

32-Bit Microcontroller

CMOS

FR30 Series

MB91F127/F128

■ DESCRIPTION

This model, designed on the basis of 32-bit RISC CPU (FR30 series), is a standard single-chip micro controller with built-in I/O resources and bus control functions. The functions are suitable for built-in control that requires high-speed CPU processing.

MB91F127 includes 256 Kbytes built-in flash memory and 14 Kbytes built-in RAM. MB91F128 includes 510 Kbytes built-in flash memory and 14 Kbytes built-in RAM.

The specifications of the devices are best suited for applications requiring high-level CPU processing capabilities, such as navigation system, high-performance FAX, and printer controller.

■ FEATURES

FR-CPU

- 32-bit RISC (FR30), load/store architecture, 5-step pipeline
- Operating frequency : Internal 25 MHz
- General register : 32bit x 16 registers
- 16-bit fixed-length instructions (primitives), 1 instruction/1 cycle
- Instructions of memory-to-memory transfer, bit processing, and barrel shift : Instructions suitable for built-in control

(Continued)

■ PACKAGE

100 pin, Plastic LQFP

(FPT-100P-M05)

MB91F127/F128

- Function entry/exit instructions, multi load/store instruction for register data : High-level language compatible instructions
- Register interlock functions : Simple description of assembler language
- Branch instructions with delay slot : Reduced overhead on branching process
- Built-in multiplier/ Supporting at instruction level
 - Signed 32-bit multiplying : 5 cycles
 - Signed 16-bit multiplying : 3 cycles
- Interrupt (saving PC and PS) : 6 cycles, 16 priority levels

Bus interface

- Maximum of 25 MHz internal operation rate
- 25-bit address bus (32 MB space)
- 16-bit address output, 8/16-bit data input/output
- Basic bus cycle : 2-clock cycle
- Chip selection outputs specifiable in a minimum of 64 Kbytes steps : 6 outputs
- Automatic wait cycle : Specifiable flexibly from 0 cycle to 7 cycles for each area
- Supporting time-division input/output interface for address/data (for area 1 only)
- Unassigned data/address terminals are available as input/output ports
- Supporting little endian mode (selecting one area from area 1 to area 5)

DMAC (DMA controller)

- 8 channels
- Transfer factor : Interrupt request of built-in resources
- Transfer sequence : Step transfer/Block transfer/Burst transfer/Consecutive transfer
- Transfer data length : Selectable among 8 bits, 16 bits, and 32 bits
- Pausing is allowed by interrupt request

UART

- 3 channels
- Full-duplex double buffer
- Data length : 7 to 9 bits (no parity), 6 to 8 bits (with parity)
- Asynchronous (start-stop synchronization) or CLK synchronous communication is selectable
- Multi processor mode
- Built-in 16-bit timer (U-Timer) used as a baud-rate generator : Generates an arbitrary baud rate
- External clock is available as a transfer clock
- Error detection : parity, frame, and overrun

A/D converter (sequential transducer)

- 8/10-bit resolution, 8 channels
- Sequential comparison and transducer : At 25 MHz, 5.2 μ s
- Built-in sample and hold circuit
- Conversion mode : Selectable among single conversion, scan conversion, and repeat conversion
- Activation : Selectable among software, external trigger, and built-in timer

Reload timer

- 16-bit timer : 3 channels
- Internal clock : 2-clock cycle resolution, selectable among 2/8/32 dividing and external clock

(Continued)

(Continued)

Other interval timers

- 16-bit timer : 3 channels (U-Timer)
- PPG timer : 4 channels
- 16-bit OCU : 4 channels, ICU : 4 channels, Free-run timer : 1 channel
- Watchdog timer: 1 channel

Flash memory 510 KB

- 510 KB FLASH ROM: Read/Write/Erase is allowed with a same power

Built-in RAM 14 KB

- D-bus RAM 12 KB, C-bus RAM 2 KB

Bit search module

- Position of a first bit that changes between “1” and “0” is searched in one cycle, within an MSB of one word.

Interrupt controller

- External interrupt input : Normal interrupt×6 (INT0 to INT5)
- Internal interrupt factors : UART, DMAC, A/D, Reload timer, UTIMER, delay interrupt, PPG, ICU, and OCU
- Priority levels are programmable (16 levels)

Reset factors

- Power-on reset/watchdog timer/software reset/external reset

Low power consumption mode

- Sleep/stop mode

Clock control

- Built-in PLL circuit, selectable among 1-multiplication, and 2-multiplication
- Gearing function : Operation clock frequencies are freely and independently specifiable for CPU and peripherals.
Gear clocks are selectable among 1/1, 1/2, 1/4, and 1/8 (or among 1/2, 1/4, 1/8, and 1/16).
Upper limit of peripheral operations is 25 MHz.

Others

- Package : LQFP-100
- CMOS technology : 0.35 μm
- Power supply voltage : 3.3 V $\pm$ 0.3 V

(FPT-100P-M05)

■ PIN DESCRIPTION

Note that the numbers in the table are not pin numbers on a package.

