1 Introduction

The i.MX 6Dual/6Quad processors are part of a growing family of multimedia-focused products that offer high performance processing and are optimized for lowest power consumption.

The i.MX 6Dual/6Quad processors feature advanced implementation of the quad Arm[®] Cortex[®]-A9 core, which operates at speeds up to 800 MHz. They include 2D and 3D graphics processors, 1080p video processing, and integrated power management. Each processor provides a 2 × 32-bit LPDDR2-800 memory interface and a number of other interfaces for connecting peripherals, such as WLAN, Bluetooth[®], GPS, hard drive, displays, and camera sensors.

The i.MX 6Dual/6Quad processors are specifically useful for applications such as the following:

- High-end mobile Internet devices (MID)
- High-end PDAs
- High-end portable media players (PMP) with HD video capability

Introduction

- Gaming consoles
- Portable navigation devices (PND)

The i.MX 6Dual/6Quad processors offers numerous advanced features, such as:

- Applications processors—The processors enhance the capabilities of high-tier portable applications by fulfilling the ever increasing MIPS needs of operating systems and games. The Dynamic Voltage and Frequency Scaling (DVFS) provides significant power reduction, allowing the device to run at lower voltage and frequency with sufficient MIPS for tasks such as audio decode.
- Multilevel memory system—The multilevel memory system of each processor is based on the L1 instruction and data caches, L2 cache, and internal and external memory. The processors support many types of external memory devices, including LPDDR2, NOR Flash, PSRAM, cellular RAM, NAND Flash (MLC and SLC), OneNAND™, and managed NAND, including eMMC up to rev 4.4/4.41.
- Smart speed technology—The processors have power management throughout the device that enables the rich suite of multimedia features and peripherals to consume minimum power in both active and various low power modes. Smart speed technology enables the designer to deliver a feature-rich product, requiring levels of power far lower than industry expectations.
- Dynamic voltage and frequency scaling—The processors improve the power efficiency of devices by scaling the voltage and frequency to optimize performance.
- Multimedia powerhouse—The multimedia performance of each processor is enhanced by a multilevel cache system, Neon® MPE (Media Processor Engine) co-processor, a multi-standard hardware video codec, 2 autonomous and independent image processing units (IPU), and a programmable smart DMA (SDMA) controller.
- Powerful graphics acceleration—Each processor provides three independent, integrated graphics processing units: an OpenGL® ES .0 3D graphics accelerator with four shaders (up to MTri/s and OpenCL support), 2D graphics accelerator, and dedicated OpenVG™ 1.1 accelerator.
- Interface flexibility—Each processor supports connections to a variety of interfaces: LCD controller for up to four displays (including parallel display, HDMI1.4, MIPI display, and LVDS display), dual CMOS sensor interface (parallel or through MIPI), high-speed USB on-the-go with PHY, high-speed USB host with PHY, multiple expansion card ports (high-speed MMC/SDIO host and other), 10/100/1000 Mbps Gigabit Ethernet controller, and a variety of other popular interfaces (such as UART, I²C, and I²S serial audio, SATA-II, and PCIe-II).
- Advanced security—The processors deliver hardware-enabled security features that enable secure e-commerce, digital rights management (DRM), information encryption, secure boot, and secure software downloads. The security features are discussed in detail in the i.MX 6Dual/6Quad security reference manual (IMX6DQ6SDL SRM).
- Integrated power management—The processors integrate linear regulators and internally generate voltage levels for different domains. This significantly simplifies system power management structure.

1.1 Ordering Information

Table 1 shows examples of orderable part numbers covered by this data sheet. This table does not include all possible orderable part numbers. The latest part numbers are available on nxp.com/imx6series. If your desired part number is not listed in the table, or you have questions about available parts, see nxp.com/imx6series or contact your NXP representative.

Figure 1 describes the part number nomenclature to identify the characteristics of the specific part number you have (for example, cores, frequency, temperature grade, fuse options, silicon revision). Figure 1 applies to the i.MX 6Dual/6Quad.

The two characteristics that identify which data sheet a specific part applies to are the part number series field and the temperature grade (junction) field:

- The i.MX 6Dual/6Quad Automotive and Infotainment Applications Processors data sheet (IMX6DQAECE) covers parts listed with “A (Automotive temp)”
- The i.MX 6Dual/6Quad Applications Processors for Consumer Products data sheet (IMX6DQCECE) covers parts listed with “D (Commercial temp)” or “E (Extended Commercial temp)”

Introduction

- The i.MX 6Dual/6Quad Applications Processors for Consumer Products data sheet (IMX6DQCPOPEC) covers parts listed with “D (Commercial temp)” or “E (Extended Commercial temp)” and that uses the Package-on-Package.
- The i.MX 6Dual/6Quad Applications Processors for Industrial Products data sheet (IMX6DQIEC) covers parts listed with “C (Industrial temp)”

Ensure that you have the right data sheet for your specific part by checking the temperature grade (junction) field and matching it to the right data sheet. If you have questions, see nxp.com/imx6series or contact your NXP representative.

1.2 Features

The i.MX 6Dual/6Quad processors are based on Arm Cortex-A9 MPCore platform, which has the following features:

- Arm Cortex-A9 MPCore 4xCPU processor (with TrustZone[®])
- The core configuration is symmetric, where each core includes:
 - 32 KByte L1 Instruction Cache
 - 32 KByte L1 Data Cache
 - Private Timer and Watchdog
 - Cortex-A9 NEON MPE (Media Processing Engine) Co-processor

The Arm Cortex-A9 MPCore complex includes:

- General Interrupt Controller (GIC) with 128 interrupt support
- Global Timer
- Snoop Control Unit (SCU)
- 1 MB unified I/D L2 cache, shared by two/four cores
- Two Master AXI (64-bit) bus interfaces output of L2 cache
- Frequency of the core (including Neon and L1 cache) as per [Table 6](#).
- NEON MPE coprocessor
 - SIMD Media Processing Architecture
 - NEON register file with 32x64-bit general-purpose registers
 - NEON Integer execute pipeline (ALU, Shift, MAC)
 - NEON dual, single-precision floating point execute pipeline (FADD, FMUL)
 - NEON load/store and permute pipeline

The SoC-level memory system consists of the following additional components:

- Boot ROM, including HAB (96 KB)
- Internal multimedia / shared, fast access RAM (OCRAM, 256 KB)
- Secure/non-secure RAM (16 KB)
- External memory interfaces:
 - 2 × 32-bit, LPDDR2-800 channels supporting DDR interleaving mode
 - 8-bit NAND-Flash, including support for Raw MLC/SLC, 2 KB, 4 KB, and 8 KB page size, BA-NAND, PBA-NAND, LBA-NAND, OneNAND™ and others. BCH ECC up to 40 bit.
 - 16/32-bit NOR Flash. All EIMv2 pins are muxed on other interfaces.
 - 16/32-bit PSRAM, Cellular RAM

Each i.MX 6Dual/6Quad processor enables the following interfaces to external devices (some of them are muxed and not available simultaneously):

- Hard Disk Drives—SATA II, 3.0 Gbps
- Displays—Total five interfaces available. Total raw pixel rate of all interfaces is up to 450 Mpixels/sec, 24 bpp. Up to four interfaces may be active in parallel.
 - One Parallel 24-bit display port, up to 225 Mpixels/sec (for example, WUXGA at 60 Hz or dual HD1080 and WXGA at 60 Hz)
 - LVDS serial ports—One port up to 170 Mpixels/sec (for example, WUXGA at 60 Hz) or two ports up to 85 MP/sec each
 - HDMI 1.4 port
 - MIPI/DSI, two lanes at 1 Gbps
- Camera sensors:
 - Parallel Camera port (up to 20 bit and up to 240 MHz peak)

- MIPI CSI-2 serial camera port, supporting up to 1000 Mbps/lane in 1/2/3-lane mode and up to 800 Mbps/lane in 4-lane mode. The CSI-2 Receiver core can manage one clock lane and up to four data lanes. Each i.MX 6Dual/6Quad processor has four lanes.
- Expansion cards:
 - Four MMC/SD/SDIO card ports all supporting:
 - 1-bit or 4-bit transfer mode specifications for SD and SDIO cards up to UHS-I SDR-104 mode (104 MB/s max)
 - 1-bit, 4-bit, or 8-bit transfer mode specifications for MMC cards up to 52 MHz in both SDR and DDR modes (104 MB/s max)
- USB:
 - One High Speed (HS) USB 2.0 OTG (Up to 480 Mbps), with integrated HS USB PHY
 - Three USB 2.0 (480 Mbps) hosts:
 - One HS host with integrated High Speed PHY
 - Two HS hosts with integrated High Speed Inter-Chip (HS-IC) USB PHY
- Expansion PCI Express port (PCIe) v2.0 one lane
 - PCI Express (Gen 2.0) dual mode complex, supporting Root complex operations and Endpoint operations. Uses x1 PHY configuration.
- Miscellaneous IPs and interfaces:
 - SSI block capable of supporting audio sample frequencies up to 192 kHz stereo inputs and outputs with I²S mode
 - ESAI is capable of supporting audio sample frequencies up to 260 kHz in I2S mode with 7.1 multi channel outputs
 - Five UARTs, up to 5.0 Mbps each:
 - Providing RS232 interface
 - Supporting 9-bit RS485 multidrop mode
 - One of the five UARTs (UART1) supports 8-wire while the other four support 4-wire. This is due to the SoC IOMUX limitation, because all UART IPs are identical.
 - Five eCSPI (Enhanced CSPI)
 - Three I2C, supporting 400 kbps
 - Gigabit Ethernet Controller (IEEE1588 compliant), 10/100/1000¹ Mbps
 - Four Pulse Width Modulators (PWM)
 - System JTAG Controller (SJC)
 - GPIO with interrupt capabilities
 - 8x8 Key Pad Port (KPP)
 - Sony Philips Digital Interconnect Format (SPDIF), Rx and Tx
 - Two Controller Area Network (FlexCAN), 1 Mbps each
 - Two Watchdog timers (WDOG)

1. The theoretical maximum performance of 1 Gbps ENET is limited to 470 Mbps (total for Tx and Rx) due to internal bus throughput limitations. The actual measured performance in optimized environment is up to 400 Mbps. For details, see the ERR004512 erratum in the i.MX 6Dual/6Quad errata document (IMX6DQCE).

— Audio MUX (AUDMUX)

The i.MX 6Dual/6Quad processors integrate advanced power management unit and controllers:

- Provide PMU, including LDO supplies, for on-chip resources
- Use Temperature Sensor for monitoring the die temperature
- Support DVFS techniques for low power modes
- Use Software State Retention and Power Gating for Arm and MPE
- Support various levels of system power modes
- Use flexible clock gating control scheme

The i.MX 6Dual/6Quad processors use dedicated hardware accelerators to meet the targeted multimedia performance. The use of hardware accelerators is a key factor in obtaining high performance at low power consumption numbers, while having the CPU core relatively free for performing other tasks.

The i.MX 6Dual/6Quad processors incorporate the following hardware accelerators:

- VPU—Video Processing Unit
- IPUv3H—Image Processing Unit version 3H (2 IPU)
- GPU3Dv4—3D Graphics Processing Unit (OpenGL ES .0)
- GPU2Dv2—2D Graphics Processing Unit (BitBlit)
- GPUVG—OpenVG 1.1 Graphics Processing Unit
- ASRC—Asynchronous Sample Rate Converter

Security functions are enabled and accelerated by the following hardware:

- Arm TrustZone including the TZ architecture (separation of interrupts, memory mapping, etc.)
- SJC—System JTAG Controller. Protecting JTAG from debug port attacks by regulating or blocking the access to the system debug features.
- CAAM—Cryptographic Acceleration and Assurance Module, containing 16 KB secure RAM and True and Pseudo Random Number Generator (NIST certified)
- SNVS—Secure Non-Volatile Storage, including Secure Real Time Clock
- CSU—Central Security Unit. Enhancement for the IC Identification Module (IIM). Will be configured during boot and by eFUSES and will determine the security level operation mode as well as the TZ policy.
- A-HAB—Advanced High Assurance Boot—HABv4 with the new embedded enhancements: SHA-256, 2048-bit RSA key, version control mechanism, warm boot, CSU, and TZ initialization.

1.3 Signal Naming Convention

Throughout this document, the updated signal names are used except where referenced as a ball name (such as the Functional Contact Assignments table, Ball Map table, and so on). A master list of the signal name changes is in the document, *IMX 6 Series Standardized Signal Name Map* (EB792). This list can be used to map the signal names used in older documentation to the new standardized naming conventions.

The signal names of the i.MX6 series of products are standardized to align the signal names within the family and across the documentation. Benefits of this standardization are as follows:

Introduction

- Signal names are unique within the scope of an SoC and within the series of products
- Searches will return all occurrences of the named signal
- Signal names are consistent between i.MX 6 series products implementing the same modules
- The module instance is incorporated into the signal name

This standardization applies only to signal names. The ball names are preserved to prevent the need to change schematics, BSDL models, IBIS models, and so on.

2 Architectural Overview

The following subsections provide an architectural overview of the i.MX 6Dual/6Quad processor system.

2.1 Block Diagram

Figure 2 shows the functional modules in the i.MX 6Dual/6Quad processor system.

