

The Traveo MCU S6J3200 family features 32-bit RISC microcontrollers with an Arm® Cortex®- R5 core and operates up to 240 MHz. This microcontroller comes with highly-efficient 2D/3D graphic engines with advanced feature-sets for memory saving, safety, and high image quality to help manufacturers take advantage of the lower overall system costs. It also meets the increasingly high levels of performance and quality that industrial, consumer, and automotive applications demand. In addition, this microcontroller offers support for the Cypress HyperBus™ memory interface, a breakthrough that dramatically improves read performance while reducing the number of pins. This microcontroller comes with Ethernet AVB, CAN-FD, a high-speed communication protocol compatible with the conventional CAN, and Secure Hardware Extension (SHE) as a security function.

Features

■ System

- 32-bit Arm Cortex-R5F CPU core at up to 240 MHz
- GPIO port: Up to 120
- 12-bit A/D converter: Up to 50 channels
- External interrupt: Up to 16 channels
- Base timer: Up to 24 channels
- 32-bit free-run timer: Up to 12 channels
- Built-in CR oscillators
- Real-time clock
- Input capture unit: Up to 24 channels
- Output compare unit: Up to 24 channels
- DMA controller: 16 channels
- Stepper motor controller (SMC): Six units
- JTAG debug interface

■ Graphics and Display

- 2D graphic engine
- 3D graphic engine (optional)
- Timing generator - TCON
- TTL/RSDS
- FPD-Link – LVDS (optional)
- Video capture (optional)
- Communication: Ethernet AVB MAC (optional)
- CAN-FD: up to four channels
- Multi-function serial interface : up to 12 channels, selectable protocol: UART, CSIO, LIN, and I²C
- MediaLB: up to one channel (optional)

■ Memory

- Cypress HyperBus Memory interface
- Dual quad double data rate SPI Flash Interface

■ Multimedia

- I2S input/output: Up to two units
- PCM to PWM output unit
- Sound mixer (optional): 1 unit x 10 inputs (optional)
- Stereo audio DAC (optional)

■ Security and Safety

- Secure Hardware Extension
- Safety features, such as MPU, TPU, ECC, and others
- CRC generator: One channel
- Watchdog timer with window function
- Low-voltage detector
- Clock supervisor for all source clocks

1. Overview

1.1 Document Definition

Following are the related documents of S6J3200.

Table 1-1

Document Type	Definition	Primary User	Document Code
Datasheet	The function and its characteristics are specified quantitatively.	Investigator and hardware engineer	002-05682 Revision (Previous: DS708-00003-Revision)
S6J3200 hardware manual	The function and operation of the S6J3200 series are described.	Software engineer	002-04852 Revision
Traveo™ Platform hardware manual	The function and operation of the CPU core platform are described.	Software engineer	002-04854 Revision
Application note	The reference software, sample application, the reference board design, and so on are explained.	Software and hardware engineer	002-09861 Revision 002-09715 Revision 002-04455 Revision 002-04096 Revision 002-12061 Revision 002-04452 Revision 002-09716 Revision 002-11319 Revision 002-02495 Revision

Notes:

- Refer to all documents for the system development.
- "Primary user" is most likely the engineer for whom the document is the most useful.
- The description of the datasheet and the S6J3200 hardware manual should precede the duplicated description of Traveo platform hardware manual.
- The Traveo platform hardware manual is expected to be used as a dictionary of platform specification.
- Document code usually includes its revision.
- Revised information from the previous revision can be seen the supplementary information.

2. Function List

2.1 Function List

The table shows the functions which are implemented in S6J3200 series.

Table 2-1

Function	Description	Remark
CPU core	Arm Cortex R5F	
FPU	Available (Double precision and Single precision)	
PPU	Available	
MPU	Available	
TPU	Available	
Endian	Little endian	
Core clock frequency	Option	See 2.2.1 and AC specification on the datasheet.
HPM bus frequency	Option	See AC specification on the datasheet
Resource clock frequency	Option	See AC specification on the datasheet
Embedded CR oscillation	Slow clock:100 kHz, Fast clock: 4 MHz (Center frequency)	See AC specification on the datasheet
PLL	PLL0, 1, 2, 3	
SSCG PLL	SSCG0, 1, 2, 3	
Clock supervisor	Available	
DMA	16 ch	
Boot-ROM	16 Kbytes	
JTAG	Available	
Data cache	16 Kbytes	
Instruction cache	16 Kbytes	
Program FLASH	Option	See 2.2.1
Work FLASH	112 Kbytes	
TC-RAM	Option	See 2.2.1
System-RAM	Option	See 2.2.1
Backup-RAM	16 Kbytes	
Security (SHE)	Option	See 2.2.1
Low latency interrupt	Available	
Power domain	5 domains	
Power supply	5 V +/- 0.5 V, 3.3 V +/- 0.3 V, 1.2 V +/- 0.1 V	
Embedded LDO power supply for 5.0 V	Available	
Low-voltage detection of external power supply	Available	
Low-voltage detection of internal LDO output	Available	
Hardware watchdog timer	Available	
Software watchdog timer	Available	
Package	Option	See 2.2.1
AUTOSAR	AUTOSAR 4.0.3	
General Purpose I/O	Option	See 2.2.3
Quad Position & Revolution Counter (Up/Down Counter)	2 ch	
I/O timer	3 unit x 8 ch	
32 bit Reload timer	14 ch	
Real time clock	Available	Automatic calibration
Sound generator	4 ch	
Sound waveform generator	Option 1 unit x 5 outputs	See 2.2.1

Function	Description	Remark
Sound mixer	Option 1 unit x 10 inputs	See 2.2.1
Stereo audio DAC	Option 1 unit (L and R)	See 2.2.1
PCM-PWM	Option 1 unit (L and R)	See 2.2.1
Base timer	12 units (24 ch)	
Free-run timer	12 ch	
Input Capture Unit	12 unit (24channels of capture)	
Output Compare Unit	12unit (24 channels of compare match)	
Stepping motor controller (SMC)	For 6 gauges	
12 bit-A/D converter	Option 1 unit x 50 input ports (Max)	See 2.2.3
CRC	4 unit	
Programmable CRC	1 unit	
Source clock timer	4 ch	
NMI	Available	
External interrupt	16 ch	
Internal interrupt	512 vectors	
I2S	2 ch	One only supports an output as a function of the sound system.
DDR HSSPI	2 ch	A type of Quad SPI
HyperBus (RPC2)	Option	See 2.2.1 See AC specification on the datasheet.
Multi-function serial interface	12 ch	
CAN-FD	4 ch	
CAN-FD RAM (ECC supported)	16KB/ch It equivalents to 128 message buffer per channel of CCAN module	
Ethernet AVB	Option	See 2.2.1
Media-LB (MOST25)	Option	See 2.2.1
LCD controller	Option 4 COM x 32 SEG (Max)	See 2.2.3
Indicator PWM	1 ch	
MPU for AHB	1 unit	
MPU for AXI	1 unit	
Internal VRAM	Option	See 2.2.1
Graphic engine clock	Option	See 2.2.1
Graphic AXI clock	Option	See 2.2.1
Display clock	Option 80 MHz (ch.0), 50 MHz(ch.1)	See 2.2.1
Display clock source	Graphic display controller clock or external clock	
Target frame rate	60 fps	
Number of display outputs	Option Maximum 2 outputs simultaneously	See 2.2.1
TTL output (RGB888)	Option	See 2.2.1
RSDS/TCON support	1 output	
FPD-Link (LVDS)	Option 1 output, 350 Mbps (Max)	See 2.2.1
Video capture unit	Option	See 2.2.1
Video capture format	ITU656, YCbCr4:4:4, YCbCr4:2:2, RGB888, RGB666	
2D Graphic engine	1 unit	
2.5D support	Available	
Vector drawing on 2D engine	Available	
Warping	Available	
Scale/Rotate/Blend	Available	
2D Driver API	CYPRESS proprietary	

Function	Description	Remark
3D Graphic engine	Option	See 2.2.1
Vector drawing on 3D engine	Option	See 2.2.1
3D Driver API	Option	See 2.2.1

Notes:

- *The options are described in 2.2.*
- *The described specifications in the table which are related the electric characteristics only show the typical values. They don't necessarily include the width of characteristics, errors, and so on. They should be seen in the datasheet in detailed.*
- *Target resolution of graphics is WVGA 800 x 480, WQVGA 480 x 272.*
- *Target capture resolution of graphics is WVGA 800 x 480.*