No.	Pin name	Input/output circuit type	Description
1 2 3 4 5 6 7 8	D16/P20 D17/P21 D18/P22 D19/P23 D20/P24 D21/P25 D22/P26 D23/P27	D	Bit 16 through bit 23 of external data bus. The terminals are available as general I/O ports (P20 through P27) when external bus width is specified at 8 bits or in single-chip mode.
9 10 11 12 13 14 15 16	D24/P30 D25/P31 D26/P32 D27/P33 D28/P34 D29/P35 D30/P36 D31/P37	D	Bit 24 through bit 31 of external data bus. The terminals are available as general I/O ports (P30 through P37) when the terminals are not used.
17 18 19 20 21 22 23 24 25 26 27 28 29 30 31 32	A00/P40 A01/P41 A02/P42 A03/P43 A04/P44 A05/P45 A06/P46 A07/P47 A08/P50 A09/P51 A10/P52 A11/P53 A12/P54 A13/P55 A14/P56 A15/P57	D	Bit 00 through bit 15 of external address bus. The terminals are available as general I/O ports (P40 through P47 and P50 through P57) when the terminals are not used as address buses.
33 34 35 36 37 38 39 40	A16/P60 A17/P61 A18/P62 A19/P63 A20/P64 A21/P65 A22/P66/IN2 A23/P67/IN3	D	Bit 16 through bit 23 of external address bus. The terminals are available as general I/O ports (P60 through P67) when the terminals are not used as address busses. [IN2,IN3]: Input terminals of input capture. This function is active when input capture is operating.

(Continued)

MB91F127/F128

No.	Pin name	Input/output circuit type	Description												
41	A24/P70/FRCK/TCI2	D	Bit 24 of external address bus. [P70] A24, FRCK and TCI2 are available as general input ports when they are not used. [FRCK] External clock input of free-run timer. This function is active when external clock input of free-run timer is used. [TCI2] External clock input of timer 2. This function is active when external clock input of timer 2 is used.												
42	RDY/P80	D	External ready input. Enter “0” when bus cycle under execution does not complete. This terminal is available as general input/output port when it is not used.												
43	$\overline{\text{BGRNT}}$ /P81/IN0	D	External bus open receive output. This terminal outputs “L” when an external bus is released. This terminal is available as general input/output port when it is not used. [IN0] Input capture input. This function is active when input capture is under input operation.												
44	BRQ/P82/IN1	D	External bus open request input. Enter “1” when releasing external bus. This terminal is available as general input/output port when it is not used. [IN1] Input capture input. This function is active when input capture is under input operation.												
45	$\overline{\text{RD}}$ /P83	D	External bus read strobe. This terminal is available as general input/output port when it is not used.												
46	$\overline{\text{WR0}}$ /P84	D	External bus write strobe. Control signals and data bus byte positions are related as the following :												
47	$\overline{\text{WR1}}$ /P85	D	<table><tr><td></td><td>16-bit bus width</td><td>8-bit bus width</td><td>Single chip mode</td></tr><tr><td>D31 to D24</td><td>$\overline{\text{WR0}}$</td><td>$\overline{\text{WR0}}$</td><td>(port allowed)</td></tr><tr><td>D23 to D16</td><td>$\overline{\text{WR1}}$</td><td>(port allowed)</td><td>(port allowed)</td></tr></table>		16-bit bus width	8-bit bus width	Single chip mode	D31 to D24	$\overline{\text{WR0}}$	$\overline{\text{WR0}}$	(port allowed)	D23 to D16	$\overline{\text{WR1}}$	(port allowed)	(port allowed)
				16-bit bus width	8-bit bus width	Single chip mode									
			D31 to D24	$\overline{\text{WR0}}$	$\overline{\text{WR0}}$	(port allowed)									
D23 to D16	$\overline{\text{WR1}}$	(port allowed)	(port allowed)												
Note : $\overline{\text{WR1}}$ is set to Hi-z during resetting. For using with 16-bit bus width, use an external pull-up resistor.															
[P84 or P85] Available as general input/output ports when $\overline{\text{WR0}}$ and $\overline{\text{WR1}}$ are not used.															
48 49 50	$\overline{\text{CS0}}$ /PA0 $\overline{\text{CS1}}$ /PA1 $\overline{\text{CS2}}$ /PA2	D	Chip select 0 output (Low active) Chip select 1 output (Low active) Chip select 2 output (Low active) [PA0,1,or 2] Available as general input/output ports when $\overline{\text{CS0}}$, $\overline{\text{CS1}}$ and $\overline{\text{CS2}}$ are not used.												