Figure 2. i.MX 6Dual/6Quad Consumer Grade System Block Diagram

NOTE

The numbers in brackets indicate number of module instances. For example, PWM (4) indicates four separate PWM peripherals.

3 Modules List

The i.MX 6Dual/6Quad processors contain a variety of digital and analog modules. [Table 2](#) describes these modules in alphabetical order.

Table 2. i.MX 6Dual/6Quad Modules List

| Block Mnemonic | Block Name | Subsystem | Brief Description |
|-------------------|---|-----------------------------------|--|
| 512 x 8 Fuse Box | Electrical Fuse Array | Security | Electrical Fuse Array. Enables to setup Boot Modes, Security Levels, Security Keys, and many other system parameters. The i.MX 6Dual/6Quad processors consist of 512x8-bit fuse box accessible through OCOTP_CTRL interface. |
| APBH-DMA | NAND Flash and BCH ECC DMA Controller | System Control Peripherals | DMA controller used for GPMI2 operation. |
| Arm | Arm Platform | Arm | The Arm Cortex-A9 platform consists of 4x (four) Cortex-A9 cores version r2p10 and associated sub-blocks, including Level 2 Cache Controller, SCU (Snoop Control Unit), GIC (General Interrupt Controller), private timers, Watchdog, and CoreSight debug modules. |
| ASRC | Asynchronous Sample Rate Converter | Multimedia Peripherals | The Asynchronous Sample Rate Converter (ASRC) converts the sampling rate of a signal associated to an input clock into a signal associated to a different output clock. The ASRC supports concurrent sample rate conversion of up to 10 channels of about -120dB THD+N. The sample rate conversion of each channel is associated to a pair of incoming and outgoing sampling rates. The ASRC supports up to three sampling rate pairs. |
| AUDMUX | Digital Audio Mux | Multimedia Peripherals | The AUDMUX is a programmable interconnect for voice, audio, and synchronous data routing between host serial interfaces (for example, SSI1, SSI2, and SSI3) and peripheral serial interfaces (audio and voice codecs). The AUDMUX has seven ports with identical functionality and programming models. A desired connectivity is achieved by configuring two or more AUDMUX ports. |
| BCH40 | Binary-BCH ECC Processor | System Control Peripherals | The BCH40 module provides up to 40-bit ECC error correction for NAND Flash controller (GPMI). |
| CAAM | Cryptographic Accelerator and Assurance Module | Security | CAAM is a cryptographic accelerator and assurance module. CAAM implements several encryption and hashing functions, a run-time integrity checker, and a Pseudo Random Number Generator (PRNG). The pseudo random number generator is certified by Cryptographic Algorithm Validation Program (CAVP) of National Institute of Standards and Technology (NIST). Its DRBG validation number is 94 and its SHS validation number is 1455. CAAM also implements a Secure Memory mechanism. In i.MX 6Dual/6Quad processors, the security memory provided is 16 KB. |
| CCM GPC SRC | Clock Control Module, General Power Controller, System Reset Controller | Clocks, Resets, and Power Control | These modules are responsible for clock and reset distribution in the system, and also for the system power management. |

Table 2. i.MX 6Dual/6Quad Modules List (continued)

| Block Mnemonic | Block Name | Subsystem | Brief Description |
|---|-----------------------------------|----------------------------|--|
| CSI | MIPI CSI-2 Interface | Multimedia Peripherals | The CSI IP provides MIPI CSI-2 standard camera interface port. The CSI-2 interface supports up to 1 Gbps for up to 3 data lanes and up to 800 Mbps for 4 data lanes. |
| CSU | Central Security Unit | Security | The Central Security Unit (CSU) is responsible for setting comprehensive security policy within the i.MX 6Dual/6Quad platform. The Security Control Registers (SCR) of the CSU are set during boot time by the HAB and are locked to prevent further writing. |
| CTI-0 CTI-1 CTI-2 CTI-3 CTI-4 | Cross Trigger Interfaces | Debug / Trace | Cross Trigger Interfaces allows cross-triggering based on inputs from masters attached to CTIs. The CTI module is internal to the Cortex-A9 Core Platform. |
| CTM | Cross Trigger Matrix | Debug / Trace | Cross Trigger Matrix IP is used to route triggering events between CTIs. The CTM module is internal to the Cortex-A9 Core Platform. |
| DAP | Debug Access Port | System Control Peripherals | The DAP provides real-time access for the debugger without halting the core to: <ul style="list-style-type: none"> • System memory and peripheral registers • All debug configuration registers The DAP also provides debugger access to JTAG scan chains. The DAP module is internal to the Cortex-A9 Core Platform. |
| DCIC-0 DCIC-1 | Display Content Integrity Checker | Automotive IP | The DCIC provides integrity check on portion(s) of the display. Each i.MX 6Dual/6Quad processor has two such modules, one for each IPU. |
| DSI | MIPI DSI interface | Multimedia Peripherals | The MIPI DSI IP provides DSI standard display port interface. The DSI interface support 80 Mbps to 1 Gbps speed per data lane. |
| eCSPI1-5 | Configurable SPI | Connectivity Peripherals | Full-duplex enhanced Synchronous Serial Interface. It is configurable to support Master/Slave modes, four chip selects to support multiple peripherals. |
| ENET | Ethernet Controller | Connectivity Peripherals | The Ethernet Media Access Controller (MAC) is designed to support 10/100/1000 Mbps Ethernet/IEEE 802.3 networks. An external transceiver interface and transceiver function are required to complete the interface to the media. The i.MX 6Dual/6Quad processors also consist of hardware assist for IEEE 1588 standard. For details, see the ENET chapter of the i.MX 6Dual/6Quad reference manual (IMX6DQRM). <p>Note: The theoretical maximum performance of 1 Gbps ENET is limited to 470 Mbps (total for Tx and Rx) due to internal bus throughput limitations. The actual measured performance in optimized environment is up to 400 Mbps. For details, see the ERR004512 erratum in the i.MX 6Dual/6Quad errata document (IMX6DQCE).</p> |
| EPIT-1 EPIT-2 | Enhanced Periodic Interrupt Timer | Timer Peripherals | Each EPIT is a 32-bit “set and forget” timer that starts counting after the EPIT is enabled by software. It is capable of providing precise interrupts at regular intervals with minimal processor intervention. It has a 12-bit prescaler for division of input clock frequency to get the required time setting for the interrupts to occur, and counter value can be programmed on the fly. |

Table 2. i.MX 6Dual/6Quad Modules List (continued)

| Block Mnemonic | Block Name | Subsystem | Brief Description |
|--|-------------------------------------|----------------------------|---|
| ESAI | Enhanced Serial Audio Interface | Connectivity Peripherals | The Enhanced Serial Audio Interface (ESAI) provides a full-duplex serial port for serial communication with a variety of serial devices, including industry-standard codecs, SPDIF transceivers, and other processors. The ESAI consists of independent transmitter and receiver sections, each section with its own clock generator. All serial transfers are synchronized to a clock. Additional synchronization signals are used to delineate the word frames. The normal mode of operation is used to transfer data at a periodic rate, one word per period. The network mode is also intended for periodic transfers; however, it supports up to 32 words (time slots) per period. This mode can be used to build time division multiplexed (TDM) networks. In contrast, the on-demand mode is intended for non-periodic transfers of data and to transfer data serially at high speed when the data becomes available. The ESAI has 12 pins for data and clocking connection to external devices. |
| FlexCAN-1 FlexCAN-2 | Flexible Controller Area Network | Connectivity Peripherals | The CAN protocol was primarily, but not only, designed to be used as a vehicle serial data bus, meeting the specific requirements of this field: real-time processing, reliable operation in the Electromagnetic interference (EMI) environment of a vehicle, cost-effectiveness and required bandwidth. The FlexCAN module is a full implementation of the CAN protocol specification, Version 2.0 B, which supports both standard and extended message frames. |
| GPIO-1 GPIO-2 GPIO-3 GPIO-4 GPIO-5 GPIO-6 GPIO-7 | General Purpose I/O Modules | System Control Peripherals | Used for general purpose input/output to external devices. Each GPIO module supports 32 bits of I/O. |
| GPMI | General Purpose Media Interface | Connectivity Peripherals | The GPMI module supports up to 8x NAND devices. 40-bit ECC error correction for NAND Flash controller (GPMI2). The GPMI supports separate DMA channels per NAND device. |
| GPT | General Purpose Timer | Timer Peripherals | Each GPT is a 32-bit “free-running” or “set and forget” mode timer with programmable prescaler and compare and capture register. A timer counter value can be captured using an external event and can be configured to trigger a capture event on either the leading or trailing edges of an input pulse. When the timer is configured to operate in “set and forget” mode, it is capable of providing precise interrupts at regular intervals with minimal processor intervention. The counter has output compare logic to provide the status and interrupt at comparison. This timer can be configured to run either on an external clock or on an internal clock. |
| GPU2Dv2 | Graphics Processing Unit-2D, ver. 2 | Multimedia Peripherals | The GPU2Dv2 provides hardware acceleration for 2D graphics algorithms, such as Bit BLT, stretch BLT, and many other 2D functions. |
| GPU3Dv4 | Graphics Processing Unit-3D, ver. 4 | Multimedia Peripherals | The GPU2Dv4 provides hardware acceleration for 3D graphics algorithms with sufficient processor power to run desktop quality interactive graphics applications on displays up to HD1080 resolution. The GPU3D provides OpenGL ES 2.0, including extensions, OpenGL ES 1.1, and OpenVG 1.1 |

Table 2. i.MX 6Dual/6Quad Modules List (continued)

| Block Mnemonic | Block Name | Subsystem | Brief Description |
|--|---|----------------------------|--|
| GPUVGv2 | Vector Graphics Processing Unit, ver. 2 | Multimedia Peripherals | OpenVG graphics accelerator provides OpenVG 1.1 support as well as other accelerations, including Real-time hardware curve tessellation of lines, quadratic and cubic Bezier curves, 16x Line Anti-aliasing, and various Vector Drawing functions. |
| HDMI Tx | HDMI Tx interface | Multimedia Peripherals | The HDMI module provides HDMI standard interface port to an HDMI 1.4 compliant display. |
| HSI | MIPI HSI interface | Connectivity Peripherals | The MIPI HSI provides a standard MIPI interface to the applications processor. |
| I ² C-1 I ² C-2 I ² C-3 | I ² C Interface | Connectivity Peripherals | I ² C provide serial interface for external devices. Data rates of up to 400 kbps are supported. |
| IOMUXC | IOMUX Control | System Control Peripherals | This module enables flexible IO multiplexing. Each IO pad has default and several alternate functions. The alternate functions are software configurable. |
| IPUv3H-1 IPUv3H-2 | Image Processing Unit, ver. 3H | Multimedia Peripherals | IPUv3H enables connectivity to displays and video sources, relevant processing and synchronization and control capabilities, allowing autonomous operation. The IPUv3H supports concurrent output to two display ports and concurrent input from two camera ports, through the following interfaces: <ul style="list-style-type: none"> • Parallel Interfaces for both display and camera • Single/dual channel LVDS display interface • HDMI transmitter • MIPI/DSI transmitter • MIPI/CSI-2 receiver The processing includes: <ul style="list-style-type: none"> • Image conversions: resizing, rotation, inversion, and color space conversion • A high-quality de-interlacing filter • Video/graphics combining • Image enhancement: color adjustment and gamut mapping, gamma correction, and contrast enhancement • Support for display backlight reduction |
| KPP | Key Pad Port | Connectivity Peripherals | KPP Supports 8 x 8 external key pad matrix. KPP features are: <ul style="list-style-type: none"> • Open drain design • Glitch suppression circuit design • Multiple keys detection • Standby key press detection |
| LDB | LVDS Display Bridge | Connectivity Peripherals | LVDS Display Bridge is used to connect the IPU (Image Processing Unit) to External LVDS Display Interface. LDB supports two channels; each channel has following signals: <ul style="list-style-type: none"> • One clock pair • Four data pairs Each signal pair contains LVDS special differential pad (PadP, PadM). |
| MMDC | Multi-Mode DDR Controller | Connectivity Peripherals | DDR Controller has the following features: <ul style="list-style-type: none"> • Supports dual x32 for LPDDR2-800 • Supports up to 4 GByte DDR memory space |

