

MAX14870 Evaluation Kit

Evaluates: MAX14870, MAX14872

General Description

The MAX14870 evaluation kit (EV kit) consists of a MAX14870 evaluation board and software. The EV kit is a fully assembled and tested circuit board that evaluates the MAX14870 full-bridge DC motor driver.

The EV Kit may also be used to evaluate the MAX14872.

The EV kit is designed to work with a PC-based GUI or as a standalone board, demonstrating all the major features of the device. The EV kit includes Windows®-compatible software that provides a graphical user interface (GUI) for exercising the features of the MAX14870. The EV kit is connected to a PC through a USB A-to-micro B cable.

Features

- Operates from a Wide 4.5V to 36V Supply
- Standalone or Software-Controlled Operation
- USB-PC Connection
- Proven PCB Layout
- Fully Assembled and Tested

Ordering Information appears at end of data sheet.

MAX14870 EV Kit Block Diagram

Windows, Windows XP, and Windows Vista are registered trademarks of Microsoft Corp.

Quick Start

Recommended Equipment

- MAX14870 EV kit
- User-supplied Windows XP®, Windows Vista®, or Windows 7 PC with a spare USB port
- 24V, 2A power supply
- DC brushed motor

Procedure

The EV kit is fully assembled and tested. Follow the steps below to verify board operation before exercising the full features of the device:

- 1) Verify that all the jumpers are in their default positions, as shown in [Table 1](#).
- 2) Connect the 24V DC power supply on the VDD and GND connectors on the EV kit board.
- 3) See the application note *Using the MAX14870EVKIT with Software* to configure the board for software operation.
- 4) Connect the DC brushed motor to the M1 and M2 terminals on the P1 connector.
- 5) Turn on the 24V supply.

Detailed Description of Hardware

The MAX14870 EV kit is a fully tested circuit board demonstrating the capabilities of the MAX14870 motor driver. The EV kit is designed to work with a PC-based GUI or as a stand-alone board, demonstrating all of the major features of the device.

Stand-Alone Operation

Remove all of the shunts on the P2 header for stand-alone operation. On-board LDOs generate logic rails and headers are included for device configuration in stand-alone mode.

On-Board LDO

The MAX15006 (U5) on-board LDO generates 3.3V for logic signals and for powering the fault LED. The 3.3V LDO also powers the on-board ICM7556 PWM signal generator.

On-Board PWM Generator

The ICM7556 (U2) general-purpose timer circuit is available to generate PWM signals for switching either the PWM or DIR inputs. Adjust the R1 potentiometer to change the duty cycle of the output signal.

The EV kit comes with the PWM frequency set up 1kHz but can be adjusted up to 10kHz by changing the C3 capacitor. Set the PWM frequency using the following equation:

$$f = 1.46 / [(R_1 + 2 \times R_{32}) \times C_3]$$

Fault Indicator LED

The $\overline{\text{FAULT}}$ output is connected to the 3.3V logic supply through R4. A fault is generated when an overcurrent condition occurs on M1 and/or M2. LED1 turns on during a fault condition.

NOTE: To ensure that LED1 turns on during a short-circuit event, use a power supply capable of supply at least 6A when testing short-circuit functionality.

Table 1. Jumper Descriptions

JUMPER	SHUNT POSITON	DESCRIPTION
J1	1-2	PWM is high
	2-3	PWM is low
J2	1-2	DIR is high
	2-3	DIR is low
J3	1-2	$\overline{\text{EN}}$ is high
	2-3	$\overline{\text{EN}}$ is low
J4	1-2*	SNS is connected to COM
	2-3	SNS is connected to GND
J5	1-2	Output of the ICM7556 circuit is connected to PWM
	2-3	Output of the ICM7556 circuit is connected to DIR
J6	Open*	COM is not shorted to ground
	Closed	COM is shorted to ground
J7	Open*	This jumper is used to program the on-board microcontroller. Do not shunt this jumper.
	Closed	
J8	Open*	This jumper is used to program the on-board microcontroller. Do not shunt this jumper.
	Closed	
J9	Open*	This jumper is used to program the on-board microcontroller. Do not shunt this jumper.
	Closed	
P2	1-2*	$\overline{\text{FAULT}}$ is connected to LED1 circuitry
	3-4*	PWM signal is generated by the on-board microcontroller.
	5-6*	DIR signal is generated by the on-board microcontroller.
	7-8*	$\overline{\text{EN}}$ signal is generated by the on-board microcontroller.

*Default position.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
