

# Enhanced Low Power, BR/EDR/BLE Bluetooth 5.0 SOC

The CYW20719 is a BT 5.0 compliant, stand-alone baseband processor with an integrated 2.4 GHz transceiver with BLE, EDR and BR. The device is intended for use in audio, IoT, sensors (medical, home, security, and so forth) and human interface device (HID) applications. Manufactured using an advanced 40nm CMOS low-power fabrication process, the CYW20719 employs high level of integration to reduce external components, thereby minimizing application footprint and costs.

This datasheet provides details of the functional, operational, and electrical characteristics of the CYW20719 device. It is intended for hardware, design, application, and OEM engineers.

**Figure 1. Functional Block Diagram**

## Features

### Bluetooth Subsystem

- Complies with Bluetooth Core Specification v5.0 with LE 2 Mbps
- Supports Basic Rate (BR), Enhanced Data Rate (EDR) 2&3 Mbps, Bluetooth Low Energy (BLE)
- Supports Adaptive Frequency Hopping (AFH)
- TX power 4 dBm
- RX sensitivity -95.5 dBm (BLE)
- Ultra-low-power radio
  - RX current 5.9 mA (BLE)
  - TX current 5.6 mA @ 0 dBm (BLE)

### Coexistence Support

- Support for Global Coexistence Interface for easy coexistence implementation with select Cypress Wi-Fi devices

### MCU Subsystem

- 96-MHz Arm Cortex-M4 microcontroller unit (MCU) with floating point unit (FPU)
- Supports serial wire debug (SWD)
- Runs Bluetooth stack and application
- Option to execute from on-chip flash or RAM

### Memory Subsystem

- 1 MB flash
- 512 KB RAM
- 2 MB ROM that stores Bluetooth stack and driver and offloads flash for user applications

### Audio features and interfaces

- 1x I<sup>2</sup>S with master and slave modes
- 1x PCM
- PDM<sup>2</sup>
- Analog front end for analog microphone<sup>1</sup>

### Clocks

- On-chip 32 kHz oscillator (LP-LPO)
- On-chip 128 kHz oscillator (HP-LPO)
- 32 kHz crystal oscillator (Optional if low power modes not required)
- 24 MHz crystal oscillator
- 48-bit real time clock (RTC)

### Peripherals and communication

- 6x 16-bit PWMs
- Programmable key-scan matrix interface, up to 8x20 key-scanning matrix <sup>1,2</sup>
- Quadrature decoder<sup>2</sup>
- Watchdog timer (WDT)
- 1x peripheral UART, 1x UART for programming and HCI
- 2x SPI (master/slave mode) Blocks (SPI, Quad SPI, and MIPI DBI-C)
- 1x I2C master/slave and 1x I2C master
- 1x 28-channel ADC (10-ENOB for DC measurement and 12-ENOB for Audio measurement)
- Hardware security engine<sup>2</sup>

### General Purpose Input Output (GPIO)

- 16 GPIOs on QFN package
- 40 GPIOs on WLCSP package
- Support up to 3.63 V operation
- Four GPIOs support 16 mA and 8 mA sink at 3.3 V and 1.8 V respectively

### Operating voltage and low-power support

- Wide operating voltage range: 1.90 V to 3.63 V
- 5 power modes to implement ultra-low power application – managed by real time operating system
- 0.4 uA current in HID-OFF mode (wake from GPIO).

### Packages

- 5 mm x 5 mm 40-pin quad flat no-lead (QFN)
- 3.2 mm x 3.1 mm 134-ball Wafer Level Chip Scale Package (WLCSP)

### Software Support

- WICED Studio

### Applications

- Wearables and Fitness bands
- Headsets, earbuds, and other audio solutions
- Home automation
- Blood pressure monitors and other medical applications
- Proximity sensors
- Key Fobs
- Thermostats and thermometers
- Toys

1. Available only in WLCSP Package

2. Subjected to driver support in WICED® Studio

## 1. Bluetooth Baseband Core

The Bluetooth Baseband Core (BBC) implements all time-critical functions required for high-performance Bluetooth operation. The BBC manages the buffering, segmentation, and routing of data for all connections. It prioritizes and schedules all RX/TX activities including adv, paging, scanning, and servicing of connections. In addition to these functions, it independently handles the host controller interface (HCI) including all commands, events, and data flowing over HCI. The core also handles symbol timing, forward error correction (FEC), header error control (HEC), cyclic redundancy check (CRC), authentication, data encryption/decryption, and data whitening/dewhitening.

### 1.1 BQB and Regulatory Testing Support

The CYW20719 fully supports Bluetooth Test mode as described in Part 1:1 of the Specification of the Bluetooth System v3.0. This includes the transmitter tests, normal and delayed loop back tests, and reduced hopping sequence.

In addition to the standard Bluetooth Test Mode, the CYW20719 also supports enhanced testing features to simplify RF debugging and qualification and type-approval testing. These features include:

- Fixed frequency carrier wave (unmodulated) transmission
  - Simplifies some type-approval measurements (Japan)
  - Aids in transmitter performance analysis
- Fixed frequency constant receiver mode
  - Receiver output directed to I/O pin
  - Allows for direct BER measurements using standard RF test equipment
  - Facilitates spurious emissions testing for receive mode
- Fixed frequency constant transmission
  - 8-bit fixed pattern or PRBS-9
  - Enables modulated signal measurements with standard RF test equipment

## **2. MCU**

The CYW20719 includes a Cortex M4 processor with 2 MB of ROM, 448 KB of data RAM, 64 KB of patch RAM, and 1 MB of on-chip flash. The CM4 has a maximum speed of 96 MHz. CYW20719 supports execution from on-chip flash (OCF).

The CM4 also includes a single precision IEEE 754 compliant floating point unit (FPU).

The CM4 runs all the BT layers as well as application code. The ROM includes LM, HCI, L2CAP, GATT, as well as other stack layers freeing up the flash for application usage. A standard SWD Interface provides debugging support.

