

PCF85063A

Tiny Real-Time Clock/calendar with alarm function and I²C-bus

Rev. 6 — 18 November 2015

Product data sheet

1. General description

The PCF85063A is a CMOS¹ Real-Time Clock (RTC) and calendar optimized for low power consumption. An offset register allows fine-tuning of the clock. All addresses and data are transferred serially via the two-line bidirectional I²C-bus. Maximum data rate is 400 kbit/s. The register address is incremented automatically after each written or read data byte.

For a selection of NXP Real-Time Clocks, see Table 45 on page 56

2. Features and benefits

- Provides year, month, day, weekday, hours, minutes, and seconds based on a 32.768 kHz quartz crystal
- Clock operating voltage: 0.9 V to 5.5 V
- Low current; typical 0.22 μ A at V_{DD} = 3.3 V and T_{amb} = 25 $^{\circ}$ C
- 400 kHz two-line I²C-bus interface (at V_{DD} = 1.8 V to 5.5 V)
- Programmable clock output for peripheral devices (32.768 kHz, 16.384 kHz, 8.192 kHz, 4.096 kHz, 2.048 kHz, 1.024 kHz, and 1 Hz)
- Selectable integrated oscillator load capacitors for C_L = 7 pF or C_L = 12.5 pF
- Alarm function
- Countdown timer
- Minute and half minute interrupt
- Oscillator stop detection function
- Internal Power-On Reset (POR)
- Programmable offset register for frequency adjustment

3. Applications

- Digital still camera
- Digital video camera
- Printers
- Copy machines
- Mobile equipment
- Battery powered devices

^{1.} The definition of the abbreviations and acronyms used in this data sheet can be found in Section 21.

7.1 Pinning

Tiny Real-Time Clock/calendar with alarm function and I²C-bus

7.2 Pin description

Table 4. Pin description

Input or input/output pins must always be at a defined level (V_{SS} or V_{DD}) unless otherwise specified.

Symbol	Pin			Туре	Description
	PCF85063AT	PCF85063ATL	PCF85063ATT	_	
OSCI	1	1	1	input	oscillator input
OSCO	2	2	2	output	oscillator output
CLKOE	-	3	-	input	CLKOUT enable or disable pin; enable is active HIGH
ĪNT	3	4	3	output	interrupt output (open-drain)
VSS	4	5 <u>[1]</u>	4	supply	ground supply voltage
SDA	5	6	5	input/output	serial data line
SCL	6	7	6	input	serial clock input
n.c.	-	8	-	-	not connected
CLKOUT	7	9	7	output	clock output (push-pull)
VDD	8	10	8	supply	supply voltage

^[1] The die paddle (exposed pad) is connected to V_{SS} through high ohmic (non-conductive) silicon attach and should be electrically isolated. It is good engineering practice to solder the exposed pad to an electrically isolated PCB copper pad as shown in Figure 37 "Footprint information for reflow soldering of SOT1197-1 (DFN2626-10) of PCF85063ATL" for better heat transfer but it is not required as the RTC doesn't consume much power. In no case should traces be run under the package exposed pad.

Tiny Real-Time Clock/calendar with alarm function and I²C-bus

8. Functional description

The PCF85063A contains 18 8-bit registers with an auto-incrementing register address, an on-chip 32.768 kHz oscillator with integrated capacitors, a frequency divider which provides the source clock for the Real-Time Clock (RTC) and calender, and an I²C-bus interface with a maximum data rate of 400 kbit/s.

The built-in address register will increment automatically after each read or write of a data byte up to the register 11h. After register 11h, the auto-incrementing will wrap around to address 00h (see Figure 5).

All registers (see <u>Table 5</u>) are designed as addressable 8-bit parallel registers although not all bits are implemented. The first two registers (memory address 00h and 01h) are used as control and status register. The register at address 02h is an offset register allowing the fine-tuning of the clock; and at 03h is a free RAM byte. The addresses 04h through 0Ah are used as counters for the clock function (seconds up to years counters). Address locations 0Bh through 0Fh contain alarm registers which define the conditions for an alarm. The registers at 10h and 11h are for the timer function.

The Seconds, Minutes, Hours, Days, Months, and Years as well as the corresponding alarm registers are all coded in Binary Coded Decimal (BCD) format. When one of the RTC registers is written or read, the contents of all time counters are frozen. Therefore, faulty writing or reading of the clock and calendar during a carry condition is prevented. For details on maximum access time, see Section 8.4 on page 25.

		O[1]	7 pF	
		1	12.5 pF	

^[1] Default value.

^[2] For a software reset, 01011000 (58h) must be sent to register Control_1 (see Section 8.2.1.3).

Tiny Real-Time Clock/calendar with alarm function and I²C-bus

8.2.1.1 EXT TEST: external clock test mode

A test mode is available which allows for on-board testing. In this mode, it is possible to set up test conditions and control the operation of the RTC.

The test mode is entered by setting bit EXT_TEST in register Control_1. Then pin CLKOUT becomes an input. The test mode replaces the internal clock signal with the signal applied to pin CLKOUT.

The signal applied to pin CLKOUT should have a minimum pulse width of 300 ns and a maximum period of 1000 ns. The internal clock, now sourced from CLKOUT, is divided down to 1 Hz by a 2⁶ divide chain called a prescaler. The prescaler can be set into a known state by using bit STOP. When bit STOP is set, the prescaler is reset to 0. (STOP must be cleared before the prescaler can operate again.)

From a stop condition, the first 1 second increment will take place after 32 positive edges on pin CLKOUT. Thereafter, every 64 positive edges cause a 1 second increment.

Remark: Entry into test mode is not synchronized to the internal 64 Hz clock. When entering the test mode, no assumption as to the state of the prescaler can be made.

Operation example:

- 1. Set EXT_TEST test mode (register Control_1, bit EXT_TEST = 1).
- 2. Set STOP (register Control_1, bit STOP = 1).
- 3. Clear STOP (register Control_1, bit STOP = 0).
- 4. Set time registers to desired value.
- 5. Apply 32 clock pulses to pin CLKOUT.
- 6. Read time registers to see the first change.
- 7. Apply 64 clock pulses to pin CLKOUT.
- 8. Read time registers to see the second change.

Repeat 7 and 8 for additional increments.

