

FEATURES

- **Ultralow Quiescent Current: 3.5 μ A Typ**
- **Open-Drain Outputs Typically Sink
Greater Than 20mA**
- Wide Supply Range: (LTC1841)
 - Single: 2V to 11V
 - Dual: \pm 1V to \pm 5.5V
- Input Voltage Range Includes the Negative Supply
- **Reference Output Drives 0.01 μ F Capacitor**
- **Adjustable Hysteresis**
- 12 μ s Propagation Delay with 10mV Overdrive
- No Current Spike When Switching

APPLICATIONS

- Battery-Powered System Monitoring
- Threshold Detectors
- Window Comparators
- Oscillator Circuits

DESCRIPTION

The LTC®1841/LTC1842/LTC1843 are ultralow power dual comparators with built-in reference (LTC1842/LTC1843). The comparators feature less than 5.7 μ A supply current over temperature, a 1.182V \pm 1% reference, programmable hysteresis and open-drain outputs that sink current. The reference output can drive a bypass capacitor of up to 0.01 μ F without oscillation.

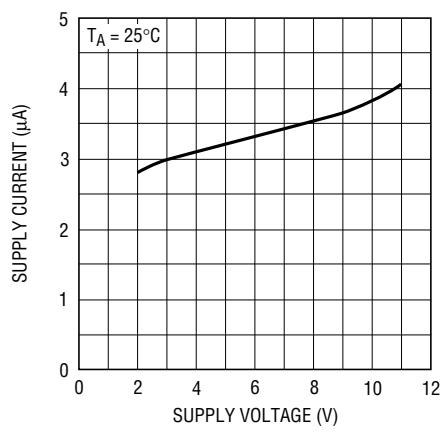

The LTC1841 operates from a single 2V to 11V supply or a dual \pm 1V to \pm 5.5V supply. The LTC1842/LTC1843 operate from a single 2.5V to 11V supply or a dual \pm 1.25V to \pm 5.5V supply. The LTC1842/LTC1843 hysteresis is easily programmed by using two resistors and the HYST pin. The comparators' input operates from the negative supply to within 1.3V of the positive supply. The comparators' output stage can typically sink greater than 20mA. By eliminating the cross-conduction current that normally happens when the comparators change logic states, power supply glitches are eliminated.

The LTC1841/LTC1842/LTC1843 are available in SO-8 packages.

PIN FUNCTIONS

OUT A (Pin 1): Comparator A Open-Drain Output. Output can typically sink greater than 20mA.

V⁻ (Pin 2): Negative Supply.

IN A⁺ (Pin 3): Noninverting Input of Comparator A. Input common mode range extends from V⁻ to V⁺ – 1.3V. Input current is typically 10pA at 25°C.

IN A⁻ (Pin 4) (LTC1841): Inverting Input of Comparator A. Input common mode range extends from V⁻ to V⁺ – 1.3V. Input current is typically 10pA at 25°C.

IN B⁺ (Pin 4) (LTC1842): Noninverting Input of Comparator B. Input common mode range extends from V⁻ to V⁺ – 1.3V. Input current is typically 10pA at 25°C.

IN B⁻ (Pin 4) (LTC1843): Inverting Input of Comparator B. Input common mode range extends from V⁻ to V⁺ – 1.3V. Input current is typically 10pA at 25°C.

IN B⁻ (Pin 5) (LTC1841): Inverting Input of Comparator B. Input common mode range extends from V⁻ to V⁺ – 1.3V. Input current is typically 10pA at 25°C.

HYST (Pin 5) (LTC1842/LTC1843): Hysteresis Input. Connect to REF if not used. Input voltage range is from V_{REF} to V_{REF} – 50mV.

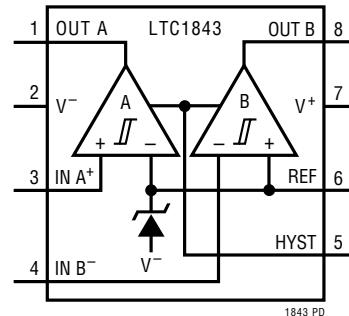

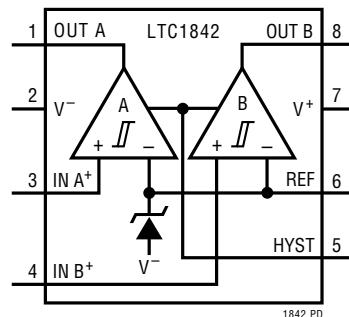

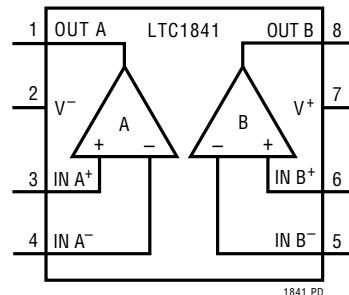

IN B⁺ (Pin 6) (LTC1841): Noninverting Input of Comparator B. Input common mode range extends from V⁻ to V⁺ – 1.3V. Input current is typically 10pA at 25°C.

