

LMH6619Q 130 MHz, 1.25 mA RRIO Operational Amplifier

Check for Samples: [LMH6619Q](#)

FEATURES

- $V_S = 5V$, $R_L = 1\text{ k}\Omega$, $T_A = 25^\circ\text{C}$ and $A_V = +1$, unless otherwise specified.
- Operating voltage range 2.7V to 11V
- Supply current per channel 1.25 mA
- Small signal bandwidth 130 MHz
- Input offset voltage (limit at 25°C) $\pm 0.75\text{ mV}$
- Slew rate 55 V/ μs
- Settling time to 0.1% 90 ns
- Settling time to 0.01% 120 ns
- SFDR ($f = 100\text{ kHz}$, $A_V = +1$, $V_{OUT} = 2\text{ V}_{PP}$) 100 dBc
- 0.1 dB bandwidth ($A_V = +2$) 15 MHz
- Low voltage noise 10 nV/ $\sqrt{\text{Hz}}$
- Rail-to-Rail input and output

- AEC-Q100 grade 2 qualified -40°C to $+105^\circ\text{C}$
- Manufactured on an automotive grade flow

APPLICATIONS

- ADC driver
- DAC buffer
- Active filters
- High speed sensor amplifier
- Current sense amplifier
- Portable video
- STB, TV video amplifier
- Automotive

DESCRIPTION

The LMH6619Q (dual) is a 130 MHz rail-to-rail input and output amplifier designed for ease of use in a wide range of applications requiring high speed, low supply current, low noise, and the ability to drive complex ADC and video loads. The operating voltage range extends from 2.7V to 11V and the supply current is typically 1.25 mA per channel at 5V. The LMH6619Q is a member of the PowerWise® family and have an exceptional power-to-performance ratio.

The amplifier's voltage feedback design topology provides balanced inputs and high open loop gain for ease of use and accuracy in applications such as active filter design. Offset voltage is typically 0.1 mV and settling time to 0.01% is 120 ns which combined with an 100 dBc SFDR at 100 kHz makes the part suitable for use as an input buffer for popular 8-bit, 10-bit, 12-bit and 14-bit mega-sample ADCs.

The input common mode range extends 200 mV beyond the supply rails. On a single 5V supply with a ground terminated 150 Ω load the output swings to within 37 mV of the ground rail, while a mid-rail terminated 1 k Ω load will swing to 77 mV of either rail, providing true single supply operation and maximum signal dynamic range on low power rails. The amplifier output will source and sink 35 mA and drive up to 30 pF loads without the need for external compensation.

The LMH6619Q is offered in the 8-Pin SOIC package.

