PIN DESCRIPTIONS

PIN	NAME	DESCRIPTION
1	CSP	Voltage Feedback Input. Connect to node of the inductor and output capacitor. CSP and CSN Kevin sense is recommended.
2	CSN	Negative input terminal of output current sense. Connect to the negative terminal of current sense resistor.
3	PDC	USB-PD Control Pin. floating: 5.1V, pulled high: 12.1V, pulled low: 9.1V. Do not drive this pin higher than 5V.
4	DP	Data Line Positive Input. Connected to D+ of attached portable device data line. This pin passes 8kV HBM ESD.
5	DM	Data Line Negative Input. Connected to D- of attached portable device data line. This pin passes 8kV HBM ESD.
6	IN	Power Supply Input. Bypass this pin with a 10 μ F ceramic capacitor to GND, placed as close to the IC as possible.
7	SW	Power Switching Output to External Inductor.
8	HSB	High Side Bias Pin. This provides power to the internal high-side MOSFET gate driver. Connect a 22nF capacitor from HSB pin to SW pin.
9	GND	Ground and Heat Dissipation Pad. Connect this exposed pad to large ground copper area with copper and vias.

ABSOLUTE MAXIMUM RATINGS^①

PARAMETER	VALUE	UNIT
IN to GND	-0.3 to 40	V
SW to GND	-1 to $V_{IN} + 1$	V
HSB to GND	$V_{SW} - 0.3$ to $V_{SW} + 7$	V
CSP, CSN to GND	-0.3 to +15	V
PDC to GND	-0.3 to +6	V
All other pins to GND	-0.3 to +6	V
Junction to Ambient Thermal Resistance	46	$^{\circ}$ C/W
Operating Junction Temperature	-40 to 150	$^{\circ}$ C
Storage Junction Temperature	-55 to 150	$^{\circ}$ C
Lead Temperature (Soldering 10 sec.)	300	$^{\circ}$ C

①: Do not exceed these limits to prevent damage to the device. Exposure to absolute maximum rating conditions for long periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

 (V_{IN} = 12V, T_J = -40°C~125°C, , unless otherwise specified.)

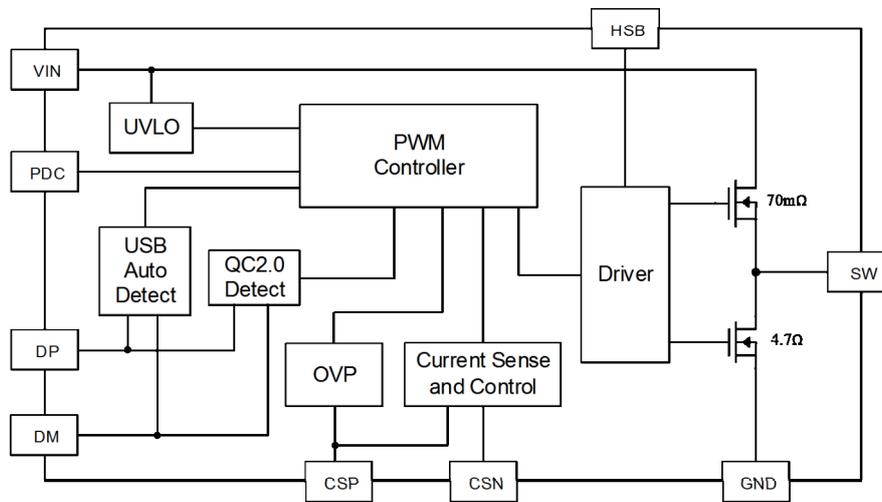

Parameter	Symbol	Condition	Min	Typ	Max	Units

PDC Low Threshold					0.6	V
PDC Drive Current				10		uA

FUNCTIONAL BLOCK DIAGRAM

FUNCTIONAL DESCRIPTION

Output Current Sensing and Regulation

Sense resistor is connected to CSP and CSN. The sensed differential voltage is compared with interval reference to regulate current. CC loop and CV loop are in parallel. The current loop response is allowed to have slower response compared to voltage loop. However, during current transient response, the inductor current overshoot/undershoot should be controlled within +/-25% to avoid inductor saturation.

Cycle-by-Cycle Current Control

The conventional cycle-by-cycle peak current mode is implemented with high-side FET current sense.

