### Description

The MAAL-011134 is a high dynamic range, single stage MMIC LNA designed to operate from 700 MHz - 6 GHz assembled in a lead-free 2 mm 8-LD PDFN plastic package. This amplifier has ultra low noise figure, high gain and excellent linearity. In the 50  $\Omega$  environment and at 3 V, this device offers less than 0.5 dB noise figure at 2.4 GHz, with 24 dB of gain and over 33 dBm OIP3.

This low noise amplifier has an integrated active bias circuit allowing direct connection to 3 V or 5 V bias and minimizing variations over temperature and process. The bias current is set by an external resistor, so the user can customize the power consumption to fit the application.  $V_{BIAS}$  can be utilized as an enable pin to power the device up and down during operation.

This MAAL-011134 is ideally suited for 802.11 multimode applications at 2.4 GHz and 5.8 GHz. The high gain, low noise figure and fast switching speed make it ideal for 4 x 4 MIMO 802.11ac applications.

### Handling Procedures

Please observe the following precautions to avoid damage:

### Static Sensitivity

Gallium Arsenide Integrated Circuits are sensitive to electrostatic discharge (ESD) and can be damaged by static electricity. Proper ESD control techniques should be used when handling these devices.

## Biasing Options

The MAAL-011134 bias can be set in 2 different ways: using only  $V_{DD}$  or using separate  $V_{DD}$  and  $V_{BIAS}$  voltages. A separate  $V_{BIAS}$  voltage allows pin 5 ( $V_{BIAS}$ ) to be used as an enable pin to power the device up and down during operation.

For both bias methods select the value of  $R_{BIAS}$  to achieve the desired current based on the tables on page 4, and use DC blocks at pin 2 ( $RF_{IN}$ ) and pin 7 ( $RF_{OUT} / V_{DD}$ ).

### Biasing Option - $V_{DD}$ only

To use only  $V_{DD}$ , connect pin 7 ( $RF_{OUT} / V_{DD}$ ) to  $V_{DD}$  through an RF choke inductor and connect pin 5 ( $V_{BIAS}$ ) to  $V_{DD}$  through bias resistor  $R_{BIAS}$  as shown in Figure 1.

Figure 1

### Biasing Option - Separate $V_{DD}$ and $V_{BIAS}$ Voltages ( $V_{BIAS} \leq V_{DD}$ )

To use separate  $V_{DD}$  and  $V_{BIAS}$  voltages, connect pin 7 ( $RF_{OUT} / V_{DD}$ ) to  $V_{DD}$  through an RF choke inductor and connect pin 5 ( $V_{BIAS}$ ) to  $V_{BIAS}$  through bias resistor  $R_{BIAS}$  as shown in Figure 2. Typical current ( $I_{BIAS}$ ) draw for pin 5 ( $V_{BIAS}$ ) is 1.4 mA @  $V_{BIAS} = 3$  V and 1  $\mu$ A @  $V_{BIAS} = 0$  V. Typical current ( $I_{DD}$ ) draw for pin 7 ( $RF_{OUT} / V_{DD}$ ) is < 1  $\mu$ A @  $V_{BIAS} = 0$  V.
