## 256-Position $\mathrm{I}^{2} \mathrm{C}^{\circledR}$-Compatible Digital Potentiometer

## FEATURES

256-position
End-to-end resistance $5 \mathrm{k} \Omega, 10 \mathrm{k} \Omega, 50 \mathrm{k} \Omega, 100 \mathrm{k} \Omega$
Compact SOT-23-8 ( $2.9 \mathrm{~mm} \times 3 \mathrm{~mm}$ ) package
Fast settling time: ts = $5 \mu$ s typ on power-up
Full read/write of wiper register
Power-on preset to midscale
Extra package address decode pin ADO
Computer software replaces $\mu \mathrm{C}$ in factory programming applications
Single supply: 2.7 V to 5.5 V
Low temperature coefficient 45 ppm/ ${ }^{\circ} \mathrm{C}$
Low power: lod $=\mathbf{8} \mu \mathrm{A}$
Wide operating temperature: $-\mathbf{4 0}{ }^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$
Evaluation board available

## APPLICATIONS

## Mechanical potentiometer replacement in new designs LCD panel V сом adjustment <br> LCD panel brightness and contrast control <br> Transducer adjustment of pressure, temperature, position, chemical, and optical sensors <br> RF amplifier biasing <br> Automotive electronics adjustment <br> Gain control and offset adjustment

## GENERAL DESCRIPTION

The AD5245 provides a compact $2.9 \mathrm{~mm} \times 3 \mathrm{~mm}$ packaged solution for 256-position adjustment applications. These devices perform the same electronic adjustment function as mechanical potentiometers or variable resistors, with enhanced resolution, solid-state reliability, and superior low temperature coefficient performance.

The wiper settings are controllable through an $\mathrm{I}^{2} \mathrm{C}$-compatible digital interface, which can also be used to read back the wiper register content. AD0 can be used to place up to two devices on the same bus. Command bits are available to reset the wiper position to midscale or to shut down the device into a state of zero power consumption.

## FUNCTIONAL BLOCK DIAGRAM

Figure 1.

## PIN CONFIGURATION

Figure 2.

Operating from a 2.7 V to 5.5 V power supply and consuming less than $8 \mu \mathrm{~A}$ allows usage in portable battery-operated applications.

Note that the terms digital potentiometer, VR, and RDAC are used interchangeably.

[^2]
## ABSOLUTE MAXIMUM RATINGS

$\mathrm{T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$, unless otherwise noted.

Table 4.

| Parameter | Value |
| :--- | :--- |
| $V_{D D}$ to GND | -0.3 V to +7 V |
| $\mathrm{~V}_{\mathrm{A}}, \mathrm{V}_{\mathrm{B}}, V_{\mathrm{W}}$ to GND | $\mathrm{V}_{\mathrm{DD}}$ |
| Terminal Current, A to B, A to W, B to $\mathrm{W}^{1}$ |  |
| $\quad$ Pulsed | $\pm 20 \mathrm{~mA}$ |
| $\quad$ Continuous | $\pm 5 \mathrm{~mA}$ |
| Digital Inputs and Output Voltage to GND | 0 V to 7 V |
| Operating Temperature Range | $-40^{\circ} \mathrm{C}$ to $+125^{\circ} \mathrm{C}$ |
| Maximum Junction Temperature (TJMax) | $150^{\circ} \mathrm{C}$ |
| Storage Temperature Range | $-65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$ |
| Lead Temperature (Soldering, 10 sec) | $245^{\circ} \mathrm{C}$ |
| Thermal Resistance ${ }^{2} \theta_{\mathrm{JA}}$ : SOT-23-8 | $230^{\circ} \mathrm{C} / \mathrm{W}$ |

${ }^{1}$ Maximum terminal current is bound by the maximum current handling of the switches, maximum power dissipation of the package, and maximum applied voltage across any two of the $A, B$, and $W$ terminals at a given resistance.
${ }^{2}$ Package power dissipation $=\left(\mathrm{T}_{\mathrm{JMAX}}-\mathrm{T}_{\mathrm{A}}\right) / \theta_{\mathrm{JA}}$.

