

### GENERAL DESCRIPTION

This document describes the specification for the F1956 Digital Step Attenuator. The F1956 is part of IDT's *Glitch-Free™* family of DSAs optimized for the demanding requirements of Base Station (BTS) radio cards and numerous other non-BTS applications. This device is offered in compact 5 mm x 5 mm 32-pin package with 50 Ω input and output impedance for ease of integration into the radio or RF system.

### COMPETITIVE ADVANTAGE

The F1956 offers very high reliability due to its construction from a monolithic silicon die in a QFN package. The insertion loss is very low with minimal distortion. Additionally the device is designed to have extremely accurate attenuations levels. These accurate attenuation level improves system SNR and/or ACLR by ensuring system gain is as close to targeted level as possible. Also, the very fast settling time in parallel mode is ideal for fast switching systems. Finally, the device is *Glitch-Free™* with less than 2 dB of ringing across the attenuation range in stark contrast to competing DSAs that glitch as much as 10 dB during MSB state changes.

- ✓ Lowest insertion loss for best SNR
- ✓ *Glitch-Free™* technology to protect PA or ADC during transitions between attenuation states.
- ✓ Extremely accurate attenuation levels
- ✓ Ultra low distortion
- ✓ MSL1 and 2000 V HBM ESD

### FEATURES

- Serial & 7-bit Parallel Interface
- 31.75 dB Range
- 0.25 dB steps
- *Glitch-Free™*: low transient overshoot
- 500 ns settling time
- Ultra linear > 64 dBm IIP3
- Low Insertion Loss < 1.7 dB @ 4 GHz
- Attenuation error < ±0.2 dB @ 4 GHz
- Bi-directional RF use
- 3.3 V or 5 V Supply
- 1.8 V or 3.3 V control logic
- Low Current Consumption: 350 μA typical
- -40 °C to +105 °C operating temperature
- 5 mm x 5 mm Thin QFN 32 pin package

## PROGRAMMING OPTIONS

F1956 can be programmed using either the parallel or serial interface; selectable via  $V_{MODE}$  (pin 3). Serial mode is selected by floating  $V_{MODE}$  or pulling  $V_{MODE}$  to a logic high and parallel mode is selected by setting  $V_{MODE}$  to logic low.

## SERIAL CONTROL MODE

F1956 Serial mode is selected by floating  $V_{MODE}$  (pin 3) or pulling it to logic high. The serial interface is a 16-bit shift register made up of two words. The first 8-bit word is the Attenuation word, which controls the DSA state. The second word is the address word, which uses only 3 of 8-bits that must match the hard wired A0-A2 programming in order to change the DSA state. If no external connections are made to A0 – A2 then internally they will default to 000 due to internal pull down resistors. If these 3 external preset address bits are not matched with the SPI loaded address bits then the current attenuator state will remain unchanged. This allows up to 8 serial-controlled devices to be used on a single board, which share a common DATA, CLK and LE.

When serial programming is used, all the parallel control input pins 26 – 32 can be left open or grounded. If a pin is grounded then an additional 25  $\mu$ A will be drawn from the voltage supply per pin.

### SERIAL MODE DEFAULT CONDITION

When the device is first powered up it will default to the **Maximum Attenuation** setting as described below: Note that for the F1956 in all cases logic high (1) has the attenuation stepped IN, while logic low (0) has the attenuation stepped OUT.

### REGISTER TIMING DIAGRAM: (NOTE THE TIMING SPEC INTERVALS IN BLUE)

With serial control, the F1956 can be programmed via the serial port on the rising edge of Latch Enable (LE) which loads the last 8 DATA line bits [formatted LSB (D0) first] resident in the SHIFT register followed by the Address Word into the ACTIVE register.

**Figure 4 - Serial Timing Diagram**

*Note - When Latch enable is high, the shift register is disabled and DATA is NOT continuously clocked into the shift register which minimizes noise. It is recommended that Latch enable be left high when the device is not being programmed.*

## PARALLEL CONTROL MODE

For the F1956 the user has the option of running in one of two parallel modes. Direct Parallel Mode or Latched Parallel Mode.

### Direct Parallel Mode:

Direct Parallel Mode is selected when V<sub>MODE</sub> is a logic low and LE is a logic high. In this mode the device will immediately react to any voltage changes to the parallel control pins [pins 26 – 32]. Use direct parallel mode for the fastest settling time.

