

Description

The MK74CB217 Buffalo™ is a monolithic CMOS high speed clock driver. It consists of two identical single input to eight low-skew output, non-inverting clock drivers. This eliminates concerns of part to part matching in many systems. The MK74CB217 is packaged in the tiny 28 pin SSOP, which uses the same board space as the narrow 16 pin SOIC. The inputs can be connected together for a 1 to 16 fanout buffer.

A quad 1 to 4, and PECL versions, are also available. Consult us for more details.

Features

- Tiny 28 pin SSOP (150 mil) package
- Dual one input to eight output clock drivers
- Outputs are skew matched to within 250 ps
- A outputs and B outputs matched to 250 ps
- 3.3 V or 5 V supply voltage
- Output Enable tri-states each bank of eight
- Clock speeds up to 200 MHz

Family of ICS Parts

The MK74CB217 Buffalo™ is designed to be used with ICS's clock synthesizer devices. The inputs of the Buffalo are matched to the outputs of ICS clock synthesizers. Consult ICS for applications support.

Suggested Layout

For simplicity, terminating resistors are not shown for the outputs, but should be placed as close to the device as possible. It is most critical to have the 0.1µF decoupling capacitors closest.

Notes:

1. Stresses beyond those listed under Absolute Maximum Ratings could cause permanent damage to the device. Prolonged exposure to levels above the operating limits but below the Absolute Maximums may affect device reliability.
2. Between any two A outputs, or any two B outputs, with equal loading.
3. Between any clock A output and any clock B output with INA connected to INB, and equal loading.
4. See discussion and graph of speed versus load.

Maximum Speed

The maximum speed at which the chip can operate is limited by power dissipation in the package. Graph 1 shows the operating frequency plotted against load capacitance per pin for a die temperature of 125°C. This is at VDD = 3.3 V, 70°C and with 33 Ω series termination resistors. The termination resistors are essential because they allow a large proportion of the total power to be dissipated outside the package. Reducing or eliminating the series termination will cause an increase in die temperature. It is not recommended to operate the chip at die temperatures greater than 125°C. Also note that the load capacitance per pin must include PC board parasitics such as trace capacitance.

If not all outputs of the chip are used, it is possible to operate the chip faster with larger loads. Consult ICS for your specific requirement.
