About this Document

This Data Sheet is addressed to embedded hardware and software developers. It provides the reader with detailed descriptions about the ordering designations, available features, electrical and physical characteristics of the XMCXXXXSC series devices.

The document describes the characteristics of a superset of the XMCXXXXSC series devices. For simplicity, the various device types are referred to by the collective term XMCXXXXSC throughout this document.

XMC1000 Family User Documentation

The set of user documentation includes:

- **Data Sheets**
 - list the complete ordering designations, available features and electrical characteristics of derivative devices.
- **API Interface Document**
 - list details regarding API interface and registers.

Attention: Please consult all parts of the documentation set to attain consolidated knowledge about your device.

Application related guidance is provided by **Users Guides** and **Application Notes**.

Please refer to <http://www.infineon.com/xmc1000> to get access to the latest versions of those documents.

1 Summary of Features

The XMCXXXXSC devices are members of the XMC1000 Family of microcontrollers based on the ARM Cortex-M0 processor core. The XMCXXXXSC series addresses the real-time control needs of wireless power systems.

Figure 1 Block Diagram

Features

CPU subsystem

- 32-bit ARM Cortex-M0 CPU Core
- MATH coprocessor

On-Chip Memories

- SRAM (with parity)
- Flash (with ECC)

Supply, Reset and Clock

- 3.3 V or 5 V supply with power on reset and brownout detector
- On-chip clock monitor
- External crystal oscillator support (8 to 20 MHz)

System Control

- Window watchdog
- Real time clock module
- Pseudo random number generator

Communication Peripherals

- Four USIC channels, usable as
 - UART (115.2 kb/s)
 - IIC (up to 400 kb/s)

Analog Frontend Peripherals

- A/D converters for voltage and current sensing
- Temperature Sensor

Industrial Control Peripherals

- 2 PWM channels for full bridge coil driver
- 1 PWM channel for step-up or step-down bridge supply control

Up to 13 Input/Output Ports

- 3.3 V or 5 V capable

Programming Support

- Secure bootloader

Packages

- VQFN-40 (5x5 mm²)

Tools

- Easy to use GUI for programming and debugging

1.1 Device Overview

The following table lists the available features per device type for the XMCXXXXSC series.

Table 1 Features of XMCXXXXSC Device Types

Features	
Operating temperature (ambient)	-40 to 105 °C
Operating voltage	3.3 V or 5.5 V
GPIOs	27
GPIs	8
Packages	VQFN-40

1.2 Ordering Information

The ordering code for an Infineon microcontroller provides an exact reference to a specific product. The code “XMC<DDDD>SC-<Z><PPP><T>” identifies:

- <DDDD> the derivatives function set
- <Z> the package variant
 - Q: VQFN
- <PPP> package pin count
- <T> the temperature range:
 - X: -40°C to 105°C

For ordering codes for the XMCXXXXSC please contact your sales representative or local distributor.

This document describes several derivatives of the XMCXXXXSC series, some descriptions may not apply to a specific product. Please see [Table 2](#).

For simplicity the term **XMCXXXXSC** is used for all derivatives throughout this document.

1.3 Device Types

These device types are available and can be ordered through Infineon’s direct and/or distribution channels.

Table 2 Synopsis of XMCXXXSC Device Types

Derivative	Description
XMC0001SC-Q040X	Evaluation device to be programmed by the customer
XMC6521SC-Q040X	Qi single coil 15W inductive MP-A11 desktop transmitter
XMC6511SC-Q040X	Qi single coil 10W sub-surface infrastructure transmitter
XMC7501SC-Q040X	Single coil low power inductive transmitter
XMC7531SC-Q040X	Single coil 30W Telecom and Security transmitter
XMC7541SC-Q040X	Single coil 80W high power inductive transmitter
XMC8511SC-Q040X	Low power resonant multi-device transmitter
XMC8531SC-Q040X	30W resonant transmitter

2 General Device Information

This section summarizes the package pin configurations with a detailed list of the functional I/O mapping.

2.1 Pin Configuration and Definition

The following figures summarize all pins, showing their locations.

Figure 7 XMCXXXXSC PG-VQFN-40-17 Pin Configuration (top view)

2.1.1 Package Pin Summary

The following columns list the package pin number to which the respective function is mapped in that package.

The “Pad Type” indicates the employed pad type:

- STD_INOUT (standard bi-directional pads)
- STD_INOUT/AN (standard bi-directional pads with analog input)
- STD_INOUT/clock (standard bi-directional pads with oscillator function)
- High Current (high current bi-directional pads)
- STD_IN/AN (standard input pads with analog input)
- Power (power supply)

Details about the pad properties are defined in the Electrical Parameter chapter.

