

# High-Efficiency Qi v1.1-Compliant Wireless Power Receiver and Battery Charger

Check for Samples: [bq51050B](#), [bq51051B](#)

## FEATURES

- **Single-Stage Wireless Power Receiver and Li-Ion/Li-Pol Battery Charger**
  - Combines Wireless Power Receiver, Rectifier and Battery Charger in a Single Small Package
  - 4.2V and 4.35V Output Voltage Options
  - Supports up to 1.5A Charging Current
  - 93% Peak AC-DC Charging Efficiency
- **Robust Architecture**
  - 20V Maximum Input Voltage Tolerance, with Input OV Protection Clamp
  - Thermal Shutdown and Over Current Protection
  - Temperature Monitoring and Fault Detection

- **Compatible with WPC v1.1 “Qi” Industry Standard**
- **Power Stage Output Tracks Rectifier and Battery Voltage to Ensure Maximum Efficiency Across the Full Charge Cycle**
- **Available in small WCSP and QFN packages**

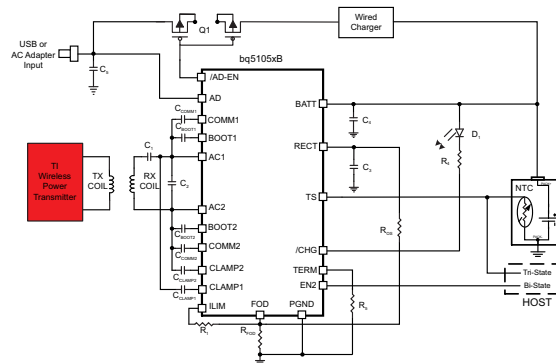

## APPLICATIONS

- **Battery Packs**
- **Cell Phones, Smart Phones**
- **Headsets**
- **Portable Media Players**
- **Other Hand-Held Devices**

## DESCRIPTION

The bq5105x is a high efficiency, wireless power receiver with Li-Ion/Li-Pol battery charge controller for portable applications. The bq5105x device provides efficient AC/DC power conversion, integrates digital controller required to comply with Qi v1.1 communication protocol and all necessary control algorithms needed for efficient and safe Li-Ion and Li-Pol battery charger. Together with bq500210 transmitter-side controller, the bq5105x enables a complete wireless power transfer system for direct battery charger solution. By utilizing near-field inductive power transfer, the receiver coil embedded in the portable device can pick up the power transmitted by transmitter coil. The AC signal from the receiver coil is then rectified and conditioned to apply power directly to the battery. Global feedback is established from the receiver to the transmitter in order to stabilize the power transfer process. This feedback is established by utilizing the Qi v1.1 communication protocol.

The bq5105x devices integrate a low-impedance synchronous rectifier, low-dropout regulator, digital control, charger controller, and accurate voltage and current loops in a single package. The entire power stage (rectifier and LDO) utilize low resistive N-MOSFET's (100mΩ typical R<sub>ds(on)</sub>) to ensures high efficiency and low power dissipation.

**Figure 1. Typical System Blocks Show bq5105xB Used as a Wireless Power Li-Ion/Li-Pol Battery Charger**

Note: Visit [ti.com/wirelesspower](http://ti.com/wirelesspower) for product details and design resources

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

**ORDERING INFORMATION**

PART NO.	IC MARKING	PACKAGE	ORDERING NUMBER (TAPE AND REEL)	QUANTITY
bq51050B	bq51050B	WCSP-28	bq51050BYFPR bq51050BYFPT	3000 250
	bq51050B	VQFN-20	bq51050BRHLR bq51050BRHLT	3000 250
bq51051B	bq51051B	WCSP-28	bq51051BYFPR bq51051BYFPT	3000 250
	bq51051B	VQFN-20	bq51051BRHLR bq51051BRHLT	3000 250

**AVAILABLE OPTIONS**

DEVICE	FUNCTION	V <sub>RECT-OVP</sub>	V <sub>RECT(REG)</sub>	V <sub>BAT(REG)</sub>	NTC MONITORING
bq51050B	4.2V Li-Ion Wireless Battery Charger	15V	Track	4.2V	JEITA
bq51051B	4.35V Li-Ion Wireless Battery Charger	15V	Track	4.35V	JEITA

**ABSOLUTE MAXIMUM RATINGS<sup>(1)(2)</sup>**

over operating free-air temperature range (unless otherwise noted)

		VALUES		UNITS
		MIN	MAX	
Input voltage	AC1, AC2, RECT, COMM1, COMM2, BAT(OUT), $\overline{\text{CHG}}$ , CLAMP1, CLAMP2	–0.3	20	V
	AD, AD-EN	–0.3	30	V
	BOOT1, BOOT2	–0.3	26	V
	EN2, TERM, FOD, TS-CTRL, ILIM	–0.3	7	V
Input current	AC1, AC2		2	A(RMS)
Output current	BAT(OUT)		1.5	A
Output sink current	$\overline{\text{CHG}}$		15	mA
	COMM1, COMM2		1.0	A
Junction temperature, T <sub>J</sub>		–40	150	°C
Storage temperature, T <sub>STG</sub>		–65	150	°C
ESD Rating	Human body model (HBM)(100pF, 1.5kΩ)		2	kV
	Charged device model (CDM)		500	V

- (1) Stresses beyond those listed under absolute maximum ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under recommended operating conditions is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- (2) All voltages are with respect to the VSS terminal, unless otherwise noted.

