

## HIGH RIPPLE-REJECTION LOW DROPOUT SOFT-START FUNCTION CMOS VOLTAGE REGULATOR

S-1137 Series, developed using the CMOS technology, is a positive voltage regulator IC which has the low dropout voltage, the high-accuracy output voltage and the soft-start function (300 mA output current).

A 1.0  $\mu\text{F}$  small ceramic capacitor can be used. It operates with low current consumption of 45  $\mu\text{A}$  typ.

The overcurrent protection circuit prevents the load current from exceeding the capacitance of output transistor. The power-off circuit ensures longer battery life.

Compared to the conventional CMOS technology regulator ICs, various capacitors including small ceramic capacitors can be used for this IC.

Furthermore a small SOT-89-5, SOT-23-5, and SNT-6A(H) packages realize high-density mounting.

### ■ Features

- Output voltage: 1.2 V to 3.5 V, selectable in 0.05 V step.
- Low equivalent series resistance capacitor : Ceramic capacitor of 1.0  $\mu\text{F}$  or more can be used as the I/O capacitor.
- Wide input voltage range: 1.7 V to 5.5 V
- High-accuracy output voltage:  $\pm 1.0\%$  (1.2 V to 1.45 V output product :  $\pm 15$  mV)
- Low dropout voltage: 210 mV typ. (products having the output of 2.8 V,  $I_{\text{OUT}} = 300$  mA)
- Low current consumption: During operation: 45  $\mu\text{A}$  typ., 65  $\mu\text{A}$  max.  
During power-off: 0.1  $\mu\text{A}$  typ., 1.0  $\mu\text{A}$  max.
- Output current: Possible to output 300 mA (at  $V_{\text{IN}} \geq V_{\text{OUT(S)}} + 1.0$  V)<sup>\*1</sup>
- Soft-start circuit with external capacitor: Soft-start time : 0.7 ms ( $C_{\text{SS}} = 1.0$  nF)
- High ripple rejection: 70 dB typ. (at 1.0 kHz)
- Built-in overcurrent protection circuit: limits overcurrent of output transistor
- Built-in power-off circuit: Ensures long battery life.
- Discharge shunt circuit can be selected.
- Pull-down resistor is selectable
- Lead-free, Sn 100%, halogen-free<sup>\*2</sup>

\*1. Attention should be paid to the power dissipation of the package when the output current is large.

\*2. Refer to “**■ Product Name Structure**” for details.

### ■ Applications

- Power supply for battery-powered devices
- Power supply for cellular phones, portable devices
- Power supply for digital still cameras, TVs, DVD recorders

### ■ Packages

- SOT-89-5
- SOT-23-5
- SNT-6A(H)

■ **Product Name Structure**

Users can select the product type, output voltage, and package type for the S-1137 Series. Refer to “**1. Product name**” regarding the contents of product name, “**2. Function list of product type**” regarding the product type, “**3. Package**” regarding the package drawings.

