

Data Sheet

FEATURES:

- Organized as 2M x16 or 4M x8
- Dual Bank Architecture for Concurrent Read/Write Operation
 - 32 Mbit Bottom Sector Protection (in the smaller bank)
 - GLS36VF3203: 8 Mbit + 24 Mbit
 - 32 Mbit Top Sector Protection (in the smaller bank)
 - GLS36VF3204: 24 Mbit + 8 Mbit
- Single 2.7-3.6V for Read and Write Operations
- · Superior Reliability
 - Endurance: 100,000 cycles (typical)Greater than 100 years Data Retention
- Low Power Consumption:
 - Active Current: 6 mA typical
 - Standby Current: 4 μA typical
 - Auto Low Power Mode: 4 μA typical
- Hardware Sector Protection/WP# Input Pin
 - Protects 8 KWord in the smaller bank by driving WP# low and unprotects by driving WP# high
- Hardware Reset Pin (RST#)
 - Resets the internal state machine to reading array data
- · Byte# Pin
 - Selects 8-bit or 16-bit mode
- Sector-Erase Capability
 - Uniform 2 KWord sectors
- Chip-Erase Capability

- Block-Erase Capability
 - Uniform 32 KWord blocks
- Erase-Suspend / Erase-Resume Capabilities
- Security ID Feature
 - Greenliant: 128 bitsUser: 256 Bytes
- Fast Read Access Time
 - 70 ns
- Latched Address and Data
- Fast Erase and Program (typical):
 - Sector-Erase Time: 18 msBlock-Erase Time: 18 ms
 - Chip-Erase Time: 35 msProgram Time: 7 µs
- Automatic Write Timing
 - Internal V_{PP} Generation
- End-of-Write Detection
 - Toggle Bit
 - Data# Polling
 - Ready/Busy# pin
- CMOS I/O Compatibility
- Conforms to Common Flash Memory Interface (CFI)
- JEDEC Standards
 - Flash EEPROM Pinouts and command sets
- · Packages Available
 - 48-ball TFBGA (6mm x 8mm)
 - 48-lead TSOP (12mm x 20mm)

PRODUCT DESCRIPTION

The GLS36VF320x are 2M x16 or 4M x8 CMOS Concurrent Read/Write Flash Memory manufactured with high performance SuperFlash technology. The split-gate cell design and thick-oxide tunneling injector attain better reliability and manufacturability compared with alternate approaches. The devices write (Program or Erase) with a 2.7-3.6V power supply and conform to JEDEC standard pinouts for x8/x16 memories.

Featuring high performance Word-Program, these devices provide a typical Program time of 7 µsec and use the Toggle Bit, Data# Polling, or RY/BY# to detect the completion of the Program or Erase operation. To protect against inadvertent write, the devices have on-chip hardware and Soft-

ware Data Protection schemes. Designed, manufactured, and tested for a wide spectrum of applications, these devices are offered with a guaranteed endurance of 10,000 cycles. Data retention is rated at greater than 100 years.

These devices are suited for applications that require convenient and economical updating of program, configuration, or data memory. For all system applications, the devices significantly improve performance and reliability, while lowering power consumption. Since for any given voltage range, the SuperFlash technology uses less current to program and has a shorter erase time, the total energy consumed during any Erase or Program operation

Data Sheet

is less than alternative flash technologies. These devices also improve flexibility while lowering the cost for program, data, and configuration storage applications.

SuperFlash technology provides fixed Erase and Program times, independent of the number of Erase/Program cycles that have occurred. Therefore the system software or hardware does not have to be modified or de-rated as is necessary with alternative flash technologies, whose Erase and Program times increase with accumulated Erase/Program cycles.

To meet high-density, surface-mount requirements, these devices are offered in 48-ball TFBGA and 48-lead TSOP packages. See Figures 2 and 3 for pin assignments.

Device Operation

Memory operation functions are initiated using standard microprocessor write sequences. A command is written by asserting WE# low while keeping CE# low. The address bus is latched on the falling edge of WE# or CE#, whichever occurs last. The data bus is latched on the rising edge of WE# or CE#, whichever occurs first.

Auto Low Power Mode

These devices also have the **Auto Lower Power** mode which puts them in a near standby mode within 500 ns after data has been accessed with a valid Read operation. This reduces the I_{DD} active Read current to 4 μA typically. While CE# is low, the devices exit Auto Low Power mode with any address transition or control signal transition used to initiate another Read cycle, with no access time penalty.

