

# Low Skew, Low Additive Jitter, 10 output LVPECL/LVDS/HCSL Fanout Buffer with one LVCMOS output

## Features

- 3 to 1 input Multiplexer: Two inputs accept any differential (LVPECL, HCSL, LVDS, SSTL, CML, LVCMOS) or a single ended signal and the third input accepts a crystal or a single ended signal
- Ten differential LVPECL/LVDS/HCSL outputs
- One LVCMOS output
- Ultra-low additive jitter: 24fs (integration band: 12kHz to 20MHz at 625MHz clock frequency)
- Supports clock frequencies from 0 to 1.6GHz
- Supports 2.5V or 3.3V power supplies on LVPECL, LVDS or HCSL outputs
- Supports 1.5V, 1.8V, 2.5V or 3.3V on LVCMOS outputs
- Embedded Low Drop Out (LDO) Voltage regulator provides superior Power Supply Noise Rejection
- Maximum output to output skew of 40ps
- Device controlled via control pins

### Functional Description

The ZL40231 is a low additive jitter, low power 3 x 10 LVPECL/HCSL/LVDS fanout buffer.

Two inputs can accept signal in differential (LVPECL, SSTL, LVDS, HSTL, CML ) or single ended (LVPECL or LVCMOS) format and the third input can accept a single ended signal or it can be used to build a crystal oscillator by connecting an external crystal resonator between its XIN and XOUT pins.

The ZL40231 has ten LVPECL/HCSL/LVDS outputs which can be powered from 3.3V or 2.5V supply. Each output bank (A and B) can be independently set to be LVPECL, LVDS, HCSL or Hi-Z via control OUTA/B\_TYPE\_SEL0/1 pins.

The control inputs: OUTA/B\_TYPE\_SEL0/1 and IN\_SEL0/1 have low input threshold voltage so they can be driven from a device with low I/O voltage (down to 1.2V).

The device operates from 2.5V+/-5% or 3.3V+/-5% supply. Its operation is guaranteed over the industrial temperature range -40°C to +85°C.

### Clock Inputs

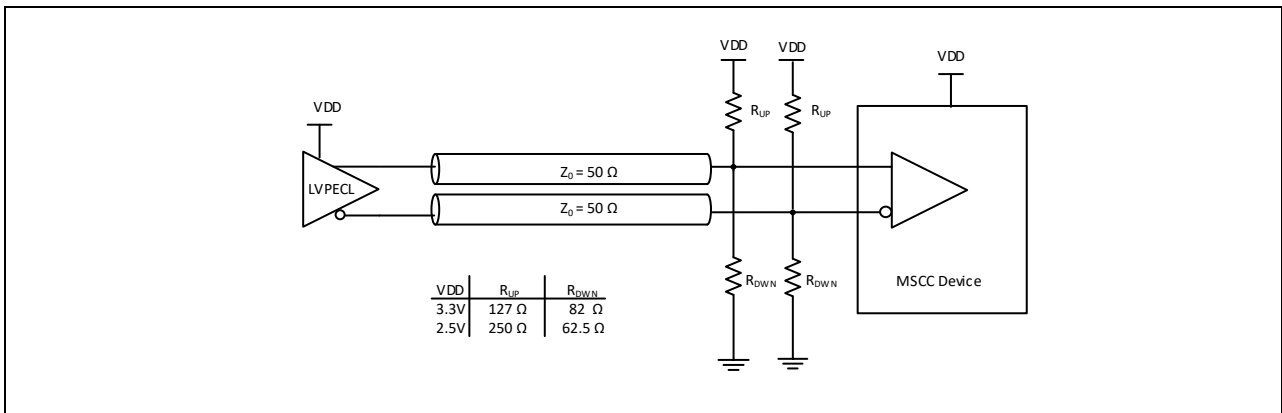

The following blocks diagram shows how to terminate different signals fed to the ZL40231 inputs.

Figure 3 shows how to terminate a single ended output such as LVCMOS. Ideally, resistors R1 and R2 should be 100Ω each and  $R_o + R_s$  should be 50Ω so that the transmission line is terminated at both ends with characteristic impedance. If the driving strength of the output driver is not sufficient to drive low impedance, the value of series resistor  $R_s$  should be increased. This will reduce the voltage swing at the input but this should be fine as long as the input voltage swing requirement is not violated (Table 7). The source resistors of  $R_s = 270\Omega$  could be used for standard LVCMOS driver. This will provide 516mV of voltage swing for 3.3V LVCMOS driver with load current of  $(3.3V/2) * (1/(270\Omega + 50\Omega)) = 5.16mA$ .

For optimum performance both differential input pins (\_p and \_n) need to be DC biased to the same voltage. Hence, the ratio R1/R2 should be equal to the ratio R3/R4.