## THERMAL INFORMATION

THERMAL METRIC <sup>(1)</sup>		YFP	RHL	UNITS
		28-PINS	20-PINS	
$\theta_{JA}$	Junction-to-ambient thermal resistance	58.9	37.7	°C/W
$\theta_{JCTop}$	Junction-to-case (top) thermal resistance	0.2	35.5	
$\theta_{JB}$	Junction-to-board thermal resistance	9.1	13.6	
$\Psi_{JT}$	Junction-to-top characterization parameter	1.4	0.5	
$\Psi_{JB}$	Junction-to-board characterization parameter	8.9	13.5	
$\theta_{JCbott}$	Junction-to-case (bottom) thermal resistance	n/a	2.7	

(1) For more information about traditional and new thermal metrics, see the *IC Package Thermal Metrics* application report, [SPRA953](#).

## RECOMMENDED OPERATING CONDITIONS

over operating free-air temperature range (unless otherwise noted)

			MIN	MAX	UNIT
$V_{IN}$	Input voltage range	RECT	4.0	10.0	V
$I_{IN}$	Input current	RECT		1.5	A
$I_{BAT}$	BAT(output) current	BAT		1.5	A
$I_{AD-EN}$	Sink current	AD-EN		1	mA
$I_{COMM}$	COMM sink current	COMM		500	mA
$T_J$	Junction temperature		0	125	°C

## TYPICAL APPLICATION SCHEMATIC

Figure 2. bq5105x Used as a Wireless Power Receiver and Li-Ion/Li-Pol Battery Charger

## ELECTRICAL CHARACTERISTICS

Over junction temperature range  $0^{\circ}\text{C} \leq T_J \leq 125^{\circ}\text{C}$  and recommended supply voltage (unless otherwise noted)

PARAMETER		TEST CONDITIONS	MIN	TYP	MAX	UNIT
$V_{UVLO}$	Under-voltage lock-out	$V_{RECT}: 0\text{V} \rightarrow 3\text{V}$	2.6	2.7	2.8	V
$V_{HYS-UVLO}$	Hysteresis on UVLO	$V_{RECT}: 3\text{V} \rightarrow 2\text{V}$		250		mV
	Hysteresis on OVP	$V_{RECT}: 16\text{V} \rightarrow 5\text{V}$		150		mV
$V_{RECT}$	Input over-voltage threshold	$V_{RECT}: 5\text{V} \rightarrow 16\text{V}$	14.5	15	15.5	V
$V_{RECT-REG}^{(1)}$	$V_{RECT}$ regulation voltage			5.11		V
$I_{LOAD}$	$I_{LOAD}$ Hysteresis for dynamic $V_{RECT}$ thresholds as a % of $I_{LIM}$	$I_{LOAD}$ falling		5%		
$V_{TRACK}$	Tracking $V_{RECT}$ regulation above $V_{BAT}$	$V_{BAT} = 3.5\text{V}$ , $I_{BAT} \geq 500\text{mA}$		300		mV
$V_{RECT-REV}$	Rectifier reverse voltage protection at the BAT(output)	$V_{RECT-REV} = V_{BAT} - V_{RECT}$ , $V_{BAT} = 10\text{V}$		8.3	9	V
$V_{RECT-DPM}$	Rectifier under voltage protection, restricts $I_{BAT}$ at $V_{RECT-DPM}$		3	3.1	3.2	V
<b>QUIESCENT CURRENT</b>						
$I_{RECT}$	Active chip quiescent current consumption from RECT (in the prswireless power is present)	$I_{BAT} = 0$ , $0^{\circ}\text{C} \leq T_J \leq 85^{\circ}\text{C}$		8	10	mA
		$I_{BAT} = 300\text{mA}$ , $0^{\circ}\text{C} \leq T_J \leq 85^{\circ}\text{C}$		2	3	mA
$I_Q$	Quiescent current at the BAT when wireless power is disabled(Standby)	$V_{BAT} = 4.2\text{V}$ , $0^{\circ}\text{C} \leq T_J \leq 85^{\circ}\text{C}$		12	20	$\mu\text{A}$
<b>ILIM SHORT PROTECTION</b>						
$R_{ILIM-SHORT}$	Highest value of $I_{LIM}$ resistor considered a fault (short). Monitored for $I_{BAT} > 100\text{mA}$	$R_{ILIM}: 200\Omega \rightarrow 50\Omega$ . $I_{BAT}$ latches off, cycle power to reset			120	$\Omega$
$t_{DGL-Short}$	Deglint time transition from $I_{LIM}$ short to $I_{BAT}$ disable			1		ms
$I_{LIM\_SC}$	$I_{LIM-SHORT\_OK}$ enables the $I_{LIM}$ short comparator when $I_{BAT}$ is greater than this value	$I_{BAT}: 0 \rightarrow 200\text{mA}$	110	145	165	mA
$I_{LIM-SHORT\_OK}$ HYSTERESIS	Hysteresis for $I_{LIM-SHORT\_OK}$ comparator	$I_{BAT}: 200 \rightarrow 0\text{mA}$		30		mA
$I_{BAT-CL}$	Maximum output current limit	Maximum $I_{BAT}$ that will be delivered for 1 ms when $I_{LIM}$ is shorted			2.4	A
<b>BATTERY SHORT PROTECTION</b>						
$V_{BAT(SC)}$	BAT pin short-circuit detection/pre-charge threshold	$V_{BAT}: 3\text{V} \rightarrow 0.5\text{V}$ , no deglitch	0.75	0.8	0.85	V
$V_{BAT(SC)-HYS}$	$V_{BAT(SC)}$ hysteresis	$V_{BAT}: 0.5\text{V} \rightarrow 3\text{V}$		100		mV
$I_{BAT(SC)}$	Source current to BAT pin during short-circuit detection	$V_{BAT} = 0\text{V}$	12	18	22	mA
<b>PRECHARGE</b>						
$V_{LOWV}$	Pre-charge to fast charge transition threshold	$V_{BAT}: 2\text{V} \rightarrow 4\text{V}$	2.9	3.0	3.1	V
$K_{PRECHG}$	Pre-charge current as a percentage of $I_{BAT}$	$V_{LOWV} > V_{BAT} > V_{BAT(SC)}$ , $I_{BAT}: 50 - 300\text{mA}$	18%	20%	23%	
$t_{pre-charge}$	Pre-charge timeout	$V_{BAT} < V_{LOWV}$		30		min
$t_{DGL1(LOWV)}$	De-glitch time, pre- to fast-charge			25		ms
$t_{DGL2(LOWV)}$	De-glitch time, fast- to pre-charge			25		ms
<b>TIMERS</b>						
$T_{fast-charge}$	Fast-charge timer	$V_{LOWV} < V_{BAT} < V_{BAT(REG)}$		36000		sec
$T_{pre-charge}$	Pre-charge timer	$V_{BAT-SHORT} < V_{BAT} < V_{LOWV}$		1800		sec
<b>OUTPUT</b>						
$V_{OREG}$	Regulated BAT(output) voltage	$I_{BAT} = 1000\text{mA}$	bq51050B	4.16	4.2	4.22
			bq51051B	4.30	4.35	4.37
$V_{DO}$	Drop-out voltage, RECT to BAT	$I_{BAT} = 1\text{A}$		110	190	mV
$K_{LIM}$	Current programming factor	$R_{LIM} = K_{LIM} / I_{LIM}$	290	300	320	A $\Omega$
$I_{BAT}$	Battery charge current limit programming range				1500	mA
$I_{COMM-CL}$	Current limit during communication		330	390	420	mA