(Continued)

No.	Pin name	Input/output circuit type	Description
51 52 53	$\overline{CS3}$ /PA3/SO1 $\overline{CS4}$ /PA4/SI1 $\overline{CS5}$ /PA5/SC1	D	Chip select 3, 4, 5 output (Low active). [PA3,4,5] Available as general input/output ports when channel 1 of chip select UART is not used. [SO1,SI1,SC1] Data output, data input, and clock terminals of UART1. Active when UART1 operation is allowed.
54	CLK/PA6	D	System clock output. Outputs a same clock as the same frequency of external bus operation. [PA6] Available as general input/output ports it is not used.
55 56 57 58 59 60 61 62	OCPA0/PG0 OCPA1/PG1 OCPA2/PG2 OCPA3/PG3 OC0/PG4 OC1/PG5 OC2/PG6 OC3/PG7	D	[OCPA0 to 3] PPG timer outputs. The function is active when PPG timer output is allowed. [OC0 to 3] Output comparison output. The function is active when output comparison output is allowed. [PB0-7] Available as general input/output ports it is not used.
63 64 65	MD0 MD1 MD2	B	Mode terminals 0 through 2. The terminals specify basic operation mode of MCU. Use the terminals by connecting them directly to VCC or VSS.
66 67	X0 X1	A	Clock (oscillation) input. Clock (oscillation) output.
68	$\overline{RST}$	C	External reset input.
69	$\overline{HST}$	C	Hardware standby input.
70	P86/ALE	D	[ALE] Address latch signal output. The function is active when ALE output of EPCR is allowed.
71 72	INT0/PE0 INT1/PE1 INT2/PE2 INT3/PE3	D	[INT0,1,2,3] External interrupt request inputs. The input is used whenever necessary if external interrupt is allowed. Output of other functions must be suspended if not on purpose. [PE0,1,2,3] General input/output port
75 76	INT4/PE4/TC11 INT5/PE5/SC0	D	[INT4,5] External interrupt request inputs. The input is used whenever necessary if concerned external interrupt is allowed. Output of other functions must be suspended if not on purpose. [TC11] External clock input of timer 1. [SC0] Clock input of UART0. [PE4,5] General input/output port
77	SI0/PE6	D	[SI0] Data input of UART0. This function is active when data input of UART0 is allowed. [PE6] General input/output port
78	SO0/PE7	D	[SO0] Data output of UART0. This function is active when data output of UART0 is allowed. [PE7] General input/output port

(Continued)

MB91F127/F128

(Continued)

No.	Pin name	Input/output circuit type	Description
79	PF0/TCI0	D	[TCI0] External clock input of timer 0.
			[PF0] General input/output port
80	SI2/PF1	D	[SI2] Data input of UART2. This function is active when data input of UART2 is allowed.
			[PF1] General input/output port
81	SO2/PF2	D	[SO2] Data output of UART2. This function is active when data output of UART2 is allowed.
			[PF2] General input/output port. This function is active when data output of UART2 is disallowed.
82	SC2/PF3/ $\overline{\text{ATG}}$	D	[SC2] Clock input of UART2 [ATG] External trigger input of A/D converter. The input is used whenever necessary if a function concerned is selected. Output of other functions must be suspended if not on purpose.
			[PF3] General input/output port
83 to 90	AN0/PJ0 AN1/PJ1 AN2/PJ2 AN3/PJ3 AN4/PJ4 AN5/PJ5 AN6/PJ6 AN7/PJ7	E	[AN0 to AN7] Analog input of A/D converter. This function is active when analog input is specified in AIC register.
			[PJ0 through PJ7] General input/output ports
91	AVCC	—	VCC power supply for A/D converter
92	AVRH	—	Reference voltage of A/D converter (high potential side). Be sure to turn on or off this terminal with a potential higher than AVRH applied to VCC.
93	AVSS/AVRL	—	A/D converter VSS power source and reference voltage (low potential side).
94 to 96	VCC	—	Power sources of digital circuits. Be sure to connect power source to all terminals when the device is used.
97 to 100	VSS	—	Ground level of digital circuits.

Note : Most of the above terminals multiplex inputs and outputs of I/O ports and resources, as indicated as "XXXX/PXX". If the outputs of ports and resources conflict with each other on the terminals, resources take preferences.

■ INPUT/OUTPUT CIRCUIT TYPE

Type	Circuit	Remarks
A		• For 25 MHz system • Oscillation feedback register : Approx. 1MΩ • Standby control is available.
B		• CMOS level input • High-voltage control is available for FLASH test.
C		• CMOS level hysteresis input • Standby control is not available.
D		• CMOS level output • CMOS level hysteresis input • Standby control is available
E		• Standby control is available • CMOS level output • CMOS level hysteresis input • Analog input

■ HANDLING DEVICES

1. Preventing latch up

On a CMOS IC, latch up may occur when a voltage higher than VCC or a voltage lower than VSS is applied to input terminal or output terminal, or when a voltage exceeding rated level is applied across VCC and VSS. Latch up causes drastic increase of power source current, which may result in destruction of the element by heat. Take extra care not to exceed maximum rating in use. Also, take extra care so that analog terminal does not exceed digital power source.