## **3. External Reset**

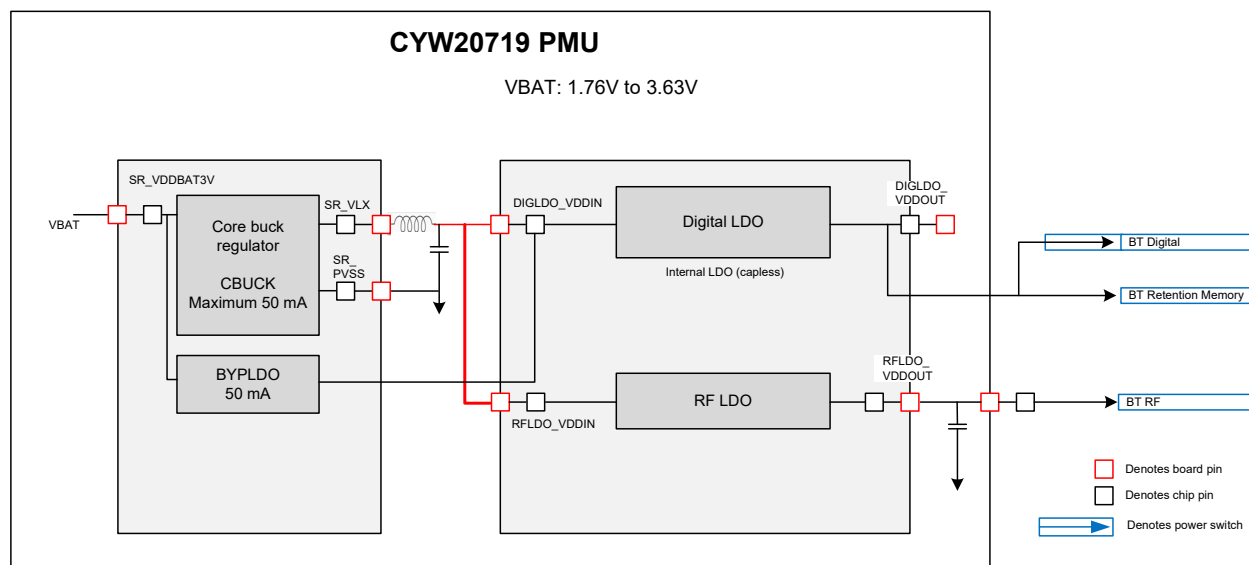

An external active-low reset signal, RESET\_N, can be used to put the CYW20719 in the reset state. The RESET\_N should be released only after the VDDO supply voltage level has been stabilized for at least 35 ms.

## 4. Power Management Unit (PMU)

Figure 2 shows the CYW20719 PMU block diagram. The CYW20719 includes an integrated buck regulator, a bypass LDO, a capless LDO for digital circuits and a separate LDO for RF. The bypass LDO automatically takes over from the buck once  $V_{bat}$  supply falls below 2.1 V.

The voltage levels shown in this figure are the default settings; the firmware may change voltage levels based on operating conditions.

**Figure 2. Default Usage Mode**

## 5. Integrated Radio Transceiver

The CYW20719 has an integrated radio transceiver that has been designed to provide low power operation in the globally available 2.4 GHz unlicensed ISM band. It is fully compliant with the Bluetooth Radio Specification and exceeds the requirements to provide the highest communication link quality of service.

### 5.1 Transmitter Path

The CYW20719 features a fully integrated transmitter. The baseband transmit data is GFSK modulated in the 2.4 GHz ISM band.

#### Digital Modulator

The digital modulator performs the data modulation and filtering required for the GFSK signal. The fully digital modulator minimizes any frequency drift or anomalies in the modulation characteristics of the transmitted signal.

#### Power Amplifier

The CYW20719 has an integrated power amplifier (PA) that can transmit up to +4 dBm for class 2 operation.

### 5.2 Receiver Path

The receiver path uses a low IF scheme to down-convert the received signal for demodulation in the digital demodulator and bit synchronizer. The receiver path provides a high degree of linearity, and an extended dynamic range to ensure reliable operation in the noisy 2.4 GHz ISM band. The front-end topology, which has built-in out-of-band attenuation, enables the CYW20719 to be used in most applications without off-chip filtering.

#### Digital Demodulator and Bit Synchronizer

The digital demodulator and bit synchronizer take the low-IF received signal and perform an optimal frequency tracking and bit synchronization algorithm.

#### Receiver Signal Strength Indicator

The radio portion of the CYW20719 provides a receiver signal strength indicator (RSSI) to the baseband. This enables the controller to take part in a Bluetooth power-controlled link by providing a metric of its own receiver signal strength to determine whether the transmitter should increase or decrease its output power.

### 5.3 Local Oscillator (LO)

LO provides fast frequency hopping (1600 hops/second) across the 79 maximum available channels for BR/EDR functionality. The CYW20719 uses an internal loop filter.

## 6. Peripheral and Communication Interfaces

### 6.1 I<sup>2</sup>C Compatible Master

The CYW20719 provides a 2-pin I<sup>2</sup>C compatible Master interface to communicate with I<sup>2</sup>C compatible peripherals. The I<sup>2</sup>C compatible master supports the following clock speeds:

- 100 kHz
- 400 kHz
- 800 kHz (Not a standard I<sup>2</sup>C-compatible speed.)
- 1 MHz (Compatibility with high-speed I<sup>2</sup>C-compatible devices is not guaranteed.)

SCL and SDA lines can be routed to any of the P0-P39 GPIOs allowing for flexible system configuration. When used as SCL/SDA the GPIOs go into open drain mode and require an external pull-up for proper operation. I<sup>2</sup>C block does not support multi master capability by either master/slave devices.

I<sup>2</sup>C1 is Master Only; I<sup>2</sup>C2 is Master/Slave. The Slave support is subject to driver support in WICED® Studio.

### 6.2 HCI UART Interface

The CYW20719 includes a UART interface for factory programming as well as when operating as a BT HCI device in a system with an external host. The UART physical interface is a standard, 4-wire interface (RX, TX, RTS, and CTS) with adjustable baud rates from 115200 bps to 1.5 Mbps. Typical rates are 115200, 921600, 1500000 bps although intermediate speeds are also available. Support for changing the baud rate during normal HCI UART operation is included through a vendor-specific command. The CYW20719 UART operates correctly with the host UART as long as the combined baud rate error of the two devices is within ±5%. The UART interface has a 1040-byte receive FIFO and a 1040-byte transmit FIFO to support enhanced data rates. The interface supports the Bluetooth UART HCI (H4) specification. The default baud rate for H4 is 115.2 kbaud.

During HCI mode the DEV\_WAKE signal can be programmed to wake up the CYW20719 or allow the CYW20719 to sleep when radio activities permit. The CYW20719 can also wake up the host as needed or allow the host to sleep via the HOST\_WAKE signal. The combined two signals allow the host and the CYW20719 to optimize system power consumption by allowing independent control of low power modes. DEV\_WAKE and HOST\_WAKE signals can be enabled via a vendor specific command.