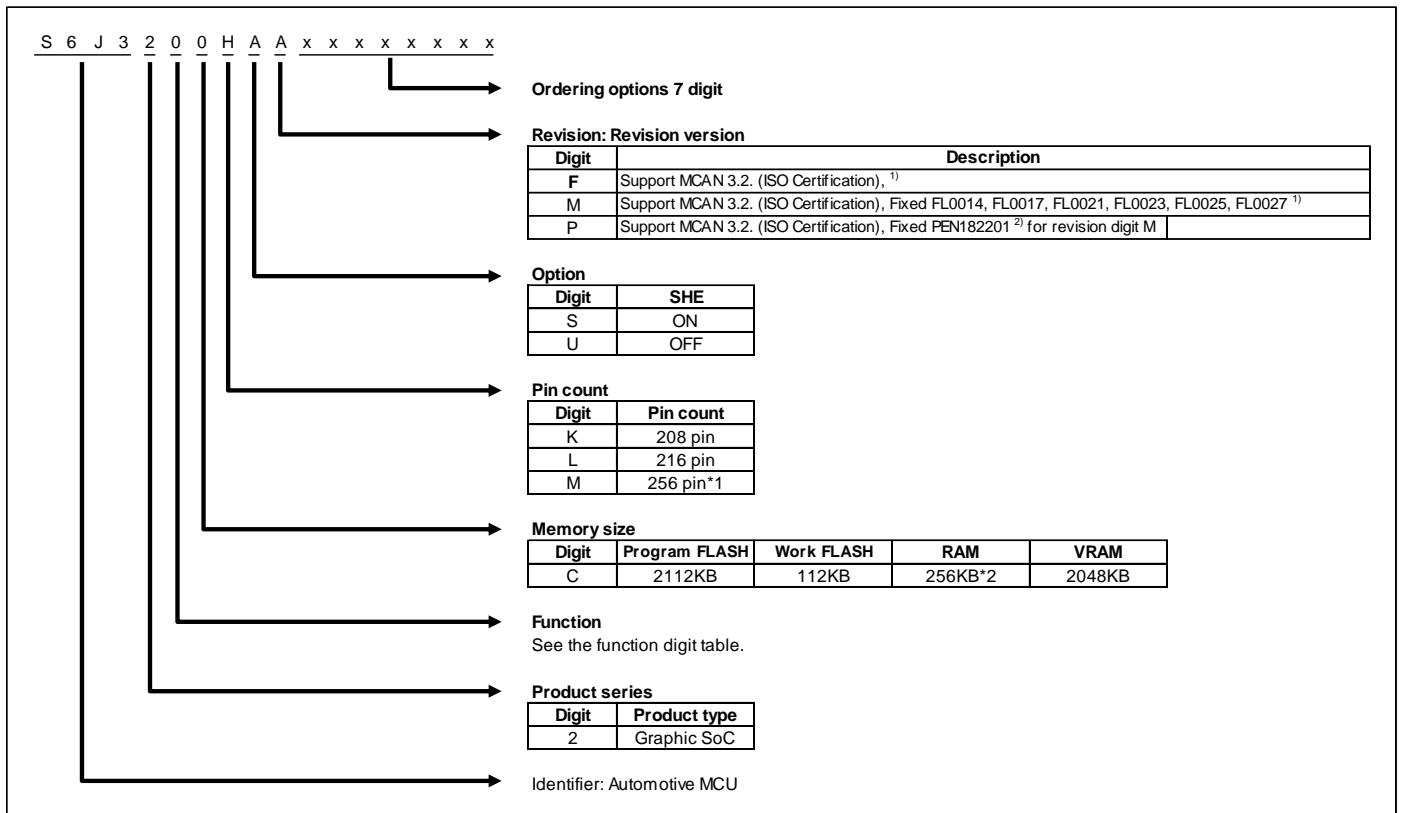

2.2 Optional Function

2.2.1 Basic Option

Notes:

- This table only shows the relation between the optional function and the part numbers. That is, all products are not necessarily available for orders. See the order number on the datasheet, and confirm actual availabilities of products.
- The sound system is composed of the sound waveform generator, the sound mixer, the audio DAC, PCM-PWM, and I2S0.
- The media system means both Ethernet AVB and Media LB.
- The CLK_CPU is assigned for CPU clock. The CLK_CD3A0 is assigned for Graphic clock. They are defined at the chapter of Clock Configuration.
- Display Output ch.0 is used for RSDS and FPD-LINK (LVDS) as well as DRGB (Digital RGB). The ch.0 of the product which doesn't support FPD-LINK is used for RSDS and DRGB.
- Display Output ch.1 is used for FPD-LINK (LVDS) and DRGB (Digital RGB). The ch.1 of the product which doesn't support FPD-LINK is used for DRGB only.
- HyperBus Interface ch.0 for MCU and ch.1 for graphic subsystem cannot be used simultaneously.

2.2.2 ID

ID is specified for each function digit and revision, which is defined in Figure 2-1 through Figure 2-3. The Chip ID can be read from SYSC0_SYSIDR and the Platform ID can be read from SYSC0_SYSPFIDR. For SYSC0_SYSIDR and SYSC0_SYSPFIDR, see the Traveo™ Platform hardware manual.

The Graphic subsystem ID can be read from the IPIdentifier register on the graphic subsystem. See the chapter Graphic Subsystem in S6J3200 hardware manual.

Notes:

- See multiplexed functions on pin assignment sheet.
- The optional restriction will be added without notification.
- TEQFP-256 is a package option under planning

3. Product Description

3.1 Overview

This section explains the product features of the S6J3200 series. The description of this section should precede the duplicated description on platform manual.

3.2 Product Description

Table 3-1: Product Features

Feature	Description
Technology	55-nm CMOS technology with embedded flash Fully automotive qualified according to ISO/TS 16949 and AEC-Q100
Functional Safety	The product series has some functional safety features suited for ASIL-B application.
Peripherals	See function list.
Power Domain (PD)	See the platform manual and the STATE TRANSITION chapter in detail. The product series supports the power-off control of PD2 (including PD3 and 5), PD4_0, PD4_1, and PD6. The power domain resets of PD3 and PD5 included in PD2 are not supported in the product series, and "0" is always read from the reset factor flags of them. This series does not support partial wakeup for PD6.
Debug and Trace	See the platform manual in detail. <ul style="list-style-type: none"> - Standard 5-pin JTAG interface - 4k Word Embedded Trace Buffer 4-bit trace support for TEQFP package. Full trace (dedicated 16-bit port) with special bond-out package is planned.
System Control	See the platform manual in detail. Main and sub oscillator is available. <ul style="list-style-type: none"> - A wide range of 3.6 - 16 MHz is available for main oscillator - 32 KHz is available for sub oscillator Sub clock is enable/disable by register settings
Clock	See the platform manual in detail. CLK_CLKO (Clock Output Function) is not supported. Main Oscillation Stabilization Wait Time (at 4 MHz):8.19 ms (Initial value)
Embedded CR oscillation	See the platform manual in detail. Stabilization time is as followings. <ul style="list-style-type: none"> - 0.35 ms to 0.8 ms for 4 MHz (Fast clock) - 0.43 ms to 1.28 ms for 100 kHz (Slow clock)
Clock Supervisor	See the platform manual in detail. This product series does not support the clock supervisor output port. (Related register and internal circuit is implemented.)
Reset	See the platform manual in detail. Following resets are not mounted on this device or not supported. <ul style="list-style-type: none"> - INITX: INITX is issued by simultaneous assert of RSTX and MODE, but this product series does not support INITX. - SRSTX (and nSRST pin) The product series does not support EX5VRST and writing EX5VRSTCNT bits in SYSC0_SPECFGR has no effect.
Hardware Watchdog	See the platform manual in detail. Hardware watchdog function stops during PSS mode. In the related register of HWDG_CFG, the bit ALLOWSTOPCLK is always read as 1 (HWDG_CFG.ALLOWSTOPCLK=1). The product series does not support Watchdog Counter Monitor Output port. (Related register and internal circuit is implemented.)

Feature	Description
Software Watchdog	See the platform manual in detail. The product series doesn't support Watchdog Counter Monitor Output port. (Related register and internal circuit is implemented.)
Standby Mode	See the platform manual in detail. Standby mode with 5 V single power supply is available. Turning off the 3.3-V supply and the external 1.2-V supply in standby mode is available. The long term pulse of the indicator PWM can be outputted during RTC Standby mode.
PLL / SSCG PLL	See the platform manual in detail. Use case assumption is following. <ul style="list-style-type: none"> - PLL <ul style="list-style-type: none"> ➢ Sound system clock ➢ Sound frequency master clock ➢ Peripherals ➢ Display clock ➢ Trace clock - SSCG <ul style="list-style-type: none"> ➢ CPU core ➢ GDC core ➢ HyperBus ➢ DDR-HSSPI Product supports down spread and center spread modes with the conditions defined in chapter "Internal Clock Timing" on the datasheet.
External Interrupts	See the platform manual in detail.
NMI	See the platform manual in detail. 1 NMI pin.
Memory Protection	MPU16 AHB: See the platform manual in detail. MPU for AXI: ch.0 (Supervise Ethernet) MPU for AHB: ch.1 (Supervise Media LB) Additional MPU for Graphic sub system, MediaLB and Ethernet AVB. They are described on the chapter of MPU for AHB and MPU for AXI. To configure Lock or Unlock for both MPUXn_UNLOCK and MPUHn_UNLOCK, <ul style="list-style-type: none"> - Lock: 0x112ABB56 - Unlock: 0xACCABB56
Peripheral Protection	See the platform manual in detail. Protected peripherals are described in the base address map.
Internal Memories System RAM	See the platform manual in detail. 1 wait cycle is necessary for RAM read at over 160 MHz. No need to insert wait cycles for RAM write.
Internal Memories TCRAM	See the platform manual in detail.
Internal Memories Backup RAM	16 KB Backup RAM can only be operated in RUN mode (normal operation mode). In other mode the memory content should be retained, but it cannot be operated. SLEEP control for Backup RAM is not supported and cannot be used.
Internal Memories VRAM	ECC region is shared with user region. Memory size available for user program become less when ECC is enabled. User can define ECC enabled area and ECC disabled area. Single error correction, double error detection (SECDED) ECC support per 32-bit word.