Table 2. i.MX 6Dual/6Quad Modules List (continued)

| Block Mnemonic | Block Name | Subsystem | Brief Description |
|----------------------------------|----------------------------|--------------------------|--|
| OCOTP_CTRL | OTP Controller | Security | The On-Chip OTP controller (OCOTP_CTRL) provides an interface for reading, programming, and/or overriding identification and control information stored in on-chip fuse elements. The module supports electrically-programmable poly fuses (eFUSEs). The OCOTP_CTRL also provides a set of volatile software-accessible signals that can be used for software control of hardware elements, not requiring non-volatility. The OCOTP_CTRL provides the primary user-visible mechanism for interfacing with on-chip fuse elements. Among the uses for the fuses are unique chip identifiers, mask revision numbers, cryptographic keys, JTAG secure mode, boot characteristics, and various control signals, requiring permanent non-volatility. |
| OCRAM | On-Chip Memory Controller | Data Path | The On-Chip Memory controller (OCRAM) module is designed as an interface between system's AXI bus and internal (on-chip) SRAM memory module. In i.MX 6Dual/6Quad processors, the OCRM is used for controlling the 256 KB multimedia RAM through a 64-bit AXI bus. |
| OSC 32 kHz | OSC 32 kHz | Clocking | Generates 32.768 kHz clock from an external crystal. |
| PCIe | PCI Express 2.0 | Connectivity Peripherals | The PCIe IP provides PCI Express Gen 2.0 functionality. |
| PMU | Power-Management Functions | Data Path | Integrated power management unit. Used to provide power to various SoC domains. |
| PWM-1 PWM-2 PWM-3 PWM-4 | Pulse Width Modulation | Connectivity Peripherals | The pulse-width modulator (PWM) has a 16-bit counter and is optimized to generate sound from stored sample audio images and it can also generate tones. It uses 16-bit resolution and a 4x16 data FIFO to generate sound. |
| RAM 16 KB | Secure/non-secure RAM | Secured Internal Memory | Secure/non-secure Internal RAM, interfaced through the CAAM. |
| RAM 256 KB | Internal RAM | Internal Memory | Internal RAM, which is accessed through OCRM memory controllers. |
| ROM 96 KB | Boot ROM | Internal Memory | Supports secure and regular Boot Modes. Includes read protection on 4K region for content protection |
| ROMCP | ROM Controller with Patch | Data Path | ROM Controller with ROM Patch support |
| SATA | Serial ATA | Connectivity Peripherals | The SATA controller and PHY is a complete mixed-signal IP solution designed to implement SATA II, 3.0 Gbps HDD connectivity. |

| SDMA | Smart Direct Memory Access | System Control Peripherals | <p>The SDMA is multi-channel flexible DMA engine. It helps in maximizing system performance by off-loading the various cores in dynamic data routing. It has the following features:</p> <ul style="list-style-type: none"> • Powered by a 16-bit Instruction-Set micro-RISC engine • Multi-channel DMA supporting up to 32 time-division multiplexed DMA channels • 48 events with total flexibility to trigger any combination of channels • Memory accesses including linear, FIFO, and 2D addressing • Shared peripherals between Arm and SDMA • Very fast context-switching with 2-level priority based preemptive multi-tasking • DMA units with auto-flush and prefetch capability • Flexible address management for DMA transfers (increment, decrement, and no address changes on source and destination address) • DMA ports can handle unit-directional and bi-directional flows (copy mode) • Up to 8-word buffer for configurable burst transfers • Support of byte-swapping and CRC calculations • Library of Scripts and API is available |
| SJC | System JTAG Controller | System Control Peripherals | <p>The SJC provides JTAG interface, which complies with JTAG TAP standards, to internal logic. The i.MX 6Dual/6Quad processors use JTAG port for production, testing, and system debugging. In addition, the SJC provides BSR (Boundary Scan Register) standard support, which complies with IEEE1149.1 and IEEE1149.6 standards.</p> <p>The JTAG port must be accessible during platform initial laboratory bring-up, for manufacturing tests and troubleshooting, as well as for software debugging by authorized entities. The i.MX 6Dual/6Quad SJC incorporates three security modes for protecting against unauthorized accesses. Modes are selected through eFUSE configuration.</p> |
| SNVS | Secure Non-Volatile Storage | Security | Secure Non-Volatile Storage, including Secure Real Time Clock, Security State Machine, Master Key Control, and Violation/Tamper Detection and reporting. |
| SPDIF | Sony Philips Digital Interconnect Format | Multimedia Peripherals | A standard audio file transfer format, developed jointly by the Sony and Phillips corporations. It supports Transmitter and Receiver functionality. |
| SSI-1 SSI-2 SSI-3 | I2S/SSI/AC97 Interface | Connectivity Peripherals | <p>The SSI is a full-duplex synchronous interface, which is used on the processor to provide connectivity with off-chip audio peripherals. The SSI supports a wide variety of protocols (SSI normal, SSI network, I2S, and AC-97), bit depths (up to 24 bits per word), and clock / frame sync options. The SSI has two pairs of 8x24 FIFOs and hardware support for an external DMA controller to minimize its impact on system performance. The second pair of FIFOs provides hardware interleaving of a second audio stream that reduces CPU overhead in use cases where two time slots are being used simultaneously.</p> |

These ports do not have “Card detection” and “Write Protection” pads and do support hardware reset. • All ports can work with 1.8 V and 3.3 V cards. There are two completely independent I/O power domains for Ports #1 and #2 in four bit configuration (SD interface). Port #3 is placed in his own independent power domain and port #4 shares power domain with some other interfaces. |
| VDOA | VDOA | Multimedia Peripherals | The Video Data Order Adapter (VDOA) is used to re-order video data from the “tiled” order used by the VPU to the conventional raster-scan order needed by the IPU. |
| VPU | Video Processing Unit | Multimedia Peripherals | A high-performing video processing unit (VPU), which covers many SD-level and HD-level video decoders and SD-level encoders as a multi-standard video codec engine as well as several important video processing, such as rotation and mirroring. See the i.MX 6Dual/6Quad reference manual (IMX6DQRM) for complete list of VPU’s decoding/encoding capabilities. |
| WDOG-1 | Watchdog | Timer Peripherals | The Watchdog Timer supports two comparison points during each counting period. Each of the comparison points is configurable to evoke an interrupt to the Arm core, and a second point evokes an external event on the WDOG line. |

| WDOG-2 (TZ) | Watchdog (TrustZone) | Timer Peripherals | The TrustZone Watchdog (TZ WDOG) timer module protects against TrustZone starvation by providing a method of escaping normal mode and forcing a switch to the TZ mode. TZ starvation is a situation where the normal OS prevents switching to the TZ mode. Such a situation is undesirable as it can compromise the system's security. Once the TZ WDOG module is activated, it must be serviced by TZ software on a periodic basis. If servicing does not take place, the timer times out. Upon a time-out, the TZ WDOG asserts a TZ mapped interrupt that forces switching to the TZ mode. If it is still not served, the TZ WDOG asserts a security violation signal to the CSU. The TZ WDOG module cannot be programmed or deactivated by a normal mode Software. |
| EIM | NOR-Flash /PSRAM interface | Connectivity Peripherals | The EIM NOR-FLASH / PSRAM provides: <ul style="list-style-type: none"> • Support 16-bit (in muxed IO mode only) PSRAM memories (sync and async operating modes), at slow frequency • Support 16-bit (in muxed IO mode only) NOR-Flash memories, at slow frequency • Multiple chip selects |
| XTALOSC | Crystal Oscillator interface | — | The XTALOSC module enables connectivity to external crystal oscillator device. In a typical application use-case, it is used for 24 MHz oscillator. |

3.1 Special Signal Considerations

The package contact assignments can be found in [Section 6, “Package Information and Contact Assignments.”](#) Signal descriptions are defined in the i.MX 6Dual/6Quad reference manual (IMX6DQRM). Special signal consideration information is contained in the Hardware Development Guide for i.MX 6Quad, 6Dual, 6DualLite, 6Solo Families of Applications Processors (IMX6DQ6SDLHDG).

3.2 Recommended Connections for Unused Analog Interfaces

The recommended connections for unused analog interfaces can be found in the section, “Unused analog interfaces,” of the Hardware Development Guide for i.MX 6Quad, 6Dual, 6DualLite, 6Solo Families of Applications Processors (IMX6DQ6SDLHDG).

¹ The absolute maximum voltage includes an allowance for 400 mV of overshoot on the IO pins. Per JEDEC standards, the allowed signal overshoot must be derated if NVCC_DRAM exceeds 1.575V.

² OVDD is the I/O supply voltage.

4.1.2 Thermal Resistance

NOTE

Per JEDEC JESD51-2, the intent of thermal resistance measurements is solely for a thermal performance comparison of one package to another in a standardized environment. This methodology is not meant to and will not predict the performance of a package in an application-specific environment.

4.1.2.1 FCPBGA Package Thermal Resistance

4.1.2.2 PoP Package Thermal Resistance

Table 5 provides the PoP package thermal resistance data.

¹ Applying the maximum voltage results in maximum power consumption and heat generation. NXP recommends a voltage set point = (V_{min} + the supply tolerance). This results in an optimized power/speed ratio.

² See the Hardware Development Guide for i.MX 6Quad, 6Dual, 6DualLite, 6Solo Families of Applications Processors (IMX6DQ6SDLHDG) for bypass capacitors requirements for each of the *_CAP supply outputs.

³ For Quad core system, connect to VDD_ARM_IN. For Dual core system, may be shorted to GND together with VDD_ARM23_CAP to reduce leakage.

⁴ VDD_ARM_IN and VDD_SOC_IN must be at least 125 mV higher than the LDO Output Set Point for correct voltage regulation.

⁵ VDD_ARM_CAP must not exceed VDD_CACHE_CAP by more than +50 mV. VDD_CACHE_CAP must not exceed VDD_ARM_CAP by more than 200 mV.

⁶ VDD_SOC_CAP and VDD_PU_CAP must be equal.

⁷ In LDO enabled mode, the internal LDO output set points must be configured such that the:

VDD_ARM LDO output set point does not exceed the VDD_SOC LDO output set point by more than 100 mV.

VDD_SOC LDO output set point is equal to the VDD_PU LDO output set point.

The VDD_ARM LDO output set point can be lower than the VDD_SOC LDO output set point, however, the minimum output set points shown in this table must be maintained.

Electrical Characteristics

- ⁸ In LDO bypassed mode, the external power supply must ensure that VDD_ARM_IN does not exceed VDD_SOC_IN by more than 100 mV. The VDD_ARM_IN supply voltage can be lower than the VDD_SOC_IN supply voltage. The minimum voltages shown in this table must be maintained.
- ⁹ To set VDD_SNVS_IN voltage with respect to Charging Currents and RTC, see the *Hardware Development Guide for i.MX 6Dual, 6Quad, 6Solo, 6DualLite Families of Applications Processors (IMX6DQ6SDLHDG)*.
- ¹⁰ All digital I/O supplies (NVCC_xxxx) must be powered under normal conditions whether the associated I/O pins are in use or not, and associated I/O pins need to have a pull-up or pull-down resistor applied to limit any floating gate current.
- ¹¹ This supply also powers the pre-drivers of the DDR I/O pins; therefore, it must always be provided, even when LVDS is not used.

4.1.4 External Clock Sources

Each i.MX 6Dual/6Quad processor has two external input system clocks: a low frequency (RTC_XTALI) and a high frequency (XTALI).

The RTC_XTALI is used for low-frequency functions. It supplies the clock for wake-up circuit, power-down real time clock operation, and slow system and watchdog counters. The clock input can be connected to either an external oscillator or a crystal using the internal oscillator amplifier. Additionally, there is an internal ring oscillator, that can be used instead of RTC_XTALI when accuracy is not important.

The system clock input XTALI is used to generate the main system clock. It supplies the PLLs and other peripherals. The system clock input can be connected to either an external oscillator or a crystal using the internal oscillator amplifier.

NOTE

The internal RTC oscillator does not provide an accurate frequency and is affected by process, voltage and temperature variations. NXP strongly recommends using an external crystal as the RTC_XTALI reference. If the internal oscillator is used instead, careful consideration should be given to the timing implications on all of the SoC modules dependent on this clock.

Table 7 shows the interface frequency requirements.

Table 7. External Input Clock Frequency

| Parameter Description | Symbol | Min | Typ | Max | Unit |
|-------------------------------------|-------------------|-----|---------------------------|-----|------|
| RTC_XTALI Oscillator ^{1,2} | f _{ckil} | — | 32.768 ³ /32.0 | — | kHz |
| XTALI Oscillator ^{2,4} | f _{xtal} | — | 24 | — | MHz |

¹ External oscillator or a crystal with internal oscillator amplifier.

² The required frequency stability of this clock source is application dependent. For recommendations, see the Hardware Development Guide for i.MX 6Dual, 6Quad, 6Solo, 6DualLite Families of Applications Processors (IMX6DQ6SDLHDG).

³ Recommended nominal frequency 32.768 kHz.

⁴ External oscillator or a fundamental frequency crystal with internal oscillator amplifier.

The typical values shown in Table 7 are required for use with NXP BSPs to ensure precise time keeping and USB operation. For RTC_XTALI operation, two clock sources are available:

- On-chip 40 kHz ring oscillator: This clock source has the following characteristics:
 - Approximately 25 μ A more I_{dd} than crystal oscillator
 - Approximately $\pm 50\%$ tolerance

- No external component required
- Starts up quicker than 32 kHz crystal oscillator
- External crystal oscillator with on-chip support circuit
 - At power up, an internal ring oscillator is used. After crystal oscillator is stable, the clock circuit switches over to the crystal oscillator automatically.
 - Higher accuracy than ring oscillator.
 - If no external crystal is present, then the ring oscillator is used.

The decision to choose a clock source should be based on real-time clock use and precision timeout.

4.1.5 Maximum Measured Supply Currents

Power consumption is highly dependent on the application. Estimating the maximum supply currents required for power supply design is difficult because the use case that requires maximum supply current is not a realistic use case.

To help illustrate the effect of the application on power consumption, data was collected while running industry standard benchmarks that are designed to be compute and graphic intensive. The results provided are intended to be used as guidelines for power supply design.