### 6.3 Peripheral UART Interface

The CYW20719 has a second UART that may be used to interface to peripherals. This peripheral UART is accessed through the optional I/O ports, which can be configured individually and separately for each functional pin. The CYW20719 can map the peripheral UART to any GPIO (P0-P39). The Peripheral UART is functionally the same as HCI UART but with a 256 byte transmit and receive FIFO.

## 6.4 Crystal Oscillators

### 6.4.1 24-MHz Crystal Oscillator

The CYW20719 uses a 24 MHz crystal oscillator (XTAL). The XTAL must have an accuracy of  $\pm 20$  ppm as defined by the Bluetooth specification. Two external load capacitors are required to work with the crystal oscillator. The selection of the load capacitors is XTAL-dependent (see [Figure 3](#)).

**Figure 3. Recommended 24 MHz Oscillator Configuration**

**Table 2. Reference Crystal Electrical Specifications**

Parameter	Conditions	Minimum	Typical	Maximum	Unit
Nominal frequency	–	–	24.000	–	MHz
Oscillation mode	–	Fundamental			–
Frequency Accuracy	Includes operating temperature range and aging	–	–	$\pm 20$	ppm
Equivalent series resistance	–	–	–	60	ohm
Load capacitance	–	–	8	–	pF
Drive level	–	–	–	200	$\mu$ W
Shunt capacitance	–	–	–	2	pF

#### 6.4.2 32 kHz Crystal Oscillator

The CYW20719 includes a 32 KHz oscillator to provide accurate timing during low power operations. Figure 4 shows the 32 kHz XTAL oscillator with external components and Table 3 lists the oscillator's characteristics. This oscillator can be operated with 32.768 kHz crystal oscillator or be driven with a clock input at similar frequency. The default component values are: R1 = 10 MΩ and C1 = C2 = ~6 pF. The values of C1 and C2 are used to fine-tune the oscillator.

**Figure 4. Recommended 32 kHz Oscillator Electrical Specification**

**Table 3. Reference 32 kHz Oscillator Electrical Specification**

Parameter	Symbol	Conditions	Minimum	Typical	Maximum	Unit
Output frequency	$F_{\text{oscout}}$	—	—	32.768	—	kHz
Frequency tolerance	—	Crystal-dependent	—	100	—	ppm
Start-up time	$T_{\text{startup}}$	—	—	500	—	ms
XTAL drive level	$P_{\text{drv}}$	For crystal selection	—	—	0.5	μW
XTAL series resistance	$R_{\text{series}}$	For crystal selection	—	—	70	kΩ
XTAL shunt capacitance	$C_{\text{shunt}}$	For crystal selection	—	—	2.2	pF

#### 6.5 GPIO Ports

The CYW20719 has 40 GPIOs labeled P0-P39 on WLCSP package and 16 GPIOs on QFN package. All GPIOs support the following:

- programmable pull-up/down of approx 45K Ohms.
- input disable, allowing pins to be left floating or analog signals connected without risk of leakage.
- source/sink 8 mA at 3.3 V and 4 mA at 1.8 V.
- P15 is Bonded to the same pin as XTALI\_32K on the QFN package (Pin 32). If External 32.768KHz crystal is not used, then this pin can be used as GPIO P15.
- P26/P27/P28/P29 (some of these pins are not available on QFN package) sink/source 16 mA at 3.3 V and 8 mA at 1.8 V.

Most peripheral functions can be assigned to any GPIO. For details, refer to Table 4 and Table 5.

For more details on Supermux configuration and control, refer to "Supermux Wizard for CYW20719" user guide.

## 6.6 Keyboard Scanner (Available only on WLCSP Package)

The CYW20719 includes a HW keyscanner that supports a maximum matrix size of 20x8. The scanner has 8 inputs (also referred to as rows) and 20 outputs (also referred to as columns). Keys are detected by driving the columns down sequentially and sampling the rows. The HW scanner includes support for ghost key detection and debouncing. The scanner can also operate in sleep and PDS mode allowing low power operation while continuing to detect/store all key strokes, up or down. In other low power modes, the scanner can continue to monitor the matrix and initiate exit to active mode upon detecting a change of state.

**Note:** Subject to the driver support in WICED® Studio.

## 6.7 Mouse Quadrature Signal Decoder

The CYW20719 includes one double-axis and one single axis quadrature decoders. There are two input lines for each axis and a programmable control signal that can be active high or low. The application can access the quadrature interface via the driver included in the firmware.

**Note:** Subject to the driver support in WICED® Studio.

## 6.8 ADC

CYW20719 includes is a  $\Sigma\Delta$  ADC designed for audio (13 bits) and DC (10 bits) measurements. The ADC can measure the voltage on 28 GPIO. When used for analog inputs, the GPIOs must be placed in digital input disable mode to disconnect the digital circuit from the pin and avoid leakage. The internal band gap reference has  $\pm 5\%$  accuracy without calibration. Calibration and digital correction schemes can be applied to reduce ADC absolute error and improve measurement accuracy in DC mode.

■ P0, P1, P8-P18, P21-23, P28-P38 can be used as ADC inputs.

## 6.9 PWM

The CYW20719 has six internal PWMs, labeled PWM0-5

- Each of the six PWM channels contains the following registers:
  - 16-bit initial value register (read/write)
  - 16-bit toggle register (read/write)
  - 16-bit PWM counter value register (read)
- PWM configuration register is shared among PWM0-5 (read/write). This 6-bit register is used:
  - To enable/disable each PWM channel
  - To select the clock of each PWM channel
  - To invert the output phase of each PWM channel

The application can access the PWM module through the FW driver.

Figure 5 shows the structure of one PWM channel.

**Figure 5. PWM Block Diagram**

## 6.10 Serial Peripheral Interface block

The CYW20719 has two independent SPI interfaces. Both interfaces support Single, Dual, and Quad mode SPI operations as well as MIPI DBI-C Interface. Either of the interface can be a master/slave. SPI2 can support only one Slave. SPI1 has a 1024 byte transmit and receive buffers which is shared with the host UART interface. SPI2 has a dedicated 256 byte transmit and receive buffers. To support more flexibility for user applications, the CYW20719 has optional I/O ports that can be configured individually and separately for each functional pin. SPI I/O voltage depends on VDDO.

