Functional Description

CY7C1041GN is high-performance CMOS fast static RAM Organized as 256K words by 16-bits.

Data writes are performed by asserting the Chip Enable ($\overline{CE}$) and Write Enable ($\overline{WE}$) inputs LOW, while providing the data on I/O_0 through I/O_{15} and address on A_0 through A_{17} pins. The Byte High Enable ($\overline{BHE}$) and Byte Low Enable ($\overline{BLE}$) inputs control write operations to the upper and lower bytes of the specified memory location. $\overline{BHE}$ controls I/O_8 through I/O_{15} and $\overline{BLE}$ controls I/O_0 through I/O_7.

Data reads are performed by asserting the Chip Enable ($\overline{CE}$) and Output Enable ($\overline{OE}$) inputs LOW and providing the required address on the address lines. Read data is accessible on the I/O lines (I/O_0 through I/O_{15}). Byte accesses can be performed by asserting the required byte enable signal ($\overline{BHE}$ or $\overline{BLE}$) to read either the upper byte or the lower byte of data from the specified address location.

All I/Os (I/O_0 through I/O_{15}) are placed in a high-impedance state during the following events:

- The device is deselected ($\overline{CE}$ HIGH)
- The control signals ($\overline{OE}$, $\overline{BLE}$, $\overline{BHE}$) are de-asserted

The logic block diagram is on page 2.

Notes

11. Test conditions assume a signal transition time (rise/fall) of 3 ns or less, timing reference levels of 1.5 V (for $V_{CC} \geq 3$ V) and $V_{CC}/2$ (for $V_{CC} < 3$ V), and input pulse levels of 0 to 3 V (for $V_{CC} \geq 3$ V) and 0 to V_{CC} (for $V_{CC} < 3$ V). Test conditions for the read cycle use output loading, as shown in part (a) of Figure 4 on page 6, unless specified otherwise.
12. For all dual chip enable devices, $\overline{CE}$ is the logical combination of $\overline{CE}_1$ and CE_2. When $\overline{CE}_1$ is LOW and CE_2 is HIGH, $\overline{CE}$ is LOW; when $\overline{CE}_1$ is HIGH or CE_2 is LOW, $\overline{CE}$ is HIGH.
13. t_{HZOE}, t_{HZCE}, t_{HZWE}, t_{HZBE}, t_{LZOE}, t_{LZCE}, t_{LZWE}, and t_{LZBE} are specified with a load capacitance of 5 pF, as shown in part (b) of Figure 4 on page 6. Transition is measured ±200 mV from steady state voltage.
14. These parameters are guaranteed by design and are not tested.
15. The internal write time of the memory is defined by the overlap of $\overline{WE}$ = V_{IL}, $\overline{CE}$ = V_{IL}, and $\overline{BHE}$ or $\overline{BLE}$ = V_{IL}. These signals must be LOW to initiate a write, and the HIGH transition of any of these signals can terminate the operation. The input data setup and hold timing should be referenced to the edge of the signal that terminates the write.
16. The minimum write cycle pulse width in Write Cycle No. 2 ($\overline{WE}$ Controlled, $\overline{OE}$ LOW) should be equal to sum of t_{SD} and t_{HZWE}.

Notes
17. The device is continuously selected, $\overline{OE}$ = V_{IL}, $\overline{CE}$ = V_{IL}, $\overline{BHE}$ or $\overline{BLE}$ or both = V_{IL}.
18. $\overline{WE}$ is HIGH for the read cycle.
19. Address valid prior to or coincident with $\overline{CE}$ LOW transition.

Notes

20. The internal write time of the memory is defined by the overlap of $\overline{WE}$ = V_{IL}, $\overline{CE}$ = V_{IL}, and $\overline{BHE}$ or $\overline{BLE}$ = V_{IL}. These signals must be LOW to initiate a write, and the HIGH transition of any of these signals can terminate the operation. The input data setup and hold timing should be referenced to the edge of the signal that terminates the write.
21. Data I/O is in HI-Z state if $\overline{CE}$ = V_{IH}, or $\overline{OE}$ = V_{IH}, or $\overline{BHE}$, and/or $\overline{BLE}$ = V_{IH}.
22. The minimum write cycle pulse width should be equal to sum of t_{SD} and t_{HZWE}.