Table 5 Package Pin Mapping

Function	VQFN 40	Pad Type	Notes
GPIO0	23	STD_INOUT	GPIO0 or COIL1_EN (coil #1 enable)
GPIO1	24	STD_INOUT	GPIO1 or COIL2_EN (coil #2 enable)
GPIO2	25	STD_INOUT	GPIO2 or COIL3_EN (coil #3 enable)
GPIO3	26	STD_INOUT	GPIO3 or GAIN0 (measurement gain control)
GPIO4	27	STD_INOUT	GPIO4 or GAIN1 (measurement gain control)
GPIO5	28	STD_INOUT	GPIO5 or PWM0 (bridge supply PWM)
GPIO6	29	STD_INOUT	GPIO6 or BRIDGE_EN (bridge enable)
GPIO7	30	STD_INOUT	GPIO7 or BUZ (buzzer)
GPIO8	33	STD_INOUT	GPIO8 or PWM3H (PWM channel #3)
GPIO9	34	STD_INOUT	GPIO9 or PWM3L (PWM channel #3)
GPIO10	35	STD_INOUT /clock_IN	GPIO10 or XI (crystal input)
GPIO11	36	STD_INOUT /clock_O	GPIO11 or XO (crystal output)
GPIO12	37	STD_INOUT	GPIO12 or PWM4L (PWM channel #4)
GPIO13	38	STD_INOUT	GPIO13 or PWM4H (PWM channel #4)

VSSP	Exp. Pad	Power	Exposed Die Pad The exposed die pad is connected internally to VSSP. For proper operation, it is mandatory to connect the exposed pad to the board ground. For thermal aspects, please refer to the Package and Reliability chapter.

3 Electrical Parameter

This section provides the electrical parameter which are implementation-specific for the XMCXXXSC.

3.1 General Parameters

3.1.1 Parameter Interpretation

The parameters listed in this section represent partly the characteristics of the XMCXXXSC and partly its requirements on the system. To aid interpreting the parameters easily when evaluating them for a design, they are indicated by the abbreviations in the “Symbol” column:

- **CC**
Such parameters indicate **C**ontroller **C**haracteristics, which are distinctive feature of the XMCXXXSC and must be regarded for a system design.
- **SR**
Such parameters indicate **S**ystem **R**equirements, which must be provided by the application system in which the XMCXXXSC is designed in.

3.1.2 Absolute Maximum Ratings

Stresses above the values listed under “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions may affect device reliability.

Table 11 Absolute Maximum Rating Parameters

Parameter	Symbol		Values			Unit	Note / Test Condition
			Min	Typ.	Max.		
Junction temperature	T_J	SR	-40	–	115	°C	–
Storage temperature	T_{ST}	SR	-40	–	125	°C	–
Voltage on power supply pin with respect to V_{SSP}	V_{DDP}	SR	-0.3	–	6	V	–
Voltage on digital pins with respect to V_{SSP} ¹⁾	V_{IN}	SR	-0.5	–	$V_{DDP} + 0.5$ or max. 6	V	whichever is lower
Voltage on analog input pins with respect to V_{SSP} ²⁾	V_{INP2}	SR	-0.3	–	$V_{DDP} + 0.3$	V	–
Voltage on analog input pins with respect to V_{SSP}	V_{AIN} V_{AREF}	SR	-0.5	–	$V_{DDP} + 0.5$ or max. 6	V	whichever is lower
Input current on any pin during overload condition	I_{IN}	SR	-10	–	10	mA	–
Absolute maximum sum of all input currents during overload condition	ΣI_{IN}	SR	-50	–	+50	mA	–

1) Excluding pins CAP2, HIRES, CAP1, CMP, VAC, CAPO, COMM.

1) Applicable to pins CAP2, HIRES, CAP1, CMP, VAC, CAPO, COMM.

3.1.3 Pin Reliability in Overload

When receiving signals from higher voltage devices, low-voltage devices experience overload currents and voltages that go beyond their own IO power supplies specification.

Table 12 defines overload conditions that will not cause any negative reliability impact if all the following conditions are met:

- full operation life-time is not exceeded
- **Operating Conditions** are met for
 - pad supply levels (V_{DDP})
 - temperature

If a pin current is outside of the **Operating Conditions** but within the overload conditions, then the parameters of this pin as stated in the Operating Conditions can no longer be guaranteed. Operation is still possible in most cases but with relaxed parameters.

Note: An overload condition on one or more pins does not require a reset.

Note: A series resistor at the pin to limit the current to the maximum permitted overload current is sufficient to handle failure situations like short to battery.

Table 12 Overload Parameters

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Input current on any port pin during overload condition	I_{OV} SR	-5	–	5	mA	
Absolute sum of all input circuit currents during overload condition	I_{OVS} SR	–	–	25	mA	

Figure 11 shows the path of the input currents during overload via the ESD protection structures. The diodes against V_{DDP} and ground are a simplified representation of these ESD protection structures.

