

2-Wire Serial Temperature Sensor and Thermal Monitor

Features:

- Solid-State Temperature Sensing:
0.5°C Accuracy (Typ.)
- Operates from -55°C to +125°C
- Operating Supply Range: 2.7V to 5.5V
- Programmable Trip Point and Hysteresis with Power-up Defaults
- Standard 2-Wire Serial Interface
- Thermal Event Alarm Output Functions as Interrupt or Comparator/Thermostat Output
- Up to 8 TCN75s may Share the Same Bus
- Shutdown Mode for Low Standby Power Consumption
- 5V Tolerant I/O at $V_{DD} = 3V$
- Low Power:
 - 250 μA (Typ.) Operating
 - 1 μA (Typ.) Shutdown Mode
- 8-Pin SOIC and MSOP Packaging

Applications:

- Thermal Protection for High-Performance CPUs
- Solid-State Thermometer
- Fire/Heat Alarms
- Thermal Management in Electronic Systems:
 - Computers
 - Telecom Racks
 - Power Supplies/UPS/Amplifiers
- Copiers/Office Electronics
- Consumer Electronics
- Process Control

Package Type

General Description:

The TCN75 is a serially programmable temperature sensor that notifies the host controller when ambient temperature exceeds a user programmed set point. Hysteresis is also programmable. The INT/CMPTR output is programmable as either a simple comparator for thermostat operation or as a temperature event interrupt. Communication with the TCN75 is accomplished via a two-wire bus that is compatible with industry standard protocols. This permits reading the current temperature, programming the set point and hysteresis, and configuring the device.

The TCN75 powers up in Comparator mode with a default set point of 80°C with 5°C hysteresis. Defaults allow independent operation as a stand-alone thermostat. A shutdown command may be sent via the 2-wire bus to activate the low-power Standby mode. Address selection inputs allow up to eight TCN75s to share the same 2-wire bus for multizone monitoring.

All registers can be read by the host and the INT/CMPTR output's polarity is user programmable. Both polled and interrupt driven systems are easily accommodated. Small physical size, low installed cost, and ease-of-use make the TCN75 an ideal choice for implementing sophisticated system management schemes.

TCN75

Device Selection Table

| Part Number | Supply Voltage | Package | Junction Temperature Range |
|--------------|----------------|------------|----------------------------|
| TCN75-3.3MOA | 3.3 | 8-Pin SOIC | -55°C to +125°C |
| TCN75-5.0MOA | 5.0 | 8-Pin SOIC | -55°C to +125°C |
| TCN75-3.3MUA | 3.3 | 8-Pin MSOP | -55°C to +125°C |
| TCN75-5.0MUA | 5.0 | 8-Pin MSOP | -55°C to +125°C |

Functional Block Diagram

1.0 ELECTRICAL CHARACTERISTICS

Absolute Maximum Ratings*

| | |
|--|------------------------------------|
| Supply Voltage (V_{DD}) | 6.0V |
| ESD Susceptibility (Note 3) | 1000V |
| Voltage on Pins: | |
| A0, A1, A2 | (GND – 0.3V) to (V_{DD} + 0.3V) |
| Voltage on Pins: | |
| SDA, SCL, INT/CMPTR.. | (GND – 0.3V) to 5.5V |
| Thermal Resistance (Junction to Ambient) | |
| 8-Pin SOIC | 170°C/W |
| 8-Pin MSOP | 250°C/W |
| Operating Temperature Range (T_J): | -55°C to +125°C |
| Storage Temperature Range (T_{STG}): | -65°C to +150°C |

*Stresses above those listed under “Absolute Maximum Ratings” may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions above those indicated in the operation sections of the specifications is not implied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability.

TCN75 ELECTRICAL SPECIFICATIONS

| t_{DH} | Data in Hold Time after SCL Low | 0 | — | — | nsec | |
| $t_{SU(STOP)}$ | Stop Condition Setup Time | 100 | — | — | nsec | |
| t_{IDLE} | Bus Free Time Prior to New Transition | 1250 | — | — | nsec | |

- Note 1:** Output current should be minimized for best temperature accuracy. Power dissipation within the TCN75 will cause self-heating and temperature drift. At maximum rated output current and saturation voltage, 4 mA and 0.8V, respectively, the error amounts to 0.544°C for the SOIC.
- Note 2:** All part types of the TCN75 will operate properly over the wider power supply range of 2.7V to 5.5V. Each part type is tested and specified for rated accuracy at its nominal supply voltage. As V_{DD} varies from the nominal value, accuracy will degrade 1°C/V of V_{DD} change.
- Note 3:** Human body model, 100 pF discharged through a 1.5k resistor.