### 6.10.1 MIPI interface

There are three options in DBI type-C corresponding to 9-bit, 16-bit, and 8-bit modes. The CYW20719 plays the role of host, and only the 9-bit and 8-bit modes (option 1 and option 3 in DBI-C spec) are supported. In the 9-bit mode, the SCL, CS, MOSI, and MISO pins are used. In the 8-bit mode, an additional pin DCX, indicating whether the current outgoing bit stream is a command or data byte is required.

## 6.11 Pulse Density Modulation (PDM) Microphone

The CYW20719 accepts a  $\Sigma\Delta$ -based one-bit PDM input stream and outputs filtered samples at either 8 kHz or 16 kHz sampling rates. The PDM signal derives from an external kit that can process analog microphone signals and generate digital signals. The PDM input shares the filter path with the aux ADC. Two types of data rates can be supported:

- 8 kHz
- 16 kHz

The external digital microphone takes in a 2.4 MHz clock generated by the CYW20719 and outputs a PDM signal which is registered by the PDM interface with either the rising or falling edge of the 2.4 MHz clock selectable through a programmable control bit. The design can accommodate two simultaneous PDM input channels, so stereo voice is possible.

**Note:** Subject to the driver support in WICED Studio.

## 6.12 I<sup>2</sup>S Interface

The CYW20719 supports a single I<sup>2</sup>S digital audio port in both master and slave modes. The I<sup>2</sup>S signals are:

- I<sup>2</sup>S Clock: I<sup>2</sup>S SCK
- I<sup>2</sup>S Word Select: I<sup>2</sup>S WS
- I<sup>2</sup>S Data Out: I<sup>2</sup>S DO
- I<sup>2</sup>S Data In: I<sup>2</sup>S DI

I<sup>2</sup>S SCK and I<sup>2</sup>S WS become outputs in master mode and inputs in slave mode, while I<sup>2</sup>S DO always stays as an output and I<sup>2</sup>S DI stays as input. The channel word length is fixed to 16 bits (frame length of 32 bits) and the data is justified so that the MSB of the left-channel data is aligned with the MSB of the I<sup>2</sup>S bus, as per I<sup>2</sup>S Specifications. The MSB of each data word is transmitted one bit clock cycle after the I<sup>2</sup>S WS transition, synchronous with the falling edge of bit clock. Left Channel data is transmitted when I<sup>2</sup>S WS is low, and right-channel data is transmitted when I<sup>2</sup>S WS is high. Data bits sent by the CYW20719 are synchronized with the falling edge of I<sup>2</sup>S SCK and should be sampled by the receiver on the rising edge of the I<sup>2</sup>S SCK.

The I<sup>2</sup>S port is primarily used to transfer audio samples while using the A2DP profile<sup>1</sup>. The A2DP controller is half duplex and the direction of the audio samples depend on the A2DP role (sink/source). The I<sup>2</sup>S clock in the master mode can either be

- 44.1 KHz x 32 bits per frame = 1411.2 KHz
- 48 KHz x 32 bits per frame = 1536 KHz

In the slave mode, any clock rate is supported up to a maximum of 3.072 MHz.

**Note:** PCM interface shares HW with the I<sup>2</sup>S interface which means that both voice and audio cannot be routed at the same time.

1. The I<sup>2</sup>S port cannot be used at the application level for purposes other than routing A2DP audio samples.

### 6.13 PCM Interface

The CYW20719 includes a PCM interface that can connect to linear PCM codec devices in master or slave mode. In master mode, the CYW20719 generates the PCM\_CLK and PCM\_SYNC signals. In slave mode, these signals are provided by another device on the PCM interface and are inputs to the CYW20719. Some of the parameters of the PCM interface may be configured by the host.

The PCM interface is used for full-duplex bi-directional transfer of 8K or 16K voice samples from and to a SCO or eSCO connection<sup>2</sup>. By default, the PCM interface runs in an I<sup>2</sup>S compatible mode, which allows the CYW20719 to transfer voice samples to I<sup>2</sup>S devices.

**Note:** PCM interface shares HW with the I<sup>2</sup>S interface which means that both voice and audio cannot be routed simultaneously.

#### 6.13.1 Slot Mapping

The CYW20719 supports up to three simultaneous full-duplex SCO or eSCO channels through the PCM Interface. These three channels are time-multiplexed onto the single PCM interface by using a time-slotting scheme where the 8 kHz or 16 kHz voice sample interval is divided into as many as 16 slots. The number of slots is dependent on the selected interface rate (128 kHz, 256kHz, 512 kHz, 1024 kHz or 2048 kHz). The corresponding number of slots for these interface rate is 1, 2, 4, 8, and 16, respectively. Transmit and receive PCM data from an SCO channel is always mapped to the same slot. The PCM data output driver tristates its output on unused slots to allow other devices to share the same PCM interface signals. The data output driver tristates its output after the falling edge of the PCM clock during the last bit of the slot.

#### 6.13.2 Frame Synchronization

The CYW20719 supports both short and long-frame synchronization in both master and slave modes and can be configured from the host. In short frame synchronization mode, the frame synchronization signal is an active-high pulse at the audio frame rate that is a single-bit period in width and is synchronized to the rising edge of the bit clock. The PCM slave looks for a high on the falling edge of the bit clock and expects the first bit of the first slot to start at the next rising edge of the clock. In long-frame synchronization mode, the frame synchronization signal is again an active-high pulse at the audio frame rate; however, the duration is three bit periods and the pulse starts coincident with the first bit of the first slot.

#### 6.13.3 Data Formatting

The CYW20719 may be configured to generate or accept several different data formats. For conventional narrow band speech mode, the CYW20719 always uses 13 of the 16 bits in each PCM frame. The location and order of these 13 bits can be configured to support various data formats on the PCM interface. The remaining three bits are ignored on the input and may be filled with 0s, 1s, a sign bit, or a programmed value on the output. The default format is 13-bit 2's complement data, left justified, filled with 0's and clocked MSB first.

#### 6.13.4 Burst PCM Mode

In this mode of operation, the PCM bus runs at a significantly higher rate of operation to allow the host to duty cycle its operation and save current. In this mode of operation, the PCM bus can operate at a rate of up to 24 MHz. This mode of operation is initiated with an HCI command from the host.