**Latched Parallel Mode:**

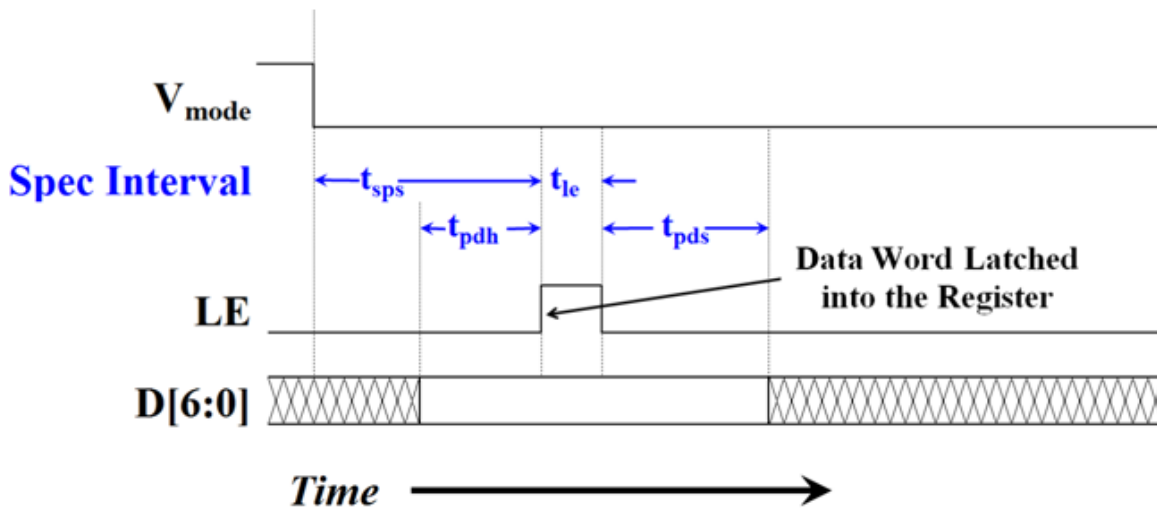

Latched Parallel Mode is selected when  $V_{MODE}$  is logic low and LE is toggled from logic low to high. To utilize Latched Parallel Mode:

- Set  $V_{MODE}$  is logic low.
- Set LE to logic low.
- Adjust pins [26, 27, 28, 29, 30, 31, 32] to the desired attenuation setting. (Note the device will not react to these pins while LE is a logic low).
- Pull LE to a logic high. The device will then transition to the attenuation settings reflected by pins D6 - D0.
- IF LE is pulled to a logic low then the attenuator will not change state.

Latched Parallel Mode implies a default state for when the device is first powered up with  $V_{MODE}$  set for logic low and LE logic low. In this case the default setting is MAXIMUM Attenuation.

## APPLICATIONS INFORMATION

### Power Supplies

A common  $V_{DD}$  power supply should be used for all pins requiring DC power. All supply pins should be bypassed with external capacitors to minimize noise and fast transients. Supply noise can degrade noise figure and fast transients can trigger ESD clamps and cause them to fail. Supply voltage change or transients should have a slew rate smaller than  $1V/20\mu S$ . In addition, all control pins should remain at 0V (+/-0.3V) while the supply voltage ramps or while it returns to zero.

### Digital Pin Voltage & Resistance Values

The following table provides open-circuit DC voltage referenced to ground and resistance values for each of the control pins listed.

Pin	Name	Open Circuit DC Voltage	Internal Connection
3	$V_{MODE}$	2.5 V	100 k $\Omega$ pullup resistor to internally regulated 2.5 V
4, 21, 22	A0, A2, A1	0 V	100 k $\Omega$ resistor to GND
23, 24, 25	LE, CLK, DATA	2.5 V	100 k $\Omega$ pullup resistor to internally regulated 2.5 V
26 – 32	D6 – D0	2.5 V	100 k $\Omega$ pullup resistor to internally regulated 2.5 V

**REVISION HISTORY SHEET**

Rev	Date	Page	Description of Change
0	2015-May-22		Initial Release
1	2015-Sep-29	2	Datasheet Format Update Added Maximum Average Power Rating
2	2016-Apr-01		Maximum operating frequency changed to 6 GHz. Added curves showing performance at higher frequencies.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