Input Over Voltage Protection

The converter is disabled if the input voltage is above 42V (+/-2V). Device resumes operation automatically 40ms after OVP is cleared.

Output Over Voltage Protection

Device stops switching when output over-voltage is sensed, and resumes operation automatically when output voltage drops to OVP- hysteresis.

Output Over Voltage Discharge

Discharge circuit starts to discharge output through CSP pins when output over voltage is detected. Discharge circuit brings 12V down to 5V in less than 100ms.

Output Under-Voltage Protection / Hiccup Mode

There is a under voltage protection (UVP) threshold. If the UVP threshold is hit for 10us, an over current or short circuit is assumed, and the converter goes into hiccup mode by disabling the converter and restarts after hiccup waiting period.

Input Brownout Protection

(ACT4529MYH-T1011 only)

If the input voltage drops below 8V but higher than UVLO for 450ms while in QC or PDC mode, the output voltage turns off and QC or PDC mode is disabled. If the output voltage drops below 3.7V, the timer restarts and waits for 450ms before attempting to restart the output voltage. When output voltage rises above 3.9V and detects the input voltage below 8V, timer restarts. If the input voltage is below 8V after 450ms, the output turns off. The cycle continues until the input voltage increases above 8.2V, for longer than 450ms, then output turns on, the IC renegotiates the PD and QC protocols, and normal operation restarts.

Thermal Shutdown

If the T_J increases beyond 160°C, ACT4529 goes into HZ mode and the timer is preserved until T_J drops by 30°C.

FUNCTIONAL DESCRIPTION

Cord Compensation

Cord Compensation increases the output voltage with increased output current to compensate for the voltage drop across the output connector and output cable.

The compensation voltage is derived as:

$$\Delta V_{out} = R_{CS} * I_{out} * K$$

Where R_{CS} is the current sense resistance, I_{out} is the load current, and $K = 3.03$

APPLICATIONS INFORMATION

Inductor Selection

The inductor maintains a continuous current to the output load. This inductor current has a ripple that is dependent on the inductance value.

Higher inductance reduces the peak-to-peak ripple current. The trade off for high inductance value is the increase in inductor core size and series resistance, and the reduction in current handling capability. In general, select an inductance value L based on ripple current requirement:

$$L = \frac{V_{OUT} \times (V_{IN} - V_{OUT})}{V_{IN} f_{SW} I_{LOADMAX} K_{RIPPLE}} \quad (1)$$

Where V_{IN} is the input voltage, V_{OUT} is the output voltage, f_{SW} is the switching frequency, $I_{LOADMAX}$ is the maximum load current, and K_{RIPPLE} is the ripple factor. Typically, choose $K_{RIPPLE} = 30\%$ to correspond to the peak-to-peak ripple current being 30% of the maximum load current.

With a selected inductor value the peak-to-peak inductor current is estimated as:

$$I_{LPK-PK} = \frac{V_{OUT} \times (V_{IN} - V_{OUT})}{L \times V_{IN} \times f_{SW}} \quad (2)$$

The peak inductor current is estimated as:

$$I_{LPK} = I_{LOADMAX} + \frac{1}{2} I_{LPK-PK} \quad (3)$$

The selected inductor should not saturate at I_{LPK} . The maximum output current is calculated as:

$$I_{OUTMAX} = I_{LIM} - \frac{1}{2} I_{LPK-PK} \quad (4)$$

I_{LIM} is the internal current limit.

Input Capacitor

The input capacitor needs to be carefully selected to maintain sufficiently low ripple at the supply input of the converter. A low ESR capacitor is highly recommended. Since large current flows in and out of this capacitor during switching, its ESR also affects efficiency.

The input capacitance needs to be higher than $10\mu\text{F}$. The best choice is the ceramic type. However, low ESR tantalum or electrolytic types

may also be used provided that the RMS ripple current rating is higher than 50% of the output current. The input capacitor should be placed close to the IN and GND pins of the IC, with the shortest traces possible. In the case of tantalum or electrolytic types, a ceramic capacitor is recommended to parallel with tantalum or electrolytic capacitor, which should be placed right next to the IC.