### 6.14 Security Engine

The CYW20719 includes a hardware security accelerator which greatly decreases the time required to perform typical security operations. This security engine includes:

- Public key acceleration (PKA) cryptography
- AES-CTR/CBC-MAC/CCM acceleration
- SHA2 message hash and HMAC acceleration
- RSA encryption and decryption of modulus sizes up to 2048 bits
- Elliptic curve Diffie-Hellman in prime field GF(p)

**Note:** Security engine is used only by Bluetooth stack to reduce CPU overhead. It is not available for application use

#### 6.14.1 Random Number Generator

This hardware block is used for key generation for Bluetooth.

**Note:** Availability for use by the application is subject to the support in WICED® Studio.

---

2. The PCM interface cannot be used as a generic serial interface at the application level. It can only be used for routing SCO or eSCO voice samples.

## 6.15 Power Modes

The CYW20719 supports the following HW power modes:

- **Active mode** - Normal operating mode in which all peripherals are available and the CPU is active.
- **Idle mode**- In this mode, the CPU is in “Wait for Interrupt” (WFI) and the HCLK, which is the high frequency clock derived from the main crystal oscillator is running at a lower clock speed. Other clocks are active and the state of the entire chip is retained.
- **Sleep mode** - In this mode, CPU is in WFI and the HCLK is not running. The PMU determines if the other clocks can be turned off and does accordingly. State of the entire chip is retained, the internal LDOs run at a lower voltage (voltage is managed by the PMU), and SRAM is retained.
- **Power Down Sleep (PDS) mode** -This mode is an extension of the PMU Sleep wherein most of the peripherals such as UART and SPI are turned off. The entire memory is retained, and on wakeup the execution resumes from where it paused.
- **Shut Down Sleep (SDS) mode** -Everything is turned off except I/O Power Domain, RTC, and LPO. The device can come out of this mode either due to BT activity or by an external interrupt. Before going into this mode, the application can store some bytes of data into “Always On RAM” (AON). When the device comes out of this mode, the data from AON is restored. After waking from SDS, the application will start from the beginning (warmboot) and has to restore its state based on information stored in AON. In the SDS mode, a single BT task with no data activity, such as an ACL connection, BLE connection, or BLE advertisement can be performed.
- **HID-OFF (Timed-Wake) mode** -The device can enter this mode asynchronously, that is, the application can force the device into this mode at any time. I/O Power Domain, RTC, and LPO are the only active blocks. A timer that runs off the LPO is used to wake the device up after a predetermined fixed time.
- **HID-OFF (External Interrupt-Waked) mode** - This mode is similar to Timed-Wake, but in HID-OFF mode even the LPO and RTC are turned off. So, the only wakeup source is an external interrupt.

Transition between power modes is handled by the on-chip firmware with host/application involvement. Please see [Firmware](#) Section for details.

## 7. Firmware

The CYW20719 ROM firmware runs on a real time operating system and handles the programming and configuration of all on-chip hardware functions as well as the BT/LE baseband, Link Manager (LM), HCI, Generic Attribute Profile (GATT), Attribute Protocol (ATT), Logical Link Control and Adaptation Protocol (L2CAP) and Service Discovery Protocol (SDP) layers. The ROM also includes drivers for on-chip peripherals as well as handling on-chip power management functions including transitions between different power modes.

The CYW20719 is fully supported by the Cypress WICED® Studio platform. WICED releases provide latest ROM patches, drivers, and sample applications allowing customized applications using the CYW20719 to be built quickly and efficiently.

Please refer to WICED Technical Brief and CYW20719 Product Guide for details on the firmware architecture, driver documentation, power modes and how to write applications/profiles using the CYW20719.

## 8. Pin Assignments and GPIOs

This section addresses both QFN and WLCSP pin assignments and GPIOs for the CYW20719 device.

### 8.1 40-Pin QFN and WLCSP Pin Assignments

**Table 4. 40-Pin QFN and WLCSP Pin Assignments**

Pin Name	Pin Number		I/O	Power Domain	Description
	QFN-40	WLCSP			
Microphone					
ADC_avddBAT	–	5	I	VDDIO	VDDIO
ADC_AVDDC	–	3	I	–	No Connect
Mic_avdd	–	19	I	MIC_AVDD	Microphone supply
Micbias	–	32	I	MIC_AVDD	Microphone Bias Supply
Micn	–	4	I	MIC_AVDD	Microphone negative input
Micp	–	18	I	MIC_AVDD	Microphone positive input
ADC_AVSS	–	34	I	AVSS	Analog ground
ADC_AVSSC	–	17	I	AVSS	Analog ground
ADC_REFGND	–	33	I	AVSS	Analog reference ground
Mic_avss	–	47	I	AVSS	Microphone analog ground
Baseband Supply					
BT_VDDO	25	1,8,9,11,14,26,29,42,56,66,91	I	VDDO	I/O Pad Power supply
BT_VDDC	–	2,43,58,74,99	I/O	VDDC	Baseband core power supply
VDDO	39	-	I	VDDO	LHL PAD power supply. Can be tied to BT_VDDO.
RF Power Supply					
BT_PAVDD	17	116	I	PAVDD	PA supply
BT_PLLVDD1p2	21	106	I	PLLVDD1P2	RFPLL and crystal oscillator supply
BT_VCOVDD1p2	20	125	I	VCOVDD1P2	VCO supply

VSSC	–	112	I	VSS	Ground
VSSO_0	–	10,13, 25, 28,72, 96,101	I	VSS	Ground
SR_PVSS	–	130	I	VSS	Ground
xtal_avss	–	35	I	XTAL_AVSS	Crystal ground
PMU_AVSS	–	113	I	PMU_AVSS	PMU ground
<b>UART</b>					
BT_UART_CTS_N	30	15	I, PU	VDDO	Clear to send (CTS) for HCI UART interface. Leave unconnected if not used.
BT_UART_RTS_N	29	31	O, PU	VDDO	Request to send (RTS) for HCI UART interface. Leave unconnected if not used.
BT_UART_RXD	27	45	I	VDDO	UART serial input. Serial data input for the HCI UART interface.
BT_UART_TXD	28	46	O, PU	VDDO	UART serial output. Serial data output for the HCI UART interface.
<b>Crystal</b>					
BT_XTALI	22	105	I	PLLVD1P2	Crystal oscillator input. See “The XTAL must have an accuracy of $\pm 20$ ppm as defined by the Bluetooth specification. Two external load capacitors are required to work with the crystal oscillator. The selection of the load capacitors is XTAL-dependent (see <a href="#">Figure 3</a> )” for options.
BT_XTALO	23	104	O	PLLVD1P2	Crystal oscillator output.
XTALI_32K	32	6	I	VDDO	Low-power oscillator input.
XTALO_32K	31	20	O	VDDO	Low-power oscillator output.
BT_RF	18	132	–	–	RF Antenna Port
BT_CLK_REQ	–	68	O	N/A	Used for shared-clock application.
JTAG_SEL	11	102	–	–	Reserved ARM JTAG debug mode control. Connect to GND for all applications.
RST_N	10	103	I	VDDO	Active-low system reset with internal pull-up resistor.
<b>Reserved Pins</b>					
Reserved	26	21, 36, 49, 61, 77, 84, 85, 108	N/A	N/A	Reserved. Leave unconnected.
Reserved, Connect to GND	–	16, 92	N/A	N/A	Reserved, connect to GND