2. Treatment of unused input terminals

Leaving unused terminals open may cause malfunction. Apply pull-up or pull-down treatment on unused terminals.

3. External reset input

Complete resetting of internal system requires inputting "L" level signal to $\overline{\text{RST}}$ terminal for a minimum of 5 machine cycles.

4. Notes on using external clock

When using an external clock, supply a clock signal to X0 terminal and supply its antiphase clock to X1 terminal simultaneously. In this case, do not use STOP mode (oscillation stop mode). (Because X1 terminal halts with "H" output under STOP status.)

Under a 12.5 MHz frequency, the device operates with a clock supplied to X0 terminal only.

Figures show examples of using an external clock.

Example of using external clock (normal)

Note : STOP mode (oscillation stop mode) is not available.

Example of using external clock (allowed under operation at 12.5 MHz or lower frequency)

5. Connecting power supply terminals (VCC, VSS)

If two or more VCC, VSS terminals are used, the terminals to be placed under the same potentials are connected with each other internally for preventing malfunctions such as latch up. However, for reducing unwanted radiation, preventing malfunctions of strobe signals and observing total power and current ratings, be sure to connect all of these terminals to power supply and ground externally.

Connecting power supply to VCC - VSS in impedance as low as possible is desirable.

6. Crystal oscillator circuit

Noises around X0 and X1 terminals causes malfunction of the device. Design printed wiring so that X0, X1, and crystal oscillator (or ceramic oscillator), and bypass capacitor to the ground are aligned as close as possible one another. Also the wiring of those elements should not cross with other wiring if possible. Printed wiring with ground wires around X0 and X1 terminals ensures more stable operations. Such designing is strongly recommended.

7. Treating NC terminals

Be sure to leave NC terminals open.

8. Mode terminals (MD0 through MD2)

Do not connect the mode terminals directly to VCC or VSS.

For preventing malfunctions caused by noises, make printed traces between the mode terminals and VCC or VSS as short as possible, and connect the elements in lower impedance.

9. Turning power on

Be sure to turn on the power of the device with $\overline{\text{RST}}$ terminal placed under "L" level. Ensure a period at a minimum of 5 cycles of internal operation clock before placing the terminal under "H" level.

10. Terminal status upon turning on power

Status upon turning on the power is indefinite. Upon turning on the power, oscillation starts and the circuit is initialized.

11. Oscillation input upon turning on power

Upon turning on the power, be sure to input a clock signal until oscillation stabilizing wait status is released.

12. Initializing power-on reset

The device includes some built-in registers that are initialized only with power-on reset operation. For initializing the registers, perform power-on reset by turning on the power again.

13. Recovery from Sleep/Stop status

For recovering from Sleep/Stop status initiated by a program in C-Bus RAM, reset the device instead of recovering by an interrupt process.

MB91F127/F128

• MB91F128

Note : External area is not accessible in single-chip mode. When accessing to external areas, select the internal ROM external bus mode in mode register.

Direct addressing areas

The areas described below are used for I/O processes. The areas, referred to as “direct addressing areas,” allow specifying an operand address directly by an instruction. The direct addressing areas varies as the following, depending on size of the data to be accessed.

- Byte-data access : 0 to 0FF_H
- Half-word data access : 0 to 1FF_H
- Word-data access : 0 to 3FF_H

■ LEGEND OF I/O MAP

Note : Register bit values indicate initial values as shown below :

- “1” : Initial value“1”
- “0” : Initial value“0”
- “X” : Initial value “X”
- “-” : Register does not exist physically in this position.

*1 : ICR specifies interrupt levels for interrupt requests, using the registers in interrupt controller.
ICR is provided for each interrupt request.

*2 : TBR is a register that indicates a head address of the vector table for EIT.
An address that is found by adding offset values defined by TBR and EIT cause, is a vector address.

*3 : If REALOS/FR is used, 0x40 and 0x41 interrupts are used for system code.

Information : An 1 Kbyte area starting with an address indicated by TBR is the vector area for EIT. Size of the area for one vector is 4 byte. Relation between a vector number and a vector address is as follows:

$$\text{vctadr} = \text{TBR} + \text{vctofs}$$

$$= \text{TBR} + (3\text{FC}_{\text{H}} - 4 \times \text{vct})$$

Vctadr Vector address, vctofs: Vector offset, vct: Vector number

■ ELECTRICAL CHARACTERISTICS

1. Absolute Maximum Ratings

($V_{SS} = AV_{SS} = 0\text{ V}$)