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## ESD CAUTION

ESD (electrostatic discharge) sensitive device. Electrostatic charges as high as 4000 V readily accumulate on the human body and test equipment and can discharge without detection. Although this product features proprietary ESD protection circuitry, permanent damage may occur on devices subjected to high energy electrostatic discharges. Therefore, proper ESD precautions are recommended to avoid performance degradation or loss of functionality.

## PIN CONFIGURATION AND FUNCTION DESCRIPTIONS

Table 5. Pin Function Descriptions

| Pin No. | Mnemonic | Description |
| :--- | :--- | :--- |
| 1 | W | W Terminal. GND $\leq \mathrm{V}_{\mathrm{W}} \leq \mathrm{V}_{\mathrm{DD}}$. |
| 2 | VDD $_{\mathrm{DD}}$ | Positive Power Supply. |
| 3 | GND | Digital Ground. |
| 4 | SCL | Serial Clock Input. Positive edge triggered. Pull-up resistor required. |
| 5 | SDA | Serial Data Input/Output. Pull-up resistor required. |
| 6 | ADO | Programmable Address Bit 0 for Two-Device Decoding. |
| 7 | B | B Terminal. GND $\leq \mathrm{V}_{\mathrm{B}} \leq \mathrm{V}_{\mathrm{DD}}$. |
| 8 | A | A Terminal. GND $\leq \mathrm{V}_{\mathrm{A}} \leq \mathrm{V}_{\mathrm{DD}}$. |

Figure 30. Test Circuit for Wiper Resistance

Figure 31. Test Circuit for Power Supply Sensitivity (PSS, PSSR)

## THEORY OF OPERATION

The AD5245 is a 256-position digitally controlled variable resistor (VR) device.

An internal power-on preset places the wiper at midscale during power-on, which simplifies the fault condition recovery at power-up.

## PROGRAMMING THE VARIABLE RESISTOR

## Rheostat Operation

The nominal resistance of the RDAC between Terminals A and B is available in $5 \mathrm{k} \Omega, 10 \mathrm{k} \Omega, 50 \mathrm{k} \Omega$, and $100 \mathrm{k} \Omega$. The nominal resistance $\left(\mathrm{R}_{A B}\right)$ of the VR has 256 contact points accessed by the wiper terminal, plus the $B$ terminal contact. The 8 -bit data in the RDAC latch is decoded to select one of the 256 possible settings.

Figure 35. Rheostat Mode Configuration
Assuming that a $10 \mathrm{k} \Omega$ part is used, the wiper's first connection starts at the B terminal for Data 0x00. Because there is a $50 \Omega$ wiper contact resistance, such a connection yields a minimum of $100 \Omega(2 \times 50 \Omega)$ resistance between Terminals W and B. The second connection is the first tap point, which corresponds to $139 \Omega\left(\mathrm{R}_{\mathrm{WB}}=\mathrm{R}_{\mathrm{AB}} / 256+2 \times \mathrm{R}_{\mathrm{W}}=39 \Omega+2 \times 50 \Omega\right)$ for Data $0 \times 01$. The third connection is the next tap point, representing $178 \Omega$ $(2 \times 39 \Omega+2 \times 50 \Omega)$ for Data $0 \times 02$, and so on. Each LSB data value increase moves the wiper up the resistor ladder until the last tap point is reached at $10,100 \Omega\left(\mathrm{R}_{A B}+2 \times \mathrm{R}_{\mathrm{W}}\right)$.

Figure 36. AD5245 Equivalent RDAC Circuit

The general equation determining the digitally programmed output resistance between $W$ and $B$ is

$$
\begin{equation*}
R_{W B}(D)=\frac{D}{256} \times R_{A B}+2 \times R_{W} \tag{1}
\end{equation*}
$$

where:
$D$ is the decimal equivalent of the binary code loaded in the 8 -bit RDAC register.
$R_{A B}$ is the end-to-end resistance.
$R_{W}$ is the wiper resistance contributed by the on resistance of the internal switch.

In summary, if $R_{A B}=10 \mathrm{k} \Omega$ and the A terminal is open circuited, then the following output resistance $\mathrm{R}_{\text {wB }}$ is set for the indicated RDAC latch codes.