**1. Product name**

**(1) SOT-89-5, SNT-6A(H)**

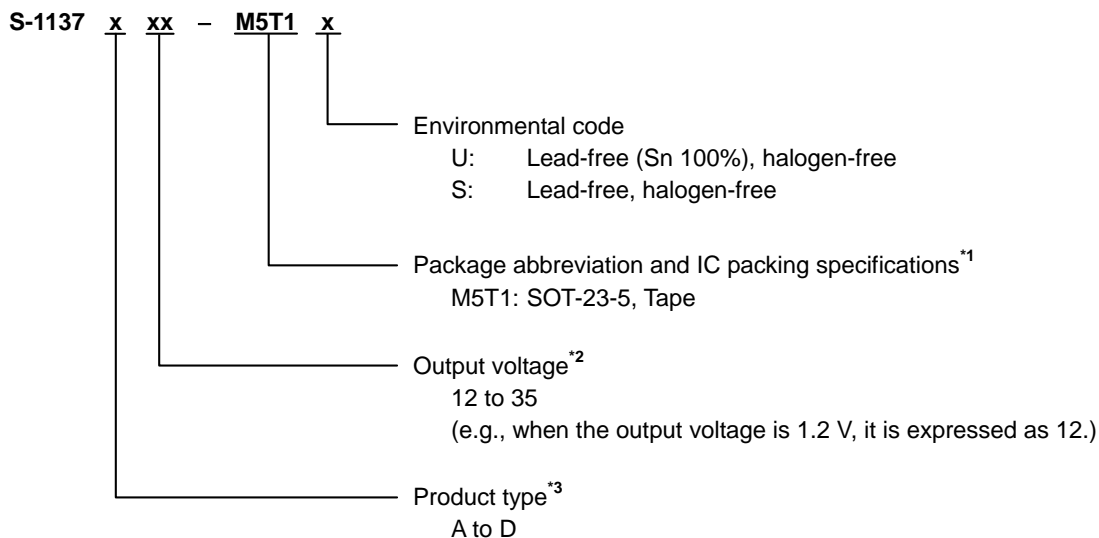

\*1. Refer to the tape specifications.

\*2. If you request the product which has 0.05 V step, contact our sales office.

\*3. Refer to “**2. Function list of product type**”.

**(2) SOT-23-5**

\*1. Refer to the tape specifications.

\*2. If you request the product which has 0.05 V step, contact our sales office.

\*3. Refer to “**2. Function list of product type**”.

**2. Function list of product type**

**Table 1**

Product Type	ON / OFF Logic	Discharge Shunt Function	Pull-down Resistor
A	Active "H"	Available	Available
B	Active "H"	Available	None
C	Active "H"	None	Available
D	Active "H"	None	None

**3. Package**

Package Name	Drawing Code			
	Package	Tape	Reel	Land
SOT-89-5	UP005-A-P-SD	UP005-A-C-SD	UP005-A-R-SD	—
SOT-23-5	MP005-A-P-SD	MP005-A-C-SD	MP005-A-R-SD	—

■ Absolute Maximum Ratings

Table 9

(Ta = 25°C unless otherwise specified)

Item	Symbol	Absolute Maximum Rating	Unit
Input voltage	$V_{IN}$	$V_{SS} - 0.3$ to $V_{SS} + 6.0$	V
	$V_{ON/OFF}$	$V_{SS} - 0.3$ to $V_{IN} + 0.3$	V
	$V_{SSC}$	$V_{SS} - 0.3$ to $V_{IN} + 0.3$	V
Output voltage	$V_{OUT}$	$V_{SS} - 0.3$ to $V_{IN} + 0.3$	V
Power dissipation	SOT-89-5	$1000^{*1}$	mW
	SOT-23-5	$600^{*1}$	mW
	SNT-6A(H)	$500^{*1}$	mW
Operating ambient temperature	$T_{opr}$	-40 to +85	°C
Storage temperature	$T_{stg}$	-40 to +125	°C

\*1. When mounted on board

[Mounted board]

- (1) Board size : 114.3 mm × 76.2 mm × t1.6 mm
- (2) Name : JEDEC STANDARD51-7

**Caution** The absolute maximum ratings are rated values exceeding which the product could suffer physical damage. These values must therefore not be exceeded under any conditions.

**Table 10 (2 / 2)**

S-1137 Series A / B type (With discharge shunt function)

Item	Symbol	Conditions	Min.	Typ.	Max.	Unit	Test Circuit
"L" output Nch ON resistance	R <sub>LOW</sub>	V <sub>OUT</sub> = 0.1 V, V <sub>IN</sub> = 5.5 V	—	35	—	Ω	3

S-1137 Series A / C type (pull-down resistor)

Item	Symbol	Conditions	Min.	Typ.	Max.	Unit	Test Circuit
Power-off pull-down resistor	R <sub>PD</sub>	—	1.0	2.2	5.0	MΩ	4

- \*1. V<sub>OUT(S)</sub>: Specified output voltage  
 V<sub>OUT(E)</sub>: Actual output voltage  
 Output voltage when fixing I<sub>OUT</sub> (= 100 mA) and inputting V<sub>OUT(S)</sub> + 1.0 V
- \*2. The output current at which the output voltage becomes 95% of V<sub>OUT(E)</sub> after gradually increasing the output current.
- \*3. V<sub>drop</sub> = V<sub>IN1</sub> - (V<sub>OUT3</sub> × 0.98)  
 V<sub>OUT3</sub> is the output voltage when V<sub>IN</sub> = V<sub>OUT(S)</sub> + 1.0 V and I<sub>OUT</sub> = 300 mA.  
 V<sub>IN1</sub> is the input voltage at which the output voltage becomes 98% of V<sub>OUT3</sub> after gradually decreasing the input voltage.
- \*4. The change in temperature [mV/°C] is calculated using the following equation.  

