1.2 Ordering Information

2 General

2.1 Introduction

The electrical specifications are preliminary and are initial evaluation. These specifications are not fully tested or guaranteed at this early stage of the product life cycle. Finalized specifications will be published after complete characterization and device qualifications have been completed.

2.2 Absolute maximum ratings

- Device will be functional down (and electrical specifications as per various datasheet parameters will be guaranteed) to the point where the LVD_IO_A_LO resets the device. When voltage drops below VLVD_IO_A_LO, device is reset.
- $V_{DD_HV_A}$, $V_{DD_HV_B}$ and $V_{DD_HV_C}$ are all independent supplies and can each be set to 3.3V or 5V. For example, if $V_{DD_HV_A} = 5V$, then $V_{DD_HV_B}$ and $V_{DD_HV_C}$ can both be 3.3V. However, care must be taken over ADC inputs that operate across the IO segments (Subject to Note 1).
- $V_{DD_HV_FLA}$ must be connected to $V_{DD_HV_A}$ when $V_{DD_HV_A} = 3.3V$
- PA3, PA7, PA10, PA11 and PE12 ADC_1 channels are coming from $V_{DD_HV_B}$ domain hence $V_{DD_HV_ADC1}$ should be within $\pm 100\text{ mV}$ of $V_{DD_HV_B}$ when these channels are used for ADC_1.

1. All monitors that are active at power-up will gate the power up recovery and prevent exit from POWERUP phase until the minimum level is crossed. These monitors can in some cases be masked during normal device operation, but when active will always generate a destructive reset.
2. Voltage monitors marked as non maskable are essential for device operation and hence cannot be masked.
3. There is no voltage monitoring on the VDD_HV_B and VDD_HV_C I/O segments. For applications requiring monitoring of these segments, either connect these to VDD_HV_A at the pcb level or monitor externally.
4. LVD_FLASH is active in low power modes to ensure that VDD_HV_FLA does not drop below 2.5V, so that Flash can exit from low power mode upon wakeup.

2.7 Electrostatic discharge (ESD) characteristics

Electrostatic discharges (a positive then a negative pulse separated by 1 second) are applied to the pins of each sample according to each pin combination. The sample size depends on the number of supply pins in the device (3 parts × (n + 1) supply pin). This test conforms to the AEC-Q100-002/-003/-011 standard.

NOTE

A device will be defined as a failure if after exposure to ESD pulses the device no longer meets the device specification requirements. Complete DC parametric and functional testing shall be performed per applicable device specification at room temperature followed by hot temperature, unless specified otherwise in the device specification.

2. The internally generated clock (known as AD_clk or ADCK) could be same as the peripheral clock or half of the peripheral clock based on register configuration in the ADC.
3. During the sample time the input capacitance C_S can be charged/discharged by the external source. The internal resistance of the analog source must allow the capacitance to reach its final voltage level within t_{sample} . After the end of the sample time t_{sample} , changes of the analog input voltage have no effect on the conversion result. Values for the sample clock t_{sample} depend on programming.
4. This parameter does not include the sample time t_{sample} , but only the time for determining the digital result and the time to load the result register with the conversion result.
5. Apart from t_{sample} and t_{conv} , few cycles are used up in ADC digital interface and hence the overall throughput from the ADC is lower.

4.2 Clocks and PLL interfaces modules

4.2.1 Main oscillator electrical characteristics

This device provides a driver for oscillator in pierce configuration with amplitude control. Controlling the amplitude allows a more sinusoidal oscillation, reducing in this way the EMI. Other benefits arises by reducing the power consumption. This Loop Controlled Pierce (LCP mode) requires good practices to reduce the stray capacitance of traces between crystal and MCU.

An operation in Full Swing Pierce (FSP mode), implemented by an inverter is also available in case of parasitic capacitances and cannot be reduced by using crystal with high equivalent series resistance. For this mode, a special care needs to be taken regarding the serial resistance used to avoid the crystal overdrive.

Other two modes called External (EXT Wave) and disable (OFF mode) are provided. For EXT Wave, the drive is disabled and an external source of clock within CMOS level based in analog oscillator supply can be used. When OFF, EXTAL is pulled down by 240 Kohms resistor and the feedback resistor remains active connecting XTAL through EXTAL by 1M resistor.

2. Typical program and erase times represent the median performance and assume nominal supply values and operation at 25 °C. Typical program and erase times may be used for throughput calculations.
3. Conditions: ≤ 150 cycles, nominal voltage.
4. Plant Programming times provide guidance for timeout limits used in the factory.

| $t_{ai32kseq}$ | Array Integrity time for sequential sequence on 32KB block. | — | — | 1024 x T_{period} x N_{read} | — |
| $t_{ai64kseq}$ | Array Integrity time for sequential sequence on 64KB block. | — | — | 2048 x T_{period} x N_{read} | — |
| $t_{ai256kseq}$ | Array Integrity time for sequential sequence on 256KB block. | — | — | 8192 x T_{period} x N_{read} | — |
| $t_{mr16kseq}$ | Margin Read time for sequential sequence on 16KB block. | 73.81 | — | 110.7 | μs |

| $t_{mr256kseq}$ | Margin Read time for sequential sequence on 256KB block. | 893.01 | — | 1,339.5 | μs |

1. Array Integrity times need to be calculated and is dependant on system frequency and number of clocks per read. The equation presented require T_{period} (which is the unit accurate period, thus for 200 MHz, T_{period} would equal $5e-9$) and N_{read} (which is the number of clocks required for read, including pipeline contribution. Thus for a read setup that requires 6 clocks to read with no pipeline, N_{read} would equal 6. For a read setup that requires 6 clocks to read, and has the address pipeline set to 2, N_{read} would equal 4 (or $6 - 2$)).
2. The units for Array Integrity are determined by the period of the system clock. If unit accurate period is used in the equation, the results of the equation are also unit accurate.

| Bus Hold from MLBCLK low | t_{mdzh} | 2 | — | ns | 3 |

1. The controller can shut off MLBCLK to place MediaLB in a low-power state. Depending on the time the clock is shut off, a runt pulse can occur on MLBCLK.
2. MLBCLK low/high time includes the pluse width variation.

USB electrical specifications

3. The MediaLB driver can release the MLBDAT/MLBSIG line as soon as MLBCLK is low; however, the logic state of the final driven bit on the line must remain on the bus for tmdzh. Therefore, coupling must be minimized while meeting the maximum load capacitance listed.