Table 6. Codes and Corresponding $\mathrm{R}_{\mathrm{wB}}$ Resistance

| $\mathbf{D}$ (Dec.) | $\mathbf{R w B}_{\mathbf{w B}}(\mathbf{\Omega})$ | Output State |
| :--- | :--- | :--- |
| 255 | 9,961 | Full Scale ( $\mathrm{R}_{\text {AB }}-1$ LSB + Rw) |
| 128 | 5,060 | Midscale |
| 1 | 139 | 1 LSB |
| 0 | 100 | Zero Scale (Wiper Contact Resistance) |

Note that in the zero-scale condition, a finite wiper resistance of $100 \Omega$ is present. Care should be taken to limit the current flow between W and B in this state to a maximum pulse current of no more than 20 mA . Otherwise, degradation or possible destruction of the internal switch contact can occur.

Similar to the mechanical potentiometer, the resistance of the RDAC between the Wiper W and Terminal A also produces a digitally controlled complementary resistance, $\mathrm{R}_{\text {wA }}$. When these terminals are used, the B terminal can be opened. Setting the resistance value for $\mathrm{R}_{\mathrm{WA}}$ starts at a maximum value of resistance and decreases as the data loaded in the latch increases in value. The general equation for this operation is

$$
\begin{equation*}
R_{W A}(D)=\frac{256-D}{256} \times R_{A B}+2 \times R_{W} \tag{2}
\end{equation*}
$$

For $\mathrm{R}_{A B}=10 \mathrm{k} \Omega$ and the B terminal open circuited, the following output resistance $\mathrm{R}_{\mathrm{wA}}$ is set for the indicated RDAC latch codes.
Table 7. Codes and Corresponding Rwa Resistance

| D (Dec.) | Rwa $(\boldsymbol{\Omega})$ | Output State |
| :--- | :--- | :--- |
| 255 | 139 | Full Scale |
| 128 | 5,060 | Midscale |
| 1 | 9,961 | 1 LSB |
| 0 | 10,060 | Zero Scale |

Typical device-to-device matching is process lot dependent and can vary by up to $\pm 30 \%$. Because the resistance element is processed in thin film technology, the change in $\mathrm{R}_{A B}$ with temperature has a very low $45 \mathrm{ppm} /{ }^{\circ} \mathrm{C}$ temperature coefficient.

## PROGRAMMING THE POTENTIOMETER DIVIDER

## Voltage Output Operation

The digital potentiometer easily generates a voltage divider at wiper-to- B and wiper-to-A proportional to the input voltage at A to $B$. Unlike the polarity of $V_{D D}$ to GND, which must be positive, voltage across $A$ to $B, W$ to $A$, and $W$ to $B$ can be at either polarity.

Figure 37. Potentiometer Mode Configuration
If ignoring the effect of the wiper resistance for approximation, then connecting the A terminal to 5 V and the B terminal to ground produces an output voltage at the wiper-to- B starting at 0 V up to 1 LSB less than 5 V . Each LSB of voltage is equal to the voltage applied across Terminal A and B divided by the 256 positions of the potentiometer divider. The general equation defining the output voltage at $\mathrm{V}_{\mathrm{w}}$ with respect to ground for any valid input voltage applied to Terminals A and B is

$$
\begin{equation*}
V_{W}(D)=\frac{D}{256} V_{A}+\frac{256-D}{256} V_{B} \tag{3}
\end{equation*}
$$

A more accurate calculation, which includes the effect of wiper resistance, $\mathrm{V}_{\mathrm{W}}$, is

$$
\begin{equation*}
V_{W}(D)=\frac{R_{W B}(D)}{R_{A B}} V_{A}+\frac{R_{W A}(D)}{R_{A B}} V_{B} \tag{4}
\end{equation*}
$$

Operation of the digital potentiometer in the divider mode results in a more accurate operation over temperature. Unlike the rheostat mode, the output voltage is dependent mainly on the ratio of the internal resistors, $\mathrm{R}_{\mathrm{WA}}$ and $\mathrm{R}_{\mathrm{WB}}$, not the absolute values. Therefore, the temperature drift reduces to $15 \mathrm{ppm} /{ }^{\circ} \mathrm{C}$.