Concurrent Read/Write Operation

The dual bank architecture of these devices allows the Concurrent Read/Write operation whereby the user can read from one bank while programming or erasing in the other bank. For example, reading system code in one bank while updating data in the other bank.

Concurrent Read/Write State

Bank 1	Bank 2
Read	No Operation
Read	Write
Write	Read
Write	No Operation
No Operation	Read
No Operation	Write

Note: For the purposes of this table, write means to perform Blockor Sector-Erase or Program operations as applicable to the appropriate bank.

Read Operation

The Read operation is controlled by CE# and OE#; both have to be low for the system to obtain data from the outputs. CE# is used for device selection. When CE# is high, the chip is deselected and only standby power is consumed. OE# is the output control and is used to gate data from the output pins. The data bus is in a high impedance state when either CE# or OE# is high. Refer to the Read cycle timing diagram for further details (Figure 4).

Program Operation

These devices are programmed on a word-by-word or byte-by-byte basis depending on the state of the BYTE# pin. Before programming, one must ensure that the sector which is being programmed is fully erased.

The Program operation is accomplished in three steps:

- 1. Software Data Protection is initiated using the three-byte load sequence.
- 2. Address and data are loaded.

During the Program operation, the addresses are latched on the falling edge of either CE# or WE#, whichever occurs last. The data is latched on the rising edge of either CE# or WE#, whichever occurs first.

3. The internal Program operation is initiated after the rising edge of the fourth WE# or CE#, which-

Data Sheet

ever occurs first. The Program operation, once initiated, will be completed typically within 7 μ s.

See Figures 5 and 6 for WE# and CE# controlled Program operation timing diagrams and Figure 20 for flowcharts. During the Program operation, the only valid reads are Data# Polling and Toggle Bit. During the internal Program operation, the host is free to perform additional tasks. Any commands issued during an internal Program operation are ignored.

Sector- (Block-) Erase Operation

These devices offer both Sector-Erase and Block-Erase operations. These operations allow the system to erase the devices on a sector-by-sector (or block-by-block) basis. The sector architecture is based on a uniform sector size of 2 KWord. The Block-Erase mode is based on a uniform block size of 32 KWord. The Sector-Erase operation is initiated by executing a six-byte command sequence with a Sector-Erase command (50H) and sector address (SA) in the last bus cycle. The Block-Erase operation is initiated by executing a six-byte command sequence with Block-Erase command (30H) and block address (BA) in the last bus cycle. The sector or block address is latched on the falling edge of the sixth WE# pulse, while the command (30H or 50H) is latched on the rising edge of the sixth WE# pulse. The internal Erase operation begins after the sixth WE# pulse. Any commands issued during the Sector- or Block-Erase operation are ignored except Erase-Suspend and Erase-Resume. See Figures 10 and 11 for timing waveforms.

Chip-Erase Operation

The devices provide a Chip-Erase operation, which allows the user to erase all sectors/blocks to the "1" state. This is useful when a device must be quickly erased.

The Chip-Erase operation is initiated by executing a sixbyte command sequence with Chip-Erase command (10H) at address 555H in the last byte sequence. The Erase operation begins with the rising edge of the sixth WE# or CE#, whichever occurs first. During the Erase operation, the only valid Read is Toggle Bit or Data# Polling. Any commands issued during the Chip-Erase operation are ignored. See Table 7 for the command sequence, Figure 9 for timing diagram, and Figure 23 for the flowchart. When WP# is low, any attempt to Chip-Erase will be ignored.

Erase-Suspend/Erase-Resume Operations

The Erase-Suspend operation temporarily suspends a Sector- or Block-Erase operation thus allowing data to be read from any memory location, or program data into any sector/block that is not suspended for an Erase operation. The operation is executed by issuing a one-byte command sequence with Erase-Suspend command (B0H). The device automatically enters read mode no more than 10 µs after the Erase-Suspend command had been issued. (Tes maximum latency equals 10 µs.) Valid data can be read from any sector or block that is not suspended from an Erase operation. Reading at address location within erasesuspended sectors/blocks will output DQ2 toggling and DQ6 at "1". While in Erase-Suspend mode, a Program operation is allowed except for the sector or block selected for Erase-Suspend. The Software ID Entry command can also be executed. To resume Sector-Erase or Block-Erase operation which has been suspended, the system must issue an Erase-Resume command. The operation is executed by issuing a one-byte command sequence with Erase Resume command (30H) at any address in the last byte sequence.