Tiny Real-Time Clock/calendar with alarm function and I²C-bus

8.2.1.2 STOP: STOP bit function

The function of the STOP bit (see <u>Figure 6</u>) is to allow for accurate starting of the time circuits. The STOP bit function causes the upper part of the prescaler (F_2 to F_{14}) to be held in reset and thus no 1 Hz ticks are generated. It also stops the output of clock frequencies below 8 kHz on pin CLKOUT.

The time circuits can then be set and do not increment until the STOP bit is released (see Figure 7 and Table 7).

Tiny Real-Time Clock/calendar with alarm function and I²C-bus

Table 7. First increment of time circuits after STOP bit release

Bit	Prescaler bits	1 Hz tick	Time	Comment
STOP	F ₀ F ₁ -F ₂ to F ₁₄		hh:mm:ss	
Clock is	running normally			
0	01-0 0001 1101 0100		12:45:12	prescaler counting normally
STOP bit	is activated by user.	F ₀ F ₁ are not reset	and values ca	nnot be predicted externally
1	XX-0 0000 0000 0000		12:45:12	prescaler is reset; time circuits are frozen
New time	e is set by user			
1	XX-0 0000 0000 0000		08:00:00	prescaler is reset; time circuits are frozen
STOP bit	is released by user			
0	XX-0 0000 0000 0000	 	08:00:00	prescaler is now running
	XX-1 0000 0000 0000		08:00:00	-
	XX-0 1000 0000 0000	0.507813	08:00:00	-
	XX-1 1000 0000 0000	to 0.507935 s	08:00:00	-
	:	0.507555 \$:	:
	11-1 1111 1111 1110	<u> </u>	08:00:00	-
	00-0 0000 0000 0001	1 1	08:00:01	0 to 1 transition of F ₁₄ increments the time circuits
	10-0 0000 0000 0001		08:00:01	-
	:		:	:

	00-0 0000 0000 0000		08:00:01	-
	10-0 0000 0000 0000		08:00:01	-
	:		:	:
	11-1 1111 1111 1110		08:00:01	-
	00-0 0000 0000 0001	<u> </u>	08:00:02	0 to 1 transition of F ₁₄ increments the time circuits
		aaa-004416		

[1] F₀ is clocked at 32.768 kHz.

The lower two stages of the prescaler (F_0 and F_1) are not reset. And because the I^2 C-bus is asynchronous to the crystal oscillator, the accuracy of restarting the time circuits is between zero and one 8.192 kHz cycle (see Figure 7).

The first increment of the time circuits is between 0.507813 s and 0.507935 s after STOP bit is released. The uncertainty is caused by the prescaler bits F_0 and F_1 not being reset (see <u>Table 7</u>) and the unknown state of the 32 kHz clock.

Tiny Real-Time Clock/calendar with alarm function and I²C-bus

8.2.1.3 Software reset

A reset is automatically generated at power-on. A reset can also be initiated with the software reset command. Software reset command means setting bits 6, 4, and 3 in register Control_1 (00h) logic 1 and all other bits logic 0 by sending the bit sequence 01011000 (58h), see Figure 8.

In reset state, all registers are set according to $\underline{\text{Table 8}}$ and the address pointer returns to address 00h.

Table 8. Registers reset values

Address	Register name	Bit	Bit							
		7	6	5	4	3	2	1	0	
00h	Control_1	0	0	0	0	0	0	0	0	
01h	Control_2	0	0	0	0	0	0	0	0	
02h	Offset	0	0	0	0	0	0	0	0	
03h	RAM_byte	0	0	0	0	0	0	0	0	
04h	Seconds	1	0	0	0	0	0	0	0	
05h	Minutes	0	0	0	0	0	0	0	0	
06h	Hours	0	0	0	0	0	0	0	0	
07h	Days	0	0	0	0	0	0	0	1	
08h	Weekdays	0	0	0	0	0	1	1	0	
09h	Months	0	0	0	0	0	0	0	1	
0Ah	Years	0	0	0	0	0	0	0	0	
0Bh	Second_alarm	1	0	0	0	0	0	0	0	
0Ch	Minute_alarm	1	0	0	0	0	0	0	0	
0Dh	Hour_alarm	1	0	0	0	0	0	0	0	
0Eh	Day_alarm	1	0	0	0	0	0	0	0	
0Fh	Weekday_alarm	1	0	0	0	0	0	0	0	
10h	Timer_value	0	0	0	0	0	0	0	0	
11h	Timer_mode	0	0	0	1	1	0	0	0	

Tiny Real-Time Clock/calendar with alarm function and I²C-bus

The PCF85063A resets to:

Time — 00:00:00

Date — 20000101

Weekday — Saturday

8.2.2 Register Control_2

Table 9. Control_2 - control and status register 2 (address 01h) bit description

Bit	Symbol	Value	Description	Reference
7	AIE		alarm interrupt	Section 8.2.2.1
		0[1]	disabled	Section 8.5.6
		1	enabled	
6	AF		alarm flag	Section 8.2.2.1

		0[1]	no timer interrupt generated	Section 8.2.2.3 Section 8.6.3
		1	flag set when timer interrupt generated	<u>Section 6.6.3</u>
2 to 0	COF[2:0]	see Table 11	CLKOUT control	Section 8.2.2.4

^[1] Default value.

Tiny Real-Time Clock/calendar with alarm function and I²C-bus

8.2.2.1 Alarm interrupt

AIE: This bit activates or deactivates the generation of an interrupt when AF is asserted, respectively.

AF: When an alarm occurs, AF is set logic 1. This bit maintains its value until overwritten by command. To prevent one flag being overwritten while clearing another, a logic AND is performed during a write access.

Tiny Real-Time Clock/calendar with alarm function and I²C-bus

8.2.2.2 MI and HMI: minute and half minute interrupt

The minute interrupt (bit MI) and half minute interrupt (bit HMI) are pre-defined timers for generating interrupt pulses on pin \overline{INT} ; see <u>Figure 10</u>. The timers are running in sync with the seconds counter (see <u>Table 19 on page 21</u>).

The minute and half minute interrupts must only be used when the frequency offset is set to normal mode (MODE = 0), see Section 8.2.3. In normal mode, the interrupt pulses on pin $\overline{\text{INT}}$ are $\frac{1}{64}$ s wide.