TIMING DIAGRAM

2.0 PIN DESCRIPTIONS

The descriptions of the pins are listed in Table 2-1.

TABLE 2-1: PIN FUNCTION TABLE

| Pin Number (8-Pin SOIC) 8-Pin MSOP) | Symbol | Description |
|---|-----------------|---------------------------------|
| 1 | SDA | Bidirectional Serial Data. |
| 2 | SCL | Serial Data Clock Input. |
| 3 | INT/CMPTR | Interrupt or Comparator Output. |
| 4 | GND | System Ground. |
| 5 | A ₂ | Address Select Pin (MSB). |
| 6 | A ₁ | Address Select Pin. |
| 7 | A ₀ | Address Select Pin (LSB). |
| 8 | V _{DD} | Power Supply Input. |

TCN75

3.0 DETAILED DESCRIPTION

A typical TCN75 hardware connection is shown in Figure 3-1.

FIGURE 3-1: Typical Application

3.1 Serial Data (SDA)

Bidirectional. Serial data is transferred in both directions using this pin.

3.2 Serial Clock (SCL)

Input. Clocks data into and out of the TCN75.

3.3 INT/CMPTR

Open Collector, Programmable Polarity. In Comparator mode, unconditionally driven active any time temperature exceeds the value programmed into the T_{SET} register. INT/CMPTR will become inactive when temperature subsequently falls below the T_{HYST} setting. (See **Section 5.0 “Register Set and Programmer’s Model”**, Register Set and Programmer’s Model). In Interrupt mode, INT/CMPTR is also made active by TEMP exceeding T_{SET} ; it is unconditionally reset to its inactive state by reading any register via the 2-wire bus. If and when temperature falls below T_{HYST} , INT/CMPTR is again driven active. Reading any register will clear the T_{HYST} interrupt. In Interrupt mode, the INT/CMPTR output is unconditionally reset upon entering Shutdown mode. If programmed as an active-low output, it can be wire-ORed with any number of other open collector devices. Most systems will require a pull-up resistor for this configuration.

Note that current sourced from the pull-up resistor causes power dissipation and may cause internal heating of the TCN75. To avoid affecting the accuracy of ambient temperature readings, the pull-up resistor should be made as large as possible. INT/CMPTR’s output polarity may be programmed by writing to the INT/CMPTR POLARITY bit in the CONFIG register. The default is active low.

3.4 Address (A2, A1, A0)

Inputs. Sets the three Least Significant bits of the TCN75 8-bit address. A match between the TCN75’s address and the address specified in the serial bit stream must be made to initiate communication with the TCN75. Many protocol-compatible devices with other addresses may share the same 2-wire bus.

3.5 Slave Address

The four Most Significant bits of the Address Byte (A6, A5, A4, A3) are fixed to 1001[B]. The states of A2, A1 and A0 in the serial bit stream must match the states of the A2, A1 and A0 address inputs for the TCN75 to respond with an Acknowledge (indicating the TCN75 is on the bus and ready to accept data). The Slave Address is represented in Table 3-1.

TABLE 3-1: TCN75 SLAVE ADDRESS

| 1 | 0 | 0 | 1 | A2 | A1 | A0 |
|-----|---|---|---|----|----|------|
| MSB | | | | | | LSBS |

3.6 Comparator/Interrupt Modes

INT/CMPTR behaves differently depending on whether the TCN75 is in Comparator mode or Interrupt mode. Comparator mode is designed for simple thermostatic operation. INT/CMPTR will go active anytime TEMP exceeds T_{SET} . When in Comparator mode, INT/CMPTR will remain active until TEMP falls below T_{HYST} , whereupon it will reset to its inactive state. The state of INT/CMPTR is maintained in Shutdown mode when the TCN75 is in Comparator mode. In Interrupt mode, INT/CMPTR will remain active indefinitely, even if TEMP falls below T_{HYST} , until any register is read via the 2-wire bus. Interrupt mode is better suited to interrupt driven microprocessor-based systems. The INT/CMPTR output may be wire-OR'ed with other interrupt sources in such systems. Note that a pull-up resistor is necessary on this pin since it is an open-drain output. Entering Shutdown mode will unconditionally reset INT/CMPTR when in Interrupt mode.