REF (Pin 6) (LTC1842/LTC1843): Reference Output. 1.182V with respect to V⁻. Can typically source greater than 1mA and sink 10μA at 25°C. Can drive 0.01μF bypass capacitor without oscillation.

V⁺ (Pin 7) (LTC1841): Positive Supply. 2V to 11V.

V⁺ (Pin 7) (LTC1842/LTC1843): Positive Supply. 2.5V to 11V.

OUT B (Pin 8): Comparator B Open-Drain Output. Output can typically sink greater than 20mA.

APPLICATIONS INFORMATION

The LTC1841/LTC1842/LTC1843 are dual micropower comparators with a built-in 1.182V reference (LTC1842/LTC1843). Features include programmable hysteresis, wide supply voltage range (2V to 11V) and the ability for the reference to drive up to a 0.01 μ F capacitor without oscillation. The comparators' open-drain outputs can typically sink greater than 20mA and the supply current glitches that normally occur when switching logic states have been eliminated.

Power Supplies

The comparators operate from a single 2V to 11V (2.5V to 11V for LTC1842/LTC1843) or dual \pm 1V to \pm 5.5V supply (\pm 1.25V to \pm 5.5V for LTC1842/LTC1843). If the reference output is required to source more than 1mA or the supply source impedance is high, V⁺ should be bypassed with a 0.1 μ F capacitor.

Comparator Inputs

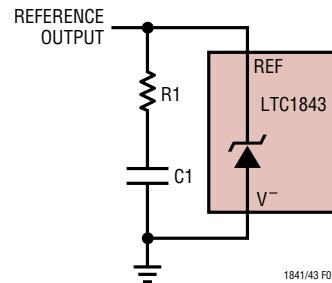

The comparators' input can swing from the negative supply V⁻ to within 1.3V (max) of the positive supply V⁺. The input can be forced 300mV below V⁻ or above V⁺ without damage and the typical input leakage current is only \pm 10pA.

Comparator Outputs

Each comparator output is an open-drain pull-down to V⁻ typically capable of sinking greater than 20mA. The low output leakage current while in three-state mode allows a high value pull-up resistor to be used. The open-drain outputs can be wire OR-ed or used in level shifting applications.

Voltage Reference

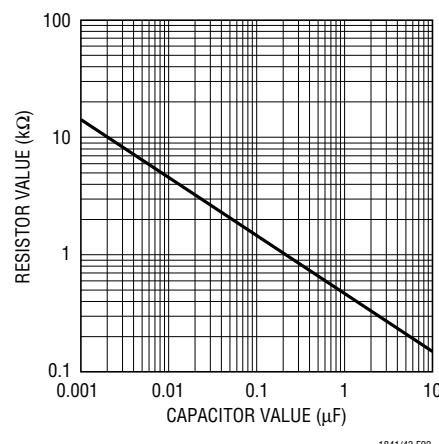

The internal bandgap reference has an output voltage of 1.182V referenced to V⁻. The reference accuracy is 1.5% from -40°C to 85°C . It can typically source greater than 1mA and sink up to 10 μ A with a 5V supply. The reference can drive a bypass capacitor of up to 0.01 μ F without oscillation. By inserting a series resistor, capacitance values up to 100 μ F can be used (Figure 1).

1841/43 F01

Figure 1. Damping the Reference Output

Figure 2 shows the resistor value required for different capacitor values to achieve critical damping. Bypassing the reference can help prevent false tripping of the comparators by preventing glitches on V⁺ or reference load transients from disturbing the reference output voltage.

1841/43 F02

Figure 2. Damping Resistance vs Bypass Capacitor Value

Figure 3 shows the bypassed reference output with a square wave applied to the V⁺ pin. Resistors R2 and R3 set a 10mV hysteresis voltage band while R1 damps the reference response. Note that the comparator output doesn't trip.

