the antenna interface.

Antenna Interface Circuitry

The ANTP and ANTN pins provide RF input to the LNA when AX5051 is in receiving mode, and RF output from the PA when AX5051 is in transmitting mode. A small antenna can be connected with an optional translation network. The network must provide DC power to the PA and LNA. A biasing to VREG is necessary.

Single-ended Antenna Interface

Beside biasing and impedance matching, the proposed networks also provide low pass filtering to limit spurious emission.

Figure 5. Structure of the Antenna Interface to 50 Ω Single–ended Equipment or Antenna

Table 22.

| Frequency Band | LC1,2 [nH] | CC1,2 [pF] | LT1,2 [nH] | CT1,2 [pF] | CM1,2 [pF] | LB1,2 [nH] | CB1,2 [pF] | LF1 [nH] | CF1,2 [pF] |
|----------------|---------------|---------------|---------------|---------------|---------------|---------------|---------------|-------------|---------------|
| 868 / 915 MHz | 68 | 0.9 | 12 | 18 | 2.4 | 12 | 2.7 | 0 Ω | NC |
| 433 MHz | 120 | 2.2 | 39 | 7.5 | 6.0 | 27 | 5.2 | 0 Ω | NC |

Voltage Regulator

The AX5051 has an integrated voltage regulator, which generates a stable supply voltage VREG from the voltage

applied at VDD_IO. Use VREG to supply all the VDD supply pins.

QFN28 PACKAGE INFORMATION

QFN28 5x5, 0.5P CASE 485EF **ISSUE A**

- NOTES: 1. DIMENSIONS AND TOLERANCING PER ASME Y14.5M, 1994. 2. CONTROLLING DIMENSION: MILLIMETERS. 3. DIMENSION & APPLIES TO PLATED TERMINAL AND IS MEASURED BETWEEN
- 0.15 AND 0.30MM FROM THE TERMINAL TIP. COPLANARITY APPLIES TO THE EXPOSED PAD AS WELL AS THE TERMINALS.

QFN28 Soldering Profile

Table 23.

| Profile Feature | Pb-Free Process | |
|--|---------------------------|--------------|
| Average Ramp-Up Rate | | 3°C/s max. |
| Preheat Preheat | | |
| Temperature Min | T _{sMIN} | 150°C |
| Temperature Max | T _{sMAX} | 200°C |
| Time (T _{sMIN} to T _{sMAX}) | t _s | 60 – 180 sec |
| Time 25°C to Peak Temperature | T _{25°C} to Peak | 8 min max. |
| Reflow Phase | | |
| Liquidus Temperature | TL | 217°C |
| Time over Liquidus Temperature | tL | 60 – 150 s |
| Peak Temperature | t _p | 260°C |
| Time within 5°C of actual Peak Temperature | Т _р | 20 – 40 s |
| Cooling Phase | | |
| Ramp-down rate | | 6°C/s max. |

1. All temperatures refer to the top side of the package, measured on the package body surface.

QFN28 Recommended Pad Layout

1. PCB land and solder masking recommendations are shown in Figure 7.

- A = Clearance from PCB thermal pad to solder mask opening, 0.0635 mm minimum
- B = Clearance from edge of PCB thermal pad to PCB land, 0.2 mm minimum
- $\label{eq:C} C = Clearance from PCB land edge to solder mask opening to be as tight as possible to ensure that some solder mask remains between PCB pads.$
- D = PCB land length = QFN solder pad length + 0.1 mm
- E = PCB land width = QFN solder pad width + 0.1 mm

Figure 7. PCB Land and Solder Mask Recommendations

- 2. Thermal vias should be used on the PCB thermal pad (middle ground pad) to improve thermal conductivity from the device to a copper ground plane area on the reverse side of the printed circuit board. The number of vias depends on the package thermal requirements, as determined by thermal simulation or actual testing.
- 3. Increasing the number of vias through the printed circuit board will improve the thermal conductivity to the reverse side ground plane and external heat sink. In general, adding more metal through the PC board under the IC will improve operational heat transfer, but will require careful attention to uniform heating of the board during assembly.

Assembly Process

Stencil Design & Solder Paste Application

- 1. Stainless steel stencils are recommended for solder paste application.
- 2. A stencil thickness of 0.125 0.150 mm (5 6 mils) is recommended for screening.

- 3. For the PCB thermal pad, solder paste should be printed on the PCB by designing a stencil with an array of smaller openings that sum to 50% of the QFN exposed pad area. Solder paste should be applied through an array of squares (or circles) as shown in Figure 8.
- 4. The aperture opening for the signal pads should be between 50–80% of the QFN pad area as shown in Figure 9.
- 5. Optionally, for better solder paste release, the aperture walls should be trapezoidal and the corners rounded.
- 6. The fine pitch of the IC leads requires accurate alignment of the stencil and the printed circuit board. The stencil and printed circuit assembly should be aligned to within + 1 mil prior to application of the solder paste.
- 7. No-clean flux is recommended since flux from underneath the thermal pad will be difficult to clean if water-soluble flux is used.

Figure 8. Solder Paste Application on Exposed Pad

Minimum 50% coverage

62% coverage

Maximum 80% coverage

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