Write Operation Status Detection

These devices provide one hardware and two software means to detect the completion of a Write (Program or Erase) cycle in order to optimize the system Write cycle time. The hardware detection uses the Ready/Busy# (RY/BY#) output pin. The software detection includes two status bits: Data# Polling (DQ $_7$) and Toggle Bit (DQ $_6$). The End-of-Write detection mode is enabled after the rising edge of WE#, which initiates the internal Program or Erase operation.

The actual completion of the nonvolatile write is asynchronous with the system; therefore, either a Ready/Busy# (RY/BY#), a Data# Polling (DQ $_7$), or Toggle Bit (DQ $_6$) Read may be simultaneous with the completion of the Write cycle. If this occurs, the system may get an erroneous result, i.e., valid data may appear to conflict with either DQ $_7$ or DQ $_6$. In order to prevent spurious rejection if an erroneous result occurs, the software routine should include a loop to read the accessed location an additional two (2) times. If both Reads are valid, then the Write cycle has completed, otherwise the rejection is valid.

Data Sheet

Ready/Busy# (RY/BY#)

The devices include a Ready/Busy# (RY/BY#) output signal. RY/BY# is an open drain output pin that indicates whether an Erase or Program operation is in progress. Since RY/BY# is an open drain output, it allows several devices to be tied in parallel to V_{DD} via an external pull-up resistor. After the rising edge of the final WE# pulse in the command sequence, the RY/BY# status is valid.

When RY/BY# is actively pulled low, it indicates that an Erase or Program operation is in progress. When RY/BY# is high (Ready), the devices may be read or left in standby mode.

Byte/Word (BYTE#)

The device includes a BYTE# pin to control whether the device data I/O pins operate x8 or x16. If the BYTE# pin is at logic "1" (V_{IH}) the device is in x16 data configuration: all data I/O pins DQ₀-DQ₁₅ are active and controlled by CE# and OE#.

If the BYTE# pin is at logic "0", the device is in x8 data configuration: only data I/O pins DQ_0 - DQ_7 are active and controlled by CE# and OE#. The remaining data pins DQ_8 - DQ_{14} are at Hi-Z, while pin DQ_{15} is used as the address input A_1 for the Least Significant Bit of the address bus.

Data# Polling (DQ₇)

When the devices are in an internal Program operation, any attempt to read DQ_7 will produce the complement of the true data. Once the Program operation is completed, DQ_7 will produce true data. During internal Erase operation, any attempt to read DQ_7 will produce a '0'. Once the internal Erase operation is completed, DQ_7 will produce a '1'. The Data# Polling is valid after the rising edge of fourth WE# (or CE#) pulse for Program operation. For Sector, Block-, or Chip-Erase, the Data# Polling is valid after the rising edge of sixth WE# (or CE#) pulse. See Figure 7 for Data# Polling (DQ_7) timing diagram and Figure 21 for a flowchart.

Toggle Bits (DQ₆ and DQ₂)

During the internal Program or Erase operation, any consecutive attempts to read DQ_6 will produce alternating "1"s and "0"s, i.e., toggling between 1 and 0. When the internal Program or Erase operation is completed, the DQ_6 bit will stop toggling. The device is then ready for the next operation. The toggle bit is valid after the rising edge of the fourth WE# (or CE#) pulse for Program operations. For Sector-, Block-, or Chip-Erase, the toggle bit (DQ_6) is valid after the rising edge of sixth WE# (or CE#) pulse. DQ_6 will be set to "1" if a Read operation is attempted on an Erase-suspended Sector/Block. If Program operation is initiated in a sector/block not selected in Erase-Suspend mode, DQ_6 will toggle.

An additional Toggle Bit is available on DQ_2 , which can be used in conjunction with DQ_6 to check whether a particular sector is being actively erased or erase-suspended. Table 1 shows detailed status bit information. The Toggle Bit (DQ_2) is valid after the rising edge of the last WE# (or CE#) pulse of a Write operation. See Figure 8 for Toggle Bit timing diagram and Figure 21 for a flowchart.

TABLE 1: Write Operation Status

Status		DQ_7	DQ_6	DQ_2	RY/BY#
Normal Operation	Standard Program	DQ7#	Toggle	No Toggle	0
	Standard Erase	0	Toggle	Toggle	0
Erase- Suspend Mode	Read From Erase Suspended Sector/Block	1	1	Toggle	1
	Read From Non-Erase Suspended Sector/Block	Data	Data	Data	1
	Program	DQ7#	Toggle	N/A	0

T1.1 1270

Note: DQ₇, DQ₆, and DQ₂ require a valid address when reading status information. The address must be in the bank where the operation is in progress in order to read the operation status. If the address is pointing to a different bank (not busy), the device will output array data.