(1)  $V_{RECT(REG)}$  is over ridden when rectifier fold back mode is active ( $V_{RECT(REG)-TRACKING}$ ).

## ELECTRICAL CHARACTERISTICS (continued)

Over junction temperature range  $0^{\circ}\text{C} \leq T_J \leq 125^{\circ}\text{C}$  and recommended supply voltage (unless otherwise noted)

## PIN FUNCTIONS

NAME	WCSP	QFN	I/O	DESCRIPTION
AC1	B3, B4	2	I	Input power from receiver coil.
AC2	B1, B2	19	I	
BOOT1	C4	3	O	Bootstrap capacitors for driving the high-side FETs of the synchronous rectifier. Connect a 10nF ceramic capacitor from BOOT1 to AC1 and from BOOT2 to AC2.
BOOT2	C1	17	O	
RECT	C2, C3	18	O	Filter capacitor for the internal synchronous rectifier. Connect a ceramic capacitor to PGND. Depending on the power levels, the value may be 4.7μF to 22μF.
BAT	D1, D2, D3, D4	4	O	Output pin, delivers power to the battery while applying the internal charger profile.
COM1	E4	6	O	Open-drain output used to communicate with primary by varying reflected impedance. Connect through a capacitor to either AC1 or AC2 for capacitive load modulation (COMM2 must be connected to the alternate AC1 or AC2 pin). For resistive modulation connect COMM1 and COMM2 to RECT via a single resistor; connect through separate capacitors for capacitive load modulation.
COM2	E1	15	O	Open-drain output used to communicate with primary by varying reflected impedance. Connect through a capacitor to either AC1 or AC2 for capacitive load modulation (COMM1 must be connected to the alternate AC1 or AC2 pin). For resistive modulation connect COMM1 and COMM2 to RECT via a single resistor; connect through separate capacitors for capacitive load modulation.
CLMP1	E3	5	O	Open drain FETs which are utilized for a non-power dissipative over-voltage AC clamp protection. When the RECT voltage goes above 15 V, both switches will be turned on and the capacitors will act as a low impedance to protect the IC from damage. If used, Clamp1 is required to be connected to AC1, and Clamp2 is required to be connected to AC2 via 0.47μF capacitors.
CLMP2	E2	16	O	
PGND	A1, A2, A3, A4	1, 20	–	Power ground

### PIN FUNCTIONS (continued)

NAME	WCSP	QFN	I/O	DESCRIPTION
ILIM	G1	12	I/O	Programming pin for the battery charge current. Connect external resistor to VSS. Size $R_{ILIM}$ with the following equation: $R_{ILIM} = 300 / I_{ILIM}$ where $I_{ILIM}$ is the desired battery charge current.
AD	G4	9	I	Connect this pin to the wired adapter input. When a voltage is applied to this pin wireless charging is disabled and AD_EN is driven low. Connect to GND through a 1 $\mu$ F capacitor. If unused, capacitor is not required and should be grounded directly.
AD-EN	F3	8	O	Push-pull driver for external PFET when wired charging is active.
TS/CTRL	F1	13	I	Must be connected to ground via a NTC resistor. If an NTC function is not desired, connect to GND with a 10 k $\Omega$ resistor. As a CTRL pin pull to ground to send end power transfer (EPT) fault to the transmitter or pull-up to an internal rail (i.e. 1.8 V) to send EPT termination to the transmitter.
TERM	G3	10	I	Input that allows the termination threshold to be programmable. $K_{TERM} = 240 \Omega/\%$ . Set the termination threshold by applying the following equation $R_{TERM} = \%I_{ILIM} \times K_{TERM}$ where $\%I_{ILIM}$ is the desired percentage of fast charge current when termination should occur.
EN2	G2	11	I	EN2=0 enables wired charging source if AD input voltage is above 3.6V, wireless charging is enabled if AD input voltage is < 3.6V, EN2=1 disables wired charging source; wireless power is always enabled if present.
FOD	F2	14	I	Input for the rectified power measurement. Connect to GND with a 188 $\Omega$ resistor.
CHG	F4	7	O	Open-drain output – active when charging of the battery is active.