PRODUCT PREVIEW

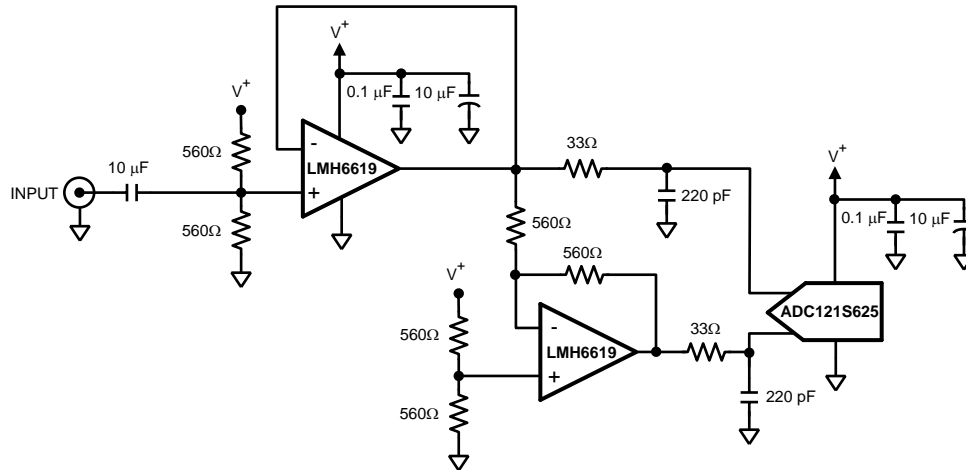

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

Typical Application

Figure 1. Single to Differential ADC Driver

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

Absolute Maximum Ratings ⁽¹⁾

ESD Tolerance ⁽²⁾	
Human Body Model	
For input pins only	2000V
For all other pins	2000V
Machine Model	200V
Supply Voltage ($V_S = V^+ - V^-$)	12V
Junction Temperature ⁽³⁾	150°C max
Storage Temperature Range	-65°C to 150°C
Soldering Information:	
See product folder at www.ti.com and www.ti.com/lit/an/snoa549c/snoa549c.pdf .	

- (1) Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is intended to be functional, but specific performance is not guaranteed. For guaranteed specifications and the test conditions, see the Electrical Characteristics.
- (2) Human Body Model, applicable std. MIL-STD-883, Method 3015.7. Machine Model, applicable std. JESD22-A115-A (ESD MM std. of JEDEC) Field-Induced Charge-Device Model, applicable std. JESD22-C101-C (ESD FICDM std. of JEDEC).
- (3) The maximum power dissipation is a function of $T_{J(MAX)}$, θ_{JA} . The maximum allowable power dissipation at any ambient temperature is $P_D = (T_{J(MAX)} - T_A) / \theta_{JA}$. All numbers apply for packages soldered directly onto a PC Board.

Operating Ratings ⁽¹⁾

Supply Voltage ($V_S = V^+ - V^-$)	2.7V to 11V
Ambient Temperature Range ⁽²⁾	-40°C to +105°C
Package Thermal Resistance (θ_{JA})	
8-Pin SOIC	160°C/W

- (1) Absolute Maximum Ratings indicate limits beyond which damage to the device may occur. Operating Ratings indicate conditions for which the device is intended to be functional, but specific performance is not guaranteed. For guaranteed specifications and the test conditions, see the Electrical Characteristics.
- (2) The maximum power dissipation is a function of $T_{J(MAX)}$, θ_{JA} . The maximum allowable power dissipation at any ambient temperature is $P_D = (T_{J(MAX)} - T_A) / \theta_{JA}$. All numbers apply for packages soldered directly onto a PC Board.

+3V Electrical Characteristics

Unless otherwise specified, all limits are guaranteed for $T_J = +25^{\circ}\text{C}$, $V^+ = 3\text{V}$, $V^- = 0\text{V}$, $V_{\text{CM}} = V_O = V^+/2$, $A_V = +1$ ($R_F = 0\Omega$), otherwise $R_F = 2\text{ k}\Omega$ for $A_V \neq +1$, $R_L = 1\text{ k}\Omega \parallel 5\text{ pF}$. **Boldface** Limits apply at temperature extremes. ⁽¹⁾

Symbol	Parameter	Condition	Min (2)	Typ (3)	Max (2)	Units
Frequency Domain Response						
SSBW	–3 dB Bandwidth Small Signal	$A_V = 1$, $R_L = 1\text{ k}\Omega$, $V_{OUT} = 0.2\text{ V}_{PP}$		120		MHz

CMRR	Common Mode Rejection Ratio	V_{CM} Stepped from –0.1V to 1.4V	78	96		dB
		V_{CM} Stepped from 2.0V to 3.1V	81	107		
A_{OL}	Open Loop Voltage Gain	$R_L = 1\text{ k}\Omega$ to +2.7V or +0.3V	85	98		dB
		$R_L = 150\Omega$ to +2.6V or +0.4V	76	82		
Output DC Characteristics						

(1) Boldface limits apply to temperature range of -40°C to 105°C

(2) Limits are 100% production tested at 25°C . Limits over the operating temperature range are guaranteed through correlations using the Statistical Quality Control (SQC) method.

(3) Typical values represent the most likely parametric norm as determined at the time of characterization. Actual typical values may vary over time and will also depend on the application and configuration. The typical values are not tested and are not guaranteed on shipped production material.

(4) Voltage average drift is determined by dividing the change in V_{OS} by temperature change.