When starting MI, the first interrupt will be generated after 1 second to 59 seconds. When starting HMI, the first interrupt will be generated after 1 second to 29 seconds. Subsequent periods do not have such a delay. The timers can be enabled independently from one another. However, a minute interrupt enabled on top of a half minute interrupt is not distinguishable.

Table 10. Effect of bits MI and HMI on INT generation

Minute interrupt (bit MI)	Half minute interrupt (bit HMI)	Result
0	0	no interrupt generated
1	0	an interrupt every minute
0	1	an interrupt every 30 s
1	1	an interrupt every 30 s

The duration of the timer is affected by the register Offset (see <u>Section 8.2.3</u>). Only when OFFSET[6:0] has the value 00h the periods are consistent.

8.2.2.3 TF: timer flag

The timer flag (bit TF) is set logic 1 on the first trigger of MI, HMI, or the countdown timer. The purpose of the flag is to allow the controlling system to interrogate what caused the interrupt: timer or alarm. The flag can be read and cleared by command.

The status of the timer flag TF can affect the $\overline{\text{INT}}$ pulse generation depending on the setting of TI_TP (see Section 8.6.2 "Register Timer_mode" on page 30):

- When TI_TP is set logic 1
 - an INT pulse is generated independent of the status of the timer flag TF
 - TF stays set until it is cleared
 - TF does not affect INT

PCF85063A

Tiny Real-Time Clock/calendar with alarm function and I²C-bus

- the countdown timer runs in a repetitive loop and keeps generating timed periods
- When TI_TP is set logic 0
 - the INT generation follows the TF flag
 - TF stays set until it is cleared
 - If TF is not cleared before the next coming interrupt, no INT is generated
 - the countdown timer stops after the first countdown

8.2.2.4 COF[2:0]: Clock output frequency

A programmable square wave is available at pin CLKOUT. Operation is controlled by the COF[2:0] bits in the register Control_2. Frequencies of 32.768 kHz (default) down to 1 Hz can be generated for use as a system clock, microcontroller clock, input to a charge pump, or for calibration of the oscillator.

Pin CLKOUT is a push-pull output and enabled at power-on. CLKOUT can be disabled by setting COF[2:0] to 111 or by setting CLKOE LOW (PCF85063ATL only). When disabled, the CLKOUT is LOW. If CLKOE is HIGH and COF[2:0]=111 there will be no clock and CLKOUT will be LOW.

The duty cycle of the selected clock is not controlled. However, due to the nature of the clock generation, all clock frequencies except 32.768 kHz have a duty cycle of 50:50.

The STOP bit function can also affect the CLKOUT signal, depending on the selected frequency. When the STOP bit is set logic 1, the CLKOUT pin generates a continuous LOW for those frequencies that can be stopped. For more details of the STOP bit function, see Section 8.2.1.2.

Table 11.	CLKOUT	frequency	solection
Table 11.	CLKOUI	treauency	selection

COF[2:0]	CLKOUT frequency (Hz)	Typical duty cycle[1]	Effect of STOP bit
000[2]	32768	60 : 40 to 40 : 60	no effect
001	16384	50 : 50	no effect
010	8192	50 : 50	no effect
011	4096	50 : 50	CLKOUT = LOW
100	2048	50 : 50	CLKOUT = LOW
101	1024	50 : 50	CLKOUT = LOW
110	1[3]	50 : 50	CLKOUT = LOW
111	CLKOUT = LOW	-	-

^[1] Duty cycle definition: % HIGH-level time : % LOW-level time.

[3] 1 Hz clock pulses are affected by offset correction pulses.

^[2] Default values: The duty cycle of the CLKOUT when outputting 32,768 Hz could change from 60:40 to 40:60 depending on the detector since the 32,768 Hz is derived from the oscillator output which is not perfect. It could change from device to device and it depends on the silicon diffusion. There is nothing that can be done from outside the chip to influence the duty cycle.

Tiny Real-Time Clock/calendar with alarm function and I²C-bus

8.2.3 Register Offset

The PCF85063A incorporates an offset register (address 02h) which can be used to implement several functions, such as:

- Accuracy tuning
- · Aging adjustment
- Temperature compensation

Table 12. Offset - offset register (address 02h) bit description

Bit	Symbol	Value	Description	
7	MODE		offset mode	
		O[1]	normal mode: offset is made once every two hours	
		1	course mode: offset is made every 4 minutes	
6 to 0	OFFSET[6:0]	see Table 13	offset value	

^[1] Default value.

For MODE = 0, each LSB introduces an offset of 4.34 ppm. For MODE = 1, each LSB introduces an offset of 4.069 ppm. The offset value is coded in two's complement giving a range of +63 LSB to -64 LSB.

Table 13. Offset values

OFFSET[6:0]	Offset value in decimal	Offset value in ppr	Offset value in ppm		
		Normal mode MODE = 0	Fast mode MODE = 1		
0111111	+63	+273.420	+256.347		
0111110	+62	+269.080	+252.278		
:	:	:	:		
0000010	+2	+8.680	+8.138		
0000001	+1	+4.340	+4.069		
0000000[1]	0	0[1]	0[1]		
1111111	–1	-4.340	-4.069		
1111110	-2	-8.680	-8.138		
:	:	:	:		
1000001	-63	-273.420	-256.347		
1000000	-64	-277.760	-260.416		

^[1] Default value.

The correction is made by adding or subtracting clock correction pulses, thereby changing the period of a single second but not by changing the oscillator frequency.

It is possible to monitor when correction pulses are applied. To enable correction interrupt generation, bit CIE (register Control_1) has to be set logic 1. At every correction cycle, a pulse is generated on pin $\overline{\text{INT}}$. The pulse width depends on the correction mode. If multiple correction pulses are applied, an interrupt pulse is generated for each correction pulse applied.

Tiny Real-Time Clock/calendar with alarm function and I²C-bus

8.2.3.1 Correction when MODE = 0

The correction is triggered once every two hours and then correction pulses are applied once per minute until the programmed correction values have been implemented.