$$\frac{\Delta V_{OUT}}{\Delta T_a} [\text{mV}/^\circ\text{C}]^{*1} = V_{OUT(S)} [\text{V}]^{*2} \times \frac{\Delta V_{OUT}}{\Delta T_a \bullet V_{OUT}} [\text{ppm}/^\circ\text{C}]^{*3} \div 1000$$
  - \*1. Change in temperature of the output voltage
  - \*2. Specified output voltage
  - \*3. Output voltage temperature coefficient
- \*5. The output current can be at least this value.  
 Due to restrictions on the package power dissipation, this value may not be satisfied. Attention should be paid to the power dissipation of the package when the output current is large.  
 This specification is guaranteed by design.

■ **Test Circuits**

**Figure 9**

**Figure 10**

**Figure 11**

**Figure 12**

**Figure 13**

■ **Standard Circuit**

- \*1.  $C_{IN}$  is a capacitor for stabilizing the input.
- \*2. Ceramic capacitor of 1.0  $\mu\text{F}$  or more can be used as  $C_L$ .
- \*3. A ceramic capacitor of 0.22 nF to 22 nF can be used for  $C_{SS}$ .

Figure 14

**Caution** The above connection diagram and constant will not guarantee successful operation. Perform thorough evaluation using the actual application to set the constant.

■ **Condition of Application**

- Input capacitor ( $C_{IN}$ ) : 1.0  $\mu\text{F}$  or more
- Output capacitor ( $C_L$ ) : 1.0  $\mu\text{F}$  or more (Ceramic capacitor)
- Capacitor for soft-start ( $C_{SS}$ ) : 0.22 nF to 22 nF (Ceramic capacitor)

**Caution** A general series regulator may oscillate, depending on the external components. Confirm that no oscillation occurs in the application for which the above capacitors are used.

■ **Selection of Input and Output Capacitors ( $C_{IN}$ ,  $C_L$ )**

The S-1137 Series requires an output capacitor between the VOUT and VSS pin for phase compensation. Operation is stabilized by a ceramic capacitor with an output capacitance of 1.0  $\mu\text{F}$  or more over the entire temperature range. When using an OS capacitor, tantalum capacitor, or aluminum electrolytic capacitor, the capacitance must be 1.0  $\mu\text{F}$  or more.

The value of the output overshoot or undershoot transient response varies depending on the value of the output capacitor. The required capacitance of the input capacitor differs depending on the application.

The recommended capacitance for an application is  $C_{IN} \geq 1.0 \mu\text{F}$ ,  $C_L \geq 1.0 \mu\text{F}$ ; however, when selecting the output capacitor, perform sufficient evaluation, including evaluation of temperature characteristics, on the actual device.

■ **Selection of Capacitor for Soft-start ( $C_{SS}$ )**

The S-1137 Series requires a capacitor for soft-start ( $C_{SS}$ ) between the SSC and VSS pins. In the all range of temperature, the S-1137 Series operates stably with a ceramic capacitor of 0.22 nF or more. By the value of this  $C_{SS}$ , the rising speed of the output voltage is adjustable. The time that the output voltage rises to 99% is 0.7 ms (typ.),  $C_{SS} = 1 \text{ nF}$ . The recommended value for applications is  $0.22 \text{ nF} \leq C_{SS} \leq 22 \text{ nF}$ , however, define the values by sufficient evaluation including the temperature characteristics under the usage condition.

## ■ Explanation of Terms

### 1. Low dropout voltage regulator

This IC's voltage regulator has the low dropout voltage due to its built-in low on-resistance transistor.

### 2. Output voltage ( $V_{OUT}$ )

The accuracy of the output voltage is ensured at  $\pm 1.0\%$  or  $\pm 15 \text{ mV}^*1$  under the specified conditions of fixed input voltage<sup>\*2</sup>, fixed output current, and fixed temperature.

\*1. When  $V_{OUT} < 1.5 \text{ V}$  :  $\pm 15 \text{ mV}$ , When  $1.5 \text{ V} \leq V_{OUT}$  :  $\pm 1.0\%$

\*2. Differs depending on the product.