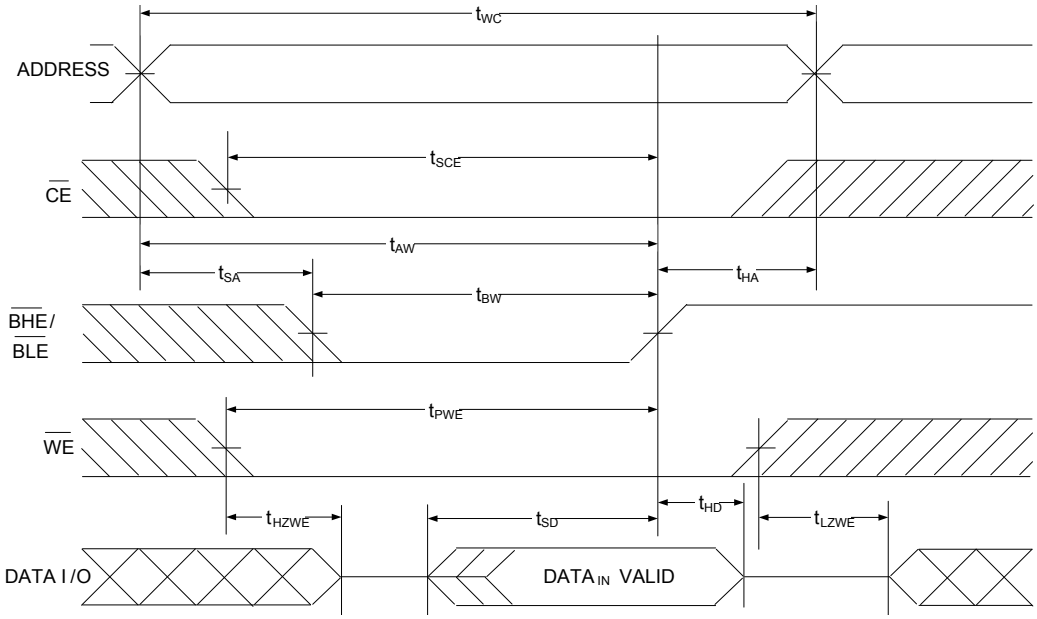

Figure 11. Write Cycle No. 4 ($\overline{WE}$ Controlled) [23, 24, 25]

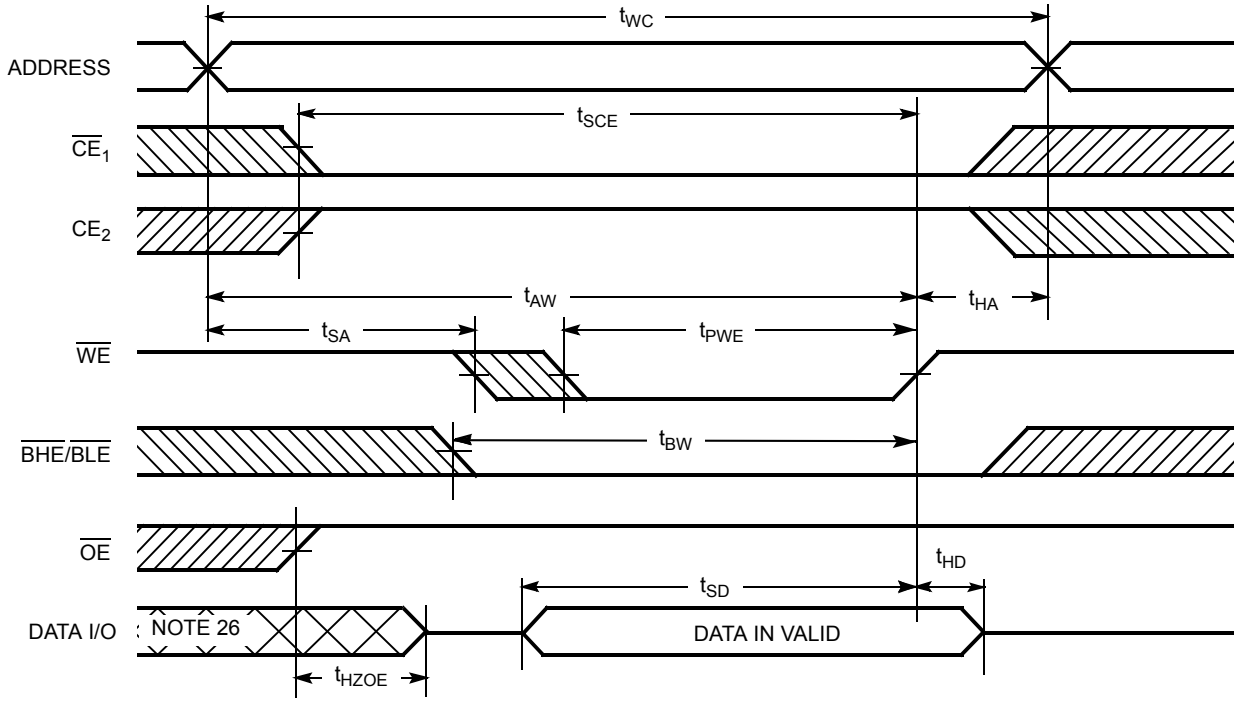

Notes

23. The internal write time of the memory is defined by the overlap of $\overline{WE}$ = V_{IL}, $\overline{CE}$ = V_{IL}, and $\overline{BHE}$ or $\overline{BLE}$ = V_{IL}. These signals must be LOW to initiate a write, and the HIGH transition of any of these signals can terminate the operation. The input data setup and hold timing should be referenced to the edge of the signal that terminates the write.
24. Data I/O is in HI-Z state if $\overline{CE}$ = V_{IH}, or $\overline{OE}$ = V_{IH}, or $\overline{BHE}$, and/or $\overline{BLE}$ = V_{IH}.
25. Data I/O is high impedance if $\overline{OE}$ = V_{IH}.
26. During this period the I/Os are in output state. Do not apply input signals.