Feature	Description
Embedded Program/Work Flash Memory	Embedded Program flash can be accessed with 0-wait-cycle if CPU frequency is 80 MHz or less. 0-wait-cycle: 80 MHz or less. 1-wait-cycle: 160 MHz or less. 2-wait-cycle: more than 160 MHz. The maximum frequency should be referred in datasheet. Erase suspend is supported. Reading and writing to the other sector are possible when Flash Erase is suspended. Serial Flash programming and Parallel Flash programming are supported. Margin mode is not supported.
Security	Chip erase function is available for flash memory. The function of "MK_CEER" is not supported. (MK_CEER = not selectable) For details, see the platform manual and chapter "Security"
Internal Power Domain	PD1: Always ON PD2: Cortex R5F platform/ GDC/ additional peripherals PD4: Backup RAM in Always On domain PD6: Peripherals in Always On domain * The chapter of the block diagram explains in detail.
Power Supply	External 5 V, 3 V, 1.2 V is required. Built in LDO provides internal 1.2 V for Always On region (PD1). External 1.2-V power supply control pin is supported. External 3.3-V power supply should be controlled by GPIO. There are constraints of power on/off sequence.
Low-voltage Detection	LVD for external voltage is supported. LVD for internal voltage is supported. See the specification of the detected level on the datasheet.
Low-voltage Detection for RAM Retention (RVD)	RVD for RAM retention is effective during the standby mode only. That is, it is only for the Backup RAM of 16 KB that the function is available.
Resource inter-connect	The output signal of some resources can be inputted to the other resource.
I/O Ports	5-V GPIO 3-V GPIO Multi input level and multi output drivability Pull-up, pull-down function is available. Resource input and output is multiplexed. +B input is allowed many pins of 3.3 V, 5 V, and 3.3 V/5 V I/O domain.
A/D Converter	12-bit resolution, 1 unit 50 channels of analog input for TEQFP256 and TEQPF216 46 channels of analog input for TEQFP208 24 channels of them are shared with the SMC for TEQFP256/216/208 External trigger and timer trigger are available. The description of the A/D converter function should be referred in the S6J3200 hardware manual. Though the chapter of I/O port in Traveo PF V3 hardware manual describes another A/D converter function, do not refer it.
CRC	See the platform manual in detail.
Programmable CRC	DMA support
Sound Generator	Produces sound/melody with varying frequency and amplitude for convenient duration Square wave sound output Automatic linear amplitude increment or decrement Interrupt request generated when specified sound length has ended

Feature	Description
Sound Waveform Generator	Sine waveform, saw-tooth waveform and Square waveform are generated with easy configuration of the parameters which specified sound sources. Fade-in and Fade-out control for reverberation.
Sound Mixer	The input channels of 0-4 are reserved for waveform generator. Mixing different sampling frequency sounds. Mixing Internal sounds and External I2S input sounds. Saturating addition function for keeping sound quality. Cut a specific frequency data by digital filter. LPF is support by FIR filter. Fade-in and Fade-out control.
PCM-PWM	Conversion of PCM audio streaming to Pulse Width Modulated signals. Supports 2 output channels for stereo and mono data Up to 16-bit output sample resolution Support for half and full H-bridges
Audio DAC	The sound source of the fixed 48 kHz sampling frequency can be outputted. 1unit, L/R channels support. BTL connection is available.
I2S	2 ch. - I2S0 can output sound sources which are processed by Sound System. - I2S1 can input sound sources which are processed by Sound System. See the "Sound System Configuration" of S6J3200 hardware manual in detail.
Base Timer	See the platform manual in detail. A unit consists of a pair of 16 bit base timers. 12 units, that is, 24 channels of base timers are available.
Reload Timer	See the platform manual in detail.
I/O Timer	See the platform manual in detail.
Quad Position & Revolution Counter (Up/Down Counter)	See the platform manual in detail.
Multi-functional Serial (MFS)	See the platform manual in detail. 5 ports of MFS only support I ² C. Note - Not all pins support I2C. Only pins which have the I2C I/O characteristics support it. See the datasheet in detail. The I ² C is not designed to be hot swappable. The availability of chip select function can be seen at Function Digit Table. Chip Select Input is not supported. CTS/RTS is not mounted (hardware flow control is not supported for this series.) WUCR function is not supported for this product.
CAN-FD	Flexible data rate is supported. 16 KB/ch of message RAM is available. The clock output from CAN pre-scaler is supplied to every CAN. ECC error generation function of the message RAM is not supported for this device. Therefore, CAN FD ECC Error Insertion Control Register (FD FECR) is not writeable. See the platform manual in detail
Real Time Clock (RTC) with Auto-calibration	See the platform manual in detail.

Feature	Description
DDR High Speed SPI	ch.0: HSSPI as a MCU peripheral ch.1: HSSPI on graphic subsystem See the platform manual in detail
HyperBus I/F	ch.0: HyperBus as a MCU peripheral ch.1: HyperBus on graphic subsystem ch.2: HyperBus on graphic subsystem The following register is not supported and cannot be used. <ul style="list-style-type: none"> - Controller Status Register (HYPERBUSIn_CSR) - Interrupt Enable Register (HYPERBUSIn_IEN) - Interrupt Status Register (HYPERBUSIn_ISR) - Write Protection Register (HYPERBUSIn_WPR) - Test Register (HYPERBUSIn_TEST) GPO signal can only be used for "Internal Control example by GPO" in this product, that is, it can select using HyperBus of PF or using HyperBus of Graphic Sub System. See the "HyperBus Interface Port Configuration" of S6J3200 hardware manual in detail.
Stepper Motor Control (SMC)	Each channel has four motor drivers with high output capability
External Interrupt Capture Unit (EICU)	See the platform manual in detail.
Ethernet AVB	10/100 Mbps MII-Interface Supports Audio-Video Bridging (AVB) ETHERNETn_revision_reg : 0x30070106 (Initial value) for after revision B ETHERNETn_designcfg_debug6: 0x0302000E (Initial value) See 0 in details.
MediaLB	MOST25 (512FS) 3 wires Maximum 15 ch is available.
LCD Controller	TEQFP256: 4com x 32seg TEQFP216: 4com x 32seg TEQFP208: 4com x 30seg LCDC pins are initialized with Reset. (Stop LCDC alternating current output). Duty and Static of segment output is supported. (SEG23/ST0, SEG24/ST1, SEG25/ST2, SEG26/ST3, SEG27/ST4, SEG28/ST5, SEG29/ST6, SEG30/ST7, SEG31/ST8)
SHE	See the platform manual in detail.
Source Clock Timer	See the platform manual in detail.
Graphics Subsystem	Variable setting about GDC clock. (Asynchronous with CPU clock) Two drawing engines for "2D drawing" and "3D drawing". Parallel processing support. CPU can direct access to VRAM. Programmable panel timing controller with RGB888 and RSDS support.
FPD-Link Converter	LFCTRL and FRANGE bit of CTRL1. See chapter FPD-Link Converter about function. -These register bit are supported for revision M, P. -These register bit are not supported for revision F and J. These bit are reserved bit(Access type is R0,W0. Initial value is 0).

Feature	Description
Power Supply Control (PSC)	<p>PSC (PSC_1) output is used for external 1.2-V power supply module control and automatically switched with the following condition.</p> <p>"High": Request to supply VCC12</p> <ul style="list-style-type: none"> - "Power ON Reset" is released - CPU wakes up from PSS shutdown mode <p>"Low": Request to stop supplying VCC12</p> <ul style="list-style-type: none"> - CPU transfers from RUN mode to PSS shutdown mode. <p>For timing chart of output signals include PSC in detail, see the "S6J3200 hardware manual" and chapter "State Transition"</p>

3.2.1 Ethernet

The following functions are not supported.

Functions	Remark
External FIFO Interface	
Additional Low Latency TX FIFO Interface for DMA configurations	
MAC Transmit Block - half-duplex - collision - back_pressure	
MAC Filtering Block - external address match - Wakeup On Lan	
Energy Efficient Ethernet support	
LPI Operation in Cadence IP	
PHY Interface - GMII - SGMII - TBI	
10/100/1000 Operation - 1000 M	
SGMII Operation	
Jumbo Frames	
Physical Control Sub-Layer

 - DATUMS A-B AND D TO BE DETERMINED AT DATUM PLANE H.
 - TO BE DETERMINED AT SEATING PLANE C.
 - DIMENSIONS D1 AND E1 DO NOT INCLUDE MOLD PROTRUSION. ALLOWABLE PROTRUSION IS 0.25mm PRE SIDE. DIMENSIONS D1 AND E1 INCLUDE MOLD MISMATCH AND ARE DETERMINED AT DATUM PLANE H.
 - DETAILS OF PIN 1 IDENTIFIER ARE OPTIONAL BUT MUST BE LOCATED WITHIN THE ZONE INDICATED.
 - REGARDLESS OF THE RELATIVE SIZE OF THE UPPER AND LOWER BODY SECTIONS. DIMENSIONS D1 AND E1 ARE DETERMINED AT THE LARGEST FEATURE OF THE BODY EXCLUSIVE OF MOLD FLASH AND GATE BURRS. BUT INCLUDING ANY MISMATCH BETWEEN THE UPPER AND LOWER SECTIONS OF THE MOLDER BODY.
 - DIMENSION b DOES NOT INCLUDE DAMBAR PROTRUSION. THE DAMBAR PROTRUSION (S) SHALL NOT CAUSE THE LEAD WIDTH TO EXCEED b MAXIMUM BY MORE THAN 0.08mm. DAMBAR CANNOT BE LOCATED ON THE LOWER RADIUS OR THE LEAD FOOT.
 - EXACT SHAPE AND SIZE OF THIS FEATURE IS OPTIONAL.
 - THESE DIMENSIONS APPLY TO THE FLAT SECTION OF THE LEAD BETWEEN 0.10mm AND 0.25mm FROM THE LEAD TIP.
 - A1 IS DEFINED AS THE DISTANCE FROM THE SEATING PLANE TO THE LOWEST POINT OF THE PACKAGE BODY.

7. Precautions and Handling Devices

7.1 Handling Precautions

Any semiconductor devices have inherently a certain rate of failure. The possibility of failure is greatly affected by the conditions in which they are used (circuit conditions, environmental conditions, etc.). This page describes precautions that must be observed to minimize the chance of failure and to obtain higher reliability from your Cypress semiconductor devices.

7.1.1 Precautions for Product Design

This section describes precautions when designing electronic equipment using semiconductor devices.

Absolute Maximum Ratings

Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of certain established limits, called absolute maximum ratings. Do not exceed these ratings.

Recommended Operating Conditions

Recommended operating conditions are normal operating ranges for the semiconductor device. All the device's electrical characteristics are warranted when operated within these ranges.

Always use semiconductor devices within the recommended operating conditions. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their sales representative beforehand.

Processing and Protection of Pins

These precautions must be followed when handling the pins which connect semiconductor devices to power supply and input/output functions.

(1) Preventing Over-Voltage and Over-Current Conditions

Exposure to voltage or current levels in excess of maximum ratings at any pin is likely to cause deterioration within the device and in extreme cases leads to permanent damage of the device. Try to prevent such overvoltage or over-current conditions at the design stage.