+3V Electrical Characteristics (continued)

Unless otherwise specified, all limits are guaranteed for $T_J = +25^\circ\text{C}$, $V^+ = 3\text{V}$, $V^- = 0\text{V}$, $V_{CM} = V_O = V^+/2$, $A_V = +1$ ($R_F = 0\Omega$), otherwise $R_F = 2\text{ k}\Omega$ for $A_V \neq +1$, $R_L = 1\text{ k}\Omega \parallel 5\text{ pF}$. **Boldface** Limits apply at temperature extremes. ⁽¹⁾

Symbol	Parameter	Condition	Min (2)	Typ (3)	Max (2)	Units
V_{OUT}	Output Voltage Swing High (Voltage from V^+ Supply Rail)	$R_L = 1\text{ k}\Omega$ to $V^+/2$		50	56 62	mV from either rail
		$R_L = 150\Omega$ to $V^+/2$		160	172 198	
	Output Voltage Swing Low (Voltage from V^- Supply Rail)	$R_L = 1\text{ k}\Omega$ to $V^+/2$		62	68 76	
		$R_L = 150\Omega$ to $V^+/2$		175	189 222	
		$R_L = 150\Omega$ to V^-		34	44 48	
I_{OUT}	Linear Output Current	$V_{OUT} = V^+/2$ ⁽⁵⁾	± 25	± 35		mA
R_{OUT}	Output Resistance	$f = 1\text{ MHz}$		0.17		Ω
Power Supply Performance						
PSRR	Power Supply Rejection Ratio	DC, $V_{CM} = 0.5\text{V}$, $V_S = 2.7\text{V}$ to 11V	84	104		dB
I_S	Supply Current (per channel)	$R_L = \infty$		1.2	1.5 1.75	

(5) Do not short circuit the output. Continuous source or sink currents larger than the I_{OUT} typical are not recommended as it may damage the part.

+5V Electrical Characteristics

Unless otherwise specified, all limits are guaranteed for $T_J = +25^\circ\text{C}$, $V^+ = 5\text{V}$, $V^- = 0\text{V}$, $V_{CM} = V_O = V^+/2$, $A_V = +1$ ($R_F = 0\Omega$), otherwise $R_F = 2\text{ k}\Omega$ for $A_V \neq +1$, $R_L = 1\text{ k}\Omega \parallel 5\text{ pF}$. **Boldface** Limits apply at temperature extremes.

Application Information

The LMH6619Q is based on National Semiconductor's proprietary VIP10 dielectrically isolated bipolar process. This device family architecture features the following:

- Complimentary bipolar devices with exceptionally high f_t (~8 GHz) even under low supply voltage (2.7V) and

low bias current.

- Common emitter push-push output stage. This architecture allows the output to reach within millivolts of either supply rail.
- Consistent performance from any supply voltage (2.7V - 11V) with little variation with supply voltage for the most important specifications (e.g. BW, SR, I_{OUT} .)
- Significant power saving compared to competitive devices on the market with similar performance.

With 3V supplies and a common mode input voltage range that extends beyond either supply rail, the LMH6619Q is well suited to many low voltage/low power applications. Even with 3V supplies, the -3 dB BW (at $A_V = +1$) is typically 120 MHz.

The LMH6619Q is designed to avoid output phase reversal. With input over-drive, the output is kept near the supply rail (or as close to it as mandated by the closed loop gain setting and the input voltage). Figure 3 shows the input and output voltage when the input voltage significantly exceeds the supply voltages.

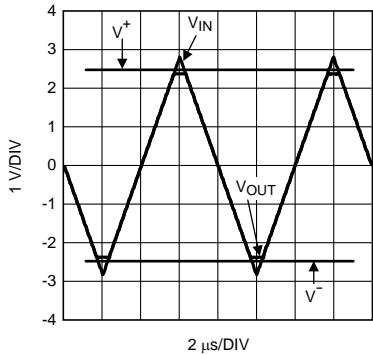

Figure 3. Input and Output Shown with CMVR Exceeded

SINGLE TO DIFFERENTIAL ADC DRIVER

Figure 4 shows the LMH6619Q used to drive a differential ADC with a single-ended input. The ADC121S625 is a fully differential 12-bit ADC. Table 1 shows the performance data of the LMH6619Q and the ADC121S625.