## PRINCIPLE OF OPERATION

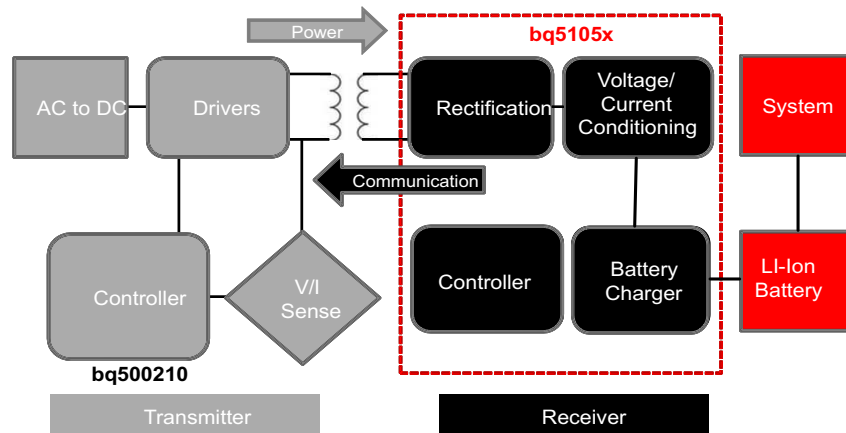

Figure 17. WPC Wireless Power Charging System Indicating the Functional Integration of the bq5105x

### A Brief Description of the Wireless System

A wireless system consists of a charging pad (primary, transmitter) and the secondary-side equipment. There are coils in the charging pad and in the secondary equipment which magnetically coupled to each other when the equipment is placed on the charging pad. Power is transferred from the primary to the secondary by transformer action between the coils. Control over the amount of power transferred is achieved by changing the frequency of the primary drive.

The secondary can communicate with the primary by changing the load seen by the primary. This load variation results in a change in the primary coil current, which is measured and interpreted by a processor in the charging pad. The communication is digital - packets are transferred from the secondary to the primary. Differential Bi-phase encoding is used for the packets. The bit rate is 2Kbits / second.

Various types of communication packets have been defined. These include identification and authentication packets, error packets, control packets, power usage packets, end of power packet and efficiency packets.

The primary coil is powered off most of the time. It wakes up occasionally to see if a secondary is present. If a secondary authenticates itself to the primary, the primary remains powered up. The secondary maintains full control over the power transfer using communication packets.

### Using the bq5105x as a Wireless Li-Ion/Li-Pol Battery Charger (With reference to [Figure 2](#))

[Figure 2](#) is the schematic of a system which uses the bq5105x as direct battery charger. When the system shown in [Figure 2](#) is placed on the charging pad (transmitter), the receiver coil couples to the magnetic flux generated by the coil in the charging pad which consequently induces a voltage in the receiver coil. The internal synchronous rectifier feeds this voltage to the RECT pin which has the filter capacitor C3.

The bq5105x identifies and authenticates itself to the primary using the COM pins by switching on and off the COM FETs and hence switching in and out  $C_{COMM}$ . If the authentication is successful, the transmitter will remain powered on. The bq5105x measures the voltage at the RECT pin, calculates the difference between the actual voltage and the desired voltage  $V_{RECT-REG}$  and sends back error packets to the primary. This process goes on until the RECT voltage settles at  $V_{RECT-REG}$ .

During power-up, the LDO is held off until the  $V_{RECT-REG}$  threshold converges. The voltage control loop ensures that the output (BAT) voltage is maintained at  $V_{BAT-REG}$  to power the system depends on the battery charge mode. The bq5105x continues to monitor the  $V_{RECT}$  and  $V_{BAT}$  and maintains sending error packets to the primary every 250ms. The bq5105x regulates the  $V_{RECT}$  voltage very close to battery voltage, this voltage tracking process minimizes the voltage difference across the internal LDO and maximize the charging efficiency. If a large transient occurs, the feedback to the primary speeds up to every 32ms in order to converge on an operating point in less time.

## Battery Charge Profile

The bq5105x charger monitors the battery current at all times and reduces the charge current when the system load requires current above the input current limit. The charge profile is shown in Figure 18.

Figure 18. Li-Ion Battery Charger Profile

This allows for proper charge termination and timer operation. Under normal battery charging conditions, the system voltage is approximately equal to the battery voltage, however if the battery is deeply discharged, the system voltage does not drop below 3.5V. This minimum system voltage support enables the system to run with a defective or absent battery pack and enables instant system turn-on even with a totally discharged battery or no battery.

The battery is charged in three phases: precharge, fast-charge constant current and constant voltage. In all charge phases, an internal control loop monitors the IC junction temperature and reduces the charge current if the internal temperature threshold is exceeded. Additionally, a voltage-based battery pack thermistor monitoring input (TS) is included that monitors battery temperature for safe charging. The TS function for bq5105x is JEITA compatible.

## Battery Charging Process

### Precharge Mode ( $V_{BAT} \leq V_{LOWV}$ )

The bq5105X enters pre-charge mode when  $V_{BAT} \leq V_{LOWV}$ . Upon entering precharge mode, battery charge current limit is set to  $I_{PRECHARGE}$ . During pre-charge mode, the charge current is regulated to 20% of the fast charge current ( $I_{BULK}$ ) setting.

If the battery is deeply discharged or shorted ( $V_{BAT} < V_{BAT-SHORT}$ ), the bq5105X applies  $I_{BAT-SHORT}$  current to bring the battery voltage up to acceptable charging levels. Once the battery rises above  $V_{BAT-SHORT}$ , the charge current is regulated to  $I_{PRECHARGE}$ .