(2) Protection of Output Pins

Shorting of output pins to supply pins or other output pins, or connection to large capacitance can cause large current flows. Such conditions if present for extended periods of time can damage the device.

Therefore, avoid this type of connection.

(3) Handling of Unused Input Pins

Unconnected input pins with very high impedance levels can adversely affect stability of operation. Such pins should be connected through an appropriate resistance to a power supply pin or ground pin.

7.1.2 Precautions for Package Mounting

Package mounting may be either lead insertion type or surface mount type. In either case, for heat resistance during soldering, you should only mount under Cypress recommended conditions. For detailed information about mount conditions, contact your sales representative.

Lead Insertion Type

Mounting of lead insertion type packages onto printed circuit boards may be done by two methods: direct soldering on the board, or mounting by using a socket.

Direct mounting onto boards normally involves processes for inserting leads into through-holes on the board and using the flow soldering (wave soldering) method of applying liquid solder. In this case, the soldering process usually causes leads to be subjected to thermal stress in excess of the absolute ratings for storage temperature. Mounting processes should conform to Cypress recommended mounting conditions.

If socket mounting is used, differences in surface treatment of the socket contacts and IC lead surfaces can lead to contact deterioration after long periods. For this reason it is recommended that the surface treatment of socket contacts and IC leads be verified before mounting.

Surface Mount Type

Surface mount packaging has longer and thinner leads than lead-insertion packaging, and therefore leads are more easily deformed or bent. The use of packages with higher pin counts and narrower pin pitch results in increased susceptibility to open connections caused by deformed pins, or shorting due to solder bridges.

You must use appropriate mounting techniques. Cypress recommends the solder reflow method, and has established a ranking of mounting conditions for each product. Users are advised to mount packages in accordance with Cypress ranking of recommended conditions.

Lead-Free Packaging

CAUTION: When ball grid array (BGA) packages with Sn-Ag-Cu balls are mounted using Sn-Pb eutectic soldering, junction strength may be reduced under some conditions of use.

Storage of Semiconductor Devices

Because plastic chip packages are formed from plastic resins, exposure to natural environmental conditions will cause absorption of moisture. During mounting, the application of heat to a package that has absorbed moisture can cause surfaces to peel, reducing moisture resistance and causing packages to crack. To prevent, do the following:

- (1) Avoid exposure to rapid temperature changes, which cause moisture to condense inside the product. Store products in locations where temperature changes are slight.
- (2) Use dry boxes for product storage. Products should be stored below 70% relative humidity, and at temperatures between 5 °C and 30 °C. When you open Dry Package that recommends humidity 40% to 70% relative humidity.
- (3) When necessary, Cypress packages semiconductor devices in highly moisture-resistant aluminum laminate bags, with a silica gel desiccant. Devices should be sealed in their aluminum laminate bags for storage.
- (4) Avoid storing packages where they are exposed to corrosive gases or high levels of dust.

Baking

Packages that have absorbed moisture may be de-moisturized by baking (heat drying). Follow the Cypress recommended conditions for baking.

Condition: 125 °C/24 h

Static Electricity

Because semiconductor devices are particularly susceptible to damage by static electricity, you must take the following precautions:

- (1) Maintain relative humidity in the working environment between 40% and 70%.
Use of an apparatus for ion generation may be needed to remove electricity.
- (2) Electrically ground all conveyors, solder vessels, soldering irons and peripheral equipment.
- (3) Eliminate static body electricity by the use of rings or bracelets connected to ground through high resistance (on the level of 1 MΩ).
Wearing of conductive clothing and shoes, use of conductive floor mats and other measures to minimize shock loads is recommended.
- (4) Ground all fixtures and instruments, or protect with anti-static measures.
- (5) Avoid the use of styrofoam or other highly static-prone materials for storage of completed board assemblies.

7.1.3 Precautions for Use Environment

Reliability of semiconductor devices depends on ambient temperature and other conditions as described above.

For reliable performance, do the following:

- (1) Humidity
Prolonged use in high humidity can lead to leakage in devices as well as printed circuit boards. If high humidity levels are anticipated, consider anti-humidity processing.
- (2) Discharge of Static Electricity
When high-voltage charges exist close to semiconductor devices, discharges can cause abnormal operation. In such cases, use anti-static measures or processing to prevent discharges.
- (3) Corrosive Gases, Dust, or Oil
Exposure to corrosive gases or contact with dust or oil may lead to chemical reactions that will adversely affect the device. If you use devices in such conditions, consider ways to prevent such exposure or to protect the devices.
- (4) Radiation, Including Cosmic Radiation
Most devices are not designed for environments involving exposure to radiation or cosmic radiation. Users should provide shielding as appropriate.
- (5) Smoke, Flame
CAUTION: Plastic molded devices are flammable, and therefore should not be used near combustible substances. If devices begin to smoke or burn, there is danger of the release of toxic gases.

Customers considering the use of Cypress products in other special environmental conditions should consult with sales representatives.

7.2 Handling Devices

For Latch-Up Prevention

The latch-up phenomenon may occur on a CMOS IC in the following cases: the voltage applied to an input or output pin is higher than VCC or lower than VSS; or the voltage applied between a VCC pin and a VSS pin exceeds the rating. A latch-up causes a rapid increase in the power supply current, possibly resulting in thermal damage to an element. When using the device, take sufficient care not to exceed the maximum rating.

About Handling Unused Pins

Leaving unused input pins open may cause permanent damage from a malfunction or latch-up. Take measures for unused pins, such as pulling up or pulling down the voltage with resistors of 2 kilo ohms or higher.

If there are any unused input/output pins, set them to the output state and then open them, or set them to the input state and handle them in the same way as input pins.

About Power Supply Pins

If the device has multiple VCC and VSS pins, the device is designed in such a way that the pins that should be at the same potential are connected to each other inside the device to prevent malfunctions such as latch-up. However, to reduce unwanted emissions, prevent malfunctions of strobe signals caused by an increase of the ground level, and observe standards on total output current, be sure to connect all the VCC and VSS pins to the power source and ground externally. Also handle all the VSS power supply pins in this way as shown in the following diagram. If there are multiple VCC or VSS systems, the device does not operate normally even within the guaranteed operating range.

Figure 7-1 Pin Assignment

In addition, consider connecting with low impedance from the power supply source to the VCC and VSS of this device.

We recommend connecting a ceramic capacitor as a bypass capacitor between VCC and VSS, near this device.

About the Crystal Oscillation Circuit

Noise entering the X0 or X1 pin may cause a malfunction. Design the printed circuit board in such a way that the X0 and X1 pins, the crystal oscillator (or ceramic resonator), and a bypass capacitor to ground are located very close to the device.

We recommend that the printed circuit board artwork have the X0 and X1 pins enclosed by ground.

About the Mode Pin (MD)

Use mode pin MD by directly connecting it to a VCC or VSS pin. To prevent noise from causing the device to accidentally enter test mode, reduce the pattern length between each mode pin and a VCC or VSS pin on the printed circuit board, and connect them with low impedance.

Point to Note during PLL Clock Operation

While a PLL clock is selected, if the oscillator breaks off or input stops, the PLL clock may continue operating with the free running frequency of the internal self-oscillator circuit. This operation is outside of the guaranteed range.

Power Supply Pin Processing of an A/D Converter

Even when no A/D converter is used, establish a connection such that $AVCC=AVRH=VCC$ and $AVSS=VSS$.

Points to Note about Using External Clocks

External clocks are not supported.

External direct clock input cannot be used.

Power-on Sequence of the Power Supply Analog Inputs of an A/D Converter

Be sure to turn on the digital power supply (VCC) before the application of the power supplies (AVCC, AVRH, and AVSS) and analog inputs (AN0 to AN63) of an A/D converter.

At the power-off time, turn off the power supplies and analog inputs of the A/D converter, and then turn off the digital power supply (VCC). Perform these power-on and power-off operations without AVRH exceeding AVCC. Even when using a pin shared with an analog input as an input port, do not allow the input voltage to exceed AVCC. (Turning on or off the analog supply voltage and digital supply voltage simultaneously is not a problem.)

Method to Switch off VCC12 during Power-off Sequence

□ For revision M, P

During power-off sequence, it is necessary to switch off VCC12 by driving PSC1 pin low by entering PSS mode (power domain 2 off). If VCC12 needs to be switched off by other means, RSTX needs to be asserted before switching off VCC12 to inactivate the operation of VCC12 supplied domain below the operation assurance range.

□ For except revision M, P

During power-off sequence, it is necessary to switch off VCC12 by driving PSC1 pin low by entering PSS mode (power domain 2 off). If VCC12 needs to be switched off by other means, VCC5 needs ramping down to occur LVDH1 reset before switching off VCC12 to inactivate the operation of VCC12 supplied domain below the operation assurance range.

About C Pin Processing

This device has a built-in voltage step-down circuit. Be sure to connect a capacitor to the C pin (refer to the pin assignment) for internal stabilization of the device. For the standard values, see "Recommended operating conditions" in the latest data sheet.

Precautions on Designing a Mounting Substrate

Measures against heat generation from the package must be taken for the mounting substrate to observe the absolute maximum rating (operating temperature). Design a mounting substrate with 4 or more layers. Connect the back of the package stage and the substrate pad with solder paste. Arrange thermal via holes on the substrate pad.

Notes on Writing to a Register Containing a Status Flag

In writing to a register containing a status flag (particularly an interrupt request flag, etc.) to control a function, it is important to take care not to accidentally clear the status flag.

Therefore, before the write operation, configure the status bit such that the flag is not cleared, and then set the control bit to the desired value.

Especially for control bits configured as a set of multiple bits, bit instructions cannot be used (bit instructions have only 1-bit access). In such cases, byte, half-word, or word access is used to write to the control bits and a status flag simultaneously. However, at this time, be careful not to accidentally clear bits other than the intended ones (the status flag bit in this case).

Note: Bit instructions take this point into account for registers that support bit-band units, so it does not need to be a concern. You need to take care when using bit instructions for registers that do not support bit-band units.