PMU_DISABLE	–	109	I	VDDO	PMU Enable/Disable. Connected to ground.

a. All GPIOs are super mux. All GPIOs can be programmed for any alternative functions as listed in [Table 6](#) and [Table 7](#).

b. During power-on reset, all inputs are disabled.

c. P15 and P37 should not be driven high externally while the part is held in reset (they can be floating or driven low). Failure to do so may cause some current to flow through these pins until the part comes out of reset.

## 10. Specifications

### 10.1 Electrical Characteristics

**Caution!** The absolute maximum ratings in the following table indicate levels where permanent damage to the device can occur, even if these limits are exceeded for only a brief duration. Functional operation is not guaranteed under these conditions. Operation at absolute maximum conditions for extended periods can adversely affect long-term reliability of the device.

**Table 9. Absolute Maximum Ratings**

Requirement Parameter	Specification			Unit
	Min.	Nom.	Max.	
Maximum Junction Temperature	–	–	125	°C
VDD IO (BT_VDDO, VDDO_0)	–0.5	–	3.795	V
VDD RF (BT_IFVDD1p2, BT_PLLVDD1p2, BT_VCOVDD1p2, BT_PAVDD)	–0.5	–	1.38	V
VDDBAT3V/SR_VDDBAT3V	–0.5	–	3.795	V
DIGLDO_VDDIN1P5	–0.5	–	1.65	V
RFLDO_VDDIN1P5	–0.5	–	1.50	V
MIC_AVDD	–0.5	–	3.795	V

**Table 10. ESD/Latch up**

Requirement Parameter	Specification			Unit
	Min.	Nom.	Max.	
ESD Tolerance HBM	–2000	–	2000	V
ESD Tolerance CDM	–500	–	500	V
Latch up	–	200	–	mA

**Table 11. Environmental Ratings**

Characteristic	Value	Units
Operating Temperature	–30 to +85	°C
Storage Temperature	–40 to +150	°C

**Note:**

Lowest operating temperature for the 32 KHz xtal is -10°C

**Table 12. Recommended Operating Conditions**

Parameter	Specification			Unit
	Min.	Typ.	Max.	
VDDIO (BT_VDDO, VDDO_0)	1.76	3.0	3.63	V
VDDBAT3V <sup>a</sup> /SR_VDDBAT3V <sup>a</sup>	1.9	3.0	3.63	V
MIC_AVDD	1.76	3.0	3.63	V

a. Supply tolerance for VDDBAT3V and SR\_VDDBAT3V must be 2% or less.

The CYW20719 uses an on board low voltage detector to shut down the part when supply voltage (VDDBAT3V) drops below operating range.

**Table 13. Shutdown Voltage**

Parameter	Specification			Unit
	Min.	Typ.	Max.	
V <sub>SHUT</sub>	1.625	1.7	1.76	V

#### 10.1.1 Core Buck Regulator

**Table 14. Core Buck Regulator**

Parameter	Conditions	Min.	Typ.	Max.	Unit
Input supply voltage DC, VBAT	DC voltage range inclusive of disturbances	1.9	3.0	3.63	V
CBUCK output current	Low Power Operation Mode (LPOM) only	–	–	65	mA
Output voltage range	Programmable, 30mV/step default = 1.2 V (bits = 0000)	1.2	1.26	1.5	V
Output voltage DC accuracy	Includes load and line regulation	–4	–	+4	%
LPOM efficiency (high load)	–	–	85	–	%
LPOM efficiency (low load)	–	–	80	–	%
Input supply voltage ramp-up time	0 to 3.3 V	40	–	–	μs

- Minimum capacitor value refers to residual capacitor value after taking into account part-to-part tolerance, DC-bias, temperature, and aging.
- Maximum capacitor value refers to the total capacitance seen at a node where the capacitor is connected. This also includes any decoupling capacitors connected at the load side, if any.

#### 10.1.2 Recommended External Component for Core Buck Regulator

**Table 15. Recommended External Component for Core Buck Regulator**

Parameter	Conditions	Min.	Typ.	Max.	Unit
External output inductor L	2.2 μH ±25%, DCR=114 mΩ ±20%, ACR<1Ω (for frequency<1 MHz)	–	2.2	–	μH

a. Dirty TX is off

b. Up to 1dB of variation may potentially be seen from typical sensitivity specs due to the chip, board and associated variations

- c. The receiver sensitivity is measured at BER of 0.1% on the device interface.  
 d. Desired signal is 10 dB above the reference sensitivity level (defined as -70 dBm).  
 e. Desired signal is 3 dB above the reference sensitivity level (defined as -70 dBm).  
 f. Desired signal is -64 dBm Bluetooth-modulated signal, interferer 1 is -39 dBm sine wave at frequency  $f_1$ , interferer 2 is -39 dBm Bluetooth modulated signal at frequency  $f_2$ ,  $f_0 = 2*f_1 - f_2$ , and  $|f_2 - f_1| = n*1$  MHz, where  $n$  is 3, 4, or 5. For the typical case,  $n = 4$ .

### 10.3 Timing and AC Characteristics

In this section, use the numbers listed in the Reference column of each table to interpret the following timing diagrams.

#### 10.3.1 UART Timing

**Table 25. UART Timing Specifications**

Reference	Characteristics	Min.	Typ.	Max.	Unit
1	Delay time, UART_CTS_N low to UART_TXD valid	—	—	1.50	Bit periods
2	Setup time, UART_CTS_N high before midpoint of stop bit	—	—	0.67	Bit periods
3	Delay time, midpoint of stop bit to UART_RTS_N HIGH	—	—	1.33	Bit periods

**Figure 8. UART Timing**

### 10.3.2 SPI Timing

The SPI interface can be clocked up to 24 MHz.