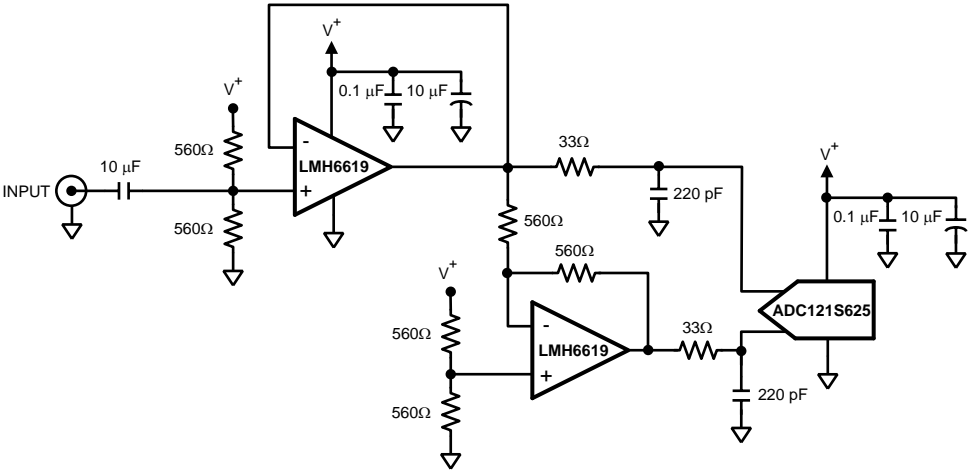

Figure 4. LMH6619Q Driving an ADC121S625

Table 1. Performance Data for the Single to Differential ADC Driver

Parameter	Measured Value
Signal Frequency	10 kHz
Signal Amplitude	2.5V

Table 1. Performance Data for the Single to Differential ADC Driver (continued)

Parameter	Measured Value
SINAD	67.9 dB
SNR	68.29 dB
THD	-78.6 dB
SFDR	75.0 dB
ENOB	11.0 bits

DIFFERENTIAL ADC DRIVER

Its low noise and wide bandwidth make the LMH6619Q an excellent choice for driving a 12-bit ADC. Figure 5 shows the LMH6619Q driving an ADC121S705. The ADC121S705 is a fully differential 12-bit ADC. The LMH6619Q is set up in a 2nd order multiple-feedback configuration with a gain of -1. The -3 dB point is at 500 kHz and the -0.01 dB point is at 100 kHz. The 22Ω resistor and 390 pF capacitor form an antialiasing filter for the ADC121S705. The capacitor also stores and delivers charge to the switched capacitor input of the ADC. The capacitive load on the LMH6619Q created by the 390 pF capacitor is decreased by the 22Ω resistor. Table 2 shows the performance data.

