

3.3V CMOS Static RAM 4 Meg (256K x 16-Bit)

IDT71V416S
IDT71V416L

Features

- ◆ 256K x 16 advanced high-speed CMOS Static RAM
- ◆ JEDEC Center Power / GND pinout for reduced noise.
- ◆ Equal access and cycle times
 - Commercial and Industrial: 10/12/15ns
- ◆ One Chip Select plus one Output Enable pin
- ◆ Bidirectional data inputs and outputs directly LVTTTL-compatible
- ◆ Low power consumption via chip deselect
- ◆ Upper and Lower Byte Enable Pins
- ◆ Single 3.3V power supply
- ◆ Available in 44-pin, 400 mil plastic SOJ package and a 44-pin, 400 mil TSOP Type II package and a 48 ball grid array, 9mm x 9mm package.
- ◆ Green parts available, see ordering information

Description

The IDT71V416 is a 4,194,304-bit high-speed Static RAM organized as 256K x 16. It is fabricated using high-performance, high-reliability CMOS technology. This state-of-the-art technology, combined with innovative circuit design techniques, provides a cost-effective solution for high-speed memory needs.

The IDT71V416 has an output enable pin which operates as fast as 5ns, with address access times as fast as 10ns. All bidirectional inputs and outputs of the IDT71V416 are LVTTTL-compatible and operation is from a single 3.3V supply. Fully static asynchronous circuitry is used, requiring no clocks or refresh for operation.

The IDT71V416 is packaged in a 44-pin, 400 mil Plastic SOJ and a 44-pin, 400 mil TSOP Type II package and a 48 ball grid array, 9mm x 9mm package.

NOTE:

- Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

Timing Waveform of Read Cycle No. 1^(1,2,3)

NOTES:

1. \overline{WE} is HIGH for Read Cycle.
2. Device is continuously selected, \overline{CS} is LOW.
3. \overline{OE} , \overline{BHE} , and \overline{BLE} are LOW.

3624 drw 06

Timing Waveform of Read Cycle No. 2⁽¹⁾

3624 drw 07

NOTES:

1. \overline{WE} is HIGH for Read Cycle.
2. Address must be valid prior to or coincident with the later of \overline{CS} , \overline{BHE} , or \overline{BLE} transition LOW; otherwise t_{AA} is the limiting parameter.
3. Transition is measured $\pm 200\text{mV}$ from steady state.

Timing Waveform of Write Cycle No. 1 (\overline{WE} Controlled Timing)^(1,2,4)

3624 drw 08

NOTES:

1. A write occurs during the overlap of a LOW \overline{CS} , LOW \overline{BHE} or \overline{BLE} , and a LOW \overline{WE} .
2. \overline{OE} is continuously HIGH. If during a \overline{WE} controlled write cycle \overline{OE} is LOW, t_{WP} must be greater than or equal to $t_{WHZ} + t_{DW}$ to allow the I/O drivers to turn off and data to be placed on the bus for the required t_{DW} . If \overline{OE} is HIGH during a \overline{WE} controlled write cycle, this requirement does not apply and the minimum write pulse is as short as the specified t_{WP} .
3. During this period, I/O pins are in the output state, and input signals must not be applied.
4. If the \overline{CS} LOW or \overline{BHE} and \overline{BLE} LOW transition occurs simultaneously with or after the \overline{WE} LOW transition, the outputs remain in a high-impedance state.
5. Transition is measured $\pm 200\text{mV}$ from steady state.

Timing Waveform of Write Cycle No. 2 ($\overline{\text{CS}}$ Controlled Timing)^(1,3)

3624 drw 09

Timing Waveform of Write Cycle No. 3 ($\overline{\text{BHE}}$, $\overline{\text{BLE}}$ Controlled Timing)^(1,3)

3624 drw 10

NOTES:

1. A write occurs during the overlap of a LOW $\overline{\text{CS}}$, LOW $\overline{\text{BHE}}$ or $\overline{\text{BLE}}$, and a LOW $\overline{\text{WE}}$.
2. During this period, I/O pins are in the output state, and input signals must not be applied.
3. If the $\overline{\text{CS}}$ LOW or $\overline{\text{BHE}}$ and $\overline{\text{BLE}}$ LOW transition occurs simultaneously with or after the $\overline{\text{WE}}$ LOW transition, the outputs remain in a high-impedance state.