- *1: These parameters are based on the condition that VSS=AVSS=DVSS=0.0 V.
- *2: Take care that DVCC, AVCC5 do not exceed VCC5 at, for example, the power-on time.
- *3: The maximum output current is defined as the value of the peak current flowing through any one of the corresponding pins.
- *4: The average output current is defined as the value of the average current flowing through any one of the corresponding pins for a 10 ms period. The average value is the operation current × the operation ratio.
- *5: The total output current is defined as the maximum current value flowing through all of corresponding pins.
- *6: Output of 5-V pins.
- *7: Output of SMC pins.
- *8: Output of 5-V/3-V pins.
- *9: Output of 3-V pins.
- *10: Output of I²C.
- *11: Output of Media LB pins
- *12: VI or VO should never exceed the specified ratings. However, if the maximum current to/from an input is limited by a suitable external resistor, the ICLAMP rating supersedes the VI rating.
- *13: Take care that the output voltage does not exceed AVCC5 + 0.3 V because ADC Analog input pins (AN0-49) are internally connected to the analog elements.

*A: Relevant pins: All general-purpose ports and analog input pins

- Corresponding pins : all general-purpose ports
- Use within the operation assurance condition (See 8.2. Operation Assurance).
- Use at DC voltage (current).
- The +B signal should always be applied by connecting a limiting resistor between the +B signal and the microcontroller.
- The value of the limiting resistor should be set so that the current input to the microcontroller pin does not exceed rated values at any time regardless of instantaneously or constantly when the +B signal is input.
- Note that when the microcontroller drive current is low, such as in the low power consumption modes, the + B input potential can increase the potential at the VCC pin via a protective diode, possibly affecting other devices.
- Note that if the + B signal is input when the microcontroller is off (not fixed at 0 V), since the power is supplied through the pin, the microcontroller may operate incompletely.
- Note that if the +B signal is input at power-on, since the power is supplied through the pin, the power-on reset may not function in the power supply voltage.
- Do not leave + B input pins open.

Example of a recommended circuit

WARNING:

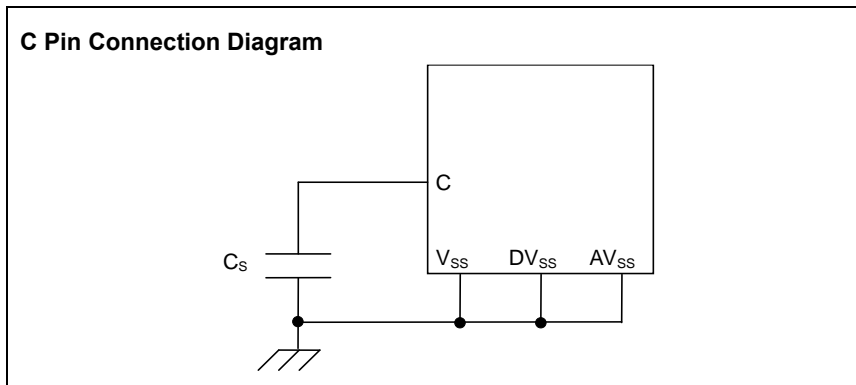

- Semiconductor devices may be permanently damaged by application of stress (including, without limitation, voltage, current or temperature) in excess of absolute maximum ratings. Do not exceed any of these ratings.

WARNING:

1. The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated under these conditions.
2. Any use of semiconductor devices will be under their recommended operating condition.
3. Operation under any conditions other than these conditions may adversely affect reliability of device and could result in device failure.
4. No warranty is made with respect to any use, operating conditions or combinations not represented on this datasheet. If you are considering application under any conditions other than listed herein, please contact sales representatives beforehand.

Notes:

- T_A : Ambient temperature (JEDEC)
- T_C : Case temperature (JEDEC), the maximum measured temperature of package case top.
- Both rating of T_A and T_C should simultaneously be satisfied as maximum operation temperature.
- The following condition should be satisfied in order to facilitate heat dissipation.
 1. Four or more layers PCB should be used.
 2. The area of PCB should be 114.3 mm x 76.2 mm or more, and the thickness should be 1.6 mm or more. (JEDEC standard)
 3. One layer of middle layers at least should be used for dedicated layer to radiate heat with residual copper rate 90% or more. The layer can be used for system ground.
 4. 35% or more of the die stage area which is exposed at back surface of package should be soldered to a part of 1st layer.
 5. The part of 1st layer should be connected to the dedicated heat radiation layer with more than 10 thermal via holes.

Figure 8-1: Example Thermal Via Holes on PCB.

Notes:

- Figure 8-1 is a schematic diagram showing PCB in section.
- Figure 8-2, Figure 8-3, and Figure 8-4 in the following pages are recommended land patterns for each package series. Thermal via holes should closely be placed and aligned with lands.
- When thermal via holes cannot be with lands, the followings are recommended as represented by Figure 8-5 which is an example for LEQ216.
 - (1). Increase pattern area size as much as possible inside the package outline.
 - (2). Place thermal via holes to be with lands as close as possible.
- $0.25\text{ mm} \leq a \leq 0.30\text{ mm}$ in Figure 8-1, Figure 8-2, Figure 8-3, and Figure 8-4
- It is recommended to connect the land pattern to the VSS-ground level (GND plan of inner layer bellow the MCU) as thermal heat sink.

A few mA which depends on usage for FPD-Link data transfer should be estimated for each port in an actual application, and then it should be added to the current consumption at V_{cc3_LVDS_Tx}.
- The current consumption at V_{cc3_LVDS_Tx} is specified under R_L=100 ohm, C_L=5 pF, f=50 MHz, and 0/1 alternation pattern output.

Notes:

- *1: Maximum clock frequencies when CPU clock = 240 MHz.
- For SSCG, down spread and center spread modes are supported with following conditions:
 - For down spread mode, clock frequency setting can be up to max SSCG frequency defined in above table.
 - For center spread mode, an appropriate clock frequency setting has to be chosen so that the modulated clock does not exceed the max SSCG frequency defined in above table.
- 240 MHz or less is available for PLL.
- *2: Maximum clock frequencies when CPU clock = 200 MHz.
- *3: Maximum clock frequencies when CPU clock = 160 MHz. This is also a combination of maximum clock frequencies for TC FLASH Programming or Erasing.
- From *1 to *3, they are applied to the product series with function digit 3, 4, 5, 6, 7, 8, 9, K, L, M, and N.
- *4: Maximum clock frequencies when CPU clock = 160 MHz for the product series with the function digit B. This is also a combination of maximum clock frequencies for TC FLASH Programming or Erasing.
- Even if a combination of clock frequency is able to be configured by software, the frequency should be configured under maximum frequency described in Table 8-1. For example, 80 MHz of CLK_LCP0A seems to be configurable from both divided 240 MHz and 160 MHz of CLK_CPU. But each duty ratio of configured 80 MHz as an internal signal is different from one another. In this series, the 80 MHz from the 160 MHz divided by 2 can only be assured, but the 240 MHz divided by 3 cannot be assured from the internal timing design point of view.
- $F_{CLK_TRC}/2$ (half frequency of F_{CLK_TRC}) comes out of the trace clock port of package external pin.
- The frequency described in () is maximum output frequency of SSCG PLL / PLL multiplier circuit.
- The configurable minimum frequency of PLLn and SSCGn output is 400 MHz.

- "Unused" means a clock source which doesn't have any supply destinations. Configure it as disable with performing at the lower clock frequency than the described maximum.

- Relationship between the oscillation clock frequency and internal clock frequency

		Internal Operation Clock Frequency								
		Main Clock	PLL Clock						Multiplied by 40	Multiplied by 60
			Multiplied by 1	Multiplied by 2	Multiplied by 3	Multiplied by 4	...			
Oscillation clock frequency [MHz]	4	2	4	8	12	16	...	160	240	

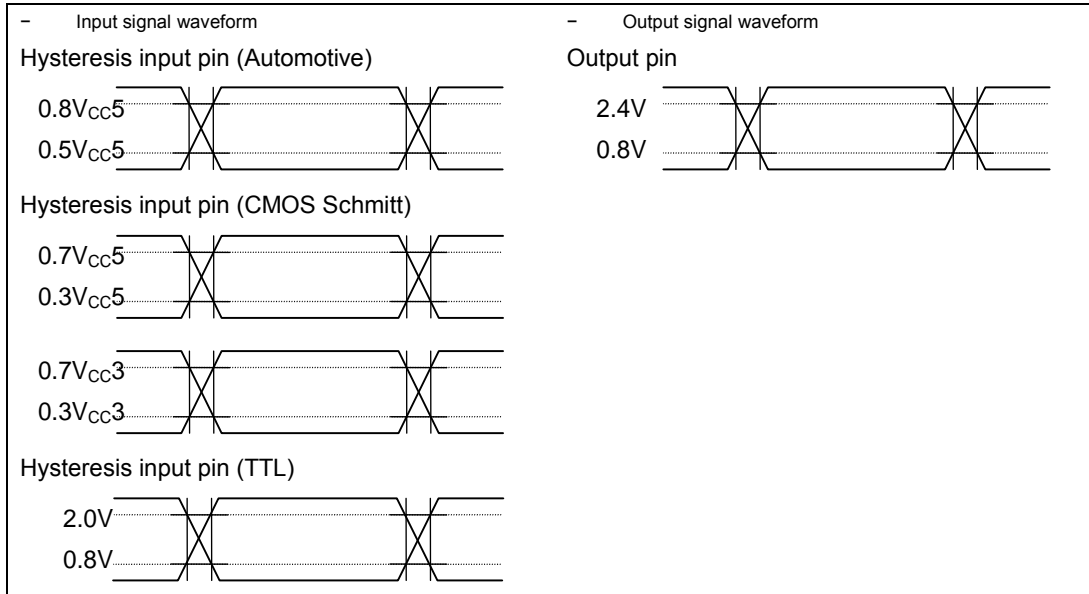

- Oscillation circuit example

Note:

For the configuration of an oscillation circuit, request the oscillator manufacturer to perform a circuit matching evaluation before starting design.