Table 14. Correction pulses for MODE = 0

Correction value	Update every nth hour	Minute	Correction pulses on INT per minute[1]
+1 or –1	2	00	1
+2 or –2	2	00 and 01	1
+3 or –3	2	00, 01, and 02	1

	2nd and next hour	00	1
+62 or –62	2	00 to 59	1
	2nd and next hour	00 and 01	1
+63 or –63	02	00 to 59	1
	2nd and next hour	00, 01, and 02	1
-64	02	00 to 59	1
	2nd and next hour	00, 01, 02, and 03	1

^[1] The correction pulses on pin $\overline{\text{INT}}$ are $^{1}\!/_{64}$ s wide.

In MODE = 0, any timer or clock output using a frequency below 64 Hz is affected by the clock correction (see $\underline{\text{Table 15}}$).

Table 15. Effect of correction pulses on frequencies for MODE = 0

Frequency (Hz)	Effect of correction
CLKOUT	
32768	no effect
16384	no effect
8192	no effect
4096	no effect
2048	no effect
1024	no effect
1	affected
Timer source clock	
4096	no effect
64	no effect
1	affected
1/60	affected

Tiny Real-Time Clock/calendar with alarm function and I²C-bus

8.2.3.2 Correction when MODE = 1

The correction is triggered once every four minutes and then correction pulses are applied once per second up to a maximum of 60 pulses. When correction values greater than 60 pulses are used, additional correction pulses are made in the 59th second.

Clock correction is made more frequently in MODE = 1; however, this can result in higher power consumption.

Table 16. Correction pulses for MODE = 1

Correction value	Update every n th minute	Second	Correction pulses on INT per second[1]
+1 or –1	2	00	1
+2 or –2	2	00 and 01	1
+3 or –3	2	00, 01, and 02	1
:	:	:	÷
+59 or –59	2	00 to 58	1
+60 or –60	2	00 to 59	1
+61 or –61	2	00 to 58	1
	2	59	2
+62 or –62	2	00 to 58	1
	2	59	3
+63 or –63	2	00 to 58	1
	2	59	4
-64	2	00 to 58	1
	2	59	5

^[1] The correction pulses on pin $\overline{\rm INT}$ are 1/1024 s wide. For multiple pulses, they are repeated at an interval of 1/512 s.

In MODE = 1, any timer source clock using a frequency below 1.024 kHz is also affected by the clock correction (see Table 17).

Table 17. Effect of correction pulses on frequencies for MODE = 1

Frequency (Hz)	Effect of correction				
CLKOUT

Tiny Real-Time Clock/calendar with alarm function and I²C-bus

8.2.3.3 Offset calibration workflow

The calibration offset has to be calculated based on the time. <u>Figure 11</u> shows the workflow how the offset register values can be calculated:

Tiny Real-Time Clock/calendar with alarm function and I²C-bus

With the offset calibration an accuracy of ± 2 ppm (0.5 × offset per LSB) can be reached (see Table 13).

 ± 1 ppm corresponds to a time deviation of 0.0864 seconds per day.

- (1) 3 correction pulses in MODE = 0 correspond to -13.02 ppm.
- (2) 4 correction pulses in MODE = 1 correspond to −16.276 ppm.
- (3) Reachable accuracy zone.

Fig 12. Result of offset calibration

8.2.4 Register RAM_byte

The PCF85063A provides a free RAM byte, which can be used for any purpose, for example, status byte of the system.

Table 18. RAM_byte - 8-bit RAM register (address 03h) bit description

Bit	Symbol	Value	Description
7 to 0	B[7:0]	00000000 <mark>11</mark> to 11111111	RAM content

^[1] Default value.

8.3 Time and date registers

Most of the registers are coded in the BCD format to simplify application use.

8.3.1 Register Seconds

Table 20. Seconds coded in BCD format

8.3.1.1 OS: Oscillator stop

When the oscillator of the PCF85063A is stopped, the OS flag is set. The oscillator can be stopped, for example, by connecting one of the oscillator pins OSCI or OSCO to ground. The oscillator is considered to be stopped during the time between power-on and stable crystal resonance. This time can be in the range of 200 ms to 2 s depending on crystal type, temperature, and supply voltage.

The flag remains set until cleared by command (see <u>Figure 13</u>). If the flag cannot be cleared, then the oscillator is not running. This method can be used to monitor the oscillator and to determine if the supply voltage has reduced to the point where oscillation fails.

^[1] Default value.

Tiny Real-Time Clock/calendar with alarm function and I²C-bus

8.3.2 Register Minutes

Table 21. Minutes - minutes register (address 05h) bit description

Bit	Symbol	Value	Place value	Description
7	-	0	-	unused

8.3.7 Register Years

Table 28. Years - years register (0Ah) bit description

Bit	Symbol	Value	Place value	Description
7 to 4	YEARS	0[1] to 9	ten's place	actual year coded in BCD format
3 to 0		0 <u>[1]</u> to 9	unit place	

^[1] Default value.

8.4 Setting and reading the time

Figure 14 shows the data flow and data dependencies starting from the 1 Hz clock tick.

During read/write operations, the time counting circuits (memory locations 04h through 0Ah) are blocked.

The blocking prevents

- Faulty reading of the clock and calendar during a carry condition
- · Incrementing the time registers during the read cycle

After this read/write access is completed, the time circuit is released again and any pending request to increment the time counters that occurred during the read/write access is serviced. A maximum of 1 request can be stored; therefore, all accesses must be completed within 1 second (see Figure 15).

Tiny Real-Time Clock/calendar with alarm function and I²C-bus

Because of this method, it is very important to make a read or write access in one go, that is, setting or reading seconds through to years should be made in one single access. Failing to comply with this method could result in the time becoming corrupted.

As an example, if the time (seconds through to hours) is set in one access and then in a second access the date is set, it is possible that the time will increment between the two accesses. A similar problem exists when reading. A roll-over may occur between reads thus giving the minutes from one moment and the hours from the next.

Recommended method for reading the time:

- Send a START condition and the slave address (see <u>Table 39 on page 35</u>) for write (A2h)
- 2. Set the address pointer to 4 (Seconds) by sending 04h
- 3. Send a RESTART condition or STOP followed by START
- 4. Send the slave address for read (A3h)
- 5. Read Seconds
- 6. Read Minutes
- 7. Read Hours
- 8. Read Days
- 9. Read Weekdays
- 10. Read Months
- 11. Read Years
- 12. Send a STOP condition

8.5 Alarm registers

8.5.1 Register Second_alarm

Table 29. Second_alarm - second alarm register (address 0Bh) bit description

Bit	Symbol	Value	Place value	Description
7	AEN_S			second alarm
		0	-	enabled
		1 <u>[1]</u>	-	disabled

3 to 0		0[1] to 9	unit place	BCD format

^[1] Default value.

