Note:

- When the products used as negative output and the input-voltage under ($V_{in-min}+2V$), C1 and C2 must be added in the circuit, and they should be placed as near as the products' footprints. Others apply to the application-environment.
- The capacitance of C1, C2, see external circuit table, can be increased if required, and tantalum or low ESR electrolytic capacitors may also suffice.
- When the products used as the circuit like figure 4, an inductor named as LDM up to 10µH is recommended in the circuit to reduce the mutual interference.
- For models $\leq 3.3 V_{out}$, if the input voltage of the model's negative output is less than 4.85 V, a dummy load of not less than 5 mA needs to be added to the output.
- Cannot use in parallel for output and hot swap for input.