Description of test conditions:

- The Power Virus data shown in [Table 8](#) represent a use case designed specifically to show the maximum current consumption possible for the Arm core complex. All cores are running at the defined maximum frequency and are limited to L1 cache accesses only to ensure no pipeline stalls. Although a valid condition, it would have a very limited, if any, practical use case, and be limited to an extremely low duty cycle unless the intention was to specifically cause the worst case power consumption.
- EEMBC CoreMark: Benchmark designed specifically for the purpose of measuring the performance of a CPU core. More information available at www.eembc.org/coremark. Note that this benchmark is designed as a core performance benchmark, not a power benchmark. This use case is provided as an example of power consumption that would be typical in a computationally-intensive application rather than the Power Virus.
- 3DMark Mobile 2011: Suite of benchmarks designed for the purpose of measuring graphics and overall system performance. Note that this benchmark is designed as a graphics performance benchmark, not a power benchmark. This use case is provided as an example of power consumption that would be typical in a very graphics-intensive application.
- Devices used for the tests were from the high current end of the expected process variation.

The NXP power management IC, MMPF0100xxxx, which is targeted for the i.MX 6 series processor family, supports the power consumption shown in [Table 8](#), however a robust thermal design is required for the increased system power dissipation.

See the *i.MX 6Dual/6Quad Power Consumption Measurement Application Note (AN4509)* for more details on typical power consumption under various use case definitions.

|--------------|------------|-----------------|----------|------|
| | | Power Virus | CoreMark | |

¹ The actual maximum current drawn from VDD_HIGH_IN will be as shown plus any additional current drawn from the VDD_HIGH_CAP outputs, depending upon actual application configuration (for example, NVCC_LVDS_2P5, NVCC_MIPI, or HDMI, PCIe, and SATA VPH supplies).

² Under normal operating conditions, the maximum current on VDD_SNVIS_IN is shown [Table 8](#). The maximum VDD_SNVIS_IN current may be higher depending on specific operating configurations, such as BOOT_MODE[1:0] not equal to 00, or use of the Tamper feature. During initial power on, VDD_SNVIS_IN can draw up to 1 mA if the supply is capable of sourcing that current. If less than 1 mA is available, the VDD_SNVIS_CAP charge time will increase.

³ This is the maximum current per active USB physical interface.

⁴ The DRAM power consumption is dependent on several factors such as external signal termination. DRAM power calculators are typically available from memory vendors which take into account factors such as signal termination. See the *i.MX 6Dual/6Quad Power Consumption Measurement Application Note* (AN4509) for examples of DRAM power consumption during specific use case scenarios.

⁵ General equation for estimated, maximum power consumption of an IO power supply:

$$I_{max} = N \times C \times V \times (0.5 \times F)$$

Where:

N—Number of IO pins supplied by the power line

C—Equivalent external capacitive load

V—IO voltage

(0.5 xF)—Data change rate. Up to 0.5 of the clock rate (F)

In this equation, I_{max} is in Amps, C in Farads, V in Volts, and F in Hertz.

4.1.6 Low Power Mode Supply Currents

[Table 9](#) shows the current core consumption (not including I/O) of the i.MX 6Dual/6Quad processors in selected low power modes.

4.2 Power Supplies Requirements and Restrictions

The system design must comply with power-up sequence, power-down sequence, and steady state guidelines as described in this section to ensure the reliable operation of the device. Any deviation from these sequences may result in the following situations:

- Excessive current during power-up phase
- Prevention of the device from booting
- Irreversible damage to the processor

4.2.1 Power-Up Sequence

For power-up sequence, the restrictions are as follows:

- VDD_SNVS_IN supply must be turned ON before any other power supply. It may be connected (shorted) with VDD_HIGH_IN supply.
- If a coin cell is used to power VDD_SNVS_IN, then ensure that it is connected before any other supply is switched on.
- The SRC_POR_B signal controls the processor POR and must be immediately asserted at power-up and remain asserted until the VDD_ARM_CAP, VDD_SOC_CAP, and VDD_PU_CAP supplies are stable. VDD_ARM_IN and VDD_SOC_IN may be applied in either order with no restrictions.

NOTE

Ensure that there is no back voltage (leakage) from any supply on the board towards the 3.3 V supply (for example, from the external components that use both the 1.8 V and 3.3 V supplies).

NOTE

USB_OTG_VBUS and USB_H1_VBUS are not part of the power supply sequence and can be powered at any time.

4.2.2 Power-Down Sequence

There are no special restrictions for i.MX 6Dual/6Quad SoC.

4.2.3 Power Supplies Usage

- All I/O pins must not be externally driven while the I/O power supply for the pin (NVCC_XXX) is OFF. This can cause internal latch-up and malfunctions due to reverse current flows. For information about I/O power supply of each pin, see the “Power Group” column of [Table 85, “12 x 12 mm Functional Contact Assignments”](#).
- When the SATA interface is not used, the SATA_VP and SATA_VPH supplies should be grounded. The input and output supplies for rest of the ports (SATA_REXT, SATA_PHY_RX_N, SATA_PHY_RX_P, and SATA_PHY_TX_N) can remain unconnected. It is recommended not to turn OFF the SATA_VPH supply while the SATA_VP supply is ON, as it may lead to excessive

power consumption. If boundary scan test is used, SATA_VP and SATA_VPH must remain powered.

- When the PCIE interface is not used, the PCIE_VP, PCIE_VPH, and PCIE_VPTX supplies should be grounded. The input and output supplies for rest of the ports (PCIE_REXT, PCIE_RX_N, PCIE_RX_P, PCIE_TX_N, and PCIE_TX_P) can remain unconnected. It is recommended not to turn the PCIE_VPH supply OFF while the PCIE_VP supply is ON, as it may lead to excessive power consumption. If boundary scan test is used, PCIE_VP, PCIE_VPH, and PCIE_VPTX must remain powered.

4.3 Integrated LDO Voltage Regulator Parameters

Various internal supplies can be powered ON from internal LDO voltage regulators. All the supply pins named *_CAP must be connected to external capacitors. The onboard LDOs are intended for internal use only and should not be used to power any external circuitry. See the i.MX 6Dual/6Quad reference manual (IMX6DQRM) for details on the power tree scheme recommended operation.

NOTE

The *_CAP signals should not be powered externally. These signals are intended for internal LDO or LDO bypass operation only.

4.3.1 Digital Regulators (LDO_ARM, LDO_PU, LDO_SOC)

There are three digital LDO regulators (“Digital”, because of the logic loads that they drive, not because of their construction). The advantages of the regulators are to reduce the input supply variation because of their input supply ripple rejection and their on die trimming. This translates into more voltage for the die producing higher operating frequencies. These regulators have three basic modes.

- Bypass. The regulation FET is switched fully on passing the external voltage, DCDC_LOW, to the load unaltered. The analog part of the regulator is powered down in this state, removing any loss other than the IR drop through the power grid and FET.
- Power Gate. The regulation FET is switched fully off limiting the current draw from the supply. The analog part of the regulator is powered down here limiting the power consumption.
- Analog regulation mode. The regulation FET is controlled such that the output voltage of the regulator equals the programmed target voltage. The target voltage is fully programmable in 25 mV steps.

Optionally LDO_SOC/VDD_SOC_CAP can be used to power the HDMI, PCIe, and SATA PHY's through external connections.

For additional information, see the i.MX 6Dual/6Quad reference manual (IMX6DQRM).

4.3.2 Regulators for Analog Modules

4.3.2.1 LDO_1P1 / NVCC_PLL_OUT

The LDO_1P1 regulator implements a programmable linear-regulator function from VDD_HIGH_IN (see [Table 6](#) for minimum and maximum input requirements). Typical Programming Operating Range is 1.0 V

to 1.2 V with the nominal default setting as 1.1 V. The LDO_1P1 supplies the 24 MHz oscillator, PLLs, and USB PHY. A programmable brown-out detector is included in the regulator that can be used by the system to determine when the load capability of the regulator is being exceeded to take the necessary steps. Current-limiting can be enabled to allow for in-rush current requirements during start-up, if needed. Active-pull-down can also be enabled for systems requiring this feature.

For information on external capacitor requirements for this regulator, see the Hardware Development Guide for i.MX 6Quad, 6Dual, 6DualLite, 6Solo Families of Applications Processors (IMX6DQ6SDLHDG).

For additional information, see the i.MX 6Dual/6Quad reference manual (IMX6DQRM).

4.3.2.2 LDO_2P5

The LDO_2P5 module implements a programmable linear-regulator function from VDD_HIGH_IN (see Table 6 for min and max input requirements). Typical Programming Operating Range is 2.25 V to 2.75 V with the nominal default setting as 2.5 V. The LDO_2P5 supplies the SATA PHY, USB PHY, LVDS PHY, HDMI PHY, MIPI PHY, E-fuse module and PLLs. A programmable brown-out detector is included in the regulator that can be used by the system to determine when the load capability of the regulator is being exceeded, to take the necessary steps. Current-limiting can be enabled to allow for in-rush current requirements during start-up, if needed. Active-pull-down can also be enabled for systems requiring this feature. An alternate self-biased low-precision weak-regulator is included that can be enabled for applications needing to keep the output voltage alive during low-power modes where the main regulator driver and its associated global bandgap reference module are disabled. The output of the weak-regulator is not programmable and is a function of the input supply as well as the load current. Typically, with a 3 V input supply the weak-regulator output is 2.525 V and its output impedance is approximately 40 Ω .

For information on external capacitor requirements for this regulator, see the Hardware Development Guide for i.MX 6Quad, 6Dual, 6DualLite, 6Solo Families of Applications Processors (IMX6DQ6SDLHDG).

For additional information, see the i.MX 6Dual/6Quad reference manual (IMX6DQRM).

4.3.2.3 LDO_USB

The LDO_USB module implements a programmable linear-regulator function from the USB_OTG_VBUS and USB_H1_VBUS voltages (4.4 V–5.25 V) to produce a nominal 3.0 V output voltage. A programmable brown-out detector is included in the regulator that can be used by the system to determine when the load capability of the regulator is being exceeded, to take the necessary steps. This regulator has a built in power-mux that allows the user to select to run the regulator from either VBUS supply, when both are present. If only one of the VBUS voltages is present, then the regulator automatically selects this supply. Current limit is also included to help the system meet in-rush current targets. If no VBUS voltage is present, then the VBUSVALID threshold setting will prevent the regulator from being enabled.

For information on external capacitor requirements for this regulator, see the Hardware Development Guide for i.MX 6Quad, 6Dual, 6DualLite, 6Solo Families of Applications Processors (IMX6DQ6SDLHDG).

For additional information, see the i.MX 6Dual/6Quad reference manual (IMX6DQRM).

4.5 On-Chip Oscillators

4.5.1 OSC24M

This block implements an amplifier that when combined with a suitable quartz crystal and external load capacitors implements an oscillator. The oscillator is powered from NVCC_PLL_OUT.

The system crystal oscillator consists of a Pierce-type structure running off the digital supply. A straight forward biased-inverter implementation is used.

4.5.2 OSC32K

This block implements an amplifier that when combined with a suitable quartz crystal and external load capacitors implements a low power oscillator. It also implements a power mux such that it can be powered from either a ~3 V backup battery (VDD_SNVS_IN) or VDD_HIGH_IN such as the oscillator consumes power from VDD_HIGH_IN when that supply is available and transitions to the back up battery when VDD_HIGH_IN is lost.

In addition, if the clock monitor determines that the OSC32K is not present, then the source of the 32 kHz clock will automatically switch to the internal ring oscillator.

CAUTION

The internal RTC oscillator does not provide an accurate frequency and is affected by process, voltage, and temperature variations. NXP strongly recommends using an external crystal as the RTC_XTALI reference. If the internal oscillator is used instead, careful consideration must be given to the timing implications on all of the SoC modules dependent on this clock.

The OSC32k runs from VDD_SNVS_CAP, which comes from the VDD_HIGH_IN/VDD_SNVS_IN power mux.

Table 19. OSC32K Main Characteristics

| Parameter | Min | Typ | Max | Comments |
|---------------------------|-----|---------------|----------------|--|
| Fosc | — | 32.768 kHz | — | This frequency is nominal and determined mainly by the crystal selected. 32.0 K would work as well. |
| Current consumption | — | 4 μ A | — | The typical value shown is only for the oscillator, driven by an external crystal. If the internal ring oscillator is used instead of an external crystal, then approximately 25 μ A must be added to this value. |
| Bias resistor | — | 14 M Ω | — | This the integrated bias resistor that sets the amplifier into a high gain state. Any leakage through the ESD network, external board leakage, or even a scope probe that is significant relative to this value will debias the amplifier. The debiasing will result in low gain, and will impact the circuit's ability to start up and maintain oscillations. |
| Target Crystal Properties | | | | |
| Clload | — | 10 pF | — | Usually crystals can be purchased tuned for different Clloads. This Clload value is typically 1/2 of the capacitances realized on the PCB on either side of the quartz. A higher Clload will decrease oscillation margin, but increases current oscillating through the crystal. |
| ESR | — | 50 k Ω | 100 k Ω | Equivalent series resistance of the crystal. Choosing a crystal with a higher value will decrease the oscillating margin. |

4.6 I/O DC Parameters

This section includes the DC parameters of the following I/O types:

- General Purpose I/O (GPIO)
- Double Data Rate I/O (DDR) for LPDDR2
- LVDS I/O

NOTE

The term 'OVDD' in this section refers to the associated supply rail of an input or output.