Data Sheet

Data Protection

The devices provide both hardware and software features to protect nonvolatile data from inadvertent writes.

Hardware Data Protection

Noise/Glitch Protection: A WE# or CE# pulse of less than 5 ns will not initiate a Write cycle.

 V_{DD} Power Up/Down Detection: The Write operation is inhibited when V_{DD} is less than 1.5V.

<u>Write Inhibit Mode:</u> Forcing OE# low, CE# high, or WE# high will inhibit the Write operation. This prevents inadvertent writes during power-up or power-down.

Hardware Block Protection

The devices provide hardware block protection which protects the outermost 8 KWord in the smaller bank. The block is protected when WP# is held low. When WP# is held low and a Block-Erase command is issued to the protected black, the data in the outermost 8 KWord/16 KByte section will be protected. The rest of the block will be erased. See Tables 3 and 4 for Block-Protection location.

A user can disable block protection by driving WP# high. This allows data to be erased or programmed into the protected sectors. WP# must be held high prior to issuing the Write command and remain stable until after the entire Write operation has completed. If WP# is left floating, it is internally held high via a pull-up resistor, and the Boot Block is unprotected, enabling Program and Erase operations on that block.

Hardware Reset (RST#)

The RST# pin provides a hardware method of resetting the devices to read array data. When the RST# pin is held low for at least T_{RP} , any in-progress operation will terminate and return to Read mode (see Figure 17) and all output pins are set to High-Z. When no internal Program/Erase operation is in progress, a minimum period of T_{RHR} is required after RST# is driven high before a valid Read can take place (see Figure 16).

The Erase operation that has been interrupted needs to be reinitiated after the device resumes normal operation mode to ensure data integrity.

Software Data Protection (SDP)

These devices provide the JEDEC standard Software Data Protection scheme for all data alteration operations, i.e., Program and Erase. Any Program operation requires the inclusion of the three-byte sequence. The three-byte load sequence is used to initiate the Program operation, providing optimal protection from inadvertent Write operations, e.g., during the system power-up or power-down. Any Erase operation requires the inclusion of the six-byte sequence. The devices are shipped with the Software Data Protection permanently enabled. See Table 7 for the specific software command codes. During SDP command sequence, invalid commands will abort the device to Read mode within $T_{\rm RC}$. The contents of $DQ_{15}\text{-}DQ_{8}$ can be $V_{\rm IL}$ or $V_{\rm IH}$, but no other value during any SDP command sequence.

Common Flash Memory Interface (CFI)

These devices also contain the CFI information to describe the characteristics of the devices. In order to enter the CFI Query mode, the system must write the three-byte sequence, same as the Software ID Entry command with 98H (CFI Query command) to address BK_x555H in the last byte sequence. In order to enter the CFI Query mode, the system can also use the one-byte sequence with BK_x55H on Address and 98H on Data Bus. See Figure 13 for CFI Entry and Read timing diagram. Once the device enters the CFI Query mode, the system can read CFI data at the addresses given in Tables 8 through 10. The system must write the CFI Exit command to return to Read mode from the CFI Query mode.

Security ID

The GLS36VF320x devices offer a 136-word Security ID space. The Secure ID space is divided into two segments—one 128-bit factory programmed segment and one 128-word (256-byte) user-programmed segment. The first segment is programmed and locked at Greenliant with a unique, 128-bit number. The user segment is left un-programmed for the customer to program as desired. To program the user segment of the Security ID, the user must use the Security ID Program command. End-of-Write status is checked by reading the toggle bits. Data# Polling is not used for Security ID End-of-Write detection. Once programming is complete, the Sec ID should be locked using the User Sec ID Program Lock-Out. This disables any future corruption of this space. Note that regardless of whether or not the Sec ID is locked, neither Sec ID segment can be erased. The Secure ID space can be gueried

Data Sheet

by executing a three-byte command sequence with Query Sec ID command (88H) at address 555H in the last byte sequence. See Figure 15 for timing diagram. To exit this mode, the Exit Sec ID command should be executed. Refer to Table 7 for more details.