AC characteristics are specified by the following measurement reference voltage values.

DDR-HSSPI and HyperBus AC characteristics are specified with the following reference voltage regardless of input level configuration automotive, CMOS Schmitt, and TTL.

8.4.4 Reset
8.4.4.1 Reset Input

(Condition: See 8.2. Operation Assurance)

Parameter	Symbol	Pin Name	Conditions	Value		Unit	Remarks
				Min	Max		
Reset input time	t_{RSTL}	RSTX	-	10	-	μs	
Reset input pulse filtered				-	1	μs	

8.4.4.2 Power Supply Voltage Stability Conditions

□ For revision M, P

(Condition: See 8.2. Operation Assurance)

Parameter	Symbol	Pin Name	Conditions	Value		Unit	Remarks
				Min	Max		
VCC5 stability time after RSTX assertion	t_{FV5}	VCC5	-	35	-	μs	$VCC5 \geq 2.7\text{ V}$
VCC12 stability time after RSTX assertion	t_{FV12}	VCC12	-	35	-	μs	$VCC12 \geq 1.1\text{ V}$

Note:

This AC specification isn't applied except revision M, P.

8.4.5 Power-On Conditions

8.4.5.1 Power-On Conditions

(Condition: See 8.2. Operation Assurance)

Parameter	Symbol	Pin Name	Conditions	Value			Unit	Remarks
				Min	Typ	Max		
Level detection voltage	-	VCC5	-	2.15	2.35	2.55	V	
Reset release voltage	-	VCC5	-	2.25	2.45	2.65	V	
Level detection time	-	-	-	-	-	540	μs	*1
Power off time	t _{OFF}	VCC5	-	1	-	-	ms	*2
Power ramp rate	dV/dt	VCC5	VCC5: Between 0.2 V to 2.55 V	-	-	6	mV/μs	*3
Maximum ramp rate guaranteed to not generate power-on reset	dV/dt	VCC5	VCC5: Between 2.6 V and 4.5 V	-	-	50	mV/μs	*4

*1: If a power fluctuation precedes the low-voltage detection time, the detection may occur or be canceled after the supply voltage passes the detection voltage range.

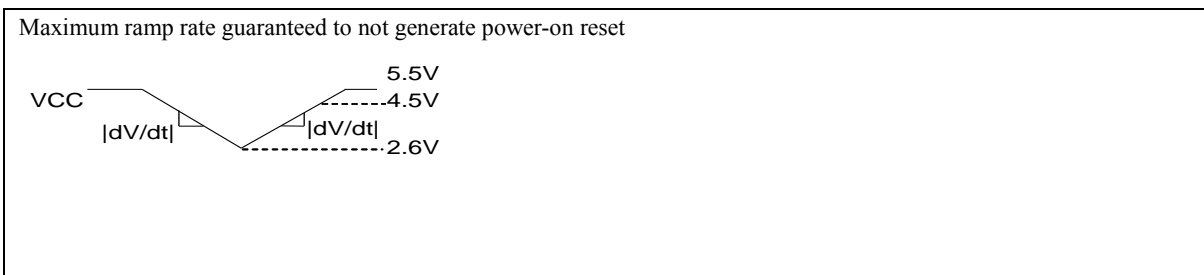

*2: If V_{CC} is held below 0.2 V for a minimum period of t_{OFF}, power-on reset will occur. If t_{OFF} is not satisfied, power-on reset will still occur if the power ramp rate is kept below 6 mV/μs.

*3: This is the power ramp rate with which power-on reset will always occur regardless of power-off time, as mentioned in *2.

*4: When VCC5 is within 2.6 V - 4.5 V, and VCC5 fluctuation is below 50mV/us, the power-on reset is suppressed. Between 4.5 V - 5.5 V, the power-on reset does not occur with any VCC5 fluctuation.

Note:

When neither *2 nor *3 can be satisfied, assert external reset (RSTX) at power-up and at any brownout event.

Notes:

- *1: This LVD cannot be used to reliably generate a reset before voltage dips below minimum guaranteed MCU operation voltage, as these detection levels are below the minimum guaranteed MCU operation voltage (3.5 V).
- *2: After the brown-out event where the voltage level dips below the detection threshold for less than this time, the detection may occur or be canceled.
- *3: Please suppress the change of the power supply within the range of the power-supply voltage regulation to do a low-voltage detection by detecting voltage.

- Following power supply voltage stability conditions need to be ensured. Moreover, the EXVRSTCNT bit in the SYSC0_SPECFGR register has to be "0" for Revision other than M, P .

For Revision M, P

(Condition: See 8.2. Operation Assurance)

Parameter	Symbol	Pin Name	Conditions	Value		Unit	Remarks
				Min	Max		
VCC5 stability time after LVDH1 low voltage detection	t_{FV5}	VCC5	-	55	-	μs	$VCC5 \geq 2.7\text{ V}$
VCC12 stability time after LVDH1 low voltage detection	t_{FV12}	VCC12	-	55	-	μs	$VCC12 \geq 1.1\text{ V}$

For except Revision M, P

8.5.2 Notes on A/D Converters

About the Output Impedance of an External Circuit for Analog Input

When the external impedance is too high, the analog voltage sampling time may become insufficient. In this case, we recommend attaching a capacitor (about 0.1 μ F) to an analog input pin.

8.5.3 Glossary

Resolution: Analog change that can be identified by an A/D converter

Integral linearity error: Deviation of the straight line connecting the zero transition point ("0000 0000 0000" <--> "0000 0000 0001") and full-scale transition point ("1111 1111 1110" <--> "1111 1111 1111") from actual conversion characteristics

Includes zero transition error, full-scale transition error, and non-linearity error.

Differential linearity error: Deviation from the ideal value of the input voltage required for changing the output code by 1 LSB

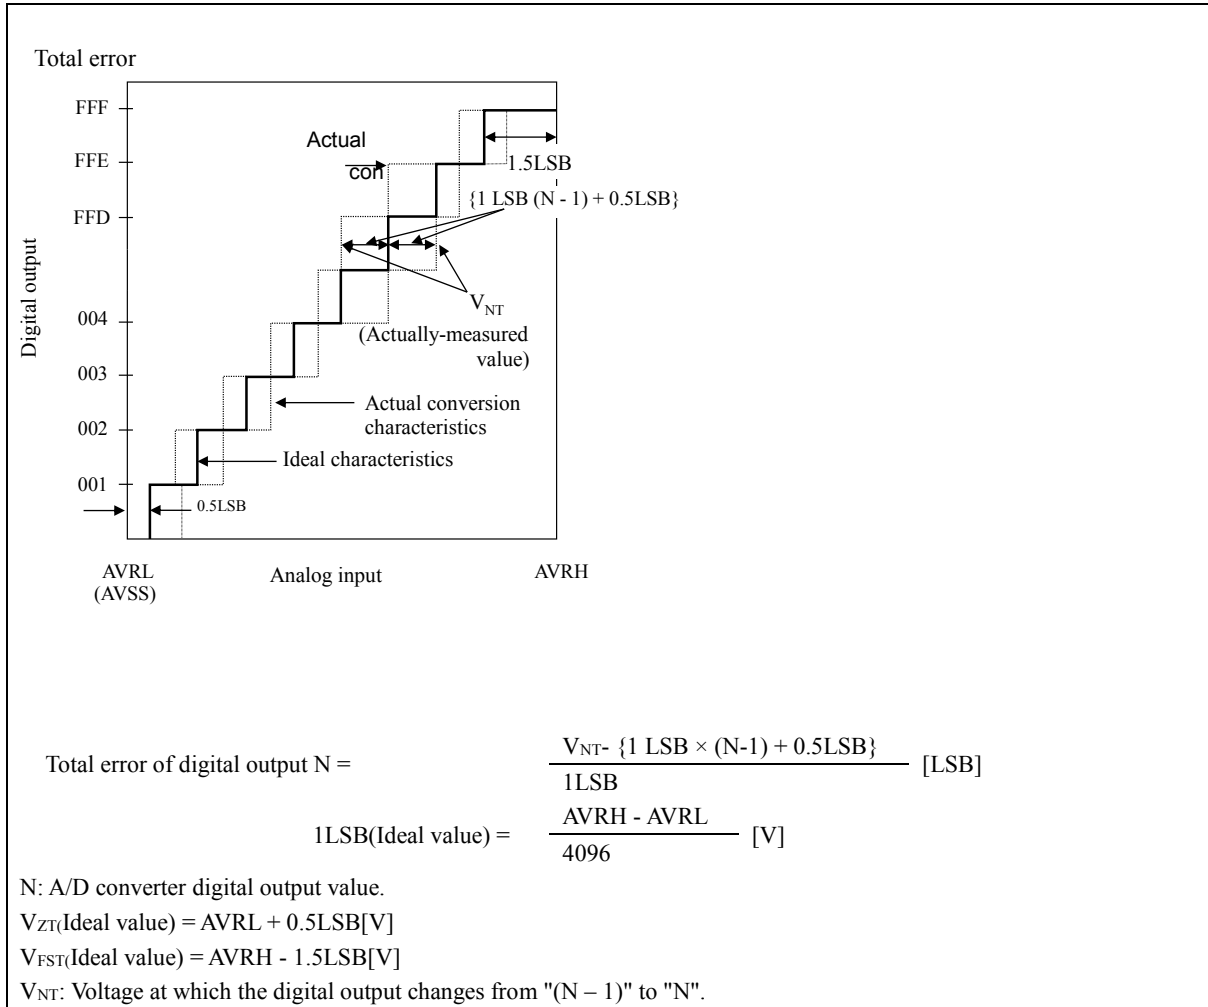

Total error: Difference between the actual value and the theoretical value.

8.5.4 Calibration Condition

Calibration Condition should be the followings.

- AV_{CC}=5.0 V
- AV_{RH}=5.0 V
- T_a=25°C
- system clock frequency (CLK_LCP1A)= 10 MHz

See A/D Converter Calibration in the S6J3200 hardware manual.