4.6.1 XTALI and RTC_XTALI (Clock Inputs) DC Parameters

Table 20 shows the DC parameters for the clock inputs.

Table 20. XTALI and RTC_XTALI DC Parameters

| Parameter | Symbol | Test Conditions | Min | Typ | Max | Unit |
|--|----------------------------|--|--------------------|-----|-----------------------------|------|

| DC input current | I _{XTALI_DC} | — | — | — | 2.5 | μA |

¹ This voltage specification must not be exceeded and, as such, is an absolute maximum specification.

² This current draw is present even if an external clock source directly drives XTALI.

NOTE

The V_{il} and V_{ih} specifications only apply when an external clock source is used. If a crystal is used, V_{il} and V_{ih} do not apply.

4.6.2 General Purpose I/O (GPIO) DC Parameters

Table 21 shows DC parameters for GPIO pads. The parameters in Table 21 are guaranteed per the operating ranges in Table 6, unless otherwise noted.

¹ Overshoot and undershoot conditions (transitions above OVDD and below GND) on switching pads must be held below 0.6 V, and the duration of the overshoot/undershoot must not exceed 10% of the system clock cycle. Overshoot/undershoot must be controlled through printed circuit board layout, transmission line impedance matching, signal line termination, or other methods. Non-compliance to this specification may affect device reliability or cause permanent damage to the device.

² DSE is the Drive Strength Field setting in the associated IOMUX control register.

³ To maintain a valid level, the transition edge of the input must sustain a constant slew rate (monotonic) from the current DC level through to the target DC level, V_{il} or V_{ih}. Monotonic input transition time is from 0.1 ns to 1 s.

⁴ Hysteresis of 250 mV is guaranteed over all operating conditions when hysteresis is enabled.

4.6.3 DDR I/O DC Parameters

The DDR I/O pads support LPDDR2.

4.6.4 RGMII I/O 2.5V I/O DC Electrical Parameters

The RGMII interface complies with the RGMII standard version 1.3. The parameters in [Table 22](#) are guaranteed per the operating ranges in [Table 6](#), unless otherwise noted.

² The single-ended signals need to be within the respective limits ($V_{ih}(dc)$ max, $V_{il}(dc)$ min) for single-ended signals as well as the limitations for overshoot and undershoot (see [Table 27](#)).

4.6.5 LVDS I/O DC Parameters

The LVDS interface complies with TIA/EIA 644-A standard. See TIA/EIA STANDARD 644-A, “*Electrical Characteristics of Low Voltage Differential Signaling (LVDS) Interface Circuits*” for details.

[Table 24](#) shows the Low Voltage Differential Signaling (LVDS) I/O DC parameters.

4.7 I/O AC Parameters

This section includes the AC parameters of the following I/O types:

- General Purpose I/O (GPIO)
- Double Data Rate I/O (DDR) for LPDDR2
- LVDS I/O

The GPIO and DDR I/O load circuit and output transition time waveforms are shown in [Figure 4](#) and [Figure 5](#).

**Figure 4. Load Circuit for Output**

Figure 5. Output Transition Time Waveform

4.7.1 General Purpose I/O AC Parameters

The I/O AC parameters for GPIO in slow and fast modes are presented in the [Table 25](#) and [Table 26](#), respectively. Note that the fast or slow I/O behavior is determined by the appropriate control bits in the IOMUXC control registers.

Table 25. General Purpose I/O AC Parameters 1.8 V Mode

| Parameter | Symbol | Test Condition | Min | Typ | Max | Unit |

4.7.2 DDR I/O AC Parameters

For details on supported DDR memory configurations, see [Section 4.10.2, “MMDC Supported LPDDR2 Configurations.”](#)

[Table 27](#) shows the AC parameters for DDR I/O operating in LPDDR2 mode.

Table 27. DDR I/O LPDDR2 Mode AC Parameters¹

| Parameter | Symbol | Test Condition | Min | Typ | Max | Unit |

| Input AC differential cross point voltage ³ | Vix(ac) | Relative to Vref | -0.12 | — | 0.12 | V |
| Over/undershoot peak | Vpeak | — | — | — | 0.35 | V |
| Over/undershoot area (above OVDD or below OVSS) | Varea | 400 MHz | — | — | 0.2 | V-ns |
| Single output slew rate, measured between Vol(ac) and Voh(ac) | tsr | 50 Ω to Vref. 5 pF load. Drive impedance = 40 Ω ±30% | 1.5 | — | 3.5 | V/ns |
| | | 50 Ω to Vref. 5pF load. Drive impedance = 60 Ω ±30% | 1 | — | 2.5 | |
| Skew between pad rise/fall asymmetry + skew caused by SSN | t _{SKD} | clk = 400 MHz | — | — | 0.1 | ns |

¹ Note that the JEDEC LPDDR2 specification (JESD209_2B) supersedes any specification in this document.

² Vid(ac) specifies the input differential voltage $V_{tr} - V_{cp}$ required for switching, where V_{tr} is the “true” input signal and V_{cp} is the “complementary” input signal. The Minimum value is equal to $V_{ih}(ac) - V_{il}(ac)$.

³ The typical value of $V_{ix}(ac)$ is expected to be about $0.5 \times OVDD$. and $V_{ix}(ac)$ is expected to track variation of OVDD. $V_{ix}(ac)$ indicates the voltage at which differential input signal must cross.

4.7.3 LVDS I/O AC Parameters

The differential output transition time waveform is shown in [Figure 6](#).

Figure 6. Differential LVDS Driver Transition Time Waveform

Table 28 shows the AC parameters for LVDS I/O.

Table 28. I/O AC Parameters of LVDS Pad

| Parameter | Symbol | Test Condition | Min | Typ | Max | Unit |

| Transition High to Low Time ² | t_{THL} | | — | — | 0.5 | |
| Operating Frequency | f | — | — | 600 | 800 | MHz |
| Offset voltage imbalance | Vos | — | — | — | 150 | mV |

¹ $t_{SKD} = |t_{PHLD} - t_{PLHD}|$, is the magnitude difference in differential propagation delay time between the positive going edge and the negative going edge of the same channel.

² Measurement levels are 20–80% from output voltage.

4.8 Output Buffer Impedance Parameters

This section defines the I/O impedance parameters of the i.MX 6Dual/6Quad processors for the following I/O types:

- General Purpose I/O (GPIO)
- Double Data Rate I/O (DDR) for LPDDR2
- LVDS I/O

NOTE

GPIO and DDR I/O output driver impedance is measured with “long” transmission line of impedance Z_{tl} attached to I/O pad and incident wave launched into transmission line. R_{pu}/R_{pd} and Z_{tl} form a voltage divider that defines specific voltage of incident wave relative to OVDD. Output driver impedance is calculated from this voltage divider (see Figure 7).

Figure 7. Impedance Matching Load for Measurement

4.8.1 GPIO Output Buffer Impedance

Table 29 shows the GPIO output buffer impedance (OVDD 1.8 V).

Table 29. GPIO Output Buffer Average Impedance (OVDD 1.8 V)

| Parameter | Symbol | Drive Strength (DSE) | Typ Value | Unit |
|-------------------------|--------|----------------------|-----------|----------|

4.8.2 DDR I/O Output Buffer Impedance

For details on supported DDR memory configurations, see [Section 4.10.2, “MMDC Supported LPDDR2 Configurations.”](#)

Table 31 shows DDR I/O output buffer impedance of i.MX 6Dual/6Quad processors.

Table 31. LPDDR2 I/O Output Buffer Impedance

| Parameter | Symbol | Test Conditions | Typical | Unit |
|-------------------------|--------|------------------------|-------------------------------|------|
| | | | NVCC_DRAM=1.2 V DDR_SEL=10 | |
| Output Driver Impedance | Rdrv | Drive Strength (DSE) = | | |
| | | 000 | Hi-Z | Ω |
| | | 001 | 240 | |
| | | 010 | 120 | |

| | | 100 | 60 | |
| | | 101 | 48 | |
| | | 110 | 40 | |
| 111 | 34 | | | |

Note:

1. Output driver impedance is controlled across PVTs using ZQ calibration procedure.
2. Calibration is done against 240 W external reference resistor.
3. Output driver impedance deviation (calibration accuracy) is ±5% (max/min impedance) across PVTs.

4.8.3 LVDS I/O Output Buffer Impedance

The LVDS interface complies with TIA/EIA 644-A standard. See, TIA/EIA STANDARD 644-A, “Electrical Characteristics of Low Voltage Differential Signaling (LVDS) Interface Circuits” for details.

4.9 System Modules Timing

This section contains the timing and electrical parameters for the modules in each i.MX 6Dual/6Quad processor.

4.9.1 Reset Timing Parameters

Figure 8 shows the reset timing and Table 32 lists the timing parameters.

NOTE

XTALOSC_RTC_XTALI is approximately 32 kHz.

XTALOSC_RTC_XTALI cycle is one period or approximately 30 μ s.

NOTE

WDOG1_B output signals (for each one of the Watchdog modules) do not have dedicated pins, but are muxed out through the IOMUX. See the IOMUX manual for detailed information.

4.9.3 External Interface Module (EIM)

The following subsections provide information on the EIM. Maximum operating frequency for EIM data transfer is 104 MHz. Timing parameters in this section that are given as a function of register settings or clock periods are valid for the entire range of allowed frequencies (0–104 MHz).

4.9.3.1 EIM Interface Pads Allocation

EIM supports 32-bit, 16-bit and 8-bit devices operating in address/data separate or multiplexed modes. Table 34 provides EIM interface pads allocation in different modes.

4.9.3.4 General EIM Timing-Asynchronous Mode

Figure 16 through Figure 20 and Table 36 provide timing parameters relative to the chip select (CS) state for asynchronous and DTACK EIM accesses with corresponding EIM bit fields and the timing parameters mentioned above.

Asynchronous read and write access length in cycles may vary from what is shown in Figure 16 through Figure 19 as RWSC, OEN & CSN is configured differently. See the i.MX 6Dual/6Quad reference manual (IMX6DQRM) for the EIM programming model.

Electrical Characteristics

² In this table:

- t means clock period from axi_clk frequency.
- CSA means register setting for WCSA when in write operations or RCSA when in read operations.
- CSN means register setting for WCSN when in write operations or RCSN when in read operations.
- ADVN means register setting for WADV when in write operations or RADVN when in read operations.
- ADVA means register setting for WADVA when in write operations or RADVA when in read operations.

4.10 Multi-Mode DDR Controller (MMDC)

The Multi-mode DDR Controller is a dedicated interface to LPDDR2 SDRAM.

4.10.1 MMDC Compatibility with JEDEC-Compliant SDRAMs

The i.MX 6Dual/6Quad MMDC supports the following memory type:

- LPDDR2 SDRAM compliant to JESD209-2B LPDDR2 JEDEC standard release June, 2009

MMDC operation with the standards stated above is contingent upon the board DDR design adherence to the DDR design and layout requirements stated in the *Hardware Development Guide for i.MX 6Quad, 6Dual, 6DualLite, 6Solo Families of Applications Processors (IMX6DQ6SDLHDG)*.

4.10.2 MMDC Supported LPDDR2 Configurations

The table below shows the supported LPDDR2 configurations:

Table 37. i.MX 6Dual/6Quad Supported LPDDR2 Configurations

| Parameter | LPDDR2 |
|-----------------|--------------------|
| Clock frequency | 400 MHz |
| Bus width | 32-bit per channel |
| Channel | Dual |
| Chip selects | 2 per channel |

4.11 General-Purpose Media Interface (GPMI) Timing

The i.MX 6Dual/6Quad GPMI controller is a flexible interface NAND Flash controller with 8-bit data width, up to 200 MB/s I/O speed and individual chip select. It supports Asynchronous timing mode, Source Synchronous timing mode, and Samsung Toggle timing mode separately described in the following subsections.

4.11.1 Asynchronous Mode AC Timing (ONFI 1.0 Compatible)

Asynchronous mode AC timings are provided as multiplications of the clock cycle and fixed delay. The Maximum I/O speed of GPMI in Asynchronous mode is about 50 MB/s. Figure 22 through Figure 25 depict the relative timing between GPMI signals at the module level for different operations under Asynchronous mode. Table 38 describes the timing parameters (NF1–NF17) that are shown in the figures.

¹ The GPMI asynchronous mode output timing can be controlled by the module's internal registers HW_GPMI_TIMING0_ADDRESS_SETUP, HW_GPMI_TIMING0_DATA_SETUP, and HW_GPMI_TIMING0_DATA_HOLD. This AC timing depends on these registers settings. In the table, AS/DS/DH represents each of these settings.

² AS minimum value can be 0, while DS/DH minimum value is 1.

³ T = GPMI clock period - 0.075ns (half of maximum p-p jitter).

⁴ NF12 is met automatically by the design.

⁵ Non-EDO mode.

⁶ EDO mode, GPMI clock \approx 100 MHz
(AS=DS=DH=1, GPMI_CTL1 [RDN_DELAY] = 8, GPMI_CTL1 [HALF_PERIOD] = 0).

