GENERAL DESCRIPTION

The AD5544-EP quad, 16-bit, current output, digital-to-analog converter (DAC) is designed to operate from a 2.7 V to 5.5 V supply range.

The applied external reference input voltage (V_{REF}x) determines the full-scale output current. Integrated feedback resistors (R_{FB}) provide temperature-tracking, full-scale voltage outputs when combined with an external I-to-V precision amplifier.

A double-buffered serial data interface offers high speed, 3-wire, SPI- and microcontroller-compatible inputs using serial data in (SDI), a chip select ($\overline{CS}$), and clock (CLK) signals. In addition, a serial data out pin (SDO) allows for daisy chaining when multiple packages are used. A common, level-sensitive, load DAC strobe ($\overline{LDAC}$) input allows the simultaneous update of all DAC outputs from previously loaded input registers. Additionally, an internal power-on reset forces the output voltage to 0 at system turn-on. The MSB pin allows system reset assertion ($\overline{RS}$) to force all registers to zero code when MSB = 0 or to half-scale code when MSB = 1. The AD5544-EP is packaged in the compact 28-lead SSOP.

Additional application and technical information can be found in the AD5544 data sheet.

[1] All static performance tests (except $I_{OUT}x$) are performed in a closed-loop system using an external precision OP177 I-to-V converter amplifier. The AD5544 R_{FB} terminal is tied to the amplifier output. Typical values represent average readings measured at 25°C.
[2] These parameters are guaranteed by design and not subject to production testing.
[3] All input control signals are specified with $t_R = t_F$ = 2.5 ns (10% to 90% of 3 V) and timed from a voltage level of 1.5 V.
[4] All ac characteristic tests are performed in a closed-loop system using an AD8038 I-to-V converter amplifier.