**Caution** If the above conditions change, the output voltage value may vary and exceed the accuracy range of the output voltage. Refer to “■ Electrical Characteristics” and “■ Characteristics (Typical Data)” for details.

### 3. Line regulation $\left( \frac{\Delta V_{OUT1}}{\Delta V_{IN} \bullet V_{OUT}} \right)$

Indicates the dependency of the output voltage on the input voltage. That is, the values show how much the output voltage changes due to a change in the input voltage with the output current remaining unchanged.

### 4. Load regulation ( $\Delta V_{OUT2}$ )

Indicates the dependency of the output voltage on the output current. That is, the values show how much the output voltage changes due to a change in the output current with the input voltage remaining unchanged.

### 5. Dropout voltage ( $V_{drop}$ )

Indicates the difference between input voltage  $V_{IN}$  and the output voltage when; decreasing input voltage  $V_{IN}$  gradually until the output voltage has dropped out to the value of 98% of output voltage  $V_{OUT3}$ , which is at  $V_{IN} = V_{OUT(S)} + 1.0 \text{ V}$ .

$$V_{drop} = V_{IN1} - (V_{OUT3} \times 0.98)$$

**6. Temperature coefficient of output voltage**  $\left(\frac{\Delta V_{OUT}}{\Delta T_a \bullet V_{OUT}}\right)$

The shaded area in **Figure 15** is the range where  $V_{OUT}$  varies in the operating temperature range when the temperature coefficient of the output voltage is  $\pm 130$  ppm/ $^{\circ}\text{C}$ .

\*1.  $V_{OUT(E)}$  is the value of the output voltage measured at 25°C.

**Figure 15**

A change in the temperature of the output voltage [mV/ $^{\circ}\text{C}$ ] is calculated using the following equation.

$$\frac{\Delta V_{OUT}}{\Delta T_a} [\text{mV}/^{\circ}\text{C}]^{*1} = V_{OUT(S)} [\text{V}]^{*2} \times \frac{\Delta V_{OUT}}{\Delta T_a \bullet V_{OUT}} [\text{ppm}/^{\circ}\text{C}]^{*3} \div 1000$$

- \*1. Change in temperature of output voltage
- \*2. Specified output voltage
- \*3. Output voltage temperature coefficient

■ **Operation**

**1. Basic operation**

Figure 16 shows the block diagram of S-1137 Series.

The error amplifier compares the reference voltage ( $V_{ref}$ ) with  $V_{fb}$ , which is the output voltage resistance-divided by feedback resistors  $R_s$  and  $R_f$ . It supplies the gate voltage necessary to maintain the constant output voltage which is not influenced by the input voltage and temperature change, to the output transistor.

\*1. Parasitic diode

Figure 16

**2. Output transistor**

In the S-1137 Series, a low on-resistance P-channel MOS FET is used as the output transistor.

Be sure that  $V_{OUT}$  does not exceed  $V_{IN} + 0.3$  V to prevent the voltage regulator from being damaged due to inverse current flowing from the VOUT pin through a parasitic diode to the VIN pin.

### 3. ON / OFF pin

This pin starts and stops the regulator.

When the ON / OFF pin is set to the power-off level, the entire internal circuit stops operating, and the built-in P-channel MOS FET output transistor between the VIN and VOUT pins is turned off, reducing current consumption significantly. The S-1137 has a discharge shunt circuit which discharges the capacitor for soft-start ( $C_{SS}$ ) so that the SSC pin is forcibly set to the  $V_{SS}$  level.

Since the S-1137 Series A / B types have a built-in discharge shunt circuit to discharge the output capacitance, the VOUT pin is forcibly set to  $V_{SS}$  level. In the S-1137 Series C / D types, the VOUT pin is set to  $V_{SS}$  level through several hundred k $\Omega$  internal divided resistors between the VOUT and VSS pins.

Note that the current consumption increases when a voltage of 0.3 V to 1.0 V ( $T_a = 25^\circ\text{C}$ ) is applied to the ON / OFF pin. The ON / OFF pin is configured as shown in **Figures 17** and **18**. In the S-1137 Series A / C types, the ON / OFF pin is internally pulled down to VSS in the floating status, so the VOUT pin is set to the  $V_{SS}$  level. In the S-1137 Series B / D types, the ON / OFF pin is not internally pulled down, so do not use these types with the ON / OFF pin in the floating status. When not using the ON / OFF pin in the S-1137 Series B / D types, connect the pin to the VIN pin.