Parameter	Symbol	Rating		Unit	Remarks
		Min	Max		
Power supply voltage	V_{CC}	$V_{SS} - 0.3$	$V_{SS} + 4.0$	V	
Analog supply voltage	AV_{CC}	$V_{SS} - 0.3$	$V_{SS} + 4.0$	V	*1
Analog reference voltage	$AVRH$	$V_{SS} - 0.3$	$V_{SS} + 4.0$	V	*1
Input voltage	V_I	$V_{SS} - 0.3$	$V_{CC} + 0.3$	V	
Analog input voltage	V_{IA}	$V_{SS} - 0.3$	$AV_{CC} + 0.3$	V	
Output voltage	V_O	$V_{SS} - 0.3$	$V_{CC} + 0.3$	V	
Maximum clamp current	I_{CLAMP}	-2.0	+2.0	mA	*5
Total maximum clamp current	$\Sigma I_{CLAMP} $	—	20	mA	*5
"L" level maximum output current	I_{OL}	—	10	mA	*2
"L" level average output current	I_{OLAV}	—	4	mA	*3
"L" level maximum total output current	ΣI_{OL}	—	100	mA	
"L" level average total output current	ΣI_{OLAV}	—	50	mA	*4
"H" level maximum output current	I_{OH}	—	-10	mA	*2
"H" level average output current	I_{OHAV}	—	-4	mA	*3
"H" level maximum total output current	ΣI_{OH}	—	-50	mA	
"H" level average total output current	ΣI_{OHAV}	—	-20	mA	*4
Power consumption	P_d	—	500	mW	
Operating temperature	T_A	-30	+70	°C	
Storage temperature	T_{stg}	-55	+150	°C	

*1 : Care must be taken that AV_{CC} , $AVRH$ do not exceed $V_{CC} + 0.3\text{ V}$. Also, care must be taken that $AVRH$ do not exceed AV_{CC} .

*2 : Maximum output current defines a peak value of a specific terminal.

*3 : Average output current defines a mean value of current flow within a period of 100 ms in a specific terminal.

*4 : Average total output current defines a mean value of current flow within a period of 100 ms in all terminals.

*5 : • Applicable to pins : D16 to D31, A00 to A24, RDY, $\overline{BGRNT}$, BRQ, $\overline{RD}$, $\overline{WR0}$, $\overline{WR1}$, $\overline{CS0}$ to $\overline{CS5}$, CLK, OCPA0 to OCPA3, OC0 to OC3, ALE, INT0 to INT5, SI0, SI2, SO0, SO2, TCI0, SC2

- Use within recommended operating conditions.
- Use at DC voltage (current) .
- The +B signal should always be applied with a limiting resistance placed between the +B signal and the microcontroller.

(Continued)

(Continued)

- The value of the limiting resistance should be set so that when the signal is applied the input current to the microcontroller pins does not exceed rated values, either instantaneously or for prolonged periods.
- Note that when the microcontroller drive current is low, such as in the power saving modes, the +B input potential may pass through the protective diode and increase the potential at the VCC pin, and this may affect other devices.
- Note that if a +B signal is input when the microcontroller power supply is off (not fixed at 0 V), the power supply is provided from the pins, so that incomplete operation may result.
- Note that if the +B input is applied during power-on, the power supply is provided from the pins and the resulting supply voltage may not be sufficient to operate the power-on reset.
- Care must be taken not to leave the input pin open.
- Sample recommended circuits

WARNING: Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

2. Recommended Operating Conditions

($V_{SS} = AV_{SS} = 0\text{ V}$)

Parameter	Symbol	Value		Unit	Remarks
		Min	Max		
Power supply	V_{CC}	3.0	3.6	V	Normal operation
		2.0	3.6		Retain RAM data under "stop" condition
Analog supply voltage	AV_{CC}	$V_{SS} - 0.3$	$V_{SS} + 3.6$	V	
Analog reference voltage	AV_{RH}	AV_{SS}	AV_{CC}	V	
Operating temperature	T_A	-30	+70	°C	

WARNING: The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their FUJITSU representatives beforehand.

MB91F127/F128

3. DC Characteristics

($AV_{CC} = V_{CC} = 3.3 \text{ V} \pm 0.3 \text{ V}$, $AV_{SS} = V_{SS} = 0 \text{ V}$, $T_A = -30 \text{ }^{\circ}\text{C}$ to $+70 \text{ }^{\circ}\text{C}$)

Parameter	Symbol	Pin name	Condition	Value			Unit	Remarks
				Min	Typ	Max		
"H" level input voltage	V_{IHS}	Hysteresis input terminal	—	$0.8 \times V_{CC}$	—	$V_{CC} + 0.3$	V	*
"L" level input voltage	V_{ILS}	Hysteresis input terminal	—	$V_{SS} - 0.3$	—	$0.2 \times V_{CC}$	V	*
"H" level output voltage	V_{OH}	Port2 to PortJ	$V_{CC} = 3.3 \text{ V}$ $I_{OH} = -4.0 \text{ mA}$	$V_{CC} - 0.5$	—	—	V	
"L" level output voltage	V_{OL}	Port2 to PortJ	$V_{CC} = 3.3 \text{ V}$ $I_{OL} = 4.0 \text{ mA}$	—	—	0.4	V	
Input leak current	I_{LI}	Port2 to PortJ	$V_{CC} = 3.6 \text{ V}$ $V_{SS} < V_I < V_{CC}$	—	—	± 5	μA	
Power supply current	I_{CC}	VCC	25 MHz $V_{CC} = 3.3 \text{ V}$	—	75	100	mA	
	I_{CC}		25 MHz $V_{CC} = 3.3 \text{ V}$	—	85	120	mA	FLASH writing
	I_{CCS}		25 MHz $V_{CC} = 3.3 \text{ V}$	—	60	85	mA	Sleeping
	I_{CCH}		$T_A = 25 \text{ }^{\circ}\text{C}$ $V_{CC} = 3.3 \text{ V}$	—	10	150	μA	Stopping
Input capacity	C_{IN}	Other than AV_{CC} , AV_{SS} , AV_{RH} , V_{CC} , V_{SS}	—	—	10	—	pF	

