ATA5756/ATA5757

UHF ASK/FSK Transmitter

DATASHEET

Features

- PLL transmitter IC with single-ended output
- High output power (6dBm) at 8.1mA (315MHz) and 8.5mA (433MHz) typical values
- Divide by 24 (Atmel[®] ATA5756) and 32 (Atmel ATA5757) blocks for 13MHz crystal frequencies and for Low XTO start-up times
- Modulation scheme ASK/FSK with internal FSK switch
- Up to 20kBaud manchester coding, up to 40kBaud NRZ coding
- Power-down idle and power-up modes to adjust corresponding current consumption through ASK/FSK/enable input pins
- ENABLE input for parallel usage of controlling pins in a 3-wire bus system
- CLK output switches ON if the crystal current amplitude has reached 35% to 80% of its final value
- Crystal oscillator time until CLK output is activated, typically 0.6ms
- Supply voltage 2.0V to 3.6V in operation temperature range of –40°C to +125°C
- ESD protection at all pins (4kV HBM)
- Small package TSSOP10

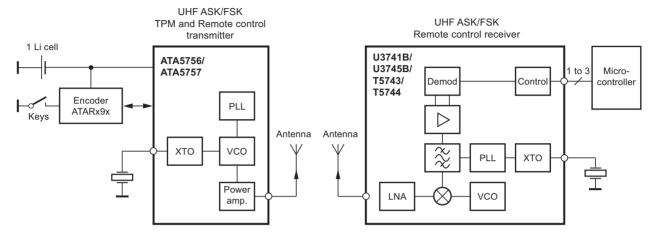

Benefits

- Low parasitic FSK switch integrated
- Very short and reproducible time to transmit typically < 0.85ms
- 13.125MHz/13.56MHz crystals give opportunity for small package sizes

1. Description

The Atmel® ATA5756/ATA5757 is a PLL transmitter IC which has been developed for the demands of RF low-cost transmission systems at data rates up to 20kBaud Manchester coding and 40kBaud NRZ coding. The transmitting frequency range is 313MHz to 317MHz (Atmel ATA5756) and 432MHz to 448MHz (Atmel ATA5757), respectively. It can be used in both FSK and ASK systems. Due to its shorten crystal oscillator settling time it is well suited for Tire Pressure Monitoring (TPM) and for Passive Entry Go applications.

3. General Description

This fully integrated PLL transmitter allows the design of simple, low-cost RF miniature transmitters for TPM and RKE applications. The VCO is locked to $24 \times f_{XTAL}/32 \times f_{XTAL}$ for Atmel[®] ATA5756/ATA5757. Thus, a 13.125MHz/13.56MHz crystal is needed for a 315MHz/433.92MHz transmitter. All other PLL and VCO peripheral elements are integrated.

The XTO is a series resonance (current mode) oscillator. Only one capacitor and a crystal connected in series to GND are needed as external elements in an ASK system. The internal FSK switch, together with a second capacitor, can be used for FSK modulation. The crystal oscillator needs typically 0.6 ms until the CLK output is activated if a crystal as defined in the electrical characteristics is used (e.g., TPM crystal). For most crystals used in RKE systems, a shorter time will result.

The CLK output is switched on if the amplitude of the current flowing through the crystal has reached 35% to 80% of its final value. This is synchronized with the 1.64/1.69MHz CLK output. As a result, the first period of the CLK output is always a full period. The PLL is then locked <250 μ s after CLK output activation. This means an additional wait time of \geq 250 μ s is necessary before the PA can be switched on and the data transmission can start. This results in a significantly lower time of about 0.85ms between enabling the Atmel ATA5756/ATA5757 and the beginning of the data transmission which saves battery power especially in tire pressure monitoring systems.

The power amplifier is an open-collector output delivering a current pulse which is nearly independent from the load impedance and can therefore be controlled via the connected load impedance.

This output configuration enables a simple matching to any kind of antenna or to 50Ω . A high power efficiency for the power amplifier results if an optimized load impedance of $Z_{\text{Load, opt}}$ = 380Ω + $j340\Omega$ (Atmel ATA5756) at 315MHz and $Z_{\text{Load, opt}}$ = 280Ω + $j310\Omega$ (Atmel ATA5757) at 433.92MHz is used at the 3-V supply voltage.