Output Capacitor

The output capacitor also needs to have low ESR to keep low output voltage ripple. The output ripple voltage is:

$$V_{RIPPLE} = I_{LPK-PK} * R_{ESR} + \frac{I_{LPK-PK}}{8 * C_{OUT} * f_{SW}} \quad (5)$$

Where I_{OUTMAX} is the maximum output current, K_{RIPPLE} is the ripple factor, R_{ESR} is the ESR of the output capacitor, f_{SW} is the switching frequency, L is the inductor value, and C_{OUT} is the output capacitance. From the equation above, V_{RIPPLE} is the combination of ESR and real capacitance.

In the case of ceramic output capacitors, R_{ESR} is very small and does not contribute to the ripple. Therefore, a lower capacitance value can be used for ceramic type. In the case of tantalum or electrolytic capacitors, the ripple is dominated by R_{ESR} multiplied by the ripple current. In that case, the output capacitor is chosen to have sufficiently low ESR.

For ceramic output capacitor, typically choose a capacitance of about $22\mu\text{F}$. For tantalum or electrolytic capacitors, choose a capacitor with less than $50\text{m}\Omega$ ESR. When $330\mu\text{F}$ or $470\mu\text{F}$ electrolytic cap or tantalum cap is used, where ripple is dominantly caused by ESR, a $2.2\mu\text{F}$ ceramic in parallel is recommended.

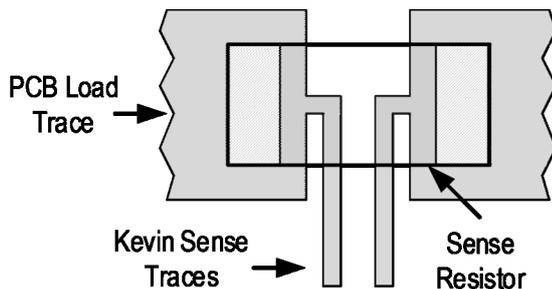

Rectifier Schottky Diode

Use a Schottky diode as the rectifier to conduct current when the High-Side Power Switch is off. The Schottky diode must have current rating higher than the maximum output current and a reverse voltage rating higher than the maximum input voltage. Further more, the low forward voltage Schottky is preferable for high efficiency and smoothly operation.

APPLICATIONS INFORMATION

Current Sense Resistors

The traces leading to and from the sense resistor can be significant error sources. With small value sense resistors, trace resistance shared with the load can cause significant errors. It is recommended to connect the sense resistor pads directly to the CSP and CSN pins using “Kelvin” or “4-wire” connection techniques as shown below.

Current Limit Setting

When the output current reaches current limit, the IC limits the peak switch current on a cycle-by-cycle basis. This reduces the output voltage to keep the output current at a constant value.

The following equation calculates the peak current limit. (6)

$$I_{Limit} (A) = \frac{66 mV}{R_{cs} (m\Omega)}$$

Where R_{cs} is current sense resistor.