**Figure 8. Input driven by LVDS output**

**Figure 9. Input driven by AC coupled LVDS**

**Figure 10. Input driven by an SSTL output**

## Clock Outputs

LVC MOS output OUT10 require only series termination resistor whose value is depending on LVC MOS output voltage as shown in Figure 11.

**Figure 11. Termination for LVC MOS output**

Differential outputs LVPECL and LVDS should have same termination as corresponding outputs described in previous section. HCSL outputs should be terminated with 33Ω series resistors at the source and 50Ω shunt resistors at the source or at the end on the transmission line. AC coupling and re-biasing is not required at the outputs when driving native HCSL receivers.

The device is designed to drive differential input of semiconductor devices. In applications that use a transformer to convert from the differential to the single ended output (for example driving an oscilloscope 50Ω input), a resistor larger than 10Ω should be added at the center tap of the primary winding to achieve optimum jitter performance as shown in Figure 12. This is to provide a nominal common mode impedance of 10Ω or higher which is typical for differential terminations.

**Figure 12. Driving a load via transformer**

### Crystal Oscillator Input

The crystal oscillator circuit can work with crystal resonators from 8MHz to 60MHz. Load capacitors C1, C2 and series resistor Rs shall be selected as per crystal vendor recommendation. Shunt resistor is implemented inside the device.

**Figure 13. Crystal Oscillator Circuit**

### Termination of unused inputs and outputs

Unused inputs can be left unconnected or alternatively IN\_0/1 can be pulled-down by 1kΩ resistor. Unused outputs should be left unconnected.

### Power Consumption

The device total power consumption can be calculated as:

$$P_T = P_S + P_{XTAL} + P_C + P_{O\_DIF} + P_{O\_LVCMOS}$$

Where:

$$P_S = V_{DD} \times I_S$$

The core power when XTAL is not used. The current is specified in Table 6. If XTAL is running this power should be set to zero.

$$P_{XTAL} = V_{DD} \times I_{DD\_XTAL}$$

The core power when XTAL is used. The current is provided in Table 6. If XTAL is not used this power should be set to zero.

$$P_C = V_{DDO} \times I_{DD\_CM}$$

Common output power shared among all ten outputs. The current  $I_{DD\_CM}$  is specified Table 6.

$$P_{O\_DIF} = V_{DDO} \times I_{DD\_LVDS} \times N$$

Output power where output current ( $I_{DD\_LVDS}$ ) is specified in Table 6. For LVPECL or HCSL just replace  $I_{DD\_LVDS}$  with  $I_{DD\_LVPECL}$  or  $I_{DD\_HCSL}$ . N is the number of enabled differential outputs and it can be either: 0, 5 or 10.

$$P_{O\_LVCMOS} = V_{DD\_LVCMOS} \times (I_{DD} \times f / 100MHz + V_{DD\_LVCMOS} \times C_{LOAD} \times f)$$

Dynamic LVCMOS output power.  $I_{DD}$  is specified in Table 6. If LVCMOS output is disabled this term is equal to zero.

Power dissipated inside the device can be calculated by subtracting power dissipated in termination/biasing resistors from the power consumption.

$$P_D = P_T - N_1 \times P_{LVPECL} - N_2 \times P_{LVDS} - N_3 \times P_{HCSL}$$

Where  $N_1$ ,  $N_2$  and  $N_3$  are the number of enabled LVPECL, LVDS and HCSL outputs respectively. When both banks are enabled  $N_1 + N_2 + N_3 = 10$  and one or two of  $N_1$ ,  $N_2$  and  $N_3$  will equal to 0.

$$P_{LVPECL} = (V_{OH} - V_B)^2 / 50\Omega + (V_{OL} - V_B)^2 / 50\Omega + (V_{OH} - V_B) \times V_B / 50\Omega + (V_{OL} - V_B) \times V_B / 50\Omega$$

$V_{OH}$  and  $V_{OL}$  are the output high and low voltages respectively for LVPECL output

$V_B$  is LVPECL bias voltage equal to  $V_{DD} - 2V$

$$P_{LVDS} = V_{SW}^2 / 100\Omega$$

$V_{SW}$  is voltage swing of LVDS output.

$$P_{HCSL} = (V_{SW} / 50\Omega)^2 \times (33\Omega + 50\Omega)$$

$V_{SW}$  is voltage swing of HCSL output.  $50\Omega$  is termination resistance and  $33\Omega$  is series resistance of the HCSL output.