## ESD PROTECTION

All digital inputs are protected with a series of input resistors and parallel Zener ESD structures, shown in Figure 38 and Figure 39. This applies to the digital input pins SDA, SCL, and AD0.

Figure 38. ESD Protection of Digital Pins

Figure 39. ESD Protection of Resistor Terminals

## TERMINAL VOLTAGE OPERATING RANGE

The AD5245 VDD and GND power supply defines the boundary conditions for proper 3-terminal digital potentiometer operation. Supply signals present on Terminals A, B, and W that exceed $V_{D D}$ or GND are clamped by the internal forward-biased diodes (see Figure 40).

Figure 40. Maximum Terminal Voltages Set by VDD and GND

## POWER-UP SEQUENCE

Because the ESD protection diodes limit the voltage compliance at Terminals A, B, and W (see Figure 40), it is important to power $\mathrm{V}_{\mathrm{DD}}$ and GND before applying any voltage to Terminals $\mathrm{A}, \mathrm{B}$, and W ; otherwise, the diode is forward biased such that $V_{D D}$ is powered unintentionally and can affect the rest of the user's circuit. The ideal power-up sequence is in the following order: GND, $V_{D D}$, digital inputs, and then $V_{A}, V_{B}$, and $V_{w}$. The relative order of powering $\mathrm{V}_{\mathrm{A}}, \mathrm{V}_{\mathrm{B}}, \mathrm{V}_{\mathrm{W}}$, and the digital inputs is not important as long as they are powered after VDD and GND.

## LAYOUT AND POWER SUPPLY BYPASSING

It is good practice to employ compact, minimum lead length layout design. The leads to the inputs should be as direct as possible with a minimum conductor length. Ground paths should have low resistance and low inductance.

Similarly, it is also good practice to bypass the power supplies with quality capacitors for optimum stability. Supply leads to the device should be bypassed with disk or chip ceramic capacitors of $0.01 \mu \mathrm{~F}$ to $0.1 \mu \mathrm{~F}$. Low ESR $1 \mu \mathrm{~F}$ to $10 \mu \mathrm{~F}$ tantalum or electrolytic capacitors should also be applied at the supplies to minimize any transient disturbance and low frequency ripple (see Figure 41). Note that the digital ground should also be joined remotely to the analog ground at one point to minimize the ground bounce.

Figure 41. Power Supply Bypassing

## CONSTANT BIAS TO RETAIN RESISTANCE SETTING

For users who desire nonvolatility but cannot justify the additional cost for the EEMEM, the AD5245 can be considered a low cost alternative by maintaining a constant bias to retain the wiper setting. The AD5245 is designed specifically with low power in mind, which allows low power consumption even in battery-operated systems. Figure 42 demonstrates the power consumption from a $3.4 \mathrm{~V}, 450 \mathrm{~mA}-\mathrm{hr} \mathrm{Li}$-Ion cell phone battery that is connected to the AD5245. The measurement over time shows that the device draws approximately $1.3 \mu \mathrm{~A}$ and consumes negligible power. Over a course of 30 days, the battery is depleted by less than $2 \%$, the majority of which is due to the intrinsic leakage current of the battery itself.

Figure 42. Battery Operating Life Depletion
This demonstrates that constantly biasing the potentiometer can be a practical approach. Most portable devices do not require the removal of batteries for charging.

Although the resistance setting of the AD5245 is lost when the battery needs replacement, such events occur rather infrequently so that this inconvenience is justified by the lower cost and smaller size offered by the AD5245. If total power is lost, then the user should be provided with a means to adjust the setting accordingly.

## EVALUATION BOARD

An evaluation board, along with all necessary software, is available to program the AD5245 from any PC running Windows ${ }^{\circledR} 98 / 2000 / X P$. The graphical user interface, as shown in Figure 43, is straightforward and easy to use. More detailed information is available in the user manual, which is provided with the board.

Figure 43. AD5245 Evaluation Board Software
The AD5245 starts at midscale upon power-up. To increment or decrement the resistance, the user can simply move the scrollbars on the left. To write a specific value, the user should use the bit pattern in the upper screen and click the Run button. The format of writing data to the device is shown in Table 8. To read the data from the device, the user can simply click the Read button. The format of the read bits is shown in Table 9.