Product Identification

The Product Identification mode identifies the devices and manufacturer. For details, see Table 2 for software operation, Figure 12 for the Software ID Entry and Read timing diagram and Figure 22 for the Software ID Entry command sequence flowchart. The addresses A_{20} and A_{18} indicate a bank address. When the addressed bank is switched to Product Identification mode, it is possible to read another address from the same bank without issuing a new Software ID Entry command. The Software ID Entry command may be written to an address within a bank that is in Read Mode or in Erase-Suspend mode. The Software ID Entry command may not be written while the device is programming or erasing in the other bank.

TABLE 2: Product Identification

	Address	Data
Manufacturer's ID	BK _X 0000H	00BFH
Device ID		
GLS36VF3203	BK _X 0001H	7354H
GLS36VF3204	BK _X 0001H	7353H

T2.1 1270

Note: $BK_X = Bank Address (A_{20}-A_{18})$

Product Identification Mode Exit/CFI Mode Exit

In order to return to the standard Read mode, the Software Product Identification mode must be exited. Exit is accomplished by issuing the Software ID Exit command sequence, which returns the device to the Read mode. This command may also be used to reset the device to the Read mode after any inadvertent transient condition that apparently causes the device to behave abnormally, e.g., not read correctly. Please note that the Software ID Exit/CFI Exit command is ignored during an internal Program or Erase operation. See Table 7 for the software command code, Figure 14 for timing waveform and Figure 22 for a flowchart.

FIGURE 2: Pin Assignments for 48-ball TFBGA (6mm x 8mm)

FIGURE 3: Pin Assignments for 48-lead TSOP (12mm x 20mm)

Data Sheet

TABLE 5: Pin Description

Symbol	Name	Functions
A ₂₀ -A ₀	Address Inputs	To provide memory addresses. During Sector-Erase and Hardware Sector Protection, A_{20} - A_{11} address lines will select the sector. During Block-Erase A_{20} - A_{15} address lines will select the block.
DQ ₁₄ -DQ ₀	Data Input/Output	To output data during Read cycles and receive input data during Write cycles Data is internally latched during a Write cycle. The outputs are in tri-state when OE# or CE# is high.
DQ ₁₅ /A ₋₁	Data Input/Output and LBS Address	DQ_{15} is used as data I/O pin when in x16 mode (BYTE# = "1") A ₋₁ is used as the LSB address pin when in x8 mode (BYTE# = "0")
CE#	Chip Enable	To activate the device when CE# is low.
OE#	Output Enable	To gate the data output buffers
WE#	Write Enable	To control the Write operations
RST#	Hardware Reset	To reset and return the device to Read mode
RY/BY#	Ready/Busy#	To output the status of a Program or Erase operation RY/BY# is a open drain output, so a $10K\Omega$ - $100K\Omega$ pull-up resistor is required to allow RY/BY# to transition high indicating the device is ready to read.
WP#	Write Protect	To protect and unprotect top or bottom 8 KWord (4 outermost sectors) from Erase or Program operation.
BYTE#	Word/Byte Configuration	To select 8-bit or 16-bit mode.
V_{DD}	Power Supply	To provide 2.7-3.6V power supply voltage
V_{SS}	Ground	
NC	No Connection	Unconnected pins

T5.0 1270

TABLE 6: Operation Modes Selection

						DQ ₁₅ -DQ ₈		
Mode	CE#	OE#	WE#	RST#	DQ ₇ -DQ ₀	BYTE# = V _{IH}	BYTE# = V _{IL}	Address
Read	V_{IL}	V_{IL}	V_{IH}	V_{IH}	D _{OUT}	D _{OUT}	DQ_{14} - DQ_{8} = High Z	A _{IN}