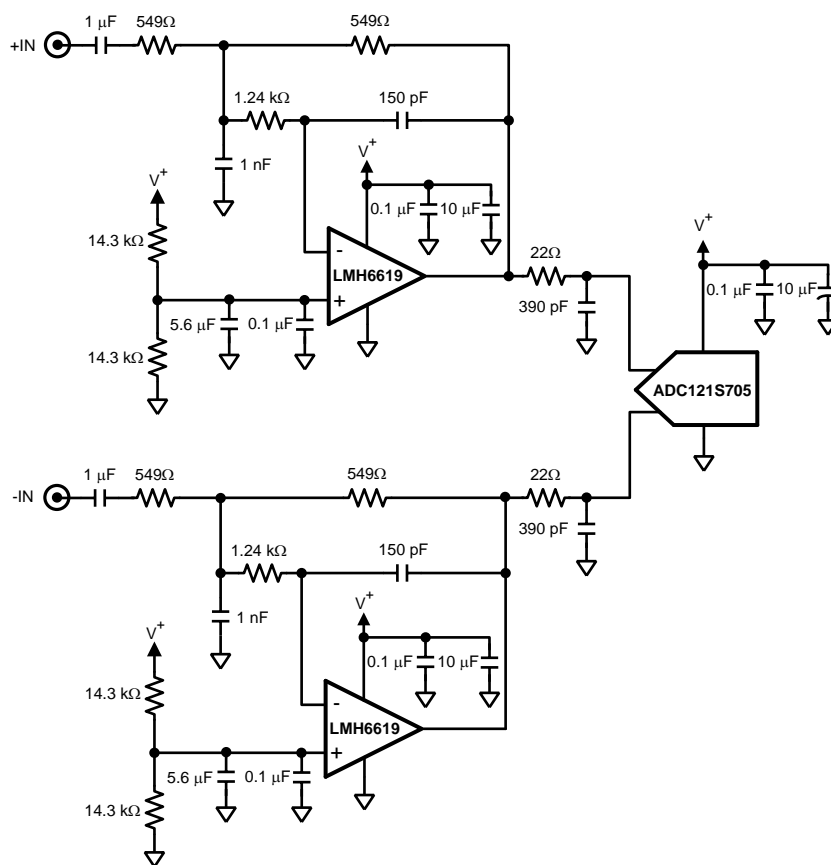

Figure 5. LMH6619Q Driving an ADC121S705

Table 2. Performance Data for the Differential ADC Driver

SFDR	90.97 dB
ENOB	11.6 bits

DC LEVEL SHIFTING

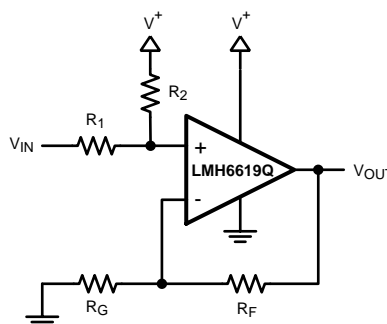

Often a signal must be both amplified and level shifted while using a single supply for the op amp. The circuit in [Figure 6](#) can do both of these tasks. The procedure for specifying the resistor values is as follows.

1. Determine the input voltage.
2. Calculate the input voltage midpoint, $V_{INMID} = V_{INMIN} + (V_{INMAX} - V_{INMIN})/2$.
3. Determine the output voltage needed.
4. Calculate the output voltage midpoint, $V_{OUTMID} = V_{OUTMIN} + (V_{OUTMAX} - V_{OUTMIN})/2$.
5. Calculate the gain needed, $gain = (V_{OUTMAX} - V_{OUTMIN})/(V_{INMAX} - V_{INMIN})$
6. Calculate the amount the voltage needs to be shifted from input to output, $\Delta V_{OUT} = V_{OUTMID} - gain \times V_{INMID}$.
7. Set the supply voltage to be used.
8. Calculate the noise gain, $noise\ gain = gain + \Delta V_{OUT}/V_S$.
9. Set R_F .
10. Calculate R_1 , $R_1 = R_F/gain$.
11. Calculate R_2 , $R_2 = R_F/(noise\ gain - gain)$.
12. Calculate R_G , $R_G = R_F/(noise\ gain - 1)$.

Check that both the V_{IN} and V_{OUT} are within the voltage ranges of the LMH6619Q.

The following example is for a V_{IN} of 0V to 1V with a V_{OUT} of 2V to 4V.

1. $V_{IN} = 0V$ to $1V$
2. $V_{INMID} = 0V + (1V - 0V)/2 = 0.5V$
3. $V_{OUT} = 2V$ to $4V$
4. $V_{OUTMID} = 2V + (4V - 2V)/2 = 3V$
5. $Gain = (4V - 2V)/(1V - 0V) = 2$
6. $\Delta V_{OUT} = 3V - 2 \times 0.5V = 2$
7. For the example the supply voltage will be +5V.
8. $Noise\ gain = 2 + 2/5V = 2.4$
9. $R_F = 2\ k\Omega$
10. $R_1 = 2\ k\Omega/2 = 1\ k\Omega$
11. $R_2 = 2\ k\Omega/(2.4 - 2) = 5\ k\Omega$
12. $R_G = 2\ k\Omega/(2.4 - 1) = 1.43\ k\Omega$

**Figure 6. DC Level Shifting**

4th ORDER MULTIPLE FEEDBACK LOW-PASS FILTER

Figure 7 shows the LMH6619Q used as the amplifier in a multiple feedback low pass filter. This filter is set up to have a gain of +1 and a -3 dB point of 1 MHz. Values can be determined by using the WEBENCH® Active Filter Designer found at amplifiers.national.com.