In EDO mode (Figure 26), NF16/NF17 are different from the definition in non-EDO mode (Figure 25). They are called tREA/tRHOH (NAND_RE_B access time/NAND_RE_B HIGH to output hold). The typical value for them are 16 ns (max for tREA)/15 ns (min for tRHOH) at 50 MB/s EDO mode. In EDO mode, GPMI will sample NAND_DATAxx at rising edge of delayed NAND_RE_B provided by an internal DPLL. The delay value can be controlled by GPMI_CTRL1.RDN_DELAY (see the GPMI chapter of the i.MX 6Dual/6Quad reference manual (IMX6DQRM)). The typical value of this control register is 0x8 at 50 MT/s EDO mode. However, if the board delay is large enough and cannot be ignored, the delay value should be made larger to compensate the board delay.

4.11.2 Source Synchronous Mode AC Timing (ONFI 2.x Compatible)

| NF31 | NAND_DQS/NAND_DQ read hold skew | tQHS | — | 1.95 | — |

¹ The GPMI source synchronous mode output timing can be controlled by the module's internal registers GPMI_TIMING2_CE_DELAY, GPMI_TIMING2_PREAMBLE_DELAY, GPMI_TIMING2_POST_DELAY. This AC timing depends on these registers settings. In the table, CE_DELAY/PRE_DELAY/POST_DELAY represents each of these settings.

² T = tCK (GPMI clock period) - 0.075ns (half of maximum p-p jitter).

Figure 30 shows the timing diagram of NAND_DQS/NAND_DATAxx read valid window. For Source Synchronous mode, the typical value of tDQSQ is 0.85 ns (max) and 1 ns (max) for tQHS at 200MB/s. GPMI will sample NAND_DATA[7:0] at both rising and falling edge of a delayed NAND_DQS signal, which can be provided by an internal DPLL. The delay value can be controlled by GPMI register GPMI_READ_DDR_DLL_CTRL.SLV_DLY_TARGET (see the GPMI chapter of the i.MX 6Dual/6Quad reference manual (IMX6DQRM)). Generally, the typical delay value of this register is equal to 0x7 which means 1/4 clock cycle delay expected. However, if the board delay is large enough and cannot be ignored, the delay value should be made larger to compensate the board delay.

4.11.3 Samsung Toggle Mode AC Timing

4.11.3.1 Command and Address Timing

Samsung Toggle mode command and address timing is the same as ONFI 1.0 compatible Async mode AC timing. See [Section 4.11.1, “Asynchronous Mode AC Timing \(ONFI 1.0 Compatible\)”](#) for details.

³ T = tCK (GPMI clock period) - 0.075ns (half of maximum p-p jitter).

⁴ CE_DELAY represents HW_GPMI_TIMING2[CE_DELAY]. NF18 is met automatically by the design. Read/Write operation is started with enough time of ALE/CLE assertion to low level.

⁵ PRE_DELAY+1) ≥ (AS+DS).

⁶ Shown in [Figure 28](#).

⁷ Shown in [Figure 29](#).

[Figure 30](#) shows the timing diagram of NAND_DQS/NAND_DATA_{xx} read valid window. For DDR Toggle mode, the typical value of tDQSQ is 1.4 ns (max) and 1.4 ns (max) for tQHS at 133 MB/s. GPMI will sample NAND_DATA[7:0] at both rising and falling edge of a delayed NAND_DQS signal, which is provided by an internal DPLL. The delay value of this register can be controlled by GPMI register GPMI_READ_DDR_DLL_CTRL.SLV_DLY_TARGET (see the GPMI chapter of the i.MX 6Dual/6Quad reference manual (IMX6DQRM)). Generally, the typical delay value is equal to 0x7 which means 1/4 clock cycle delay expected. However, if the board delay is large enough and cannot be ignored, the delay value should be made larger to compensate the board delay.

4.12 External Peripheral Interface Parameters

The following subsections provide information on external peripheral interfaces.

4.12.1 AUDMUX Timing Parameters

The AUDMUX provides a programmable interconnect logic for voice, audio, and data routing between internal serial interfaces (SSIs) and external serial interfaces (audio and voice codecs). The AC timing of AUDMUX external pins is governed by the SSI module. For more information, see the respective SSI electrical specifications found within this document.

4.12.2 ECSPI Timing Parameters

This section describes the timing parameters of the ECSPI block. The ECSPI has separate timing parameters for master and slave modes.

4.12.2.1 ECSPi Master Mode Timing

Figure 33 depicts the timing of ECSPi in master mode and Table 41 lists the ECSPi master mode timing characteristics.

Note: ECSPi_MOSI is always driven (not tri-stated) between actual data transmissions. This limits the ECSPi to be connected between a single master and a single slave.

- ¹ i ck = internal clock
x ck = external clock
i ck a = internal clock, asynchronous mode
(asynchronous implies that ESAI_TX_CLK and ESAI_RX_CLK are two different clocks)
i ck s = internal clock, synchronous mode
(synchronous implies that ESAI_TX_CLK and ESAI_RX_CLK are the same clock)

- ² bl = bit length
wl = word length
wr = word length relative

- ³ ESAI_TX_CLK(ESAI_TX_CLK pin) = transmit clock
ESAI_RX_CLK(ESAI_RX_CLK pin) = receive clock
ESAI_TX_FS(ESAI_TX_FS pin) = transmit frame sync
ESAI_RX_FS(ESAI_RX_FS pin) = receive frame sync
ESAI_TX_HF_CLK(ESAI_TX_HF_CLK pin) = transmit high frequency clock
ESAI_RX_HF_CLK(ESAI_RX_HF_CLK pin) = receive high frequency clock

- ⁴ For the internal clock, the external clock cycle is defined by l_{cy}c and the ESAI control register.

- ⁵ The word-relative frame sync signal waveform relative to the clock operates in the same manner as the bit-length frame sync signal waveform, but it spreads from one serial clock before the first bit clock (like the bit length frame sync signal), until the second-to-last bit clock of the first word in the frame.

- ⁶ Periodically sampled and not 100% tested.

¹ In low speed mode, card clock must be lower than 400 kHz, voltage ranges from 2.7 to 3.6 V.

² In normal (full) speed mode for SD/SDIO card, clock frequency can be any value between 0–25 MHz. In high-speed mode, clock frequency can be any value between 0–50 MHz.

³ In normal (full) speed mode for MMC card, clock frequency can be any value between 0–20 MHz. In high-speed mode, clock frequency can be any value between 0–52 MHz.

⁴To satisfy hold timing, the delay difference between clock input and cmd/data input must not exceed 2 ns.

4.12.4.2 eMMC4.4/4.41 (Dual Data Rate) eSDHCv3 AC Timing

Figure 38 depicts the timing of eMMC4.4/4.41. Table 45 lists the eMMC4.4/4.41 timing characteristics. Be aware that only SDx_DATAx is sampled on both edges of the clock (not applicable to SD_CMD).

4.12.4.4 Bus Operation Condition for 3.3 V and 1.8 V Signaling

Signaling level of SD/eMMC4.3 and eMMC4.4/4.41 modes is 3.3 V. Signaling level of SDR104/SDR50 mode is 1.8 V. The DC parameters for the NVCC_SD1, NVCC_SD2, and NVCC_SD3 supplies are identical to those shown in [Table 21, “GPIO I/O DC Parameters,”](#) on page 38.

4.12.5 Ethernet Controller (ENET) AC Electrical Specifications

4.12.5.1 ENET MII Mode Timing

This subsection describes MII receive, transmit, asynchronous inputs, and serial management signal timings.

4.12.5.1.1 MII Receive Signal Timing (ENET_RX_DATA3,2,1,0, ENET_RX_EN, ENET_RX_ER, and ENET_RX_CLK)

The receiver functions correctly up to an ENET_RX_CLK maximum frequency of 25 MHz + 1%. There is no minimum frequency requirement. Additionally, the processor clock frequency must exceed twice the ENET_RX_CLK frequency.

[Figure 40](#) shows MII receive signal timings. [Table 47](#) describes the timing parameters (M1–M4) shown in the figure.

Figure 40. MII Receive Signal Timing Diagram

Table 47. MII Receive Signal Timing

| ID | Characteristic ¹ | Min | Max | Unit |
|----|--|-----|-----|--------------------|
| M1 | ENET_RX_DATA3,2,1,0, ENET_RX_EN, ENET_RX_ER to ENET_RX_CLK setup | 5 | — | ns |
| M2 | ENET_RX_CLK to ENET_RX_DATA3,2,1,0, ENET_RX_EN, ENET_RX_ER hold | 5 | — | ns |

| M4 | ENET_RX_CLK pulse width low | 35% | 65% | ENET_RX_CLK period |

¹ ENET_RX_EN, ENET_RX_CLK, and ENET0_RXD0 have the same timing in 10 Mbps 7-wire interface mode.

4.12.5.1.2 MII Transmit Signal Timing (ENET_TX_DATA3,2,1,0, ENET_TX_EN, ENET_TX_ER, and ENET_TX_CLK)

The transmitter functions correctly up to an ENET_TX_CLK maximum frequency of 25 MHz + 1%. There is no minimum frequency requirement. Additionally, the processor clock frequency must exceed twice the ENET_TX_CLK frequency.

Figure 41 shows MII transmit signal timings. Table 48 describes the timing parameters (M5–M8) shown in the figure.

¹ ENET_COL has the same timing in 10-Mbit 7-wire interface mode.

4.12.5.1.4 MII Serial Management Channel Timing (ENET_MDIO and ENET_MDC)

The MDC frequency is designed to be equal to or less than 2.5 MHz to be compatible with the IEEE 802.3 MII specification. However the ENET can function correctly with a maximum MDC frequency of 15 MHz.

Figure 43 shows MII asynchronous input timings. Table 50 describes the timing parameters (M10–M15) shown in the figure.

**Figure 43. MII Serial Management Channel Timing Diagram****Table 50. MII Serial Management Channel Timing**

| M15 | ENET_MDC pulse width low | 40% | 60% | ENET_MDC period |

4.12.5.2 RMII Mode Timing

In RMII mode, ENET_CLK is used as the REF_CLK, which is a 50 MHz \pm 50 ppm continuous reference clock. ENET_RX_EN is used as the ENET_RX_EN in RMII. Other signals under RMII mode include ENET_TX_EN, ENET0_TXD[1:0], ENET_RXD[1:0] and ENET_RX_ER.

Figure 44 shows RMII mode timings. Table 51 describes the timing parameters (M16–M21) shown in the figure.

4.12.5.3 RGMII Signal Switching Specifications

The following timing specifications meet the requirements for RGMII interfaces for a range of transceiver devices.

Table 52. RGMII Signal Switching Specifications¹

| Symbol | Description | Min | Max | Unit |
|---------------------|--|------|------|------|
| T_{cyc}^2 | Clock cycle duration | 7.2 | 8.8 | ns |
| T_{skewT}^3 | Data to clock output skew at transmitter | -100 | 900 | ps |
| T_{skewR}^3 | Data to clock input skew at receiver | 1 | 2.6 | ns |
| Duty_G ⁴ | Duty cycle for Gigabit | 45 | 55 | % |
| Duty_T ⁴ | Duty cycle for 10/100T | 40 | 60 | % |
| Tr/Tf | Rise/fall time (20–80%) | — | 0.75 | ns |

¹ The timings assume the following configuration:

DDR_SEL = (11)b

DSE (drive-strength) = (111)b

² For 10 Mbps and 100 Mbps, T_{cyc} will scale to 400 ns \pm 40 ns and 40 ns \pm 4 ns respectively.

³ For all versions of RGMII prior to 2.0; This implies that PC board design will require clocks to be routed such that an additional delay of greater than 1.2 ns and less than 1.7 ns will be added to the associated clock signal. For 10/100, the max value is unspecified.

⁴ Duty cycle may be stretched/shrunk during speed changes or while transitioning to a received packet's clock domain as long as minimum duty cycle is not violated and stretching occurs for no more than three T_{cyc} of the lowest speed transitioned between.

4.12.6 Flexible Controller Area Network (FlexCAN) AC Electrical Specifications

The Flexible Controller Area Network (FlexCAN) module is a communication controller implementing the CAN protocol according to the CAN 2.0B protocol specification. The processor has two CAN modules available for systems design. Tx and Rx ports for both modules are multiplexed with other I/O pins. See the IOMUXC chapter of the i.MX 6Dual/6Quad reference manual (IMX6DQRM) to see which pins expose Tx and Rx pins; these ports are named FLEXCAN_TX and FLEXCAN_RX, respectively.

4.12.7 HDMI Module Timing Parameters

4.12.7.1 Latencies and Timing Information

Power-up time (time between TX_PWRON assertion and TX_READY assertion) for the HDMI 3D Tx PHY while operating with the slowest input reference clock supported (13.5 MHz) is 3.35 ms.

Power-up time for the HDMI 3D Tx PHY while operating with the fastest input reference clock supported (340 MHz) is 133 μ s.

4.12.7.2 Electrical Characteristics

4.12.9 I²C Module Timing Parameters

This section describes the timing parameters of the I²C module. Figure 56 depicts the timing of I²C module, and Table 55 lists the I²C module timing characteristics.

| ID | Parameter | Standard Mode | | Fast Mode | | Unit |
|------|--|---------------|------|-----------------|-----|------|
| | | Min | Max | Min | Max | |
| IC9 | Bus free time between a STOP and START condition | 4.7 | — | 1.3 | — | μs |

| IC12 | Capacitive load for each bus line (C_b) | — | 400 | — | 400 | pF |

¹ A device must internally provide a hold time of at least 300 ns for I2Cx_SDA signal to bridge the undefined region of the falling edge of I2Cx_SCL.