Notes:

- *1: All parameters specified fs=44.1 kHz, system clock 256 fs and 16-bit data, R_L-20 kΩ, C_L=100 pF, unless otherwise noted.
- *2: Refer to bellow note on R_L load connection.
- *3: These values do not include the noise caused by the analog power supply. (Refer to 7. Use examples)
- *4: 10μF is connected to C_L, C_R.
- *5: Startup time (Figure 8-8)

Figure 8-8: Startup Time

Startup time can be calculated as follows.

1. Startup time (TYP) = 650[ms] (Table 5.2)
2. $CCOM = 10\mu F \times (1 \pm \alpha / 100)$

CCOM is a capacitor connected to Terminal C_L/C_R including capacitance variance.

α = Capacitance variance [%]

3. Startup time = Start up time (TYP) \times (1 \pm α) [ms]

For example, CCOM=11 μ F then $\alpha = (11\mu F - 10\mu F) / 10\mu F = 10$ [%]

So, Startup time = 650ms \times (1 + 10/100) = 715[ms]

Notes:

- Two usages of R_L load connection.
- Case1: R_L is connected to AVCC3_DAC /2 (Figure 8-9)
- Case2: The coupling capacitance must be inserted as shown in (Figure 8-10).

Figure 8-9: R_L is Connected to AVCC_DAC/2 (Example)

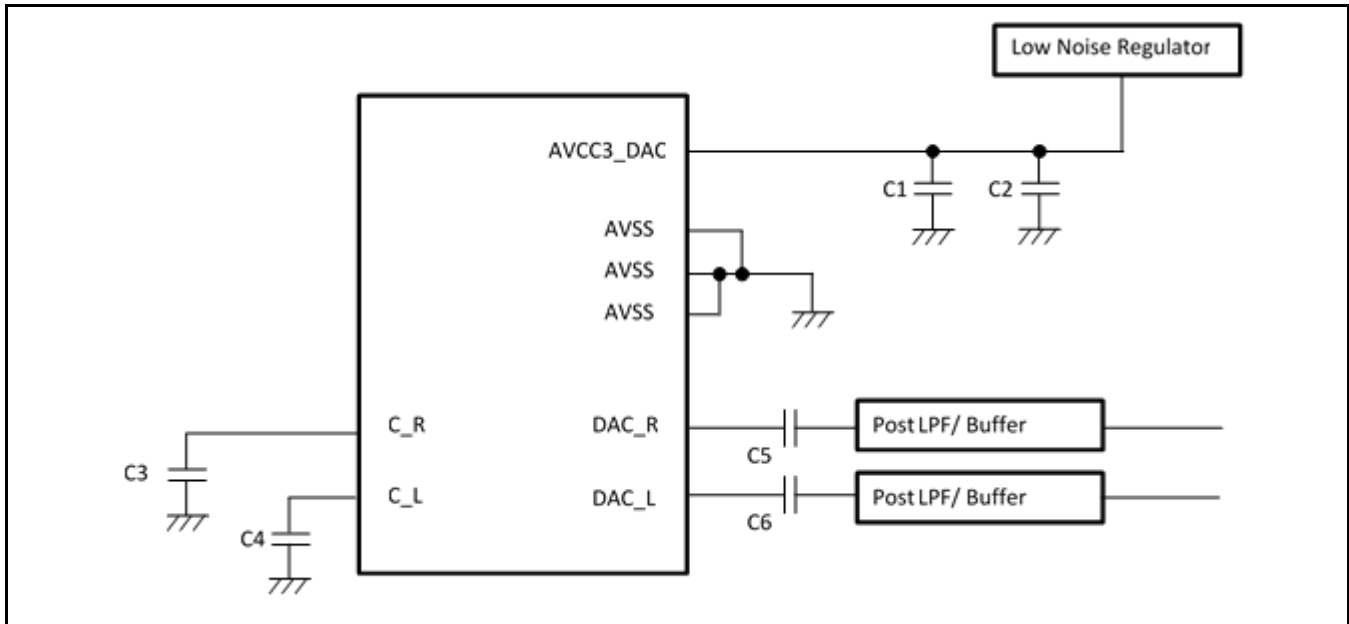

Figure 8-10: Coupling Capacitance (Example)

Notes:

- C1: more than 10 μ F low ESR capacitors
- C2: 0.1 μ F ceramic capacitors
- C3, C4, C5, C6: 10 μ F low ESR capacitors
- Impedance of each power line must be as low as possible.

Notes:

- When DAC is not used in your system, the related pins should be
- AVCC3_DAC=GND and AVSS=GND
- C_L=OPEN and C_R=OPEN
- DAC_L=OPEN and DAC_R=OPEN

8.7.2 Notes

- For revision M, P

While the Flash memory is written or erased, shutdown of the external power (V_{CC5} and V_{CC12}) is prohibited.

In the application system, where V_{CC5} and V_{CC12} might be shut down while writing or erasing, be sure to turn the power off by using an external voltage detection function or external reset (RSTX).

For external power supply voltage stability conditions please see chapter 8.4.4.2 and 8.4.10.4.

- For except revision M, P

While the Flash memory is written or erased, shutdown of the external power (V_{CC5} and V_{CC12}) is prohibited.

In the application system where V_{CC5} and V_{CC12} might be shut down while writing or erasing, be sure to turn the power off by using an external voltage detection function.

To put it concretely, after the external power supply voltage falls below the detection voltage (V_{DL}), hold V_{CC5} at 2.7 V or more and V_{CC12} at 1.1 V or more within the duration calculated by the following expression:

$$T_d^{*1} [\mu s] + (1 / F_{CRF}^{*2} [MHz]) \times 1029 + 25 [\mu s]$$

1. MCAN wrong message transmission

■ Problem Definition

There is a possibility a message with an ID (arbitration field) and a format and DLC (control field) is transmitted which was not configured by the application. The message itself is syntactically correct and can be received by other nodes.

The occurrence of the limitation requires a certain relationship in time between a transmission request for sending a

message and the coincidence of noise in the 3rd bit of intermission field which is treated as the start of new message transmission (SoF).

■ Trigger Condition

Under the following conditions a message with wrong ID, format and DLC is transmitted:

- M_CAN is in state "Receiver" (PSR.ACT = "10"), no pending transmission.
- A new transmission is requested after sample point of 2nd bit of intermission but before the 3rd bit of Intermission is reached.
- The CAN bus is sampled dominant at the third bit of Intermission which is treated as SoF (see ISO11898-1:2015 Section 10.4.2.2).

■ Scope of Impact

Under the conditions listed above it may happen, that:

- The shift register is not loaded with ID, format, and DLC of the requested message.
- The M_CAN will start arbitration with wrong ID, format, and DLC.
- In case the ID won arbitration, a CAN message with valid CRC is transmitted.
- In case this message is acknowledged, the ID stored in the Tx Event FIFO is the ID of the requested Tx message and not the ID of the message transmitted on the CAN bus
- Neither an error is detected by the transmitting node nor at the receiving node.

■ Workaround

Workaround 1:

This workaround avoids submitting a transmission request in the critical time window of about one bit time before the sample point of the 3rd bit of intermission field when on other pending transmission request exists:

- Request a new transmission if another transmission is already pending or when the M_CAN / M_TTCAN is not in state "Receiver" (when PSR.ACT ≠ "10").
- If no pending transmission request exists, the application software needs to evaluate the Rx Interrupt flags IR.DRX, IR.RF0N, IR.RF1N which are set at the last bit of EoF when a received and accepted message gets valid.
- A new transmission may be requested by writing to TXBAR once the Rx interrupt occurred and the application waited another 3 bit times before submitting its Tx request. Note the Rx interrupt is generated at the last bit of EoF which is followed by three bits of Intermission.
- The application has to take care that the transmission request for the CAN Protocol Controller is activated before the critical window of the following reception is reached.

A supplemental action can be applied in order to detect messages which contain wrong ID and control field information:

- A checksum covering arbitration and control fields can be added to the data field of the message to be transmitted, to detect frames transmitted with wrong arbitration and control fields.

Workaround 2:

This workaround ensures that always at least one pending Tx request exists. If that is the case, the application may launch its Tx requests at any time without suffering from the limitation.

- Define a low priority message with DLC = 0 that can be sent without harm. E.g. loses arbitration against all other application messages, does not pass any acceptance filter of nodes in the same network. DLC = 0 shall reduce latency for other application messages.
- Configure sufficient Tx buffers – at least two - for this message type thus that there is always another one waiting to be sent. E.g. an application that cannot react quickly enough with the time a single message of this type is sent, more than 2 Tx buffer may become necessary.
- The application uses the standard interfaces of the CAN / CAN FD stack to feed these messages.
- Whenever Tx confirmation is indicated for the second but last message of this type with pending Tx request, the application needs to submit at least one new Tx request. Note Tx confirmation is a standard feature in the AUTOSAR SW architecture.
- Before initially leaving INIT state of the M_CAN IP by clearing CCCR.INIT bit, make sure to activate a Tx request after having cleared CCCR.CCE. This will ensure that the conditions for the occurrence of the limitation when synchronizing to the CAN bus the first time after RESET are prevented.

■ Fix Status

Not be planned.