4.0 SHUTDOWN MODE

When the appropriate bit is set in the configuration register (CONFIG) the TCN75 enters its low-power Shutdown mode ($I_{DD} = 1 \mu A$, typical) and the temperature-to-digital conversion process is halted. The TCN75's bus interface remains active and TEMP, T_{SET} , and T_{HYST} may be read from and written to. Transitions on SDA or SCL due to external bus activity may increase the standby power consumption. If the TCN75 is in Interrupt mode, the state of INT/CMPTR will be reset upon entering Shutdown mode.

4.1 Fault Queue

To lessen the probability of spurious activation of INT/CMPTR the TCN75 may be programmed to filter out transient events. This is done by programming the desired value into the Fault Queue. Logic inside the TCN75 will prevent the device from triggering INT/CMPTR unless the programmed number of sequential temperature-to-digital conversions yield the same qualitative result. In other words, the value reported in TEMP must remain above T_{SET} or below T_{HYST} for the consecutive number of cycles programmed in the Fault Queue. Up to a six-cycle "filter" may be selected. See **Section 5.0 "Register Set and Programmer's Model"**, Register Set and Programmer's Model.

4.2 Serial Port Operation

The Serial Clock input (SCL) and bidirectional data port (SDA) form a 2-wire bidirectional serial port for programming and interrogating the TCN75. The following table indicates TCN75 conventions that are used in this bus scheme.

TABLE 4-1: SERIAL BUS CONVENTIONS

| Term | Explanation |
|-------------|--|
| Transmitter | The device sending data to the bus. |
| Receiver | The device receiving data from the bus. |
| Master | The device which controls the bus: initiating transfers (Start), generating the clock, and terminating transfers (Stop). |
| Slave | The device addressed by the master. |
| Start | A unique condition signaling the beginning of a transfer indicated by SDA falling (High – Low) while SCL is high. |
| Stop | A unique condition signaling the end of a transfer indicated by SDA rising (Low – High) while SCL is high. |
| ACK | A Receiver acknowledges the receipt of each byte with this unique condition. The Receiver drives SDA low during SCL high of the ACK clock-pulse. The Master provides the clock pulse for the ACK cycle. |
| NOT Busy | When the bus is idle, both SDA & SCL will remain high. |
| Data Valid | The state of SDA must remain stable during the High period of SCL in order for a data bit to be considered valid. SDA only changes state while SCL is low during normal data transfers. (See Start and Stop conditions). |

All transfers take place under control of a host, usually a CPU or microcontroller, acting as the Master, which provides the clock signal for all transfers. The TCN75 *always* operates as a Slave. This serial protocol is illustrated in Figure 5-1. All data transfers have two phases; and all bytes are transferred MSB first. Accesses are initiated by a Start condition, followed by a device address byte and one or more data bytes. The device address byte includes a Read/Write selection bit. Each access must be terminated by a Stop condition. A convention called Acknowledge (ACK) confirms receipt of each byte. Note that SDA can change only during periods when SCL is LOW (SDA changes while SCL is HIGH are reserved for Start and Stop conditions).

4.3 Start Condition (Start)

The TCN75 continuously monitors the SDA and SCL lines for a Start condition (a HIGH-to-LOW transition of SDA while SCL is HIGH), and will not respond until this condition is met.

4.3.1 ADDRESS BYTE

Immediately following the Start condition, the host must next transmit the address byte to the TCN75. The four Most Significant bits of the Address Byte (A6, A5, A4, A3) are fixed to 1001(B). The states of A2, A1 and A0 in the serial bit stream must match the states of the A2, A1 and A0 address inputs for the TCN75 to respond with an Acknowledge (indicating the TCN75 is on the bus and ready to accept data). The eighth bit in the Address Byte is a Read/Write Bit. This bit is a '1' for a read operation or '0' for a write operation.