* : Refer to "■ INPUT/OUTPUT CIRCUIT TYPE".

4. AC Characteristics

(1) Clock Timing Ratings

($V_{CC} = 3.3 \text{ V} \pm 0.3 \text{ V}$, $AV_{SS} = V_{SS} = 0 \text{ V}$, $T_A = -30 \text{ }^{\circ}\text{C}$ to $+70 \text{ }^{\circ}\text{C}$)

Parameter		Symbol	Condition	Value		Unit	Remarks	
				Min	Max			
Clock frequency (High speed, automatic oscil- lation)		f _c	—	10	25	MHz	Self oscillation allowable range	
Clock frequency (High speed, PLL used)				10	25	MHz	PLL-use allowable area for self oscillation and external clock input *1	
Clock frequency (High speed, 1/2 division in- put)				10	25	MHz	External clock input allowable range	
Clock cycle time				t _c	40	100	ns	
Frequency regulation (when locked)				Δf	—	10	%	*2
Input clock pulse width		P _{WH} , P _{WL}	—	9.5	—	ns		
Input clock rise and fall time		t _{CR} t _{CF}	—	—	8	ns	(t _{CR} + t _{CF})	
Internal operation clock frequency	CPU system	f _{CP}	—	0.625 *3	25	MHz		
	Peripheral system	f _{CPP}		0.625 *3	25	MHz		
Internal operation clock cycle time	CPU system	t _{CP}		40	1600 *3	ns		
	Peripheral system	t _{LCPP}		40	1600 *3	ns		

*1 : Although PLL allows selection among x1 and x2 multiplication modes, the selection is limited by oscillation frequency as follows:

Specifying "x2 multiplication" is not allowed if oscillation frequency exceeds 12.5 MHz.

*2 : Frequency regulation indicates a maximum fluctuation from a specified center frequency under locked frequency multiplication.

$$\Delta f = \frac{|\alpha|}{f_o} \times 100 (\%)$$

MB91F127/F128

*3 : This is a value in the case where 10 MHz signal, a minimum value of clock frequency, is input to X0 and where 1/2-division in oscillation circuit and 1/8-gear are used.

(2) Clock Output Timing

($V_{CC} = 3.3 \text{ V} \pm 0.3 \text{ V}$, $AV_{SS} = V_{SS} = 0 \text{ V}$, $T_A = -30^\circ \text{C}$ to $+70^\circ \text{C}$)

Parameter	Symbol	Pin name	Condition	Value		Unit	Remarks
				Min	Max		
Cycle time	t_{CYC}	CLK	—	t_{CP}	—	ns	*1
$\text{CLK}\uparrow \rightarrow \text{CLK}\downarrow$	t_{CHCL}	CLK		$1/2 \times t_{CYC} - 10$	$1/2 \times t_{CYC} + 10$	ns	*2
$\text{CLK}\downarrow \rightarrow \text{CLK}\uparrow$	t_{CLCH}	CLK		$1/2 \times t_{CYC} - 10$	$1/2 \times t_{CYC} + 10$	ns	*3

*1 : t_{CYC} is a frequency of 1 clock cycle indicating gear cycle.

*2 : The values indicate specifications where x1 gear cycle is used.

If gear cycle of 1/2, 1/4, or 1/8 is specified, calculate in the formula below by substituting 1/2, 1/4, or 1/8 into n.

Min : $(1 - n/2) \times t_{CYC} - 10$

Max : $(1 - n/2) \times t_{CYC} + 10$

*3 : The values indicate specifications where x1 gear cycle is used.

If gear cycle of 1/2, 1/4, or 1/8 is specified, calculate in the formula below by substituting 1/2, 1/4, or 1/8 into n.