				3.Product Description 3.2 Product Description [Improve] Deleted the unnecessary description for PPU of I2S
				4. Package and Pin Assignment 4.1 Pin Assignment [Improve] Added the part number information for figure 4-8 and 4-15
				4. Package and Pin Assignment 4.1.1 TEQFP-216 Pin Assignment [Improve] Added the "M_CK_0" for TEQFP-216 Pin Assignment
				4. Package and Pin Assignment 4.1.2 TEQPF-208 Pin Assignment [Improve] Corrected part number in figure title. (S6J32xCL -> S6J32xCK)
				4. Package and Pin Assignment 4.1.3 TEQPF-256 Pin Assignment [Improve] Corrected the IO-circuit type for pin.217 to 256
				6. Port Description 6.1 Port Description List [Improve] Added the supplementary information for I2C pin name of SCL, SDA.
				7. Precautions and Handling Devices 7.2 Handling Devices [Improve] Deleted the obsolete description about power ramp rate ("About the Power-on Time")
				7. Precautions and Handling Devices 7.2 Handling Devices [Improve] Removed duplicated description
				7. Precautions and Handling Devices 7.2. Handling Devices [Limitation] Added description of how to turn off VCC12 during power off sequence.
				8. Electric Characteristics 8.1 Absolute Maximum Rating [Improve] Deleted "total maximum clamp current" for special spec.
				8. Electric Characteristics 8.1 Absolute Maximum Rating [Limitation] Added the condition to "Analog pin input voltage"
				8. Electric Characteristics 8.2 Operation Assurance Condition [Improve] clarified the rate of die stage area which is exposed at back surface of package for heat dissipation.
				8. Electric Characteristics 8.3.1 Port Function Characteristics [Improve] Remarks of VOH5 is modified.
				8. Electric Characteristics 8.3.2.1 Run Mode [Improve] Added information. "50 MHz" into AVCC3_LVDS_PLL.
				8. Electric Characteristics 8.3.2.2 PSS Timer Mode Shutdown (PD6=OFF) [Enhance] PD4 shutdown support [Improve] Added remarks in osc mode spec
				8. Electric Characteristics 8.4.1 Source Clock Timing [Improve] Corrected the min value of source oscillation clock cycle time.
				8.Electric Characteristics 8.4.3 Internal Clock Timing [Enhancement] Added support for center spread mode with limited condition
				8. Electric Characteristics 8.4.3 Internal Clock Timing

Revision	ECN	Orig. of Change	Submission Date	Description of Change
				[Enhance] The series of port reference voltage level VIL/VIH/VOL/VOH for HyperBus AC specification is defined.
				8. Electric Characteristics 8.4.3 Internal Clock Timing [Improve] Corrected the maximum output frequency of SSCG0 and PLL0
				8. Electric Characteristics 8.4.4 Reset Input [Improve] Improved readability for width for reset input removal.
				8 Electric Characteristics 8.4.5 Power-On Conditions [Enhancement] Reduced Power off time to 1ms [Limitation] Defined Power ramp rate requirement for 1)when tOFF is satisfied 2)tOFF is not satisfied [Limitation] Increased Level detection time to 540us
				8.Electric Characteristics 8.4.5.2 VCC12 Stabilization Time during Power-On / PSS to RUN Transition [Limitation] Added VCC12 stabilization time requirement for power-up sequence and PSS to RUN transition
				8. Electric Characteristics 8.4.6.2 CSIO Timing (SMR:MD2-0=0b010) [Improve] Corrected min value of Serial clock "H" pulse width and Serial clock "L" pulse width
				8. Electric Characteristics 8.4.6.2 CSIO Timing (SMR:MD2-0=0b010) [Limitation] Changed AC spec of MFS CSIO mode
				8.Electric Characteristics 8.4.6.2 CSIO Timing (SMR:MD2-0=0b010) [Improve] Added CS output AC timing.
				8. Electric Characteristics 8.4.6.4 I2C Timing (SMR:MD2-0=0b100) [Improve] Corrected the name of "High-Speed Mode" to "Fast Mode".
				8. Electric Characteristics 8.4.7 Timer Input [Improve]Clock definition of remarks is modified
				8. Electric Characteristics 8.4.8 Trigger Input [Improve] Definition of RXx pin and limitation of stop mode is deleted.
				8. Electric Characteristics 8.4.10 Low-Voltage Detection [Limitation] Corrected release voltage for LVDL0, LVDH0 and LVDL1
				8 Electric Characteristics 8.4.10 Low-Voltage Detection [Limitation] Add note that this LVDL0 cannot be used to reliably generate a reset before voltage dips below minimum guaranteed MCU operation voltage [Improve] Removed LVDH0 table due to duplication with 8.4.5 Power-On Conditions [Limitation] Add note that this LVDL1 cannot be used to reliably generate a reset before voltage dips below minimum guaranteed MCU operation voltage with any setting [Limitation] Add note that this LVDH1 cannot be used to reliably generate a reset before voltage dips below minimum guaranteed MCU operation voltage for some of the settings [Limitation] Add note that this LVDL2 cannot be used to reliably generate a reset before

				voltage dips below minimum guaranteed MCU operation voltage with any setting [Limitation] Add note that this LVDH2 cannot be used to reliably generate a reset before voltage dips below minimum guaranteed MCU operation voltage for some of the settings
				8. Electric Characteristics 8.4.10.3 LVDL1 [Improve] Deleted the useless configuration of LVDL1. (LVDL1V=01)
				8.Electric Characteristics 8.4.10.6 LVDH2 [Improve] Typ value of release voltage at conditions of LVDH2V=0001 changes 2.75V to 2.85V.
				8. Electric Characteristics 8.4.11 High Current Output Slew Rate [Improve] Corrected the typo in figure. (VOL8, VOH8 -> VOL, VOH)
				8. Electric Characteristics 8.4.12.2 Display Controller0 Timing (RSDS) [Improve] Delete unnecessary characteristics
				8. Electric Characteristics 8.4.14 FPD-link [Improve] Corrected unit. "Ohm" -> "ohm" [Improve] Corrected remarks on "Common mode voltage". "One of three" -> "One of two" [Improve] Added missing information. "5 pF (differential)" [Improve] Corrected format. "25MHz" -> "25 MHz", "4/7" -> "4 / 7". [Improve] Added cycle to cycle jitter spec. [Improve] Added information. "Equals 1/f" into TCIP. [Improve] Corrected max time in "Cycle time of TXCLKP/M". [Improve] Added other frequency spec into "Output pulse position". [Limitation] Added PLL lock-up time. [Improve] Separately added specs for revision H.
				8. Electric Characteristics 8.4.14. FPD-Link (LVDS) [Limitation] Specified minimum output frequency 5MHz.
				8. Electric Characteristics 8.4.16 HyperBus [Enhance] Enhanced AC spec Hyper Bus read timing and corrected timing chart
				8. Electric Characteristics 8.4.16 HyperBus [Enhance] The series of port reference voltage level VIL/VIH/VOL/VOH for HyperBus AC specification is defined.
				8. Electric Characteristics 8.4.16 HyperBus [Improve] Added a note for clarifying the HyperBus clock cycle and source.
				8. Electric Characteristics 8.4.16 HyperBus [Improve] Corrected the revision digit information.
				8. Electric Characteristics 8.4.19 Port Noise Filter [Improve] Change the description of filter specification and note for GPIO [Improve] Added the filter specification for EINT, TIN [Improve] Added the filter specification for SCL, SDA of I2C
				9. Abbreviation [Improve] Added the word "QPRC" to abbreviation.

Revision	ECN	Orig. of Change	Submission Date	Description of Change
				10. Ordering Information [Improve] Updated "Order Part Number Table"
				11. Appendix 11.1 Application 1: JTAG tool connection [Improve] Figure of JTAG tool connection as an application example is added.
*C	5515119	NNAS	11/10/2016	2. Function List 2.2.1.1 S6J320C [Improve] Added new function digit 9 to Function digit table

				4. Package and Pin Assignment 4.1 Pin Assignment [Improve] Added "S6J329" for PKG figure information

Revision	ECN	Orig. of Change	Submission Date	Description of Change
				4. Package and Pin Assignment 4.2 Package Dimensions [Improve] Corrected "A1" value of LEQ216, LET208, LER208 (0.00(MIN)-0.20(MAX) -> 0.05(MIN)-0.15(MAX)) [Improve] Added figure for 256 pin PKG
				6. Port Description 6.1 Port Description List [Improve] Exposed pad connection recommendation
				7. Precautions and Handling Devices 7.2 Handling Devices [Improve] Corrected the typo in "Method to Switch off VCC12 during Power-off Sequence" (RTSX -> RSTX)
				8. Electric Characteristics 8.2 Operation Assurance Condition [Improve] Exposed pad connection recommendation
				8. Electric Characteristics 8.2 Operation Assurance Condition [Limitation] Added the note about the connection of Vcc53.
				8. Electric Characteristics 8.3.1 Port Function Characteristics [Improve] Corrected the VOH/VOL drive capacity when VCC53=3.0V.
				8. Electric Characteristics 8.3.2 Power Supply Current [Improve] Add revision E and J to 'Remarks' of AVCC3_LVDS_PLL.
				8. Electric Characteristics 8.3.2.2 PSS Timer Mode Shutdown (PD6=OFF) [Enhance] Added external clock mode spec
				8. Electric Characteristics 8.3.2 Power Supply Current [Improve] Added note of regulator mode for measurement condition to 8.3.2.2 PSS Timer Mode Shutdown (PD6=OFF) and 8.3.2.3 PSS Stop Mode Shutdown.
				8. Electric Characteristics 8.4.6.2 CSIO Timing (SMR: MD2-0=0b010) [Improve] Corrected the min. value of tSCYC [Improve] Corrected the min. value of tSOVLI and tSOVHI [Improve] Remove the Remarks for tSYSC, tSHSL and tSLSH
				8. Electric Characteristics 8.4.10.4 LVDH1 [Limitation] Added more setting needed for power supply voltage stability conditions
				8. Electric Characteristics 8.4.10.5 LVDL2 [Improve] Corrected the typo in Max release voltage of "LVDL2V=01" condition. (9.995 -> 0.995)
				8. Electric Characteristics 8.4.12 Display Controller [Improve] Corrected the min. value of Clock Cycle for DSP0_CLK in 8.4.12.1 Display Controller0 Timing (TTL Mode). [Improve] Corrected the min. value of Clock Cycle for DSP0_CLK+/- in 8.4.12.2 Display Controller0 Timing (RSDS).
				8. Electric Characteristics 8.4.15 DDR-HSSPI [Enhance] Add description for reference voltage of VIL, VIH, VOL and VOH
				8. Electric Characteristics 8.4.15.2 DDR-HSSPI Interface Timing (DDR Mode) [Improve] Corrected timing chart of "G_SDATA0_0-3", "GSDATA1_0-3" and "GSSEL0,1" for DDR mode.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