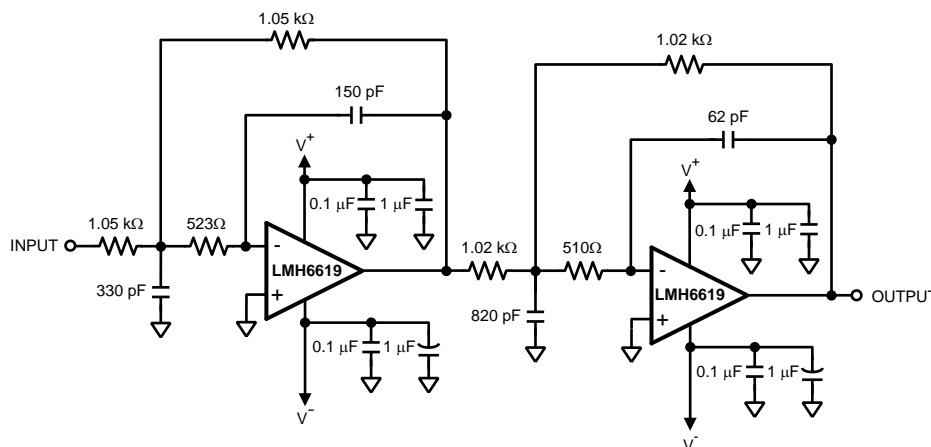

Figure 7. 4th Order Multiple Feedback Low-Pass Filter

CURRENT SENSE AMPLIFIER

With its rail-to-rail input and output capability, low V_{OS} , and low I_B the LMH6619Q is an ideal choice for a current sense amplifier application. Figure 8 shows the schematic of the LMH6619Q set up in a low-side sense configuration which provides a conversion gain of 2V/A. Voltage error due to V_{OS} can be calculated to be $V_{OS} \times (1 + R_F/R_G)$ or $0.6 \text{ mV} \times 21 = 12.6 \text{ mV}$. Voltage error due to I_O is $I_O \times R_F$ or $0.26 \mu\text{A} \times 1 \text{ k}\Omega = 0.26 \text{ mV}$. Hence total voltage error is $12.6 \text{ mV} + 0.26 \text{ mV}$ or 12.86 mV which translates into a current error of $12.86 \text{ mV} / (2 \text{ V/A}) = 6.43 \text{ mA}$.

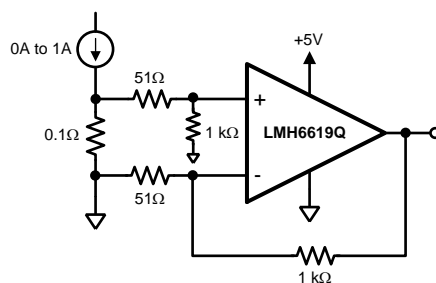

Figure 8. Current Sense Amplifier

TRANSIMPEDANCE AMPLIFIER

By definition, a photodiode produces either a current or voltage output from exposure to a light source. A Transimpedance Amplifier (TIA) is utilized to convert this low-level current to a usable voltage signal. The TIA often will need to be compensated to insure proper operation.