4.3.2 ACKNOWLEDGE (ACK)

Acknowledge (ACK) provides a positive handshake between the host and the TCN75. The host releases SDA after transmitting eight bits then generates a ninth clock cycle to allow the TCN75 to pull the SDA line LOW to acknowledge that it successfully received the previous eight bits of data or address.

4.3.3 DATA BYTE

After a successful ACK of the address byte, the host must next transmit the data byte to be written or clock out the data to be read. (See the appropriate timing diagrams.) ACK will be generated after a successful write of a data byte into the TCN75.

4.3.4 STOP CONDITION (STOP)

Communications must be terminated by a Stop condition (a LOW-to-HIGH transition of SDA while SCL is HIGH). The Stop condition must be communicated by the transmitter to the TCN75.

4.3.5 POWER SUPPLY

To minimize temperature measurement error, the TCN75-3.3 MOA and TCN75-3.3 MUA are factory calibrated at a supply voltage of 3.3V \pm 5% and the TCN75-5.0 MOA and TCN75-5.0 MUA are factory calibrated at a supply voltage of 5V \pm 5%. Either device is fully operational over the power supply voltage range of 2.7V to 5.5V, but with a lower measurement accuracy. The typical value of this power supply-related error is \pm 2°C.

5.0 REGISTER SET AND PROGRAMMER'S MODEL

TABLE 5-1: REGISTER (POINT), 8 BITS, WRITE ONLY

7.0 REVISION HISTORY

Revision D (December 2012)

Added a note to each package outline drawing.

THE MICROCHIP WEB SITE

Microchip provides online support via our WWW site at www.microchip.com. This web site is used as a means to make files and information easily available to customers. Accessible by using your favorite Internet browser, the web site contains the following information:

- **Product Support** – Data sheets and errata, application notes and sample programs, design resources, user's guides and hardware support documents, latest software releases and archived software
- **General Technical Support** – Frequently Asked Questions (FAQ), technical support requests, online discussion groups, Microchip consultant program member listing
- **Business of Microchip** – Product selector and ordering guides, latest Microchip press releases, listing of seminars and events, listings of Microchip sales offices, distributors and factory representatives

CUSTOMER CHANGE NOTIFICATION SERVICE

Microchip's customer notification service helps keep customers current on Microchip products. Subscribers will receive e-mail notification whenever there are changes, updates, revisions or errata related to a specified product family or development tool of interest.

To register, access the Microchip web site at www.microchip.com. Under "Support", click on "Customer Change Notification" and follow the registration instructions.

CUSTOMER SUPPORT

Users of Microchip products can receive assistance through several channels:

- Distributor or Representative
- Local Sales Office
- Field Application Engineer (FAE)
- Technical Support

Customers should contact their distributor, representative or field application engineer (FAE) for support. Local sales offices are also available to help customers. A listing of sales offices and locations is included in the back of this document.

Technical support is available through the web site at: <http://microchip.com/support>

READER RESPONSE

It is our intention to provide you with the best documentation possible to ensure successful use of your Microchip product. If you wish to provide your comments on organization, clarity, subject matter, and ways in which our documentation can better serve you, please FAX your comments to the Technical Publications Manager at (480) 792-4150.

Please list the following information, and use this outline to provide us with your comments about this document.

Questions:

1. What are the best features of this document?

2. How does this document meet your hardware and software development needs?

3. Do you find the organization of this document easy to follow? If not, why?

4. What additions to the document do you think would enhance the structure and subject?

5. What deletions from the document could be made without affecting the overall usefulness?

6. Is there any incorrect or misleading information (what and where)?

7. How would you improve this document?

Note the following details of the code protection feature on Microchip devices:

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.

Information contained in this publication regarding device applications and the like is provided only for your convenience and may be superseded by updates. It is your responsibility to ensure that your application meets with your specifications. MICROCHIP MAKES NO REPRESENTATIONS OR WARRANTIES OF ANY KIND WHETHER EXPRESS OR IMPLIED, WRITTEN OR ORAL, STATUTORY OR OTHERWISE, RELATED TO THE INFORMATION, INCLUDING BUT NOT LIMITED TO ITS CONDITION, QUALITY, PERFORMANCE, MERCHANTABILITY OR FITNESS FOR PURPOSE. Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
