### Application Notes

#### Input Fusing and Safety Considerations

The QSC150 series converters have no internal fuse. In order to achieve maximum safety and system protection, always use an input line fuse. We recommended a 30 A time delay fuse for nominal 24 V and 15 A time delay fuse for nominal 48 V. It is recommended that the circuit has a transient voltage suppressor diode (TVS) across the input terminals to protect the unit against surge or spike voltages and input reverse voltage (as shown). A suitable part would be SMCJ78A.

#### Output Voltage Adjustment

The Trim input permits the user to adjust the output voltage up or down 10%. This is accomplished by connecting an external resistor between the Trim pin and either the +Sense pin or the -Sense pin.

##### To Trim Down

Connecting an external resistor ( $R_D$ ) between the Trim pin and the Vout (+) (or +Sense) pin decreases the output voltage. The following table can be used to determine the required external resistor ( $R_D$ ) value to obtain a percentage output voltage change of  $\Delta\%$ .

Trim Down %	RD (k $\Omega$ )				
	5 V	12 V	24 V	28 V	48 V
1%	110.400	660.30	1671.00	1984.00	3106.00

10%	5.980	11.94	59.17	42.14	32.25

##### To Trim Up

Connecting an external resistor ( $R_U$ ) between the Trim pin and the Vout (-) (or -Sense) pin increases the output voltage. The following table can be used to determine the required external resistor ( $R_U$ ) value to obtain a percentage output voltage change of  $\Delta\%$ .

### Thermal Resistance Information

#### Airflow Derating Graph - Without Heatsink

Air Flow Rate	Typical Rca
Natural Convection 20 ft/min (0.1 m/s)	10.1 °C/W
100 ft/min (0.5 m/s)	8.0 °C/W
200 ft/min (1.0 m/s)	5.4 °C/W
300 ft/min (1.5 m/s)	4.4 °C/W
400 ft/min (2.0 m/s)	3.4 °C/W

#### Example (Without Heatsink)

To determine the minimum airflow necessary for a QS15048S12 operating at an input voltage of 48 V, an output current of 12.5 A, and a maximum ambient temperature of 40°C:

Determine Power dissipation (Pd):  $Pd = Pi - Po = Po(1-\eta)/\eta$ ,

$$Pd = 12V \times 12.5A \times (1-0.9)/0.9 = 16.67 \text{ Watts}$$

Where  $Pi$  = Input power,  $Po$  = Output Power and  $\eta$  = Efficiency

Determine airflow from airflow derating graph using data points for  $Pd=16.67 \text{ W}$  and  $Ta = 40 \text{ °C}$

Minimum airflow= 400 ft./min.

To check that the maximum case temp of 105 °C is not exceeded:

Maximum temperature rise is  
 $\Delta T = Pd \times Rca = 16.67 \times 3.4 = 56.65 \text{ °C}$ .

Maximum case temperature is

$$Tc = Ta + \Delta T = 96.68 \text{ °C} < 105 \text{ °C}$$

Where: Rca is the thermal resistance from case to ambient environment. Ta is ambient temperature and Tc is case temperature.