Table 26 and Figure 9 show the timing requirements when operating in SPI Mode 0 and 2.

**Table 26. SPI Mode 0 and 2**

Reference	Characteristics	Min.	Max.	Unit
1	Time from master assert SPI_CSN to first clock edge	45	–	ns
2	Hold time for MOSI data lines	12	$\frac{1}{2}$ SCK	ns
3	Time from last sample on MOSI/MISO to slave deassert SPI_INT	0	100	ns
4	Time from slave deassert SPI_INT to master deassert SPI_CSN	0	–	ns
5	Idle time between subsequent SPI transactions	1 SCK	–	ns

**Figure 9. SPI Timing, Mode 0 and 2**

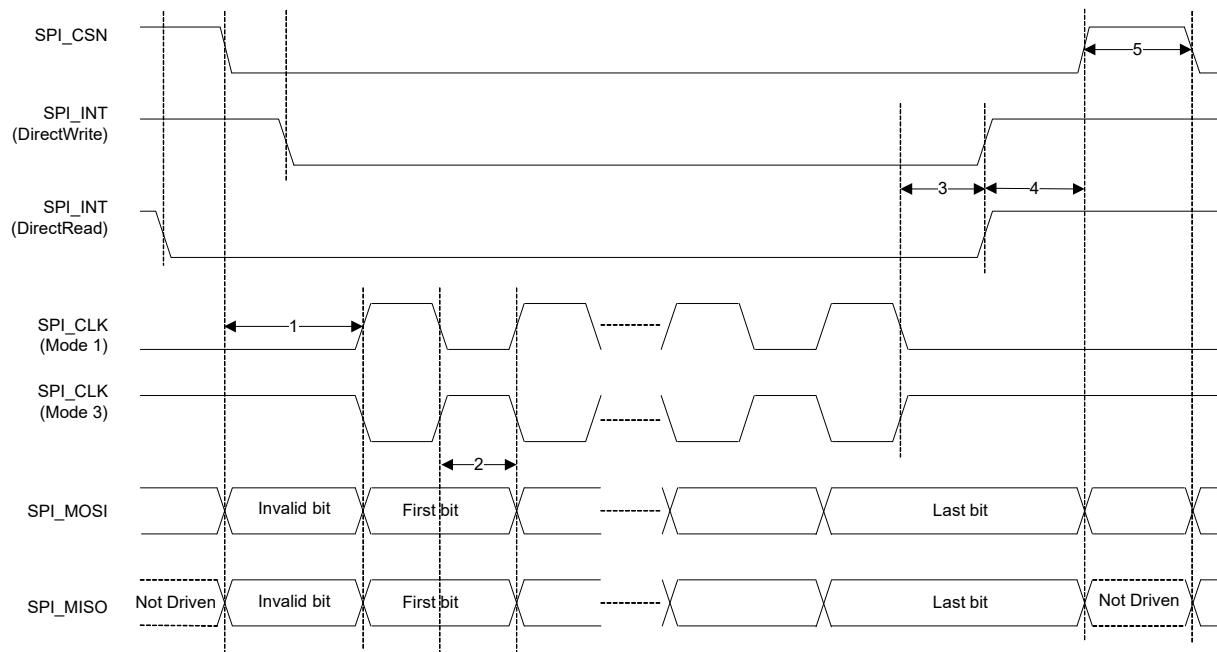

Table 27 and Figure 10 show the timing requirements when operating in SPI Mode 0 and 2.

**Table 27. SPI Mode 1 and 3**

Reference	Characteristics	Min.	Max.	Unit
1	Time from master assert SPI_CSN to first clock edge	45	–	ns
2	Hold time for MOSI data lines	12	$\frac{1}{2}$ SCK	ns
3	Time from last sample on MOSI/MISO to slave deassert SPI_INT	0	100	ns
4	Time from slave deassert SPI_INT to master deassert SPI_CSN	0	–	ns
5	Idle time between subsequent SPI transactions	1 SCK	–	ns

**Figure 10. SPI Timing, Mode 1 and 3**

### 10.3.3 I<sup>2</sup>C Compatible Interface Timing

The specifications in Table 28 references Figure 11.

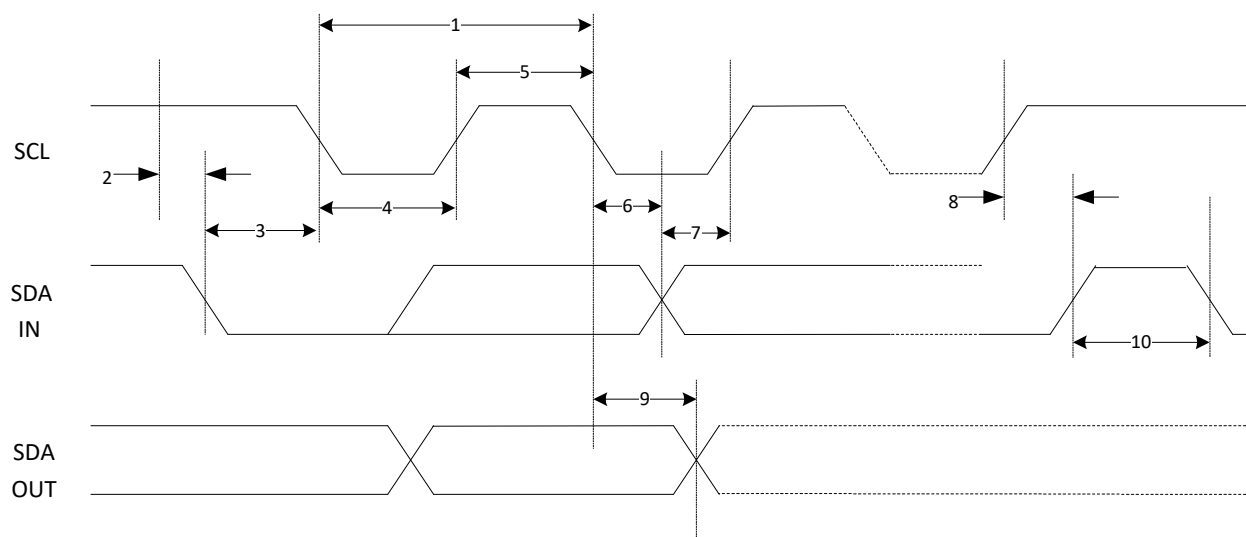

**Table 28. I<sup>2</sup>C Compatible Interface Timing Specifications (up to 1 MHz)**

Reference	Characteristics	Minimum	Maximum	Unit
1	Clock frequency	–	100	kHz
			400	
			800	
			1000	
2	START condition setup time	650	–	ns
3	START condition hold time	280	–	ns
4	Clock low time	650	–	ns
5	Clock high time	280	–	ns
6	Data input hold time <sup>a</sup>	0	–	ns
7	Data input setup time	100	–	ns
8	STOP condition setup time	280	–	ns
9	Output valid from clock	–	400	ns
10	Bus free time <sup>b</sup>	650	–	ns