**Table 11**

Logic Type	ON / OFF Pin	Internal Circuits	VOUT Pin Voltage	Current Consumption
A / B / C / D	"H": Power-on	Operate	Set value	$I_{SS1}$ <sup>*1</sup>
A / B / C / D	"L": Power-off	Stop	$V_{SS}$ level	$I_{SS2}$

\*1. IC's current consumption increases as much as current flows into the pull-down resistor when the ON / OFF pin is connected to VIN and the S-1137 Series A / C types is operating (**Figure 17**).

**(1) S-1137 Series A / C Type**

**Figure 17**

**(2) S-1137 Series B / D Type**

**Figure 18**

**4. Discharge shunt function (S-1137 Series A / B types)**

The S-1137 Series A / B types have a built-in discharge shunt circuit to discharge the output capacitance. When the ON / OFF pin is set to power-off level, turns the output transistor off, and turns the discharge shunt function on so that the output capacitor discharges. These types allow for the VOUT pin reach the V<sub>SS</sub> level faster than the S-1137 Series C / D types that does not have a discharge shunt circuit.

\*1. Parasitic diode

Figure 19

**5. Overcurrent protection circuit**

The S-1137 Series has an overcurrent protection circuit having the characteristics shown in “(1) Output Voltage vs. Output Current (When Load Current Increases) (Ta = 25°C)” in “■ Characteristics (Typical Data)”, in order to protect the output transistor against an excessive output current and short circuiting between the VOUT and VSS pins. The current (I<sub>short</sub>) when the output pin is short-circuited is internally set at approx. 150 mA (typ.), and the normal value is restored for the output voltage, if releasing a short circuit once.

**Caution** Using the overcurrent protection circuit is to protect the output transistor from accidental conditions such as short circuited load and the rapid and large current flow in the large capacitor. The overcurrent protection circuit is not suitable for use under the short circuit status or large current flowing (300 mA or more) that lasts long.

**6. Pull-down resistor (S-1137 Series A / C types)**

In the S-1137 Series A / C types, the ON / OFF pin is internally pulled down to VSS, so the VOUT pin is in the V<sub>SS</sub> level when in the floating status.

IC's current consumption increases as much as current flows into the pull-down resistor of 2.2 MΩ (typ.) when the ON / OFF pin is connected to VIN and the S-1137 Series A / C types is operating.

**7. Soft-start function**

The S-1137 Series has a soft-start circuit to suppress the rush current ( $I_{RUSH}$ ) and overshoot of the output voltage generated at power-on the application or at turn-on the ON / OFF pin.

After immediately power-on the application or at turn-on the ON / OFF pin, the output voltage slowly rises. The time that the output voltage rises to 99% ( $t_{SS}$ ) is adjustable by a capacitor ( $C_{SS}$ ) externally connected between the SSC and VSS pins. When  $C_{SS} = 1$  nF, the time is 0.7 ms (typ.). When the ON / OFF pin is off, the electric charge charged in the external capacitor ( $C_{SS}$ ) will be discharged by the discharge shunt transistor.

The soft-start time ( $t_{SS}$ ) is defined by time consonants of the built-in constant current (approx. 1  $\mu$ A) and the external capacitor ( $C_{SS}$ ):

$$t_{SS} \text{ (ms)} = \text{soft-start coefficient} \times C_{SS} \text{ (nF)}$$

The soft-start coefficient (25°C) is as follows.

Min. : 0.4, Typ. : 0.7, Max. : 1.2

**Figure 20**

The rush current can be suppressed greatly by the soft-start function. As the value of the external capacitor is larger, the rush current decreases more. **Figure 21** shows the waveform example of the rush current.

**Figure 21 Waveform Example of Rush Current**

## ■ Precautions

- Wiring patterns for the VIN, VOUT and GND pins should be designed so that the impedance is low. When mounting an output capacitor between the VOUT and VSS pins ( $C_L$ ), the capacitor for stabilizing the input between the VIN and VSS pins ( $C_{IN}$ ), and the capacitor for soft-start between the SSC and VSS pins, the distance from the capacitors to these pins should be as short as possible.
- Note that the output voltage may increase when a series regulator is used at low load current (1.0 mA or less).
- Note that the output voltage may increase due to the leakage current from a driver when a series regulator is used at high temperature.
- Generally a series regulator may cause oscillation, depending on the selection of external parts. The following conditions are recommended for this IC. However, be sure to perform sufficient evaluation under the actual usage conditions for selection, including evaluation of temperature characteristics. See “**(8) Example of Equivalent Series Resistance vs. Output Current Characteristics ( $T_a = 25^\circ\text{C}$ )**” in “**■ Reference Data**” for the equivalent series resistance ( $R_{ESR}$ ) of the output capacitor.