Figure 11 Input Overload Current via ESD structures

Table 13 and **Table 14** list input voltages that can be reached under overload conditions. Note that the absolute maximum input voltages as defined in the **Absolute Maximum Ratings** must not be exceeded during overload.

CAP2, HIRES, CAP1, CMP, VAC, CAP0, COMM	$V_{INP2} = V_{DDP} + 0.3 \text{ V}$

Table 14 PN-Junction Characteristics for negative Overload

Pad Type	$I_{OV} = 5 \text{ mA}$
Standard, High-current, AN/DIG_IN	$V_{IN} = V_{SS} - 0.5 \text{ V}$ $V_{AIN} = V_{SS} - 0.5 \text{ V}$ $V_{AREF} = V_{SS} - 0.5 \text{ V}$
CAP2, HIRES, CAP1, CMP, VAC, CAP0, COMM	$V_{INP2} = V_{SS} - 0.3 \text{ V}$

3.1.4 Operating Conditions

The following operating conditions must not be exceeded in order to ensure correct operation and reliability of the XMCXXXSC. All parameters specified in the following tables refer to these operating conditions, unless noted otherwise.

Table 15 Operating Conditions Parameters

Parameter	Symbol		Values			Unit	Note / Test Condition
			Min.	Typ.	Max.		
Ambient Temperature	T_A	SR	-40	–	105	°C	Temp. Range X

1) See also the Supply Monitoring thresholds, [Chapter 3.3.2](#).

3.2 DC Parameters

3.2.1 Input/Output Characteristics

Table 16 provides the characteristics of the input/output pins of the XMCXXXXSC.

Note: These parameters are not subject to production test, but verified by design and/or characterization.

Note: Unless otherwise stated, input DC and AC characteristics, including peripheral timings, assume that the input pads operate with the standard hysteresis.

- 1) Rise/Fall time parameters are taken with 10% - 90% of supply.
- 2) Additional rise/fall time valid for $C_L = 50$ pF - $C_L = 100$ pF @ 0.150 ns/pF at 5 V supply voltage.
- 3) Additional rise/fall time valid for $C_L = 50$ pF - $C_L = 100$ pF @ 0.205 ns/pF at 3.3 V supply voltage.
- 4) .
- 5) Additional rise/fall time valid for $C_L = 50$ pF - $C_L = 100$ pF @ 0.225 ns/pF at 5 V supply voltage.
- 6) Additional rise/fall time valid for $C_L = 50$ pF - $C_L = 100$ pF @ 0.288 ns/pF at 3.3 V supply voltage.
- 7) .
- 8) Hysteresis is implemented to avoid meta stable states and switching due to internal ground bounce. It cannot be guaranteed that it suppresses switching due to external system noise.
- 9) An additional error current (I_{INJ}) will flow if an overload current flows through an adjacent pin.
- 10) However, for applications with strict low power-down current requirements, it is mandatory that no active voltage source is supplied at any GPIO pin when V_{DDP} is powered off.

3.2.2 Oscillator Pins

Note: It is strongly recommended to measure the oscillation allowance (negative resistance) in the final target system (layout) to determine the optimal parameters for the oscillator operation. Please refer to the limits specified by the crystal or ceramic resonator supplier.

Note: These parameters are not subject to production test, but verified by design and/or characterization.

The oscillator pins can be operated with an external crystal/resonator (see [Figure 15](#)) or in direct input mode (see [Figure 16](#)).

		-0.3	–	5.5	V	Direct Input Mode
Input amplitude (peak-to-peak) at GPIO10 ²⁾³⁾	V_{PPX} SR	0.6	–	1.7	V	External Crystal Mode

- 1) t_{OSCS} is defined from the moment the oscillator is enabled with SCU_ANAOSCHPCTRL.MODE until the oscillations reach an amplitude at XTAL1 of $0.9 * V_{\text{PPX}}$.
- 2) The external oscillator circuitry must be optimized by the customer and checked for negative resistance and amplitude as recommended and specified by crystal suppliers.
- 3) If the shaper unit is enabled and not bypassed.

3.2.3 Power Supply Current

The total power supply current defined below consists of a leakage and a switching component.

Application relevant values are typically lower than those given in the following tables, and depend on the customer's system operating conditions (e.g. thermal connection or used application configurations).

Note: These parameters are not subject to production test, but verified by design and/or characterization.

3.3.2 Power-Up and Supply Threshold Characteristics

Table 26 provides the characteristics of the supply threshold in XMCXXXXSC.

The guard band between the lowest valid operating voltage and the brownout reset threshold provides a margin for noise immunity and hysteresis. The electrical parameters may be violated while V_{DDP} is outside its operating range.

The brownout detection triggers a reset within the defined range. The prewarning detection can be used to trigger an early warning and issue corrective and/or fail-safe actions in case of a critical supply voltage drop.

