FSTU6800
10-Bit Bus Switch with Precharged Outputs and −2V Undershoot Protection

General Description

The Fairchild Switch FSTU6800 provides 10-bits of high-speed CMOS TTL-compatible bus switching. The low on resistance of the switch allows inputs to be connected to outputs without adding propagation delay or generating additional ground bounce noise. Both the A Ports and the B Ports have "undershoot hardened" circuit protection to support an extended input range to 2.0V below ground. Fairchild's integrated Undershoot Hardened Circuit (UHC®) senses undershoot at the I/Os, and responds by preventing voltage differentials from developing and turning on the switch. The device also precharges the B Port to a selectable bias voltage (BiasV) to minimize live insertion noise.

The device is organized as a 10-bit switch with a bus enable ($\overline{OE}$) signal. When $\overline{OE}$ is LOW, the switch is ON and Port A is connected to Port B. When $\overline{OE}$ is HIGH, the switch is OPEN and the B Port is precharged to BiasV through an equivalent 10-kΩ resistor.

Features

- 4Ω switch connection between two ports.
- Undershoot Hardened to -2.0V.
- Soft enable turn-on to minimize bus-to-bus charge sharing during enable.
- Low I_{CC}.
- Zero bounce in flow-through mode.
- Output precharge to minimize live insertion noise.
- Control inputs compatible with TTL level.
- See Applications Note AN-5008 for details.

The Recommended Operating Conditions tables will define the conditions for actual device operation.

Note 2: The input and output negative voltage ratings may be exceeded if the input and output diode current ratings are observed.

Note 3: Unused control inputs must be held HIGH or LOW. They may not float.