² The maximum hold time has only to be met if the device does not stretch the LOW period (ID no IC5) of the I2Cx_SCL signal.

³ A Fast-mode I2C-bus device can be used in a Standard-mode I2C-bus system, but the requirement of Set-up time (ID No IC7) of 250 ns must be met. This automatically is the case if the device does not stretch the LOW period of the I2Cx_SCL signal. If such a device does stretch the LOW period of the I2Cx_SCL signal, it must output the next data bit to the I2Cx_SDA line $\text{max_rise_time (IC9) + data_setup_time (IC7) = 1000 + 250 = 1250 ns}$ (according to the Standard-mode I2C-bus specification) before the I2Cx_SCL line is released.

⁴ C_b = total capacitance of one bus line in pF.

4.12.10 Image Processing Unit (IPU) Module Parameters

The purpose of the IPU is to provide comprehensive support for the flow of data from an image sensor and/or to a display device. This support covers all aspects of these activities:

- Connectivity to relevant devices—cameras, displays, graphics accelerators, and TV encoders.
- Related image processing and manipulation: sensor image signal processing, display processing, image conversions, and other related functions.
- Synchronization and control capabilities, such as avoidance of tearing artifacts.

4.12.10.1 IPU Sensor Interface Signal Mapping

The IPU supports a number of sensor input formats. Table 56 defines the mapping of the Sensor Interface Pins used for various supported interface formats.

- ⁵ RGB, 16 bits—Supported in two ways: (1) As a “generic data” input—with no on-the-fly processing; (2) With on-the-fly processing, but only under some restrictions on the control protocol.
- ⁶ YCbCr, 16 bits—Supported as a “generic-data” input—with no on-the-fly processing.
- ⁷ YCbCr, 16 bits—Supported as a sub-case of the YCbCr, 20 bits, under the same conditions (BT.1120 protocol).
- ⁸ YCbCr, 20 bits—Supported only within the BT.1120 protocol (syncs embedded within the data stream).

4.12.10.2 Sensor Interface Timings

There are three camera timing modes supported by the IPU.

4.12.10.2.1 BT.656 and BT.1120 Video Mode

Smart camera sensors, which include imaging processing, usually support video mode transfer. They use an embedded timing syntax to replace the IPU2_CSIx_VSYNC and IPU2_CSIx_HSYNC signals. The timing syntax is defined by the BT.656/BT.1120 standards.

This operation mode follows the recommendations of ITU BT.656/ ITU BT.1120 specifications. The only control signal used is IPU2_CSIx_PIX_CLK. Start-of-frame and active-line signals are embedded in the data stream. An active line starts with a SAV code and ends with a EAV code. In some cases, digital blanking is inserted in between EAV and SAV code. The CSI decodes and filters out the timing-coding from the data stream, thus recovering IPU2_CSIx_VSYNC and IPU2_CSIx_HSYNC signals for internal use. On BT.656 one component per cycle is received over the IPU2_CSIx_DATA_EN bus. On BT.1120 two components per cycle are received over the IPU2_CSIx_DATA_EN bus.

4.12.10.2.2 Gated Clock Mode

The IPU2_CSIx_VSYNC, IPU2_CSIx_HSYNC, and IPU2_CSIx_PIX_CLK signals are used in this mode. See [Figure 57](#).

Figure 57. Gated Clock Mode Timing Diagram

A frame starts with a rising edge on IPU2_CSIx_VSYNC (all the timings correspond to straight polarity of the corresponding signals). Then IPU2_CSIx_HSYNC goes to high and hold for the entire line. Pixel clock is valid as long as IPU2_CSIx_HSYNC is high. Data is latched at the rising edge of the valid pixel clocks. IPU2_CSIx_HSYNC goes to low at the end of line. Pixel clocks then become invalid and the CSI

stops receiving data from the stream. For the next line, the IPU2_CSIx_HSYNC timing repeats. For the next frame, the IPU2_CSIx_VSYNC timing repeats.

4.12.10.2.3 Non-Gated Clock Mode

The timing is the same as the gated-clock mode (described in [Section 4.12.10.2.2, “Gated Clock Mode,”](#)) except for the IPU2_CSIx_HSYNC signal, which is not used (see [Figure 58](#)). All incoming pixel clocks are valid and cause data to be latched into the input FIFO. The IPU2_CSIx_PIX_CLK signal is inactive (states low) until valid data is going to be transmitted over the bus.

Figure 58. Non-Gated Clock Mode Timing Diagram

The timing described in [Figure 58](#) is that of a typical sensor. Some other sensors may have a slightly different timing. The CSI can be programmed to support rising/falling-edge triggered IPU2_CSIx_VSYNC; active-high/low IPU2_CSIx_HSYNC; and rising/falling-edge triggered IPU2_CSIx_PIX_CLK.

4.12.10.3 Electrical Characteristics

Figure 59 depicts the sensor interface timing. IPU2_CSIx_PIX_CLK signal described here is not generated by the IPU. Table 57 lists the sensor interface timing characteristics.

¹ Signal mapping (both data and control/synchronization) is flexible. The table provides examples.
² Restrictions for ports IPUx_DISPx_DAT00 through IPUx_DISPx_DAT23 are as follows:
 • A maximum of three continuous groups of bits can be independently mapped to the external bus. Groups must not overlap.
 • The bit order is expressed in each of the bit groups, for example, B[0] = least significant blue pixel bit.
³ This mode works in compliance with recommendation ITU-R BT.656. The timing reference signals (frame start, frame end, line start, and line end) are embedded in the 8-bit data bus. Only video data is supported, transmission of non-video related data during blanking intervals is not supported.

NOTE

Table 58 provides information for both the DISP0 and DISP1 ports. However, DISP1 port has reduced pinout depending on IOMUXC configuration and therefore may not support all configurations. See the IOMUXC table for details.

4.12.10.5 IPU Display Interface Timing

The IPU Display Interface supports two kinds of display accesses: synchronous and asynchronous. There are two groups of external interface pins to provide synchronous and asynchronous controls.

4.12.10.5.1 Synchronous Controls

The synchronous control changes its value as a function of a system or of an external clock. This control has a permanent period and a permanent waveform.

There are special physical outputs to provide synchronous controls:

- The `ipp_disp_clk` is a dedicated base synchronous signal that is used to generate a base display (component, pixel) clock for a display.
- The `ipp_pin_1`–`ipp_pin_7` are general purpose synchronous pins, that can be used to provide HSYNC, VSYNC, DRDY or any else independent signal to a display.

The IPU has a system of internal binding counters for internal events (such as, HSYNC/VSYNC) calculation. The internal event (local start point) is synchronized with internal `DI_CLK`. A suitable control starts from the local start point with predefined UP and DOWN values to calculate control's changing points with half `DI_CLK` resolution. A full description of the counter system can be found in the IPU chapter of the i.MX 6Dual/6Quad reference manual (IMX6DQRM).

4.12.10.5.2 Asynchronous Controls

The asynchronous control is a data-oriented signal that changes its value with an output data according to additional internal flags coming with the data.

There are special physical outputs to provide asynchronous controls, as follows:

- The `ipp_d0_cs` and `ipp_d1_cs` pins are dedicated to provide chip select signals to two displays.
- The `ipp_pin_11`–`ipp_pin_17` are general purpose asynchronous pins, that can be used to provide WR, RD, RS or any other data-oriented signal to display.

NOTE

The IPU has independent signal generators for asynchronous signals toggling. When a DI decides to put a new asynchronous data on the bus, a new internal start (local start point) is generated. The signal generators calculate predefined UP and DOWN values to change pins states with half `DI_CLK` resolution.

4.12.10.6 Synchronous Interfaces to Standard Active Matrix TFT LCD Panels

4.12.10.6.1 IPU Display Operating Signals

The IPU uses four control signals and data to operate a standard synchronous interface:

- `IPP_DISP_CLK`—Clock to display
- `HSYNC`—Horizontal synchronization
- `VSYNC`—Vertical synchronization
- `DRDY`—Active data

All synchronous display controls are generated on the base of an internally generated “local start point”. The synchronous display controls can be placed on time axis with DI's offset, up and down parameters. The display access can be whole number of DI clock (`Tdick`) only. The `IPP_DATA` can not be moved relative to the local start point. The data bus of the synchronous interface is output direction only.

4.12.10.6.2 LCD Interface Functional Description

Figure 60 depicts the LCD interface timing for a generic active matrix color TFT panel. In this figure, signals are shown with negative polarity. The sequence of events for active matrix interface timing is:

- DI_CLK internal DI clock is used for calculation of other controls.
- IPP_DISP_CLK latches data into the panel on its negative edge (when positive polarity is selected). In active mode, IPP_DISP_CLK runs continuously.
- HSYNC causes the panel to start a new line. (Usually IPU_x_DI_x_PIN02 is used as HSYNC.)
- VSYNC causes the panel to start a new frame. It always encompasses at least one HSYNC pulse. (Usually IPU_x_DI_x_PIN03 is used as VSYNC.)
- DRDY acts like an output enable signal to the CRT display. This output enables the data to be shifted onto the display. When disabled, the data is invalid and the trace is off. (DRDY can be used either synchronous or asynchronous generic purpose pin as well.)

4.12.10.6.3 TFT Panel Sync Pulse Timing Diagrams

Figure 61 depicts the horizontal timing (timing of one line), including both the horizontal sync pulse and the data. All the parameters shown in the figure are programmable. All controls are started by corresponding internal events—local start points. The timing diagrams correspond to inverse polarity of the IPP_DISP_CLK signal and active-low polarity of the HSYNC, VSYNC, and DRDY signals.

Figure 62 depicts the vertical timing (timing of one frame). All parameters shown in the figure are programmable.

¹ Display interface clock period immediate value.

$$T_{dicp} = \begin{cases} T_{diclk} \times \frac{DISP_CLK_PERIOD}{DI_CLK_PERIOD}, & \text{for integer } \frac{DISP_CLK_PERIOD}{DI_CLK_PERIOD} \\ T_{diclk} \left(\text{floor} \left[\frac{DISP_CLK_PERIOD}{DI_CLK_PERIOD} \right] + 0.5 \pm 0.5 \right), & \text{for fractional } \frac{DISP_CLK_PERIOD}{DI_CLK_PERIOD} \end{cases}$$

DISP_CLK_PERIOD—number of DI_CLK per one Tdicp. Resolution 1/16 of DI_CLK.

DI_CLK_PERIOD—relation of between programing clock frequency and current system clock frequency

Display interface clock period average value.

$$\bar{T}_{dicp} = T_{diclk} \times \frac{DISP_CLK_PERIOD}{DI_CLK_PERIOD}$$

² DI's counter can define offset, period and UP/DOWN characteristic of output signal according to programed parameters of the counter. Same of parameters in the table are not defined by DI's registers directly (by name), but can be generated by corresponding DI's counter. The SCREEN_WIDTH is an input value for DI's HSYNC generation counter. The distance between HSYNCs is a SCREEN_WIDTH.

The maximum accuracy of UP/DOWN edge of controls is:

$$\text{Accuracy} = (0.5 \times T_{diclk}) \pm 0.62\text{ns}$$

The maximum accuracy of UP/DOWN edge of IPP_DISP_DATA is:

$$\text{Accuracy} = T_{diclk} \pm 0.62\text{ns}$$

The DISP_CLK_PERIOD, DI_CLK_PERIOD parameters are register-controlled.

Electrical Characteristics

4.12.14 PCIe PHY Parameters

The PCIe interface complies with PCIe specification Gen2 x1 lane and supports the PCI Express 1.1/2.0 standard.

4.12.14.1 PCIE_REXT Reference Resistor Connection

The impedance calibration process requires connection of reference resistor 200 Ω . 1% precision resistor on PCIE_REXT pads to ground. It is used for termination impedance calibration.

4.12.15 Pulse Width Modulator (PWM) Timing Parameters

This section describes the electrical information of the PWM. The PWM can be programmed to select one of three clock signals as its source frequency. The selected clock signal is passed through a prescaler before being input to the counter. The output is available at the pulse-width modulator output (PWMO) external pin.

Figure 79 depicts the timing of the PWM, and Table 65 lists the PWM timing parameters.

4.12.16 SATA PHY Parameters

This section describes SATA PHY electrical specifications.

4.12.16.1 Transmitter and Receiver Characteristics

The SATA PHY meets or exceeds the electrical compliance requirements defined in the SATA specifications.

NOTE

The tables in the following sections indicate any exceptions to the SATA specification or aspects of the SATA PHY that exceed the standard, as well as provide information about parameters not defined in the standard.

The following subsections provide values obtained from a combination of simulations and silicon characterization.

4.12.16.1.1 SATA PHY Transmitter Characteristics

Table 66 provides specifications for SATA PHY transmitter characteristics.

Table 66. SATA PHY Transmitter Characteristics

| Parameters | Symbol | Min | Typ | Max | Unit |
|--|-----------|------|-----|-----|------|
| Transmit common mode voltage | V_{CTM} | 0.4 | — | 0.6 | V |
| Transmitter pre-emphasis accuracy (measured change in de-emphasized bit) | — | -0.5 | — | 0.5 | dB |

4.12.16.1.2 SATA PHY Receiver Characteristics

Table 67 provides specifications for SATA PHY receiver characteristics.

| Parameters | Symbol | Min | Typ | Max | Unit |
|---|----------------------------|------|-----|-----|------|
| Minimum Rx eye height (differential peak-to-peak) | $V_{MIN_RX_EYE_HEIGHT}$ | 175 | — | — | mV |
| Tolerance | PPM | -400 | — | 400 | ppm |

4.12.16.2 SATA_REXT Reference Resistor Connection

The impedance calibration process requires connection of reference resistor 191 Ω . 1% precision resistor on SATA_REXT pad to ground.