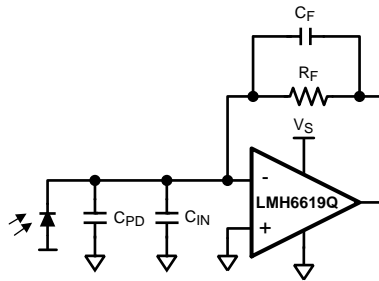

Figure 9. Photodiode Modeled with Capacitance Elements

Figure 9 shows the LMH6619Q modeled with photodiode and the internal op amp capacitances. The LMH6619Q allows circuit operation of a low intensity light due to its low input bias current by using larger values of gain (R_F). The total capacitance (C_T) on the inverting terminal of the op amp includes the photodiode capacitance (C_{PD}) and the input capacitance of the op amp (C_{IN}). This total capacitance (C_T) plays an important role in the stability of the circuit. The noise gain of this circuit determines the stability and is defined by:

$$NG = \frac{1 + sR_F(C_T + C_F)}{1 + sC_F R_F} \quad (1)$$

$$\text{Where, } f_z \cong \frac{1}{2\pi R_F C_T} \text{ and } f_p = \frac{1}{2\pi R_F C_F} \quad (2)$$

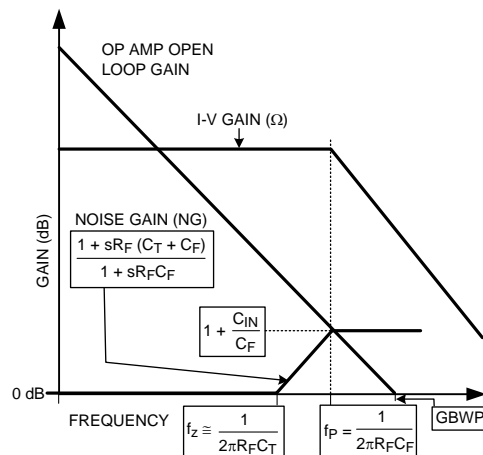

Figure 10. Bode Plot of Noise Gain Intersecting with Op Amp Open-Loop Gain

Figure 10 shows the bode plot of the noise gain intersecting the op amp open loop gain. With larger values of gain, C_T and R_F create a zero in the transfer function. At higher frequencies the circuit can become unstable due to excess phase shift around the loop.

A pole at f_p in the noise gain function is created by placing a feedback capacitor (C_F) across R_F . The noise gain slope is flattened by choosing an appropriate value of C_F for optimum performance.

Theoretical expressions for calculating the optimum value of C_F and the expected -3 dB bandwidth are:

$$C_F = \sqrt{\frac{C_T}{2\pi R_F (GBWP)}} \quad (3)$$

$$f_{-3\text{ dB}} = \sqrt{\frac{GBWP}{2\pi R_F C_T}} \quad (4)$$

Equation 4 indicates that the -3 dB bandwidth of the TIA is inversely proportional to the feedback resistor. Therefore, if the bandwidth is important then the best approach would be to have a moderate transimpedance gain stage followed by a broadband voltage gain stage.

Table 3 shows the measurement results of the LMH6619Q with different photodiodes having various capacitances (C_{PD}) and a feedback resistance (R_F) of 1 k Ω .

Table 3. TIA (Figure 1) Compensation and Performance Results

C_{PD} (pF)	C_T (pF)	C_F CAL (pF)	C_F USED (pF)	$f_{-3\text{ dB CAL}}$ (MHz)	$f_{-3\text{ dB MEAS}}$ (MHz)	Peaking (dB)
22	24	7.7	5.6	23.7	20	0.9
47	49	10.9	10	16.6	15.2	0.8
100	102	15.8	15	11.5	10.8	0.9
222	224	23.4	18	7.81	8	2.9

Figure 11 shows the frequency response for the various photodiodes in Table 3.