^[2] Hour mode is set by the 12_24 bit in register Control_1.

Tiny Real-Time Clock/calendar with alarm function and I²C-bus

8.5.5 Register Weekday_alarm

Table 33. Weekday_alarm - weekday alarm register (address 0Fh) bit description

Bit	Symbol	Value	Description
7	AEN_W		weekday alarm
		0	enabled
		1 <u>[1]</u>	disabled
6 to 3	-	0	unused
2 to 0	WEEKDAY_ALARM	0 <u>[1]</u> to 6	weekday alarm information coded in BCD format

^[1] Default value.

8.5.6 Alarm function

By clearing the alarm enable bit (AEN_x) of one or more of the alarm registers, the corresponding alarm condition(s) are active. When <u>an alarm occurs</u>, AF is set logic 1. The asserted AF can be used to generate an interrupt (INT). The AF is cleared by command.

The registers at addresses 0Bh through 0Fh contain alarm information. When one or more of these registers is loaded with second, minute, hour, day or weekday, and its corresponding AEN_x is logic 0, then that information is compared with the current second, minute, hour, day, and weekday. When all enabled comparisons first match, the alarm flag (AF in register Control_2) is set logic 1.

The generation of interrupts from the alarm function is controlled via bit AIE. If bit AIE is enabled, the INT pin follows the condition of bit AF. AF remains set until cleared by command. Once AF has been cleared, it will only be set again when the time increments to match the alarm condition once more. Alarm registers which have their AEN_x bit at logic 1 are ignored.

Tiny Real-Time Clock/calendar with alarm function and I²C-bus

8.6 Timer registers

The 8-bit countdown timer at address 10h is controlled by the register Timer_mode at address 11h.

8.6.1 Register Timer_value

Table 34. Timer_value - timer value register (address 10h) bit description

Bit	Symbol	Value	Description
7 to 0	T[7:0]	0h ^[1] to FFh	countdown timer value[2]

[1] Default value.

[2] Countdown period in seconds: $CountdownPeriod = \frac{T}{SourceClockFrequency}$ where T is the countdown value.

Tiny Real-Time Clock/calendar with alarm function and I²C-bus

8.6.2 Register Timer_mode

Table 35. Timer_mode - timer control register (address 11h) bit description

Bit	Symbol	Value	Description
7 to 5	-	000	unused
4 to 3	TCF[1:0]		timer clock frequency
		00	4.096 kHz timer source clock
		01	64 Hz timer source clock
		10	1 Hz timer source clock
		11[1]	1/60 Hz timer source clock
2 TE			timer enable
		0 <u>[1]</u>	timer is disabled
		1	timer is enabled
1	TIE		timer interrupt enable
		O[1]	no interrupt generated from timer
		1	interrupt generated from timer
0	TI_TP[2]		timer interrupt mode
		O[1]	interrupt follows timer flag
		1	interrupt generates a pulse

^[1] Default value.

8.6.3 Timer functions

The timer has four selectable source clocks allowing for countdown periods in the range from 244 μs to 4 hours 15 min. For periods longer than 4 hours, the alarm function can be used.

Table 36. Timer clock frequency and timer durations

TCF[1:0]	Timer source clock frequency[1]	Delay			
		Minimum timer duration T = 1	Maximum timer duration T = 255		
00	4.096 kHz	244 μs	62.256 ms		
01	64 Hz	15.625 ms	3.984 s		
10	1 Hz ^[2]	1 s	255 s		
11	½ Hz[2]	60 s	4 hours 15 min		

^[1] When not in use, TCF[1:0] must be set to $^1\!\!/_{\!60}$ Hz for power saving.

Remark: Note that all timings which are generated from the 32.768 kHz oscillator are based on the assumption that there is 0 ppm deviation. Deviation in oscillator frequency results in deviation in timings. This is not applicable to interface timing.

The timer counts down from a software-loaded 8-bit binary value, T[7:0], in register Timer_value. Loading the counter with 0 stops the timer. Values from 1 to 255 are valid.

^[2] How the setting of TI_TP and the timer flag TF can affect the INT pulse generation is explained in Section 8.2.2.3 on page 15.

^[2] Time periods can be affected by correction pulses.

Tiny Real-Time Clock/calendar with alarm function and I²C-bus

When the counter decrements from 1, the timer flag (bit TF in register Control_2) is set and the counter automatically re-loads and starts the next timer period.

If a new value of T is written before the end of the current timer period, then this value takes immediate effect. NXP does not recommend changing T without first disabling the counter by setting bit TE logic 0. The update of T is asynchronous to the timer clock. Therefore changing it without setting bit TE logic 0 may result in a corrupted value loaded into the countdown counter. This results in an undetermined countdown period for the first period. The countdown value T will, however, be correctly stored and correctly loaded on subsequent timer periods.

When the TIE flag is set, an interrupt signal on $\overline{\text{INT}}$ is generated if this mode is enabled. See Section 8.2.2 for details on how the interrupt can be controlled.

When starting the timer for the first time, the first period has an uncertainty. The uncertainty is a result of the enable instruction being generated from the interface clock which is asynchronous from the timer source clock. Subsequent timer periods do not have such delay. The amount of delay for the first timer period depends on the chosen source clock, see <u>Table 37</u>.

Table 37. First period delay for timer counter value T

Timer source clock	Minimum timer period	Maximum timer period
4.096 kHz	Т	T + 1
64 Hz	Т	T + 1
1 Hz	$(T-I) + \frac{I}{64 \text{ Hz}}$	$T + \frac{I}{64 \text{ Hz}}$
1⁄ ₆₀ Hz	$(T-I) + \frac{I}{64 \text{ Hz}}$	$T + \frac{1}{64 \text{ Hz}}$

Tiny Real-Time Clock/calendar with alarm function and I²C-bus

At the end of every countdown, the timer sets the countdown timer flag (bit TF in register Control_2). Bit TF can only be cleared by command. The asserted bit TF can be used to generate an interrupt at pin $\overline{\text{INT}}$. The interrupt may be generated as a pulsed signal every countdown period or as a permanently active signal which follows the condition of bit TF. Bit TI_TP is used to control this mode selection and the interrupt output may be disabled with bit TIE, see Table 35 and Figure 17.