Under normal conditions, the time spent in this pre-charge region is a very short percentage of the total charging time and this does not affect the overall charging efficiency for very long.

### Fast Charge Mode /Constant Voltage Mode

Once  $V_{BAT} > V_{LOWV}$ , the bq5105x enters fast charge mode (Current Regulation Phase) where charge current is regulated using the internal MOSFETs between RECT and BAT. Once the battery voltage charges up to  $V_{BAT-REG}$ , the bq5105x enters constant voltage (CV) phase and regulates battery voltage to  $V_{BAT(REG)}$  and the charging current is reduced.

Once the input current falls below the termination threshold ( $I_{TERM}$ ), the charger goes into high impedance.

### Battery Charge Current Setting Calculations

#### $R_{ILIM}$ Calculations

The bq5105x includes a means of providing hardware overcurrent protection by means of an analog current regulation loop. The hardware current limit provides an extra level of safety by clamping the maximum allowable output current (e.g., a current compliance). The calculation for the total  $R_{ILIM}$  resistance is as follows:

$$R_1 = \frac{300}{I_{BULK}} - R_{FOD} \quad R_{ILIM} = R_1 + R_{FOD} \quad (1)$$

Where  $I_{BULK}$  is the expected maximum battery charge current during fast charge mode and  $I_{BULK}$  is the hardware over current limit. When referring to the application diagram shown in [Figure 2](#),  $R_{ILIM}$  is the sum of  $R_{FOD}$  (188Ω) and the resistance from the  $I_{LIM}$  pin to GND).

#### Termination Calculations

The bq5105X includes a programmable upper termination threshold. This pin can be used to send the charge status 100% packet (CS100) to the transmitter in order to indicate a full charge status. The header for this packet is 0x05. Note that this packet does not turn off the transmitter and is only used as an informative indication of the mobile device's charge status. The upper termination threshold is calculated using [Equation 2](#):

$$R_{TERM} = K_{TERM} \times \%I_{BULK} \quad (2)$$

The  $K_{TERM}$  constant is specified in the datasheet as 240. The upper termination threshold is set as a percentage of the ILIM setting.

For example, if the ILIM resistor is set to 300 Ω the ILIM current will be 1A ( $300 \div 300$ ). If the upper termination threshold is desired to be 100 mA, this would be 10% of ILIM. The  $R_{TERM}$  resistor would then equal 2.4 kΩ ( $240 \times 10$ ).

### Battery-Charger Safety and JEITA Guidelines

The bq5105x continuously monitors battery temperature by measuring the voltage between the TS pin and GND. A negative temperature coefficient thermistor (NTC) and an external voltage divider typically develop this voltage. The bq5105x compares this voltage against its internal thresholds to determine if charging is allowed. To initiate a charge cycle, the voltage on TS pin must be within the  $V_{T1}$  to  $V_{T4}$  thresholds. If  $V_{TS}$  is outside of this range, the bq5105x suspends charge and waits until the battery temperature is within the  $V_{T1}$  to  $V_{T4}$  range.

If  $V_{TS}$  is within the range of  $V_{T1}$  and  $V_{T2}$ , the charge current is reduced to  $I_{BULK}/2$ . If  $V_{TS}$  is within the range of  $V_{T2}$  and  $V_{T3}$ , the maximum charge voltage regulation is 4.25V. If  $V_{TS}$  is within  $V_{T3}$  and  $V_{T4}$ , the maximum charge voltage regulation is reduced back to 4.10V and charge current is reduced to  $I_{BULK}/2$ . [Figure 19](#) summarizes the operation.

Figure 19. JEITA Compatible TS Profile

### Input over-voltage

If, for some condition (e.g., a change in position of the equipment on the charging pad), the rectifier voltage suddenly increases in potential, the voltage-control loop inside the bq5105x becomes active, and prevents the output from going beyond  $V_{BAT-REG}$ . The receiver then starts sending back error packets every 30ms until the RECT voltage comes back to an acceptable level, and then maintains the error communication every 250ms.

If the input voltage increases in potential beyond  $V_{OVP}$ , the IC switches off internal FET and tells the primary to bring the voltage back to  $V_{RECT(REG)}$ . In addition a proprietary voltage protection circuit is activated by means of  $C_{clamp1}$  and  $C_{clamp2}$  that protects the IC from voltages beyond the maximum rating of the IC (e.g., 20V).

### End Power Transfer Packet (WPC Header 0x02)

The WPC allows for a special command to terminate power transfer from the TX termed End Power Transfer (EPT) packet. The v1.1 specifies the below reasons and their responding data field value. The *Condition* column corresponds to the case where the bq5101x device will send this command.

REASON	VALUE	CONDITION
Unknown	0x00	$AD > 3.6V$
Charge Complete	0x01	$TS/CTRL = 1$
Internal Fault	0x02	$T_J > 150^{\circ}C$ or $R_{ILIM} < 100\Omega$
Over Temperature	0x03	$TS < V_{HOT}$ , $TS > V_{COLD}$ , or $TS/CTRL < 100mV$
Over Voltage	0x04	Not Sent
Over Current	0x05	Not Sent
Battery Failure	0x06	Not Sent
Reconfigure	0x07	Not Sent
No Response	0x08	$V_{RECT}$ target does not converge

## Status Outputs

The bq5105x provides one status output,  $\overline{\text{CHG}}$ . This output is an open-drain NMOS device that is rated to 20 V. The open-drain FET connected to the  $\overline{\text{CHG}}$  pin will be turned on whenever the output (BAT) of the charger is enabled. As a note, the output of the charger supply will not be enabled if the  $V_{\text{RECT(REG)}}$  does not converge at the no-load target voltage.

