## 1.8V/2.5V/3.3V Crystal Input to 1:6 LVTTL/LVCMOS Clock Fanout Buffer with OE

### Description

The NB3H83905C is a 1.8 V, 2.5 V or 3.3 V  $V_{DD}$  core Crystal input to 1:6 LVTTL/LVCMOS fanout buffer with outputs powered by flexible 1.8 V, 2.5 V, or 3.3 V supply  $V_{DDO}$  (with  $V_{DD} \geq V_{DDO}$ ). The device accepts a fundamental Parallel Resonant crystal from 3 MHz to 40 MHz or a single-ended LVCMOS Clock from up to 100 MHz.

Two synchronous LVTTL/LVCMOS Enable lines permit independent control over outputs BCLK[0:4] and output BCLK5; enabling or disabling only when the output is in LOW state eliminating potential output glitching or runt pulse generation. When unused, leave floating open, pins will default to HIGH state.

The 6 outputs drive 50  $\Omega$  series or parallel terminated transmission lines. Parallel termination should be to  $1/2 V_{CC}$ . Series terminated lines can drive 2 loads each, or 12 lines total.

Fit, Form, and Function compatible with ICS83905 and PI6C10806.

**Figure 3. ENABLEx Control Timing Diagram**

The ENABLEx control inputs will synchronously enable or disable the selected output(s). This control detects the falling edge of the internal signal and asserts or de-asserts the output after 3 clock cycles. When ENABLEx is LOW, the outputs are disabled to a LOW state. When ENABLEx is HIGH, the outputs are enabled to toggle.

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

2. Maximum ratings applied to the device are individual stress limit values (not normal operating conditions) and not valid simultaneously. If stress limits are exceeded device functional operation is not implied, damage may occur and reliability may be affected.

## APPLICATION INFORMATION

### Crystal Input Interface

Figure 8 shows the NB3H83905C device crystal oscillator interface using a typical parallel resonant crystal. A parallel crystal with loading capacitance  $C_L = 18 \text{ pF}$  would use  $C1 = 32 \text{ pF}$  and  $C2 = 32 \text{ pF}$  as nominal values, assuming  $4 \text{ pF}$  of stray cap per line. The frequency accuracy and duty cycle skew can be fine tuned by adjusting the  $C1$  and  $C2$  values. For example, increasing the  $C1$  and  $C2$  values will reduce the operational frequency. Note  $R1$  is optional and may be  $0 \Omega$ .

**Figure 8. NB3H83905C Crystal Oscillator Interface**  
\*  $R1$  is optional

### Termination

NB3H83905C device output series termination may be used by locating a  $28 \Omega$  series resistor at the driver pin as shown in Figure 9. Alternatively, a Thevenin Parallel termination may be used by locating a  $100 \Omega$  pullup resistor to  $V_{DD}$  and a  $100 \Omega$  pullup resistor to GND at the receiver pin, instead of an  $R_s$  source termination resistor, Figure 10.

### Unused Input and Output Pins

All LVCMOS control pins have internal pull-ups or pull-downs; additional external resistors are not required (optionally  $1 \text{ k}\Omega$  resistors may be used). All unused LVCMOS outputs can be left floating with no trace attached.

### Bypass

The  $V_{DD}$  and  $V_{DDO}$  supply pins should be bypassed with both a  $10 \mu\text{F}$  and a  $0.1 \mu\text{F}$  cap from supply pins to GND.