T7.1 1270

- 1. Address format A₁₀-A₀ (Hex), Addresses A₂₀-A₁₁ can be V_{IL} or V_{IH}, but no other value (unless otherwise stated), for the command sequence when in x16 mode.
 - When in x8 mode, Addresses A₂₀-A₁₂, Address A₋₁, and DQ₁₄-DQ₈ can be V_{IL} or V_{IH}, but no other value (unless otherwise stated), for the command sequence.
- 2. DQ₁₅-DQ₈ can be V_{IL} or V_{IH}, but no other value, for the command sequence
- 3. WA = Program word address
- 4. SA_X for Sector-Erase; uses A₂₀-A₁₁ address lines BA_X for Block-Erase; uses A₂₀-A₁₅ address lines BK_X for Bank Address; uses A₂₀-A₁₈ address lines
- 5. For GLS36VF3203 the Security ID Address Range is: (x16 mode) = 100000H to 100087H,(x8 mode) = 100000H to 10010FH Greenliant ID is read at Address Range(x16 mode) = 100000H to 100007H (x8 mode) = 100000H to 10000FH User ID is read at Address Range(x16 mode) = 100008H to 100087H (x8 mode) = 100010H to 10010FH Lock status is read at Address 1000FFH (x16) or 1001FFH (x8). Unlocked: DQ3 = 1 / Locked: DQ3 = 0. For GLS36VF3204 the Security ID Address Range is:(x16 mode) = 000000H to 000087H, (x8 mode) = 000000H to 00010FH Greenliant ID is read at Address Range (x16 mode) = 000000H to 000007H (x8 mode) = 000000H to 00000FH User ID is read at Address Range (x16 mode) = 000008H to 000087H (x8 mode) = 000010H to 00010FH Lock Status is read at Address 0000FFH (x16) or 0001FFH (x8). Unlocked: DQ3 = 1 / Locked: DQ3 = 0
- 6. SIWA = Valid Word addresses for user Sec ID
 - For GLS36VF3203 User ID valid Address Range is (x16 mode) = 100008H-100087H (x8 mode) = 100010H-10010FH. For GLS36VF3204 User ID valid Address Range is (x16 mode) = 000008H-000087H (x8 mode) = 000010H-00010FH. All 4 cycles of User Security ID Program and Program Lock-out must be completed before going back to Read-Array mode.
- The User Security ID Program Lock-out command must be executed in x16 mode (BYTE#=V_{IH}).
- 8. The device does not remain in Software Product Identification mode if powered down.
- A₂₀ A₁₉ and A₁₈ = BK_X (Bank Address): address of the bank that is switched to Software ID/CFI Mode With A_{17} - A_1 = 0; Greenliant Manufacturer's ID = 00BFH, is read with A_0 = 0

GLS36VF3203 Device ID = 7354H, is read with $A_0 = 1$

GLS36VF3204 Device ID = 7353H, is read with $A_0 = 1$

- 10. Both Software ID Exit operations are equivalent
- 11. If users never lock after programming, User Sec ID can be programmed over the previously unprogrammed bits (data=1) using the User Sec ID mode again (the programmed "0" bits cannot be reversed to "1").

Data Sheet

Data Sheet

Absolute Maximum Stress Ratings (Applied conditions greater than those listed under "Absolute Maximum Stress Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these conditions or conditions greater than those defined in the operational sections of this data sheet is not implied. Exposure to absolute maximum stress rating conditions may affect device reliability.)

Temperature Under Bias	55°C to +125°C
Storage Temperature	65°C to +150°C
D. C. Voltage on Any Pin to Ground Potential	0.5V to V _{DD} +0.5V
Transient Voltage (<20 ns) on Any Pin to Ground Potential	2.0V to V _{DD} +2.0V
Package Power Dissipation Capability (T _A = 25°C)	
Surface Mount Solder Reflow Temperature	260°C for 10 seconds
Output Short Circuit Current	50 mA

Operating Range

Range	Ambient Temp	V_{DD}
Extended	-20°C to +85°C	2.7-3.6V
Industrial	-40°C to +85°C	2.7-3.6V

AC Conditions of Test

Input Rise/Fall Time	5 ns
Output Load	$C_L = 30 pF$
See Figures 18 and 19	

Data Sheet

Data Sheet

TABLE 17: Revision History

Number	Description	Date
00	Initial release of data sheet	Feb 2005
01	Updated "Erase-Suspend/Erase-Resume Operations" on page 3	Sep 2005
	 Updated footnote 5 and added footnote 7 to Table 7 on page 14 	
	Updated CFI Query Identification in Table 8 on page 15	
	Updated Device Geometry Information in Table 10 on page 16	
	 Updated T_{ES} parameter from 20 μs to 10 μs in Table 16 on page 19 	
	In "Product Ordering Information" on page 32	
	 Removed all MPNs for packages containing Pb (B3K/EK) Removed all commercial temperature MPNs Added extended temperature MPNs for all devices 	
02	Removed Industrial Grade reference	May 2006
	Changed to Data Sheet	
	Removed non-Pb reference	
	Updated Bank information	
	Changes TOE from 30ns to 35ns, Table 15, page 18	
03	Re-added Industrial Grade reference	Jul 2006
04	Edited Tby TY/BY# Delay Time in Table 15 on page 19 from 90ns Min to 90ns Max	Nov 2009
05	Transferred from SST to Greenliant	May 2010

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов:
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001:
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