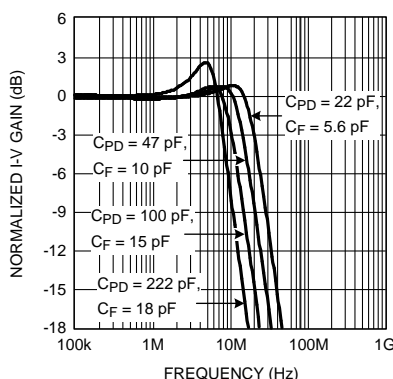

Figure 11. Frequency Response for Various Photodiode and Feedback Capacitors

When analyzing the noise at the output of the TIA, it is important to note that the various noise sources (i.e. op amp noise voltage, feedback resistor thermal noise, input noise current, photodiode noise current) do not all operate over the same frequency band. Therefore, when the noise at the output is calculated, this should be taken into account. The op amp noise voltage will be gained up in the region between the noise gain's zero and pole (f_z and f_p in Figure 10). The higher the values of R_F and C_T , the sooner the noise gain peaking starts and therefore its contribution to the total output noise will be larger. It is obvious to note that it is advantageous to minimize C_{IN} by proper choice of op amp or by applying a reverse bias across the diode at the expense of excess dark current and noise.

DIFFERENTIAL CABLE DRIVER FOR NTSC VIDEO

The LMH6619Q can be used to drive an NTSC video signal on a twisted-pair cable. Figure 12 shows the schematic of a differential cable driver for NTSC video. This circuit can be used to transmit the signal from a camera over a twisted pair to a monitor or display located a distance. C_1 and C_2 are used to AC couple the video signal into the LMH6619Q. The two amplifiers of the LMH6619Q are set to a gain of 2 to compensate for the 75 Ω back termination resistors on the outputs. The LMH6619Q is set to a gain of 1. Because of the DC bias the output of the LMH6619Q is AC coupled. Most monitors and displays will accept AC coupled inputs.

(1) The marketing status values are defined as follows:

ACTIVE: Product device recommended for new designs.

LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

PREVIEW: Device has been announced but is not in production. Samples may or may not be available.

OBSOLETE: TI has discontinued the production of the device.

(2) Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

TBD: The Pb-Free/Green conversion plan has not been defined.

Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

Pb-Free (RoHS Exempt): This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

(3) MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

(4) Only one of markings shown within the brackets will appear on the physical device.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, enhancements, improvements and other changes to its semiconductor products and services per JESD46, latest issue, and to discontinue any product or service per JESD48, latest issue. Buyers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All semiconductor products (also referred to herein as "components") are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its components to the specifications applicable at the time of sale, in accordance with the warranty in TI's terms and conditions of sale of semiconductor products. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by applicable law, testing of all parameters of each component is not necessarily performed.

TI assumes no liability for applications assistance or the design of Buyers' products. Buyers are responsible for their products and applications using TI components. To minimize the risks associated with Buyers' products and applications, Buyers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right relating to any combination, machine, or process in which TI components or services are used. Information published by TI regarding third-party products or services does not constitute a license to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of significant portions of TI information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. TI is not responsible or liable for such altered documentation. Information of third parties may be subject to additional restrictions.

Resale of TI components or services with statements different from or beyond the parameters stated by TI for that component or service voids all express and any implied warranties for the associated TI component or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

Buyer acknowledges and agrees that it is solely responsible for compliance with all legal, regulatory and safety-related requirements concerning its products, and any use of TI components in its applications, notwithstanding any applications-related information or support that may be provided by TI. Buyer represents and agrees that it has all the necessary expertise to create and implement safeguards which anticipate dangerous consequences of failures, monitor failures and their consequences, lessen the likelihood of failures that might cause harm and take appropriate remedial actions. Buyer will fully indemnify TI and its representatives against any damages arising out of the use of any TI components in safety-critical applications.

In some cases, TI components may be promoted specifically to facilitate safety-related applications. With such components, TI's goal is to help enable customers to design and create their own end-product solutions that meet applicable functional safety standards and requirements. Nonetheless, such components are subject to these terms.

No TI components are authorized for use in FDA Class III (or similar life-critical medical equipment) unless authorized officers of the parties have executed a special agreement specifically governing such use.

Only those TI components which TI has specifically designated as military grade or "enhanced plastic" are designed and intended for use in military/aerospace applications or environments. Buyer acknowledges and agrees that any military or aerospace use of TI components which have **not** been so designated is solely at the Buyer's risk, and that Buyer is solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI has specifically designated certain components as meeting ISO/TS16949 requirements, mainly for automotive use. In any case of use of non-designated products, TI will not be responsible for any failure to meet ISO/TS16949.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