4. Functional Description

If ASK = Low, FSK = Low and ENABLE = open or Low, the circuit is in power-down mode consuming only a very small amount of current so that a lithium cell used as power supply can work for many years.

If the ENABLE pin is left open, ENABLE is the logical OR operation of the ASK and FSK input pins. This means, the IC can be switched on by either the FSK of the ASK input.

If the ENABLE pin is Low and ASK or FSK are High, the IC is in idle mode where the PLL, XTO and power amplifier are off and the microcontroller ports controlling the ASK and FSK inputs can be used to control other devices. This can help to save ports on the microcontroller in systems where other devices with 3-wire interface are used.

With FSK = High and ASK = Low and ENABLE = open or High, the PLL and the XTO are switched on and the power amplifier is off. When the amplitude of the current through the crystal has reached 35% to 80% of its final amplitude, the CLK driver is automatically activated. The CLK output stays Low until the CLK driver has been activated. The driver is activated synchronously with the CLK output frequency, hence, the first pulse on the CLK output is a complete period. The PLL is then locked within <250µs after the CLK driver has been activated, and the transmitter is then ready for data transmission.

With ASK = High the power amplifier is switched on. This is used to perform the ASK modulation. During ASK modulation the IC is enabled with the FSK or the ENABLE pin.

With FSK = Low the switch at pin XTO2 is closed, with FSK = High the switch is open. To achieve a faster start-up of the crystal oscillator, the FSK pin should be High during start-up of the XTO because the series resistance of the resonator seen from pin XTO1 is lower if the switch is off.

The different modes of the Atmel[®] ATA5756/ATA5757 are listed in Table 4-1, the corresponding current consumption values can be found in the table "Electrical Characteristics" on page 14.

Table 4-1. ATA5756/ATA5757 Modes

ASK Pin	FSK Pin	ENABLE Pin	Mode
Low	Low	Low/open	Power-down mode, FSK switch High Z
Low	Low	High	Power-up, PA off, FSK switch Low Z
Low	High	High/open	Power-up, PA off, FSK switch High Z
High	Low	High/open	Power-up, PA on, FSK switch Low Z
High	High	High/open	Power-up, PA on, FSK switch High Z
Low/High	High	Low	Idle mode, FSK switch High Z
High	Low/High	Low	Idle mode, FSK switch High Z

4.1 Transmission with ENABLE = open

4.1.1 ASK Mode

The Atmel[®] ATA5756/ATA5757 is activated by ENABLE = open, FSK = High, ASK = Low. The microcontroller is then switched to external clocking. After typically 0.6ms, the CLK driver is activated automatically (i.e., the microcontroller waits until the XTO and CLK are ready). After another time period of \leq 50µs, the PLL is locked and ready to transmit. The output power can then be modulated by means of pin ASK. After transmission, ASK is switched to Low and the microcontroller returns back to internal clocking. Then, the Atmel ATA5756/ATA5757 is switched to power-down mode with FSK = Low.

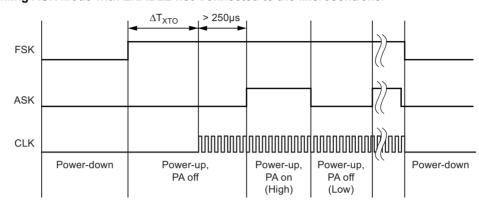

Figure 4-1. Timing ASK Mode with ENABLE not Connected to the Microcontroller

4.1.2 FSK Mode

The Atmel ATA5756/ATA5757 is activated by FSK = High, ASK = Low. The microcontroller is then switched to external clocking. After typically 0.6ms, the CLK driver is activated automatically (i.e., the microcontroller waits until the XTO and CLK are ready. After another time period of \leq 50 μ s, the PLL is locked and ready to transmit. The power amplifier is switched on with ASK = H. The Atmel ATA5756/ATA5757 is then ready for FSK modulation. The microcontroller starts to switch on and off the capacitor between the crystal load capacitor and GND by means of pin FSK, thus, changing the reference frequency of the PLL. IF FSK = L the output frequency is lower, if FSK = H output frequency is higher. After transmission, FSK stays High and ASK is switched to Low and the microcontroller returns back to internal clocking. Then, the Atmel ATA5756/ATA5757 is switched to power-down mode with FSK = Low.