## Communication Modulator

The bq5105x provides two identical, integrated communication FETs which are connected to the pins COM1 and COM2. These FETs are used for modulating the secondary load current which allows bq5105x to communicate error control and configuration information to the transmitter. Figure 20 shows how the COMM pins can be used for resistive load modulation. Each COMM pin can handle at most a  $24\Omega$  communication resistor. Therefore, if a COMM resistor between  $12\Omega$  and  $24\Omega$  is required COM1 and COM2 pins must be connected in parallel. bq5105x does not support a COMM resistor less than  $12\Omega$ .

Figure 20. Resistive Load Modulation

In addition to resistive load modulation, the bq5105x is also capable of capacitive load modulation as shown in Figure 21. In this case, a capacitor is connected from COM1 to AC1 and from COM2 to AC2. When the COMM switches are closed there is effectively a  $22\text{ nF}$  capacitor connected between AC1 and AC2. Connecting a capacitor in between AC1 and AC2 modulates the impedance seen by the coil, which will be reflected in the primary as a change in current.

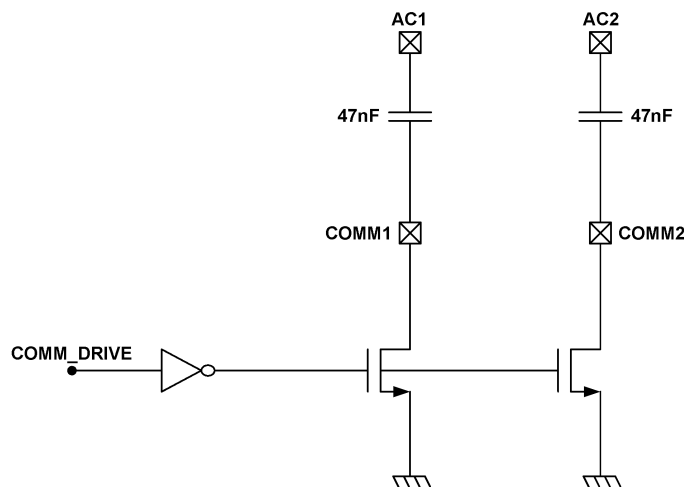

Figure 21. Capacitive Load Modulation

## Synchronous Rectification

The bq5105x provides an integrated, self-driven synchronous rectifier that enables high-efficiency AC to DC power conversion. The rectifier consists of an all NMOS H-Bridge driver where the back gates of the diodes are configured to be the rectifier when the synchronous rectifier is disabled. During the initial startup of the WPC system the synchronous rectifier is not enabled. At this operating point, the DC rectifier voltage is provided by the diode rectifier. Once VRECT is greater than UVLO, half synchronous mode will be enabled until the load current surpasses 140 mA. Above 140 mA the full synchronous rectifier stays enabled until the load current drops back below 100 mA where half synchronous mode is enabled instead.

## Internal Temperature Sense (TS)

The bq5105x includes a ratiometric battery temperature sense circuit. The temperature sense circuit has two ratiometric thresholds which represent a hot and cold condition. An external temperature sensor is recommended to provide safe operating conditions to the receiver product. This pin is best utilized when monitoring the surface that can be exposed to the end user.

The circuit in [Figure 22](#) allows for any NTC resistor to be used with the given V<sub>HOT</sub> and V<sub>COLD</sub> thresholds.

**Figure 22. NTC Circuit used for Safe Operation of the Wireless Receiver Power Supply**

The resistors R2 and R3 can be solved by resolving the system of equations at the desired temperature thresholds. The two equations are:

$$\%V_{\text{COLD}} = \frac{\left( \frac{R_3 R_{\text{NTC}}|_{\text{TCOLD}}}{R_3 + R_{\text{NTC}}|_{\text{TCOLD}}} \right)}{\left( \frac{R_3 R_{\text{NTC}}|_{\text{TCOLD}}}{R_3 + R_{\text{NTC}}|_{\text{TCOLD}}} \right) + R_2} \times 100 \quad (3)$$

$$\%V_{\text{HOT}} = \frac{\left( \frac{R_3 R_{\text{NTC}}|_{\text{THOT}}}{R_3 + R_{\text{NTC}}|_{\text{THOT}}} \right)}{\left( \frac{R_3 R_{\text{NTC}}|_{\text{THOT}}}{R_3 + R_{\text{NTC}}|_{\text{THOT}}} \right) + R_2} \times 100 \quad (4)$$

Where:

$$R_{\text{NTC}}|_{\text{TCOLD}} = R_0 e^{\beta \left( \frac{1}{\text{TCOLD}} - \frac{1}{T_0} \right)}$$

$$R_{\text{NTC}}|_{\text{THOT}} = R_0 e^{\beta \left( \frac{1}{\text{THOT}} - \frac{1}{T_0} \right)}$$

$T_{\text{COLD}}$  and  $T_{\text{HOT}}$  are the desired temperature thresholds in degrees Kelvin.  $R_0$  is the nominal resistance and  $\beta$  is the temperature coefficient of the NTC resistor. An example solution for part number ERT-JZEG103JA is:

$$R_2 = 7.81 \text{ k}\Omega$$

$$R_3 = 13.98 \text{ k}\Omega$$

Where,

$$T_{\text{COLD}} = 0^\circ\text{C}$$

$$T_{\text{HOT}} = 0^\circ\text{C}$$

$$\beta = 4500$$

$$R_0 = 10 \text{ k}\Omega$$

The plot of the percent  $V_{\text{TSB}}$  vs temperature is shown in Figure 23:

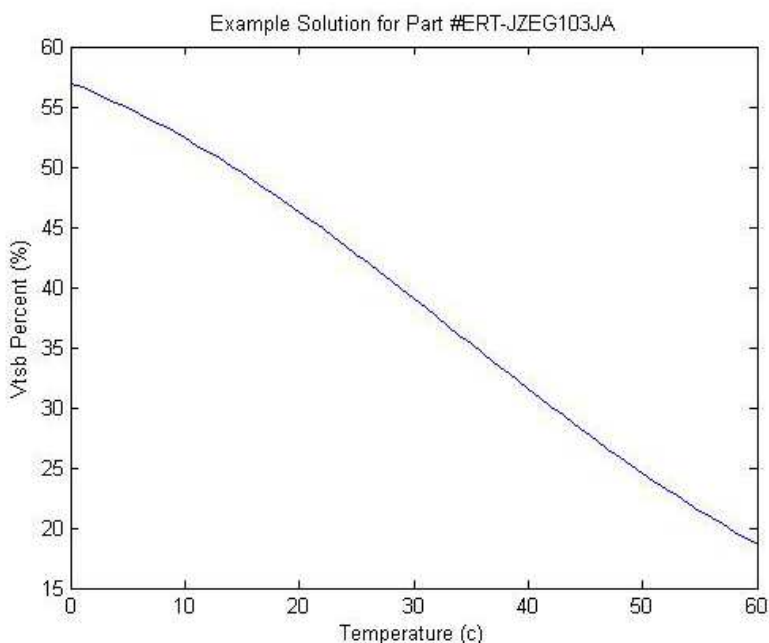

Figure 23. Example Solution for Panasonic Part # ERT-JZEG103JA

Figure 24 illustrates the periodic biasing scheme used for measuring the TS state. The TS\_READ signal enables the TS bias voltage for 25 ms. During this period the TS comparators are read (each comparator has a 10 ms deglitch) and appropriate action is taken based on the temperature measurement. After this 25 ms period has elapsed the TS\_READ signal goes low, which causes the TS-Bias pin to become high impedance. During the next 100 ms period the TS voltage is monitored and compared to 100 mV. If the TS voltage is greater than 100 mV then a secondary device is driving the TS/CTRL pin and a CTRL = '1' is detected.

Figure 24. Timing Diagram for TS Detection Circuit

**TS/CTRL Function:**

The TS-CTRL pin offers three functions:

1. NTC temperature monitoring,
2. Charge done indication,
3. Fault indication

When NTC is connected between TS/CTRL pin and the GND, the NTC is function is allowed to operate. If the TS/CTRL pin is pulled to the battery voltage, the Rx is shutdown with the indication of a charge complete condition. If the TS-CTRL pin is pulled to GND, The Rx is shutdown with the indication of a fault.

**Thermal Protection**

The bq5105x includes a thermal shutdown protection. If the die temperature reaches TJ(OFF), the LDO is shut off to prevent any further power dissipation.

**WPC 1.1 Compatibility**

The bq5105x is a WPC 1.1 compatible device, In order to enable a Power Transmitter to monitor the power loss across the interface as one of the possible methods to limit the temperature rise of Foreign Objects, the bq51050B reports its Received Power to the Power Transmitter. The Received Power equals the power that is available from the output of the Power Receiver plus any power that is lost in producing that output power. For example, the power loss includes (but is not limited to) the power loss in the Secondary Coil and series resonant capacitor, the power loss in the Shielding of the Power Receiver, the power loss in the rectifier, the power loss in any post-regulation stage, and the eddy current loss in metal components or contacts within the Power Receiver. In WPC1.1 specification, foreign object detection (FOD) is enforced, that means the bq51050B will send received power information with known accuracy to the transmitter.

WPC 1.1 defines Received Power is “the average amount of power that the Power Receiver receives through its Interface Surface, in the time window indicated in the Configuration Packet”.

A Receiver will be certified as WPC 1.1 only after meeting following requirement The DUT (Device Under Test) is tested on a Reference Transmitter whose transmitted power is calibrated, the receiver must send a received power such that:

$$0 < (\text{TX PWR})_{\text{REF}} - (\text{RX PWR out})_{\text{DUT}} < 250\text{mW}$$

This 250mW bias ensures that system will remain interoperable.

WPC 1.1 Transmitter will be tested to see if they can detect reference Foreign Objects with a Reference receiver. WPC1.1 Specification will allow much more accurate sensing of Foreign Objects.

A Transmitter can be certified as a WPC 1.1 only after meeting the following requirement- A Transmitter is tested to see if it can prevent some reference Foreign Objects (disc, coin, foil) from exceeding their threshold temperature (60°C, 80°C).

**Series and Parallel Resonant Capacitor Selection**

Shown in [Figure 2](#), the capacitors C1 (series) and C2 (parallel) make up the dual resonant circuit with the receiver coil. These two capacitors must be sized correctly per the WPC v1.1 specification. [Figure 25](#) illustrates the equivalent circuit of the dual resonant circuit:

Figure 25. Dual Resonant Circuit with the Receiver Coil

Section 4.2 (Power Receiver Design Requirements) in volume 1 of the WPC v1.1 specification highlights in detail the sizing requirements. To summarize, the receiver designer will be required take inductance measurements with a fixed test fixture. The test fixture is shown in Figure 26:

Figure 26. WPC v1.1 Receiver Coil Test Fixture for the Inductance Measurement  $L_s'$