LTC1841/LTC1842/LTC1843

APPLICATIONS INFORMATION

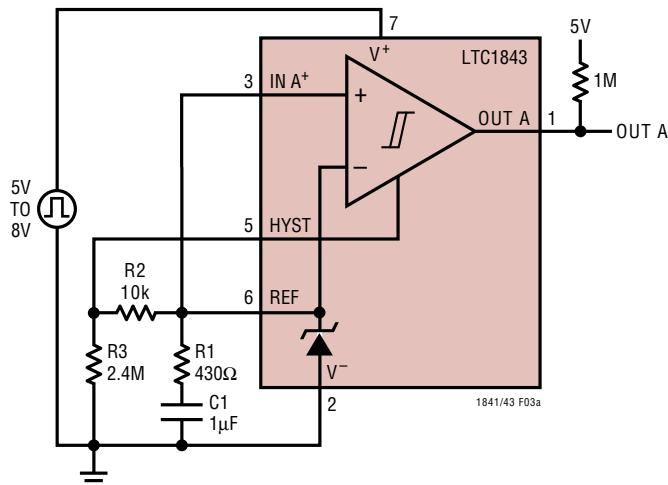

Figure 3a. Power Supply Transient Test Circuit

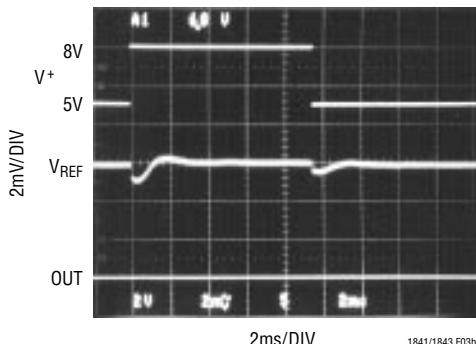

Figure 3b. Power Supply Transient Rejection

Hysteresis

Hysteresis can be added to the LTC1842/LTC1843 by connecting a resistor (R1) between the REF and HYST pins and a second resistor (R2) from HYST to V⁻ (Figure 4).

The difference between the upper and lower threshold voltages, or hysteresis voltage band (V_{HB}), is equal to twice the voltage difference between the REF and HYST pins.

As more hysteresis is added, the upper threshold increases the same amount as the low threshold decreases. The maximum voltage allowed between REF and HYST pins is 50mV, producing a maximum hysteresis voltage band of 100mV. The hysteresis band may vary by up to

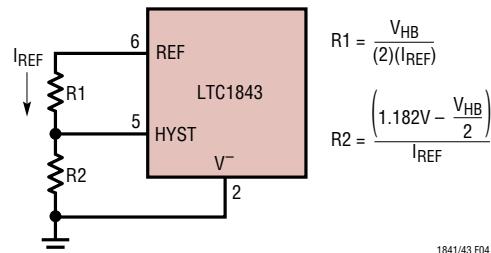

Figure 4. Programmable Hysteresis

15%. If hysteresis is not wanted, the HYST pin should be shorted to REF. Acceptable values for I_{REF} range are from 0.1μA to 5μA. If 2.4M is chosen for R₂, then the value of R₁ is equal to the value of V_{HB} .

Window Detector

The LTC1843 is ideal for use as a micropower window detector as shown in Figure 5. The values of R₁, R₂ and R₃ are selected for a 4.5V undervoltage threshold and a 5.5V overvoltage threshold. R₄ and R₅ set the hysteresis voltage. The following design procedure can be used to select the component values:

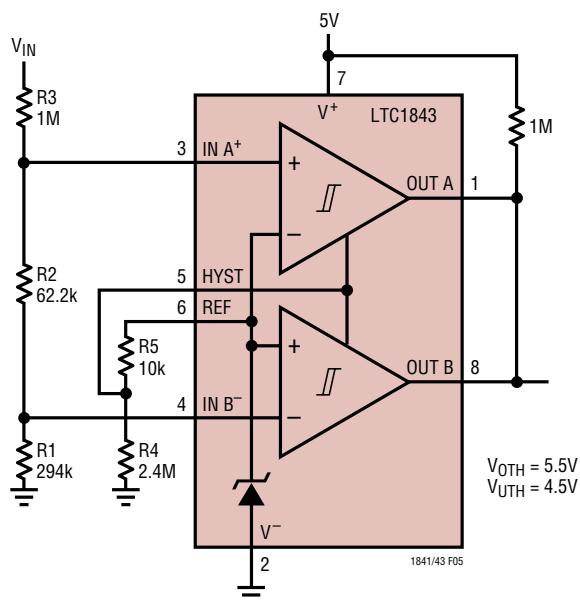

Figure 5. Dual Level Detector

APPLICATIONS INFORMATION

1. Choose the required hysteresis voltage band and calculate values for R4 and R5 according to the formulas in the hysteresis section. In this example, $\pm 5\text{mV}$ of hysteresis has been added at the comparator input ($V_H = V_{HB}/2$). Note that the hysteresis apparent at V_{IN} will be larger because of the input resistor divider.
2. Select R1. The leakage current into IN B⁻ is under 1nA so the current through R1 should exceed 100nA, to ensure threshold accuracy. R1 values up to about 10M can be used, but values in the 100k to 1M range are usually easier to deal with. In this example choose R1 = 294k.
3. Calculate R2 + R3. The overvoltage threshold should be set at 5.5V. The design equation is as follows:

$$\begin{aligned} R_2 + R_3 &= R_1 \left(\frac{V_{UTH}}{V_{REF} + V_H} - 1 \right) \\ &= 294\text{k} \left(\frac{5.5}{1.182 + 0.005} - 1 \right) \\ &= 1.068\text{M} \end{aligned}$$

4. Calculate R2. The undervoltage threshold should be set at 4.5V. The design equation is as follows:

$$\begin{aligned} R_2 &= (R_1 + R_2 + R_3) \frac{V_{REF} - V_H}{V_{LTH}} - R_1 \\ &= (294\text{k} + 1.068\text{M}) \frac{1.182 - 0.005}{4.5} - 294\text{k} \\ &= 62.2\text{k} \end{aligned}$$

Choose $R_2 = 61.9\text{k}$ (1% standard value)

5. Calculate R3:

$$\begin{aligned} R_3 &= (R_2 + R_3) - R_2 \\ &= 1.068\text{M} - 61.9\text{k} \\ &= 1.006\text{M} \end{aligned}$$

Choose $R_3 = 1\text{M}$ (1% standard value)

6. Verify the resistor values. The equations are as follows, evaluated for the above example:

Ovvoltage threshold:

$$\begin{aligned} V_{OTH} &= (V_{REF} + V_H) \frac{R_1 + R_2 + R_3}{R_1} \\ &= 5.474\text{V} \end{aligned}$$

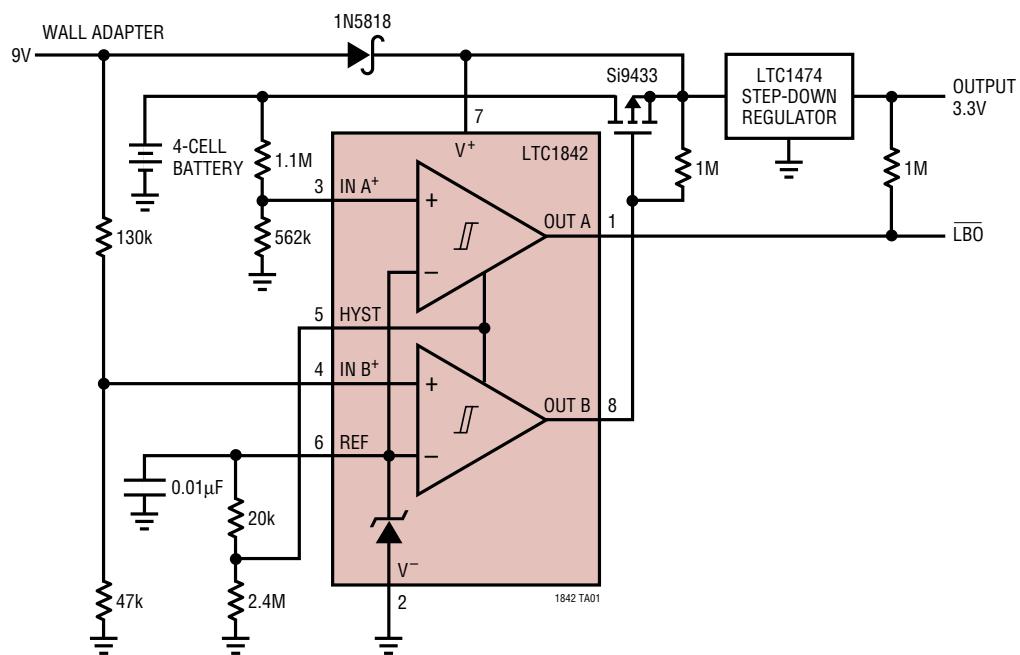

Undervoltage threshold:

$$\begin{aligned} V_{UTH} &= (V_{REF} - V_H) \frac{R_1 + R_2 + R_3}{R_1 + R_2} \\ &= 4.484\text{V} \end{aligned}$$

where the hysteresis voltage $V_H = (V_{REF}) \left(\frac{R_5}{R_4} \right)$

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помошь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помошь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