When reading the timer, the current countdown value is returned and **not** the initial value T. Since it is not possible to freeze the countdown timer counter during read back, it is recommended to read the register twice and check for consistent results.

Timer source clock frequency selection of 1 Hz and $^{1}/_{60}$ Hz is affected by the Offset register. The duration of a program period varies according to when the offset is initiated. For example, if a 100 s timer is set using the 1 Hz clock as source, then some 100 s periods will contain correction pulses and therefore be longer or shorter depending on the setting of the Offset register. See Section 8.2.3 to understand the operation of the Offset register.

8.6.3.1 Countdown timer interrupts

The pulse generator for the countdown timer interrupt uses an internal clock and is dependent on the selected source clock for the countdown timer and on the countdown value T. As a consequence, the width of the interrupt pulse varies (see Table 38).

Table 38. INT operation
TF and INT become active simultaneously.

Source clock (Hz)	INT period (s)		
	T = 1[1]	T > 1[1]	
4096	1/8192	1/4096	
64	1/128	1/64	
1	1/64	1/64	
1/60	1/64	1/64	

^[1] T = loaded countdown value. Timer stops when T = 0.

Tiny Real-Time Clock/calendar with alarm function and I²C-bus

9. Characteristics of the I²C-bus interface

The I²C-bus is for bidirectional, two-line communication between different ICs or modules. The two lines are a Serial DAta line (SDA) and a Serial CLock line (SCL). Both lines must be connected to a positive supply via a pull-up resistor. Data transfer may be initiated only when the bus is not busy.

9.1 Bit transfer

One data bit is transferred during each clock pulse. The data on the SDA line must remain stable during the HIGH period of the clock pulse, as changes in the data line at this time are interpreted as a control signal (see Figure 18).

9.2 START and STOP conditions

Both data and clock lines remain HIGH when the bus is not busy.

A HIGH-to-LOW transition of the data line while the clock is HIGH is defined as the START condition - S.

A LOW-to-HIGH transition of the data line while the clock is HIGH is defined as the STOP condition - P (see Figure 19).

9.3 System configuration

A device generating a message is a transmitter; a device receiving a message is a receiver. The device that controls the message is the master; and the devices which are controlled by the master are the slaves (see <u>Figure 20</u>).

Tiny Real-Time Clock/calendar with alarm function and I²C-bus

9.4 Acknowledge

The number of data bytes transferred between the START and STOP conditions from transmitter to receiver is unlimited. Each byte of 8 bits is followed by an acknowledge cycle.

- A slave receiver, which is addressed, must generate an acknowledge after the reception of each byte
- Also a master receiver must generate an acknowledge after the reception of each byte that has been clocked out of the slave transmitter
- The device that acknowledges must pull-down the SDA line during the acknowledge clock pulse, so that the SDA line is stable LOW during the HIGH period of the acknowledge related clock pulse (set-up and hold times must be considered)
- A master receiver must signal an end of data to the transmitter by not generating an acknowledge on the last byte that has been clocked out of the slave. In this event, the transmitter must leave the data line HIGH to enable the master to generate a STOP condition

Acknowledgement on the I²C-bus is shown in Figure 21.

Tiny Real-Time Clock/calendar with alarm function and I²C-bus

9.5 I²C-bus protocol

9.5.1 Addressing

One I²C-bus slave address (1010001) is reserved for the PCF85063A. The entire I²C-bus slave address byte is shown in Table 39.

Table 39. I²C slave address byte

	Slave address							
Bit	7	6	5	4	3	2	1	0
	MSB							LSB
	1	0	1	0	0	0	1	R/W

After a START condition, the I²C slave address has to be sent to the PCF85063A device.

The R/W bit defines the direction of the following single or multiple byte data transfer (R/W = 0 for writing, R/W = 1 for reading). For the format and the timing of the START condition (S), the STOP condition (P) and the acknowledge bit (A) refer to the I^2C -bus characteristics (see Ref. 16 "UM10204"). In the write mode, a data transfer is terminated by sending either the STOP condition or the START condition of the next data transfer.

9.5.2 Clock and calendar READ or WRITE cycles

The I²C-bus configuration for the different PCF85063A READ and WRITE cycles is shown in <u>Figure 22</u> and <u>Figure 23</u>. The register address is a 5-bit value that defines which register is to be accessed next. The upper 3 bits of the register address are not used.

		C _L = 12.5 pF	7.5	12.5	17.5	pF	
R _s	series resistance		-	-	100	kΩ	

- [1] For reliable oscillator start-up at power-on use V_{DD} greater than 1.2 V. If powered up at 0.9 V the oscillator will start but it might be a bit slow, especially if at high temperature. Normally the power supply is not 0.9 V at start-up and only comes at the end of battery discharge. V_{DD} min of 0.9 V is specified so that the customer can calculate how large a battery or capacitor they need for their application. V_{DD} min of 1.2 V or greater is needed to ensure speedy oscillator start-up time.
- [2] 400 kHz I2C operation is production tested at 1.8 V. Design methodology allows I2C operation at 1.8 V 5 % (1.71 V) which has been verified during product characterization on a limited number of devices.
- [3] Timer source clock = $\frac{1}{60}$ Hz, level of pins SCL and SDA is V_{DD} or V_{SS} .
- [4] Tested on sample basis.
- [5] The I²C-bus interface of PCF85063A is 5 V tolerant.
- [6] Implicit by design.
- [7] Integrated load capacitance, $C_{L(itg)}$, is a calculation of C_{OSCI} and C_{OSCO} in series: $C_{L(itg)} = \frac{(C_{OSCI} \cdot C_{OSCO})}{(C_{OSCI} + C_{OSCO})}$.

Tiny Real-Time Clock/calendar with alarm function and I²C-bus

 $C_{L(itg)}$ = 12.5 pF; CLKOUT disabled.