Note: These parameters are not subject to production test, but verified by design and/or characterization.

- 1) A capacitor of at least 100 nF has to be added between V_{DDP} and V_{SSP} to fulfill the requirement as stated for this parameter.
- 2) Valid for a 100 nF buffer capacitor connected to supply pin where current from capacitor is forwarded only to the chip. A larger capacitor value has to be chosen if the power source sink a current.
- 3) This values does not include the ramp-up time. During startup firmware execution, MCLK is running at 48 MHz and the clocks to peripheral as specified in register CGATSTAT0 are gated.

3.3.3.1 Inter-IC (IIC) Interface Timing

The following parameters are applicable for a USIC channel operated in IIC mode.

Note: Operating Conditions apply.

Table 33 USIC IIC Standard Mode Timing¹⁾

Parameter	Symbol	Values			Unit	Note / Test Condition
		Min.	Typ.	Max.		
Fall time of both SDA and SCL	t_1 CC/SR	-	-	300	ns	
Rise time of both SDA and SCL	t_2 CC/SR	-	-	1000	ns	
Data hold time	t_3 CC/SR	0	-	-	µs	
Data set-up time	t_4 CC/SR	250	-	-	ns	
LOW period of SCL clock	t_5 CC/SR	4.7	-	-	µs	
HIGH period of SCL clock	t_6 CC/SR	4.0	-	-	µs	
Hold time for (repeated) START condition	t_7 CC/SR	4.0	-	-	µs	
Set-up time for repeated START condition	t_8 CC/SR	4.7	-	-	µs	
Set-up time for STOP condition	t_9 CC/SR	4.0	-	-	µs	
Bus free time between a STOP and START condition	t_{10} CC/SR	4.7	-	-	µs	
Capacitive load for each bus line	C_b SR	-	-	400	pF	

¹⁾ Due to the wired-AND configuration of an IIC bus system, the port drivers of the SCL and SDA signal lines need to operate in open-drain mode. The high level on these lines must be held by an external pull-up device, approximately 10 kOhm for operation at 100 kbit/s, approximately 2 kOhm for operation at 400 kbit/s.

4 Package and Reliability

The XMCXXXSC is a member of the XMC1000 Family of microcontrollers. It is also compatible to a certain extent with members of similar families or subfamilies.

Each package is optimized for the device it houses. Therefore, there may be slight differences between packages of the same pin-count but for different device types. In particular, the size of the exposed die pad may vary.

If different device types are considered or planned for an application, it must be ensured that the board layout fits all packages under consideration.

4.1 Package Parameters

Table 37 provides the thermal characteristics of the packages used in XMCXXXSC.

Table 37 Thermal Characteristics of the Packages

Parameter	Symbol	Limit Values		Unit	Package Types
		Min.	Max.		
Exposed Die Pad Dimensions	Ex × Ey CC	-	3.7 × 3.7	mm	PG-VQFN-40-17
Thermal resistance Junction-Ambient	$R_{\theta JA}$ CC	-	45.3	K/W	PG-VQFN-40-17 ¹⁾

1) Device mounted on a 4-layer JEDEC board (JESD 51-5); exposed pad soldered.

Note: For electrical reasons, it is required to connect the exposed pad to the board ground V_{SSP} , independent of EMC and thermal requirements.

4.1.1 Thermal Considerations

When operating the XMCXXXSC in a system, the total heat generated in the chip must be dissipated to the ambient environment to prevent overheating and the resulting thermal damage.

The maximum heat that can be dissipated depends on the package and its integration into the target board. The “Thermal resistance $R_{\theta JA}$ ” quantifies these parameters. The power dissipation must be limited so that the average junction temperature does not exceed 115 °C.

The difference between junction temperature and ambient temperature is determined by

$$\Delta T = (P_{\text{INT}} + P_{\text{IOSTAT}} + P_{\text{IODYN}}) \times R_{\Theta\text{JA}}$$

The internal power consumption is defined as

$$P_{\text{INT}} = V_{\text{DDP}} \times I_{\text{DDP}} \text{ (switching current and leakage current).}$$

The static external power consumption caused by the output drivers is defined as

$$P_{\text{IOSTAT}} = \Sigma((V_{\text{DDP}} - V_{\text{OH}}) \times I_{\text{OH}}) + \Sigma(V_{\text{OL}} \times I_{\text{OL}})$$

The dynamic external power consumption caused by the output drivers (P_{IODYN}) depends on the capacitive load connected to the respective pins and their switching frequencies.

If the total power dissipation for a given system configuration exceeds the defined limit, countermeasures must be taken to ensure proper system operation:

- Reduce V_{DDP} , if possible in the system
- Reduce the system frequency
- Reduce the number of output pins
- Reduce the load on active output drivers

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
