

## CURRENT MODE PWM CONTROLLER

### DESCRIPTION

The SG1846 family of control ICs provides all of the necessary features to implement fixed frequency, current mode control schemes while maintaining a minimum external parts count. The superior performance of this technique can be measured in improved line regulation, enhanced load response characteristics, and a simpler, easier-to-design control loop. Topological advantages include inherent pulse-by-pulse current limiting capability, automatic symmetry correction for push-pull converters, and the ability to parallel "power modules" while maintaining equal current sharing.

Protection circuitry includes built-in under-voltage lockout and programmable current limit in addition to soft start capability. A shutdown function is also available which can initiate either a complete shutdown with automatic restart or latch the supply off.

Other features include fully latched operation, double pulse suppression, deadtime adjust capability, and a  $\pm 1\%$  trimmed bandgap reference.

If  $\frac{V_{REF}}{R_1} < 0.8mA$  the shutdown latch will commutate when  $I_{SS} < 0.8mA$  and a restart cycle will be initiated.

$$\frac{V_{REF}}{R_1} > 3mA \text{ (LATCHED OFF)}$$

FIGURE 29 - SHUTDOWN WITHOUT AUTO-RESTART (LATCHED)

If  $\frac{V_{REF}}{R_1} > 3mA$  the device will latch off until power is recycled.