- (1) $V_{DD} = 5.5 \text{ V}.$
- (2) $V_{DD} = 3.3 \text{ V}.$

Fig 26. Typical $I_{\mbox{\scriptsize DD}}$ as a function of temperature

t _{VD;DAT}	data valid time		0	0.9	μS
t _{VD;ACK}	data valid acknowledge time		0	0.9	μS
t _{SP}	pulse width of spikes that must be suppressed by the input filter		0	50	ns

- [1] A detailed description of the I²C-bus specification is given in Ref. 16 "UM10204".
- [2] I²C-bus access time between two STARTs or between a START and a STOP condition to this device must be less than one second.
- [3] A device must internally provide a hold time of at least 300 ns for the SDA signal (with respect to the V_{IH(min)} of the SCL signal) to bridge the undefined region of the falling edge of SCL.
- [4] The maximum t_f for the SDA and SCL bus lines is specified at 300 ns. The maximum fall time for the SDA output stage t_f is specified at 250 ns. This allows series protection resistors to be connected in between the SDA and the SCL pins and the SDA/SCL bus lines without exceeding the maximum specified t_f .

Tiny Real-Time Clock/calendar with alarm function and I²C-bus

Tiny Real-Time Clock/calendar with alarm function and I²C-bus

14. Application information

The data sheet values were obtained using a crystal with an ESR of 60 k Ω . If a crystal with an ESR of 70 k Ω is used then the power consumption would increase by a few nA and the start-up time will increase slightly.

A 1 farad super capacitor combined with a low V_F diode can be used as a standby or back-up supply. With the RTC in its minimum power configuration that is, timer off and CLKOUT off, the RTC may operate for weeks.

(1) R1 limits the inrush current to the super capacitor at power-on.

18. Soldering of SMD packages

This text provides a very brief insight into a complex technology. A more in-depth account of soldering ICs can be found in Application Note *AN10365* "Surface mount reflow soldering description".

18.1 Introduction to soldering

Soldering is one of the most common methods through which packages are attached to Printed Circuit Boards (PCBs), to form electrical circuits. The soldered joint provides both the mechanical and the electrical connection. There is no single soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and Surface Mount Devices (SMDs) are mixed on one printed wiring board; however, it is not suitable for fine pitch SMDs. Reflow soldering is ideal for the small pitches and high densities that come with increased miniaturization.

18.2 Wave and reflow soldering

Wave soldering is a joining technology in which the joints are made by solder coming from a standing wave of liquid solder. The wave soldering process is suitable for the following:

- Through-hole components
- Leaded or leadless SMDs, which are glued to the surface of the printed circuit board

Not all SMDs can be wave soldered. Packages with solder balls, and some leadless packages which have solder lands underneath the body, cannot be wave soldered. Also, leaded SMDs with leads having a pitch smaller than ~0.6 mm cannot be wave soldered, due to an increased probability of bridging.

The reflow soldering process involves applying solder paste to a board, followed by component placement and exposure to a temperature profile. Leaded packages, packages with solder balls, and leadless packages are all reflow solderable.

Key characteristics in both wave and reflow soldering are:

- · Board specifications, including the board finish, solder masks and vias
- · Package footprints, including solder thieves and orientation
- The moisture sensitivity level of the packages
- Package placement
- Inspection and repair
- Lead-free soldering versus SnPb soldering

18.3 Wave soldering

Key characteristics in wave soldering are:

- Process issues, such as application of adhesive and flux, clinching of leads, board transport, the solder wave parameters, and the time during which components are exposed to the wave
- Solder bath specifications, including temperature and impurities

Tiny Real-Time Clock/calendar with alarm function and I²C-bus

18.4 Reflow soldering

Key characteristics in reflow soldering are:

- Lead-free versus SnPb soldering; note that a lead-free reflow process usually leads to higher minimum peak temperatures (see <u>Figure 35</u>) than a SnPb process, thus reducing the process window
- Solder paste printing issues including smearing, release, and adjusting the process window for a mix of large and small components on one board
- Reflow temperature profile; this profile includes preheat, reflow (in which the board is heated to the peak temperature) and cooling down. It is imperative that the peak temperature is high enough for the solder to make reliable solder joints (a solder paste characteristic). In addition, the peak temperature must be low enough that the packages and/or boards are not damaged. The peak temperature of the package depends on package thickness and volume and is classified in accordance with Table 43 and 44

Table 43. SnPb eutectic process (from J-STD-020D)

Package thickness (mm)	Package reflow temperature (°C)						
	Volume (mm³)						
	< 350	≥ 350					
< 2.5	235	220					
≥ 2.5	220	220					

Table 44. Lead-free process (from J-STD-020D)

Package thickness (mm)	Package reflow temperature (°C) Volume (mm³)							
	< 350	350 to 2000	> 2000					
< 1.6	260	260	260					
1.6 to 2.5	260	250	245					
> 2.5	250	245	245					

Moisture sensitivity precautions, as indicated on the packing, must be respected at all times.

Studies have shown that small packages reach higher temperatures during reflow soldering, see Figure 35.

Tiny Real-Time Clock/calendar with alarm function and I²C-bus

24.1 Data sheet status

Document status[1][2]	Product status[3]	Definition
Objective [short] data sheet	Development	This document contains data from the objective specification for product development.
Preliminary [short] data sheet	Qualification	This document contains data from the preliminary specification.
Product [short] data sheet	Production	This document contains the product specification.

- [1] Please consult the most recently issued document before initiating or completing a design.
- [2] The term 'short data sheet' is explained in section "Definitions"
- [3] The product status of device(s) described in this document may have changed since this document was published and may differ in case of multiple devices. The latest product status information is available on the Internet at URL http://www.nxp.com.

24.2 Definitions

Draft — The document is a draft version only. The content is still under internal review and subject to formal approval, which may result in modifications or additions. NXP Semiconductors does not give any representations or warranties as to the accuracy or completeness of information included herein and shall have no liability for the consequences of use of such information.

Short data sheet — A short data sheet is an extract from a full data sheet with the same product type number(s) and title. A short data sheet is intended for quick reference only and should not be relied upon to contain detailed and full information. For detailed and full information see the relevant full data sheet, which is available on request via the local NXP Semiconductors sales office. In case of any inconsistency or conflict with the short data sheet, the full data sheet shall prevail.