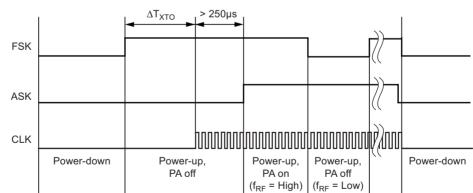

Figure 4-2. Timing FSK Mode with ENABLE not Connected to the Microcontroller

4.2 Transmission with ENABLE = High

4.2.1 FSK Mode

The Atmel[®] ATA5756/ATA5757 is activated by ENABLE = High, FSK = High and ASK = Low. The microcontroller is then switched to external clocking. After typically 0.6ms, the CLK driver is activated automatically (i.e., the microcontroller waits until the XTO and CLK are ready). After another time period of $\leq 50\mu$ s, the PLL is locked and ready to transmit. The power amplifier is switched on with ASK = H. The Atmel ATA5756/ATA5757 is then ready for FSK modulation. The microcontroller starts to switch on and off the capacitor between the crystal load capacitor and GND by means of pin FSK, thus, changing the reference frequency of the PLL. IF FSK = L the output frequency is lower, if FSK = H output frequency is higher. After transmission, ASK is switched to Low and the microcontroller returns back to internal clocking. Then, the Atmel ATA5756/ATA5757 is switched to power-down mode with ENABLE = Low and FSK = Low.

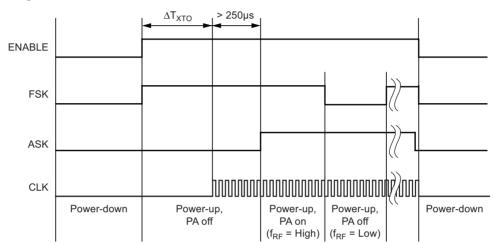

Figure 4-3. Timing FSK Mode with ENABLE Connected to the Microcontroller

4.2.2 ASK Mode

The Atmel® ATA5756/ATA5757 is activated by ENABLE = High, FSK = High and ASK = Low. After activation the microcontroller is switched to external clocking. After typically 0.6ms, the CLK driver is activated automatically (the microcontroller waits until the XTO and CLK are ready). After another time period of \leq 50 μ s, the PLL is locked and ready to transmit. The output power can then be modulated by means of pin ASK. After transmission, ASK is switched to Low and the microcontroller returns back to internal clocking. Then, the Atmel ATA5756/ATA5757 is switched to power-down mode with ENABLE = Low and FSK = Low.

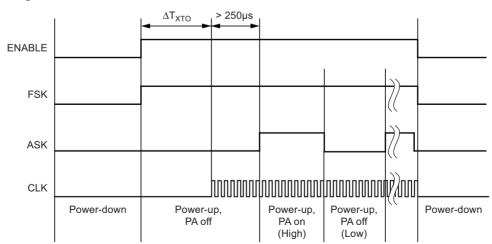

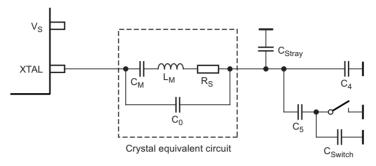

Figure 4-4. Timing ASK Mode with ENABLE Connected to the Microcontroller

4.3 Accuracy of Frequency Deviation

The accuracy of the frequency deviation using the XTAL pulling method is about $\pm 20\%$ if the following tolerances are considered. One important aspect is that the values of C_0 and C_M of typical crystals are strongly correlated which reduces the tolerance of the frequency deviation.

Figure 4-5. Tolerances of Frequency Modulation

Using a crystal with a motional capacitance of C_M = 4.37fF ±15%, a nominal load capacitance of C_{LNOM} = 18pF and a parallel capacitance of C_0 = 1.30pF correlated with C_M results in C_0 = 297 × C_M (the correlation has a tolerance of 10%, so C_0 = 267 to 326 × C_M). If using the internal FSK switch with C_{Switch} = 0.9pF ±20% and estimated parasites of C_{Stray} = 0.7pF ±10%, the resulting C_4 and C_5 values are C_4 = 10pF ±1% and C_5 = 15pF ±1% for a nominal frequency deviation of ±19.3kHz with worst case tolerances of ±15.8kHz to ±23.2kHz.