a. As a transmitter, 125 ns of delay is provided to bridge the undefined region of the falling edge of SCL to avoid unintended generation of START or STOP conditions.

b. Time that the CBUS must be free before a new transaction can start.

**Figure 11. I<sup>2</sup>C Interface Timing Diagram**

**Table 29. Timing for I<sup>2</sup>S Transmitters and Receivers**

	Transmitter				Receiver				Notes
	Lower Limit		Upper Limit		Lower Limit		Upper Limit		
	Min	Max	Min	Max	Min	Max	Min	Max	
Clock Period T	T <sub>tr</sub>	—	—	—	T <sub>r</sub>	—	—	—	a
Master Mode: Clock generated by transmitter or receiver									
HIGH t <sub>HC</sub>	0.35T <sub>tr</sub>	—	—	—	0.35T <sub>tr</sub>	—	—	—	b
LOWt <sub>LC</sub>	0.35T <sub>tr</sub>	—	—	—	0.35T <sub>tr</sub>	—	—	—	b
Slave Mode: Clock accepted by transmitter or receiver									
HIGH t <sub>HC</sub>	—	0.35T <sub>tr</sub>	—	—	—	0.35T <sub>tr</sub>	—	—	c
LOW t <sub>LC</sub>	—	0.35T <sub>tr</sub>	—	—	—	0.35T <sub>tr</sub>	—	—	c
Rise time t <sub>RC</sub>	—	—	0.15T <sub>tr</sub>	—	—	—	—	—	d
Transmitter									
Delay t <sub>dtr</sub>	—	—	—	0.8T	—	—	—	—	e
Hold time t <sub>htr</sub>	0	—	—	—	—	—	—	—	d
Receiver									
Setup time t <sub>sr</sub>	—	—	—	—	0.2T <sub>tr</sub>	—	—	—	f
Hold time t <sub>hr</sub>	—	—	—	—	0.2T <sub>tr</sub>	—	—	—	f

- a. The system clock period T must be greater than  $T_{tr}$  and  $T_r$  because both the transmitter and receiver have to be able to handle the data transfer rate.
- b. At all data rates in master mode, the transmitter or receiver generates a clock signal with a fixed mark/space ratio. For this reason,  $t_{HC}$  and  $t_{LC}$  are specified with respect to T.
- c. In slave mode, the transmitter and receiver need a clock signal with minimum HIGH and LOW periods so that they can detect the signal. So long as the minimum periods are greater than  $0.35T_{tr}$ , any clock that meets the requirements can be used.
- d. Because the delay ( $t_{dtr}$ ) and the maximum transmitter speed (defined by  $T_{tr}$ ) are related, a fast transmitter driven by a slow clock edge can result in  $t_{dtr}$  not exceeding  $t_{RC}$  which means  $t_{htr}$  becomes zero or negative. Therefore, the transmitter has to guarantee that  $t_{htr}$  is greater than or equal to zero, so long as the clock rise-time  $t_{RC}$  is not more than  $t_{RCmax}$ , where  $t_{RCmax}$  is not less than  $0.15T_{tr}$ .
- e. To allow data to be clocked out on a falling edge, the delay is specified with respect to the rising edge of the clock signal and T, always giving the receiver sufficient setup time.
- f. The data setup and hold time must not be less than the specified receiver setup and hold time.

**Figure 12. I<sup>2</sup>S Transmitter Timing**

$T$  = Clock period

$T_{tr}$  = Minimum allowed clock period for transmitter

$T = T_{tr}$

\*  $t_{RC}$  is only relevant for transmitters in slave mode.

### 13.1 Acronyms and Abbreviations

The following list of acronyms and abbreviations may appear in this document.

Term	Description
AFH	adaptive frequency hopping
ATT	Attribute Protocol
BBC	Bluetooth Baseband Core
BDR	basic data rate
BLE	Bluetooth low energy
BR	basic data rate
BQS	Bluetooth Qualification Body
CRC	cyclic redundancy check
ED	erroneous data
EIR	extended inquiry response
EPR	encryption pause resume
FEC	forward error correction
FPU	floating point unit
GATT	Generic Attribute Profile
GAP	generic access profile
GFSK	Gaussian Frequency Shift Keying
GPIO	general-purpose I/O
HCI	host control interface
IF	intermediate frequency
JTAG	Joint Test Action Group
L2CAP	Logical Link Control and Adaptation Protocol
LCU	link control unit
LDO	low drop-out
LE	low energy
LM	Link Manager
LO	local oscillator
LPO	low power oscillator
LSTO	link supervision time out
PA	power amplifier

Term	Description
PBF	packet boundary flag
PDM	pulse density modulation
PDS	Power down sleep
PLL	phase locked loop
PMU	power management unit
POR	power-on reset
PRBS	Pseudo Random Binary Sequence
PWM	pulse width modulation
QFN	quad flat no-lead
QoS	quality of service
RAM	random access memory
RC oscillator	A resistor-capacitor oscillator is a circuit composed of an amplifier, which provides the output signal, and a resistor-capacitor network, which controls the frequency of the signal.
RF	radio frequency
ROM	read-only memory
RX/TX	receive/transmit
SCO	synchronous connection-oriented
SDP	Service Discovery Protocol
SDS	Shut Down Sleep
SPI	serial peripheral interface
SPIFFY	serial peripheral interface fully functional
SSP	secure simple pairing
SSR	sniff subrating
SWD	serial wire debug
TSSI	transmit signal strength indicator
UART	universal asynchronous receiver/transmitter
WLCSP	wafer level chip scale package

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);