The primary shield is to be 50 mm x 50 mm x 1 mm of Ferrite material PC44 from TDK Corp. The gap  $d_z$  is to be 3.4 mm. The receiver coil, as it will be placed in the final system (e.g. the back cover and battery must be included if the system calls for this), is to be placed on top of this surface and the inductance is to be measured at 1-V RMS and a frequency of 100 kHz. This measurement is termed  $L_s'$ . This measurement is termed  $L_s$  or the free-space inductance. Each capacitor can then be calculated using Equation 5:

$$C_1 = \frac{1}{(2\pi \times f_s)^2 \times L_s'}$$

$$C_2 = \frac{1}{(2\pi \times f_D)^2 \times \left( L_s - \frac{1}{C_1} \right)}$$
(5)

Where  $f_s$  is 100 kHz  $\pm 5\%$ –10% and  $f_D$  is 1 MHz  $\pm 10\%$ .  $C_1$  must be chosen first prior to calculating  $C_2$ . The quality factor must be greater than 77 and can be determined by Equation 6:

$$Q = \frac{2\pi \times f_D \times L_s}{R}$$
(6)

Where  $R$  is the DC resistance of the receiver coil. All other constants are defined above.

## REVISION HISTORY

Changes from Original (August 2012) to Revision A	Page
• Changed bq51051B from product preview to production data .....	2
• Changed Regulated BAT(output) voltage .....	4
• Changed Recharge threshold .....	5
• Deleted $I_{TS-Bias-Max}$ .....	5
• Changed $V_{COLD}$ to $V_{OC}$ and values .....	5
• Changed $V_{45C}$ values .....	5
• Changed $V_{60C}$ values .....	5
• Changed <a href="#">Figure 19</a> .....	16
Changes from Revision A (August 2012) to Revision B	Page
• Changed last features bullet from: 1.9 x 3.0mm WCSP and 4.5 x 3.5mm QFN Package Options to: Available in small WCSP and QFN packages .....	1
• Changed Figure 1 and changed caption from: Wireless Power Consortium (WPC or Qi) Inductive Power Charging System, to: Typical System blocks shows bq5105xB used as a Wireless Power Li-Ion/Li-Pol Battery Charger .....	1
• Added note: Visit <a href="http://ti.com/wirelesspower">ti.com/wirelesspower</a> for product details and design resources .....	1
Changes from Revision B (September 2012) to Revision C	Page
• First release of the full data sheet .....	1

(1) The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSOLETE:** TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

<sup>(4)</sup> Only one of markings shown within the brackets will appear on the physical device.

**Important Information and Disclaimer:** The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

PLASTIC QUAD FLATPACK NO-LEAD

- NOTES:
- All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M-1994.
  - This drawing is subject to change without notice.
  - QFN (Quad Flatpack No-Lead) Package configuration.
  - The package thermal pad must be soldered to the board for thermal and mechanical performance.
  - See the additional figure in the Product Data Sheet for details regarding the exposed thermal pad features and dimensions.

RHL (S-PVQFN-N20)

PLASTIC QUAD FLATPACK NO-LEAD

## THERMAL INFORMATION

This package incorporates an exposed thermal pad that is designed to be attached directly to an external heatsink. The thermal pad must be soldered directly to the printed circuit board (PCB). After soldering, the PCB can be used as a heatsink. In addition, through the use of thermal vias, the thermal pad can be attached directly to the appropriate copper plane shown in the electrical schematic for the device, or alternatively, can be attached to a special heatsink structure designed into the PCB. This design optimizes the heat transfer from the integrated circuit (IC).

For information on the Quad Flatpack No-Lead (QFN) package and its advantages, refer to Application Report, QFN/SON PCB Attachment, Texas Instruments Literature No. SLUA271. This document is available at [www.ti.com](http://www.ti.com).

The exposed thermal pad dimensions for this package are shown in the following illustration.

Bottom View

Exposed Thermal Pad Dimensions

NOTE: All linear dimensions are in millimeters

RHL (R-PVQFN-N20)

PLASTIC QUAD FLATPACK NO-LEAD

- NOTES:
- All linear dimensions are in millimeters.
  - This drawing is subject to change without notice.
  - Publication IPC-7351 is recommended for alternate designs.
  - This package is designed to be soldered to a thermal pad on the board. Refer to Application Note, Quad Flat-Pack Packages, Texas Instruments Literature No. SLUA271, and also the Product Data Sheets for specific thermal information, via requirements, and recommended board layout. These documents are available at [www.ti.com](http://www.ti.com) <<http://www.ti.com>>.
  - Laser cutting apertures with trapezoidal walls and also rounding corners will offer better paste release. Customers should contact their board assembly site for stencil design recommendations. Refer to IPC 7525 for stencil design considerations.
  - Customers should contact their board fabrication site for minimum solder mask web tolerances between signal pads.

- NOTES:
- A. All linear dimensions are in millimeters. Dimensioning and tolerancing per ASME Y14.5M–1994.
  - B. This drawing is subject to change without notice.
  - C. NanoFree™ package configuration.
  - D. To determine the exact package size of a particular device, refer to the device datasheet or contact a local TI representative.
  - E. This package contains Pb–free balls.

## IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.

### Products

Audio	<a href="http://www.ti.com/audio">www.ti.com/audio</a>
Amplifiers	<a href="http://amplifier.ti.com">amplifier.ti.com</a>
Data Converters	<a href="http://dataconverter.ti.com">dataconverter.ti.com</a>
DLP® Products	<a href="http://www.dlp.com">www.dlp.com</a>
DSP	<a href="http://dsp.ti.com">dsp.ti.com</a>
Clocks and Timers	<a href="http://www.ti.com/clocks">www.ti.com/clocks</a>
Interface	<a href="http://interface.ti.com">interface.ti.com</a>
Logic	<a href="http://logic.ti.com">logic.ti.com</a>

### TI E2E Community

[e2e.ti.com](http://e2e.ti.com)

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