### Power Supply Filtering

Each power pin (VDD and VDDO) should be decoupled with  $0.1\mu F$  capacitor with minimum equivalent series resistance (ESR) and minimum series inductance (ESL). For example, 0402 X5R Ceramic Capacitors with 6.3V minimum rating could be used. These capacitors should be placed as close as possible to the power pins. To reduce the power noise from adjacent digital components on the board each power supply could be further insulated with low resistance ferrite bead with two capacitors. The ferrite bead will also insulate adjacent component from the noise generated from the device. Following figure shows recommended decoupling for each power pin.

**Figure 14. Power Supply Filtering**

### Power Supplies and Power-up Sequence

The device has four different power supplies: VDD, VDDO\_A, VDDO\_B and VDD\_LVCMOS which are mutually independent. Voltages supported by each of these power supplies are specified in Table 1.

The device is not sensitive to the power-up sequence. For example, commonly used sequence where higher voltage comes up before or at the same time as the lower voltages can be used (or any other sequence).

## Host Interface

ZL40231 is controlled via Input Select (IN\_SEL0/1) pins which select which one of three inputs is fed to the output and show in Table 2 and OUTA/B\_TYPE\_SEL0/1 pins which select signal level (LVPECL, LVDS, HCSL or Hi-Z) for each of two (A and B) output banks as shown in Table 3.

All input control pins have low input threshold voltage so they can be driven from the device with low output voltage (FPGA/CPLD). Supported voltages are between 1.2V and VDD (2.5V or 3.3V).

4	Differential input common mode voltage for IN0_p/n and IN1_p/n	$V_{CM}$	1		2	V	
5	Differential input voltage difference for IN0_p/n and IN1_p/n $f \leq 1GHz$ **	$V_{ID}$	0.15		1.3	V	
6	Differential input voltage difference for IN0_p/n and IN1_p/n for $1GHz < f \leq 1.6GHz$ **	$V_{ID}$	0.35		1.3	V	
7	Differential input leakage current for IN0_p/n and IN1_p/n (includes current due to pull-up and pull-down resistors)	$I_{IL}$	-150		150	$\mu A$	$V_i = 2V$ or 0V
8	Single ended input voltage for IN0_p and IN1_p	$V_{SI}$	-0.3		2.7	V	$V_{DD} = 3.3V$ or $2.5V$
9	Single ended input common mode voltage (IN0_p/n and IN1_p/n)	$V_{SIC}$	1		2	V	$V_{DD} = 3.3V$ or $2.5V$
10	Single ended input voltage swing for IN0_p and IN1_p	$V_{SID}$	0.3		1.3	V	$V_{DD} = 3.3V$ or $2.5V$
11	Input frequency (differential)	$f_{IN}$	0		1600	MHz	
12	Input frequency (LVCMOS)	$f_{IN\_CMOS}$	0		250	MHz	
13	Input duty cycle	dc	35%		65%		
14	Input slew rate	slew		2		V/ns	
15	Input pull-up/ pull-down resistance	$R_{PU}/R_{PD}$		60k $\Omega$			
16	Input pull-down resistance for INx_p	$R_{PD}$		30k $\Omega$			
17	Input multiplexer isolation IN0_p/n to IN1_p/n and vice versa Power on both inputs 0dBm, $f_{OFFSET} > 50kHz$	Iso		-84		dBc	$f_{IN} = 100$ MHz
				-82			$f_{IN} = 200$ MHz
				-71			$f_{IN} = 400$ MHz
				-67			$f_{IN} = 800$ MHz

\* Values are over Recommended Operating Conditions

\* Values are over all two power supply modes ( $V_{DD} = 3.3V$  and  $V_{DD} = 2.5V$ )

\* Input mux isolation is measured as amplitude of  $f_{OFFSET}$  spur in dBc on the output clock phase noise plot

\*\*Input differential voltage is calculated as  $V_{ID} = V_{IH} - V_{IL}$  where  $V_{IH}$  and  $V_{IL}$  are input voltage high and low respectively. It should not be confused with  $V_{ID} = 2 * (V_{IH} - V_{IL})$  used in some datasheets. Please refer to Figure 37.

(1) Theta-JA ( $\theta_{JA}$ ) is the thermal resistance from junction to ambient when the package is mounted on an 4-layer JEDEC standard test board and dissipating maximum power

(2) Theta-JP ( $\theta_{JP}$ ) is the thermal resistance from junction to the center exposed pad on the bottom of the package)

## Change History

June 2017 was the first release of the document.

July 2017 release changes:

- Modified power calculation in the Power Consumption section.

August 2017 release changes:

- Modified “Input driven by HCSL output” figure.
- Modified additive jitter for 156.25MHz input clock.
- Added Figure 37 and Figure 38

October 2018 release changes:

- Added note in pinout to tie XIN pin when crystal circuit is not used
- Removed Figures 15 and 16 due to inaccuracy
- Fixed typo in Table 3

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов;
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001;
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