Input capacitor ( $C_{IN}$ ) :	1.0 $\mu\text{F}$ or more
Output capacitor ( $C_L$ ) :	1.0 $\mu\text{F}$ or more
Capacitor for soft-start ( $C_{SS}$ ) :	0.22 nF to 22 nF

- The voltage regulator may oscillate when the impedance of the power supply is high and the input capacitor is small or an input capacitor is not connected.
- If the output capacitance is small, power supply's fluctuation and the characteristics of load fluctuation become worse. Sufficiently evaluate the output voltage's fluctuation with the actual device.
- Although this IC has a soft-start circuit, small overshoot may be included in the output voltage by the lower-valued capacitor for soft-start ( $C_{SS}$ ). Evaluate sufficiently with actual devices.
- The application conditions for the input voltage, output voltage, and load current should not exceed the package power dissipation.
- Do not apply an electrostatic discharge to this IC that exceeds the performance ratings of the built-in electrostatic protection circuit.
- In determining the output current, attention should be paid to the output current value specified in **Table 10** in “**■ Electrical Characteristics**” and footnote \*5 of the table.
- SII claims no responsibility for any disputes arising out of or in connection with any infringement by products including this IC of patents owned by a third party.

■ Characteristics (Typical Data)

(1) Output Voltage vs. Output Current (When Load Current Increases) ( $T_a = 25^\circ\text{C}$ )

**Remark** In determining the output current, attention should be paid to the following.

1. The minimum output current value and footnote \*5 in Table 10 in the "■ Electrical Characteristics"
2. The package power dissipation

(2) Output Voltage vs. Input Voltage ( $T_a = 25^\circ\text{C}$ )

**(3) Dropout Voltage vs. Output Current**

**(4) Dropout Voltage vs. Set Output Voltage**

**(5) Output Voltage vs. Ambient Temperature**

**(6) Current Consumption vs. Input Voltage**

**(7) Ripple Rejection ( $T_a = 25^\circ\text{C}$ )**

$V_{OUT} = 1.2\text{ V}$

$V_{OUT} = 2.5\text{ V}$

$V_{OUT} = 3.5\text{ V}$

※1. ランドパターンの幅に注意してください (0.25 mm min. / 0.30 mm typ.).

※2. パッケージ中央にランドパターンを広げないでください (1.30 mm ~ 1.40 mm)。

- 注意
1. パッケージのモールド樹脂下にシルク印刷やハンダ印刷などしないでください。
  2. パッケージ下の配線上のソルダーレジストなどの厚みをランドパターン表面から0.03 mm以下にしてください。
  3. マスク開口サイズと開口位置はランドパターンと合わせてください。
  4. 詳細は "SNTパッケージ活用の手引き" を参照してください。

※1. Pay attention to the land pattern width (0.25 mm min. / 0.30 mm typ.).

※2. Do not widen the land pattern to the center of the package (1.30 mm to 1.40 mm).

- Caution**
1. Do not do silkscreen printing and solder printing under the mold resin of the package.
  2. The thickness of the solder resist on the wire pattern under the package should be 0.03 mm or less from the land pattern surface.
  3. Match the mask aperture size and aperture position with the land pattern.
  4. Refer to "SNT Package User's Guide" for details.

※1. 请注意焊盘模式的宽度 (0.25 mm min. / 0.30 mm typ.)。

※2. 请勿向封装中间扩展焊盘模式 (1.30 mm ~ 1.40 mm)。

- 注意
1. 请勿在树脂型封装的下面印刷丝网、焊锡。
  2. 在封装下、布线上的阻焊膜厚度 (从焊盘模式表面起) 请控制在0.03 mm以下。
  3. 掩膜的开口尺寸和开口位置请与焊盘模式对齐。
  4. 详细内容请参阅 "SNT封装的应用指南"。

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