The maximum output current is defined by

$$I_{LOADMAX} = I_{Limit} - \frac{1}{2} I_{LPK-PK} \quad (7)$$

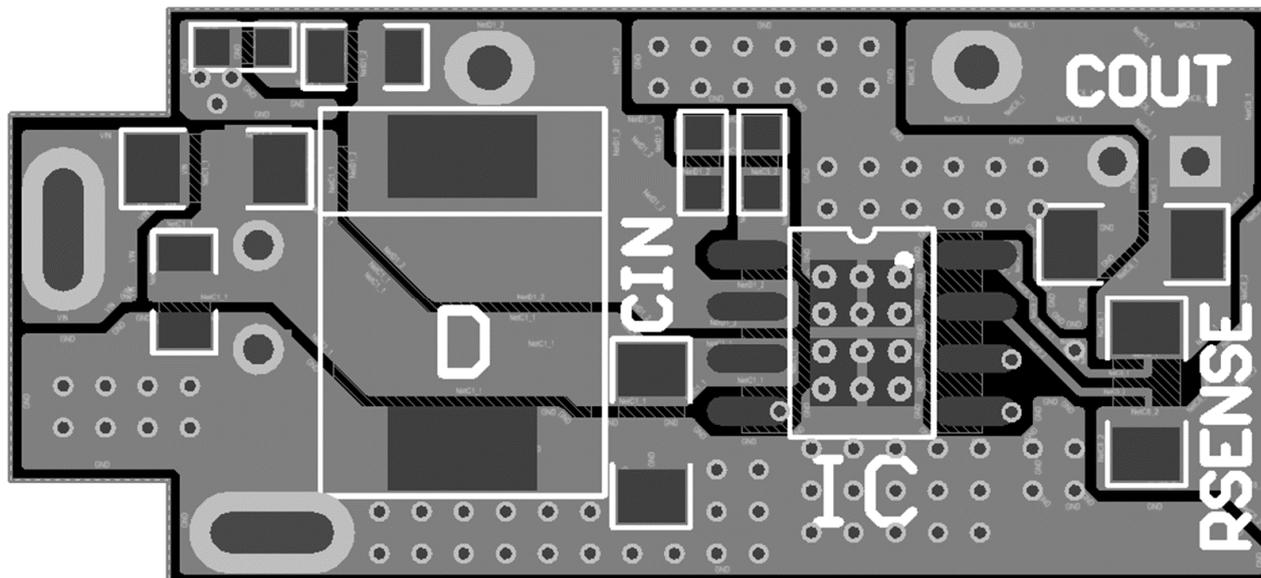

APPLICATIONS INFORMATION

PCB Layout Guidance

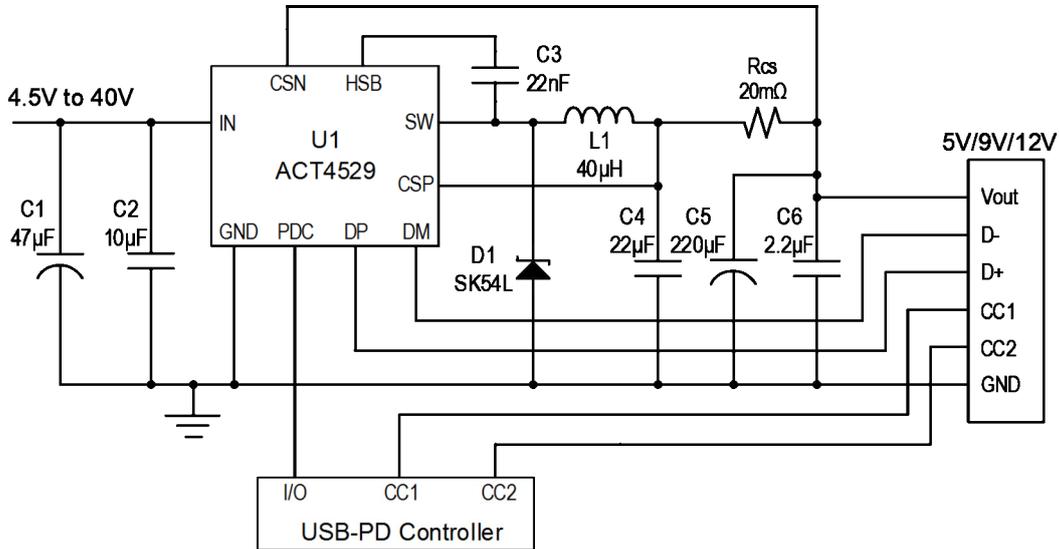

When laying out the printed circuit board, the following checklist should be used to ensure proper operation of the IC.

- 1) Arrange the power components to reduce the AC loop size consisting of C_{IN} , IN pin, SW pin, the Schottky diode, and GND
- 2) Place input decoupling ceramic capacitor C_{IN} as close to VIN pin as possible. The GND side of C_{IN} must be placed as close as possible to power GND on the top layer. The traces should be short and wide.
- 3) The high power loss components, e.g. the controller, Schottky diode, and the inductor should be placed carefully to make the thermal spread evenly on the board.
- 4) Schottky anode pad and IC exposed pad should be placed close to ground clips in CLA applications
- 5) Use “Kelvin” or “4-wire” connection techniques from the sense resistor pads directly to the CSP and CSN pins. The CSP and CSN traces should be in parallel to avoid interference.
- 6) Place multiple vias between top and bottom GND planes for best heat dissipation and noise immunity.
- 7) Use short traces connecting HSB- C_{HSB} -SW loop.
- 8) SW node is noisy, switching from V_{IN} to GND. Its size should be minimized and it should be isolated away from the rest of circuit for good EMI and low noise operation.

Example PCB Layout

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