4.4 Accuracy of the Center Frequency

The imaginary part of the impedance in large signal steady state oscillation IM_{XTO} , seen into the pin 7 (XTO1), causes some additional frequency tolerances, due to pulling of the XTO oscillation frequency. These tolerances have to be added to the tolerances of the crystal itself (adjustment tolerance, temperature stability and ageing) and the influence to the center frequency due to tolerances of C_4 , C_5 , C_{Switch} and C_{Stray} . The nominal value of $IM_{XTO} = 110\Omega$, C_{Switch} and C_{Stray} should be absorbed into the C_4 and C_5 values by using a crystal with known frequency and choosing C_4 and C_5 , so that the XTO center frequency equals the crystal frequency, and the frequency deviation is as expected. Then, from the nominal value, the IM_{XTO} has $\pm 90\Omega$ tolerances, using the pulling formula $P = -IM_{XTO} \times C_M \times \pi \times f_{XTO}$ with $f_{XTO} = 13.56 MHz$ and $C_M = 4.4 fF$ an additional frequency tolerance of $P = \pm 16.86 pm$ results. If using crystals with other C_M the additional frequency tolerance can be calculated in the same way. For example, a lower $C_M = 3.1 fF$ will reduce the frequency tolerance to 11.87 ppm, where a higher $C_M = 5.5 fF$ increases the tolerance to 21.07 ppm.

4.5 CLK Output

An output CLK signal of 1.64MHz (Atmel[®] ATA5756 operating at 315MHz) and 1.69MHz (Atmel ATA5757 operating at 433.92MHz) is provided for a connected microcontroller. The delivered signal is CMOS-compatible with a High and Low time of >125ns if the load capacitance is lower than 20pF. The CLK output is Low in power-down mode due to an internal pull-down resistor. After enabling the PLL and XTO the signal stays Low until the amplitude of the crystal oscillator has reached 35% to 80% of its amplitude. Then, the CLK output is activated synchronously with its output signal so that the first period of the CLK output signal is a full period.

4.5.1 Clock Pulse Take-over by Microcontroller

The clock of the crystal oscillator can be used for clocking the microcontroller. Atmel's ATARx9x microcontroller family provides the special feature of starting with an integrated RC oscillator to switch on the Atmel ATA5756/ATA5757's external clocking and to wait automatically until the CLK output of the Atmel ATA5756/ATA5757 is activated. After a time period of 250µs the message can be sent with crystal accuracy.

4.5.2 Output Matching and Power Setting

The output power is set by the load impedance of the antenna. The maximum output power is achieved with a load impedance of $Z_{Load, opt}$ = 380 Ω + j340 Ω (Atmel ATA5756) at 315MHz and $Z_{Load, opt}$ = 280 Ω + j310 Ω (Atmel ATA5757) at 433.92MHz. A low resistive path to V_S is required to deliver the DC current (see Figure 4-6 on page 10).

The power amplifier delivers a current pulse and the maximum output power is delivered to a resistive load if the 0.66pF output capacitance of the power amplifier is compensated by the load impedance.

At the ANT1 pin, the RF output amplitude is about $V_S - 0.5V$.

The load impedance is defined as the impedance seen from the Atmel ATA5756's ANT1, ANT2 into the matching network. Do not mix up this large-signal load impedance with a small-signal input impedance delivered as an input characteristic of RF amplifiers.

The latter is measured from the application into the IC instead of from the IC into the application for a power amplifier.

The 0.66pF output capacitance absorbed into the load impedance a real impedance of 684Ω (Atmel ATA5756) at 315MHz and 623Ω (Atmel ATA5757) at 433.92MHz should be measured with a network analyses at pin 5 (ANT1) with the Atmel ATA5756/ATA5757 soldered, an optimized antenna connected and the power amplifier switched off.

Less output power is achieved by lowering the real parallel part where the parallel imaginary part should be kept constant. Lowering the real part of the load impedance also reduces the supply voltage dependency of the output power.

Output power measurement can be done with the circuit as shown in Figure 4-6. Please note that the component values must be changed to compensate the individual board parasitics until the Atmel ATA5756/ATA5757 has the right load impedance. Also, the damping of the cable used to measure the output power must be calibrated.

