

Integrated Power Hybrid IC for
Appliance Motor Drive Applications

IRAM109-015SD

*MOTION*TM Series

H-Bridge 1A, 500V

Description

International Rectifier's IRAM109-015SD is a multi-chip Hybrid IC developed for low power appliance motor control applications such as Fans, Pumps, refrigerator compressors, etc. The compact Single in line (SIP-S) package minimizes PCB space.

Several built-in protection features such as temperature feedback, shoot through prevention, under voltage lockout, and shutdown input makes this a very robust solution. The internal shunt resistor saves board space and provides clean current feedback. The combination of highly efficient high voltage MOSFETs, the industry benchmark Half-Bridge HVIC driver (3.3V/5V input compatible) and thermally enhanced package makes this a highly competitive solution.

The bootstrapped power supplies for the high side drivers can be generated using internal bootstrap diodes eliminating the need for isolated power supplies. This feature reduces the component count, board space, and cost of the system.

Features

- Motor Power range 60~250W / 85~253 Vac.
- Integrated Gate Drivers and Bootstrap Diodes.
- Shut-Down input turns off both channels.
- Under-voltage lockout for all switches.
- Matched propagation delay.
- Schmitt-triggered input logic.
- Cross-conduction prevention logic.
- Low di/dt switching for better noise immunity.
- Internal Current Shunt.
- Internal thermistor for temperature feedback.

Typical Application Connection – IRAM109-015SD

Application Circuit Recommendation

1. Electrolytic bus capacitors should be mounted as close to the module bus terminals as possible to reduce ringing and EMI problems. Additional high frequency ceramic capacitor mounted close to the module pins will further improve performance.
2. In order to provide good decoupling between VCC-VSS and PO1,2-VB1,2 terminals, and the capacitors shown connected between these terminals should be located very close to the module pins. Additional high frequency capacitors, typically 0.1μF, are strongly recommended.
3. Value of the boot-strap capacitors depends upon the switching frequency. Their selection should be made based on IR design tip DN 98-2a, application note AN-1044, or Figure 12. Bootstrap capacitor value must be selected to limit the power dissipation of the internal resistor in series with V_{CC} (See maximum ratings Table on page 3).
4. **The case of the module is connected to the negative DC Bus and is NOT Isolated. It is recommended to provide isolation material between case and heat sink to avoid electrical shock.**