Product specification — The information and data provided in a Product data sheet shall define the specification of the product as agreed between NXP Semiconductors and its customer, unless NXP Semiconductors and customer have explicitly agreed otherwise in writing. In no event however, shall an agreement be valid in which the NXP Semiconductors product is deemed to offer functions and qualities beyond those described in the Product data sheet.

24.3 Disclaimers

Limited warranty and liability — Information in this document is believed to be accurate and reliable. However, NXP Semiconductors does not give any representations or warranties, expressed or implied, as to the accuracy or completeness of such information and shall have no liability for the consequences of use of such information. NXP Semiconductors takes no responsibility for the content in this document if provided by an information source outside of NXP Semiconductors.

In no event shall NXP Semiconductors be liable for any indirect, incidental, punitive, special or consequential damages (including - without limitation - lost profits, lost savings, business interruption, costs related to the removal or replacement of any products or rework charges) whether or not such damages are based on tort (including negligence), warranty, breach of contract or any other legal theory.

Notwithstanding any damages that customer might incur for any reason whatsoever, NXP Semiconductors' aggregate and cumulative liability towards customer for the products described herein shall be limited in accordance with the *Terms and conditions of commercial sale* of NXP Semiconductors.

Right to make changes — NXP Semiconductors reserves the right to make changes to information published in this document, including without limitation specifications and product descriptions, at any time and without notice. This document supersedes and replaces all information supplied prior to the publication hereof.

Suitability for use — NXP Semiconductors products are not designed, authorized or warranted to be suitable for use in life support, life-critical or safety-critical systems or equipment, nor in applications where failure or malfunction of an NXP Semiconductors product can reasonably be expected to result in personal injury, death or severe property or environmental damage. NXP Semiconductors and its suppliers accept no liability for inclusion and/or use of NXP Semiconductors products in such equipment or applications and therefore such inclusion and/or use is at the customer's own risk

Applications — Applications that are described herein for any of these products are for illustrative purposes only. NXP Semiconductors makes no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

Customers are responsible for the design and operation of their applications and products using NXP Semiconductors products, and NXP Semiconductors accepts no liability for any assistance with applications or customer product design. It is customer's sole responsibility to determine whether the NXP Semiconductors product is suitable and fit for the customer's applications and products planned, as well as for the planned application and use of customer's third party customer(s). Customers should provide appropriate design and operating safeguards to minimize the risks associated with their applications and products.

NXP Semiconductors does not accept any liability related to any default, damage, costs or problem which is based on any weakness or default in the customer's applications or products, or the application or use by customer's third party customer(s). Customer is responsible for doing all necessary testing for the customer's applications and products using NXP Semiconductors products in order to avoid a default of the applications and the products or of the application or use by customer's third party customer(s). NXP does not accept any liability in this respect.

Limiting values — Stress above one or more limiting values (as defined in the Absolute Maximum Ratings System of IEC 60134) will cause permanent damage to the device. Limiting values are stress ratings only and (proper) operation of the device at these or any other conditions above those given in the Recommended operating conditions section (if present) or the Characteristics sections of this document is not warranted. Constant or repeated exposure to limiting values will permanently and irreversibly affect the quality and reliability of the device.

Terms and conditions of commercial sale — NXP Semiconductors products are sold subject to the general terms and conditions of commercial sale, as published at http://www.nxp.com/profile/terms, unless otherwise agreed in a valid written individual agreement. In case an individual agreement is concluded only the terms and conditions of the respective agreement shall apply. NXP Semiconductors hereby expressly objects to applying the customer's general terms and conditions with regard to the purchase of NXP Semiconductors products by customer.

No offer to sell or license — Nothing in this document may be interpreted or construed as an offer to sell products that is open for acceptance or the grant, conveyance or implication of any license under any copyrights, patents or other industrial or intellectual property rights.

Export control — This document as well as the item(s) described herein may be subject to export control regulations. Export might require a prior authorization from competent authorities.

Non-automotive qualified products — Unless this data sheet expressly states that this specific NXP Semiconductors product is automotive qualified, the product is not suitable for automotive use. It is neither qualified nor tested in accordance with automotive testing or application requirements. NXP Semiconductors accepts no liability for inclusion and/or use of non-automotive qualified products in automotive equipment or applications.

In the event that customer uses the product for design-in and use in automotive applications to automotive specifications and standards, customer (a) shall use the product without NXP Semiconductors' warranty of the product for such automotive applications, use and specifications, and (b) whenever customer uses the product for automotive applications beyond NXP Semiconductors' specifications such use shall be solely at customer's

own risk, and (c) customer fully indemnifies NXP Semiconductors for any liability, damages or failed product claims resulting from customer design and use of the product for automotive applications beyond NXP Semiconductors' standard warranty and NXP Semiconductors' product specifications.

Translations — A non-English (translated) version of a document is for reference only. The English version shall prevail in case of any discrepancy between the translated and English versions.

Компания «ЭлектроПласт» предлагает заключение долгосрочных отношений при поставках импортных электронных компонентов на взаимовыгодных условиях!

Наши преимущества:

- Оперативные поставки широкого спектра электронных компонентов отечественного и импортного производства напрямую от производителей и с крупнейших мировых складов:
- Поставка более 17-ти миллионов наименований электронных компонентов;
- Поставка сложных, дефицитных, либо снятых с производства позиций;
- Оперативные сроки поставки под заказ (от 5 рабочих дней);
- Экспресс доставка в любую точку России;
- Техническая поддержка проекта, помощь в подборе аналогов, поставка прототипов;
- Система менеджмента качества сертифицирована по Международному стандарту ISO 9001:
- Лицензия ФСБ на осуществление работ с использованием сведений, составляющих государственную тайну;
- Поставка специализированных компонентов (Xilinx, Altera, Analog Devices, Intersil, Interpoint, Microsemi, Aeroflex, Peregrine, Syfer, Eurofarad, Texas Instrument, Miteq, Cobham, E2V, MA-COM, Hittite, Mini-Circuits, General Dynamics и др.);

Помимо этого, одним из направлений компании «ЭлектроПласт» является направление «Источники питания». Мы предлагаем Вам помощь Конструкторского отдела:

- Подбор оптимального решения, техническое обоснование при выборе компонента;
- Подбор аналогов;
- Консультации по применению компонента;
- Поставка образцов и прототипов;
- Техническая поддержка проекта;
- Защита от снятия компонента с производства.