Figure 4-6. Output Power Measurement Atmel ATA5756/ATA5757

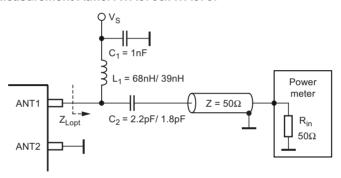

Table 4-2 and Table 4-3 show the output power and the supply current versus temperature and supply voltage.

Table 4-2. Output Power and Supply Current versus Temperature and Supply Voltage for the Atmel ATA5756 with $Z_{Load} = 380\Omega + j340\Omega$ (Correlation Tested)

4.6 Application Circuits

For the supply voltage blocking capacitor C_3 , a value of 68nF/X7R is recommended (see Figure 4-7 on page 12 and Figure 4-8 on page 13). C_1 and C_2 are used to match the loop antenna to the power amplifier. For C_2 , two capacitors in series should be used to achieve a better tolerance value and to enable it to realize $Z_{Load,opt}$ by using capacitors with standard values.

Together with the pins of Atmel ATA5756 and the PCB board wires, $C_{1 \text{ forms}}$ a series resonance loop that suppresses the 1st harmonic, hence the position of C_1 on the PCB is important. Normally, the best suppression is achieved when C_1 is placed as close as possible to the pins ANT1 and ANT2.

The loop antenna should not exceed a width of 1.5mm, otherwise the Q-factor of the loop antenna is too high.

 L_1 (50nH to 100nH) can be printed on the PCB. C_4 should be selected so that the XTO runs on the load resonance frequency of the crystal. Normally, a value of 10pF results in a 12pF load-capacitance crystal due to the board parasitic capacitances and the inductive impedance of the XTO1 pin.

Capacitive load at Pin XTO1		C _{L_max}			5	pF
FSK modulation frequency rate	This corresponds to 20kBaud in Manchester coding and 40kBaud in NRZ coding	f _{MOD_FSK}	0		20	kHz
FSK switch OFF resistance	High Z	R _{SWIT_OFF}	50			kΩ
FSK switch OFF capacitance	High Z capacitance	C _{SWIT_OFF}	0.75	0.9	1.1	pF
FSK switch ON resistance	Low Z	R _{SWIT_ON}		130	175	Ω
ASK modulation frequency rate	Duty cycle of the modulation signal = 50%, this corresponds to 20kBaud in Manchester coding and 40kBaud in NRZ coding	f _{MOD_ASK}	0		20	kHz
ASK input	Low level input voltage High level input voltage Input current high	V _{II} V _{Ih} I _{In}	1.7		0.25 V _S 30	V V µA
FSK input	Low level input voltage High level input voltage Input current high	V _{II} V _{Ih} I _{In}	1.7		0.25 V _S 30	V V µA
ENABLE input	Low level input voltage High level input voltage Input current high Input current low	V _{II} V _{Ih} I _{Inh} I _{InI}	1.7 -40 -40		0.25 V _S 40 40	V V µA µA

8. Ordering Information

Extended Type Number	Package	Remarks
ATA5756C-6DQY	TSSOP10	Pb-free
ATA5757C-6DQY	TSSOP10	Pb-free

9. Package Information TSSOP10

10. Revision History

Revision No.	History
4702L-RKE-03/14	Put datasheet in the latest template
4702K-RKE-11/12	Section 8 "Ordering Information" on page 17 updated
	Put datasheet in the latest template
4702J-RKE-07/08	Page1: PB-free logo deleted
	Page 18: Ordering information updated
	Put datasheet in the latest template
4702I-RKE-11/05	First page: Pb-free logo added
	Page 18: Ordering information and package drawing updated
4702H-RKE-09/04	• Electrical Characteristics table, page 15, row "Output power for the full"> maximum value updated
4702G-RKE-08/04	• Electrical Characteristics table, page 15, row "Output power variation"> the word "variation" deleted
4702F-RKE-08/04	Preliminary deleted
	Abs. Max. Ratings table (page 14): row "Input voltage" added
4702E-RKE-07/04	 Abs. Max. Ratings table (page 14): table note 1 added El. Char. table (page 17): rows "ASK input", "FSK input", "ENABLE input" maximum values updated

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001:
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