Min : $n/2 \times t_{CYC} - 10$

Max : $n/2 \times t_{CYC} + 10$

Clock output timing

(3) Reset Input Ratings

($V_{CC} = 3.3 \text{ V} \pm 0.3 \text{ V}$, $AV_{SS} = V_{SS} = 0 \text{ V}$, $T_A = -30^\circ \text{C}$ to $+70^\circ \text{C}$)

Parameter	Symbol	Pin name	Condition	Value		Unit	Remarks
				Min	Max		
Reset input time	t_{RSTL}	$\overline{\text{RST}}$	—	$t_{CP} \times 5$	—	ns	

MB91F127/F128

(4) Power-on Reset

($V_{CC} = 3.3 \text{ V} \pm 0.3 \text{ V}$, $V_{SS} = 0 \text{ V}$, $T_A = -30 \text{ }^{\circ}\text{C}$ to $+70 \text{ }^{\circ}\text{C}$)

Parameter	Symbol	Pin name	Condition	Value		Unit	Remarks
				Min	Max		
Power supply rise time	t_R	VCC	$V_{CC} = 3.3 \text{ V}$	—	20	ms	$V_{CC} < 0.2 \text{ V}$ before turning on power
Power supply shut off time	t_{OFF}	VCC	—	2	—	ms	
Oscillation stabilizing wait time	t_{OSC}	—	—	$2 \times t_c \times 2^{21} + 100 \mu\text{s}$	—	ns	

A sudden change of supply voltage may activate the power-on reset function. It is recommended that power voltage should be changed smoothly with less fluctuation of voltages.

Be sure to turn on the power while keeping RST terminal at L level first. When the power becomes V_{CC} level, rise the voltage to H level after a period of t_{RSTL} .

(5) Normal Bus Access Read/Write Operation

($V_{CC} = 3.3 \text{ V} \pm 0.3 \text{ V}$, $V_{SS} = 0 \text{ V}$, $T_A = -30^\circ\text{C}$ to $+70^\circ\text{C}$)

Parameter	Symbol	Pin name	Condition	Value		Unit	Remarks
				Min	Max		
CS0 to CS5 delay time	t _{CHCSL}	CLK CS0 to CS5	—	—	15	ns	
CS0 to CS5 delay time	t _{CHCSH}			—	15	ns	
Address delay time	t _{CHAV}	CLK A24 to A00		—	15	ns	
Data delay time	t _{CHDV}	CLK D31 to D16		—	15	ns	
$\overline{RD}$ delay time	t _{CLRL}	CLK $\overline{RD}$		—	15	ns	
$\overline{RD}$ delay time	t _{CLRH}			—	15	ns	
$\overline{WR0}, \overline{1}$ delay time	t _{CLWL}	CLK $\overline{WR0}, \overline{1}$		—	15	ns	
$\overline{WR0}, \overline{1}$ delay time	t _{CLWH}			—	15	ns	
Valid address→ Valid data input time	t _{AVDV}	A24 to A00 D31 to D16		—	3 / 2 × t _{cyc} – 25	ns	*1 *2
$\overline{RD}\downarrow\rightarrow$ Valid data input time	t _{RLDV}	$\overline{RD}$ D31 to D16		—	t _{cyc} – 25	ns	*1
Data setup → $\overline{RD}\uparrow$ Time	t _{DSRH}			25	—	ns	
$\overline{RD}\uparrow\rightarrow$ Data hold time	t _{RHDX}			0	—	ns	

*1 : If the bus is expanded by automatic wait insertion or RDY input, add time ($t_{cyc} \times$ the number of expanded cycles) to the rated value.

*2 : The ratings are based on conditions with “gear cycle $\times 1$ ”. If gear cycle of 1/2, 1/4, or 1/8 is specified, calculate in the formula below by substituting 1/2, 1/4, or 1/8 into n.

Formula : $(2 - n / 2) \times t_{cyc} - 25$

MB91F127/F128

(6) Timeshared Bus Access Read/Write Operations

($V_{CC} = 3.3 \text{ V} \pm 0.3 \text{ V}$, $V_{SS} = 0 \text{ V}$, $T_A = -30 \text{ }^{\circ}\text{C}$ to $+70 \text{ }^{\circ}\text{C}$)

* : t_{CYCP} is a cycle time of peripheral system clock.

(11) A/D Converter Block Electrical Characteristics

($V_{CC} = 3.3 \text{ V} \pm 0.3 \text{ V}$, $AV_{SS} = V_{SS} = 0 \text{ V}$, $T_A = -30 \text{ }^{\circ}\text{C}$ to $+70 \text{ }^{\circ}\text{C}$)

Parameter	Symbol	Pin name	Value			Unit	Remarks
			Min	Typ	Max		
Resolution	—	—	—	10	10	BIT	
Total error	—	—	—	—	± 4.0	LSB	
Linearity error	—	—	—	—	± 3.5	LSB	
Differential linearity error	—	—	—	—	± 2.0	LSB	
Zero transition voltage	V_{0t}	AN0 to AN7	$AV_{SS} - 1.5 \text{ LSB}$	$AV_{SS} + 0.5 \text{ LSB}$	$AV_{SS} + 2.5 \text{ LSB}$	mV	
Full-scale transition voltage	V_{FST}	AN0 to AN7	$AVRH - 5.5 \text{ LSB}$	$AVRH - 1.5 \text{ LSB}$	$AVRH + 0.5 \text{ LSB}$	mV	
Conversion time	—	—	5.3	—	—	μs	
Analog input current	I_{AIN}	AN0 to AN7	—	0.1	10	μA	
Analog input voltage	V_{AIN}	AN0 to AN7	AV_{SS}	—	$AVRH$	V	
Reference voltage	—	$AVRH$	AV_{SS}	—	AV_{CC}	V	
Power supply current	I_A	$AVCC$	—	3.0	5.0	mA	
	I_{AH}		—	—	5.0	μA	
Reference voltage supply current	I_R	$AVRH$	—	100	150	μA	
	I_{RH}		—	—	10	μA	
Variation among channels	—	AN0 to AN7	—	—	4	LSB	