Resistor calibration consists of learning which state of the internal Resistor Calibration register causes an internal, digitally trimmed calibration resistor to best match the impedance applied to the SATA_REXT pin. The calibration register value is then supplied to all Tx and Rx termination resistors.

During the calibration process (for a few tens of microseconds), up to 0.3 mW can be dissipated in the external SATA_REXT resistor. At other times, no power is dissipated by the SATA_REXT resistor.

| SS42 | AUDx_RXD setup before AUDx_TXC falling | 10.0 | — | ns |
| SS43 | AUDx_RXD hold after AUDx_TXC falling | 0.0 | — | ns |

NOTE

- All the timings for the SSI are given for a non-inverted serial clock polarity (TSCKP/RSCKP = 0) and a non-inverted frame sync (TFSI/RFSI = 0). If the polarity of the clock and/or the frame sync have been inverted, all the timing remains valid by inverting the clock signal AUDx_TXC/AUDx_RXC and/or the frame sync AUDx_TXFS/AUDx_RXFS shown in the tables and in the figures.
- All timings are on Audiomux Pads when SSI is being used for data transfer.
- The terms, WL and BL, refer to Word Length(WL) and Bit Length(BL).
- For internal Frame Sync operation using external clock, the frame sync timing is the same as that of transmit data (for example, during AC97 mode of operation).

4.12.19.2 SSI Receiver Timing with Internal Clock

Figure 87 depicts the SSI receiver internal clock timing and Table 72 lists the timing parameters for the receiver timing with the internal clock.

| SS50 | Oversampling clock low period | 6.0 | — | ns |
| SS51 | Oversampling clock fall time | — | 3.0 | ns |

NOTE

- All the timings for the SSI are given for a non-inverted serial clock polarity (TSCKP/RSCCKP = 0) and a non-inverted frame sync (TFSI/RFSI = 0). If the polarity of the clock and/or the frame sync have been inverted, all the timing remains valid by inverting the clock signal AUDx_TXC/AUDx_RXC and/or the frame sync AUDx_TXFS/AUDx_RXFS shown in the tables and in the figures.
- All timings are on Audiomux Pads when SSI is being used for data transfer.
- AUDx_TXC and AUDx_RXC refer to the Transmit and Receive sections of the SSI.
- The terms, WL and BL, refer to Word Length (WL) and Bit Length (BL).
- For internal Frame Sync operation using external clock, the frame sync timing is same as that of transmit data (for example, during AC97 mode of operation).

4.12.19.3 SSI Transmitter Timing with External Clock

Figure 88 depicts the SSI transmitter external clock timing and Table 73 lists the timing parameters for the transmitter timing with the external clock.

4.12.20 UART I/O Configuration and Timing Parameters

4.12.20.1 UART RS-232 I/O Configuration in Different Modes

The i.MX 6Dual/6Quad UART interfaces can serve both as DTE or DCE device. This can be configured by the DCEDTE control bit (default 0 – DCE mode). [Table 75](#) shows the UART I/O configuration based on the enabled mode.

Table 75. UART I/O Configuration vs. Mode

| Port | DTE Mode | | DCE Mode | |
|---------------|-----------|-----------------------------|-----------|-----------------------------|
| | Direction | Description | Direction | Description |
| UARTx_RTS_B | Output | RTS from DTE to DCE | Input | RTS from DTE to DCE |
| UARTx_CTS_B | Input | CTS from DCE to DTE | Output | CTS from DCE to DTE |
| UARTx_DTR_B | Output | DTR from DTE to DCE | Input | DTR from DTE to DCE |
| UARTx_DSR_B | Input | DSR from DCE to DTE | Output | DSR from DCE to DTE |
| UARTx_DCD_B | Input | DCD from DCE to DTE | Output | DCD from DCE to DTE |
| UARTx_RI_B | Input | RING from DCE to DTE | Output | RING from DCE to DTE |
| UARTx_TX_DATA | Input | Serial data from DCE to DTE | Output | Serial data from DCE to DTE |
| UARTx_RX_DATA | Output | Serial data from DTE to DCE | Input | Serial data from DTE to DCE |

4.12.20.2 UART RS-232 Serial Mode Timing

The following sections describe the electrical information of the UART module in the RS-232 mode.

4.12.20.2.1 UART Transmitter

Figure 90 depicts the transmit timing of UART in the RS-232 serial mode, with 8 data bit/1 stop bit format. Table 76 lists the UART RS-232 serial mode transmit timing characteristics.

Figure 90. UART RS-232 Serial Mode Transmit Timing Diagram

Table 76. RS-232 Serial Mode Transmit Timing Parameters

| ID | Parameter | Symbol | Min | Max | Unit |
|-----|-------------------|------------|---------------------------------------|-----------------------------------|------|
| UA1 | Transmit Bit Time | t_{Tbit} | $1/F_{baud_rate}^1 - T_{ref_clk}^2$ | $1/F_{baud_rate} + T_{ref_clk}$ | — |

¹ F_{baud_rate} : Baud rate frequency. The maximum baud rate the UART can support is $(ipg_perclk \text{ frequency})/16$.

² T_{ref_clk} : The period of UART reference clock ref_clk (ipg_perclk after RFDIV divider).

4.12.20.2.2 UART Receiver

Figure 91 depicts the RS-232 serial mode receive timing with 8 data bit/1 stop bit format. Table 77 lists serial mode receive timing characteristics.

Figure 91. UART RS-232 Serial Mode Receive Timing Diagram

Table 77. RS-232 Serial Mode Receive Timing Parameters

| ID | Parameter | Symbol | Min | Max | Unit |
|-----|-------------------------------|------------|---|---|------|
| UA2 | Receive Bit Time ¹ | t_{Rbit} | $1/F_{baud_rate}^2 - 1/(16 \times F_{baud_rate})$ | $1/F_{baud_rate} + 1/(16 \times F_{baud_rate})$ | — |

¹ The UART receiver can tolerate $1/(16 \times F_{baud_rate})$ tolerance in each bit. But accumulation tolerance in one frame must not exceed $3/(16 \times F_{baud_rate})$.

² F_{baud_rate} : Baud rate frequency. The maximum baud rate the UART can support is $(ipg_perclk \text{ frequency})/16$.

4.12.20.2.3 UART IrDA Mode Timing

The following subsections give the UART transmit and receive timings in IrDA mode.

UART IrDA Mode Transmitter

Figure 92 depicts the UART IrDA mode transmit timing, with 8 data bit/1 stop bit format. Table 78 lists the transmit timing characteristics.

Figure 92. UART IrDA Mode Transmit Timing Diagram

Table 78. IrDA Mode Transmit Timing Parameters

| ID | Parameter | Symbol | Min | Max | Unit |
|-----|--------------------------------|----------------|---|---|------|
| UA3 | Transmit Bit Time in IrDA mode | t_{TIRbit} | $1/F_{baud_rate}^1 - T_{ref_clk}^2$ | $1/F_{baud_rate} + T_{ref_clk}$ | — |
| UA4 | Transmit IR Pulse Duration | $t_{TIRpulse}$ | $(3/16) \times (1/F_{baud_rate}) - T_{ref_clk}$ | $(3/16) \times (1/F_{baud_rate}) + T_{ref_clk}$ | — |

¹ F_{baud_rate} : Baud rate frequency. The maximum baud rate the UART can support is (ipg_perclk frequency)/16.

² T_{ref_clk} : The period of UART reference clock ref_clk (ipg_perclk after RFDIV divider).

UART IrDA Mode Receiver

Figure 93 depicts the UART IrDA mode receive timing, with 8 data bit/1 stop bit format. Table 79 lists the receive timing characteristics.

Figure 93. UART IrDA Mode Receive Timing Diagram

Table 79. IrDA Mode Receive Timing Parameters

| ID | Parameter | Symbol | Min | Max | Unit |
|-----|--|----------------|---|---|------|
| UA5 | Receive Bit Time ¹ in IrDA mode | t_{RIRbit} | $1/F_{baud_rate}^2 - 1/(16 \times F_{baud_rate})$ | $1/F_{baud_rate} + 1/(16 \times F_{baud_rate})$ | — |
| UA6 | Receive IR Pulse Duration | $t_{RIRpulse}$ | 1.41 μ s | $(5/16) \times (1/F_{baud_rate})$ | — |

¹ The UART receiver can tolerate $1/(16 \times F_{baud_rate})$ tolerance in each bit. But accumulation tolerance in one frame must not exceed $3/(16 \times F_{baud_rate})$.

² F_{baud_rate} : Baud rate frequency. The maximum baud rate the UART can support is (ipg_perclk frequency)/16.

4.12.21 USB HSIC Timings

This section describes the electrical information of the USB HSIC port.

NOTE

HSIC is a DDR signal. The following timing specification is for both rising and falling edges.

4.12.21.1 Transmit Timing

Figure 94. USB HSIC Transmit Waveform

Table 80. USB HSIC Transmit Parameters

| Name | Parameter | Min | Max | Unit | Comment |

5 Boot Mode Configuration

This section provides information on boot mode configuration pins allocation and boot devices interfaces allocation.

5.1 Boot Mode Configuration Pins

Table 82 provides boot options, functionality, fuse values, and associated pins. Several input pins are also sampled at reset and can be used to override fuse values, depending on the value of BT_FUSE_SEL fuse. The boot option pins are in effect when BT_FUSE_SEL fuse is '0' (cleared, which is the case for an unblown fuse). For detailed boot mode options configured by the boot mode pins, see i.MX 6Dual/6Quad the System Boot chapter of the i.MX 6Dual/6Quad reference manual (IMX6DQRM).

6 Package Information and Contact Assignments

This section includes the contact assignment information and mechanical package drawing.

6.1 Signal Naming Convention

The signal names of the i.MX6 series of products are standardized to align the signal names within the family and across the documentation. Benefits of this standardization are as follows:

- Signal names are unique within the scope of an SoC and within the series of products
- Searches will return all occurrences of the named signal
- Signal names are consistent between i.MX 6 series products implementing the same modules
- The module instance is incorporated into the signal name

This standardization applies only to signal names. The ball names are preserved to prevent the need to change schematics, BSDL models, IBIS models, and so on.

Throughout this document, the signal names are used except where referenced as a ball name (such as the Functional Contact Assignments table, Ball Map table, and so on). A master list of signal names is in the document, *IMX 6 Series Standardized Signal Name Map* (EB792). This list can be used to map the signal names used in older documentation to the standardized naming conventions.

6.2 12 x 12 mm Package on Package (PoP) Information

This section contains the outline drawing, signal assignment map, ground/power reference ID (by ball grid location) for the 12 x 12 mm, 0.4 mm pitch PoP package.

6.2.1 Case PoP, 0.4 mm Pitch, 12 x 12 Ball Matrix

Figure 97 and Figure 97 show the top, bottom, and side views of the 12 x 12 mm PoP package.

NOTES:

1. ALL DIMENSIONS IN MILLIMETERS.

2. DIMENSIONING AND TOLERANCING PER ASME Y14.5M-1994.

3. MAXIMUM SOLDER BALL DIAMETER MEASURED PARALLEL TO DATUM A.

4. DATUM A, THE SEATING PLANE, IS DETERMINED BY THE SPHERICAL CROWNS OF THE SOLDER BALLS.

5. PARALLELISM MEASUREMENT SHALL EXCLUDE ANY EFFECT OF MARK AND LANDING PADS ON TOP SURFACE OF PACKAGE.

¹ The state immediately after reset and before ROM firmware or software has executed.

² Variance of the pull-up and pull-down strengths are shown in the tables as follows:

- [Table 21, “GPIO I/O DC Parameters,” on page 38.](#)
- [Table 24, “LVDS I/O DC Parameters,” on page 41.](#)

³ ENET_REF_CLK is used as a clock source for MII and RGMII modes only. RGMII mode uses either GPIO_16 or RGMII_TX_CTL as a clock source. For more information on these clocks, see the device Reference Manual and the Hardware Development Guide for i.MX 6Quad, 6Dual, 6DualLite, 6Solo Families of Applications Processors (iMX6DQ6SDLHDG).

6.2.4 Signals with Different Reset States

For most of the signals, the state during reset is same as the state after reset, given in Out of Reset Condition column of [Table 85, “12 x 12 mm Functional Contact Assignments”](#). However, there are few signals for which the state during reset is different from the state after reset. These signals along with their state during reset are given in [Table 86](#).

6.2.5 12 x 12 mm PoP, 0.4 mm Pitch Ball Maps

Table 87 shows the 12 x 12 mm, 0.4 mm pitch top ball map. Table 88 shows the 12 x 12 mm, 0.4 mm pitch bottom ball map.

NOTE

On the top of the package, the data and control signals associated with each byte have been swizzled relative to the ball map of the associated LPDDR2 memory. This does not affect the operation of the i.MX 6Dual/6Quad SoC with the LPDDR2 memory.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