## AD5245

## I 2 C INTERFACE

## $I^{2}$ C-COMPATIBLE 2-WIRE SERIAL BUS

The 2 -wire $\mathrm{I}^{2} \mathrm{C}$ serial bus protocol operates as follows:

1. The master initiates data transfer by establishing a START condition, which is when a high-to-low transition on the SDA line occurs while SCL is high (see Figure 45). The next byte is the slave address byte, which consists of the 7-bit slave address followed by an $\mathrm{R} / \overline{\mathrm{W}}$ bit (this bit determines whether data is read from or written to the slave device). The AD5245 has one configurable address bit, AD0 (see Table 8).

The slave whose address corresponds to the transmitted address responds by pulling the SDA line low during the ninth clock pulse (this is termed the acknowledge bit). At this stage, all other devices on the bus remain idle while the selected device waits for data to be written to or read from its serial register. If the $\mathrm{R} / \overline{\mathrm{W}}$ bit is high, the master reads from the slave device. On the other hand, if the $\mathrm{R} / \overline{\mathrm{W}}$ bit is low, the master writes to the slave device.
2. In write mode, the second byte is the instruction byte. The first bit (MSB) of the instruction byte is a don't care.

The second MSB, RS, is the midscale reset. A logic high on this bit moves the wiper to the center tap, where $R_{w A}=R_{w b}$. This feature effectively overwrites the contents of the register; therefore, when taken out of reset mode, the RDAC remains at midscale.

The third MSB, SD, is a shutdown bit. A logic high causes an open circuit at Terminal A while shorting the wiper to Terminal B. This operation yields almost $0 \Omega$ in rheostat mode or 0 V in potentiometer mode. It is important to note that the shutdown operation does not disturb the contents of the register. When brought out of shutdown, the previous setting is applied to the RDAC. Also during shutdown, new settings can be programmed. When the part is returned from shutdown, the corresponding VR setting is applied to the RDAC.

The remainder of the bits in the instruction byte are don't cares (see Table 8).
3. After acknowledging the instruction byte, the last byte in write mode is the data byte. Data is transmitted over the serial bus in sequences of nine clock pulses (eight data bits followed by an acknowledge bit). The transitions on the SDA line must occur during the low period of SCL and remain stable during the high period of SCL (see Figure 45).
4. In read mode, the data byte follows immediately after the acknowledgment of the slave address byte. Data is transmitted over the serial bus in sequences of nine clock pulses (a slight difference with write mode, in which eight data bits are followed by an acknowledge bit). Similarly, the transitions on the SDA line must occur during the low period of SCL and remain stable during the high period of SCL (see Figure 46).
5. After all data bits have been read or written, a STOP condition is established by the master. A STOP condition is defined as a low-to-high transition on the SDA line while SCL is high. In write mode, the master pulls the SDA line high during the $10^{\text {th }}$ clock pulse to establish a STOP condition (see Figure 45). In read mode, the master issues a no acknowledge for the ninth clock pulse (that is, the SDA line remains high). The master then brings the SDA line low before the $10^{\text {th }}$ clock pulse, which goes high to establish a STOP condition (see Figure 46).

A repeated write function gives the user flexibility to update the RDAC output a number of times after addressing and instructing the part only once. For example, after the RDAC has acknowledged its slave address and instruction bytes in the write mode, the RDAC output updates on each successive byte. If different instructions are needed, then the write/read mode has to start again with a new slave address, instruction, and data byte. Similarly, a repeated read function of the RDAC is also allowed.

Table 8. Write Mode

## AD5245

## Multiple Devices on One Bus

Figure 47 shows two AD5245 devices on the same serial bus. Each has a different slave address because the states of their AD0 pins are different. This allows the RDAC within each device to be written to or read from independently. The master device's output bus line drivers are open-drain pull-downs in a fully $\mathrm{I}^{2} \mathrm{C}$-compatible interface.

## NOTES

Purchase of licensed $\mathrm{I}^{2} \mathrm{C}$ components of Analog Devices or one of its sublicensed Associated Companies conveys a license for the purchaser under the Philips $I^{2} C$ Patent Rights to use these components in an $I^{2} C$ system, provided that the system conforms to the $I^{2} C$ Standard Specification as defined by Philips.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits,General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