Notes : • Relatively, the errors increase as $|AVRH|$ value becomes smaller.

- Define an output impedance of external circuit analog input under the following conditions :

Output impedance of external circuit $\leq 2 \text{ (k}\Omega\text{)}$

If an output impedance of external circuit is exceedingly high, sampling time for analog voltage may run short.

Analog input circuit model diagram

5. A/D Converter Block Electrical Characteristics

- Resolution
Analog variations recognized by an A/D converter.
- Linearity error
Deviation of actual conversion characteristics from an ideal line, which is across zero-transition point ("00 0000 0000" ↔ "00 0000 0001") and full-scale transition point ("11 1111 1110" ↔ "11 1111 1111")
- Differential linearity error
Deviation from ideal value of input voltage, which is required for changing output code by 1 LSB.
- Total error
Difference between actual value and ideal value. The error includes zero-transition error, full-scale transition error, and linearity error.

$$1 \text{ LSB}' (\text{Ideal value}) = \frac{AVRH - AVSS}{1024} \text{ [V]}$$

$$\text{Total error of digital output } N = \frac{V_{NT} - \{1 \text{ LSB}' \times (N - 1) + 0.5 \text{ LSB}'\}}{1 \text{ LSB}'}$$

V_{NT} : Transition voltage for digital output to change from (N+1) to N.

$$V_{OT}' (\text{Ideal value}) = AVSS + 0.5 \text{ LSB}' \text{ [V]}$$

$$V_{FST}' (\text{Ideal value}) = AVRH - 1.5 \text{ LSB}' \text{ [V]}$$

(Continued)

(Continued)

$$\text{Linearity error of digital output } N = \frac{V_{NT} - \{1 \text{ LSB}' \times (N - 1) + V_{OT}\}}{1 \text{ LSB}'} \quad [\text{LSB}]$$

$$\text{Differential linearity error of digital output } N = \frac{V_{(N+1)T} - V_{NT}}{1 \text{ LSB}'} - 1 \quad [\text{LSB}]$$

$$1 \text{ LSB} = \frac{V_{FST} - V_{OT}}{1022} \quad [\text{V}]$$

V_{OT} : Transition voltage for digital output to change from $(000)_H$ to $(001)_H$.

V_{FST} : Transition voltage for digital output to change from $(3FE)_H$ to $(3FF)_H$.

■ FLASH MEMORY WRITE/ERASE CHARACTERISTICS

Parameter	Condition	Value			Unit	Remarks
		Min	Typ	Max		
Sector erase time	$T_A = +25\text{ }^{\circ}\text{C}$, $V_{CC} = 3.3\text{ V}$	—	1	15	s	Not including time for internal writing before deletion.
Chip erase time		—	4	—	s	Not including time for internal writing before deletion.
Half byte (16 bit width) writing time		—	16	3600	μs	Not including system-level overhead time.
Write/erase cycle	—	—	10,000	—	cycle	
Data holding time	—	—	100,000	—	h

All Rights Reserved.

The contents of this document are subject to change without notice. Customers are advised to consult with FUJITSU sales representatives before ordering.

The information and circuit diagrams in this document are presented as examples of semiconductor device applications, and are not intended to be incorporated in devices for actual use. Also, FUJITSU is unable to assume responsibility for infringement of any patent rights or other rights of third parties arising from the use of this information or circuit diagrams.

The products described in this document are designed, developed and manufactured as contemplated for general use, including without limitation, ordinary industrial use, general office use, personal use, and household use, but are not designed, developed and manufactured as contemplated (1) for use accompanying fatal risks or dangers that, unless extremely high safety is secured, could have a serious effect to the public, and could lead directly to death, personal injury, severe physical damage or other loss (i.e., nuclear reaction control in nuclear facility, aircraft flight control, air traffic control, mass transport control, medical life support system, missile launch control in weapon system), or (2) for use requiring extremely high reliability (i.e., submersible repeater and artificial satellite).

Please note that Fujitsu will not be liable against you and/or any third party for any claims or damages arising in connection with above-mentioned uses of the products.

Any semiconductor devices have an inherent chance of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

If any products described in this document represent goods or technologies subject to certain restrictions on export under the Foreign Exchange and Foreign Trade Law of Japan, the prior authorization by Japanese government will be required for export of those products from Japan.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
